Rev.1.20 May, 2018

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

(Rev.4.0-1 November 2017)

Notes for CMOS devices

(1) Voltage application waveform at input pin:

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIL (MAX) and VIH (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (MAX) and VIH (MIN).

(2) Handling of unused input pins:

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

(3) Precaution against ESD:

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

(4) Status before initialization:

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

(5) Power ON/OFF sequence:

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

(6) Input of signal during power off state:

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

How to Use This Manual

Readers This manual is intended for users who wish to understand the functions of the RH850/C1M-A and design application systems using the following RH850/C1M-A microcontrollers:

Purpose This manual is intended to give users an understanding of the hardware functions of the RH850/C1M-A shown in the *Organization* below.

Organization This manual is divided into two parts: Hardware (this manual) and Architecture (RH850G3MH User's Manual: Software (R01US0143E)).

Hardware	Software
Pin functions	Overview
CPU function	Processor Model
On-chip peripheral functions	Register Reference
Flash memory programming	Exceptions and Interrupts
	Memory Management
	Instruction Reference
	Reset
	Appendix

How to read this manual It is assumed that the readers of this manual have general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.

To understand the overall functions of the RH850/C1M-A.

→ Read this manual according to the Contents.

To understand the details of an instruction function

→ See RH850G3MH Family User's Manual: Software (R01US0143E) available separately.

Conventions

Data significance: Higher digits on the left and lower digits on the right

Active low representation: xxx (overscore over pin or signal name)

Memory map address: Higher addresses on the top and lower addresses on the bottom

Note: Footnote for item marked with Note in the text

Caution: Information requiring particular attention

Remark: Supplementary information

Numeric representation: Binary ... xxxx or $xxxx_B$

Decimal ... xxxx

Hexadecimal ... $xxxx_H$

Prefix indicating power of 2 (address space, memory capacity):

K (kilo): $2^{10} = 1,024$

M (mega): $2^{20} = 1,024^2$

G (giga): $2^{30} = 1,024^3$

Description of Registers

Each register description includes register access, register address, and register value after a reset, a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meaning of the bit settings.

The standard format for bit charts and tables are described below.

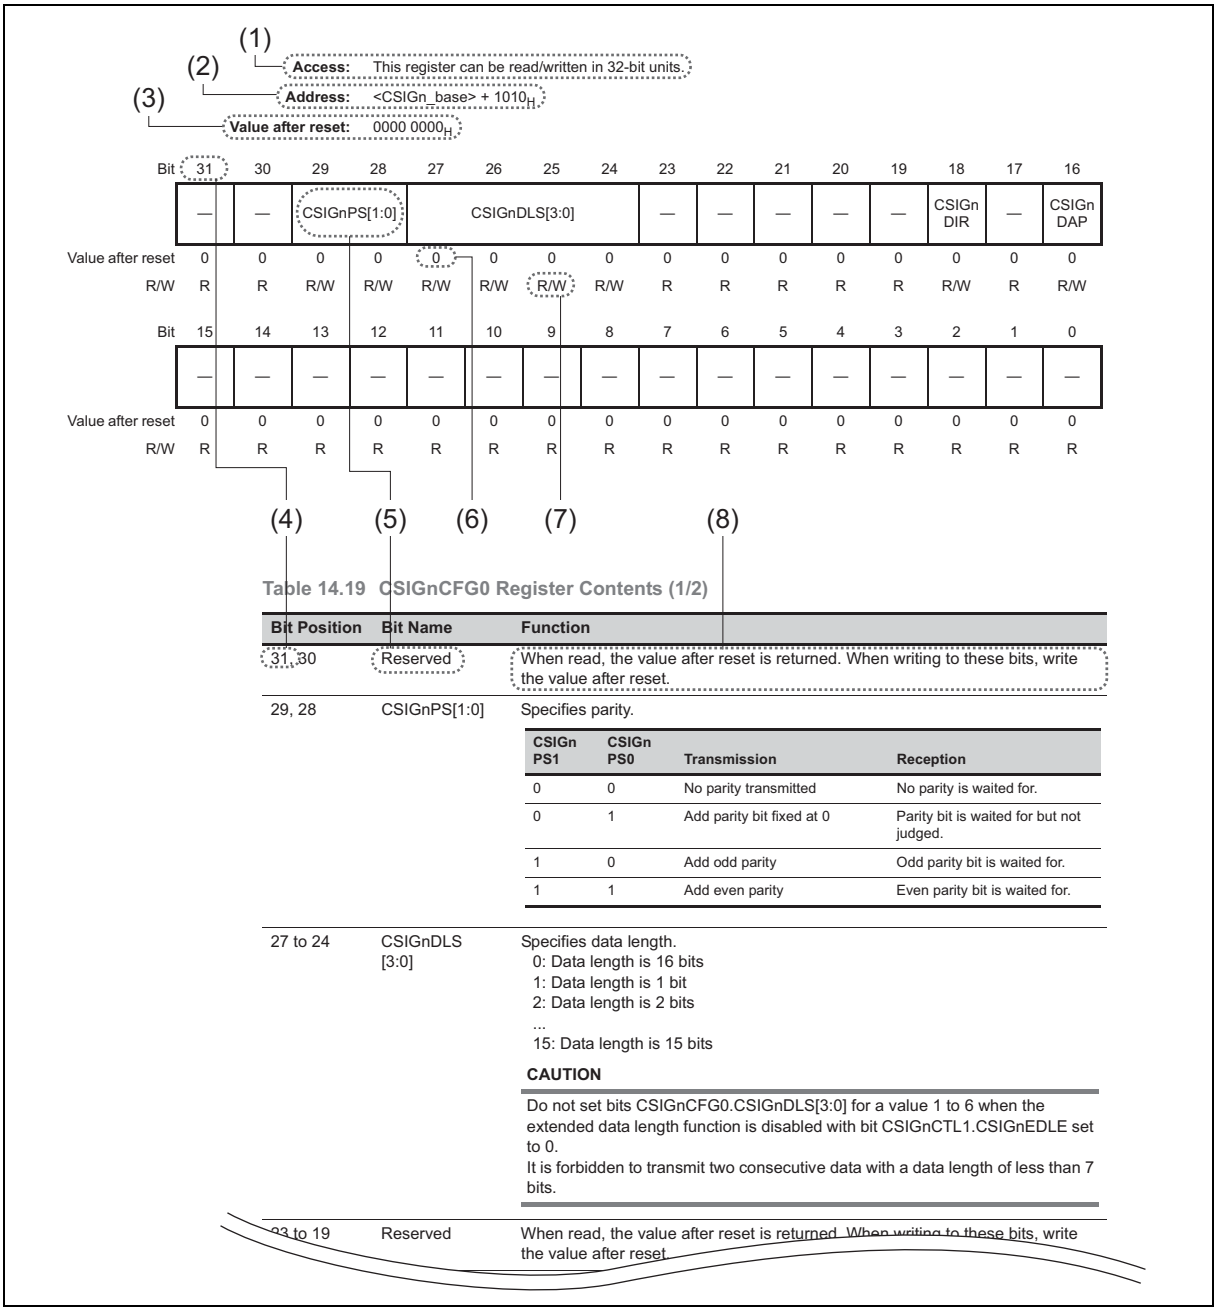

Table 14.19 CSIGnCFG0 Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
29, 28	CSIGnPS[1:0]	Specifies parity.
27 to 24	CSIGnDLS [3:0]	Specifies data length. 0: Data length is 16 bits 1: Data length is 1 bit 2: Data length is 2 bits ... 15: Data length is 15 bits
23 to 19	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

CSIGn PS1	CSIGn PS0	Transmission	Reception
0	0	No parity transmitted	No parity is waited for.
0	1	Add parity bit fixed at 0	Parity bit is waited for but not judged.
1	0	Add odd parity	Odd parity bit is waited for.
1	1	Add even parity	Even parity bit is waited for.

CAUTION

Do not set bits CSIGnCFG0.CSIGnDLS[3:0] for a value 1 to 6 when the extended data length function is disabled with bit CSIGnCTL1.CSIGnEDLE set to 0.
It is forbidden to transmit two consecutive data with a data length of less than 7 bits.

(1) Access

The register can be accessed in the bit unit indicated here.

(2) Address

This is the register address.
For base address, see description of base address in each section.

(3) Value after a reset (in hexadecimal notation)

This is the value of all bits of the register after a reset. Values for bytes are given as numbers in the range from 0 to 9 and letters from A to F or as X where they are undefined.

(4) Bit position

This is the bit number.
The bits are numbered from 31 to 0 for 32-bit registers, 15 to 0 for 16-bit registers, and 7 to 0 for 8-bit registers.

(5) Bit name

Bit name or field name is indicated.
When clearly identifying the digits of a bit field is required, do so by using a form such as CSIGnDLS[3:0] above.
Indicate reserved bits by using a dash (—).

(6) Value after a reset (in binary notation)

This is the bit values after a reset.

0	:	The value after a reset is 0.
1	:	The value after a reset is 1.
—	:	The value after a reset is undefined.

(7) R/W

This is the bit attribute of all bits of the register.

R/W	:	The bit or field is readable and writable.
R	:	The bit or field is readable. Note that all reserved bits are indicated as R. When written, the value specified in the bit chart or the value after a reset should be written. In case of writing to writable registers that also include non-reserved bits with the R-attribute, writing to the R-attribute bits will be ignored unless otherwise specified.
W	:	This bit or field is writable. When read, the value is undefined. If a value is indicated in the bit chart, the value is returned.

(8) Function

This is function of the bit.

All trademarks and registered trademarks are the property of their respective owners.

Table of Contents

Section 1 Overview 61

1.1 Features of RH850/C1M-A Products 61

1.1.1 Functions of the RH850/C1M-A 62

1.1.2 For Development and Debugging 64

1.1.3 Internal Block Diagram 65

1.2 Pin Connection Diagram (Top View) 67

1.2.1 RH850/C1M-A2 (252-Pin BGA) 67

1.2.2 RH850/C1M-A1 (176-Pin QFP) 74

Section 2 Pins 79

2.1 Port Functions 79

2.1.1 Features 79

2.1.2 Overview 80

2.1.2.1 Terms 80

2.1.2.2 Overview of Pin Functions 81

2.1.2.3 Pin Data Input/Output 83

2.1.3 Port Type 85

2.1.4 Port Group Configuration Register 87

2.1.4.1 Outline 87

2.1.4.2 Configuration of Pin Function 88

2.1.4.3 Pin Data Input/Output 97

2.1.4.4 Configuration of Electrical Characteristics Registers 102

2.1.4.5 Pin-Unit Register 104

2.1.4.6 Example Port Settings 105

2.1.5 Functional Selection 109

2.1.5.1 Register Configuration in Use of the Alternative Function 109

2.1.5.2 Alternative Function to be Used in Direct I/O Control Alternative Mode 109

2.1.5.3 Setting of the $\overline{\text{ERROROUT_C}}$ Pin 110

2.1.5.4 Selecting Debugging Function of the JTAG Port 110

2.2 Organization of Port Groups 111

2.2.1 C1M-A2 Port Function (BGA) 111

2.2.1.1 List of the C1M-A2 Port Registers (BGA) 111

2.2.1.2 List of Pin Alternative Functions of C1M-A2 (BGA) 120

2.2.2 C1M-A1 Port Function (QFP) 126

2.2.2.1 List of the C1M-A1 Port Registers (QFP) 126

2.2.2.2 List of Pin Alternative Functions in C1M-A1 (QFP) 135

2.3 DNF 140

2.3.1 Example of Noise Elimination 140

2.3.2 Peripheral Function DNF 140

2.3.2.1 Overview of Peripheral Function DNF 140

2.3.2.2 Details of the Control Registers 141

2.3.2.3 DNFP01nCTLm — Digital Noise Elimination Control Register 142

2.3.2.4 Setting Procedures of Peripheral Function DNF 143

2.3.2.5 Peripheral Function Pin for DNF Insertion 144

2.4 Pin Description 147

2.4.1 Overview 147
2.4.2 List of Pin Functions 147
2.4.3 Pin State 153
2.4.4 Handling of Unused Pins 156

Section 3 CPU System 158
3.1 Overview 158
3.1.1 Block Configuration 158
3.1.2 Configuration of Peripheral Groups 160
3.2 CPU 164
3.2.1 Core Functions 164
3.2.1.1 Features 164
3.2.1.2 Register Set 165
3.2.2 Instruction Cache and Data Buffer 206
3.2.2.1 Features 206
3.2.2.2 Instruction Cache Function 207
3.2.2.3 Data buffer function 208
3.2.3 Inter-Processor Interrupts 209
3.2.3.1 Inter-Processor Interrupt Control Registers 209
3.2.4 Reliability Functions 210

7.10.2.7 DRTCn — DMAC Reload Transfer Count Register....366
7.10.2.8 DTCCn — DMAC Transfer Count Compare Register 367
7.10.2.9 DCENn — DMAC Channel Operation Enable Setting Register 368
7.10.2.10 DCSTn — DMAC Transfer Status Register....369
7.10.2.11 DCSTSn — DMAC Transfer Status Set Register....370
7.10.2.12 DCSTCn — DMAC Transfer Status Clear Register 371
7.10.2.13 DTFRn — DTFR Setting Register 372
7.10.2.14 DTFRRQn — DTFR Transfer Request Status Register....373
7.10.2.15 DTFRRQCn — DTFR Transfer Request Clear Register....374
7.11 DTS Channel Register....375
7.11.1 Transfer information of the DTS (TI)....375
7.11.1.1 Structure of the TI 375
7.11.1.2 Organization of the TI in the DTSRAM 375
7.11.1.3 Accessing the TI 376
7.11.1.4 Caution about accessing the TI 377
7.11.2 DTS Channel Register Address....378
7.11.3 Details of DTS Channel Registers 379
7.11.3.1 DTSAnnn — DTS Source Address Register 379
7.11.3.2 DTDAnnn — DTS Destination Address Register 380
7.11.3.3 DTTCnnn — DTS Transfer Count Register....381
7.11.3.4 DTTCTnnn — DTS Transfer Control Register....382
7.11.3.5 DTRSAnnn — DTS Reload Source Address Register 385
7.11.3.6 DTRDAnnn — DTS Reload Destination Address Register 386
7.11.3.7 DTRTCnnn — DTS Reload Transfer Count Register....387
7.11.3.8 DTTCCnnn — DTS Transfer Count Compare Register 388
7.11.3.9 DTFSLnnn — DTSFSL Operation Setting Register 389
7.11.3.10 DTFSTnnn — DTSFSL Transfer Request Status Register 390
7.11.3.11 DTFSSnnn — DTSFSL Transfer Request Set Register....391
7.11.3.12 DTFSCnnn — DTSFSL Transfer Request Clear Register 392
7.12 DMA/DTS Trigger Source Select Registers 393

7.12.1 DMA/DTS Trigger Source Select Register Addresses 393
7.12.2 Details of DMA/DTS Trigger Source Select Registers....393
7.12.2.1 DTSTRGSELn — DTS Trigger Source Select Register n 393
7.12.2.2 DMATRGSELn — DMA Trigger Source Select Register n 395

Section 8 Resets....397
8.1 Features of the RH850/C1M-A Reset....397
8.2 Reset State 398
8.2.1 External Reset State 398
8.2.2 Internal Reset State 398
8.3 Reset Sources 399
8.4 Register Specifications 400
8.4.1 List of Registers 400

Section 11 Clocked Serial Interface H (CSIH)....430
11.1 Features of RH850/C1M-A CSIH....430
11.1.1 Units....430
11.1.2 Register Base Addresses....431
11.1.3 Clock Supply....431
11.1.4 Interrupt Requests....431
11.1.5 Reset Sources....432
11.1.6 External Input/Output Signals....432
11.1.7 Data Consistency Check....433
11.2 Overview....434
11.2.1 Functional Overview....434
11.2.2 Functional Overview Description....435
11.2.3 Block Diagram....436
11.3 Registers....437
11.3.1 List of Registers....437
11.3.2 CSIHnCTL0 — CSIHn Control Register 0....438
11.3.3 CSIHnCTL1 — CSIHn Control Register 1....439
11.3.4 CSIHnCTL2 — CSIHn Control Register 2....442
11.3.5 CSIHnSTR0 — CSIHn Status Register 0....444
11.3.6 CSIHnSTCR0 — CSIHn Status Clear Register 0....448
11.3.7 CSIHnMCTL0 — CSIHn Memory Control Register 0....449
11.3.8 CSIHnMCTL1 — CSIHn Memory Control Register 1....450
11.3.9 CSIHnMCTL2 — CSIHn Memory Control Register 2....451
11.3.10 CSIHnMRWP0 — CSIHn Memory Read/Write Pointer Register 0....453
11.3.11 CSIHnCFGx — CSIHn Configuration Register x....455
11.3.12 CSIHnTX0W — CSIHn Transmit Data Register 0 for Word Access....460
11.3.13 CSIHnTX0H — CSIHn Transmit Data Register 0 for Half Word Access....462
11.3.14 CSIHnRX0W — CSIHn Receive Data Register 0 for Word Access....462
11.3.15 CSIHnRX0H — CSIHn Receive Data Register 0 for Half Word Access....463
11.3.16 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y = 0 to 3)....464
11.4 Functions....465
11.4.1 Overview of Interrupt Function....465
11.4.2 Interrupt Delay....466
11.4.3 INTCSIHTIC (Communication Status Interrupt)....467
11.4.3.1 INTCSIHTIC in direct access mode....467
11.4.3.2 INTCSIHTIC in FIFO mode....469
11.4.3.3 INTCSIHTIC in job mode....470

11.4.4 INTCSIHTIR (Reception Status Interrupt) 471
11.4.4.1 INTCSIHTIR in direct access mode 471
11.4.4.2 INTCSIHTIR in dual buffer mode 472
11.4.5 IINTCSIHTIRE (Reception Error Interrupt) 473
11.4.6 INTCSIHTIJC (Job Completion Interrupt) 474
11.4.7 Operating Modes (Master/Slave) 475
11.4.7.1 Master mode 475
11.4.7.2 Slave mode 476
11.4.8 Master/Slave Connections 477
11.4.8.1 One master and one slave 477
11.4.8.2 One master and multiple slaves 477
11.4.9 Chip Selection (CS) Features 479
11.4.9.1 Configuration Registers 479
11.4.9.2 CS Example 481
11.4.9.3 Job Concept 481
11.4.10 Chip Select Timing Details 482
11.4.10.1 Changing the Clock Phase 482
11.4.10.2 Changing the Data Phase 483
11.4.11 Transmission clock selection 485
11.4.12 CSIH Buffer Memory 487
11.4.12.1 FIFO mode 487
11.4.12.2 Dual buffer mode 488
11.4.12.3 Transmit-only buffer mode 488
11.4.12.4 Direct access mode 488
11.4.13 Data Transfer Modes 489
11.4.13.1 Transmit-only mode 489
11.4.13.2 Receive-only mode 489
11.4.13.3 Transmit/receive mode 489
11.4.13.4 Summary 489
11.4.14 Data Length Selection 490
11.4.14.1 Data length between 2 and 16 bits 490
11.4.14.2 Data length greater than 16 bits 491
11.4.15 Serial Data Direction Selection 493
11.4.16 SS (Slave Select) Function 494
11.4.16.1 Communication timing using SS function 494
11.4.16.2 CSIHTSSO operation 495
11.4.17 Handshake Function 496
11.4.17.1 Slave mode 496
11.4.17.2 Master mode 498
11.4.18 Error Detection 500
11.4.18.1 Data consistency check 500
11.4.18.2 Parity check 501
11.4.18.3 Time-out error 502
11.4.18.4 Overflow error 503
11.4.18.5 Overrun error 505
11.4.19 Loop-back Mode 508
11.4.20 CPU-controlled High Priority Communication Function 509
11.4.21 Enforced Chip Select Idle Setting 512

11.5 Procedures 513
11.5.1 Procedures in Direct Access Mode 513
11.5.1.1 Transmission/reception in master mode when job mode is disabled 513
11.5.1.2 Transmission/reception in master mode when job mode is enabled 515
11.5.2 Procedures in Transmit-only Buffer Mode 517
11.5.2.1 Transmission/reception in master mode when job mode is disabled 517
11.5.2.2 Transmission/reception in master mode when job mode is enabled 519
11.5.3 Procedures in Dual Buffer Mode 521
11.5.3.1 Transmission/reception in master mode when job mode is disabled 521
11.5.3.2 Transmission/reception in master mode when job mode is enabled 523
11.5.3.3 Transmission/reception in slave mode when job mode is disabled 525
11.5.4 Procedures in FIFO Mode 527
11.5.4.1 Transmission/reception in master mode when job mode is disabled 527
11.5.4.2 Transmission/reception in master mode when job mode is enabled 529
11.6 Notes 531

Section 12 Serial Communication Interface 3 (SCI3) 534
12.1 Features of RH850/C1M-A SCI3 534

13.3 Registers 589
13.3.1 List of Registers 589
13.3.2 LIN Master Related Registers 590
13.3.2.1 RLN3nLWBR ─ LIN Wake-Up Baud Rate Select Register 590
13.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register 591
13.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register 592
13.3.2.4 RLN3nLSTC — LIN Self-Test Control Register 593
13.3.2.5 RLN3nLMD — LIN Mode Register 594
13.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register 596
13.3.2.7 RLN3nLSC — LIN Space Configuration Register 597
13.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register 598
13.3.2.9 RLN3nLIE — LIN Interrupt Enable Register 599

13.3.2.10 RLN3nLEDE — LIN Error Detection Enable Register 601
13.3.2.11 RLN3nLCUC — LIN Control Register 603
13.3.2.12 RLN3nLTRC — LIN Transmission Control Register 604
13.3.2.13 RLN3nLMST — LIN Mode Status Register 605
13.3.2.14 RLN3nLST — LIN Status Register 606
13.3.2.15 RLN3nLEST — LIN Error Status Register 608
13.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register 610
13.3.2.17 RLN3nLIDB — LIN ID Buffer Register 612
13.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register 613
13.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8) 614
13.3.3 LIN Slave Related Registers 616
13.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register 616
13.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register 617
13.3.3.3 RLN3nLSTC — LIN Self-Test Control Register 618
13.3.3.4 RLN3nLMD — LIN Mode Register 619
13.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register 620
13.3.3.6 RLN3nLSC — LIN Space Configuration Register 621
13.3.3.7 RLN3nLWUP — LIN Wake-Up Configuration Register 622
13.3.3.8 RLN3nLIE — LIN Interrupt Enable Register 623
13.3.3.9 RLN3nLEDE — LIN Error Detection Enable Register 625
13.3.3.10 RLN3nLCUC — LIN Control Register 627
13.3.3.11 RLN3nLTRC — LIN Transmission Control Register 628
13.3.3.12 RLN3nLMST — LIN Mode Status Register 629
13.3.3.13 RLN3nLST — LIN Status Register 630
13.3.3.14 RLN3nLEST — LIN Error Status Register 632
13.3.3.15 RLN3nLDFC — LIN Data Field Configuration Register 634
13.3.3.16 RLN3nLIDB — LIN ID Buffer Register 636
13.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register 637
13.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8) 638
13.3.4 UART Related Registers 639
13.3.4.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register 639
13.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register 640
13.3.4.3 RLN3nLMD — UART Mode Register 641
13.3.4.4 RLN3nLBFC — UART Configuration Register 642
13.3.4.5 RLN3nLSC — UART Space Configuration Register 645
13.3.4.6 RLN3nLEDE — UART Error Detection Enable Register 646
13.3.4.7 RLN3nLCUC — UART Control Register 647
13.3.4.8 RLN3nLTRC — UART Transmission Control Register 648
13.3.4.9 RLN3nLMST — UART Mode Status Register 649
13.3.4.10 RLN3nLST — UART Status Register 650
13.3.4.11 RLN3nLEST — UART Error Status Register 652
13.3.4.12 RLN3nLDFC — UART Data Field Configuration Register 654
13.3.4.13 RLN3nLIDB — UART ID Buffer Register 655
13.3.4.14 RLN3nLUDB0 — UART Data 0 Buffer Register 656
13.3.4.15 RLN3nLDBRb — UART Data Buffer b Register (b = 1 to 8) 657
13.3.4.16 RLN3nLUOER — UART Operation Enable Register 658
13.3.4.17 RLN3nLUOR1 — UART Option Register 1 659
13.3.4.18 RLN3nLUTDR — UART Transmission Data Register 661
13.3.4.19 RLN3nLURDR — UART Reception Data Register 662
13.3.4.20 RLN3nLUWTDR — UART Wait Transmission Data Register 663
13.4 Interrupt Sources 664

14.3.5 Details of Receive Rule-Related Registers 767
14.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register 767
14.3.5.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0 768
14.3.5.3 RSCANnGAFLIDj — Receive Rule ID Register (j = 0 to 15) 770

14.3.5.4 RSCANnGAFLMj — Receive Rule Mask Register (j = 0 to 15) 772
14.3.5.5 RSCANnGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15) 774
14.3.5.6 RSCANnGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15) 776
14.3.6 Details of Receive Buffer-Related Registers 777
14.3.6.1 RSCANnRMNB — Receive Buffer Number Register 777
14.3.6.2 RSCANnRMNDy — Receive Buffer New Data Register (y = 0, 1) 778
14.3.6.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 63) 779
14.3.6.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 63) 780
14.3.6.5 RSCANnRMDF0_q — Receive Buffer Data Field 0 Register (q = 0 to 63) 782
14.3.6.6 RSCANnRMDF1_q — Receive Buffer Data Field 1 Register (q = 0 to 63) 783
14.3.7 Details of Receive FIFO Buffer-Related Registers 784
14.3.7.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) 784
14.3.7.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) 787
14.3.7.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7) 789
14.3.7.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7) 790
14.3.7.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7) 791
14.3.7.6 RSCANnRFDF0_x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7) 793
14.3.7.7 RSCANnRFDF1_x — Receive FIFO Buffer Access Data Field 1 Register (x = 0 to 7) 794
14.3.8 Details of Transmit/Receive FIFO Buffer-Related Registers 795
14.3.8.1 RSCANnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register (k = 0 to 11) 795
14.3.8.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 11) 799
14.3.8.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 11) 803
14.3.8.4 RSCANnCFIDk — Transmit/Receive FIFO Buffer Access ID Register (k = 0 to 11) 805
14.3.8.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 11) 807
14.3.8.6 RSCANnCFDF0_k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 11) 809
14.3.8.7 RSCANnCFDF1_k — Transmit/receive FIFO Buffer Access Data Field 1 Register (k = 0 to 11) 810
14.3.9 Details of FIFO Status-Related Registers 811
14.3.9.1 RSCANnFESTS — FIFO Empty Status Register 811
14.3.9.2 RSCANnFFSTS — FIFO Full Status Register 813
14.3.9.3 RSCANnFMSTS — FIFO Message Lost Status Register 815
14.3.9.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register 817
14.3.9.5 RSCANnCFRISTS — Transmit/Receive FIFO Buffer Receive Interrupt Flag Status Register 818
14.3.9.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register 819
14.3.10 Details of Transmit Buffer-Related Registers 820
14.3.10.1 RSCANnTMCp — Transmit Buffer Control Register (p = 0 to 63) 820
14.3.10.2 RSCANnTMSTSp — Transmit Buffer Status Register (p = 0 to 63) 822
14.3.10.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 63) 824
14.3.10.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 63) 826
14.3.10.5 RSCANnTMDF0_p — Transmit Buffer Data Field 0 Register (p = 0 to 63) 828
14.3.10.6 RSCANnTMDF1_p — Transmit Buffer Data Field 1 Register (p = 0 to 63) 829

14.3.10.7 RSCANnTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0, 1) 830
14.3.11 Details of Transmit Buffer Status-Related Registers 832
14.3.11.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0, 1) 832
14.3.11.2 RSCANnTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0, 1) 834
14.3.11.3 RSCANnTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0, 1) 836
14.3.11.4 RSCANnTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0, 1) 838
14.3.12 Details of Transmit Queue-Related Registers 840
14.3.12.1 RSCANnTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 3) 840
14.3.12.2 RSCANnTXQSTSm — Transmit Queue Configuration and Control Register (m = 0 to 3) 842
14.3.12.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 3) 844
14.3.13 Details of Transmit History-Related Registers 845
14.3.13.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0 to 3) 845
14.3.13.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0 to 3) 847
14.3.13.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 3) 849
14.3.13.4 RSCANnTHLACCm — Transmit History Access Register (m = 0 to 3) 850
14.3.14 Details of Test-Related Registers 852
14.3.14.1 RSCANnGTSTCFG — Global Test Configuration Register 852
14.3.14.2 RSCANnGTSTCTR — Global Test Control Register 854
14.3.14.3 RSCANnGLOCKK — Global Lock Key Register 855
14.3.14.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63) 856
14.4 Registers (CAN FD Mode) 857
14.4.1 List of Registers 857
14.4.2 Details of Interface Mode-Related Registers 862
14.4.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register 862
14.4.3 Details of Channel-Related Registers 863
14.4.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0 to 3) 863
14.4.3.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0 to 3) 866
14.4.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0 to 3) 872
14.4.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0 to 3) 875
14.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0 to 3) 879
14.4.3.6 RSCFDnCFDCmFDCFG — Channel CAN FD Configuration Register (m = 0 to 3) 882
14.4.3.7 RSCFDnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 to 3) 887
14.4.3.8 RSCFDnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 3) 888
14.4.3.9 RSCFDnCFDCmFDCRC — Channel CAN FD CRC Register (m = 0 to 3) 891
14.4.4 Details of Global-Related Registers 893
14.4.4.1 RSCFDnCFDGCFG — Global Configuration Register 893
14.4.4.2 RSCFDnCFDGCTR — Global Control Register 897
14.4.4.3 RSCFDnCFDGSTS — Global Status Register 900
14.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register 902
14.4.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register 905

14.4.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0 906
14.4.4.7 RSCFDnCFDGFDCFG — Global FD Configuration Register 909
14.4.4.8 RSCFDnCFDGCRCCFG — Global CRC Configuration Register 910
14.4.5 Details of Receive Rule-Related Registers 911
14.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register 911
14.4.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0 912
14.4.5.3 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15) 914
14.4.5.4 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15) 916
14.4.5.5 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15) 918
14.4.5.6 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15) 921
14.4.6 Details of Receive Buffer-Related Registers 922
14.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register 922
14.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0, 1) 923
14.4.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 63) 924
14.4.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 63) 926
14.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 63) 928
14.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 63) 930
14.4.7 Details of Receive FIFO Buffer-Related Registers 931
14.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) 931
14.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) 934
14.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7) 936
14.4.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7) 937
14.4.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7) 939
14.4.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register (x = 0 to 7) ..941
14.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x =0 to 7) 943
14.4.8 Transmit/Receive FIFO Buffer Related Registers 944
14.4.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 11) 944
14.4.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 11) 949
14.4.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 11) 952
14.4.8.4 RSCFDnCFDCFIDk — Transmit/Receive FIFO Buffer Access ID Register (k = 0 to 11) 954
14.4.8.5 RSCFDnCFDCFPTRk — Transmit/Receive FIFO Buffer Access Pointer Register (k = 0 to 11) 957
14.4.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CAN FD Configuration/ Status Register (k = 0 to 11) 959
14.4.8.7 RSCFDnCFDCFDFd_k — Transmit/Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 11) 961
14.4.9 Details of FIFO Status-Related Registers 962
14.4.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register 962
14.4.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register 964
14.4.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register 966
14.4.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register 968

14.4.9.5 RSCFDnCFDCFRISTS — Transmit/Receive FIFO Buffer Receive Interrupt Flag Status Register 969
14.4.9.6 RSCFDnCFDCFTISTS — Transmit/Receive FIFO Buffer Transmit Interrupt Flag Status Register 970
14.4.10 Details of FIFO DMA-Related Registers 971
14.4.10.1 RSCFDnCFDCDTCT — DMA Enable Register 971
14.4.10.2 RSCFDnCFDCDTSTS — DMA Status Register 973
14.4.11 Details of Transmit Buffer-Related Registers 975
14.4.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 63) 975
14.4.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 63) 977
14.4.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 63) 979
14.4.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 63) 981
14.4.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register (p = 0 to 63) 983
14.4.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 63) 985
14.4.11.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0, 1) 986
14.4.12 Details of Transmit Buffer Status-Related Registers 988
14.4.12.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0, 1) 988
14.4.12.2 RSCFDnCFDTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0, 1) 990
14.4.12.3 RSCFDnCFDTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0, 1) 992
14.4.12.4 RSCFDnCFDTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0, 1) 994
14.4.13 Details of Transmit Queue-Related Registers 996
14.4.13.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 3) 996
14.4.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0 to 3) 998
14.4.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 3) 1000
14.4.14 Details of Transmit History-Related Registers 1001
14.4.14.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 to 3) 1001
14.4.14.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0 to 3) 1003
14.4.14.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 3) 1005
14.4.14.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0 to 3) 1006
14.4.15 Details of Test-Related Registers 1008
14.4.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register 1008
14.4.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register 1010
14.4.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register 1011
14.4.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63) 1012
14.5 Interrupt Sources and DMA Trigger 1013
14.5.1 Interrupt Sources 1013
14.5.2 DMA Trigger (Only in CAN FD Mode) 1017
14.6 CAN Modes 1018
14.6.1 Global Modes 1019

14.6.1.1 Global Stop Mode 1020
14.6.1.2 Global Reset Mode 1020
14.6.1.3 Global Test Mode 1020
14.6.1.4 Global Operating Mode 1020
14.6.2 Channel Modes 1021
14.6.2.1 Channel Stop Mode 1022
14.6.2.2 Channel Reset Mode 1022
14.6.2.3 Channel Halt Mode 1022
14.6.2.4 Channel Communication Mode 1023
14.6.2.5 Bus Off State 1024
14.6.3 Initializing Registers by Transition to CAN Mode 1025
14.7 Reception Function 1027
14.7.1 Data Processing Using the Receive Rule Table 1027
14.7.1.1 Acceptance Filter Processing 1028
14.7.1.2 DLC Filter Processing 1029
14.7.1.3 Routing Processing 1029
14.7.1.4 Label Addition Processing 1029
14.7.1.5 Mirror Function Processing 1029
14.7.1.6 Timestamp 1030
14.8 Transmission Functions 1031
14.8.1 Transmit Priority Determination 1032
14.8.2 Transmission Using Transmit Buffers 1032
14.8.2.1 Transmit Abort Function 1032
14.8.2.2 One-Shot Transmission Function (Retransmission Disabling Function) 1033
14.8.2.3 Transmit Buffer Merge Mode (Only in CAN FD Mode) 1033
14.8.3 Transmission Using FIFO Buffers 1034
14.8.3.1 Interval Transmission Function 1034
14.8.4 Transmission Using Transmit Queues 1037
14.8.5 Transmit Data Padding (Only in CAN FD Mode) 1037
14.8.6 Transmit History Function 1038
14.9 Gateway Function 1040
14.9.1 CAN-CAN FD Gateway (Only in CAN FD Mode) 1040
14.10 Test Function 1041
14.10.1 Standard Test Mode 1041
14.10.2 Listen-Only Mode 1041
14.10.3 Self-Test Mode (Loopback Mode) 1042
14.10.3.1 Self-Test Mode 0 (External Loopback Mode) 1042
14.10.3.2 Self-Test Mode 1 (Internal Loopback Mode) 1043
14.10.4 Restricted Operation Mode (Only in CAN FD Mode) 1043
14.10.5 RAM Test 1043
14.10.6 Inter-Channel Communication Test 1044
14.10.6.1 CRC Error Test 1045
14.11 RS-CANFD Setting Procedure 1046
14.11.1 Initial Settings 1046

17.2.4 Interrupt Request (OSTMnTINT) 1161
17.3 Registers 1162
17.3.1 List of Registers 1162
17.3.2 OSTMnCMP — OSTMn Compare Register 1162
17.3.3 OSTMnCNT — OSTMn Counter Register 1163
17.3.4 OSTMnTO — OSTMn Output Register 1164
17.3.5 OSTMnTOE — OSTMn Output Enable Register 1164
17.3.6 OSTMnTE — OSTMn Count Enable Status Register 1165
17.3.7 OSTMnTS — OSTMn Count Start Trigger Register 1166
17.3.8 OSTMnTT — OSTMn Count Stop Trigger Register 1166
17.3.9 OSTMnCTL — OSTMn Control Register 1167
17.4 Functions 1168
17.4.1 Starting and Stopping the Timer 1168
17.4.2 Interval Timer Mode 1169
17.4.2.1 Basic Operation in Interval Timer Mode 1169
17.4.2.2 Operation when OSTMnCMP = 0000 0000$_H$ 1171
17.4.2.3 Setting Procedure for Interval Timer Mode 1172
17.4.3 Free-Run Compare Mode 1172
17.4.3.1 Basic Operation in Free-Run Compare Mode 1172
17.4.3.2 Operation when OSTMnCMP = 0000 0000$_H$ 1174
17.4.3.3 Setting Procedure for Free-Run Compare Mode 1174

Section 18 Timer Array Unit D (TAUD) 1175
18.1 Overview of RH850/C1M-A TAUD 1175

18.1.1 Units 1175
18.1.2 Register Base Addresses 1175
18.1.3 Clock Supply 1175
18.1.4 Interrupts Requests 1176
18.1.5 Reset Sources 1178
18.1.6 External Input/Output Signals 1178
18.2 Overview 1179
18.2.1 Functional Overview 1179
18.2.2 Terms 1180
18.2.3 Functional List of Timer Operations 1181
18.2.4 TAUD I/O and Interrupt Request Signals 1182
18.2.5 Block Diagram 1183
18.2.6 Description of Blocks 1184
18.3 Registers 1186
18.3.1 List of Registers 1186
18.3.2 TAUDnTPS — TAUDn Prescaler Clock Select Register 1187
18.3.3 TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register 1190
18.3.4 TAUDnCDRm — TAUDn Channel Data Register 1191
18.3.5 TAUDnCNTm — TAUDn Channel Counter Register 1192
18.3.6 TAUDnCMORm — TAUDn Channel Mode OS Register 1194
18.3.7 TAUDnCMURm — TAUDn Channel Mode User Register 1197
18.3.8 TAUDnCSRm — TAUDn Channel Status Register 1198
18.3.9 TAUDnCSCm — TAUDn Channel Status Clear Register 1199
18.3.10 TAUDnTS — TAUDn Channel Start Trigger Register 1199
18.3.11 TAUDnTE — TAUDn Channel Enable Status Register 1200
18.3.12 TAUDnTT — TAUDn Channel Stop Trigger Register 1200
18.3.13 TAUDnRDE — TAUDn Channel Reload Data Enable Register 1201
18.3.14 TAUDnRDS — TAUDn Channel Reload Data Control Channel Select Register 1201
18.3.15 TAUDnRDM — TAUDn Channel Reload Data Mode Register 1202
18.3.16 TAUDnRDC — TAUDn Channel Reload Data Control Register 1202
18.3.17 TAUDnRDT — TAUDn Channel Reload Data Trigger Register 1203
18.3.18 TAUDnRSF — TAUDn Channel Reload Status Register 1203
18.3.19 TAUDnTOE — TAUDn Channel Output Enable Register 1204
18.3.20 TAUDnTO — TAUDn Channel Output Register 1204
18.3.21 TAUDnTOM — TAUDn Channel Output Mode Register 1205
18.3.22 TAUDnTOC — TAUDn Channel Output Configuration Register 1206
18.3.23 TAUDnTOL — TAUDn Channel Output Active Level Register 1207
18.3.24 TAUDnTDE — TAUDn Channel Dead Time Output Enable Register 1207
18.3.25 TAUDnTDM — TAUDn Channel Dead Time Output Mode Register 1208
18.3.26 TAUDnTDL — TAUDn Channel Dead Time Output Level Register 1208
18.3.27 TAUDnTRE — TAUDn Channel Real-time Output Enable Register 1209
18.3.28 TAUDnTRC — TAUDn Channel Real-time Output Control Register 1209
18.3.29 TAUDnTRO — TAUDn Channel Real-time Output Register 1210

18.3.30 TAUDnTME — TAUDn Channel Modulation Output Enable Register 1210
18.4 Function 1211
18.4.1 General Operating Procedure 1211
18.4.2 Concepts of Synchronous Channel Operation 1212
18.4.2.1 Rules of Synchronous Channel Operation 1212
18.4.2.2 Simultaneous Start and Stop of Synchronous Channel Counters 1214
18.4.3 Simultaneous Rewrite 1214
18.4.3.1 Overview of Operations 1214
18.4.3.2 How to Control Simultaneous Rewrite 1216
18.4.3.3 Other General Rules of Simultaneous Rewrite 1217
18.4.3.4 Types of Simultaneous Rewrite 1218
18.4.4 Channel Output Modes 1226
18.4.4.1 General Procedures for Specifying a Channel Output Mode 1228
18.4.4.2 Channel Output Modes Controlled Independently by TAUDn Signals 1229
18.4.4.3 Channel Output Modes Controlled Synchronously by TAUDn Signals 1231
18.4.5 Start Timing in Each Operating Modes 1235
18.4.5.1 Interval Timer Mode, Judge Mode, Capture Mode, Up/Down Count Mode, and Count Capture Mode 1235
18.4.5.2 Event Count Mode 1236
18.4.5.3 Other Operating Modes 1236
18.4.6 TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts 1237
18.4.7 Interrupt Generation upon Overflow 1238
18.4.7.1 Count Capture Mode 1238
18.4.8 TAUDTTINm Edge Detection 1239
18.4.9 Independent Channel Operation Functions 1240
18.4.9.1 Interval Timer Function 1240
18.4.9.2 TAUDTTINm Input Interval Timer Function 1248
18.4.9.3 Clock Divide Function 1252
18.4.9.4 External Event Count Function 1260
18.4.9.5 Delay Count Function 1266
18.4.9.6 One-Pulse Output Function 1270
18.4.9.7 TAUDTTINm Input Pulse Interval Measurement Function 1275
18.4.9.8 TAUDTTINm Input Signal Width Measurement Function 1283
18.4.9.9 TAUDTTINm Input Position Detection Function 1291
18.4.9.10 TAUDTTINm Input Period Count Detection Function 1296
18.4.9.11 TAUDTTINm Input Pulse Interval Judgment Function 1301
18.4.9.12 TAUDTTINm Input Signal Width Judgment Function 1305
18.4.10 Independent Channel Real-Time Functions 1309
18.4.10.1 Real-Time Output Function Type 1 1309
18.4.10.2 Real-Time Output Function Type 2 1316
18.4.11 Independent Channel Simultaneous Rewrite Functions 1324
18.4.11.1 Simultaneous Rewrite Trigger Generation Function Type 1 1324
18.4.12 Synchronous Channel Operation Functions 1331
18.4.12.1 PWM Output Function 1331
18.4.12.2 One-Shot Pulse Output Function 1343
18.4.12.3 Trigger Start PWM Output Function 1355
18.4.12.4 Delay Pulse Output Function 1365
18.4.12.5 Offset Trigger Output Function 1381

18.4.12.6 A/D Conversion Trigger Output Function Type 1 1390
18.4.12.7 Triangle PWM Output Function 1392
18.4.12.8 Triangle PWM Output Function with Dead Time 1403
18.4.12.9 A/D Conversion Trigger Output Function Type 2 1419
18.4.12.10 Interrupt Request Signals Culling Function 1421
18.4.12.11 One-Phase PWM Output Function 1429
18.4.13 Synchronous Non-Complementary and Complementary Modulation OutputFunctions ..1436
18.4.13.1 Non-Complementary Modulation Output Function Type 1 1436
18.4.13.2 Non-Complementary Modulation Output Function Type 2 1450
18.4.13.3 Complementary Modulation Output Function 1463

20.3.2 TSG3nCTL0 — TSG3n Control Register 0 1583
20.3.3 TSG3nCTL1 — TSG3n Control Register 1 1584
20.3.4 TSG3nCTL3 — TSG3n Control Register 3 1586
20.3.5 TSG3nCTL4 — TSG3n Control Register 4 1587
20.3.6 TSG3nCTL5 — TSG3n Control Register5 1589
20.3.7 TSG3nCTL6 — TSG3n Control Register 6 1591
20.3.8 TSG3nCTL7 — TSG3n Control Register 7 1593
20.3.9 TSG3nCTL8 — TSG3n Control Register 8 1594
20.3.10 TSG3nIOC0 — TSG3n I/O Control Register 0 1595
20.3.11 TSG3nIOC1 — TSG3n I/O Control Register 1 1596
20.3.12 TSG3nIOC2 — TSG3n I/O Control Register 2 1597
20.3.13 TSG3nIOC3 — TSG3n I/O Control Register3 1598
20.3.14 TSG3nSTR0 — TSG3n Status Register 0 1599
20.3.15 TSG3nSTR1 — TSG3n Status Register 1 1600
20.3.16 TSG3nSTR2 — TSG3n Status Register 2 1601
20.3.17 TSG3nSTC — TSG3n Status Clear Trigger Register 1604
20.3.18 TSG3nOPT0 — TSG3n Option Register 0 1606
20.3.19 TSG3nOPT1 — TSG3n Option Register 1 1608
20.3.20 TSG3nOPT2 — TSG3n Option Register 2 1608
20.3.21 TSG3nOPT2BF — TSG3n Option 2 Buffer Register 1609
20.3.22 TSG3nTRG0 — TSG3n Trigger Register 0 1610
20.3.23 TSG3nTRG1 — TSG3n Trigger Register 1 1610
20.3.24 TSG3nTRG2 — TSG3n Trigger Register 2 1611
20.3.25 TSG3nCNT — TSG3n Counter Read Buffer Register 1611
20.3.26 TSG3nCNTE — TSG3n Bit-Extended Counter Read Buffer Register 1612
20.3.27 TSG3nSBC — TSG3n Sub-Counter Read Buffer Register 1613
20.3.28 TSG3nSBCE — TSG3n Bit Extended Sub-Counter Read Buffer Register 1613
20.3.29 TSG3nCMP0 — TSG3n Compare Register 0 1614
20.3.30 TSG3nCMP0E — TSG3n Bit Extended Compare Register 0 1614
20.3.31 TSG3nCMP1W — TSG3n Compare Register 1, 2 1615
20.3.32 TSG3nCMP3W — TSG3n Compare Register 3, 4 1615
20.3.33 TSG3nCMP5W — TSG3n Compare Register 5, 6 1616
20.3.34 TSG3nCMP7W — TSG3n Compare Registers 7, 8 1616
20.3.35 TSG3nCMP9W — TSG3n Compare Registers 9, 10 1617
20.3.36 TSG3nCMP11W — TSG3n Compare Registers 11, 12 1617
20.3.37 TSG3nCMP1 to TSG3nCMP12 — TSG3n Compare Registers 1 to 12 1618
20.3.38 TSG3nCMP1E to TSG3nCMP12E — TSG3n Bit Extended Compare Registers 1 to 12 1619
20.3.39 TSG3nDCMP0W — TSG3n Diagnostic Output Compare Register 0, 1 1621
20.3.40 TSG3nDCMP2 — TSG3n Diagnostic Output Compare Register 2 1621
20.3.41 TSG3nDCMP0E to 2E — TSG3n Bit Extended Diagnostic Output Compare Register 0 to 2 1622

20.3.42 TSG3nPAT0W — TSG3n Pattern Register 0 1623
20.3.43 TSG3nPAT1W — TSG3n Pattern Register 1 1624
20.3.44 TSG3nDTC0W — TSG3n Dead Time Setting Register 0 1625
20.3.45 TSG3nDTC1W — TSG3n Dead Time Setting Register 1 1626
20.3.46 TSG3nCMPU — TSG3n HT-PWM U Phase Compare Register 1626
20.3.47 TSG3nCMPV — TSG3n HT-PWM V Phase Compare Register 1627
20.3.48 TSG3nCMPW — TSG3n HT-PWM W Phase Compare Register 1627
20.3.49 TSG3nCMPUE — TSG3n Bit Extended HT-PWM U Phase Compare Register 1628
20.3.50 TSG3nCMPVE — TSG3n Bit Extended HT-PWM V Phase Compare Register 1629
20.3.51 TSG3nCMPWE — TSG3n Bit Extended HT-PWM W Phase Compare Register 1630
20.3.52 TSG3nUPW — TSG3n SP-PWM U Phase Active Width Register 1631
20.3.53 TSG3nVPW — TSG3n SP-PWM V Phase Active Width Register 1631
20.3.54 TSG3nWPW — TSG3n SP-PWM W Phase Active Width Register 1632
20.3.55 TSG3nUPWE — TSG3n Bit Extended SP-PWM U Phase Active Width Register 1633
20.3.56 TSG3nVPWE — TSG3n Bit Extended SP-PWM V Phase Active Width Register 1634
20.3.57 TSG3nWPWE — TSG3n Bit Extended SP-PWM W Phase Active Width Register 1635
20.3.58 TSG3nHSPCMUE — TSG3n HSP-PWM Mode U Phase Compare Register 1636
20.3.59 TSG3nHSPCMVE — TSG3n HSP-PWM Mode V Phase Compare Register 1636
20.3.60 TSG3nHSPCMWE — TSG3n HSP-PWM Mode W Phase Compare Register 1637
20.3.61 TSG3nHSPSHUE — TSG3n HSP-PWM Mode U Phase Shift Register 1637
20.3.62 TSG3nHSPSHVE — TSG3n HSP-PWM Mode V Phase Shift Mode Register 1638
20.3.63 TSG3nHSPSHWE — TSG3n HSP-PWM Mode W Phase Sift Register 1638
20.3.64 TSG3nDTPR — TSG3n Dead Time Protection Register 1639
20.4 Function 1640
20.4.1 Basic Operation 1640
20.4.1.1 Basic Operation of 18-Bit Counter 1640
20.4.1.2 Function of Compare Registers 1642
20.4.1.3 Compare Register Rewrite Operation 1644
20.4.1.4 List or Outputs in Each Mode 1653
20.4.2 Match Interrupt 1656
20.4.3 Flags 1661
20.4.3.1 Up Count Flag (TSG3nCUF, TSG3nSUF) 1661
20.4.3.2 Positive Phase and Inverse Phase Simultaneous Active State Detection Flag (TSG3nTBF0 to TSG3nTBF2) 1663
20.4.3.3 Reload Request Flag (TSG3nRSF) 1664
20.4.3.4 Noise Detection Flag (TSG3nNDF) 1665
20.4.3.5 Pattern Order Detection Flag (TSG3nTSF) 1666
20.4.3.6 Pattern Error Detection Flag (TSG3nPEF) 1668
20.4.3.7 Pattern Reversal Detection Flag (TSG3nPRF) 1669
20.4.3.8 TSG3nPTSI2 to TSG3nPTSI0 Pin Abnormal Toggle Detection Flag (TSG3nPTF) 1671
20.4.3.9 TSG3nOPCI0, TSG3nOPCI1 Signal Simultaneous Trigger Detection Flag (TSG3nTDF) 1672
20.4.3.10 Pattern Phase Difference Detection Flag (TSG3nPPF) 1673
20.4.3.11 Timer Output Pattern Flag (TSG3nOPF2-TSG3nOPF0) 1674
20.4.3.12 Pattern Switch Detection Signal (TSG3nPTE) 1674

20.4.4 Interrupt Skipping Function 1676
20.4.4.1 Operation of Interrupt Skipping Function 1676
20.4.4.2 Example of Operation when Peak Interrupt is Generated (in PWM Mode) 1680
20.4.5 A/D Conversion Trigger Function 1681
20.4.5.1 Operation of A/D Conversion Trigger 1682
20.4.6 Error/Warning Interrupt 1687
20.4.6.1 Error Interrupt Function 1687
20.4.6.2 Warning Interrupt Function 1690
20.4.7 Operating Modes 1691
20.4.7.1 PWM Mode 1691
20.4.7.2 HT-PWM mode (High Accuracy Triangular Pulse Width Modulation Mode) 1702
20.4.7.3 Data Transfer from EMU3 1725
20.4.7.4 ESW Function 1728
20.4.7.5 SP-PWM Mode (Shifted-Pulse - Pulse Width Modulation Mode) 1731
20.4.7.6 120-DC Mode 1742
20.4.7.7 HSP-PWM Mode (High-Accuracy Shifted-Pulse - Pulse Width Modulation Mode) 1777
20.4.7.8 Compare Register Set Value in HSP-PWM Mode 1784
20.4.7.9 Timer Output Operation in HSP-PWM Mode 1785
20.4.7.10 Software Output Control Function 1795

23.3.9 ENCAnCNT — ENCAn Counter Register....1863
23.3.10 ENCAnTE — ENCAn Timer Enable Status Register....1864
23.3.11 ENCAnTS — ENCAn Timer Start Trigger Register....1864
23.3.12 ENCAnTT — ENCAn Timer Stop Trigger Register....1865
23.4 Functions....1866
23.4.1 Timer Counter Operation....1866
23.4.2 Up/Down Control of Timer Counter....1868
23.4.2.1 When ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 00_B....1868
23.4.2.2 When ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 01_B....1869
23.4.2.3 When ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 10_B....1870
23.4.2.4 When ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 11_B....1871
23.4.3 Timer Counter Clear Control by Encoder Input....1872
23.4.3.1 Clearing Method when ENCAnSCE = 0....1872
23.4.3.2 Clearing Method when ENCAnSCE = 1....1872
23.4.4 Functions of ENCAnCCR0....1874
23.4.4.1 Compare Function....1874
23.4.4.2 Capture Function....1874

23.4.5 Functions of ENCAnCCR1 1875
23.4.5.1 Compare Function 1875
23.4.5.2 Capture Function 1876
23.4.5.3 Timer Counter Clearing upon Compare Register Match 1877
23.4.6 Starting and Stopping the Timer Counter 1878
23.4.6.1 Starting the Timers 1878
23.4.6.2 Stopping the Timers 1878
23.4.6.3 Example of Connection when Two ENCAn Units are Used 1879
23.5 Procedure 1880
23.5.1 ENCAn Setting Procedure 1880
23.5.1.1 Initial Setting Procedure for the Counter 1880
23.5.1.2 Initial Setting Procedure for Clearing the Counter 1881
23.5.1.3 Setting Procedure for the ENCAnCCR0 Register 1881
23.5.1.4 Setting Procedure for the ENCAnCCR1 Register 1882
23.6 Timing Charts for Encoder Operations 1883
23.6.1 Timing of Basic Encoder Operation 1 (Encoder Comparison Mode 1) 1883
23.6.2 Timing of Basic Encoder Operation 2 (Encoder Comparison Mode 2) 1884
23.6.3 Timing of Basic Encoder Operation 3 (Encoder Comparison Mode 3) 1885
23.6.4 Timing of Basic Encoder Operation 4 (Encoder Capture Mode) 1886
23.6.5 Timing of Basic Encoder Operation 5 (Encoder Capture and Comparison Mode) 1887
23.6.6 Overflow Occurrence and Overflow Flag Clear Operation 1888
23.6.7 Underflow Occurrence and Underflow Flag Clear Operation 1889
23.6.8 Counter Clearing and Capture Operation by Encoder Clear Input (ENCAnEC pin) 1890
23.6.9 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin) 1891
23.6.10 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin) 1892
23.6.11 Overflow Operation Immediately after Startup 1893
23.6.12 Underflow Operation Immediately after Startup 1894
23.6.13 Using the ENCAnLDE Function Immediately after Startup 1895
23.6.14 ENCAnLDE Function (Loading Counter Value) 1896
23.6.15 Conflict between ENCAnLDE Function (Loading Counter Value) and Rewriting of ENCAnCCR0 Register 1898
23.6.16 Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC pin) 1899
23.6.17 Up-counting after Conflict between ENCAnLDE Function (loading counter value) and Clear Operation by Encoder Clear Input 1901
23.6.18 Capture Operation between Counter Clocks (ENCAnCCR1) 1902
23.6.19 Capture Operation between Counter Clocks (ENCAnCCR0) 1903
23.6.20 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0 1904
23.6.21 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1 1905
23.6.22 Encoder Operation when Compare Match Clear Control is Disabled 1906

23.6.23 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, and ENCAnE1 when ENCAnSCE = 1 1907
23.6.23.1 Accompanying Capture Operation....1907
23.6.23.2 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count 1908
23.6.23.3 When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count 1909
23.6.23.4 When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count 1909
23.6.23.5 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count....1910
23.6.24 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0....1911

EMU3n V-Phase Current Value Register (EMU3nIVFIX)
EMU3n W-Phase Current Value Register (EMU3nIWFIX)
EMU3n d-Axis Current Value Register (EMU3nIDFIX)
EMU3n q-Axis Current Value Register (EMU3nIQFIX) 2170

25.3.2.62 EMU3n U-Phase Current Value Output Buffer Register (EMU3nIUFIXOBUF)
EMU3n V-Phase Current Value Output Buffer Register (EMU3nIVFIXOBUF)
EMU3n W-Phase Current Value Output Buffer Register (EMU3nIWFIXOBUF)
EMU3n d-Axis Current Value Output Buffer Register (EMU3nIDFIXOBUF)
EMU3n q-Axis Current Value Output Buffer Register (EMU3nIQFIXOBUF).....2171
25.3.2.63 EMU3n Kirchhoff's Current Law Threshold Value Register (EMU3nKCLJUD)....2172
25.3.2.64 EMU3n A/D Data Input Buffer Select Register (EMU3nADBUFSEL) 2173
25.3.2.65 EMU3n A/D Data k Converted Value Output Buffer Register (EMU3nADkFIXOBUF) (k = 0 to 2).....2174
25.3.2.66 EMU3n PI Control IP Control Register (EMU3nPICTR).....2175
25.3.2.67 EMU3n d-Axis Directive Current Value Register (EMU3nIDIN)
EMU3n q-Axis Directive Current Value Register (EMU3nIQIN)
EMU3n d-Axis Current Value Software Input Register (EMU3nID)
EMU3n q-Axis Current Value Software Input Register (EMU3nIQ)
EMU3n d-Axis Integrated Value Software Input Register (EMU3nSUMID)
EMU3n q-Axis Integrated Value Software Input Register (EMU3nSUMIQ)
EMU3n d-Axis Integrated Value Monitor Register (EMU3nSUMIDM)
EMU3n q-Axis Integrated Value Monitor Register (EMU3nSUMIQM)
EMU3n d-Axis Voltage Value Register (EMU3nVD)
EMU3n q-Axis Voltage Value Register (EMU3nVQ)
EMU3n d-Axis Voltage Value Output Buffer Register (EMU3nVDOBUF)
EMU3n q-Axis Voltage Value Output Buffer Register (EMU3nVQOBUF).....2176
25.3.2.68 EMU3n d-Axis Proportional Gain 0 Register (EMU3nGPD0)
EMU3n q-Axis Proportional Gain 0 Register (EMU3nGPQ0)
EMU3n d-Axis Proportional Gain Register (EMU3nGPD)
EMU3n q-Axis Proportional Gain Register (EMU3nGPQ)
EMU3n d-Axis Integral Gain Register (EMU3nGID)
EMU3n q-Axis Integral Gain Register (EMU3nGIQ).....2178
25.3.2.69 EMU3n d-Axis Integrated Maximum Value Register (EMU3nGIDMAX)
EMU3n q-Axis Integrated Maximum Value Register (EMU3nGIQMAX)
EMU3n d-Axis Voltage Maximum Value Register (EMU3nVDMAX)
EMU3n q-Axis Voltage Maximum Value Register (EMU3nVQMAX).....2179
25.3.2.70 EMU3n PWM IP Control Register (EMU3nPWMCTR).....2180
25.3.2.71 EMU3n PWM Data Software Transfer Register (EMU3nPWMDT) 2182
25.3.2.72 EMU3n d-Axis Voltage Correction Value Register (EMU3nVDCRCT)
EMU3n q-Axis Voltage Correction Value Register (EMU3nVQCRCT) 2183
25.3.2.73 EMU3n Angular Velocity Value Register (EMU3nVEL)
EMU3n Angular Velocity Value Software Input Register (EMU3nVELSFT).....2184
25.3.2.74 EMU3n Non-Interference Control Coefficient Angular Velocity Value Gain Register (EMU3nDECVELG)
EMU3n Non-Interference Control Coefficient Magnetic Flux Value Register (EMU3nDECFLUX)
EMU3n Non-Interference Control Coefficient Ld Value Register (EMU3nDECLD)
EMU3n Non-Interference Control Coefficient Lq Value Register (EMU3nDECLQ) 2185
25.3.2.75 EMU3n Non-Interference Control d-Axis Maximum Value Register (EMU3nVD2MAX).....2186
25.3.2.76 EMU3n Non-Interference Control q-Axis Maximum Value Register (EMU3nVQ2MAX).....2187
25.3.2.77 EMU3n PWM IP Electrical Angle Offset Register (EMU3nPHI) 2187
25.3.2.78 EMU3n PWM IP Electrical Angle Adjustment Coefficient Register (EMU3nGTHT).....2188

25.3.2.79 EMU3n PWM IP Electrical Angle Software Input Register (EMU3nTHTFORESFT)....2188
25.3.2.80 EMU3n PWM IP Post Correction Electrical Angle Register (EMU3nTHTEPWM)2189
25.3.2.81 EMU3n dq-Axis Voltage Phase Angle Software Input Register (EMU3nTHTVSFT) 2189
25.3.2.82 EMU3n dq-Axis Voltage Value Software Input Register (EMU3nVDQSFT) 2190
25.3.2.83 EMU3n 3-Phase Voltage Conversion Coefficient Register (EMU3nSR23).....2191
25.3.2.84 EMU3n Post 3-Phase Voltage Conversion U-Phase Voltage Value Register (EMU3nVU)
EMU3n Post 3-Phase Voltage Conversion V-Phase Voltage Value Register (EMU3nVV)
EMU3n Post 3-Phase Voltage Conversion W-Phase Voltage Value Register (EMU3nVW)
EMU3n PWM Post Modulation U-Phase Voltage Value Register (EMU3nVU0)
EMU3n PWM Post Modulation V-Phase Voltage Value Register (EMU3nVV0)
EMU3n PWM Post Modulation W-Phase Voltage Value Register (EMU3nVW0)
EMU3n Post Duty Factor Calculation U-Phase Voltage Value Register (EMU3nVU1)
EMU3n Post Duty Factor Calculation V-Phase Voltage Value Register (EMU3nVV1)
EMU3n Post Duty Factor Calculation W-Phase Voltage Value Register (EMU3nVW1)
EMU3n Post Offset Addition U-Phase Voltage Value Register (EMU3nVU2)
EMU3n Post Offset Addition V-Phase Voltage Value Register (EMU3nVV2)
EMU3n Post Offset Addition W-Phase Voltage Value Register (EMU3nVW2)
EMU3n Post Correction d-Axis Voltage Value Register (EMU3nVD2)
EMU3n Post Correction q-Axis Voltage Value Register (EMU3nVQ2)
EMU3n Post Limit Processing U-Phase Voltage Value Register (EMU3nVUFIX)
EMU3n Post Limit Processing V-Phase Voltage Value Register (EMU3nVVFIX)
EMU3n Post Limit Processing W-Phase Voltage Value Register (EMU3nVWFIX)
EMU3n U-Phase PWM Value Register (EMU3nPWMU0)
EMU3n V-Phase PWM Value Register (EMU3nPWMV0)
EMU3n W-Phase PWM Value Register (EMU3nPWMW0)
EMU3n PWM Modulation Peak Value Register (EMU3nTMAX)
EMU3n Duty Factor Upper-Limit Value Register (EMU3nDTUL)
EMU3n Duty Factor Lower-Limit Value Register (EMU3nDTLL) 2192
25.3.2.85 EMU3n Digit Position Alignment 1 Register (EMU3nPWMK1) 2194
25.3.2.86 EMU3n Input Voltage Register (EMU3nVOLV).....2195
25.3.2.87 EMU3n U-Phase Voltage Correction Value Register (EMU3nVUOFS) 2195
25.3.2.88 EMU3n V-Phase Voltage Correction Value Register (EMU3nVVOFS).....2196
25.3.2.89 EMU3n W-Phase Voltage Correction Value Register (EMU3nVWOFS).....2196
25.3.2.90 EMU3n Digit Position Alignment 2 Register (EMU3nPWMK2) 2197
25.3.2.91 EMU3n Dead Time Setting Register (EMU3nDTT).....2197
25.3.2.92 EMU3n Carrier Period Register (EMU3nCARR) 2198
25.3.2.93 EMU3n Carrier Period Buffer Register (EMU3nCARRBUF) 2198
25.3.2.94 EMU3n Dead Time Compensation Threshold Value Register (EMU3nDTOTH) .2199
25.3.2.95 EMU3n Dead Time Compensation Addend for Positive Current Register (EMU3nDTOPV) 2199
25.3.2.96 EMU3n Dead Time Compensation Addend for Negative Current Register (EMU3nDTONV).....2200
25.3.2.97 EMU3n Post Dead Time Compensation U-Phase PWM Value Register (EMU3nPWMUDT)

EMU3n Post Dead Time Compensation V-Phase PWM Value Register (EMU3nPWMVDT)
EMU3n Post Dead Time Compensation W-Phase PWM Value Register (EMU3nPWMWDT).....2201
25.3.2.98 EMU3n PWM Upper-Limit Value Register (EMU3nPWMUL).....2202
25.3.2.99 EMU3n PWM Lower-Limit Register (EMU3nPWMLL).....2202
25.3.2.100 EMU3n U-Phase PWM Compare Value Register (EMU3nPWMUIP)
EMU3n V-Phase PWM Compare Value Register (EMU3nPWMVIP)
EMU3n W-Phase PWM Compare Value Register (EMU3nPWMWIP) 2203
25.3.2.101 EMU3n U-Phase PWM Compare Value Software Input Register (EMU3nPWMU)
EMU3n V-Phase PWM Compare Value Software Input Register (EMU3nPWMV)
EMU3n W-Phase PWM Compare Value Software Input Register (EMU3nPWMW) 2203
25.3.2.102 EMU3n Rectangle IP Control Register (EMU3nRECCTR).....2204
25.3.2.103 EMU3n Rectangle Output Software Control Pattern Register (EMU3nPTNN) 2205
25.3.2.104 EMU3n Rectangle Output Pattern AB Register (EMU3nPTNAB) 2206
25.3.2.105 EMU3n Rectangle Output Pattern CD Register (EMU3nPTNCD) 2207
25.3.2.106 EMU3n Rectangle Output Pattern EF Register (EMU3nPTNEF).....2208
25.3.2.107 EMU3n Angle Compare 0 Comparison Value Software Input Register (EMU3nCMP0).....2209
25.3.2.108 EMU3n Angle Compare 1 Comparison Value Software Input Register (EMU3nCMP1).....2209
25.3.2.109 EMU3n q-Axis Reference Voltage Phase Software Input Register (EMU3nPHQSFT).....2210
25.3.2.110 EMU3n Switching Instruction Software-input Register (EMU3nPSWSFT) 2210
25.3.2.111 EMU3n Switching Instruction Register (EMU3nPSW).....2211
25.3.2.112 EMU3n Angle Compare 0 Comparison Value IP Output Register (EMU3nIPCMP0) 2211
25.3.2.113 EMU3n Independent Rectangle IP 1 Control Register (EMU3nIRECCTR) 2212
25.3.2.114 EMU3n Independent Rectangle IP 1 Output Pattern Update Register (EMU3nIRPTN).....2213
25.3.2.115 EMU3n Independent Rectangle IP1 Flag Select Signal Initialization Register (EMU3nIRCTRST).....2214
25.3.2.116 EMU3n Independent Rectangle IP1 U-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 0 Register (EMU3nIRUCPPN0)
EMU3n Independent Rectangle IP1 U-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 1 Register (EMU3nIRUCPPN1)
EMU3n Independent Rectangle IP1 U-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 2 Register (EMU3nIRUCPPN2)
EMU3n Independent Rectangle IP1 V-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 0 Register (EMU3nIRVCPPN0)
EMU3n Independent Rectangle IP1 V-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 1 Register (EMU3nIRVCPPN1)
EMU3n Independent Rectangle IP1 V-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 2 Register (EMU3nIRVCPPN2)
EMU3n Independent Rectangle IP1 W-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 0 Register (EMU3nIRWCPPN0)
EMU3n Independent Rectangle IP1 W-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 1 Register (EMU3nIRWCPPN1)
EMU3n Independent Rectangle IP1 W-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 2 Register (EMU3nIRWCPPN2) 2215

26.6.3.2 Resolver Excitation Signal Input Circuit (Dual Power Supply) 2461
26.7 Usage Notes 2462
26.7.1 Countermeasures for Magnetic Disturbance Noise 2462
26.7.2 Countermeasures for Electric Disturbance Noise 2462
26.7.3 Other General Measures 2463

Section 27 A/D Converter (ADCC) 2464
27.1 Features of RH850/C1M-A ADCC 2464
27.1.1 Number of Units 2464
27.1.2 Register Base Address 2464
27.1.3 Clock Supply 2465
27.1.4 Interrupt Requests 2465
27.1.5 Reset Sources 2466
27.1.6 External Input/Output Signals 2466
27.1.7 Rule for Naming Analog Input Pins 2468
27.2 Overview 2469
27.2.1 Functional Overview 2469
27.2.2 Block Diagram 2470
27.2.3 Virtual Channel (Virtual ch) 2474
27.2.4 Scan Group (SG) 2475
27.3 Register 2476
27.3.1 List of Registers 2476
27.3.2 ADCC0ADSYNSTCR — A/D Synchronization Start Control Register 2477
27.3.3 ADCC0ADTSYNSTCR — A/D Timer Synchronization Start Control Register 2478
27.3.4 ADCCnVCRj — Virtual Channel Register j 2479
27.3.5 ADCCnDRj — Data Register j 2482
27.3.6 ADCCnDIRj — Data Supplementary information Register j 2484
27.3.7 ADCCnADHALTR — A/D Halt Register 2486
27.3.8 ADCCnADCR1 — A/D Control Register 1 2486
27.3.9 ADCCnADCR2 — A/D Control Register 2 2487
27.3.10 ADCCnTHSMPSTCR — T&H Sampling Start Control Register 2488
27.3.11 ADCCnTHSTPCR — T&H Stop Control Register 2488
27.3.12 ADCCnTHCR — T&H Control Register 2489
27.3.13 ADCCnTHAHLDSTCR — T&H Group A Hold Start Control Register 2489
27.3.14 ADCCnTHBHLDSTCR — T&H Group B Hold Start Control Register 2490
27.3.15 ADCCnTHACR — T&H Group A Control Register 2491
27.3.16 ADCCnTHBCR — T&H Group B Control Register 2492
27.3.17 ADCCnTHER — T&H Enable Register 2493
27.3.18 ADCCnTHGSR — T&H Group Select Register 2493
27.3.19 ADCCnSFTCR — Safety Control Register 2494
27.3.20 ADCCnTDCR — Pin Level Self-diagnostic Control Register 2495
27.3.21 ADCCnODCR — Wiring-break Detection Control Register 2496

27.3.22 ADCCnULLMTBR0 to ADCCnULLMTBR2 ─ Upper Limit/Lower Limit Table Registers 0 to 2 2497
27.3.23 ADCCnECR ─ Error Clear Register 2498
27.3.24 ADCCnULER ─ Upper Limit/Lower Limit Error Register 2499
27.3.25 ADCCnOWER ─ Overwrite Error Register 2500
27.3.26 ADCCnPER ─ Parity Error Register 2501
27.3.27 ADCCnIDER ─ ID Error Register 2502
27.3.28 ADCCnSGSTCRx ─ Scan Group x Start Control Register 2503
27.3.29 ADCCnADTSTCRy ─ A/D Timer y Start Control Register 2503
27.3.30 ADCCnADTENDCRy ─ A/D Timer y End Control Register 2504
27.3.31 ADCCnSGCRx ─ Scan Group x Control Register 2505
27.3.32 ADCCnSGVCSPx ─ Scan Group x Start Virtual Channel Pointer 2507
27.3.33 ADCCnSGVCEPx ─ Scan Group x End Virtual Channel Pointer 2508
27.3.34 ADCCnSGMCYCRx ─ Scan Group x Multicycle Register 2509
27.3.35 ADCCnSGSRx ─ Scan Group x Status Register 2510
27.3.36 ADCCnADTIPRy ─ A/D Timer Initial Phase Register y 2511
27.3.37 ADCCnADTPRRy ─ A/D Timer Cycle Register y 2512
27.3.38 ADCCnULLMSRx ─ Scan Group x Upper Limit/Lower Limit Table Select Register 2513
27.3.39 ADCCnVCULLMTBR0 to ADCCnVCULLMTBR6 ─ Virtual Channel Threshold Table Registers 0 to 6 2514
27.3.40 ADCCnSGVCPRx ─ Scan Group x Virtual Channel Pointer Register 2515
27.4 Function 2516
27.4.1 Method of A/D Conversion 2516
27.4.2 A/D Conversion Function 2517
27.4.2.1 Normal A/D Conversion Function 2517
27.4.2.2 Simultaneous track and hold function 2517
27.4.2.3 Addition A/D Conversion Function 2519
27.4.2.4 Multicycle Scan Mode 2519
27.4.2.5 Continuous Scan Mode 2519
27.4.3 Trigger Function 2520
27.4.3.1 Input Selection of Triggers for Scan Groups 2520
27.4.3.2 Starting Scan Groups by HW triggers 2521
27.4.3.3 Starting Scan Groups by SW Triggers 2522
27.4.4 Suspend Function 2524
27.4.4.1 Synchronous Suspend Operation 2524
27.4.4.2 Asynchronous Suspend Operation 2525
27.4.4.3 Synchronous and Asynchronous Combination Suspend Operation 2526
27.4.5 Interrupt Request Function 2527
27.4.5.1 Scan Group X End Interrupt 2527
27.4.5.2 A/D Error Interrupt Request 2528
27.4.5.3 A/D Parity Error Trigger 2528
27.4.6 Function for Transferring Results of A/D Conversion to EMU 2529
27.4.7 Self-Diagnostic Functions 2530
27.4.7.1 Pin-Level Self-Diagnostic Function 2530
27.4.7.2 A/D Conversion Circuit Self-Diagnosis Function 2531
27.4.7.3 Wiring-Break Detection Self-Diagnosis Circuit Function 2531

27.5 Procedure 2532
27.5.1 Procedure for Setting A/D Conversion 2532
27.5.2 Procedure for Starting A/D Conversion 2534
27.5.3 Procedure for Stopping A/D Conversion 2535
27.5.4 Procedure for Setting Pin-Level Self-Diagnosis 2536
27.5.5 Procedure for Setting Wiring-Break Detection Self-Diagnosis 2537
27.6 Definition of A/D Conversion Accuracy 2539
27.7 Notes 2540
27.7.1 Notes on Register Settings 2540

28.5.1 Basic Operation 2563
28.5.2 Start-Up Diagnosis 2563

Section 29 Functional Safety 2564
29.1 Overview 2564
29.2 ECC and EDC 2565
29.2.1 Overview 2565
29.2.1.1 ECC 2565
29.2.1.2 Address Parity 2567
29.2.1.3 Data Parity 2567
29.2.2 Code Flash ECC and Address Parity 2568
29.2.2.1 Overview 2568
29.2.2.2 List of Registers 2571
29.2.2.3 Details of Registers 2572
29.2.2.4 Test Function 2583
29.2.3 Data Flash ECC 2584
29.2.3.1 Overview 2584
29.2.3.2 List of Registers 2585
29.2.3.3 Details of Registers 2586
29.2.3.4 Test Function 2592
29.2.4 Local RAM (CPU1, CPU2, SubCPU) ECC and Address Parity 2593
29.2.4.1 Overview 2593
29.2.4.2 List of Registers 2595
29.2.4.3 Details of Registers 2596
29.2.4.4 Test Function 2608
29.2.5 Global RAM ECC and Address Parity 2610
29.2.5.1 Overview 2610
29.2.5.2 List of Registers 2615
29.2.5.3 Details of Registers 2616
29.2.5.4 Test Function 2630
29.2.6 Instruction Cache ECC and EDC 2633
29.2.6.1 Overview 2633
29.2.6.2 List of Registers 2634
29.2.6.3 Details of Registers 2635
29.2.6.4 Test Function 2647
29.2.7 DTS RAM ECC 2648
29.2.8 ECC for Peripheral RAM (32 Bits) 2648
29.2.8.1 Overview 2648
29.2.8.2 List of Registers 2649
29.2.8.3 Details of Registers 2651
29.2.8.4 Notification to ECM 2661
29.2.8.5 Test Function 2662
29.2.9 Data Parity for Data Transfer Path 2663
29.2.9.1 List of Registers 2664
29.2.9.2 Details of Registers 2666
29.3 Lockstep 2670
29.3.1 List of Registers 2670
29.3.2 Details of Registers 2671
29.3.2.1 TESTCOMPREG0 — Comparator test register 0 2671
29.3.2.2 TESTCOMPREG1 — Comparator test register 1 2672
29.3.2.3 LS_ERR_CNT — Lockstep error control register 2673
29.3.2.4 LS_ERR_ST — Lockstep error status register 2674

29.3.2.5 LS_ERR_ADDRESS — Lockstep error address register....2676
29.3.2.6 LS_ERR_DATA — Lockstep error data register....2677
29.4 Memory Protection....2678
29.4.1 Overview....2678
29.4.1.1 Identifiers for Slave Guard....2679
29.4.2 GRG (Global RAM Guard)....2680
29.4.2.1 List of Registers....2680
29.4.2.2 Details of Registers....2682
29.4.3 PBG....2692
29.4.3.1 List of Registers....2696
29.4.3.2 Details of Registers....2697
29.5 Multi-Input Signature Generator (MISG)....2703
29.5.1 Overview....2703
29.5.2 Block Diagram....2704
29.5.2.1 MISG....2704
29.5.2.2 Signature Generation....2705
29.5.3 Functional Specification....2706
29.5.3.1 Conditions for Signature Generation....2706
29.5.3.2 Automatic Signature Comparison....2708
29.5.3.3 Data Counter....2708
29.5.3.4 Error Notification....2708
29.5.4 Register Specifications....2709
29.5.4.1 Register Map....2709
29.5.4.2 MISRCDR_PE1/PE2/ PE3 — MISR calculation data register....2711
29.5.4.3 MISR1_PE1/PE2/ PE3 — Multi-input signature register 1....2712
29.5.4.4 MISR2_PE1/PE2/ PE3 — Multiple-input signature register 2....2713
29.5.4.5 MISRCR_PE1/PE2/ PE3 — MISR control register....2714
29.5.4.6 MISRBASEADR_PE1/PE2/ PE3 — MISR monitoring area base address register....2715
29.5.4.7 MISRADRMSK_PE1/PE2/PE3 — MISR monitor area address mask register....2716
29.5.4.8 MISRDCNTCTL_PE1/PE2/ PE3 — MISR data counter control register....2718
29.5.4.9 MISRDCNT_PE1/PE2/ PE3 — MISR data counter register....2719
29.5.4.10 MISRCMPCTL — MISR comparator control register....2720
29.5.4.11 MISRCMPERSTR — MISR compare error status register....2721
29.5.4.12 MISRCMPERRSTC — MISR compare error status clear register....2722
29.5.4.13 MISRERRCTL — MISR error notification control register....2723
29.5.5 Usage Example....2724
29.5.5.1 Usage example 1....2724
29.5.5.2 Usage example 2....2725
29.6 Clock Monitors....2726
29.6.1 Overview....2726
29.6.2 List of Registers....2727
29.6.2.1 Clock Monitor Channel Register....2727
29.6.2.2 Shared registers....2727
29.6.3 Details of Registers....2728
29.6.3.1 CLMAnCTL0 — CLMAn control register 0....2728
29.6.3.2 CLMAnCMPL — CLMAn compare register L....2729
29.6.3.3 CLMAnCMPH — CLMAn compare register H....2729
29.6.3.4 CLMAnPCMD — CLMAn protection command register....2730

29.6.3.5 CLMAnPS — CLMAn protection command status register 2730
29.6.3.6 CLMATEST — CLMA self-test register 2731
29.6.3.7 CLMATESTS — CLMA self-test status register 2732
29.6.4 Detection of Abnormal Clock Frequency 2733
29.6.5 Self-Diagnosis 2736
29.6.6 Notes on Register Setting 2737
29.6.6.1 Writing to protected registers 2737
29.6.6.2 Setting CLMAnCMPL/CLMAnCMPH register 2737
29.7 ECM 2738

Section 30 Error Control Module (ECM) 2739
30.1 Features of RH850/C1M-A ECM 2739

Section 1 Overview

The RH850/C1M-A is a series of single-chip microcomputers in the RH850 Family from Renesas Electronics. This section covers the features of the RH850/C1M-A.

1.1 Features of RH850/C1M-A Products

The CPU of these products is the G3MH of the RH850 Family running at 320 or 240 MHz for high-speed processing.

These products incorporate ROM, RAM, DMA, various timers including timers for motor control, various serial interfaces including a CAN interface, and a 12-bit A/D converter (ADCC). They also incorporate the set of peripheral functions, which are an R/D converter (RDC3A) that converts the signal output by a resolver into digital values representing angles, and a motor control unit (EMU3) that is capable of operating in parallel with the CPU, is optimized for HEV and EV motor control.

Two products, the one for controlling two motors and the other for controlling one motor, are available. The products are provided in 252-pin BGA (for two-motor control) and 176-pin QFP (for one-motor control) packages.

Applications

Automotive (motor control for HEVs and EVs)

1.1.1 Functions of the RH850/C1M-A

Table 1.1 Overview of Products (1/2)

Item		C1M-A2	C1M-A1
CPU	CPU system	G3MH (LSDC*1) + G3MH	G3MH (LSDC*1)
	CPU frequency	320 MHz	240 MHz
	PE internal peripheral device protection function (IPG)	Provided	Provided
	System error notification control function (SEG)	Provided	Provided
	Memory protection unit (MPU)	Provided	Provided
	Floating-point unit (FPU)	Provided	Provided
	Mutual Exclusion Control Registers (MEV)	Provided	Not provided
On-chip memory	Code Flash	2 MB × 2	2 MB
	Instruction cache (Icache)	8 KB × 2	8 KB
	Local RAM	64 KB × 2	64 KB
	Data Flash	64 KB	64 KB
	Global RAM	128 KB	64 KB
External Interrupts	Maskable interrupt (IRQ)	8	8
DMA, DTS		16 channels, 128 channels	16 channels, 128 channels
Clock	Main oscillator (main OSC)	20 MHz	20 MHz
	PLL	Provided	Provided
Security	Intelligence cryptographic unit E (ICUSE)	Provided	Provided
	Secure watchdog timer A (SWDTA)	2	1
I/O ports		99	81
Timers	Timer array unit D (TAUD)	4 units	2 units
	Timer array unit J (TAUJ)	2 units	1 unit
	Motor control timer (TSG3)	3 units	2 units
	Timer option (TAPA)	6 units	4 units
	Timer pattern buffer (TPBA)	2 units	1 unit
	OS timer (OSTM)	4 units	3 units
	Encoder timer (ENCA)	2 units	2 units
	Watchdog timer (WDTA)	2 units	1 unit
Serial interface	Clocked Serial Interface H (CSIH)	3 channels	3 channels
	CAN interface (RS-CANFD)	4 channels	4 channels
	LIN interface (RLIN3)	3 channels	3 channels
	Serial Communication Interface (SCI3)	3 channels	3 channels
	RSENT (Single Edge Nibble Transmission)	4 channels	4 channels

Table 1.1 Overview of Products (2/2)

Item		C1M-A2	C1M-A1
A/D converter	12-bit A/D core	3 units	3 units
	ADCC0 : Number of input pins	16	11
	ADCC0 : Number of T&H	6	6
	ADCC1 : Number of input pins	16	14
	ADCC1 : Number of T&H	6	6
	ADCC2 : Number of input pins	16	5
	ADCC2 : Number of T&H	4	4
Motor control	R/D converter (RDC3A)	2 units	1 unit
	Enhanced motor control unit (EMU3): Number of units	1 unit (2 channels)	1 unit (2 channels)
	Enhanced motor control unit (EMU3): SubCPU frequency	320 MHz	240 MHz
Other functions	Error control module (ECM)	Provided	Provided
	Clock Monitor (CLMA)	Provided	Provided
	Data CRC (DCRA)	2 units	2 units
	Error correction coding (ECC)	Provided	Provided
	On-chip debug (OCD)	Provided	Provided
	Boundary scan	Provided	Provided
	Peripheral interconnection 1 (PIC1B)	2 units	1 unit
	Peripheral interconnection 2 (PIC2D)	1 unit	1 unit
Power supply voltage	Internal power supply	1.25 V ± 0.1 V	1.25 V ± 0.1 V
	I/O power supply	5.0 V ± 0.5 V	5.0 V ± 0.5 V
	R/D converter power supply	5.0 V ± 0.5 V	5.0 V ± 0.5 V
	A/D converter power supply	5.0 V ± 0.5 V	5.0 V ± 0.5 V
Temperature	Junction temperature (Tj)	– 40°C to 150°C	– 40°C to 150°C
Package		252-pin BGA	176-pin QFP

Note 1. LSDC (Lock Step Dual Core)

Table 1.2 List of Products

Group Name	Part Number	Package
RH850/C1M-A2	R7F701275EABG	252-pin plastic BGA (0.8-mm ball pitch) (17 × 17 mm)
RH850/C1M-A1	R7F701278EAFP	176-pin plastic QFP (0.5-mm pin pitch) (24 × 24 mm)

1.1.2 For Development and Debugging

Table 1.3 List of Development Tools

Function	Outline
On-chip debug (OCD)	On-chip debug interfaces • IEEE 1149.1 standard JTAG interface for NEXUS class 3 compliant debugging • Low pin debug (LPD) interface: 4 pins
On-chip debug emulator	E1 emulator
RAM monitor	Advanced user debugger II RAM monitor function
	NEXUS RAM monitor function
Compiler/Debugger	CubeSuite+
	MULTI environment from GreenHills
Application support hardware	RH850 evaluation platform
Flash programming	PG-FP5 flash programmer
	RFP (Renesas flash programmer) + E1 emulator
	Self-programming library
Software tool (optional)	AUTOSAR MCAL

1.1.3 Internal Block Diagram

CPU1, CPU2, and the SubCPU include their own CPU peripherals. They can access only their own CPU peripherals. The same address is assigned to all the CPU peripherals of CPU1, CPU2, and the SubCPU, but CPU1 always accesses the CPU peripheral of CPU1, CPU2 always accesses the CPU peripheral of CPU2, and the SubCPU always accesses the CPU peripheral of the SubCPU.

For the peripheral modules in each peripheral group, see **Section 3.1.2, Configuration of Peripheral Groups.**

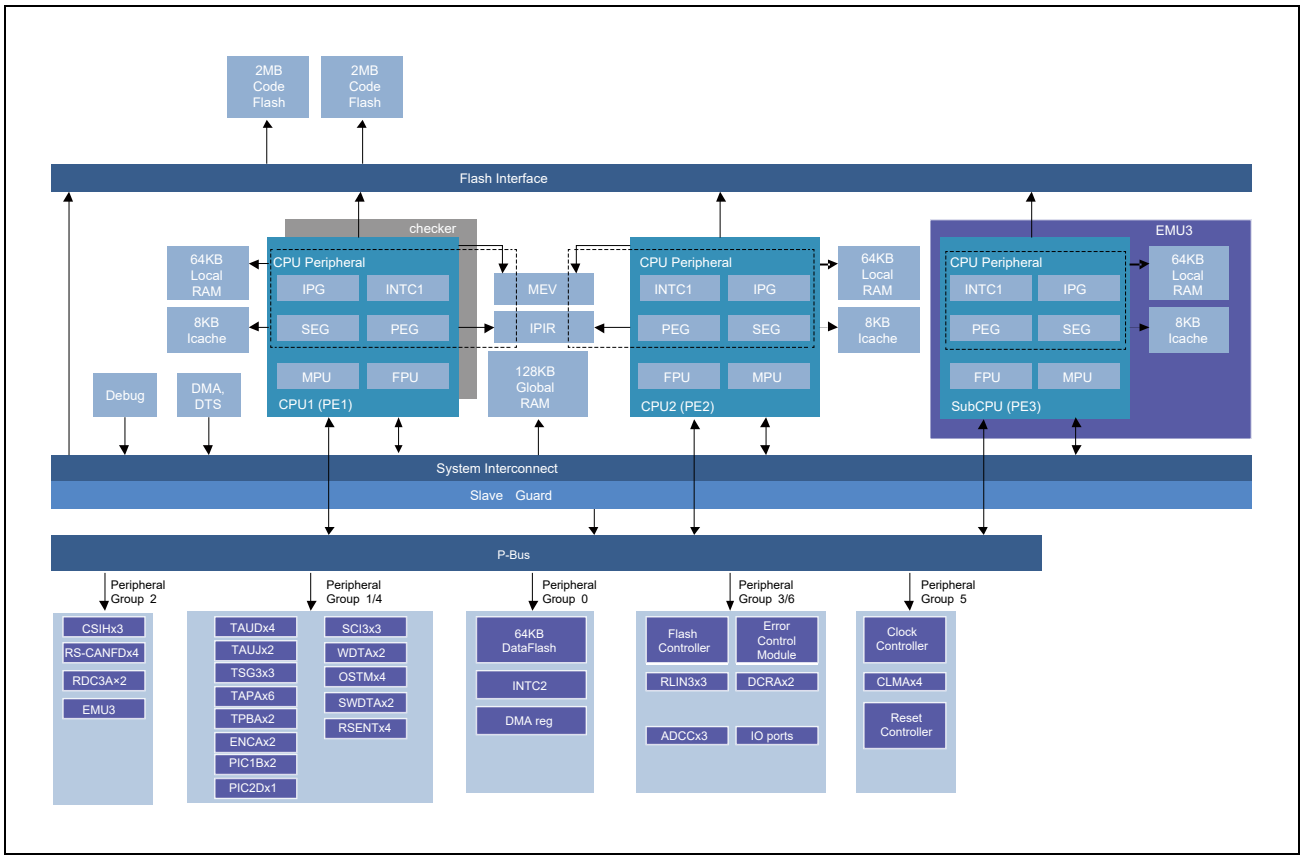

Figure 1.1 Internal Block Diagram of RH850/C1M-A2

CPU1 and the SubCPU include their own CPU peripherals. They can access only their own CPU peripherals.

For the peripheral modules in each peripheral group, see **Section 3.1.2, Configuration of Peripheral Groups**.

Figure 1.3 Pin Connections of RH850/C1M-A2

CAUTION

Though the pins indicated with the names of power supply pins (and as N.C.) do not affect operation of the microcontroller even if they are open-circuit, we recommend connecting the pins to the power supply of the same name as those that do not include N.C. to ensure that the power supply is stable.

In addition, be sure to mount solder balls on the substrate. The pins indicated with the names of power supply pins (and as N.C.) are internally connected with the power supply of the same name as those that do not include N.C.

Section 2 Pins

This section describes the pin and port functions.

The first part of the section describes the port functions.

The remainder describes the port groups, digital noise filter, and respective pin functions.

2.1 Port Functions

2.1.1 Features

Port Group

The RH850/C1M-A provides the following port groups, indicated by the numbers in the table below.

Table 2.1 Port Groups in RH850/C1M-A

Product		Number of Groups	Name of Group
RH850/C1M-A	BGA252/QFP176	8	P0 to P7

Port Group Index n

Each port group is identified by its own index “n” (n = 0 to 7) throughout this section; e.g. PMCn for the port mode control register of the Pn pin.

Base addresses of register base address ports are listed in the following table. Port register addresses are given as offsets from the base addresses in general.

Table 2.2 Register Base Address

Base Address Name	Base Address
<PORT_base>	FFC1 0000_H

2.1.2 Overview

This product has various pins for input/output (I/O) functions, known as ports. The ports are organized in port groups.

This product also has several control registers to allocate the functions other than general-purpose I/O to the corresponding pins.

For definitions of pin, port, and port group, see **Section 2.1.2.1, Terms.**

2.1.2.1 Terms

The terms descried in this section are defined as follows.

- Port group
  A port group consists of a maximum of 16 pins. The number of pins differs depending on the port group. All the pins of a specific port group are controlled by the same port control register.
- Port mode/Port
  A pin in port mode functions as a general-purpose I/O pin. This general-purpose I/O pin is called “port”, and is named as Pn_m. For example, P0_7 indicates port 7 of port group 0.
- Alternative mode
  A pin in alternative mode functions as an I/O pin for peripheral functions. A pin has multiple peripheral functions, and the functions to be used can be selected by control registers.

2.1.2.2 Overview of Pin Functions

Pins can operate in three modes.

- Port mode (PMCn.PMCn_m = 0)
  A pin in port mode operates as a general-purpose input/output pin. The I/O mode is selected by setting the PMn.PMn_m bit.
- Software I/O control alternative mode (PMCn.PMCn_m = 1, PIPCn.PIPCn_m = 0)
  In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn_m control bit by using software.
- Direct I/O control alternative mode (PMCn.PMCn_m = 1, PIPCn.PIPCn_m = 1)
  In this mode, the pins operate as alternative functions. Unlike the software I/O alternative mode, however, the I/O mode is selected by the alternative function.

Table 2.3 shows the outline of the register settings.

Table 2.3 Pin Function Configuration (Outline)

Mode	Bit			I/O
	PMCn_m	PMn_m	PIPCn_m	
Port mode	0	0	0/1	Output mode
		1	0/1	Input mode*1
Software I/O control alternative mode	1	0	0	Output mode
		1	0	Input mode*2
Direct I/O control alternative mode		0/1	1	Controlled by the alternative function*2

Note 1. The input buffer should be enabled (PIBCn_m = 1).

Note 2. When the pin is used as an input pin in alternative mode, set PIBCn_m to 0.

If a pin is in alternative mode (PMCn.PMCn_m = 1), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

- Software I/O control alternative mode (PIPCn.PIPCn_m = 0):
  - Output (PMn_m = 0): ALT-OUT1 to ALT-OUT7
  - Input (PMn_m = 1): ALT-IN1 to ALT-IN7
- Direct I/O control alternative mode (PIPCn.PIPCn_m = 1):
  - The I/O mode for ALT-OUT1 to ALT-OUT7 and ALT-IN1 to ALT-IN7 is directly selected by the alternative function.

Table 2.4 Outline of Alternative Mode Selection (PMCn.PMCn_m = 1)

Function	Register				I/O
	PFCAE	PFCE	PFC	PM*1	
Alternative output mode 1 (ALT-OUT1)	0	0	0	0	O
Alternative input mode 1 (ALT-IN1)	0	0	0	1	I
Alternative output mode 2 (ALT-OUT2)	0	0	1	0	O
Alternative input mode 2 (ALT-IN2)	0	0	1	1	I
Alternative output mode 3 (ALT-OUT3)	0	1	0	0	O
Alternative input mode 3 (ALT-IN3)	0	1	0	1	I
Alternative output mode 4 (ALT-OUT4)	0	1	1	0	O
Alternative input mode 4 (ALT-IN4)	0	1	1	1	I
Alternative output mode 5 (ALT-OUT5)	1	0	0	0	O
Alternative input mode 5 (ALT-IN5)	1	0	0	1	I
Alternative output mode 6 (ALT-OUT6)	1	0	1	0	O
Alternative input mode 6 (ALT-IN6)	1	0	1	1	I
Alternative output mode 7 (ALT-OUT7)	1	1	0	0	O
Alternative input mode 7 (ALT-IN7)	1	1	0	1	I

Note 1. When PIPCn.PIPCn_m = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

If a pin is in alternative mode (PMCn.PMCn_m = 1), one of several alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

2.1.2.3 Pin Data Input/Output

The registers used for data input and output are described below.

The source of the data to be read via the PPRn register depends on pin mode.

Output data

In port mode (PMCn.PMCn_m = 0), the value of Pn.Pn_m is output from the Pn_m pin.

Input data

A read operation of the PPRn register returns either the value of the Pn_m pin, the associated bit of the port register Pn.Pn_m, or the data output by an alternative function.

The source of the data read via PPRn depends on pin mode and setting of several control bits.

Table 2.5 summarizes the differences of PPRn read modes.

Table 2.5 PPRn_m Read Values

PMCn_m	PMn_m	PIBCn_m	PIPCn_m	Mode	PPRn_m Read Value
0	1	0	X	Port input, input buffer disabled	Pn.Pn_m bit
		1		Port input, input buffer enabled	Pn_m pin
	0	X		Port push-pull output	Pn.Pn_m bit*1
1	1	X	0	Software I/O control alternative input	Pn_m pin
	0			Software I/O control alternative output	Alternative function internal output signal*1
	X		1	Direct I/O control alternative mode	I/O port in alternative mode: • Input: Pn_m pin • Output: Output signal from the alternative function*1

Note 1. When PBDCn_m = 1, the level of the Pn_m pin is returned by the PPRn_m bit.

The control registers in **Table 2.5** have the following effects:

- PMCn.PMCn_m
  This bit selects port mode (PMCn_m = 0) or alternative mode (PMCn_m = 1).
- PMn.PMn_m
  This bit selects input (PMn_m = 1) or output (PMn_m = 0) in port mode (PMCn_m = 0) and software I/O control alternative mode (PMCn_m = 1, PIPCn_m = 0).
- PIBCn.PIBCn_m
  This bit disables (PIBCn_m = 0) or enables (PIBCn_m = 1) the input buffer in input port mode (PMCn_m = 0 and PMn_m = 1). When the input buffer is disabled, PPRn_m reads the Pn.Pn_m bit, otherwise the Pn_m pin level is returned.
- PIPCn.PIPCn_m
  This bit selects the software or direct I/O control alternative mode.
- PBDCn.PBDCn_m
  In output mode, when this bit is set to 1, the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

Writing to the Pn Register

The data to be output via port Pn_m in port mode (PMCn.PMCn_m = 0) is held in the port register Pn.

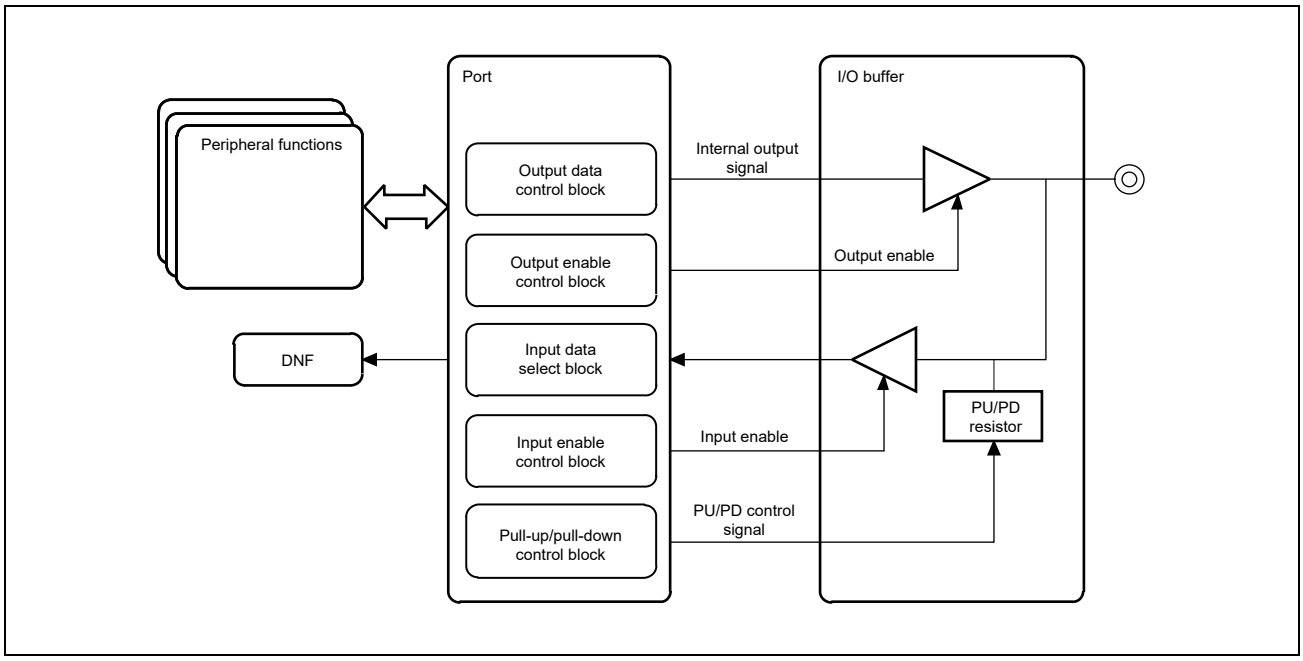
Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.
  In this case, new data can be written directly to the Pn register.
- By performing an indirect bitwise operation (a “set”, “reset”, or “not” operation) on the Pn register.
  An indirect bitwise operation (“set”, “reset”, or “not”), can be performed on the Pn register by using the following two registers:
  - Port set/reset register: PSRn
    If the PSRn.PSRn_(m + 16) bit = 1, the value of the Pn.Pn_m bit is determined by the value of the PSRn.PSRn_m bit.
    In other words, the Pn_m bit can be set or reset without writing directly to the Pn register.
  - Port NOT register: PNOTn
    By setting PNOTn.PNOTn_m to 1, the Pn.Pn_m bit can be inverted without writing directly to the Pn register.

An indirect bitwise operation on the Pn register (“set”, “reset”, or “not”), has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

2.1.3 Port Type

Figure 2.1 shows the overall configuration of the pins. For the details of port blocks, see **Figure 2.2**.



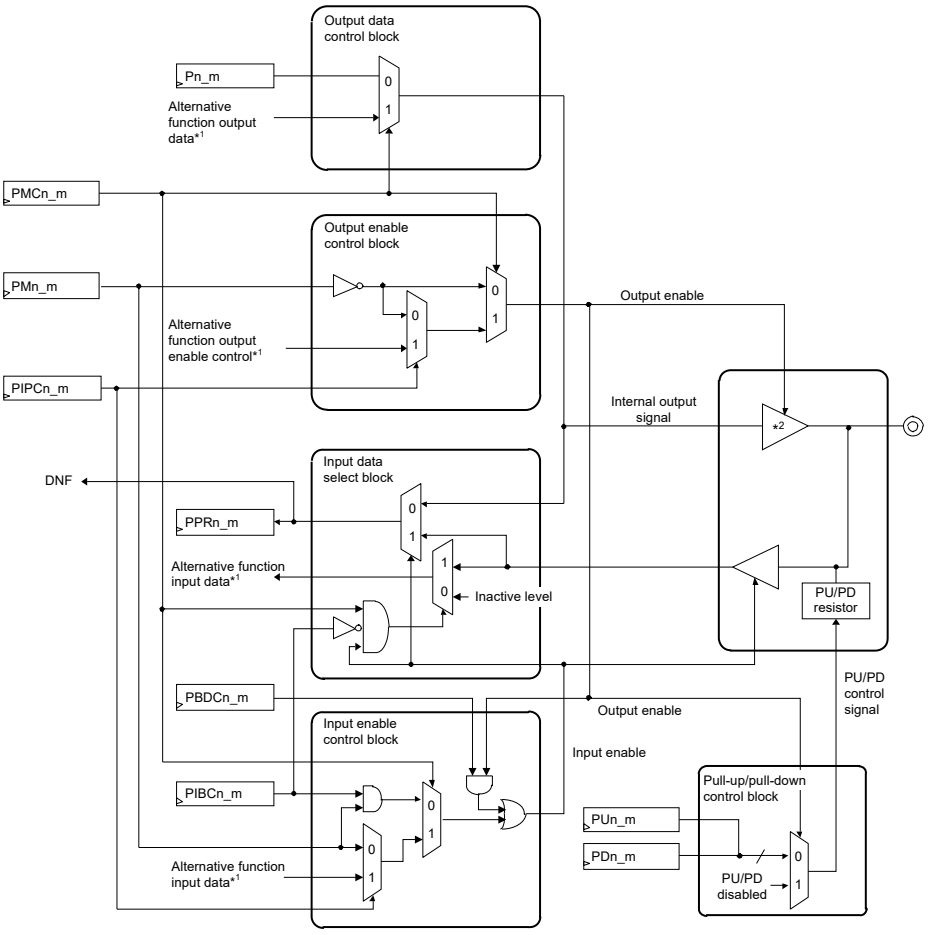


Figure 2.1 Block Diagram of Pin Configuration

Figure 2.2 shows the logical circuitry of the port control functions. The diagram is only a logical reference and does not show the real circuitry.

Note 1. Alternative function signal selected by PFCn_m, PFCEn_m, or PFCAEn_m.

Note 2. Output drive strength can be set by the PDSC and PUCC bits in PCRn_m.

Figure 2.2 Port Control Logic Diagram

2.1.4 Port Group Configuration Register

This section starts with an overview of all configuration registers and then presents all registers in detail.

The configuration registers are classified as follows:

- **2.1.4.2, Configuration of Pin Function**
- **2.1.4.3, Pin Data Input/Output**
- **2.1.4.4, Configuration of Electrical Characteristics Registers**
- **2.1.4.5, Pin-Unit Register**

2.1.4.1 Outline

The following registers are used for the configuration of the individual pins of the port groups:

Table 2.6 Registers for Port Group Configuration

Register Name	Symbol	Register Configuration Unit	Address
Port register	Pn	Port group	<PORT_base> + 0000_H + n × 40_H
Port set/reset register	PSRn	Port group	<PORT_base> + 0004_H + n × 40_H
Port NOT register	PNOTn	Port group	<PORT_base> + 0008_H + n × 40_H
Port pin read register	PPRn	Port group	<PORT_base> + $000C_H$ + n × 40_H

Port function control register	PFCn	Port group	<PORT_base> + 0018_H + n × 40_H
Port function control expansion register	PFCEn	Port group	<PORT_base> + $001C_H$ + n × 40_H
Port mode set/reset register	PMSRn	Port group	<PORT_base> + 0020_H + n × 40_H
Port mode control set/reset register	PMCSRn	Port group	<PORT_base> + 0024_H + n × 40_H
Port function control additional expansion register	PFCAEn	Port group	<PORT_base> + 0028_H + n × 40_H
Port input buffer control register	PIBCn	Port group	<PORT_base> + 4000_H + n × 40_H
Port bidirectional control register	PBDCn	Port group	<PORT_base> + 4004_H + n × 40_H
Port IP control register	PIPCn	Port group	<PORT_base> + 4008_H + n × 40_H
Pull-up option register	PUn	Port group	<PORT_base> + $400C_H$ + n × 40_H
Pull-down option register	PDn	Port group	<PORT_base> + 4010_H + n × 40_H
Port control register	PCRn_m	Pin	<PORT_base> + 2000_H + n × 40_H + m × 4_H

Note: n: Port group number
m: Bit number in a port group

Base address

The base address of PORTn <PORT_base> is defined in Register Base Address in **Section 2.1.1, Features**.

Register value after reset

The value after resets of the registers after reset release depend on the port, and are not described in the following register descriptions, but are given in **Section 2.2.1.1, List of the C1M-A2 Port Registers (BGA), Section 2.2.2.1, List of the C1M-A1 Port Registers (QFP)**.

2.1.4.2 Configuration of Pin Function

(1) PMCn — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + 0014_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCn_15	PMCn_14	PMCn_13	PMCn_12	PMCn_11	PMCn_10	PMCn_9	PMCn_8	PMCn_7	PMCn_6	PMCn_5	PMCn_4	PMCn_3	PMCn_2	PMCn_1	PMCn_0

Table 2.7 PMCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMCn_[15:0]	Specify the operation mode of the corresponding pin: 0: Port mode 1: Alternative mode

(2) PMCSRn — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to a bit in the PMCn register.

The 16 higher-order bits of PMCSRn (PMCSRn_[31:16]) select or deselect writing of values from the 16 lower-order bits (PMCSRn_[15:0]) to the corresponding PMCn.PMCn_m bits.

Even when pins being used by multiple programs belong to the same port group, the PMCSRn register allows masking of the unused bits when overwriting so that independent setting of the corresponding bits by each program is possible.

Access: This register is readable/writable in 32-bit units.

Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of the PMCn register.

Address: <PORT_base> + 0024_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMCSRn_31	PMCSRn_30	PMCSRn_29	PMCSRn_28	PMCSRn_27	PMCSRn_26	PMCSRn_25	PMCSRn_24	PMCSRn_23	PMCSRn_22	PMCSRn_21	PMCSRn_20	PMCSRn_19	PMCSRn_18	PMCSRn_17	PMCSRn_16
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCSRn_15	PMCSRn_14	PMCSRn_13	PMCSRn_12	PMCSRn_11	PMCSRn_10	PMCSRn_9	PMCSRn_8	PMCSRn_7	PMCSRn_6	PMCSRn_5	PMCSRn_4	PMCSRn_3	PMCSRn_2	PMCSRn_1	PMCSRn_0

Table 2.8 PMCSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMCSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower-order bit of PMCSRn_m is to be written to PMCn_m: 0: PMCn_m does not depend on PMCSRn_m. 1: The value of PMCn_m is the same as that of PMCSRn_m. Example: If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15.
15 to 0	PMCSRn_[15:0]	Data bits that specify the PMCn_m value when the corresponding higher-order bit PMCSRn_(m+16) is 1: 0: PMCn_m = 0 1: PMCn_m = 1

(3) PIPCn — Port IP Control Register

This register specifies whether the I/O direction of pin Pn_m is controlled by the port mode register PMn.PMn_m or by an alternative function.

When the Pn_m pin is operated in alternative mode (PMCn.PMCn_m = 1) and the alternative function directly controls the I/O direction of Pn_m, PIPCn.PIPCn_m must be set to 1 as well. This hands over I/O control to the alternative function and overrules the PMn.PMn_m setting.

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + 4008_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPCn_15	PIPCn_14	PIPCn_13	PIPCn_12	PIPCn_11	PIPCn_10	PIPCn_9	PIPCn_8	PIPCn_7	PIPCn_6	PIPCn_5	PIPCn_4	PIPCn_3	PIPCn_2	PIPCn_1	PIPCn_0

Table 2.9 PIPCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIPCn_[15:0]	Specify the I/O mode: 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control).

(4) PMn — Port Mode Register

The PMn register specifies whether the individual pins of port group n are in input mode or in output mode.

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + 0010_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn_15	PMn_14	PMn_13	PMn_12	PMn_11	PMn_10	PMn_9	PMn_8	PMn_7	PMn_6	PMn_5	PMn_4	PMn_3	PMn_2	PMn_1	PMn_0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.10 PMn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMn_[15:0]	Specify input/output mode of the corresponding pin: 0: Output mode (output enabled) 1: Input mode (output disabled)

NOTES

1. To use a pin in input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), the input buffer must be enabled (PIBCn.PIBCn_m = 1).
2. PMn_m specifies the I/O direction in port mode (PMCn.PMCn_m = 0) and alternative mode (PMCn.PMCn_m = 1) because PIPCn.PIPCn_m = 0 after reset.

(5) PMSRn — Port Mode Set/Reset Register

This register provides an alternative method to write data to a bit in the PMn register.

The 16 higher-order bits of PMSRn (PMSRn_[31:16]) select or deselect writing of values from the 16 lower-order bits (PMSRn_[15:0]) to the corresponding PMn.PMn_m bits.

Even when pins being used by multiple programs belong to the same port group, the PMSRn register allows masking of the unused bits when overwriting so that independent setting of the corresponding bits by each program is possible.

Access: This register is readable/writable in 32-bit units.

Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of the PMn register.

Address: <PORT_base> + 0020_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMSRn_15	PMSRn_14	PMSRn_13	PMSRn_12	PMSRn_11	PMSRn_10	PMSRn_9	PMSRn_8	PMSRn_7	PMSRn_6	PMSRn_5	PMSRn_4	PMSRn_3	PMSRn_2	PMSRn_1	PMSRn_0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.11 PMSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower-order bit of PMSRn_m is written to PMn_m: 0: PMn_m does not depend on PMSRn_m. 1: The value of PMn_m is the same as that of PMSRn_m. Example: If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15.
15 to 0	PMSRn_[15:0]	Data bits that specify the PMn_m value when the corresponding higher-order bit PMSRn_(m+16) is 1: 0: PMn_m = 0 1: PMn_m = 1

(6) PIBCn — Port Input Buffer Control Register

This register enables and disables the input buffer when a pin is used in input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1). However, when the pin is used as an input pin in software I/O control alternative mode (PMCn.PMCn_m = 1 and PIPCn.PIPCn_m = 0) or in direct I/O control alternative mode (PMCn.PMCn_m = 1 and PIPCn.PIPCn_m = 1), set PIBCn.PIBCn_m to 0.

And when pins are in bidirectional mode (PBDCn.PBDCn_m = 1), alternative output level loopback function and pin output level read function can be selected by the setting of PIBCn.PIBCn_m.

Refer to **2.1.4.3(1), PBDCn — Port Bidirectional Control Register**.

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + 4000_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBCn_15	PIBCn_14	PIBCn_13	PIBCn_12	PIBCn_11	PIBCn_10	PIBCn_9	PIBCn_8	PIBCn_7	PIBCn_6	PIBCn_5	PIBCn_4	PIBCn_3	PIBCn_2	PIBCn_1	PIBCn_0

Table 2.12 PIBCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enable and disable the input buffer in input port mode. 0: Input buffer is disabled. 1: Input buffer is enabled.

NOTE

When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.

(7) PFCn — Port Function Control Register

This register, together with the PFCEn and PFCAEn registers, specifies an alternative function of the pins.

Some alternative functions directly control input/output of pin Pn_m. For such alternative functions PIPCn.PIPCn_m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + 0018_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 2.13 PFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCn_[15:0]	Specify an alternative function of a pin. See **Table 2.4, Outline of Alternative Mode Selection (PMCn.PMCn_m = 1)** for details.

(8) PFCEn — Port Function Control Expansion Register

This register, together with the PFCn and PFCAEn registers, specifies an alternative function of the pins.

Some alternative functions directly control input/output of pin Pn_m. For such alternative functions PIPCn.PIPCn_m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + $001C_H$ + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit Position	Bit Name	Function
15 to 0	PFCEn_[15:0]	Specify an alternative function of a pin. See **Table 2.4, Outline of Alternative Mode Selection (PMCn.PMCn_m = 1)** for details.

(9) PFCAEn — Port Function Control Additional Expansion Register

This register, together with the PFCn and PFCEn registers, specifies an alternative function of the pins.

Some alternative functions directly control input/output of pin Pn_m. For such alternative functions PIPCn.PIPCn_m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + 0028_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
15 to 0	PFCAEn_[15:0]	Specify an alternative function of a pin. See **Table 2.4, Outline of Alternative Mode Selection (PMCn.PMCn_m = 1)** for details.

2.1.4.3 Pin Data Input/Output

(1) PBDCn — Port Bidirectional Control Register

When a pin is used in output mode, this register enables the input buffer and sets the port to bidirectional mode. The Pn_m pin level is read via PPRn.PPRn_m in bidirectional mode.

- Alternative output level loopback function
  When the Pn_m pin is used as the alternative output function, the actual pin output level based on the alternative output function can be looped back to the alternative input side by setting PBDCn.PBDCn_m = 1 and PIBCn.PIBCn_m = 0. For example, the pin output level based on the first alternative function can be looped back to the same alternative input side. Also the pin output level can be read via PPRn.PPRn_m.
- Pin output level read function
  When the Pn_m pin is used as the general-purpose output port function or the alternative output function, the actual pin output level can be read via PPRn.PPRn_m by setting PBDCn.PBDCn_m = 1 and PIBCn.PIBCn_m = 1. Under this setting, the pin output level will never be looped back to the alternative input side even in alternative output mode.

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + 4004_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDCn_15	PBDCn_14	PBDCn_13	PBDCn_12	PBDCn_11	PBDCn_10	PBDCn_9	PBDCn_8	PBDCn_7	PBDCn_6	PBDCn_5	PBDCn_4	PBDCn_3	PBDCn_2	PBDCn_1	PBDCn_0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.16 PBDCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PBDCn_[15:0]	Enable or disable bidirectional mode of the corresponding pin: 0: Bidirectional mode is disabled. 1: Bidirectional mode is enabled.

(2) PPRn — Port Pin Read Register

This register reflects an actual Pn_m pin level, a Pn.Pn_m bit value, or an output level of the alternative function. The value to be read depends on various control settings as described in **Table 2.5, PPRn_m Read Values**.

Access: This register is only readable in 16-bit units.

Address: <PORT_base> + $000C_H$ + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 2.17 PPRn Register Contents

Bit Position	Bit Name	Function
15 to 0	PPRn_[15:0]	Indicate a Pn_m pin level, a Pn.Pn_m value, or alternative function output level.

(3) Pn — Port Register

This register sets and holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 0).

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + 0000_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn_15	Pn_14	Pn_13	Pn_12	Pn_11	Pn_10	Pn_9	Pn_8	Pn_7	Pn_6	Pn_5	Pn_4	Pn_3	Pn_2	Pn_1	Pn_0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.18 Pn Register Contents

Bit Position	Bit Name	Function
15 to 0	Pn_[15:0]	Set the output level of pin m (m = 0 to 15): 0: Low level output 1: High level output

NOTE

The bits of this register can be manipulated by various means; refer to the subsection, Write to the Pn Register in **Section 2.1.2.3, Pin Data Input/Output**.

(4) PNOTn — Port NOT Register

This register allows bit Pn_m of the port register Pn to be inverted without directly writing to Pn.

Access: This register is writable in 16-bit units. The read value is always 0000_H.

Address: <PORT_base> + 0008_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOTn_15	PNOTn_14	PNOTn_13	PNOTn_12	PNOTn_11	PNOTn_10	PNOTn_9	PNOTn_8	PNOTn_7	PNOTn_6	PNOTn_5	PNOTn_4	PNOTn_3	PNOTn_2	PNOTn_1	PNOTn_0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 2.19 PNOTn Register Contents

Bit Position	Bit Name	Function
15 to 0	PNOTn_[15:0]	Specify if Pn.Pn_m is inverted or not: 0: Pn.Pn_m is not inverted (Pn_m → Pn_m). 1: Pn.Pn_m is inverted ($\overline{\text{Pn_m}}$ → Pn_m)

(5) PSRn — Port Set/Reset Register

This register provides an alternative method to write data to a bit in the Pn register.

The 16 higher-order bits of PSRn (PSRn_[31:16]) select or deselect writing of values from the 16 lower-order bits (PSRn_[15:0]) to the corresponding Pn.Pn_m bits.

Even when pins being used by multiple programs belong to the same port group, the PSRn register allows masking of the unused bits when overwriting so that independent setting of the corresponding bits by each program is possible.

Access: This register is readable/writable in 32-bit units.

Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of the Pn register.

Address: <PORT_base> + 0004_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Table 2.20 PSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower-order bit of PSRn_m is written to Pn_m: 0: Pn_m does not depend on PSRn_m. 1: The value of Pn_m is the same as that of PSRn_m. Example: When PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15 and output.
15 to 0	PSRn_[15:0]	Specify the Pn_m value when the corresponding higher-order bit PSRn_(m+16) is 1: 0: Pn_m = 0 1: Pn_m = 1

2.1.4.4 Configuration of Electrical Characteristics Registers

(1) PUn — Pull-Up Option Register

This register specifies whether an on-chip pull-up resistor is connected to an input pin.

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + $400C_H$ + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 2.21 PUn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUn_[15:0]	Specify whether an on-chip pull-up resistor is connected to the corresponding pin: 0: No on-chip pull-up resistor is connected. 1: On-chip pull-up resistor is connected.

NOTES

1. Do not set PUn.PUn_m = 1 and PDn.PDn_m = 1 to a single pin.
2. The on-chip pull-up resistor has no effect when the pin is operated in output mode.

(2) PDn — Pull-Down Option Register

This register specifies whether an on-chip pull-down resistor is connected to an input pin.

Access: This register is readable/writable in 16-bit units.

Address: <PORT_base> + 4010_H + n × 40_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDn_15	PDn_14	PDn_13	PDn_12	PDn_11	PDn_10	PDn_9	PDn_8	PDn_7	PDn_6	PDn_5	PDn_4	PDn_3	PDn_2	PDn_1	PDn_0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.22 PDn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDn_[15:0]	Specify whether an on-chip pull-down resistor is connected to the corresponding pin: 0: No on-chip pull-down resistor is connected. 1: On-chip pull-down resistor is connected.

NOTES

1. Do not set PUn.PUn_m = 1 and PDn.PDn_m = 1 to a single pin.
2. The on-chip pull-down resistor has no effect when the pin is operated in output mode.

2.1.4.5 Pin-Unit Register

(1) PCRn_m — Port Control Register

Each register of a port group can be accessed via this register and a PCRn_m register can set all functions of a single pin. For example, setting bit 6 of the PCRn_m register to 1 sets bit m of the PMCn register to 1 also.

Access: This register is readable/writable in 32-bit units.

Address: <PORT_base> + 2000_H + n × 40_H + m × 4_H

Value after reset: See **Section 2.2.1.1 List of the C1M-A2 Port Registers (BGA)** and **Section 2.2.2.1 List of the C1M-A1 Port Registers (QFP)**.

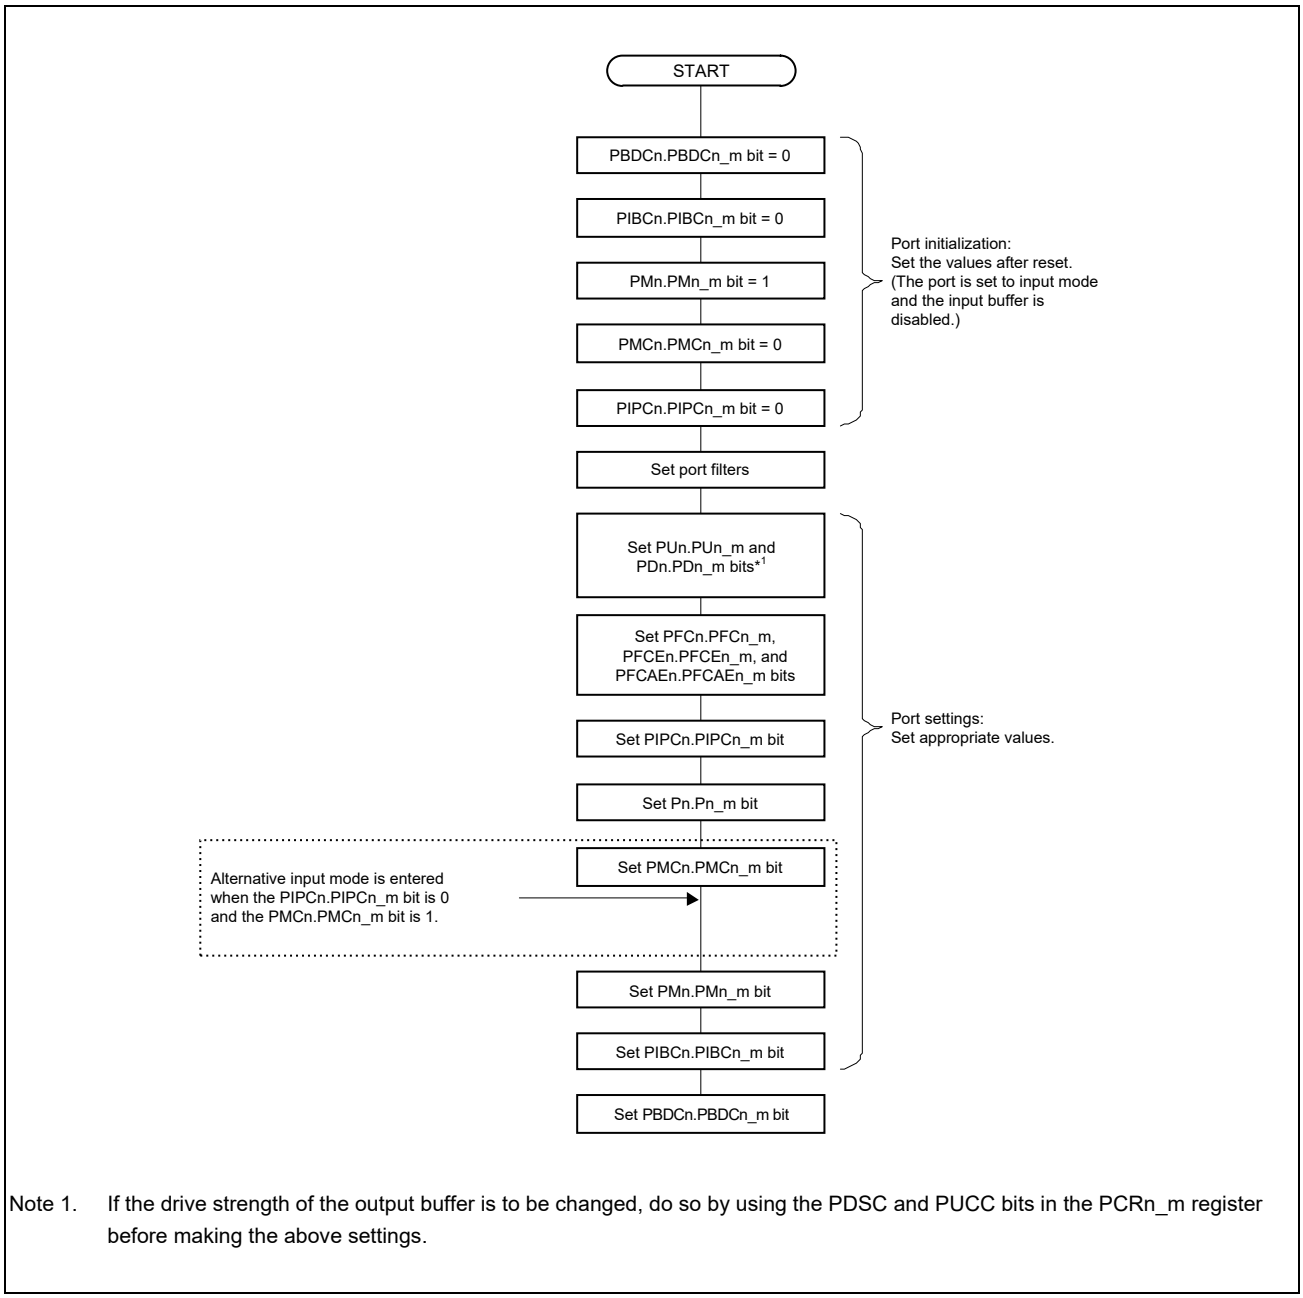
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PUCC	PDSC	—	—	—	—	PU	PD	PBDC	PIBC
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	P	—	—	—	PPR	—	PMC	PIPC	PM	—	PFCAE	PFCE	PFC
R/W	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Table 2.23 PCRn_m Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is read. When writing, write the value after reset.
25	PUCC	PUCC PDSC Selects the output drive strength. 0 0: Low 0 1: High 1 0: Mid Settings other than the above are prohibited.
24	PDSC	
23 to 20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19	PU	Same function as bit m of the PUn register
18	PD	Same function as bit m of the PDn register
17	PBDC	Same function as bit m of the PBDCn register
16	PIBC	Same function as bit m of the PIBCn register
15 to 13	Reserved	When read, the value after reset is read. When writing, write the value after reset.
12	P	Same function as bit m of the Pn register
11 to 9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8	PPR	Same function as bit m of the PPRn register
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6	PMC	Same function as bit m of the PMCn register
5	PIPC	Same function as bit m of the PIPCn register
4	PM	Same function as bit m of the PMn register
3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2	PFCAE	Same function as bit m of the PFCAEn register
1	PFCE	Same function as bit m of the PFCEn register
0	PFC	Same function as bit m of the PFCn register

2.1.4.6 Example Port Settings



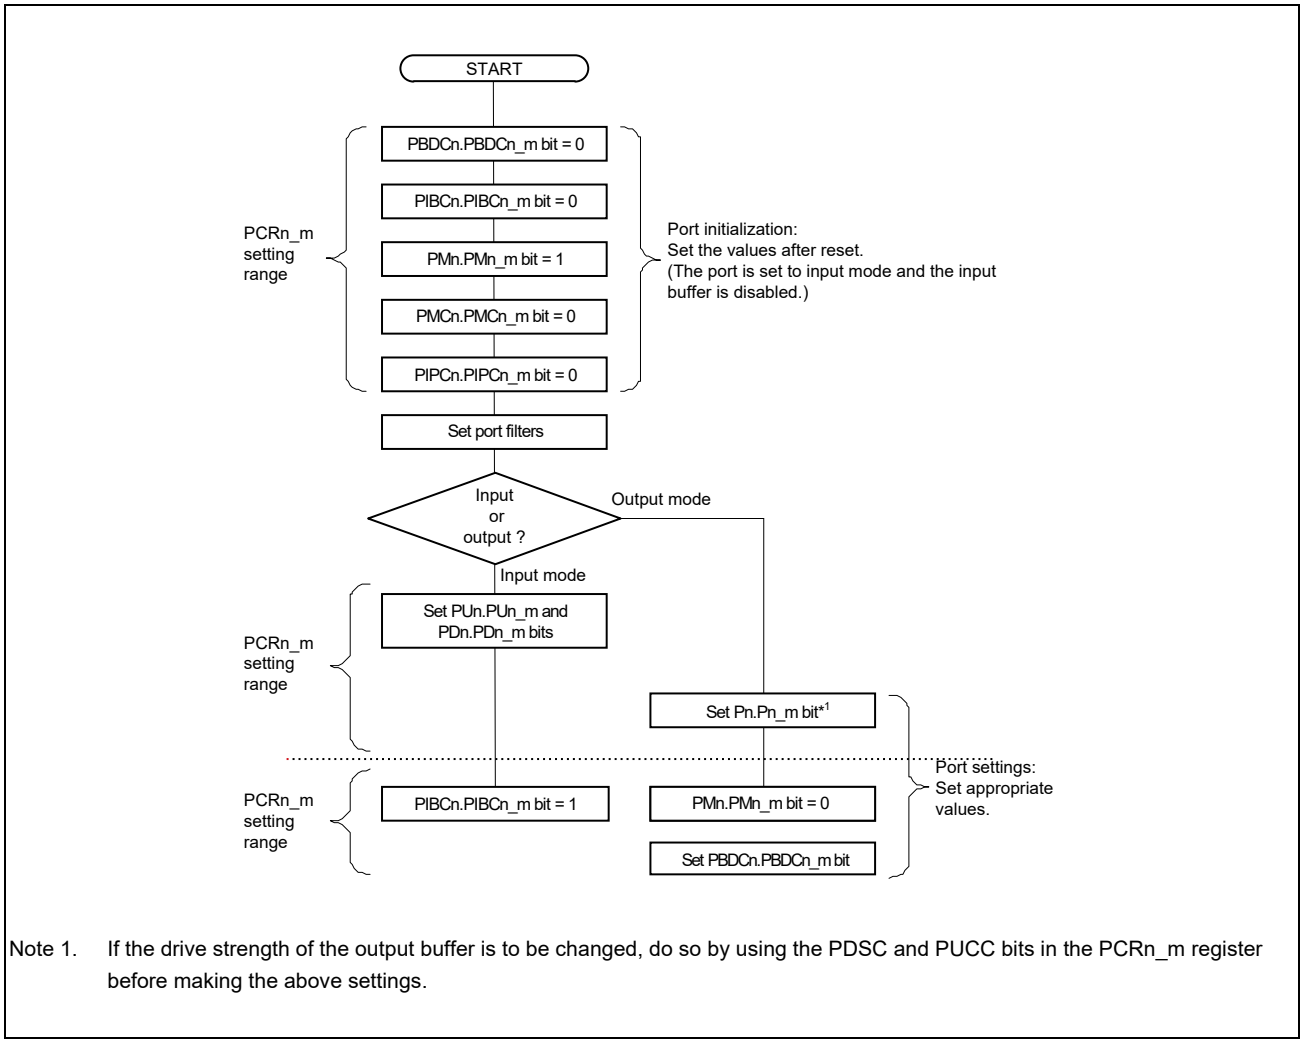
Examples of the port settings are shown in the flowchart below. For port filter setting of each flow chart, see **Section 2.3.2.4, Setting Procedures of Peripheral Function DNF**.

CAUTION

If a port is used in software I/O control alternative mode, it may be temporarily switched to alternative input mode in the following example. This may occur between when PMCn_m is set to 1 and when PMn_m is set to 0.

(1) Batch Setting

An example of specifying batch port settings is shown in the flowchart below.

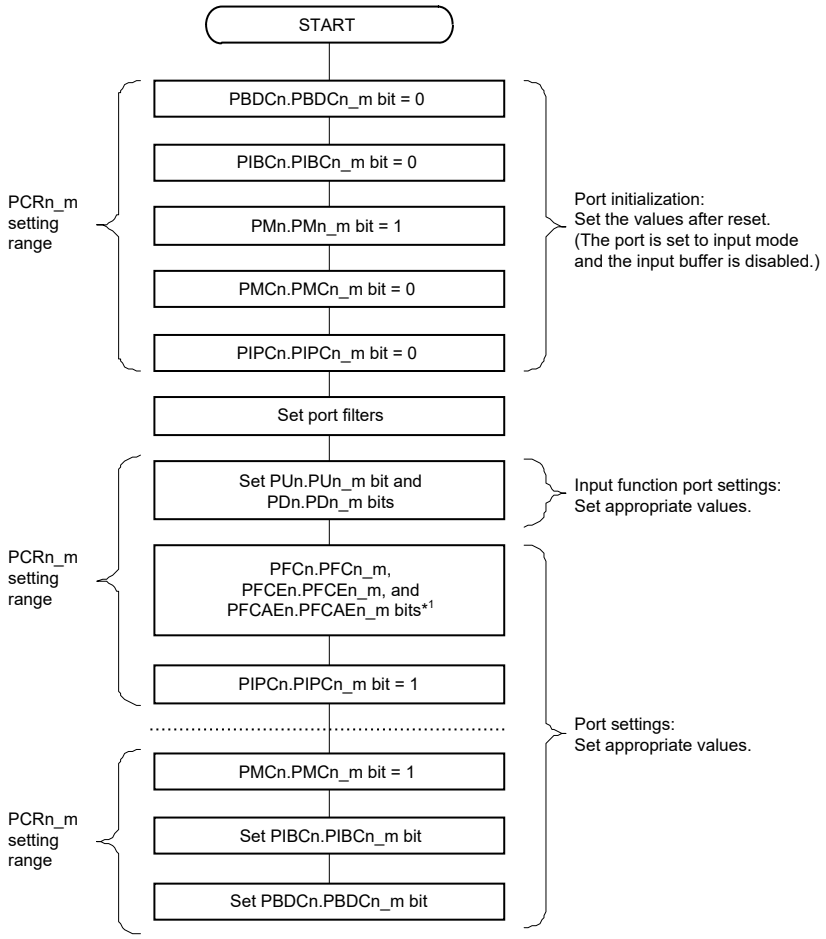


Note 1. If the drive strength of the output buffer is to be changed, do so by using the PDSC and PUCC bits in the PCRn_m register before making the above settings.

Figure 2.3 Example of Port Settings (When Specified in Batch)

(2) Individual Settings

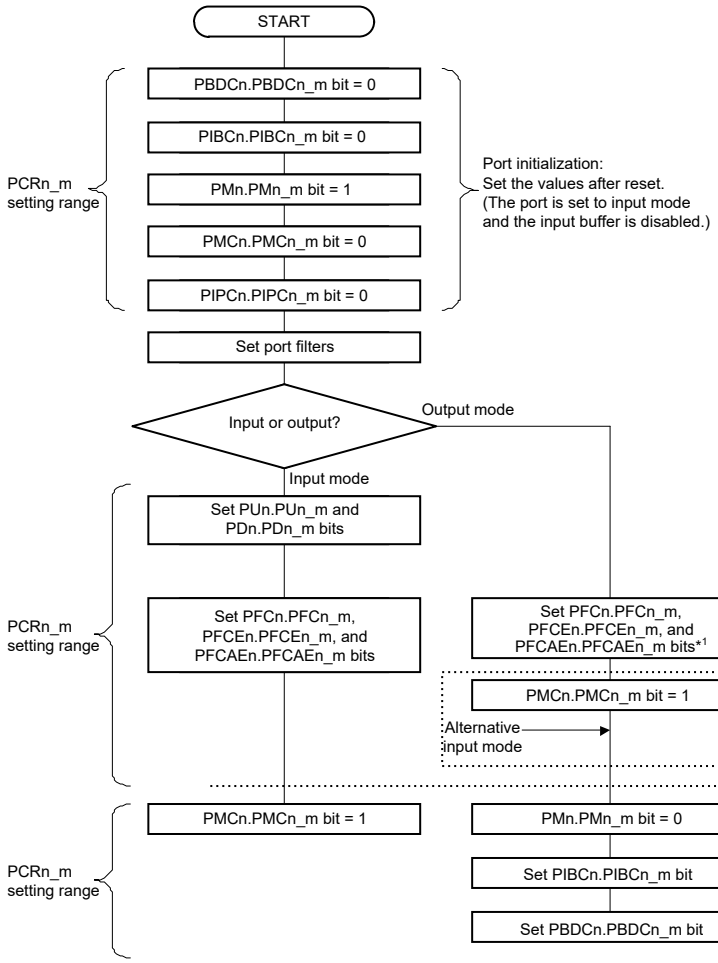
An example of specifying individual port settings is shown in the flowchart below.



Furthermore, setting of multiple bits within the range for setting of the PCRn_m register shown in the figure below is possible.

Note 1. If the drive strength of the output buffer is to be changed, do so by using the PDSC and PUCC bits in the PCRn_m register before making the above settings.

Figure 2.4 Example of Port Settings (in Port Mode)



(a) With IP Control (PIPC = 1)

Note 1. If the drive strength of the output buffer is to be changed, do so by using the PDSC and PUCC bits in the PCRn_m register before making the above settings.

Figure 2.5 Example of Port Settings (in Alternative Mode) (1/2)

(b) Without IP Control (PIPC = 0)

Note 1. If the drive strength of the output buffer is to be changed, do so by using the PDSC and PUCC bits in the PCRn_m register

Figure 2.6 Example of Port Settings (in Alternative Mode) (2/2)

2.1.5 Functional Selection

2.1.5.1 Register Configuration in Use of the Alternative Function

When the pin alternative function is used, set PMCn_m = 1 and select the alternative numbers of PFCn_m, PFCEn_m, and PFCAEn_m. In several peripheral functions, a single alternative I/O function is allocated to multiple pins. However, such an alternative function should not be enabled in multiple pins at the same time.

2.1.5.2 Alternative Function to be Used in Direct I/O Control Alternative Mode

When the alternative functions described in **Table 2.24** are used, switch to direct I/O control alternative mode. When setting PIPCn_m = 1, the PMn_m value which has been set is ignored because the peripheral function enables or disables inputs and outputs of the buffer.

If you are using an alternative function not listed in **Table 2.24**, set PIPCn_m = 0.

Table 2.24 List of the Pins which Require PIPC Register Setting

Category	Pin Name	I/O	Function
SCIn (n = 0 to 2)	SCInRXD	I	Receive data input
	SCInTXD	O	Transmit data output
	SCInSCK	I/O	Serial clock input/output
CSIHn (n = 0 to 2)	CSIHnSO	O	Transmit data output
	CSIHnSC	I/O	Serial clock input/output
	CSIHnRYI/CSIHnRYO	I/O	Handshake signal input/output
TSG3n*1	TSG3nO1	O	Three-phase PWM output (Hi-Z control)
	TSG3nO2	O	
	TSG3nO3	O	
	TSG3nO4	O	
	TSG3nO5	O	
	TSG3nO6	O	
TAPAn*2	TAPAn UN	O	Three-phase PWM output (Hi-Z control)
	TAPAn UP	O	
	TAPAn VN	O	
	TAPAn VP	O	
	TAPAn WN	O	
	TAPAn WP	O	
RSENT (n = 0 to 3)	RSENTnRX	I	RSENTn receive data input
	RSENTnSPCO	O	RSENTnSPC extended output

Note 1. C1M-A2: n = 0 to 2, C1M-A1: n = 0 and 1

Note 2. C1M-A2: n = 0 to 5, C1M-A1: n = 0, 1, 3, and 4

2.1.5.3 Setting of the $\overline{\text{ERROROUT_C}}$ Pin

When an error output function of the $\overline{\text{ERROROUT_C}}$ pin is used, enable the alternative output level loopback function for fault diagnosis.

2.1.5.4 Selecting Debugging Function of the JTAG Port

For the connection of multiple tools to the JTAG port, the interface is multiplexed on multiple sets of pins. The interface is selected by the combination of the settings of mode pins and an option byte. When user boot mode is selected as the operating mode, the interface is selected by the setting of option byte OPBT2.

When any other operating mode is selected, the setting of OPBT2 has no effect and the I/F that corresponds to the operating mode is selected. For details, refer to **Section 5.2, Operating Mode.**

2.2 Organization of Port Groups

2.2.1 C1M-A2 Port Function (BGA)

2.2.1.1 List of the C1M-A2 Port Registers (BGA)

Table 2.25 to **Table 2.32** show detailed bitmaps of control registers in each port group. In the bitmap field, "√" means an effective bit and "—" means a reserved one. Reserved bits are always read as value after resets. The write value also should be a value after reset.

Table 2.25 List of Registers in Port Group 0 of C1M-A2 (BGA)

2.2.2 C1M-A1 Port Function (QFP)

2.2.2.1 List of the C1M-A1 Port Registers (QFP)

Table 2.41 to **Table 2.48** show detailed bitmaps of control registers in each port group. In the bitmap field, "√" means an effective bit and "—" means a reserved one. Reserved bits are always read as value after resets. The write value also should be a value after reset.

Table 2.41 List of Registers in Port Group 0 of C1M-A1 (QFP)

2.3 DNF

Digital Noise Filter (DNF) eliminates digital noise from external input signals. This product incorporates peripheral function DNF.

2.3.1 Example of Noise Elimination

Figure 2.7 shows an example of noise elimination in peripheral function DNF. In this example, the sampling clock, the sampling count, and the current output level are set to 1/2 of the DNF input clock, two (twice), and low, respectively. "○" in the figure means that high level is detected.

In input examples 1, 2, and 3, the output level changes from low to high because the same level is detected twice in a row through sampling. In input examples 4, 5, and 6, on the other hand, the same level is not detected twice consecutively. Therefore, these inputs are regarded as noise and the input signal state is eliminated.

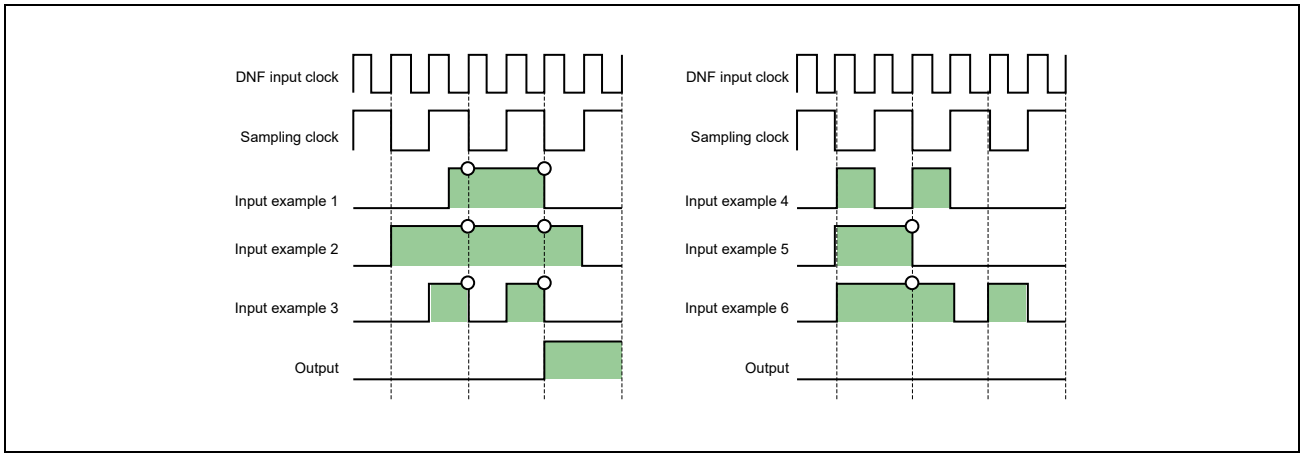

Figure 2.7 Timing Chart of Digital Noise Elimination

2.3.2 Peripheral Function DNF

2.3.2.1 Overview of Peripheral Function DNF

This DNF eliminates noise from the input function pins for the peripheral function.

Peripheral function DNF has the following functions:

- Eliminates digital noise from input signals and outputs noiseless signals.
- Selects whether to output signals from which digital noise is eliminated or signals containing digital noise.
- Selects the digital noise elimination width from 2, 3, 4, and 5 counts of the sampling clock.
- Selects five types of sampling frequency shown below:
  1/1, 1/2, 1/4, 1/8, and 1/16 of the DNF input clock.
- The conditions for noise elimination can be set by each channel via the registers.
- The DNF input clock of DNF group number 0 is a low-speed peripheral clock.
- The DNF input clock of DNF group number 1, 2, 3, 4, 5, 6, and 7 is an unmodulated high-speed peripheral clock.
- The DNF input clock of DNF group number 8 is non-modulated low-speed peripheral clock.

2.3.2.2 Details of the Control Registers

Base addresses of peripheral function DNF are listed in the following table.

Register addresses of peripheral function DNF are given as offsets from the base addresses in general.

Table 2.57 Register Base Address

Base Address Name	Base address
<DNF0_base>	FFC3 0000_H
<DNF1_base>	FFC3 0400_H
<DNF2_base>	FFC3 0800_H
<DNF3_base>	FFC3 $0C00_H$
<DNF4_base>	FFC3 1000_H
<DNF5_base>	FFC3 1400_H
<DNF6_base>	FFC3 1800_H
<DNF7_base>	FFC3 $1C00_H$
<DNF8_base>	FFC3 2000_H

2.3.2.3 DNFP01nCTLm — Digital Noise Elimination Control Register

This register sets conditions for noise elimination of channel number m in DNF group number n.

Access: This register is readable/writable in 8-bit units.

Address: <DNFn_base> + 4_H × m (m: channel number)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NFEN	SLST[1:0]		—	—	PRS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W

Table 2.58 DNFP01nCTLm Register Contents

Bit Position	Bit Name	Function
7	NFEN	Enables/disables digital noise elimination. 0: Digital noise is not eliminated. 1: Digital noise is eliminated.
6, 5	SLST[1:0]	Specifies the sampling count for digital noise elimination. 00: Sampling count = 2 01: Sampling count = 3 10: Sampling count = 4 11: Sampling count = 5
4, 3	Reserved	When read, 0 is read. When writing, write 0.
2 to 0	PRS[2:0]	Specifies the sampling clock division ratio for digital noise elimination. 000: DNF input clock/1 001: DNF input clock/2 010: DNF input clock/4 011: DNF input clock/8 100: DNF input clock/16 Other than the above: Setting is prohibited.

2.3.2.4 Setting Procedures of Peripheral Function DNF

The following shows the procedures to set peripheral function DNF. If the input level to a pin varies during (4) and (5), an unexpected signal may be input to the peripheral function. Therefore, the corresponding flag at the peripheral function side or the like should be cleared in (6).

(1) Set the PRS2 to PRS0 bits (bits 2 to 0) and the SLST1 and SLST0 bits (bits 6 and 5) in the DNFP01nCTLm register.

(2) Set the NFEN bit (bit 7) in the DNFP01nCTLm register. This setting can be made at the same time as (1).

(3) Set a port register to select an alternative function.

(4) Wait for the following time: sampling clock period × the number of samples + DNF input clock period × 2.

(5) Enable an operation of a peripheral function in the destination to which DNF is connected.

(6) Clear the flag of peripheral function, and the like.

To change the setting while the DNF is in operation, clear the NFEN bit (bit 7) in the DNFP01nCTLm register first, and then execute the procedure in steps (1) to (6) above to remake the settings.

2.3.2.5 Peripheral Function Pin for DNF Insertion

The signals shown in the table below are the targets of DNF insertion.

Table 2.59 DNF Insertion Targets (1/3)

DNF Group Number n	DNF Channel Number m	Target Pins for DNF Insertion		
		Pin Name	Pin Function	Peripheral IP
0	0	INTP0	External interrupt input	INTC

	3	RSENT3RX	RSENT3 receive data input	RSENT3

Note 1. C1M-A1 does not have this pin.

2.4 Pin Description

2.4.1 Overview

This subsection describes pin functions, external pin lists, and external pin states at a reset and in other each operating status.

2.4.2 List of Pin Functions

Function of each pin is described below.

Table 2.60 C1M-A2 Pin Function (1/3)

Pin Name	I/O	Function
AnVREFH (n = 0 to 2)	—	ADCCn voltage supply and reference voltage
AnVSS (n = 0 to 2)	—	ADCCn ground
$\overline{\text{ADCCnTRG}}$ (n = 0 to 2)	I	ADCCn trigger
ADCCnIpq (n = 0 to 2, p = 0 to 3, q = 0 to 3)	I	ADCCn input channel pq
AUDATAm (m = 0 to 3)	IO	AUDR command / address / data / flag m
AUDCK	I	AUDR clock
$\overline{\text{AUDRST}}$	I	AUDR reset
$\overline{\text{AUDSYNC}}$	I	AUDR timing control
AnVCC (n = 0 to 2)	—	ADCCn voltage supply
CANmRX (m = 0 to 3)	I	CANm receive data input
CANmTX (m = 0 to 3)	O	CANm transmit data output
CSIHnCSS0 (n = 0 to 2)	O	CSIHn serial peripheral chip select signal 0
CSIHnCSS1 (n = 0 to 2)	O	CSIHn serial peripheral chip select signal 1
CSIHnCSS2 (n = 0 to 2)	O	CSIHn serial peripheral chip select signal 2
CSIHnCSS3 (n = 0 to 2)	O	CSIHn serial peripheral chip select signal 3
CSIHnRYI (n = 0 to 2)	I	CSIHn ready (1) / busy (0) input signal
CSIHnRYO (n = 0 to 2)	O	CSIHn ready (1) / busy (0) output signal
CSIHnSC (n = 0 to 2)	IO	CSIHn serial clock signal
CSIHnSI (n = 0 to 2)	I	CSIHn serial data input
CSIHnSO (n = 0 to 2)	O	CSIHn serial data output
$\overline{\text{CSIHnSSI}}$ (n = 0 to 2)	I	CSIHn slave select input signal
$\overline{\text{DCURDY}}$	O	Debug ready
DCUTCK	I	Debug clock
DCUTDI	I	Debug data input
DCUTDO	O	Debug data output
DCUTMS	I	Debug mode select
$\overline{\text{DCUTRST}}$	I	Debug reset
FLSCI3TX (FPDT)	O	Transmit data output
FLSCI3RX (FPDR)	I	Receive data input
FLSCI3SCK (FPCK)	I	Serial clock input
ENCAnE0 (n = 0, 1)	I	ENCAn encoder input (count pulse 0)
ENCAnE1 (n = 0, 1)	I	ENCAn encoder input (count pulse 1)

Table 2.60 C1M-A2 Pin Function (2/3)

Pin Name	I/O	Function
ENCAnTINm (n = 0, 1, m = 0, 1)	I	ENCAn capture trigger input nm
ENCAnEC (n = 0, 1)	I	ENCAn encoder input (clear pulse)
$\overline{\text{ERROROUT_M}}$	O	ECM error output (main)
$\overline{\text{ERROROUT_C}}$	O	ECM error output (checker)
FLMODE	I	Operating mode select pin
MD0	I	Operating mode select pin 0
MD1	I	Operating mode select pin 1
INTPm (m = 0 to 7)	I	External interrupt input m
LPDCLK	I	LPD clock input (4-pin mode)
LPDCLKOUT	O	LPD clock output (4-pin mode)
LPDI	I	LPD data input (4-pin mode)
LPDO	O	LPD data output (4-pin mode)
$\overline{\text{LPDRST}}$	I	LPD Reset (4-pin mode)
P0_m (m = 0 to 15)	IO	Port 0_m
P1_m (m = 0 to 15)	IO	Port 1_m
P2_m (m = 0 to 7)	IO	Port 2_m
P3_m (m = 0 to 7)	IO	Port 3_m
P4_m (m = 0 to 15)	IO	Port 4_m
P5_m (m = 0 to 9)	IO	Port 5_m
P6_m (m = 0 to 15)	IO	Port 6_m
P7_m (m = 0 to 7)	IO	Port 7_m
P7_m (m = 8)	I	Port 7_m
SYSVCC	—	Voltage supply for system and PLL
VCC	—	Voltage supply for oscillator, flash memory, and port buffer
VDD	—	Voltage regulators voltage supply
VSS	—	Ground
RVCC	—	Voltage supply for RDC
RVSS	—	Ground for RDC
$\overline{\text{RESET}}$	I	External reset input
RDC3AnCOM (n = 0, 1)	IO	Excitation common signal input/output
RDC3AnCOSMNT (n = 0, 1)	O	COS-side monitoring signal output
RDC3AnRSO (n = 0, 1)	IO	Excitation signal input/output
RDC3AnS1 (n = 0, 1)	I	Resolver signal input
RDC3AnS2 (n = 0, 1)	I	Resolver signal input
RDC3AnS3 (n = 0, 1)	I	Resolver signal input
RDC3AnS4 (n = 0, 1)	I	Resolver signal input
RDC3AnSINMNT (n = 0, 1)	O	SIN-side monitoring signal output
RLIN3mRX (m = 0 to 2)	I	RLIN3m receive data input
RLIN3mTX (m = 0 to 2)	O	RLIN3m transmit data output
SCInRXD (n = 0 to 2)	I	SCIn receive data

Table 2.60 C1M-A2 Pin Function (3/3)

Pin Name	I/O	Function
SCInSCK (n = 0 to 2)	IO	SCIn clock
SCInTXD (n = 0 to 2)	O	SCIn transmit data
TAPAnESO (n = 0 to 5)	I	Hi-Z control
TAPAnUN (n = 0 to 2)	O	Motor control output U phase (negative)
TAPAnUP (n = 0 to 2)	O	Motor control output U phase (positive)
TAPAnVN (n = 0 to 2)	O	Motor control output V phase (negative)
TAPAnVP (n = 0 to 2)	O	Motor control output V phase (positive)
TAPAnWN (n = 0 to 2)	O	Motor control output W phase (negative)
TAPAnWP (n = 0 to 2)	O	Motor control output W phase (positive)
TPBAnO (n = 0, 1)	O	TPBAn channel output
TAUDnIm (n = 0 to 3, m = 0 to 15)	I	TAUDn channel input m
TAUDnOm (n = 0 to 3, m = 0 to 15)	O	TAUDn channel output m
TAUJnIm (n = 0 to 1, m = 0 to 3)	I	TAUJn channel input m
TAUJnOm (n = 0 to 1, m = 0 to 3)	O	TAUJn channel output m
TSG3nOm (n = 0 to 2, m = 0 to 7)	O	TSG3n channel output m
X1, X2	—	Crystal oscillator connections
RSENTnRX (n = 0 to 3)	I	SENT input
RSENTnSPCO (n = 0 to 3)	O	SENT control output
RDC3An_OUT_U (n = 0, 1)	O	RDC U-phase output
RDC3An_OUT_V (n = 0, 1)	O	RDC V-phase output
RDC3An_OUT_W (n = 0, 1)	O	RDC W-phase output

CAUTION

In C1M-A2, use SCI30 with the alternative function pins within the same port group.

- When serial clock I/O signals are used
  - P5_0(SCI0RXD), P5_1(SCI0TXD), P5_2(SCI0SCK)
- When serial clock I/O signals are not used
  - P5_0(SCI0RXD), P5_1(SCI0TXD)
  - P7_2(SCI0RXD), P7_4(SCI0TXD)

Table 2.61 C1M-A1 Pin Function (1/3)

Pin Name	I/O	Function
AnVREFH (n = 0 to 2)	—	ADCCn voltage supply and reference voltage
AnVSS (n = 0 to 2)	—	ADCCn ground
$\overline{\text{ADCCnTRG}}$ (n =0 to 2)	I	ADCCn trigger
ADCC0Ipq (p = 0 to 3, q = 0 to 3) This excludes the combination of p = 2 and q = 2 or 3 and of p = 3 and q = 1 to 3.	I	ADCC0 input channel pq
ADCC1Ipq (p = 0 to 3, q = 0 to 3) This excludes the combination of p = 3 and q = 0 or 3.	I	ADCC1 input channel pq
ADCC2Ipq (p = 1, q = 1 to 3)	I	ADCC2 input channel pq
AUDATAm (m = 0 to 3)	IO	AUDR command / address / data / flag m
AUDCK	I	AUDR clock
$\overline{\text{AUDRST}}$	I	AUDR reset
$\overline{\text{AUDSYNC}}$	I	AUDR timing control
AnVCC (n = 0 to 2)	—	ADCCn voltage supply
CANmRX (m = 0 to 3)	I	CANm receive data input
CANmTX (m = 0 to 3)	O	CANm transmit data output
CSIHnCSS0 (n = 0 to 2)	O	CSIHn serial peripheral chip select signal 0
CSIHnCSS1 (n = 0 to 2)	O	CSIHn serial peripheral chip select signal 1
CSIHnCSS2 (n = 0 to 2)	O	CSIHn serial peripheral chip select signal 2
CSIHnCSS3 (n = 0 to 2)	O	CSIHn serial peripheral chip select signal 3
CSIHnRYI (n = 0 to 2)	I	CSIHn ready (1) / busy (0) input signal
CSIHnRYO (n = 0 to 2)	O	CSIHn ready (1) / busy (0) output signal
CSIHnSC (n = 0 to 2)	IO	CSIHn serial clock signal
CSIHnSI (n = 0 to 2)	I	CSIHn serial data input
CSIHnSO (n = 0 to 2)	O	CSIHn serial data output
$\overline{\text{CSIHnSSI}}$ (n = 0 to 2)	I	CSIHn slave select input signal
$\overline{\text{DCURDY}}$	O	Debug ready
DCUTCK	I	Debug clock
DCUTDI	I	Debug data input
DCUTDO	O	Debug data output
DCUTMS	I	Debug mode select
$\overline{\text{DCUTRST}}$	I	Debug reset
FLSCI3TX (FPDT)	O	Transmit data output
FLSCI3RX (FPDR)	I	Receive data input
FLSCI3SCK (FPCK)	I	Serial clock input
ENCAnE0 (n = 0, 1)	I	ENCAn encoder input (count pulse 0)
ENCAnE1 (n = 0, 1)	I	ENCAn encoder input (count pulse 1)

Table 2.61 C1M-A1 Pin Function (2/3)

Pin Name	I/O	Function
ENCAnTINm (n = 0, 1, m = 0, 1)	I	ENCAn capture trigger input nm
ENCAnEC (n = 0, 1)	I	ENCAn encoder input (clear pulse)
$\overline{\text{ERROROUT_M}}$	O	ECM error output (main)
$\overline{\text{ERROROUT_C}}$	O	ECM error output (checker)
FLMODE	I	Operating mode select pin
MD0	I	Operating mode select pin 0
MD1	I	Operating mode select pin 1
INTPm (m = 0 to 7)	I	External interrupt input m
LPDCLK	I	LPD clock input (4-pin mode)
LPDCLKOUT	O	LPD clock output (4-pin mode)
LPDI	I	LPD data input (4-pin mode)
LPDO	O	LPD data output (4-pin mode)
$\overline{\text{LPDRST}}$	I	LPD Reset (4-pin mode)
P0_m (m = 0 to 15)	IO	Port 0_m
P1_m (m = 0 to 15)	IO	Port 1_m
P2_m (m = 0 to 7)	IO	Port 2_m
P3_m (m = 0 to 7)	IO	Port 3_m
P4_m (m = 0 to 15)	IO	Port 4_m
P5_m (m = 0 to 9)	IO	Port 5_m
P6_m (m = 2, 4, 6)	IO	Port 6_m
P7_m (m = 0, 2, 4)	IO	Port 7_m
P7_m (m = 8)	I	Port 7_m
SYSVCC	—	Voltage supply for system and PLL
VCC	—	Voltage supply for oscillator, flash memory, and port buffer
VDD	—	Voltage regulators voltage supply
VSS	—	Ground
RVCC	—	Voltage supply for RDC
RVSS	—	Ground for RDC
$\overline{\text{RESET}}$	I	External reset input
RDC3AnCOM (n = 0)	IO	Excitation common signal input/output
RDC3AnCOSMNT (n = 0)	O	COS-side monitoring signal output
RDC3AnRSO (n = 0)	IO	Excitation signal input/output
RDC3AnS1 (n = 0)	I	Resolver signal input

RDC3AnS3 (n = 0)	I	Resolver signal input
RDC3AnS4 (n = 0)	I	Resolver signal input
RDC3AnSINMNT (n = 0)	O	SIN-side monitoring signal output
RLIN3mRX (m = 0 to 2)	I	RLIN3m receive data input
RLIN3mTX (m = 0 to 2)	O	RLIN3m transmit data output
SCInRXD (n = 0 to 2)	I	SCIn receive data

Table 2.61 C1M-A1 Pin Function (3/3)

Pin Name	I/O	Function
SCInSCK (n = 0 to 2)	IO	SCIn clock
SCInTXD (n = 0 to 2)	O	SCIn transmit data
TAPAnESO (n = 0 to 1,3 to 4)	I	Hi-Z control
TAPAnUN (n = 0 to 1)	O	Motor control output U phase (negative)
TAPAnUP (n = 0 to 1)	O	Motor control output U phase (positive)
TAPAnVN (n = 0 to 1)	O	Motor control output V phase (negative)
TAPAnVP (n = 0 to 1)	O	Motor control output V phase (positive)
TAPAnWN (n = 0 to 1)	O	Motor control output W phase (negative)
TAPAnWP (n = 0 to 1)	O	Motor control output W phase (positive)
TPBAnO (n = 0)	O	TPBAn channel output
TAUDnIm (n = 0 to 1, m = 0 to 15)	I	TAUDn channel input m
TAUDnOm (n = 0 to 1, m = 0 to 15)	O	TAUDn channel output m
TAUJnIm (n = 0, m = 0 to 3)	I	TAUJn channel input m
TAUJnOm (n = 0, m = 0 to 3)	O	TAUJn channel output m
TSG3nOm (n = 0 to 1, m = 0 to 7)	O	TSG3n channel output m
X1, X2	—	Crystal oscillator connections
RSENTnRX (n = 0 to 3)	I	SENT input
RSENTnSPCO (n = 0 to 3)	O	SENT control output
RDC3An_OUT_U (n = 0)	O	RDC U-phase output
RDC3An_OUT_V (n = 0)	O	RDC V-phase output
RDC3An_OUT_W (n = 0)	O	RDC W-phase output

CAUTION

In C1M-A1, use SCI30 with the alternative function pins within the same port group.

- When serial clock I/O signals are used
  - P5_0(SCI0RXD), P5_1(SCI0TXD), P5_2(SCI0SCK)
- When serial clock I/O signals are not used
  - P5_0(SCI0RXD), P5_1(SCI0TXD)
  - P7_2(SCI0RXD), P7_4(SCI0TXD)

2.4.3 Pin State

Definition of Reset State

In description of pin state, each reset state is defined as shown in **Table 2.62**.

Table 2.62 Definition of Reset State

Reset State	Definition
External reset	Reset state from an external pin ($\overline{\text{RESET}}$ = L)
Internal reset	Between external reset release to internal reset release
After internal reset release	State where internal reset is released

Table 2.62 and **Table 2.63** show detailed pin states. Some pins may be excluded depending on grades and packages of this product. For the pins included in each product, see Section **1.2, Pin Connection Diagram (Top View).**

Table 2.63 Pin State (1/2)

Pin Function		Pin Function		
		$\overline{\text{RESET}}$ = L	$\overline{\text{RESET}}$ = H	
Classification	Pin Name	External Reset State	Before Internal Reset Release	After Internal Reset Release

		Writer I/F: (w/o function)	Z	Z	Z
		BSCAN:(w/o function)	Z	Z	Z

Note: I: Input
O: Output
Z: High impedance
Pull-up: On-chip pull-up resistor
Pull-down: On-chip pull-down resistor

Note 1. $\overline{\text{EVTO}}$ is not used in this device.

2.4.4 Handling of Unused Pins

Table 2.64 shows an example handling of unused pins.

Table 2.64 Example Handling of Unused Pins (1/2)

Category	Pins	IO	Example handling of unused pins	Internal pull-up/pull-down resistor
Clock	X1	I	(Required)	None
	X2	O	(Required)	None
System control	$\overline{\text{RESET}}$	I	(Required)	An internal pull-down resistor is included.
	MD0, FLMODE	I	(Required. When they are used in user boot mode, separately connect them with VSS via resistors.)	An internal pull-down resistor is included.
	MD1	I	Separately connect the pin with VSS via a resistor.	An internal pull-down resistor is included.
ECM	$\overline{\text{ERROROUT_M}}$	O	Leave the pin open.	None
General-purpose I/O port	P0_m, P1_m, P2_m, P3_m, P4_m, P5_m, P6_m, P7_m (m = 0 to 7)	IO	[Input mode] • Leave the pins open, and disable “input enable” (PMCn_m = 0, PMn_m = 1, and PIBCn_m = 0 (values after reset)). • Leave the pins open, and enable the internal pull-up/pull-down resistors (use PUn_m and PDn_m). • Separately connect each pin with the power supply/GND via a resistor. [Output mode] • Leave the pins open.	Internal pull-up/pull-down resistors that can be set by the registers are included.
General-purpose input port	P7_8	I	• Leave the pin open. • Separately connect the pin with VSS via a resistor.	An internal pull-down resistor is included.
ADCC	ADCCnIpq (Analog input-only)	I	Leave the pin open.	None
RDC3A	RDC3AnCOM, RDC3AnRSO	I/O	Leave the pins open and stop the analog circuit.	None
	RDC3AnS1, RDC3AnS2, RDC3AnS3, RDC3AnS4	I	Leave the pins open and stop the analog circuit.	None
Debug system (AUDRAM)	$\overline{\text{AUDRST}}$	I	• Leave the pin open. • Separately connect the pin with VSS via a resistor.	An internal pull-down resistor is included.
	AUDCK, $\overline{\text{AUDSYNC}}$	I	• Leave the pin open. • Separately connect the pin with VCC via a resistor.	An internal pull-up resistor is included.
	AUDATAn	IO	Leave the pin open.	An internal pull-up resistor is included.

Table 2.64 Example Handling of Unused Pins (2/2)

Category	Pins	IO	Example handling of unused pins	Internal pull-up/pull-down resistor
Debug system (NEXUS/LPD)	DCUTDI	I	• Leave the pin open. • Separately connect the pin with VCC via a resistor. (Serial programming mode is disabled.)	An internal pull-up resistor is included.
	DCUTDO	O	• Leave the pin open. (Serial programming mode is disabled.)	None
	DCUTCK	I	• Leave the pin open. • Separately connect the pin with VCC via a resistor. (Serial programming mode is disabled.)	An internal pull-up resistor is included.
	$\overline{\text{DCUTMS}}$	I	• Leave the pin open. • Separately connect the pin with VCC via a resistor.	An internal pull-up resistor is included.
	$\overline{\text{DCUTRST}}$	I	Separately connect the pin with VSS via a resistor.	An internal pull-down resistor is included.
	DCURDY	O	Leave the pin open.	None
N.C.	A0VSS(N.C.), A2VSS(N.C.), VSS(N.C.)	—	Connect the pins to the power supply of the same name as those that do not include N.C.	None
Power system	SYSVCC	—	(Required)	
	VCC	—	(Required)	
	VDD	—	(Required)	
	VSS	—	(Required)	
	AnVCC	—	(Required)	
	AnVSS	—	(Required)	
	AnVREFH	—	(Required)	
	RVCC	—	(Required)	
	RVSS	—	(Required)	

Note 1. When a pull-up/pull-down is performed via a resistor outside the product, set the resistance value to 1 kΩ or more.

Note 2. When a pull-up/pull-down is also performed via a resistor outside the product for a pin that includes internal pull-up/pull-down resistors, be careful so that the resistance voltage is not divided.

Section 3 CPU System

3.1 Overview

3.1.1 Block Configuration

A block diagram of RH850/C1M-A is shown in **Figure 3.1**.

RH850/C1M-A1 does not have CPU2 (PE2).

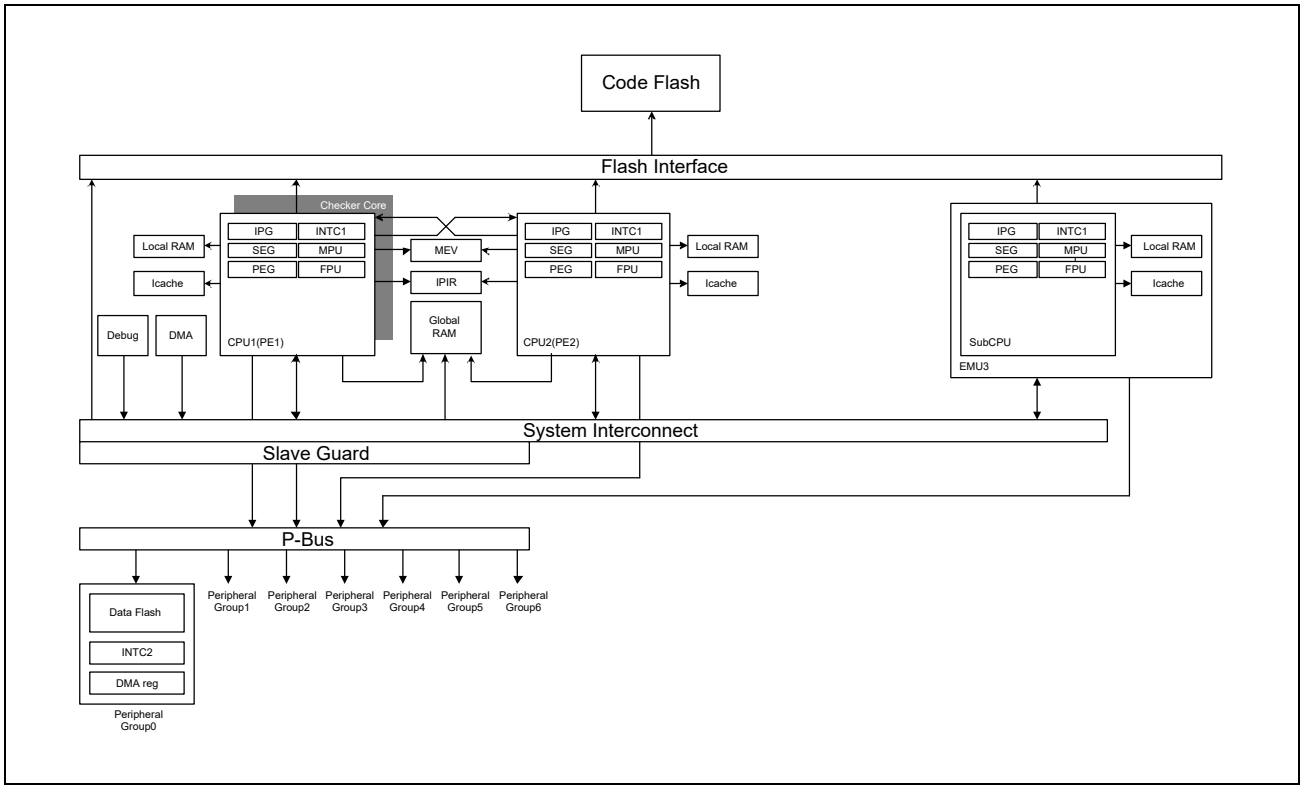

Figure 3.1 Block Diagram of RH850/C1M-A1 and C1M-A2

CPU1 (PE1)

The RH850 G3MH core is included as a main CPU. CPU1 also includes the checker core for safety assurance.

CPU2 (PE2)

The RH850 G3MH core is included for enhanced performance CPU (RH850/C1M-A2).

SubCPU (PE3) in EMU3

The G3MH core is included as the SubCPU (PE3) in EMU3, the motor controlling IP.

Local RAM

Each PE has a RAM to which high speed access is possible.

Global RAM

A large-capacity shared RAM.

Code Flash

A large-capacity flash memory is included for program storage. CPU1, CPU2, and the SubCPU share the code flash and they are connected with each other via the flash interface.

Data Flash

This is a flash memory which can be rewritten by the CPUs.

P-Bus

The P-Bus connects the peripheral IPs. The P-Bus is divided into seven peripheral groups (0 to 6). For details, see **Section 3.1.2, Configuration of Peripheral Groups**.

INTC1, INTC2

INTC1 is an interrupt controller exclusive to each PE. INTC2 is a common interrupt controller that all PEs share, being able to set the binding destination PE of an interrupt request by the registers.

DMA

Two DMA transfer modules, DMAC and DTS, are included.

Slave Guard

The slave guard is a function to prevent unauthorized access from the specific bus master, consisting of the following guard functions:

(1) PE guard (PEG)
The PE guard is a function to prevent unauthorized access to the resources in the PE from the bus master other than the PE itself. Access from the PE itself is only enabled but all other accesses are disabled after release from the reset state. For details, see **Section 3.2.4.1, PE Guard Function (PEG)**.

(2) Global RAM guard (GRG)
The global RAM guard is a function to prevent unauthorized access to the global RAM from the bus master. The global RAM is in the unprotected state (accessible from all bus masters) after release from the reset state. For details, see **29.4.2, GRG (Global RAM Guard)** in **Section 29, Functional Safety**.

(3) Peripheral guard (PBG)
The peripheral guard is a function to prevent unauthorized access to peripheral devices from the bus master. Peripheral devices are in the unprotected state (accessible from all bus masters) after release from the reset state. For details, see **29.4.3, PBG** in **Section 29, Functional Safety**.

3.1.2 Configuration of Peripheral Groups

P-Bus is connected to peripheral groups 0 to 6 and CPUs. The individual modules belong to one of the peripheral groups as shown in the table below. For module names, see the corresponding list of registers in each chapter.

Table 3.1 Peripheral Group Configuration (1/4)

Peripheral Group	Module Name*1
CPU	INTC1
	IPIRSS
	IPG
	MEV

Note 1. The applicable module or register is indicated with [ ].

Note 2. Refer to *RH850/C1M-A Flash Memory User's Manual: Hardware Interface*.

Note 3. Access to EMU3 from the SubCPU is not via peripheral group 2 but through a dedicated path.

3.2 CPU

3.2.1 Core Functions

3.2.1.1 Features

Table 3.2 lists features of the RH850G3MH core.

Table 3.2 Features of the RH850G3MH Core

Item	Feature
CPU	● Advanced 32-bit architecture for embedded control ● 32-bit internal data bus ● Thirty-two 32-bit general registers ● RISC-type instruction sets – Long-/short- format load/store instructions – Three-operand instructions – Instruction sets based on C language ● CPU operating modes – User mode and supervisor mode ● Address space: 4-Gbyte linear address space for both data and instructions ● Instructions: A snooze instruction (SNOOZE) is included for temporary suspension by switching the CPU clock signal (CLK_CPU*1) off for 32 clock cycles.
Coprocessor	● A floating-point operation coprocessor (FPU) mounted – Supports single precision (32 bits) and double precision (64 bits). – Supports data types and exceptions conforming to IEEE754. – Rounding mode: Neighborhood, 0 direction, + ∞ direction, and – ∞ direction – Handling subnormal numbers: Rounding down to 0 or exception notification to conform to IEEE754
Exception/Interrupt	● 16 interrupt priority levels settable for each channel ● Vector selection method selectable according to performance request or memory usage – Direct branching exception vectors – Indirect branching exception vectors referring to the address table ● Supports the high-speed save/return processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt
Memory Management	● Memory protection function (MPU): 16 areas settable
Cache	● Instruction cache

Note 1. CLK_EMU_H for the SubCPU of EMU3.

3.2.1.2 Register Set

The program registers and system registers are explained in this section.

(1) Program registers

Program registers include the general-purpose registers (r0 to r31) and a program counter (PC). The general-purpose register r0 always retains 0, but the values of the registers r1 to r31 after reset are undefined.

Table 3.3 List of Program Registers

Program Register	Name	Function	Description
General-purpose registers	r0	Zero register	Always retains “0”.
	r1	Assembler reserved register	Used as working register for generating addresses
	r2	Register for address and data variables (this register is used when the real-time OS in use does not use this register)	
	r3	Stack pointer (SP)	Used for generating a stack frame when a function is called
	r4	Global pointer (GP)	Used for accessing a global variable in the data area
	r5	Text pointer (TP)	Used as a register that indicates the start of the text area (area where program code is placed).
	r6-29	Register for addresses and data variables	
	r30	Element pointer (EP)	Used as a base pointer for generating addresses when accessing memory
	r31	Link pointer (LP)	Used when the compiler calls a function
Program counter	PC	Retains instruction addresses during execution of programs	

Note: For further descriptions of r1, r3 to r5, and r31 used for an assembler and/or C compiler, see the manual of each software development environment.

(a) General-purpose registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables. The general-purpose register r0 always retains 0, but the values of the registers r1 to r31 after reset are undefined.

Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

1. r0, r3, and r30
   These registers are implicitly used by instructions.

   r0 is a register that always retains "0". It is used for operations that use 0 and addressing with base address being 0.

   r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.

   r30 is used as a base pointer when the SLD or SST instruction accesses memory

2. r1, r4, r5, and r31
   These registers are implicitly used by the assembler and C compiler.

   When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

3. r2
   This register might be used by a real-time OS in some cases. If the real-time OS that is being used is not using r2, r2 can be used as a register for address variables or data variables.

(b) PC — Program counter

The PC retains the address of the instruction being executed.

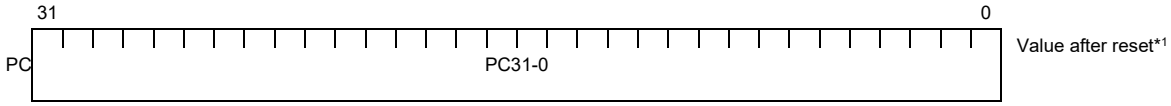

Table 3.4 PC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	PC31-1	The address of the instruction being executed.	R/W	*1
0	PC0	Fixed to 0. Branching to an odd number is disabled.	R/W	0

Note 1. The value after reset differs depending on the startup area. For details, see **Section 4, Address Space**.

(2) Basis System Registers

The basic system registers are used to control CPU status and to retain exception information.

System registers are read from or written to by using the LDSR or STSR instruction and specifying the system register number, which is made up of a register number and a selection ID.

Table 3.5 Basic System Registers

Register Number (reg.ID, sel.ID)	Name	Function	Access Permission
SR0, 0	EIPC	Status save registers when acknowledging EI level exception	SV
SR1, 0	EIPSW	Status save registers when acknowledging EI level exception	SV
SR2, 0	FEPC	Status save registers when acknowledging FE level exception	SV
SR3, 0	FEPSW	Status save registers when acknowledging FE level exception	SV
SR5, 0	PSW	Program status word	*1
SR6, 0	FPSR	(See **(4) FPU function register**)	CU0 and SV
SR7, 0	FPEPC	(See **(4) FPU function register**)	CU0 and SV
SR8, 0	FPST	(See **(4) FPU function register**)	CU0
SR9, 0	FPCC	(See **(4) FPU function register**)	CU0
SR10, 0	FPCFG	(See **(4) FPU function register**)	CU0
SR13, 0	EIIC	EI level exception cause	SV
SR14, 0	FEIC	FE level exception cause	SV
SR16, 0	CTPC	CALLT execution status save register	UM
SR17, 0	CTPSW	CALLT execution status save register	UM
SR20, 0	CTBP	CALLT base pointer	UM
SR28, 0	EIWR	EI level exception working register	SV
SR29, 0	FEWR	FE level exception working register	SV
SR0, 1	MCFG0	Machine configuration	SV
SR2, 1	RBASE	Reset vector address	SV
SR3, 1	EBASE	Exception handler vector address	SV
SR4, 1	INTBP	Base addresses of the interrupt handler address table	SV
SR5, 1	MCTL	CPU control	SV
SR6, 1	PID	Processor ID	SV
SR11, 1	SCCFG	SYSCALL operation setting	SV
SR12, 1	SCBP	SYSCALL base pointer	SV
SR0, 2	HTCFG0	Thread configuration	SV
SR6, 2	MEA	Memory error address	SV
SR7, 2	ASID	Address space ID	SV
SR8, 2	MEI	Memory error information	SV

Note 1. The access permission differs depending on the bit. For details, see **(e) PSW — Program status word**.

(a) EIPC ─ Status save register when acknowledging EI level exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (refer to *section 4.1.3, Types of Exceptions in the RH850G3MH User's Manual: Software*).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address must not be specified.

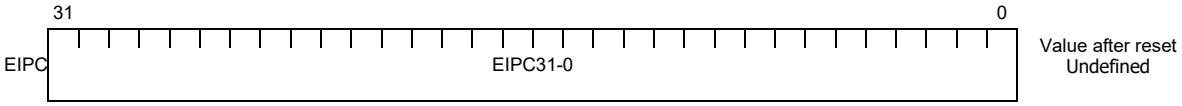

Table 3.6 EIPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	EIPC31-1	These bits indicate the PC saved when an EI level exception is acknowledged.	R/W	Undefined
0	EIPC0	This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0.	R/W	Undefined

(b) EIPSW ─ Status save register when acknowledging EI level exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

CAUTION

Bits 11 to 9 are related to the debug function and therefore cannot normally be changed.

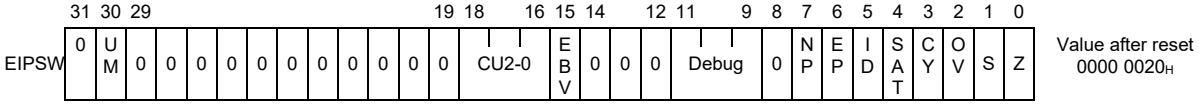

Table 3.7 EIPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	Reserved	This bit is read as 0. The write value should be 0.	R	0
30	UM	This bit saves the PSW.UM bit when an EI level exception is acknowledged.	R/W	0
29 to 19	Reserved	These bits are read as 0. The write value should be 0.	R	0
18 to 16	CU2-0	These bits save the PSW.CU2-0 field setting when an EI level exception is acknowledged. (CU2 and CU1 are reserved for future expansion. Be sure to clear them to 0.)	R/W	0
15	EBV	This bit saves the PSW.EBV bit setting when an EI level exception is acknowledged.	R/W	0
14 to 12	Reserved	These bits are read as 0. The write value should be 0.	R	0
11 to 9	Debug	These bits save the PSW.Debug field setting when an EI level exception is acknowledged.	R/W	0
8	Reserved	This bit is read as 0. The write value should be 0.	R	0
7	NP	These bits save the PSW.NP bit setting when an EI level exception is acknowledged.	R/W	0
6	EP	These bits save the PSW.EP bit setting when an EI level exception is acknowledged.	R/W	0
5	ID	These bits save the PSW.ID bit setting when an EI level exception is acknowledged.	R/W	1
4	SAT	These bits save the PSW.SAT bit setting when an EI level exception is acknowledged.	R/W	0
3	CY	These bits save the PSW.CY bit setting when an EI level exception is acknowledged.	R/W	0
2	OV	These bits save the PSW.OV bit setting when an EI level exception is acknowledged.	R/W	0
1	S	These bits save the PSW.S bit setting when an EI level exception is acknowledged.	R/W	0
0	Z	These bits save the PSW.Z bit setting when an EI level exception is acknowledged.	R/W	0

(c) FEPC ─ Status save register when acknowledging FE level exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (refer to *section 4.1.3, Types of Exceptions in the RH850G3MH User's Manual: Software*).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program. Be sure to set an even-numbered address to the FEPC register. An odd-numbered address must not be specified.

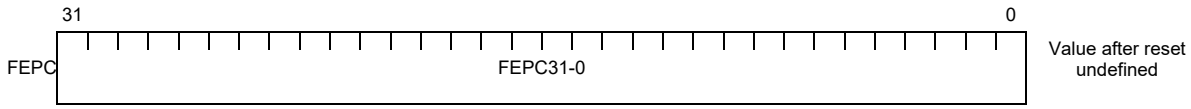

Table 3.8 FEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FEPC31-1	These bits indicate the PC saved when an FE level exception is acknowledged.	R/W	Undefined
0	FEPC0	This bit indicates the PC saved when an FE level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0.	R/W	Undefined

(d) FEPSW ─ Status save register when acknowledging FE level exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register. Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

CAUTION

Bits 11 to 9 are related to the debug function and therefore cannot normally be changed.

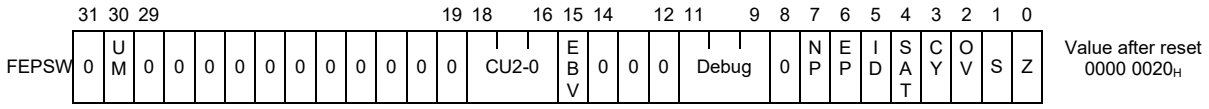

Table 3.9 FEPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	Reserved	This bit is read as 0. The write value should be 0.	R	0
30	UM	This bit saves the PSW.UM bit setting when an FE level exception is acknowledged.	R/W	0
29 to 19	Reserved	These bits are read as 0. The write value should be 0.	R	0
18 to 16	CU2-0	These bits save the PSW.CU2-0 field setting when an FE level exception is acknowledged. (CU2 and CU1 are reserved for future expansion. Be sure to clear them to 0.)	R/W	0
15	EBV	PSW.EBV bit setting when an FE level exception is acknowledged.	R/W	0
14 to 12	Reserved	These bits are read as 0. The write value should be 0.	R	0
11 to 9	Debug	These bits save the PSW.Debug bit setting when an FE level exception is acknowledged.	R/W	0
8	Reserved	This bit is read as 0. The write value should be 0.	R	0
7	NP	This bit saves the PSW.NP bit setting when an FE level exception is acknowledged.	R/W	0
6	EP	This bit saves the PSW.EP bit setting when an FE level exception is acknowledged.	R/W	0
5	ID	This bit saves the PSW.ID bit setting when an FE level exception is acknowledged.	R/W	1
4	SAT	This bit saves the PSW.SAT bit setting when an FE level exception is acknowledged.	R/W	0
3	CY	This bit saves the PSW.CY bit setting when an FE level exception is acknowledged.	R/W	0
2	OV	This bit saves the PSW.OV bit setting when an FE level exception is acknowledged.	R/W	0
1	S	This bit saves the PSW.S bit setting when an FE level exception is acknowledged.	R/W	0
0	Z	This bit saves the PSW.Z bit setting when an FE level exception is acknowledged.	R/W	0

(e) PSW ─ Program status word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by a condition instruction (Bcond, CMOV, etc.)).

CAUTIONS

1. When the LDSR instruction is used to change the contents of bits 7 to 0 in this register, the changed contents become valid from the instruction following the LDSR instruction.
2. The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See **Table 3.10 Access Permission for PSW Register** for the access permission for each bit.

Table 3.10 Access Permission for PSW Register

Bit		Access Permission when Reading	Access Permission when Writing
30	UM	UM	SV*1
18 to 16	CU2-0	UM	SV*1
15	EBV	UM	SV*1
11 to 9	Debug	UM	Special*1
7	NP	UM	SV*1
6	EP	UM	SV*1
5	ID	UM	SV*1
4	SAT	UM	UM
3	CY	UM	UM
2	OV	UM	UM
1	S	UM	UM
0	Z	UM	UM

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1. In this case, writing is ignored.

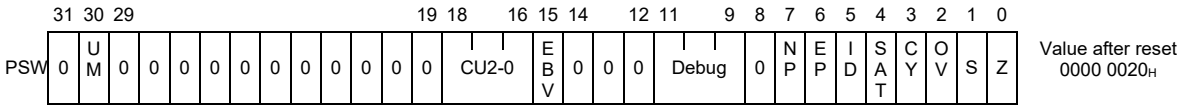

Table 3.11 PSW Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value after Reset
31	Reserved	This bit is read as 0. The write value should be 0.	R	0
30	UM	This bit indicates that the CPU is in the user mode (the UM mode). 0: Supervisor mode 1: User mode	R/W	0
29 to 19	Reserved	These bits are read as 0. The write value should be 0.	R	0
18 to 16	CU2-CU0	These bits indicate the coprocessor use permissions. When the bit corresponding to the coprocessor is 0, a coprocessor unusable exception occurs if an instruction for the coprocessor is executed or a coprocessor resource (system register) is accessed. CU2 bit 18: Reserved for future expansion. Be sure to clear to 0. CU1 bit 17: Reserved for future expansion. Be sure to clear to 0. CU0 bit 16: FPU	R/W	000
15	EBV	This bit indicates the reset vector and exception vector operation. See the descriptions of RBASE and EBASE registers for details.	R/W	0
14 to 12	Reserved	These bits are read as 0. The write value should be 0.	R	0
11 to 9	Debug	These bits are used for the debug function for the development tool. Always set these bits to 0.	—	0
8	Reserved	These bits are read as 0. The write value should be 0.	R	0
7	NP	This bit disables acknowledgment of FE level exception. When an FE level exception is acknowledged, this bit is set to 1, which disables acknowledgment of EI and FE level exceptions. For the exceptions of which acknowledgement is disabled by the NP bit, refer to *Table 4.1, Exception Cause List* of *RH850G3MH User's Manual: Software.* 0: Acknowledgement of FE level exception is enabled. 1: Acknowledgement of FE level exception is disabled.	R/W	0
6	EP	This bit indicates that an exception other than an interrupt is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. 0: Handling of an exception other than an interrupt is not in progress. 1: Handling of an exception other than an interrupt is in progress.	R/W	0
5	ID	This bit disables acknowledgement of EI level exception. When an EI or FE level exception is acknowledged, this bit is set to 1, which disables acknowledgement of EI level exceptions. For the exceptions of which acknowledgement is disabled by the ID bit, refer to *Table 4.1, Exception Cause List* of *RH850G3MH User's Manual: Software.* This bit is also used to disable EI level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. The change made in the ID bit by the EI or DI instruction is reflected from the next instruction. 0: Acknowledgement of EI level exception is enabled. 1: Acknowledgement of EI level exception is disabled.	R/W	1

Table 3.11 PSW Register Contents (2/2)

Bit Position	Bit Name	Function	R/W	Value after Reset
4	SAT*1	This bit indicates that a saturation arithmetic operation instruction resulted in overflow and saturation processing is applied to the result. This is a cumulative flag, that is, it is set (1) once a saturation occurs and not cleared (0) by subsequent instructions with unsaturated results. This bit is cleared by the LDSR instruction. Note that execution of an arithmetic operation instruction neither set nor clear this flag. 0: The result was not saturated 1: The result was saturated	R/W	0
3	CY	This bit indicates whether a carry or borrow has occurred in the operation result. 0: Carry and borrow have not occurred. 1: Carry or borrow has occurred.	R/W	0
2	OV*1	This bit indicates whether or not an overflow has occurred during an operation. 0: Overflow has not occurred. 1: Overflow has occurred.	R/W	0
1	S*1	This bit indicates whether or not the result of an operation is negative. 0: Result of operation is positive or 0. 1: Result of operation is negative.	R/W	0
0	Z	This bit indicates whether or not the result of an operation is 0. 0: Result of operation is not 0. 1: Result of operation is 0.	R/W	0

Note 1. Saturation processing is applied to the operation result in accordance with the contents of the OV and S flags. The SAT flag is set (1) only when the OV flag is set (1) in the saturation arithmetic operation.

Operation Result Status	Flag Status			Operation Result after Saturation Processing
	SAT	OV	S	
Exceeded positive maximum value	1	1	0	7FFF FFFF$_H$
Exceeded negative maximum value	1	1	1	8000 0000$_H$
Positive (maximum value not exceeded)	Value prior to operation is retained.	0	0	Operation result as is
Negative (maximum value not exceeded)			1	

(f) EIIC ─ EI level exception cause

The EIIC register retains the cause of any EI level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception cause.

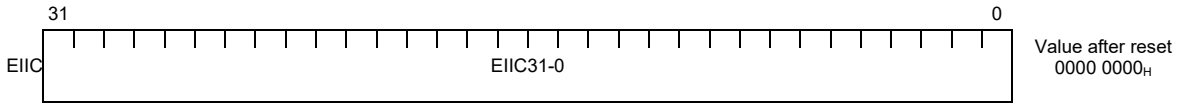

Table 3.12 EIIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIIC31-0	These bits hold the exception cause code when an EI level exception occurs. For the exception cause code to be stored, refer to the exception cause list of **Table 6.11, Interrupt Exception Handlers and Orders of Priority (CPU1, CPU2)**, **Table6.12 Interrupt Exception Handlers and Orders of Priority (SubCPU in EMU3)**, and *RH850G3MH User's Manual: Software*. Detailed exception cause codes defined individually for each exception are stored in the EIIC31-16 field. If there is no particular definition, these bits are set to 0.	R/W	0

(g) FEIC ─ FE level exception cause

The FEIC register retains the cause of any FE level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception cause.

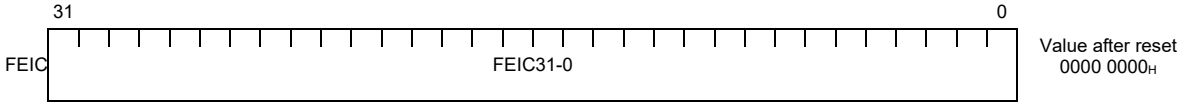

Table 3.13 FEIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEIC31-0	These bits hold the exception cause code when an FE level exception occurs. For the exception cause code to be stored, refer to the exception cause list of **Table 6.11, Interrupt Exception Handlers and Orders of Priority (CPU1, CPU2)** and *RH850G3MH User's Manual: Software*. The FEIC31-16 field stores detailed exception cause codes defined individually for each exception. If there is no particular definition, these bits are set to 0.	R/W	0

(h) CTPC ─ Status save register when executing CALLT

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address must not be specified.

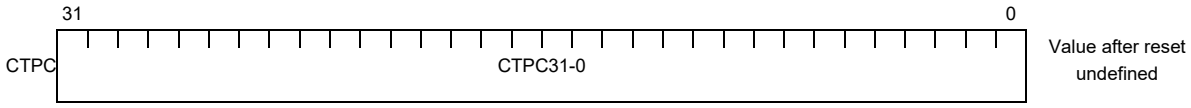

Table 3.14 CTPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTPC31-1	These bits indicate the PC of the instruction after the CALLT instruction.	R/W	Undefined
0	CTPC0	This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0.	R/W	Undefined

(i) CTPSW ─ Status save register when executing CALLT

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

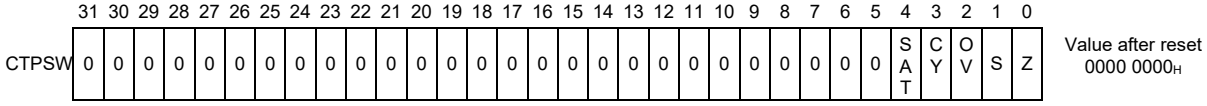

Table 3.15 CTPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	Reserved	These bits are read as 0. The write value should be 0.	R	0
4	SAT	This bit stores the PSW.SAT bit setting when the CALLT instruction is executed.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when the CALLT instruction is executed.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when the CALLT instruction is executed.	R/W	0
1	S	This bit stores the PSW.S bit setting when the CALLT instruction is executed.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when the CALLT instruction is executed.	R/W	0

(j) CTBP ─ CALLT base pointer

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses. Be sure to set the CTBP register to a halfword address.

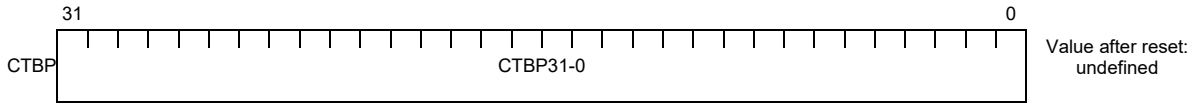

Table 3.16 CTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTBP31-1	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the start address of the table used by the CALLT instruction.	R/W	Undefined
0	CTBP0	This bit indicates the base pointer address of the CALLT instruction. This bit indicates the start address of the table used by the CALLT instruction. Always set this bit to 0.	R	0

(k) ASID ─ Address space ID

This is the address space ID. This is used to identify the address space provided by the memory management function.

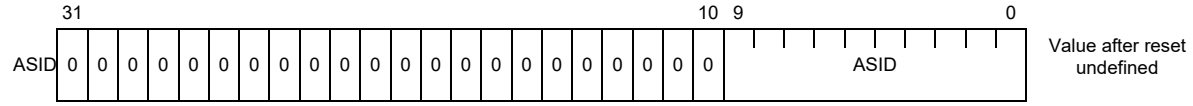

Table 3.17 ASID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 10	Reserved	These bits are read as 0. The write value should be 0.	R	0
9 to 0	ASID9-0	These bits are the address space ID.	R/W	Undefined

(l) EIWR ─ EI level exception working register

The EIWR register is used as a working register when an EI level exception has occurred.

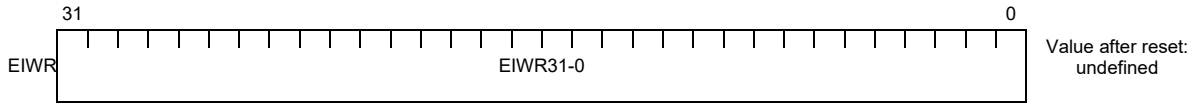

Table 3.18 EIWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIWR31-0	These bits constitute a working register that can be used for any purpose during the processing of an EI level exception. Use this register for purposes such as saving the values of general-purpose registers.	R/W	Undefined

(m) FEWR ─ FE level exception working register

The FEWR register is used as a working register when an FE level exception has occurred.

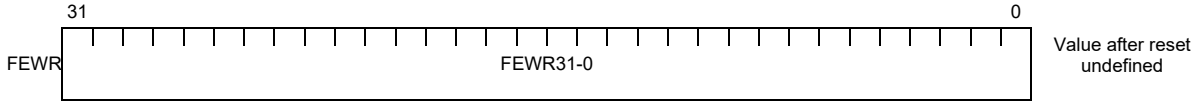

Table 3.19 FEWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEWR31-0	These bits constitute a working register that can be used for any purpose during the processing of an FE level exception. Use this register for purposes such as saving the values of general-purpose registers.	R/W	Undefined

(n) HTCFG0 ─ Thread configuration register

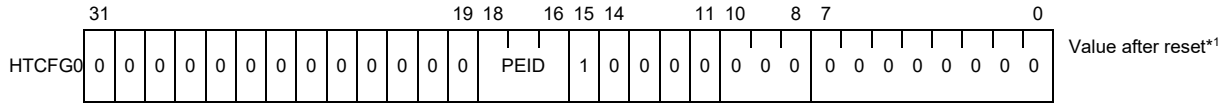

Table 3.20 HTCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 19	Reserved	These bits are read as 0. The write value should be 0	R	0
18 to 16	PEID	These bits indicate the processor element number.	R	*2
15	Reserved	These bits are read as 1. The write value should be 1.	R	1
14 to 0	Reserved	These bits are read as 0. The write value should be 0.	R	0

Note 1. This value is 0001 8000_H for CPU1 (PE1), 0002 8000_H for CPU2 (PE2), and 0003 8000_H for the SubCPU (PE3).

Note 2. This value is 001_B for CPU1 (PE1), 010_B for CPU2 (PE2), and 011_B for the SubCPU (PE3).

(o) MEA ─ Memory error address

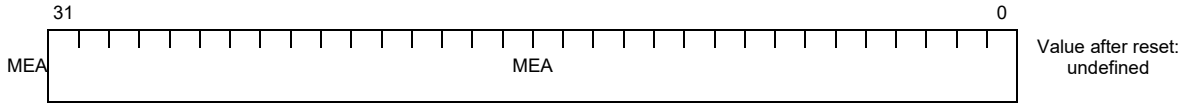

Table 3.21 MEA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MEA	These bits store the virtual address when an MAE (misaligned) or MPU exception occurs.	R/W	Undefined

(p) MEI ─ Memory error information register

This register is used to store information about the instruction that caused the exception when a misaligned (MAE) or memory protection (MDP) exception occurs.

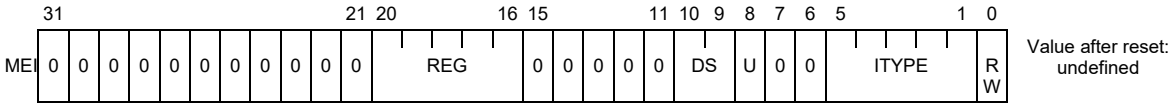

Table 3.22 MEI Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 21	Reserved	These bits are read as 0. The write value should be 0.	R	0
20 to 16	REG	These bits indicate the number of the source or destination register accessed by the instruction that caused the exception. For details, see **Table 3.23 Instructions that Cause Exceptions and Values of MEI Registers**.	R/W	Undefined
15 to 11	Reserved	These bits are read as 0. The write value should be 0.	R	0
10, 9	DS	These bits indicate the type of data handled by the instruction that caused the exception.*1 0: Byte (8 bits) 1: Halfword (16 bits) 2: Word (32 bits) 3: Double-word (64 bits) For details, see **Table 3.23 Instructions that Cause Exceptions and Values of MEI Registers**.	R/W	Undefined
8	U	These bits indicate the sign extension method of the instruction that caused the exception. 0: Signed 1: Unsigned For details, see **Table 3.23 Instructions that Cause Exceptions and Values of MEI Registers**.	R/W	Undefined
7, 6	Reserved	These bits are read as 0. The write value should be 0.	R	0
5 to 1	ITYPE	These bits indicate the instruction that caused the exception. For details, see **Table 3.23 Instructions that Cause Exceptions and Values of MEI Registers**.	R/W	Undefined
0	RW	This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory). 0: Read (Load-memory) 1: Write (Store-memory) For details, see **Table 3.23 Instructions that Cause Exceptions and Values of MEI Registers**.	R/W	Undefined

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3.23 Instructions that Cause Exceptions and Values of MEI Registers

Instruction	REG	DS	U	RW	ITYPE
SLD.B	dst	0 (Byte)	0 (Signed)	0 (Read)	00000_B
SLD.BU	dst	0 (Byte)	1 (Unsigned)	0 (Read)	00000_B
SLD.H	dst	1 (Half-word)	0 (Signed)	0 (Read)	00000_B
SLD.HU	dst	1 (Half-word)	1 (Unsigned)	0 (Read)	00000_B
SLD.W	dst	2 (Word)	0 (Signed)	0 (Read)	00000_B
SST.B	src	0 (Byte)	0 (Signed)	1 (Write)	00000_B
SST.H	src	1 (Half-word)	0 (Signed)	1 (Write)	00000_B
SST.W	src	2 (Word)	0 (Signed)	1 (Write)	00000_B

LD.BU (disp16)	dst	0 (Byte)	1 (Unsigned)	0 (Read)	00001_B
LD.H (disp16)	dst	1 (Half-word)	0 (Signed)	0 (Read)	00001_B
LD.HU (disp16)	dst	1 (Half-word)	1 (Unsigned)	0 (Read)	00001_B
LD.W (disp16)	dst	2 (Word)	0 (Signed)	0 (Read)	00001_B
ST.B (disp16)	src	0 (Byte)	0 (Signed)	1 (Write)	00001_B
ST.H (disp16)	src	1 (Half-word)	0 (Signed)	1 (Write)	00001_B
ST.W (disp16)	src	2 (Word)	0 (Signed)	1 (Write)	00001_B
LD.B (disp23)	dst	0 (Byte)	0 (Signed)	0 (Read)	00010_B
LD.BU (disp23)	dst	0 (Byte)	1 (Unsigned)	0 (Read)	00010_B
LD.H (disp23)	dst	1 (Half-word)	0 (Signed)	0 (Read)	00010_B
LD.HU (disp23)	dst	1 (Half-word)	1 (Unsigned)	0 (Read)	00010_B
LD.W (disp23)	dst	2 (Word)	0 (Signed)	0 (Read)	00010_B
ST.B (disp23)	src	0 (Byte)	0 (Signed)	1 (Write)	00010_B
ST.H (disp23)	src	1 (Half-word)	0 (Signed)	1 (Write)	00010_B
ST.W (disp23)	src	2 (Word)	0 (Signed)	1 (Write)	00010_B
LD.DW (disp23)	dst	3 (Double-word)	0 (Signed)	0 (Read)	00010_B
ST.DW (disp23)	src	3 (Double-word)	0 (Signed)	1 (Write)	00010_B
LDL.W	dst	2 (Word)	0 (Signed)	0 (Read)	00111_B
STC.W	src	2 (Word)	0 (Signed)	1 (Write)	00111_B
CAXI	dst	2 (Word)	0 (Signed)*1	0 (Read)*2	01000_B
SET1	—	0 (Byte)	0 (Signed)*1	0 (Read)*2	01001_B
CLR1	—	0 (Byte)	0 (Signed)*1	0 (Read)*2	01001_B
NOT1	—	0 (Byte)	0 (Signed)*1	0 (Read)*2	01001_B
TST1	—	0 (Byte)	0 (Signed)*1	0 (Read)	01001_B
PREPARE	src*1	2 (Word)	0 (Signed)*1	1 (Write)	01100_B
DISPOSE	dst*1	2 (Word)	0 (Signed)*1	0 (Read)	01100_B
PUSHSP	src*1	2 (Word)	0 (Signed)*1	1 (Write)	01101_B
POPSP	dst*1, *3	2 (Word)	0 (Signed)*1	0 (Read)	01101_B
SWITCH	—	1 (Half-word)	0 (Signed)	0 (Read)	10000_B
CALLT	—	1 (Half-word)	1 (Unsigned)	0 (Read)	10001_B
SYSCALL	—	2 (Word)	0 (Signed)*1	0 (Read)	10010_B
CACHE	—	—	—	0 (Read)	10100_B
Interrupt (table reference method)*4	—	2 (Word)	0 (Signed)*1	0 (Read)	10101_B

Note 1. This value is different from that of G3M.

Note 2. This exception occurs when the instruction executes a read access.

Note 3. If the instruction is for general-purpose register r3, 0 is stored.

Note 4. When the interrupt vector of the table reference method is read.

NOTE

dst: destination register number, src: source register number

(q) RBASE ─ Reset vector base address

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this vector address is also used as the exception vector address.

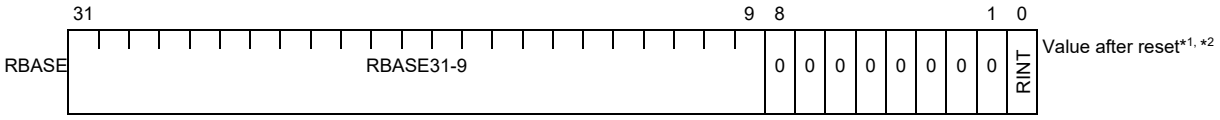

Table 3.24 RBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	RBASE31-9	These bits indicate the reset vector when there is a reset. When PSW.EBV = 0, this address is also used as the exception vector. The RBASE8-0 bits are implicitly set to 0.	R	*1
8 to 1	Reserved	These bits are read as 0. The write value should be 0.	R	0
0	RINT*2	When the RINT bit is set, the exception handler address for interrupt processing is reduced. Refer to *Section 4.4.1 (1) Direct Vector Method* of *RH850G3MH User's Manual: Software* for details. This bit is valid when PSW.EBV = 0.	R	*2

Note 1. The value after reset depends on the startup area. For details, see **Section 4, Address Space**.

Note 2. This is 0_B for these products.

(r) EBASE ─ Exception handler vector address

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

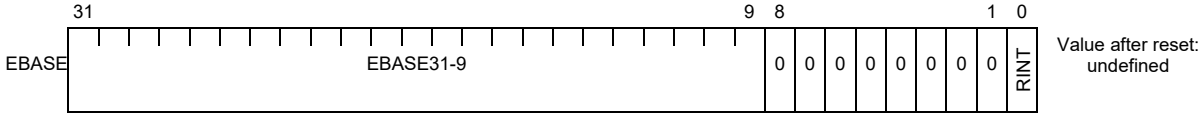

Table 3.25 EBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	EBASE31-9	The exception handler routine address is changed to the address resulting from adding the offset address of each exception to the base address specified for this register. The EBASE8-0 bits are are implicitly set to 0.	R/W	Undefined
8 to 1	Reserved	These bits are read as 0. The write value should be 0.	R	0
0	RINT	While this bit is set, the exception handler address for interrupt processing is reduced. Refer to *Section 4.4.1 (1) Direct Vector Method* of *RH850G3MH User's Manual: Software* for details.	R/W	Undefined

(s) INTBP ─ Base address of the interrupt handler table

This register indicates the base address of the table when the table reference method is selected as the interrupt handler address selection method.

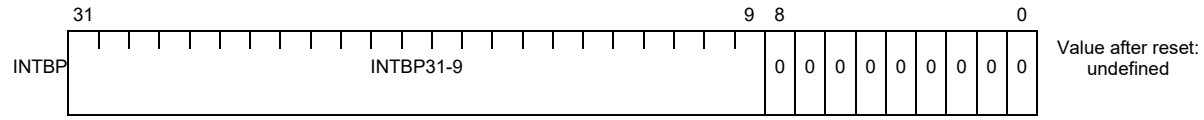

Table 3.26 INTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	INTBP31-9	These bits indicate the base pointer address for an interrupt when the expanded specification is used. The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified by the expanded specification (EIINT0-383) is acknowledged. The INTBP8-0 bits are are implicitly set to 0.	R/W	Undefined
8 to 0	Reserved	These bits are read as 0. The write value should be 0.	R	0

(t) PID ─ Processor ID

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

CAUTION

The PID register indicates information used to identify the incorporated CPU core and CPU core configuration. Usage such that the software behavior varies dynamically according to the PID register information is not assumed.

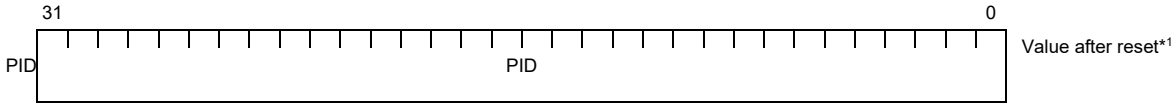

Table 3.27 PID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 24	PID	Architecture identifier This identifier indicates the architecture of the processor.	R	05_H
23 to 8		Function identifier This identifier indicates the functions of the processor. These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). Bits 23 to 11: Reserved Bit 10 : Double-precision floating-point operation function Bit 9 : Single-precision floating-point operation function Bit 8 : Memory protection unit (MPU) function	R	8007_H
7 to 0		Version identifier This identifier indicates the version of the processor.	R	81_H

Note 1. This value is 0580 0781_H for these products.

(u) SCCFG ─ SYSCALL operation setting

This register is used to set operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

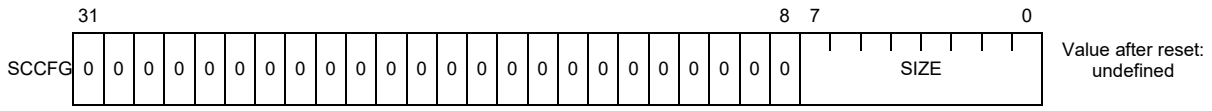

Table 3.28 SCCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	Reserved	These bits are read as 0. The write value should be 0.	R	0
7 to 0	SIZE	These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255. By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used. If a vector exceeding the maximum number of entries is specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry.	R/W	Undefined

(v) SCBP ─ SYSCALL base pointer

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

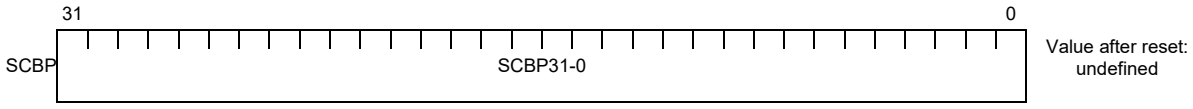

Table 3.29 SCBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	SCBP31-2	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction.	R/W	Undefined
1, 0	SCBP1-0	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction. Always set these bits to 0.	R	0

(w) MCFG0 ─ Machine configuration

This register indicates the CPU configuration.

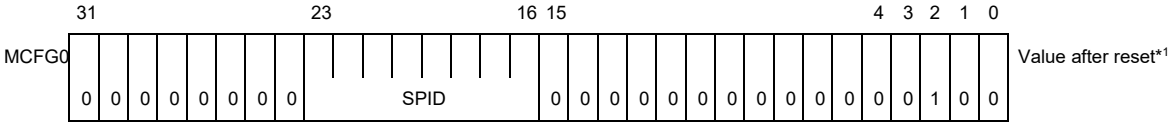

Table 3.30 MCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 24	Reserved	These bits are read as 0. The write value should be 0.	R	0
23 to 16	SPID	Bits 23 to 18: Not used for these products. (Reserved for future expansion. Be sure to clear to 0.) Bits 17, 16: These bits indicate the system protection number.	R/W	*2
15 to 3	Reserved	These bits are read as 0. The write value should be 0.	R	0
2	Reserved	These bits are read as 1. The write value should be 1.	R	1
1, 0	Reserved	These bits are read as 0. The write value should be 0.	R	0

Note 1. This value is 0001 0004_H for CPU1 (PE1), 0002 0004_H for CPU2 (PE2), and 0003 0004_H for the SubCPU (PE3) for these products.

Note 2. This value is 01_H for CPU1 (PE1), 02_H for CPU2 (PE2), and 03_H for the SubCPU (PE3) for these products.

(x) MCTL ─ Machine control

This register is used to control the CPU.

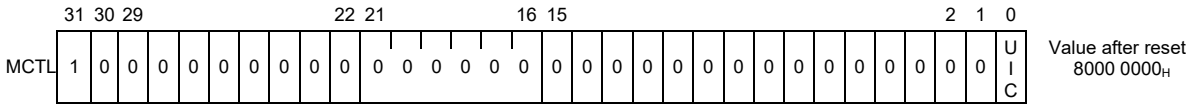

Table 3.31 MCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	Reserved	This bit is read as 1. The write value should be 1.	R	1
30 to 1	Reserved	These bits are read as 0. The write value should be 0.	R	0
0	UIC	This bit is used to control the interrupt enable/disable operation in the user mode. When this bit is set to 1, executing the EI/DI instruction become possible.	R/W	0

(3) Interrupt function registers

The interrupt function system registers are read from or written to by using the LDSR or STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.32 Interrupt Function System Registers

Register Number (reg.ID, sel.ID)	Name	Function	Access Permission
SR10, 2	ISPR	Priority of interrupt being serviced	SV
SR11, 2	PMR	Interrupt priority masking	SV
SR12, 2	ICSR	Interrupt control status	SV
SR13, 2	INTCFG	Interrupt function setting	SV

(a) ISPR — Priority of interrupt being serviced register

This register retains the priority of the EIINTn interrupt being serviced. This priority value is then used to perform priority ceiling processing when multiple interrupts are generated.

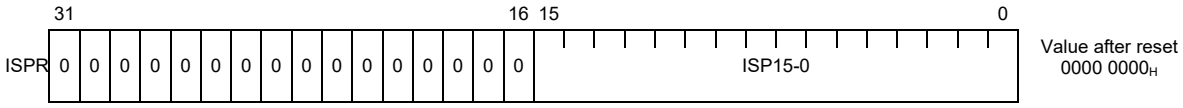

Table 3.33 ISPR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	Reserved	These bits are read as 0. The write value should be 0.	R	0
15 to 0	ISP15-0	These bits indicate the acknowledgment status of an EIINTn interrupt with a priority*1 that corresponds to the relevant bit position. 0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged. 1: An interrupt request for an interrupt whose priority corresponds to the relevant position is being serviced by the CPU core. The bit positions correspond to the following priority levels: Bit 0 — Priority 0 (highest) Bit 1 — Priority 1 : Bit 14 — Priority 14 Bit 15 — Priority 15 When an interrupt request (EIINTn) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15-0 bits that are set (0 is the highest priority) is cleared to 0*2. While a bit in this register is set to 1, same or lower priority interrupts (EIINTn) are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged. For details, refer to *Section 4.1.5, Interrupt Exception Priority and Priority Masking* of *RH850G3MH User's Manual: Software*. When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit.	R*3	0

Note 1. For details, refer to *Section 4.1.5, Interrupt Exception Priority and Priority Masking* of *RH850G3MH User's Manual: Software.*

Note 2. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) to the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.

Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

(b) PMR — Interrupt priority masking register

This register is used to mask the specified interrupt priority.

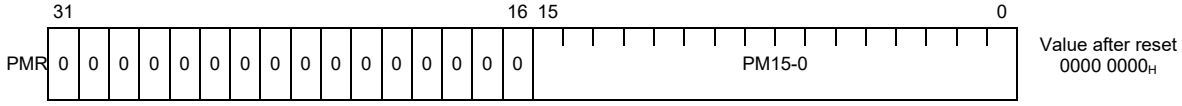

Table 3.34 PMR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	Reserved	These bits are read as 0. The write value should be 0.	R	0
15 to 0	PM15-0	These bits mask an interrupt request with a priority level that corresponds to the relevant bit position. 0: Servicing of an interrupt request with a priority that corresponds to the relevant bit position is enabled. 1: Servicing of an interrupt request with a priority that corresponds to the relevant bit position is disabled. The bit positions correspond to the following priority levels: Bit 0 — Priority 0 (highest) Bit 1 — Priority 1 : Bit 14 — Priority 14 Bit 15 — Priority 15 and Priority 16 (lowest) While a bit in this register is set to 1, interrupts (EIINTn) with the priority corresponding to that bit are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged*1.	R/W	0

Note 1. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, $FF00_H$ can be set, but $F0F0_H$ or $00FF_H$ cannot be set.

(c) ICSR — Interrupt control status register

This register indicates the interrupt control status in the CPU.

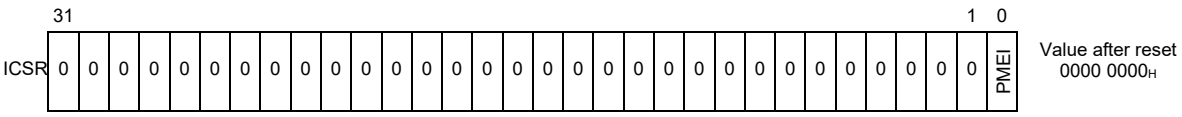

Table 3.35 ICSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	Reserved	These bits are read as 0. The write value should be 0.	R	0
0	PMEI	This bit indicates that an interrupt (EIINTn) with the priority level masked by the PMR register exists.	R	0

(d) INTCFG ─ Interrupt function setting register

This register is used to specify settings related to the CPU's internal interrupt function.

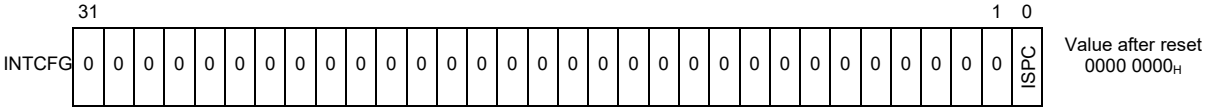

Table 3.36 INTCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	Reserved	These bits are read as 0. The write value should be 0.	R	0
0	ISPC	This bit changes how the ISPR register is written. 0: The ISPR register is automatically updated. Updates triggered by the program (via execution of an LDSR instruction) are ignored. 1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of an LDSR instruction) are performed. If this bit is cleared to 0, the bits of the ISPR register are automatically set to 1 when an interrupt (EIINTn) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, the bits are not updated by an LDSR instruction executed by the program. If this bit is set to 1, the bits of the ISPR register are not updated by the acknowledgement of an interrupt (EIINTn) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program. In normal cases, the ISPC bit should be cleared. When performing software-based priority control, however, set this bit to 1 and perform priority control by using the PMR register.	R/W	0

(4) FPU function registers

(a) Floating-point registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations.

- Single-precision floating-point instruction:
  Thirty-two 32-bit registers can be specified. These corresponds to the general-purpose registers r0 to r31.
- Double-precision floating-point instruction:
  Sixteen 64-bit registers can be specified. Paired general-purpose registers are used as register pairs ({r1, r0},{r3, r2}•••{r31, r30}). Each register pair is specified in the instruction format with an even numbered register. Because r0 is a zero register (always holds "0"), in principle, {r1, r0} cannot be used by a double-precision floating-point instruction.

(b) Floating-point system registers

The FPU can use the following system registers to control floating-point operations.

The floating-point system registers are read from or written to by using the LDSR or STSR instructions and specifying the system register number, which is made up of a register number and selection ID. For details of these registers, refer to *Section 3.4.2 Floating-Point Function System Registers* of *RH850G3MH User's Manual: Software*.

Table 3.37 List of FPU Function Registers

Register Number (reg.ID, sel.ID)	Name	Function	Access Permission
SR6, 0	FPSR	Configuration and status of floating-point operation	CU0 and SV
SR7, 0	FPEPC	Program counter for floating-point operation exception	CU0 and SV
SR8, 0	FPST	State of a floating-point operation	CU0
SR9, 0	FPCC	Results of comparison of floating-point operations	CU0
SR10, 0	FPCFG	Settings for floating-point operations	CU0

(5) MPU function registers

(a) MPU function system registers

The MPU function system registers are read from or written to by using the LDSR or STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.38 List of MPU Function System Registers (1/2)

Register Number (reg.ID, sel.ID)	Name	Function	Access Permission
SR0, 5	MPM	Memory protection operation mode setting	SV
SR1, 5	MPRC	MPU region control	SV
SR4, 5	MPBRGN	MPU base region number	SV
SR5, 5	MPTRGN	MPU end region number	SV
SR8, 5	MCA	Memory protection setting check address	SV
SR9, 5	MCS	Memory protection setting check size	SV
SR10, 5	MCC	Memory protection setting check command	SV
SR11, 5	MCR	Memory protection setting check result	SV
SR0, 6	MPLA0	The lower limit address of the protection area	SV
SR1, 6	MPUA0	The upper limit address of the protection area	SV
SR2, 6	MPAT0	The attribute of the protection area	SV
SR4, 6	MPLA1	The lower limit address of the protection area	SV
SR5, 6	MPUA1	The upper limit address of the protection area	SV
SR6, 6	MPAT1	The attribute of the protection area	SV
SR8, 6	MPLA2	The lower limit address of the protection area	SV
SR9, 6	MPUA2	The upper limit address of the protection area	SV
SR10, 6	MPAT2	The attribute of the protection area	SV
SR12, 6	MPLA3	The lower limit address of the protection area	SV
SR13, 6	MPUA3	The upper limit address of the protection area	SV
SR14, 6	MPAT3	The attribute of the protection area	SV
SR16, 6	MPLA4	The lower limit address of the protection area	SV
SR17, 6	MPUA4	The upper limit address of the protection area	SV
SR18, 6	MPAT4	The attribute of the protection area	SV
SR20, 6	MPLA5	The lower limit address of the protection area	SV
SR21, 6	MPUA5	The upper limit address of the protection area	SV
SR22, 6	MPAT5	The attribute of the protection area	SV
SR24, 6	MPLA6	The lower limit address of the protection area	SV
SR25, 6	MPUA6	The upper limit address of the protection area	SV

SR30, 7	MPAT15	The attribute of the protection area	SV

(b) MPM ─ Memory protection operation mode register

This register is used to define the basic operating state of the memory protection function.

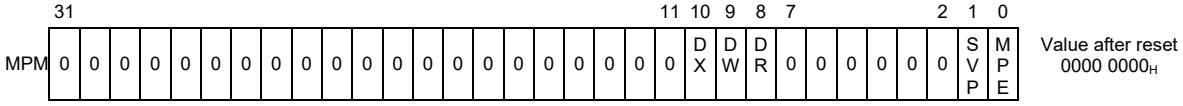

Table 3.39 MPM Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 11	Reserved	These bits are read as 0. The write value should be 0.	R	0
10	DX	This bit is not used in these products. This bit is read as 0. The write value should be 0.	R	0
9	DW	This bit is not used in these products. This bit is read as 0. The write value should be 0.	R	0
8	DR	This bit is not used in these products. This bit is read as 0. The write value should be 0.	R	0
7 to 2	Reserved	These bits are read as 0. The write value should be 0.	R	0
1	SVP	In SV mode (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area*1. 0: As usual, implicitly enable all access in SV mode. 1: Restrict access according to the SX, SW, and SR bits even in SV mode*2.	R/W	0
0	MPE	This bit is used to specify whether to enable or disable the MPU function. 0: Disable 1: Enable	R/W	0

Note 1. When the SVP bit is set to 1, access restriction will be given according to the settings for each protection area, even in SV mode. Therefore, specify the protection area before setting the SVP bit in order to prevent restriction of access by the program itself.

Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access to the memory area necessary for the exception handler and exception handling is permitted.

(c) MPRC ─ MPU region control

Bits used to perform special memory protection function operations are located in this register.

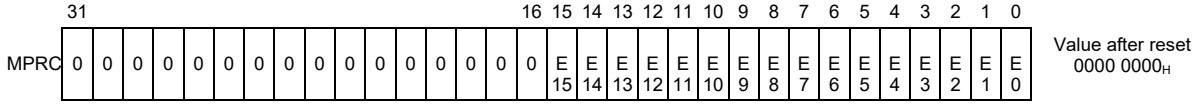

Table 3.40 MPRC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	Reserved	These bits are read as 0. The write value should be 0.	R	0
15 to 0	E15-E0	These are the enable bits for each protection area. Bit En is a copy of bit MPATn.E (where n = 15 to 0). These products are provided with sixteen protection areas.	R/W	0

(d) MPBRGN ─ MPU base region register

This register indicates the minimum usable MPU area number.

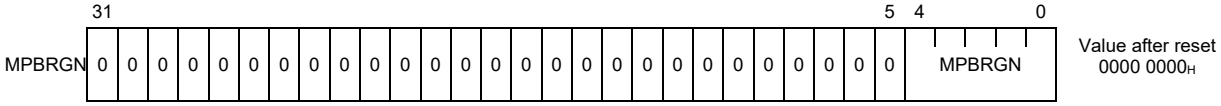

Table 3.41 MPBRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	Reserved	These bits are read as 0. The write value should be 0.	R	0
4 to 0	MPBRGN	These bits indicate the smallest number of an MPU area. These bits are always read as 0.	R	0

(e) MPTRGN — MPU end region register

This register indicates the maximum usable MPU area number + 1.

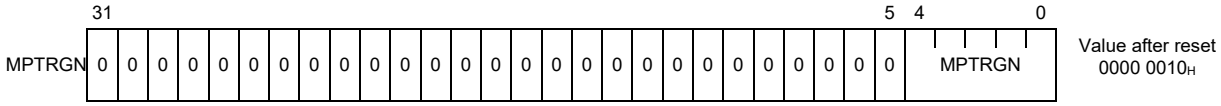

Table 3.42 MPTRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	Reserved	These bits are read as 0. The write value should be 0.	R	0
4 to 0	MPTRGN	These bits indicate the largest number of an MPU area plus one. These bits always indicate the maximum number of MPU areas that the hardware can support . These products are provided with sixteen protection areas.	R	10_H

(f) MCA ─ Memory protection setting check address register

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

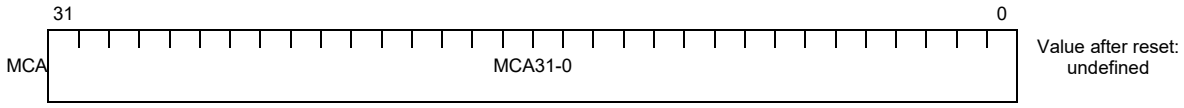

Table 3.43 MCA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCA31-MCA0	These bits are used to specify the start address of the memory area subject to a memory protection setting check in bytes.	R/W	Undefined

(g) MCS ─ Memory protection setting check size register

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

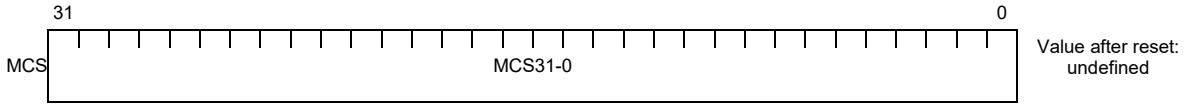

Table 3.44 MCS Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCS31-MCS0	These bits are used to specify the size of the memory area in bytes which subjects to a memory protection setting check. Because the specified size is assumed to represent an unsigned integer, it is not possible to check an area in the direction in which the address value decreases relative to the MCA register value. Do not specify 0000 0000_H for the MCS register.	R/W	Undefined

(h) MCC ─ Memory protection setting check command register

This command register is used to start a memory protection setting check.

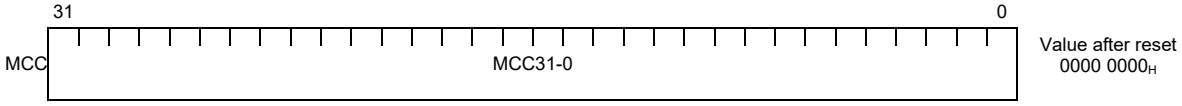

Table 3.45 MCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCC31-MCC0	When any value is written to the MCC register, a memory protection setting check starts. Setting the MCA and MCS registers and then writing to this register leads to storage of the result of checking in the MCR register. Since writing any value to this register starts the check, doing so does not require any extra registers when r0 is used as a source register. The result of checking is reflected in MCR according to any area setting regardless of the setting of the PSW.UM bit. The value read from the MCC register is always 0000 0000_H.	R/W	0

(i) MCR ─ Memory protection setting check result register

This register is used to store the results of a memory protection setting check.

Be sure to clear (0) bits 31 to 9, 7 and 6.

CAUTIONS

1. If the specified area to be checked crosses 0000 0000$_H$, it is judged as an area setting error, and the MCR.OV bit is set to 1. This means that the MCR.OV bit must be checked to access the check results. Do not use the check result until it is confirmed that the result is not invalid (OV = 0).
2. If the default operations specified by using the MPM.DX, DW, and DR bits are enabled (1), the correct result might not be able to be obtained. If enabling the specified default operation, do not use the memory protection setting check function.

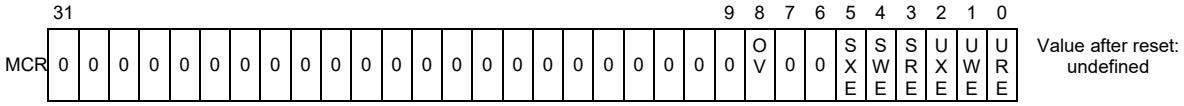

Table 3.46 MCR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	Reserved	These bits are read as 0. The write value should be 0.	R	0
8	OV	If the specified area includes 0000 0000$_H$ or 7FFF FFFF$_H$, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
7, 6	Reserved	These bits are read as 0. The write value should be 0.	R	0
5	SXE	If the specified area is contained within one protection area and execution is permitted for that area in the supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
4	SWE	If the specified area is contained within one protection area and writing to that area is permitted in the supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
3	SRE	If the specified area is contained within one protection area and reading from that area is permitted in the supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
2	UXE	If the specified area is contained within one protection area and execution is permitted for that area in the user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
1	UWE	If the specified area is contained within one protection area and writing to that area is permitted in the user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
0	URE	If the specified area is contained within one protection area and reading from that area is permitted in the user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined

(j) MPLAn ─ The lower limit address of the protection area

These registers indicate the minimum address of area n (where n = 0 to 15). These products are provided with sixteen protection areas.

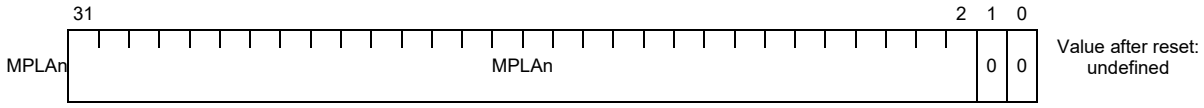

Table 3.47 MPLAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPLA31-2	These bits indicate the lower-limit address of area n. MPLA1 and 0 are implicitly set to 0.	R/W	Undefined
1, 0	Reserved	These bits are read as 0. The write value should be 0.	R	0

(k) MPUAn ─ The upper limit address of the protection area

These registers indicate the upper limit address of area n (where n = 0 to 15). These products are provided with sixteen protection areas.

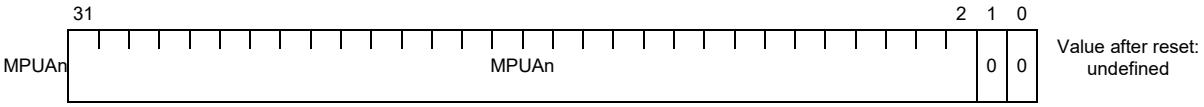

Table 3.48 MPUAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPUA31-2	These bits indicate the upper limit address of area n. MPUA1 and 0 are implicitly set to 1.	R/W	Undefined
1, 0	Reserved	These bits are read as 0. The write value should be 0.	R	0

(l) MPATn ─ The attribute of the protection area

These registers indicate the attributes of area n (where n = 0 to 15). These products are provided with sixteen protection areas.

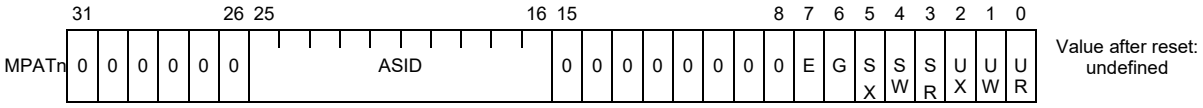

Table 3.49 MPATn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 26	Reserved	These bits are read as 0. The write value should be 0.	R	0
25 to 16	ASID	These bits indicate the ASID value to be used as the area match condition	R/W	Undefined
15 to 8	Reserved	These bits are read as 0. The write value should be 0.	R	0
7	E	This bit indicates whether area n is enabled or disabled. 0: Area n is disabled. 1: Area n is enabled.	R/W	0
6	G	0: ASID match is the condition. 1: ASID match is not the condition. When this bit is 0, the condition of the area match is MPATn.ASID =ASID.ASID. When this bit is 1, the area match of the values of MPATn.ASID and ASID.ASID is not the condition.	R/W	Undefined
5	SX	This bit indicates the execution privilege in supervisor mode*1. 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
4	SW	This bit indicates the write permission in supervisor mode*1. 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
3	SR	This bit indicates the read permission in supervisor mode*1. 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined
2	UX	This bit indicates the execution privilege in user mode. 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
1	UW	This bit indicates the write permission in user mode. 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
0	UR	This bit indicates the read permission in user mode. 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful with giving access restrictions so that access to the memory area necessary for the exception handler and exception handling is permitted.

(6) Cache operation function register

(a) Cache control function system register

Cache control function system registers are read from or written to by using the LDSR or STSR instructions and specifying the system register number, which is made up of a register number and a selection ID.

Table 3.50 List of Cache Operation Function System Registers

Register Number (reg.ID, sel.ID)	Name	Function	Access Permission
SR16, 4	ICTAGL	Instruction cache tag Lo access	SV
SR17, 4	ICTAGH	Instruction cache tag Hi access	SV
SR18, 4	ICDATL	Instruction cache data Lo access	SV
SR19, 4	ICDATH	Instruction cache data Hi access	SV
SR24, 4	ICCTRL	Instruction cache control	SV
SR26, 4	ICCFG	Instruction cache configuration	SV
SR28, 4	ICERR	Instruction cache error	SV

(b) ICTAGL ─ Instruction cache tag Lo access

This register is used for CIST and CILD instructions for the instruction cache. This register retains values to be stored in the tag RAM of the instruction cache by the execution of CIST instructions and values read from the tag RAM of the instruction cache by the execution of CILD instructions.

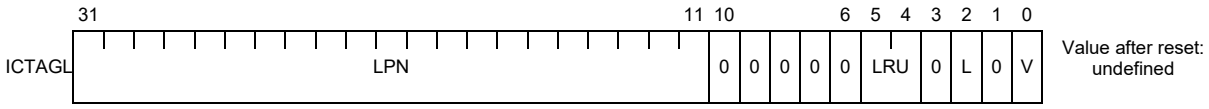

Table 3.51 ICTAGL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 11	LPN	These bits retain the values of bits 24 to 11, i.e. the physical page numbers. When writing, always write 0 to bits 31 to 25.	R/W	Undefined
10 to 6	Reserved	These bits are read as 0. The write value should be 0.	R	0
5, 4	LRU	These bits indicate the LRU information of the specified cache line. The CIST instruction cannot be used to change the LRU information to desired values.	R/W	Undefined
3	Reserved	This bit is read as 0. The write value should be 0.	R	0
2	L	This bit retains the lock information.	R/W	Undefined
1	Reserved	This bit is read as 0. The write value should be 0.	R	0
0	V	This bit retains whether the specified cache line is enabled or disabled.	R/W	Undefined

(c) ICTAGH — Instruction cache tag Hi access

This register is used for a CIST or CILD instruction for the instruction cache. This register holds the value to be stored in the instruction cache tag RAM by the execution of CIST instruction and the value read from the instruction cache tag RAM by the execution of CILD instruction.

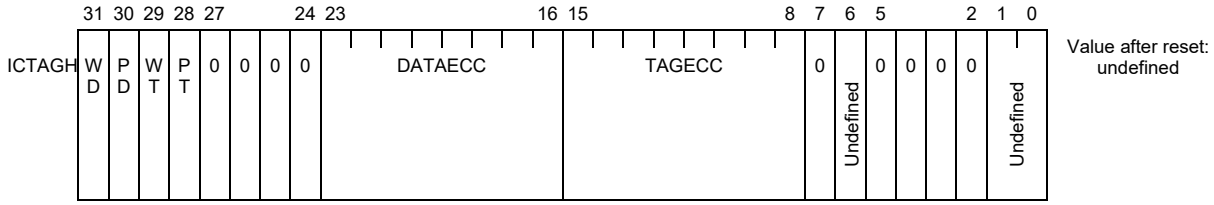

Table 3.52 ICTAGH Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	WD	When this bit is set to 1, executing a CIST instruction updates the cache data RAM.	R/W	Undefined
30	PD	When this bit is set to 1, the value in the DATAECC field of this register is written to the ECC field of the data RAM on execution of a CIST instruction. When this bit is cleared to 0, the ECC is automatically generated from the written data.	R/W	Undefined
29	WT	When this bit is set to 1, executing a CIST instruction updates the cache data RAM.	R/W	Undefined
28	PT	When this bit is set to 1, the value in the TAGECC field is written to the ECC of the tag RAM on execution of a CIST execution. When this bit is cleared to 0, the ECC is automatically generated from the written data.	R/W	Undefined
27 to 24	Reserved	These bits are read as 0. The write value should be 0.	R	0
23 to 16	DATAECC	These bits retain ECC of the data RAM.	R/W	Undefined
15 to 8	TAGECC	These bits retain ECC of the tag RAM. Be sure to set bits 15 and 14 to 0.	R/W	Undefined
7	Reserved	This bit is read as 0. The write value should be 0.	R	0
6	Reserved	When read, an undefined value is returned. The write value should be 0.	R	Undefined
5 to 2	Reserved	These bits are read as 0. The write value should be 0.	R	0
1, 0	Reserved	When read, an undefined value is returned. The write value should be 0.	R	Undefined

(d) ICDATL — Instruction cache data Lo access

This register is used for a CIST or CILD instruction for the instruction cache. This register stores the value to be stored in the instruction cache data RAM by the execution of CIST instruction and the value read from the instruction cache data RAM by the execution of CILD instruction.

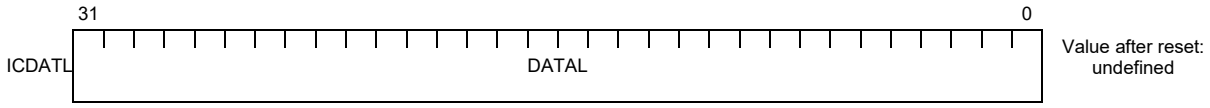

Table 3.53 ICDATL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	DATAL	These bits retain the values of the 32 lower-order bits from 64 bits of the instruction data of the block within the specified cache line. The offset of the index specifies the target range of bit numbers. Index offset = 00000: bits 31 to 0 Index offset = 01000: bits 95 to 64 Index offset = 10000: bits 159 to 128 Index offset = 11000: bits 223 to 192 The arrangement of data is as shown in **Figure 3.4**.	R/W	Undefined

(e) ICDATH — Instruction cache data Hi access

This register is used for a CIST or CILD instruction for the instruction cache. This register stores the value to be stored in the instruction cache data RAM by the execution of CIST instruction and the value read from the instruction cache data RAM by the execution of CILD instruction.

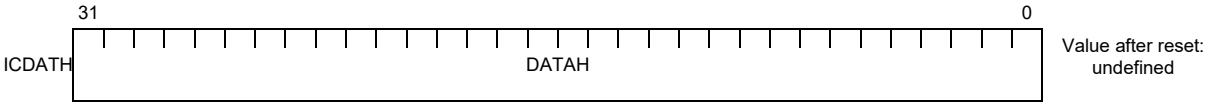

Table 3.54 ICDATH Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	DATAH	These bits retain the values of the 32 higher-order bits from 64 bits of the instruction data of the block within the specified cache line. The index offset specifies the bit number to be retained. Index offset = 00000: bits 63 to 32 Index offset = 01000: bits 127 to 96 Index offset = 10000: bits 191 to 160 Index offset = 11000: bits 255 to 224 The arrangement of data is as shown in **Figure 3.4**.	R/W	Undefined

(f) ICCTRL ─ Instruction cache control

This register controls the instruction cache.

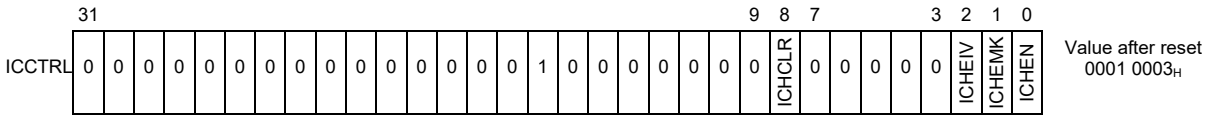

Table 3.55 ICCTRL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 17	Reserved	These bits are read as 0. The write value should be 0.	R	0
16	Reserved	This bits are read as 1. The write value should be 1.	R	1
15 to 9	Reserved	These bits are read as 0. The write value should be 0.	R	0
8	ICHCLR	Setting this bit to 1 selects clearing of the whole instruction cache in a single operation. After this bit has been set to 1, it will be read as 1 until clearing is completed. The bit is cleared to 0 once clearing of the cache is completed.	R/W	0
7 to 3	Reserved	These bits are read as 0. The write value should be 0.	R	0
2	ICHEIV	Setting this bit to 1 allows the instruction cache to be automatically disabled (ICHEN bit to be cleared to 0) when a cache error occurs.	R/W	0
1	ICHEMK	Setting this bit to 1 selects masking of cache error exception notifications for the CPU when a cache error occurs.	R/W	1
0	ICHEN	This bit disables or enables the instruction cache. 0: Instruction cache is disabled. 1: Instruction cache is enabled. This bit is read as the previous value until the setting is actually reflected in the instruction cache.	R/W	1

(g) ICCFG ─ Instruction cache configuration register

This register shows the configuration of the instruction cache.

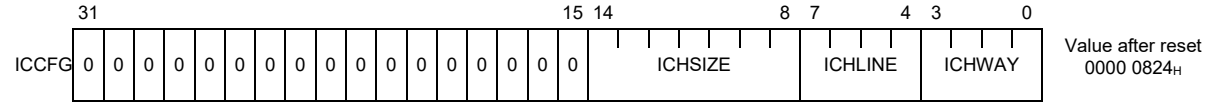

Table 3.56 ICCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 15	Reserved	These bits are read as 0. The write value should be 0.	R	0
14 to 8	ICHSIZE	These bits indicate the capacity (in Kbytes) of the instruction cache. 000 1000: 8 Kbytes	R	08_H
7 to 4	ICHLINE	These bits indicate the number of lines per 1 way in the instruction cache. 0100: 64 lines	R	2_H
3 to 0	ICHWAY	These bits indicate the number of ways of the instruction cache. 0100: 4 ways	R	4_H

(h) ICERR ─ Instruction cache error

This register stores cache error data of the instruction cache.

Once the ICHERR bit is set to 1, indicators that subsequent cache errors have occurred are not stored in this register until the ICHERR bit is cleared to 0. However, bits that indicate error states (ESMH, ESPBSE, ESTE1, ESTE2, ESDC, ESDE) continue to be cumulatively updated.

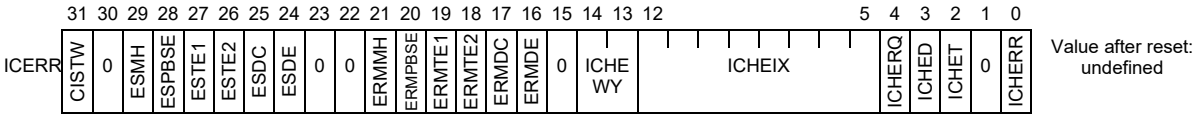

Table 3.57 ICERR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	CISTW	This bit is set to indicate that the destination way specified for a CISTI instruction was in error. Although the entry information is overwritten so that writing is completed, the V bit will be cleared the next time the cache line is read (i.e. reading will be judged to have missed the cache). However, setting of this bit is not accompanied by an exception for the CPU.	R/W	Undefined
30	Reserved	This bit is read as 0. The write value should be 0.	R	0
29	ESMH	Error status: Multi-hit	R/W	Undefined
28	ESPBSE	Error status: WAY error	R/W	Undefined
27	ESTE1	Error status: 1-bit error in the tag RAM	R/W	Undefined
26	ESTE2	Error status: 2-bit error in the tag RAM	R/W	Undefined
25	ESDC	Error status: 1-bit correction in the data RAM	R/W	Undefined
24	ESDE	Error status: 2-bit error in the data RAM	R/W	Undefined
23, 22	Reserved	These bits are read as 0. The write value should be 0.	R	0
21	ERMMH	Error exception notification mask: Multi-hit	R/W	0
20	ERMPBSE	Error exception notification mask: WAY error	R/W	0
19	ERMTE1	Error exception notification mask: 1-bit error in the tag RAM	R/W	0
18	ERMTE2	Error exception notification mask: 2-bit error in the tag RAM	R/W	0
17	ERMDC	Error exception notification mask: 1-bit correction in the data RAM	R/W	0
16	ERMDE	Error exception notification mask: 2-bit error in the data RAM	R/W	0
15	Reserved	This bit is read as 0. The write value should be 0.	R	0
14, 13	ICHEWY	These bits retain the WAY number where a cache error occurred.	R/W	Undefined
12 to 5	ICHEIX	These bits retain the cache index where a cache error occurred.	R/W	Undefined
4	ICHERQ	Setting this bit to 1 indicates that the CPU is being notified of a cache error exception. If cache error exceptions are masked, however, the CPU is not notified of an exception even when this bit is set to 1.	R/W	0
3	ICHED	This bit indicates that an error occurred in the data RAM.	R/W	0
2	ICHET	This bit indicates that an error occurred in the tag RAM.	R/W	0
1	Reserved	This bit is read as 0. The write value should be 0.	R	0
0	ICHERR	This bit is set to 1 when a cache error occurred.	R/W	0

(7) Data buffer operation function register

(a) Data buffer control function system register

Data buffer control function system registers are read from or written to by using the LDSR or STSR instruction and specifying the system register number, which is made up of a register number and a selection ID.

Table 3.58 List of Data Buffer Operation Function Registers

egister Number (reg.ID, sel.ID)	Name	Function	Access Permission
SR24, 13	CDBCR	Data Buffer Control Function Registers	SV

(b) CDBCR ─ Data buffer control register

This register controls the data buffers.

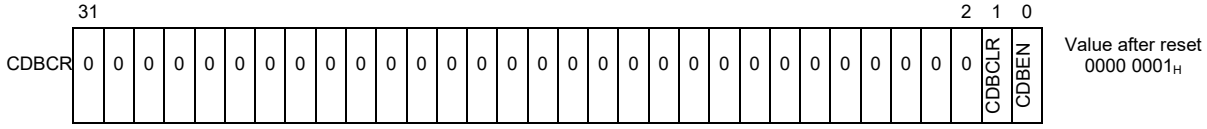

Table 3.59 CDBCR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	Reserved	These bits are read as 0. The write value should be 0.	R	0
1	CDBCLR	When this bit is set to 1, the data buffer is cleared at a time. This bit is always read as 0.	W	0
0	CDBEN	This bit disables or enables the data buffer. 0: Data buffer is disabled. 1: Data buffer is disabled.	R/W	1

3.2.2 Instruction Cache and Data Buffer

3.2.2.1 Features

An 8-Kbyte and 4-way set-associative instruction cache is mounted between the CPU and the code flash. The instruction cache and the code flash are connected to each other via a 256-bit dedicated bus to minimize penalties caused by a cache miss-hit. Also a data buffer is mounted between the CPU and the code flash to achieve high-speed data access. The area of 32 Mbytes from 0000 0000_H to 01FF $FFFF_H$ in the address space is intended for the instruction cache and data buffer.

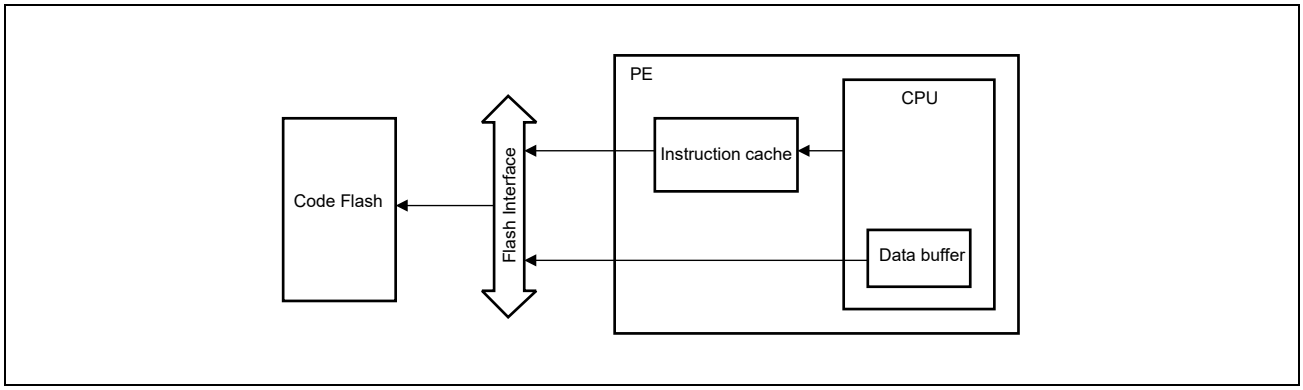

Figure 3.2 Instruction Cache and Data Buffer

3.2.2.2 Instruction Cache Function

The instruction cache is a 4-Way set associative cache with a total capacity of 8 Kbytes. The size of each cache is 32 bytes. When a cache is missed, a line is refilled, with LRU as the algorithm that controls replacement. The amount of data that can be fetched at once is 8 bytes, which means, the 8 bytes of data at a specified offset within one line are selected.

The Ways are divided into two groups: Way group 0, consisting of Ways 0 and 1, and Way group 1, consisting of Ways 2 and 3. The Way group for use is selected by decoding the address information of the destination for access.

The cache destination is the instruction fetch access to the code flash area.

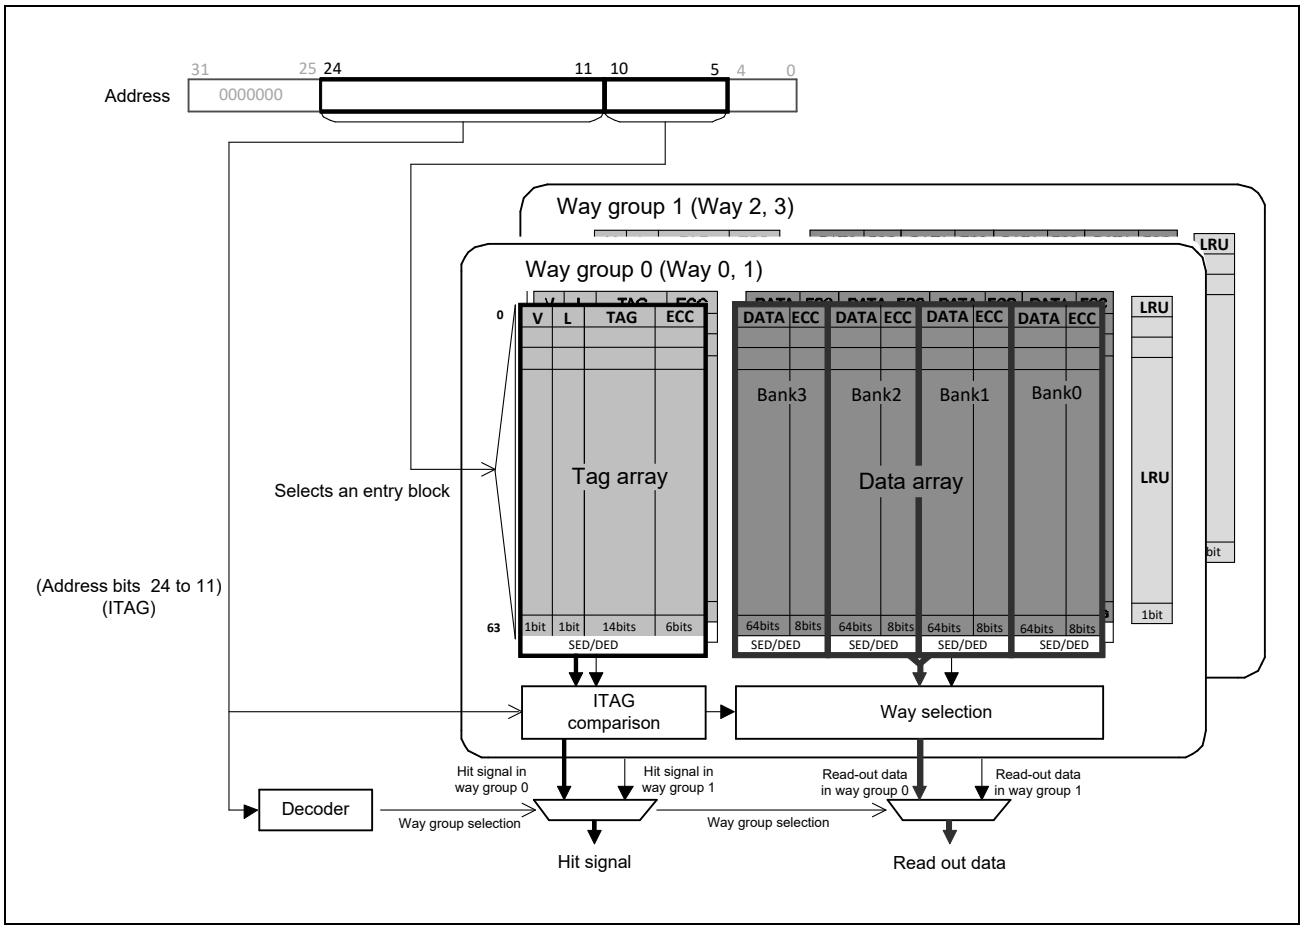

Figure 3.3 Instruction Cache Configuration

Tag Array

TAG	Among 32 bits in the operable addresses of the data line to be cached, bits 24 to 11 are stored in this bit. The TAG bit is not initialized by a reset.
ECC	The ECC of the tag array is stored in this bit. The ECC bit is not initialized by a reset.

Valid/Lock

V bit	This bit indicates whether valid data is stored in the cache line. Setting of this bit to 1 makes the cache line data valid. The V bit is initialized to 0 by a reset.
L bit	This bit indicates whether a cache line is locked or not. Setting of this bit to 1 locks the cache line and it cannot be replaced with new data. The L bit is valid only when the V bit is 1, and it is initialized by a reset.

Data Array

DATA	The 256 bits of data in cache line is stored with 64 bits in each bank. The way and offset determine the locations at which data are stored. The arrangement of data is as shown in **Figure 3.4**. The data are not initialized by a reset.
ECC	The ECC of data array are stored. The ECC is not initialized by a reset.

LRU

LRU	The information in the same Way group is stored in this data array. LRU is initialized by reset.

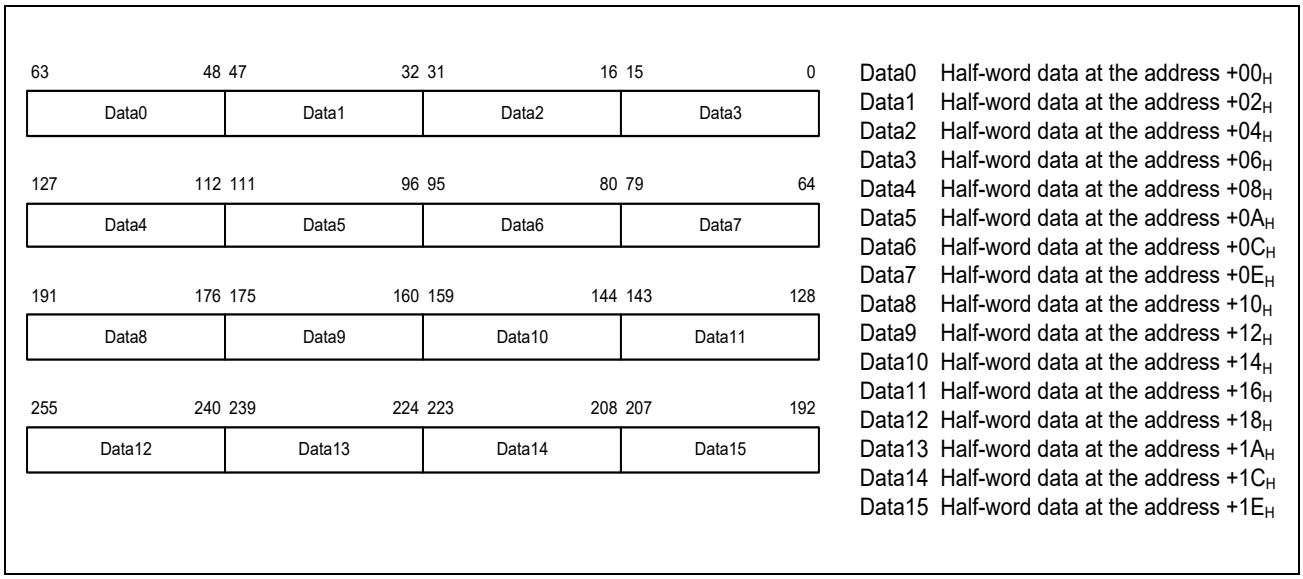

Figure 3.4 Arrangement of Data within the Cache

3.2.2.3 Data buffer function

The eight-line buffer with 128 bits per line is mounted as a data buffer. The data of 256 bits read from the code flash is stored in the data buffer with 128 bits per line. The data is read out from the data buffer after the next access to the same address, so the code flash is not accessed again.

3.2.3 Inter-Processor Interrupts

Registers (IPIR_CHn) for interrupt communication between PE1 and PE2 are provided for four channels. IPIR_CH0 to IPIR_CH3 are assigned to CH0 to CH3 of user interrupt (EIINT). An interrupt for specific PEs (including own PE) can be requested by manipulating bits corresponding to respective PEs.

3.2.3.1 Inter-Processor Interrupt Control Registers

Each of these registers are located in the CPU peripheral of the individual PEs. Each PE has its own IPIR_CH0 to IPIR_CH3 registers and cannot access those in other PEs.

Table 3.60 List of Registers

Register Symbol	Register Name	R/W	Value after Reset	Access Size				Address
				1	8	16	32	
IPIR_CH0	Inter-PE interrupt register 0	R/W	0000 0000$_H$	√	√	√	√	FFFE EC80$_H$
IPIR_CH1	Inter-PE interrupt register 1	R/W	0000 0000$_H$	√	√	√	√	FFFE EC84$_H$
IPIR_CH2	Inter-PE interrupt register 2	R/W	0000 0000$_H$	√	√	√	√	FFFE EC88$_H$

Table 3.61 IPIR_CHn Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are read as 0. The write value should be 0.
1	PE2	Inter-PE Interrupt Request to PE2 Writing 1 to this bit makes an interrupt request to PE2. This bit is automatically cleared to 0 once the interrupt request has been notified. 0: Inter-PE interrupt request output is not specified or an interrupt request is not being output. 1: Interrupt request output is specified or an interrupt request is being output.
0	PE1	Inter-PE Interrupt Request to PE1 Writing 1 to this bit makes an interrupt request to PE1. This bit is automatically cleared to 0 once the interrupt request has been notified. 0: Inter-PE interrupt request output is not specified or an interrupt request is not being output. 1: Interrupt request output is specified or an interrupt request is being output.

3.2.4 Reliability Functions

3.2.4.1 PE Guard Function (PEG)

(1) Overview of the PEG function

The PEG is a constituent of the Slave Guard function and blocks unauthorized accesses to the resources in the PE (local RAM) from the external bus master. In the state after a reset, all access other than by the bus master of its own PE is blocked. Setting the registers listed in **Section 3.2.4.1 (3), List of Protection with PEG Setting Registers** enables access other than by the bus masters of its own PE.

(a) Detecting PE guard violation

If the bus master outside the PE for which PE guard is set makes an unauthorized access to the resource area in the PE, the access is detected as a PE guard violation.

(b) Blocking unauthorized accesses

When a PE guard violation is detected, unauthorized accesses to the internal resources of the PE are blocked to prevent the contents of PE resources from being modified illegally.

(c) Notifying occurrence of violation

When a PE guard violation is detected, it is notified to ECM. When the DMAC or DTS makes an attempt of unauthorized access, meanwhile, a DMA transfer error is detected.

(2) Protection Made by PEID and SPID

- Setting protection with PEG
  - The PE can set protection for up to four areas in its own local RAM by specifying the address.
  - The range of the target area is specified by the base address and the mask bit (4 Kbytes to 16 Mbytes).
  - Read access and write access are respectively enabled for the individual areas.
  - Protection is enabled or disabled for the individual areas on each system protection identifier (SPID) basis and on each processor element identifier (PEID) basis.

- Access permission by the system processor element identifier (PEID) and system protection identifier (SPID) (see **Figure 3.5**)

  1. When the local RAM area is to be accessed, go to step 2.

     Otherwise, return an error response.

  2. When any of enabled areas 0 to 3 is to be accessed, go to step 3.

     Otherwise, return an error response.

  3. Whether all the conditions below for the relevant area met or not.

     - The system protection identifier (SPID) is enabled
     - The processor element identifier (PEID) is enabled
     - The required operation (read or write) is enabled.

     Otherwise, return an error response.

Memory access which is not allowed in the table below leads to an error being returned.

Note that CAXI and bit operation instructions (BitOp in the table) cannot proceed unless both reading and writing are allowed.

Table 3.62 Access Allowed for Each Request Type

Request Type	Read Access	Write Access
READ	Allowed	Not allowed
WRITE	Not allowed	Allowed
BitOp	Allowed	Allowed
CAXI	Allowed	Allowed
LDL	Allowed	Not allowed
STC	Not allowed	Allowed

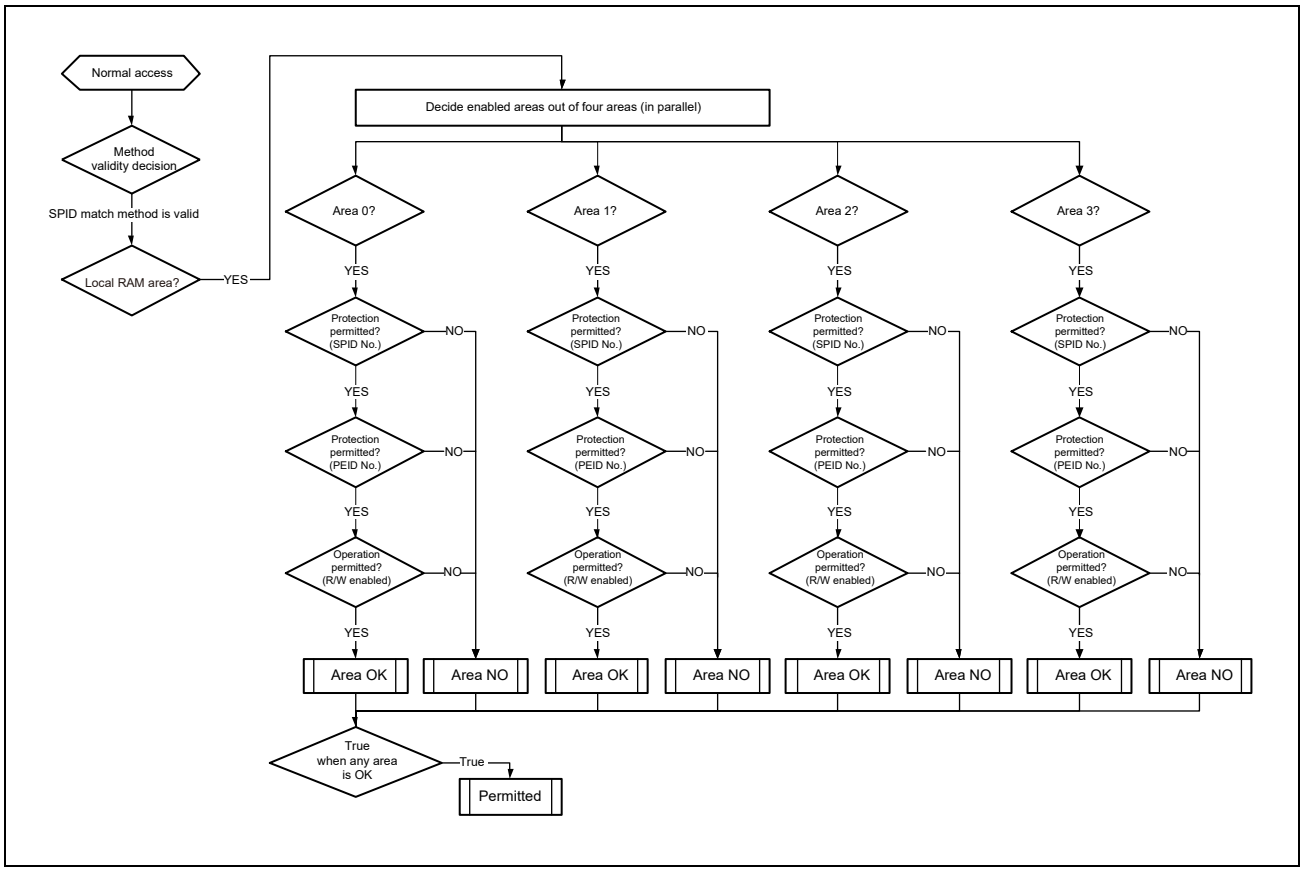

Figure 3.5 Access Permission by the Processor Element (PEID) and System Protection Identifier (SPID)

(3) List of Protection with PEG Setting Registers

Make necessary settings for the following registers to protect PE resources from unauthorized accesses by the external bus masters.

- Detection of accesses to the following areas are enabled: the areas for peripheral devices, and the local RAM area in the PE.
- Access permission for the register sets is not controlled by the PEG function. Make necessary settings for access permission by the IPG or other function.

Table 3.63 PEG Register Base Address: FFFE E600$_H$

Address Offset	Size (byte)	Register Name	Symbol	Permission	R/W	Operable Bit				Value after Reset
						1	8	16	32	
+00C$_H$	2	PE guard PEID&SPID master decision control register	PEGSP	—	R/W	—	√	√	—	0000$_H$

+0AC$_H$	4	PE guard area PEID setting register 2	PEGG2PE	—	R/W	—	√	√	√	0000 0000$_H$
+0B0$_H$	4	PE guard area mask setting register 3	PEGG3MK	—	R/W	—	√	√	√	FFE0 0000$_H$
+0B4$_H$	4	PE guard area base setting register 3	PEGG3BA	—	R/W	—	√	√	√	*1
+0B8$_H$	4	PE guard area SPID setting register 3	PEGG3SP	—	R/W	—	√	√	√	0000 0000$_H$
+0BC$_H$	4	PE guard area PEID setting register 3	PEGG3PE	—	R/W	—	√	√	√	0000 0000$_H$

Note 1. This value is FEA0_0000$_H$ for CPU1 (PE1), FE80_0000$_H$ for CPU2 (PE2), and FE60_0000$_H$ for the SubCPU (PE3).

(4) Register set

(a) PEGSP ─ PE guard PEID & SPID master decision control register

This register is used to enable or disable access by the external master to the resources in the PE. The value of the SPEN bit is 0 at its initial state, which disables access to the resources in the PE from outside. Setting the SPEN bit to 1 enables access from the external master under the conditions set by PEGGnMK and PEGGnBA.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SPEN
Value after Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 3.64 PEGSP Register Contents

Bit Position	Bit Name	Function
15 to 1	Reserved	These bits are read as 0. The write value should be 0.
0	SPEN	This bit enables or disables access settings by the bus master having PEID and SPID. 0: Detection of access by the external master having PEID and SPID is disabled. 1: Detection of access by the external master having PEID and SPID is enabled.

(b) PEGGnMK ─ PE guard area n mask setting register

In combination with the PEGGnBA register, this register specifies a range or ranges of the areas n to be protected with PEG. Setting a GnMASK bit to 1 masks the corresponding address bit of the PEGGnBA register and places the corresponding area or areas within the range of PE guard area n. Note that the minimum setting unit for the PE guard area n is 4 Kbytes.

Though PEGGnMK[31:21] is readable and writable, the value of these bits is ignored when judgment of access permission by PEID and SPID is made. At this time, the value is treated as follows:

- PEGGnMK[31:21] = $1111_1111_111_B$

In combination with the PEGGnBA register, this register protects the areas from an external master, which are at $FEA0_0000_H$ to $FEBF_FFFF_H$ in CPU1 (PE1), at $FE80_0000_H$ to $FE9F_FFFF_H$ in CPU2 (PE2), and at $FE60_0000_H$ to $FE7F_FFFF_H$ in the SubCPU (PE3). These areas respectively corresponds to the local RAM area in each PE.

Example: When PEGGnBA[31:12] = $FEBF6_H$ and PEGGnMK[31:12] = 00008_H are set, the PE guard areas n are $FEBF_6000_H$ to $FEBF_6FFF_H$ and $FEBF_E000_H$ to $FEBF_EFFF_H$.

Writing to the PEGGnMK register automatically clears the GnEN register in the PEGGnBA registers to 0. This prevents unintended accesses from an external master during configuration of access areas.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GnMASK															
Value after Reset	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GnMASK				—	—	—	—	—	—	—	—	—	—	—	—
Value after Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Table 3.65 PEGGnMK Register Contents

Bit Position	Bit Name	Function
31 to 12	GnMASK	These bits determine whether to mask the base address bits PEGGnBA[31:12] that specify the range of the area n protected with PE guard. 0: Target address bits are compared when determining the PE guard area. 1: Target address bits are not compared when determining the PE guard area.
11 to 0	Reserved	These bits are read as 0. The write value should be 0.

(c) PEGGnBA ─ PE guard area n base setting register

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard area n and sets the access enable conditions for the specified area. Setting the GnEN bit to 1 brings the address enable conditions specified by this register and the PEGGnMK register into effect. Though PEGGnBA[31:21] is readable and writable, the value of these bits is ignored when decision of access permission by PEID and SPID is made. At this time, the value is treated as follows:

- When an access to the resource in CPU1 (PE1) is detected: PEGGnBA[31:21] = $1111_1110_101_B$
- When an access to the resource in CPU2 (PE2) is detected: PEGGnBA[31:21] = $1111_1110_100_B$
- When an access to the resource in the SubCPU (PE3) is detected: PEGGnBA[31:21] = $1111_1110_011_B$

In combination with the PEGGnMK registers, this register protects the areas from an external master, which are at $FEA0_0000_H$ to $FEBF_FFFF_H$ in CPU1 (PE1), $FE80_0000_H$ to $FE9F_FFFF_H$ in CPU2 (PE2), and at $FE60_0000_H$ to $FE7F_FFFF_H$ in the SubCPU (PE3). These areas respectively corresponds to the local RAM area in each PE.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GnBASE															
Value after Reset	1	1	1	1	1	1	1	0	*1	*1	*1	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GnBASE				—	—	—	—	—	—	—	GnLOCK	—	GnWR	GnRD	GnEN
Value after Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Note 1. This value is 101_B for CPU1 (PE1), 100_B for CPU2 (PE2), 011_B for the SubCPU (PE3).

Table 3.66 PEGGnBA Register Contents

Bit Position	Bit Name	Function
31 to 12	GnBASE	The value for a base address that specifies the PE guard area n is set in these bits.
11 to 5	Reserved	These bits are read as 0. The write value should be 0.
4	GnLOCK	Disables writing to the system register in the protected area n. This bit can only be set to 1 and cannot be set to 0. 0: Writing to PEGGnMK, PEGGnBA, PEGGnSP, and PEGGnBA is enabled. 1: Writing to PEGGnMK, PEGGnBA, PEGGnSP, and PEGGnBA is disabled.
3	Reserved	This bit is read as 0. The write value should be 0.
2	GnWR	Permits write access to the PE guard area n. 0: Write access is rejected. 1: Write access is permitted.
1	GnRD	Permits read access to the PE guard area n. 0: Read access is rejected. 1: Read access is permitted.
0	GnEN	Enables settings for access enable conditions for the PE guard area n. 0: Settings for the conditions are disabled. 1: Settings for the conditions are enabled.

CAUTION

PEGGnBA.GnEN is cleared by writing to the PEGGnMK register.

(d) PEGGnSP ─ PE guard area n SPID setting register

These registers enable or disable permission for access to PE guard areas n by external masters which have the given SPID.

Specifically, setting a PEGGnSP[m] bit to 1 permits access from an external master which has the SPID m.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	GnSP			
Value after Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 3.67 PEGGnSP Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	These bits are read as 0. The write value should be 0.
3 to 0	GnSP	Each bit determines permission for access by an external master with the same SPID as the bit position to the PE guard area n. For the bit position m: 0: Access from an external master with SPID = m is rejected. 1: Access from an external master with SPID = m is permitted.

(e) PEGGnPE ─ PE guard area n PEID setting register

These registers enable or disable permission for access to PE guard areas n by external masters which have the given PEID.

Specifically, setting a PEGGnPE[m] bit to 1 permits access from an external master which has the PEID m.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GnPE							
Value after Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3.68 PEGGnPE Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as 0. The write value should be 0.
7 to 0	GnPE	Each bit determines permission for access by an external master with the same PEID as the bit position to the PE guard area n. For the bit position m: 0: Access from an external master with PEID = m is rejected. 1: Access from an external master with PEID = m is permitted.

3.2.4.2 PE-internal peripheral device guard function (IPG)

(1) Overview of the IPG function

The IPG is a function to prevent unauthorized accesses to peripheral devices from the CPU core. The following features are achieved. IPG covers the peripheral devices on the CPU.

(a) Detecting violation of peripheral device guard

If the CPU makes an unauthorized access to an area (peripheral device) for which peripheral device guard is set, the access is detected as “violation of peripheral device guard”.

(b) Storing information of the unauthorized access

When a violation of peripheral device guard is detected, the information of the unauthorized access is stored in the IPG's internal register.

(c) Blocking unauthorized accesses

When a violation of peripheral device guard is detected, such access is blocked to prevent contents of peripheral devices from being modified illegally.

(d) Notifying violations

When a violation of peripheral device guard is detected, a request for generating a system error exception (SYSERR exception) is made to ask the CPU to stop the processing.

For the details on system error exception (SYSERR exception), see **Section 3.2.4.3, System Error Notification Control Function (SEG)**.

(e) Invalidating subsequent accesses

When a violation of peripheral guard is detected, subsequent accesses (regardless of authorized or not) are blocked until instructions from the CPU are received.

NOTE

Even if a request for generating an exception is immediately sent to the CPU in step (d) above, a subsequent access which has been issued by the CPU before receiving a request from the IPG, which does not know an occurrence of violation, may illegally modify contents of peripheral devices. Accesses after a violation has occurred result in unauthorized accesses.

(2) IPG function

1. This function invalidates accesses according to their attributes (including address, transfer type, and access right).
2. After an access right violation is detected, subsequent accesses are invalidated until the error flag (described later) is cleared by a writing by the software. However, invalidation is applied only to accesses from the CPU and is not applied to accesses from outside the CPU core. Invalidation is performed independently of addresses.
3. When a request for accessing different peripheral devices simultaneously is made due to misalignment or double-word access, the access is executed when all such accesses are enabled.

(3) IPG setting registers for illegal users

To protect peripheral devices from unauthorized accesses by programs in user mode, necessary settings are required for the registers listed below.

- Accesses in user mode are to be detected.
- This register set is intended for IPG settings related to user mode and for reading of the IPG settings.

Table 3.69 IPG Register Base Addresses: FFFE E000$_H$

Address Offset	Size (byte)	Register Name	Symbol	Authorization*1	R/W	Operable Bit				Value after Reset
						1	8	16	32	
+002$_H$	2	Peripheral Device Guard Violation Access Information Register	IPGECRUM	SV	R/W	—	—	√	—	Undefined (retained)
+008$_H$	4	Peripheral Device Guard Violation Access Address Register	IPGADRUM	SV	R/W	—	—	—	√	Undefined (retained)
+00D$_H$	1	Peripheral Device Guard Enable Register	IPGENUM	SV	R/W	√	√	—	—	00$_H$
+022$_H$	1	Peripheral Device Guard Setting Register 2	IPGPMTUM2	SV	R/W	√	√	—	—	00$_H$
+023$_H$	1	Peripheral Device Guard Setting Register 3	IPGPMTUM3	SV	R/W	√	√	—	—	00$_H$
+024$_H$	1	Peripheral Device Guard Setting Register 4	IPGPMTUM4	SV	R/W	√	√	—	—	00$_H$

Note 1. The registers with “SV” are only accessible in SV mode (UM = 0).

(4) Register set

(a) IPGECRUM ─ Peripheral device guard violation access information register

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DS				EX	WR	RD	VD
Value after Reset	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Remark: x means the value is undefined (retained)

Table 3.70 IPGECRUM Register Contents

Bit Position	Bit Name	Function
15 to 8	Reserved	These bits are read as 0. The write value should be 0.
7 to 4	DS	Data size of the violation access is stored in these bits. 0100: Word (4byte) 0010: Halfword (2byte) 0001: Byte Other than above: Reserved
3	EX	This bit is set to 1 when a violation occurred in an instruction fetch read access. In other cases, this bit is cleared to 0.
2	WR	This bit is set to 1 when a violation occurred in a write access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0.
1	RD	This bit is set to 1 when a violation occurred in a read access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0.
0	VD	This bit is set to 1 when a violation of peripheral device guard is detected by a program with the relevant right. Even if another violation of peripheral device guard is detected while this bit is 1, data of IPGECRUM and IPGADRUM are not updated and retained.

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device guard by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(b) IPGADRUM ─ Peripheral device guard violation access address register

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EADR															
Value after Reset	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EADR															
Value after Reset	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: ×: Undefined (retained)

Table 3.71 IPGADRUM Register Contents

Bit Position	Bit Name	Function
31 to 0	EADR	Address of the access in which violation occurred is stored in these bits.

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device guard by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(c) IPGENUM ─ Peripheral device guard enable register

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IRE	E
Value after Reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 3.72 IPGENUM Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are read as 0. The write value should be 0.
1	IRE	This bit sets whether to store the access information in the peripheral device guard violation access address register and the peripheral device guard violation access information register when a violation of peripheral device guard occurred in an instruction fetch access. 0: Instruction fetch access information is not stored. 1: Instruction fetch access information is stored. Caution: If you do not want to detect speculative instruction fetches (no instruction is executed in some cases), clear this bit to 0.
0	E	This bit enables or disables the peripheral devices protection function against accesses by the relevant access right. 0: The peripheral device protection function is disabled. 1: The peripheral device protection function is enabled.

(d) IPGPMTUM2 ─ Peripheral device guard setting register 2

Bit	7	6	5	4	3	2	1	0
	—	—	W1	R1	—	—	W0	R0
Value after Reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 3.73 IPGPMTUM2 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	These bits are read as 0. The write value should be 0.
5	W1	This bit sets whether to enable write access to IPIR or MEV or TESTCOMP. *1 0: Write access to IPIR or MEV or TESTCOMP is treated as violation. 1: Write access to IPIR or MEV or TESTCOMP is not restricted.
4	R1	This bit sets whether to enable read access to IPIR, MEV, or TESTCOMP.*1 0: Read access to IPIR or MEV or TESTCOMP is treated as violation. 1: Read access to IPIR or MEV or TESTCOMP is not restricted.
3, 2	Reserved	These bits are read as 0. The write value should be 0.
1	W0	This bit sets whether to enable write access to INTC1. 0: Write access to INTC1 is treated as violation. 1: Write access to INTC1 is not restricted.
0	R0	This bit sets whether to enable read access to INTC1. 0: Read access to INTC1 is treated as violation. 1: Read access to INTC1 is not restricted.

Note 1. Access to TESTCOMP by CPU2 is not allowed. Access to IPIR or MEV or TESTCOMP by the SubCPU is not allowed.

(e) IPGPMTUM3 — Peripheral device guard setting register 3

Bit	7	6	5	4	3	2	1	0
	—	—	W1	R1	—	—	—	—
Value after Reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 3.74 IPGPMTUM3 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	These bits are read as 0. The write value should be 0.
5	W1	This bit sets whether to enable write access to SysErrGen. 0: Write access to SysErrGen is treated as violation. 1: Write access to SysErrGen is not restricted.
4	R1	This bit sets whether to enable read access to SysErrGen. 0: Read access to SysErrGen is treated as violation. 1: Read access to SysErrGen is not restricted.
3 to 0	Reserved	These bits are read as 0. The write value should be 0.

(f) IPGPMTUM4 — Peripheral device guard setting register 4

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	W0	R0
Value after Reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 3.75 IPGPMTUM4 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are read as 0. The write value should be 0.
1	W0	This bit sets whether to enable write access to PEG. 0: Write access to PEG is treated as violation. 1: Write access to PEG is not restricted.
0	R0	This bit sets whether to enable read access to PEG. 0: Read access to PEG is treated as violation. 1: Read access to PEG is not restricted.

3.2.4.3 System Error Notification Control Function (SEG)

Errors due to an instruction fetch or data access can be the sources of system error exceptions. A SYSERR exception is an FE level exception from which return or recovery is not possible.

For source codes (FEIC) of the SYSERR exceptions and error handling, see **Table 3.78**.

SEG (SysErrGen) controls the notification and record of the error by the data access. Though errors by instruction fetch access are not conveyed to the SEG, instruction cache errors occurred on the RAM are notified to the SEG.

For details, see **Section 3.2.4.3 (2) (a) SEGCONT ─ Error notification control register** and **Section 3.2.4.3 (3) (c) Supplementary notes on SYSERR exception**.

Multiple error occurrence inputs are categorized according to error factors, and are processed sequentially from the highest-priority error factor, generating an FE-level asynchronous exception (SYSERR).

The priorities for error sources are based on their bit positions in the SEGFLAG register. Error factors of lower-order bits take precedence over error factors of higher-order bits.

Error information is recorded once regardless of error frequency.

The error with the highest priority of error factor (in case errors occurred simultaneously) is valid. Recorded error information is not overwritten by subsequent errors

(1) List of SEG function control registers

Table 3.76 Base Address of SEG Register: FFFE E980$_H$

Address Offset	Size (byte)	Register Name	Symbol	Right	R/W	Operable Bit Width				Value After Reset
						1	8	16	32	
+00$_H$	2	Error Notification Control Register	SEGCONT	—	R/W*1	—	—	√	—	0000$_H$
+02$_H$	2	Error Occurrence Retention Register	SEGFLAG	—	R/W*1	—	—	√	—	0000$_H$
+08$_H$	4	Error Source Retention Register (Address)	SEGADDR	—	R/W*1	—	—	√	√	Undefined (retained)

Note 1. Write access made in user mode is ignored.

NOTE

- If an access is made with an address offset or operable bit other than those specified above, an error response is returned.
- Write access is only possible in supervisor mode (UM = 0). Attempting to write in other modes leads to an error being returned.
- No restriction is provided for read accesses. Read accesses to ranges permitted by other protection facilities are enabled at any time.

(2) Register Set

(a) SEGCONT ─ Error notification control register

This register is used to enable (= 1) or disable (= 0) notification of SYSERR request in response to error flags that holds the data indicating the state of error occurrence by each factor.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PBPE	HBPE	GRME *1	LRME	CFBE	LSUE	—	ICCE	—	—
Value after Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R

Note 1. This is configured as a reserved bit for the SubCPU.

Table 3.77 SEGCONT Register Contents (1/2)

Bit Position	Bit Name	Function
15 to 10	Reserved	These bits are read as 0. The write value should be 0.
9	PBPE	This bit notifies of a response to an error in P-Bus. The error includes the following: • Bus parity error
8	HBPE	This bit notifies of a response to an error in reading from the resources in the SubCPU by CPU1 or CPU2, or from the resources in CPU1 or CPU2 or from the global RAM by the SubCPU. The error includes the following: • Bus parity error
7	GRME*1	This bit notifies of a response to an error in data access to the global RAM. The error includes the following: • Uncorrectable ECC error (including the case where 1-bit correction is disabled) • Address parity error (including the case where redundant bit correction is disabled)
6	LRME	This bit notifies of a response to an error in data access to the local RAM of its own. The error includes the following: • Uncorrectable ECC error (including the case where 1-bit correction is disabled). • Address parity error (including the case where redundant bit correction is disabled)
5	CFBE	This bit notifies of a response to an error in access to the code flash. The error includes the following: • Uncorrectable ECC error (including the case where 1-bit correction is disabled). • Address parity error (including the case where redundant bit correction is disabled)
4	LSUE	This bit notifies of a response to a guard error or error response in data access. The guard error and error response includes the following: • Notification of a response to a P-Bus error (excluding errors in writing to P-Bus) – When an unimplemented area (FFFF 7900_H-FFFF $7EFF_H$) is accessed – PE-internal peripheral device guard (IPG) error – Access error to the local RAM of other PE (PEG error) – P-Bus guard error (for P-Bus guard for each register regarding the INTC2, PDMA, or the global RAM) • An access to an unimplemented area on the on-chip I/O register (self area) • Response to an occurrence of the following errors in the global RAM – An access guard violation error – An access to an unimplemented area • Response to an occurrence of the following error in the local RAM – An access to an unimplemented area • Response to an occurrence of the following error in the code flash – An error in store access • Response to an occurrence of the following error in the data flash*2 – Uncorrectable ECC error

Table 3.77 SEGCONT Register Contents (2/2)

Bit Position	Bit Name	Function
3	Reserved	This bit is read as 0. The write value should be 0.
2	ICCE	Instruction Cache Error Notification Enable The error occurred in the instruction cache is handled when the instruction cache system register, ICCTRL.ICHEMK, is set to 0 (whose value after reset is 1). For instruction cache errors, see **Section 3.2.1.2(6) (h) ICERR ─ Instruction cache error**.
1, 0	Reserved	These bits are read as 0. The write value should be 0.

Note 1. This is configured as a reserved bit for the SubCPU. It is read as 0 and the write value should be 0.

Note 2. This is the case where an uncorrectable ECC error occurs while conveyance of the ECC error signal is enabled.

Table 3.78 Error Source Codes and Handling of G3MH Core System Error Exceptions

Source Code	Error Description
10	Reserved
11	A guard error in instruction fetch and its response.
12	An error for which notification is enabled by ICCE, the second bit of SEGCONT.
13	The following errors in instruction fetch: • Bus parity error • Uncorrectable ECC error (including the case where 1-bit correction is disabled) • Address parity error (including the case where duplex bit correction is disabled)
14	An error for which notification is enabled by LSUE, the forth bit of SEGCONT.
15	An error for which notification is enabled by CFBE, the fifth bit of SEGCONT.
16	An error for which notification is enabled by LRME, the sixth bit of SEGCONT.
17	An error for which notification is enabled by GRME, the seventh bit of SEGCONT.*1
18	An error for which notification is enabled by HBPE, the eighth bit of SEGCONT.
19	An error for which notification is enabled by PBPE, the ninth bit of SEGCONT.
1A	Reserved
1B	Reserved
1C	Reserved
1D	Reserved
1E	Reserved
1F	Reserved

Note 1. This bit is reserved in the SubCPU.

(b) SEGFLAG ─ Error occurrence retention register

- This register contains the flags which indicate the state of error occurrence by each factor. Occurrence of an error sets this flag (= 1). These flags are not automatically cleared to 0.
- Writing to this register either sets or clears the values in this register.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PBPF	HBPF	GRMF*1	LRMF	CFBF	LSUF	—	ICCF	—	—
Value after Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R

Note 1. This is configured as a reserved bit for the SubCPU.

Table 3.79 SEGFLAG Register Contents

Bit Position	Bit Name	Function
15 to 10	Reserved	These bits are read as 0. The write value should be 0.
9	PBPF	The flag corresponding to bit 9 of the SEGCONT register.
8	HBPF	The flag corresponding to bit 8 of the SEGCONT register.
7	GRMF*1	The flag corresponding to bit 7 of the SEGCONT register.
6	LRMF	The flag corresponding to bit 6 of the SEGCONT register.
5	CFBF	The flag corresponding to bit 5 of the SEGCONT register.
4	LSUF	The flag corresponding to bit 4 of the SEGCONT register.
3	Reserved	This bit is read as 0. The write value should be 0.
2	ICCF	The flag corresponding to bit 2 of the SEGCONT register.
1, 0	Reserved	These bits are read as 0. The write value should be 0.

Note 1. This is configured as a reserved bit for the SubCPU. It is read as 0 and the write value should be 0.

(c) SEGADDR ─ Error source retention register (address)

This register records information of an error factor that has notified a SYSERR request (only one history is recorded). This register covers bit 4 to 9 of the SEGFLAG register, which are, PBPF, HBPF, GRMF*1, LRMF, CFBF, and LSUF. The content of this register cannot be modified while an error occurrence flag for which notification of a SYSERR request has been enabled remains set.

Note 1. GRMF is not included in the SubCPU.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Address[31:16]															
Value after Reset	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×
R/W	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Address[15:0]															
Value after Reset	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×
R/W	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Note: ×: Undefined (retained)

Note 1. This bit cannot be modified while an error occurrence flag for which notification of a SYSERR request has been enabled remains set.

Table 3.80 SEGADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	Address[31:0]	These bits retain the address at which a SYSERR source has occurred. 0 is stored if an instruction cache error (ICCE) has occurred. See the description of the ICERR register.

(3) SEG function

(a) SEG function: Notifying a SYSERR request in response to an error flag

- Setting an error flag takes precedence over clearing the same flag.
  - Simultaneous clearing operation is ignored.
- Priority of error sources to be notified
  - The priorities for error sources are based on their bit positions in the SEGFLAG register for which notification of SYSERR request has been enabled. Error factors of lower-order bits take precedence over error factors of higher-order bits.
  - The bit position of the error source is used as "SYSERR source code" to be notified.
- Conditions for starting notification of SYSERR requests
  - Setting the flags for which error notification is disabled does not start notification.
  - Setting the flags for which error notification is enabled immediately starts notification.
  - After clearing of a flag, notification is made depending on the flag state (re-arbitration).
- Stopping notification by responding to the SYSERR request
  - Stopping notification does not automatically clear the flag.
  - Notification will not be resumed until re-arbitration is performed by setting or clearing a flag.
  - If an error flag for the error source with the priority higher than that of the error source whose error flag is waiting for a response is set, the SYSERR source code to be notified may be replaced with the error source with the higher priority.

(b) SEG function: Recording error source information

- In response to an input of an error for which notification is enabled, the address at which the error has occurred is retained in the SEGADDR register.
  - No information is retained in the register by setting or clearing the error flag described in **Section 3.2.4.3(3)(a) SEG function: Notifying a SYSERR request in response to an error flag**.
  - When two or more errors have occurred at the same time, the address at which an error source with the highest priority occurred only is retained.
- While an error flag for which notification is enabled, described in **Section 3.2.4.3(3)(a) SEG function: Notifying a SYSERR request in response to an error flag**, is set, overwriting to the SEGADDR register is inhibited.
  - If inputs of error occurrence are generated sequentially, only the information of the first error source is retained.
  - To release inhibition of overwriting to the SEGADDR register, clear either SEGCONT or SEGFLAG register (or both).

(c) Supplementary notes on SYSERR exception

- Even when a SYSERR exception occurs, the value of the PSW.EBV bit is held, and the base address of the exception handler is not switched.
- Error detection in the instruction cache

  Even when an error is detected in the RAM in instruction cache, a rerun-typed SYSERR exception caused by instruction fetch does not occur. The instruction cache automatically invalidates the target entry in which an error occurred, and that entry is fetched again from the code flash. Thus execution of CPU instructions continues. Setting the ICCTRL.ICHEMK bit of the system register to 0 notifies the SEG of an error occurred in the instruction cache. For details on instruction cache errors, see **Section 3.2.1.2(6)(h), ICERR – Instruction cache error**.

3.2.4.4 Checker Core

CPU1 has the checker core for safety assurance, resulting in a highly reliable system. Monitoring the outputs from CPU1 and the checker core with the comparator all the time enables immediate detection of abnormal operations of CPU1. The CPU core, FPU, MPU, PEG, IPG, SEG, and INTC1 are duplicated by the checker core. CPU1 can also conduct a fault diagnosis test of its own comparator through a pseudo-error generated by the COMPTEST module. For details of the COMPTEST module, see **Section 29, Functional Safety**.

CAUTION

Reading of any register with an undefined value after a reset in a PE or writing to memory or a register outside the PE may cause a lockstep comparison error. The values of some program registers and system registers are undefined after a reset, so pay attention to this when saving register values on the stack in RAM.

3.2.5 Boot Control Function

This microcontroller has two startup modes for the CPUs: starting up both CPU1 (PE1) and CPU2 (PE2) simultaneously and starting up only CPU1 (PE1) while leaving CPU2 (PE2) in the non-operating state. A setting in an option byte selects the startup mode. See the description of the STARTUPPE bit of option byte 6 in **Section 35, Flash Memory**.

To start CPU2 (PE2) up from the non-operating state, use software running on CPU1 (PE1) to configure the boot control register.

Regardless of the startup mode of the CPUs, the SubCPU (PE3) in EMU3 will not be operating after release from a reset. It is started by software running on CPU1 (PE1) or CPU2 (PE2). For details, see **Section 25, Enhanced Motor Control Unit 3 (EMU3)**.

Table 3.81 Boot Control Register

Address	Size (byte)	Register Name	Symbol	Right	R/W	Operable Bit Width				Value After Reset
						1	8	16	32	
FFC5 8000$_H$	4	Boot Control Register	BOOTCTRL	—	R/W	—	√	√	√	*1

Note 1. 0000 003X$_H$ (This depends on the value set in the option byte register 6 (STARTUPPE)).

3.2.5.1 Boot Control Register ─ BOOTCTRL

This register controls startup of CPU1 (PE1) and CPU2 (PE2). Setting an effective bit of this register to 1 activates the corresponding CPU and the CPU starts fetching instructions. After a reset, the CPU waits without any operation if the corresponding bit is not set. The BC2 bit is invalid for the RH850/C1M-A1. A setting in an option byte determines the initial value of BC2. Writing 0 to these bits while the value is 1 is ignored.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	BC2	—	—
Value after Reset	0	0	0	0	0	0	0	0	0	0	1	1	1	X	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R

Table 3.82 Boot Control Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are read as 0. The write value should be 0.
5 to 3	Reserved	These bits are read as 1. The write value should be 1.
2	BC2	Boot Control 2 Setting this bit to 1 starts up CPU2 (PE2). 0: CPU2 (PE2) is not stated. 1: CPU2 (PE2) is started. Writing 0 while this bit is 1 is ignored.
1	Reserved	This bit is read as 1. The write value should be 1.
0	Reserved	This bit is read as 0. The write value should be 0.

3.3 Inter-CPU Functions

3.3.1 Processor Element Identifier

The PEID, each processor element ID number, can be read from the PEID field in the HTCFG0 register. Which CPU core performs a specific program can be checked by referring to the PEID. The following shows the PEIDs of this product.

CPU Core	PEID
CPU1 (PE1)	001_B
CPU2 (PE2)	010_B
SubCPU (PE3) in EMU3	011_B

3.3.2 Inter-Processor Interrupt

CPU1 (PE1) and CPU2 (PE2) have the IPIR register as their own peripheral devices. Setting of the IPIR register enables an EI level interrupt request from a PE to another PE. For details, see **3.2.3 Inter-Processor Interrupts**.

The SubCPU in EMU3 is not provided with this function.

3.3.3 Exclusive Function

CPU1 and CPU2 can use the local RAM for their own, the global RAM, and the exclusive control registers (MEV) as a resource for exclusive control. Atomic operation instructions of LDL/STC, CAXI, SET1, CLR1, and NOT1 can be performed for the local RAM for each and the global RAM. For the exclusive control registers (MEV), the instructions of CAXI, SET1, CLR1, and NOT1 can be performed. Note that atomic operations are not performed for the LD and ST instructions even though they can access those resources.

CAUTIONS

1. Atomic guarantee is provided in access by the SubCPU in EMU3 to its own local RAM by the CAXI or bit operation instruction. However, atomic guarantee is not provided in the case of access by the SubCPU to the local RAM of CPU1 and CPU2 or to the global RAM.
2. Atomic operations succeeds in access by the SubCPU in EMU3 to its own local RAM by LDL or STC instruction. However, the operations always fail in access to the local RAM of CPU1 and CPU2 or the global RAM.
3. Atomic guarantee is not provided in access by CPU1 or CPU2 to the local RAM of the SubCPU by the CAXI instruction.
4. Atomic operation in access by CPU1 or CPU2 to the local RAM of the SubCPU by the LDL or STC instruction always fails.
5. The SubCPU in EMU3 does not have access to the MEV (mutual exclusion variable registers).

3.3.3.1 Exclusive Control Registers (MEV)

These registers support exclusive control for variables shared among PEs (common resources).
(MEV: Mutual Exclusion Variable Register)

- Thirty-two 32-bit MEV registers are included.
- Each register is accessible in 1-, 8-, 16-, and 32-bit units.
- These registers are accessible by CPU1 (PE1) and CPU2 (PE2). Accessing these registers by the SubCPU in EMU3 is not possible.
- Atomic operation instructions of CAXI, SET1, CLR1 and NOT1 are available.

CPU1 (PE1) and CPU2 (PE2) each has an independent access path for the MEV registers. Therefore, when CPU1 (PE1) and CPU2 (PE2) each accesses different MEV registers, they do not need to wait for access. When they access the same MEV register, however, waiting for access is required.

Table 3.83 List of Registers (Base Address: FFFE EC00$_H$)

Register Symbol	Register Name	R/W	Value After Reset	Access Size				Offset Address
				1	8	16	32	
G0MEV0	Exclusive control register 0	R/W	0000 0000$_H$	√	√	√	√	+00$_H$
G0MEV1	Exclusive control register 1	R/W	0000 0000$_H$	√	√	√	√	+04$_H$
G0MEV2	Exclusive control register 2	R/W	0000 0000$_H$	√	√	√	√	+08$_H$
G0MEV3	Exclusive control register 3	R/W	0000 0000$_H$	√	√	√	√	+0C$_H$
:	:	:	:	:	:	:	:	:
G0MEV31	Exclusive control register 31	R/W	0000 0000$_H$	√	√	√	√	+7C$_H$

3.3.3.2 Operations of the LDL.W and STC.W Instructions

The LDL.W and STC.W instructions can be used to correctly handle memory update in a multicore system by enabling atomic read-modify-write processing. The operations of the LDL.W and STC.W instructions are described below:

For the operations of LDL.W and STC.W instructions, refer to *RH850/G3MH User's Manual: Software*.

- Link generation
  The CPU can generate links for both the local RAM and global RAM. If the LDL.W instruction is executed to read the target, the link is generated with the link flag set. The following two types of link flags are provided:

(1) One for the own local RAM

(2) One for other than (1)

These link flags are generated independently to each other. If the CPU generates a link to its own local RAM, for example, the link will not disappear even if another link flag is generated in the global RAM, for example, by the LDL.W instruction.

- Successful store: Storing proceeds only for the links which has been generated and the applicable STC.W instruction has been executed to the link.
- Storing failure: Storing does not proceed while the link is lost even if the STC.W instruction is executed. Storing does not proceed as well when the STC.W instruction that does not correspond to the link is executed.
- Condition for successful storing: The STC.W instruction is determined that it corresponds to the link if the following condition is satisfied:
  - The address of the STC.W instruction is the same as the address of the LDL.W instruction that generated the link.
- Link lost: When either of the following occurs, the link flag is cleared, and the link is lost:

  When either of the following events occurs in the CPU that generated the link:
  - The CLL instruction is executed.
  - The STC.W instruction is executed. The corresponding link ((1) or (2) above) is lost regardless of whether the store succeeded or failed.
  - Occurrence of all EI level interrupts/exceptions
  - Occurrence of all FE level interrupts/exceptions
  - A restore instruction (FERET or EIRET) from the exception is executed. The link flags ((1) or (2) above) will be all cleared.
  - A EST instruction is executed.
  - Multiple LDL.W instructions are executed in succession for the same type of the link flag ((1) or (2) above). The link which has been generated by the preceding LDL.W instruction will be lost. Do not execute such processing.
  - A store operation other than the STC.W instruction is executed for the range of 32-byte order address containing the address*1 for which the link is generated. Do not execute such processing.
  - When a store operation (including execution of the STC.W instruction) is executed by another bus master for the range of 32-byte order address containing the address*1 for which the link is generated. The corresponding link is lost.

Note 1. This indicates the address that corresponds to 27 higher-order bits of the address of the link.

  - When the STC.W instruction is successful, an atomic read-modify-write processing has been executed by the LDL.W and STS.W instructions.

3.4 Notes on Usage

3.4.1 Synchronizing Completion of Store Instruction and Generation of Subsequent Instruction

When a control register is updated by a store instruction, there is a time lag from execution of the instruction by the CPU to actual updating of the control register. Therefore, appropriate processing for synchronization is required to ensure that control registers reflect updated values before execution of subsequent instructions. The processing for synchronization is shown below.

For details of the procedure regarding updating of the system registers by the LDSR instruction and synchronization with subsequent instructions, refer to *APPENDIX A, HAZARD RESOLUTION PROCEDURE FOR SYSTEM REGISTERS* in the *RH850G3MH User's Manual: Software*.

3.4.1.1 When updated results in the control registers are reflected in the implementation of a subsequent instruction:

Example 1: This includes the following case: an interrupt is enabled by implementation of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits.

Proceed as follows in this case.

(1) Store instruction to update a control register (ST.W, etc.)

(2) Dummy reading of the above-mentioned control register (LD.W etc.)*1

(3) SYNCP

(4) Subsequent instruction (EI, etc.)

Example 2: If an access to another control register (control register B) is needed after a control register (control register A) has been completely updated, execute the similar processing. This includes the following cases: different peripheral devices are linked, or the interrupt mask for INTC is cleared after the peripheral device is set. Note that this processing is not required if the control registers A and B belong to the same peripheral group. For details on the peripheral groups, see **Section 3.1.2, Configuration of Peripheral Groups**.

(1) Store instruction to update the control register A (ST.W, etc.)

(2) Dummy read of the above-mentioned control register (LD.W etc.)*1

(3) SYNCP

(4) Store instruction to access the control register B (ST.W, LD.W, etc.)

The similar processing is also required when an access to a memory or control register to be protected is started after a safety function (such as some kind of memory protection and ECC) has been completely set up.

Note 1. Dummy reading of any register of the same peripheral group can be used instead.

3.4.1.2 When the updated results in the control registers and memories are reflected in the instruction fetch of a subsequent instruction:

(a) If you wish to write an instruction to the RAM and then branch to the RAM to execute the written instruction, handle this as follows.

(1) Store instruction to update a memory (ST.W, etc.)

(2) Dummy read of the above-mentioned memory (LD.W, etc.)

(3) SYNCP

(4) SYNCI

(5) Subsequent instruction (branch instruction, etc.)

(b) When branching to a target memory after waiting for the completion of updating the control registers for memory protection and ECC, handle this as follows.

(1) Store instruction to update a control register (ST.W, etc.)

(2) Dummy read of the control register (LD.W, etc.)

(3) SYNCP

(4) SYNCI

(5) Subsequent instruction (branch instruction, etc.)

3.4.1.3 When switching the code flash memory area:

In this case, refer to *(7) Updating the FCUFAREA Register, in section 9, Usage Notes, in the RH850/C1M-A Flash Memory User's Manual: Hardware Interface*.

3.4.2 Access to Registers by Bit-Manipulation Instructions

Processing of writing by bit-manipulation instructions consists of atomic read-modify-write processing in 8-bit units. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

3.4.3 Ensure Coherency after Rewriting the Code Flash

The CPU is equipped with the valid instruction cache and data buffer for the code flash area. Therefore, clear the instruction cache and data buffer to ensure coherency after rewriting the code flash by self-programming. The instruction cache is cleared by the ICCTRL register, and the data buffer is cleared by the CDBCR register.

3.4.4 Overwriting Context when Acknowledging Multiple Exceptions

Exceptions may be acknowledged regardless of the states of the ID or NP bit of the PSW register. This depends on the type of exception. When multiple exceptions occur, the contents of the system registers which hold the context information are overwritten. Regarding the conditions for acknowledging exceptions from each source and the possibility of return and recovery, see the list of exception sources in the *RH850G3MH User's Manual: Software*.

3.4.5 Usage Notes on Prefetching

CPU executes speculative instruction fetching from locations later than the current value of the program counter to maintain the throughput of instruction fetches. Reading from memory due to such prefetching may proceed even from locations to which instruction codes have not been assigned (note 1 in **Figure 3.6**). Please note the following. The CPU does not execute values read in such cases.

These notes apply to instruction fetching from memory in general.

- Occurrence of ECC errors due to values in memory being undefined

  This prefetching may lead to an ECC error in case of reading from the code flash memory after it has been erased or from the local RAM or global RAM before initialization. When instruction codes are assigned to memory, initialize said area with values as desired (note 1 in **Figure 3.6**).

- Detection of illegal access by the GRG or IPG

  The GRG or IPG may detect such prefetching as illegal access. To prevent prefetching being detected as an illegal access, do not allow any region of overlap area with said areas (note 1 in **Figure 3.6**) and areas to which access is prohibited by the GRG or IPG. Reading from an area protected by the MPU does not cause a memory protection exception.

- Access to Access Prohibited Area

  Assign instruction codes to memory without allowing any overlap between said area (note 1 in **Figure 3.6**) and an access-prohibited area.

Note 1. Area from final address of instruction code to final address + 64 bytes. Even if instruction codes are not placed in this area, requests for prefetching may lead to reading from memory at the time of branching.

Figure 3.6 Area that Requires Attention Regarding Prefetching

Section 4 Address Space

4.1 RH850/C1M-A Address Space

4.1.1 Address Space (C1M-A2)

Table 4.1 shows the address space of the RH850/C1M-A2.

Do not access an address with which no register is mapped in the on-chip I/O register space. Do not access any address that is not specified in **Table 4.1** and any reserved area. If an unspecified address or reserved area is accessed, operation is not guaranteed.

Table 4.1 Address Space (C1M-A2)

Address	Address Space Type	Size
0000 0000$_H$ to 001F FFFF$_H$ (0001 7000$_H$ to 0001 7FFF$_H$)	On-chip ROM (user area read, bank A) (FCU firmware area (Map is switched by the FCUFAREA register))*3	2.0 MB (4 KB)
0020 0000$_H$ to 003F FFFF$_H$	On-chip ROM (user area read, bank B)	2.0 MB
0040 0000$_H$ to 00FF FFFF$_H$	Reserved area	—
0100 0000$_H$ to 0100 7FFF$_H$	On-chip ROM (user boot area read)	32 KB
0100 8000$_H$ to 0103 6FFF$_H$	Reserved area	—
0103 7000$_H$ to 0103 7FFF$_H$	FCU firmware area*3	4 KB
0103 8000$_H$ to FBFF FFFF$_H$	Reserved area	—
FC00 0000$_H$ to FC07 FFFF$_H$	EMU on-chip I/O register*4	512 KB
FC08 0000$_H$ to FE7E FFFF$_H$	Reserved area	—
FE7F 0000$_H$ to FE7F FFFF$_H$	On-chip RAM (local RAM EMU SubCPU area)	64 KB
FE80 0000$_H$ to FE9E FFFF$_H$	Reserved area	—
FE9F 0000$_H$ to FE9F FFFF$_H$	On-chip RAM (local RAM CPU2 area)	64 KB
FEA0 0000$_H$ to FEBE FFFF$_H$	Reserved area	—
FEBF 0000$_H$ to FEBF FFFF$_H$	On-chip RAM (local RAM CPU1 area)	64 KB
FEC0 0000$_H$ to FEDE FFFF$_H$	Reserved area	—
FEDF 0000$_H$ to FEDF FFFF$_H$	On-chip RAM (local RAM self area*1)	64 KB
FEE0 0000$_H$ to FEEE FFFF$_H$	Reserved area	—
FEEF 0000$_H$ to FEEF FFFF$_H$	On-chip RAM (global RAM area bank A)	64 KB
FEF0 0000$_H$ to FEF0 FFFF$_H$	On-chip RAM (global RAM area bank B)	64 KB
FEF1 0000$_H$ to FEFF FFFF$_H$	Reserved area	—
FF00 0000$_H$ to FFFD FFFF$_H$ (FF20 0000$_H$ to FF20 FFFF$_H$) (FFA1 2000$_H$ to FFA1 2FFF$_H$)	On-chip I/O register (Data Flash (read/write)) (FCU RAM area)	16 MB to 128 KB (64 KB) (4 KB)
FFFE 0000$_H$ to FFFE DFFF$_H$	Reserved area	—
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip I/O register (self area*2)	8 KB
FFFF 0000$_H$ to FFFF 4FFF$_H$	Reserved area	
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip I/O register	44 KB

Note 1. The local RAM self area is an address area for access by each of the CPUs (CPU1, CPU2, and the SubCPU) to its own local RAM.

Note 2. The internal I/O register area (“self area”) is an address range for access by each of the CPUs (CPU1, CPU2, and the SubCPU) to its own internal I/O registers (registers for peripherals of the given CPU).

Note 3. For details, see *RH850/C1M-A Flash Memory User’s Manual: Hardware Interface.*

Note 4. This area is accessible only by the SubCPU of EMU3.

4.1.2 Address Space (C1M-A1)

Table 4.2 shows the address space of the RH850/C1M-A1.

Do not access an address with which no register is mapped in the on-chip I/O register space. Do not access any address that is not specified in **Table 4.2** and any reserved area. If an unspecified address or reserved area is accessed, operation is not guaranteed.

Table 4.2 Address Space (C1M-A1)

Address	Address Space Type	Size
0000 0000_H to 001F $FFFF_H$ (0001 7000_H to 0001 $7FFF_H$)	On-chip ROM (user area read, bank A) (FCU firmware area (Map is switched by the FCUFAREA register))*3	2.0 MB (4 KB)
0020 0000_H to 00FF $FFFF_H$	Reserved area	—
0100 0000_H to 0100 $7FFF_H$	On-chip ROM (user boot area read)	32 KB
0100 8000_H to 0103 $6FFF_H$	Reserved area	—
0103 7000_H to 0103 $7FFF_H$	FCU firmware area*3	4 KB
0103 8000_H to FBFF $FFFF_H$	Reserved area	—
FC00 0000_H to FC07 $FFFF_H$	EMU on-chip I/O register*4	512 KB
FC08 0000_H to FE7E $FFFF_H$	Reserved area	—
FE7F 0000_H to FE7F $FFFF_H$	On-chip RAM (local RAM EMU SubCPU area)	64 KB
FE80 0000_H to FEBE $FFFF_H$	Reserved area	—
FEBF 0000_H to FEBF $FFFF_H$	On-chip RAM (local RAM CPU1 area)	64 KB
FEC0 0000_H to FEDE $FFFF_H$	Reserved area	—
FEDF 0000_H to FEDF $FFFF_H$	On-chip RAM (local RAM self area*1)	64 KB
FEE0 0000_H to FEEE $FFFF_H$	Reserved area	—
FEEF 0000_H to FEEF $FFFF_H$	On-chip RAM (global RAM area bank A)	64 KB
FEF 00000_H to FEFF $FFFF_H$	Reserved area	—
FF00 0000_H to FFFD $FFFF_H$ (FF20 0000_H to FF20 $FFFF_H$) (FFA1 2000_H to FFA1 $2FFF_H$)	On-chip I/O register (Data Flash (read/write)) (FCU RAM area)	16 MB to 128 KB (64 KB) (4 KB)
FFFE 0000_H to FFFE $DFFF_H$	Reserved area	—
FFFE $E000_H$ to FFFE $FFFF_H$	On-chip I/O register (self area*2)	8 KB
FFFF 0000_H to FFFF $4FFF_H$	Reserved area	
FFFF 5000_H to FFFF $FFFF_H$	On-chip I/O register	44 KB

Note 1. The local RAM self area is an address area for access by each of the CPUs (CPU1 and the SubCPU) to its own local RAM.

Note 2. The internal I/O register area (“self area”) is an address range for access by each of the CPUs (CPU1 and the SubCPU) to its own internal I/O registers (registers for peripherals of the given CPU).

Note 3. For details, see *RH850/C1M-A Flash Memory User’s Manual: Hardware Interface.*

Note 4. This area is accessible only by the SubCPU of EMU3.

4.1.3 Address Space Viewed from Each Bus Master

Figure 4.1 (C1M-A2) and **Figure 4.2** (C1M-A1) show address spaces viewed from each bus master.

4.1.3.1 Space in which Instructions can be Fetched

1. Instructions of CPU1, CPU2 (C1M-A2 only), and the SubCPU of EMU can be fetched from the on-chip ROM and on-chip RAM (local RAM and global RAM areas).
2. The reset vector (the initial value of RBASE) of CPU1, CPU2 (C1M-A2 only), and the SubCPU of EMU are as follows:
   - When the startup area is the user boot area, its head address is 0100 0000_H.
   - When the startup area is the user area, its head address is 0000 0000_H.

4.1.3.2 Data Space Accessible by CPU1

See **Figure 4.1** and **Figure 4.2** for the accessible spaces from CPU1.

4.1.3.3 Data Space Accessible by CPU2 (C1M-A2 only)

See **Figure 4.1** and **Figure 4.2** for the accessible spaces from CPU2 (applicable to C1M-A2 only).

4.1.3.4 Data Space Accessible by the SubCPU of EMU

See **Figure 4.1** and **Figure 4.2** for the accessible spaces from the SubCPU of EMU.

4.1.3.5 Data Space Accessible by DMA (DMAC, DTS)

See **Figure 4.1** and **Figure 4.2** for the accessible spaces from the DMA.

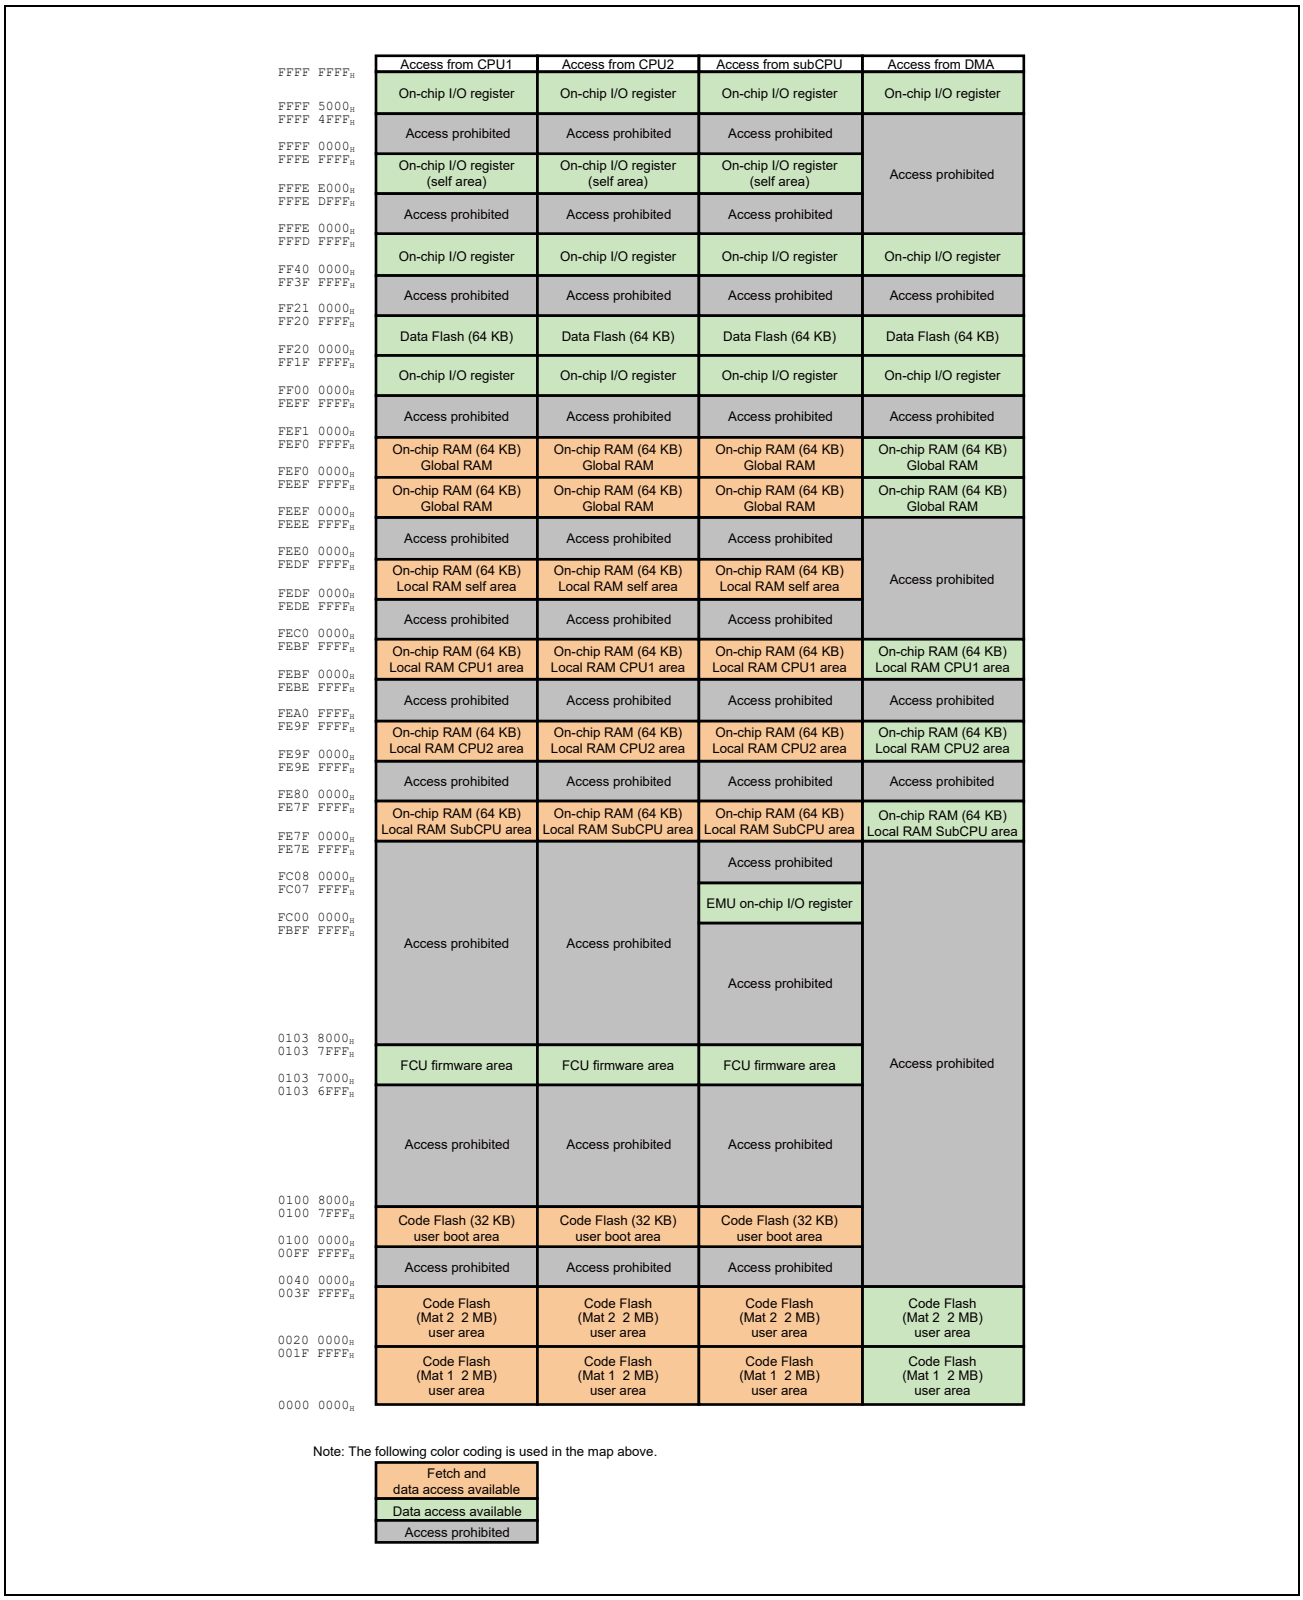

Figure 4.1 Address Space Viewed from Each Bus Master (C1M-A2)

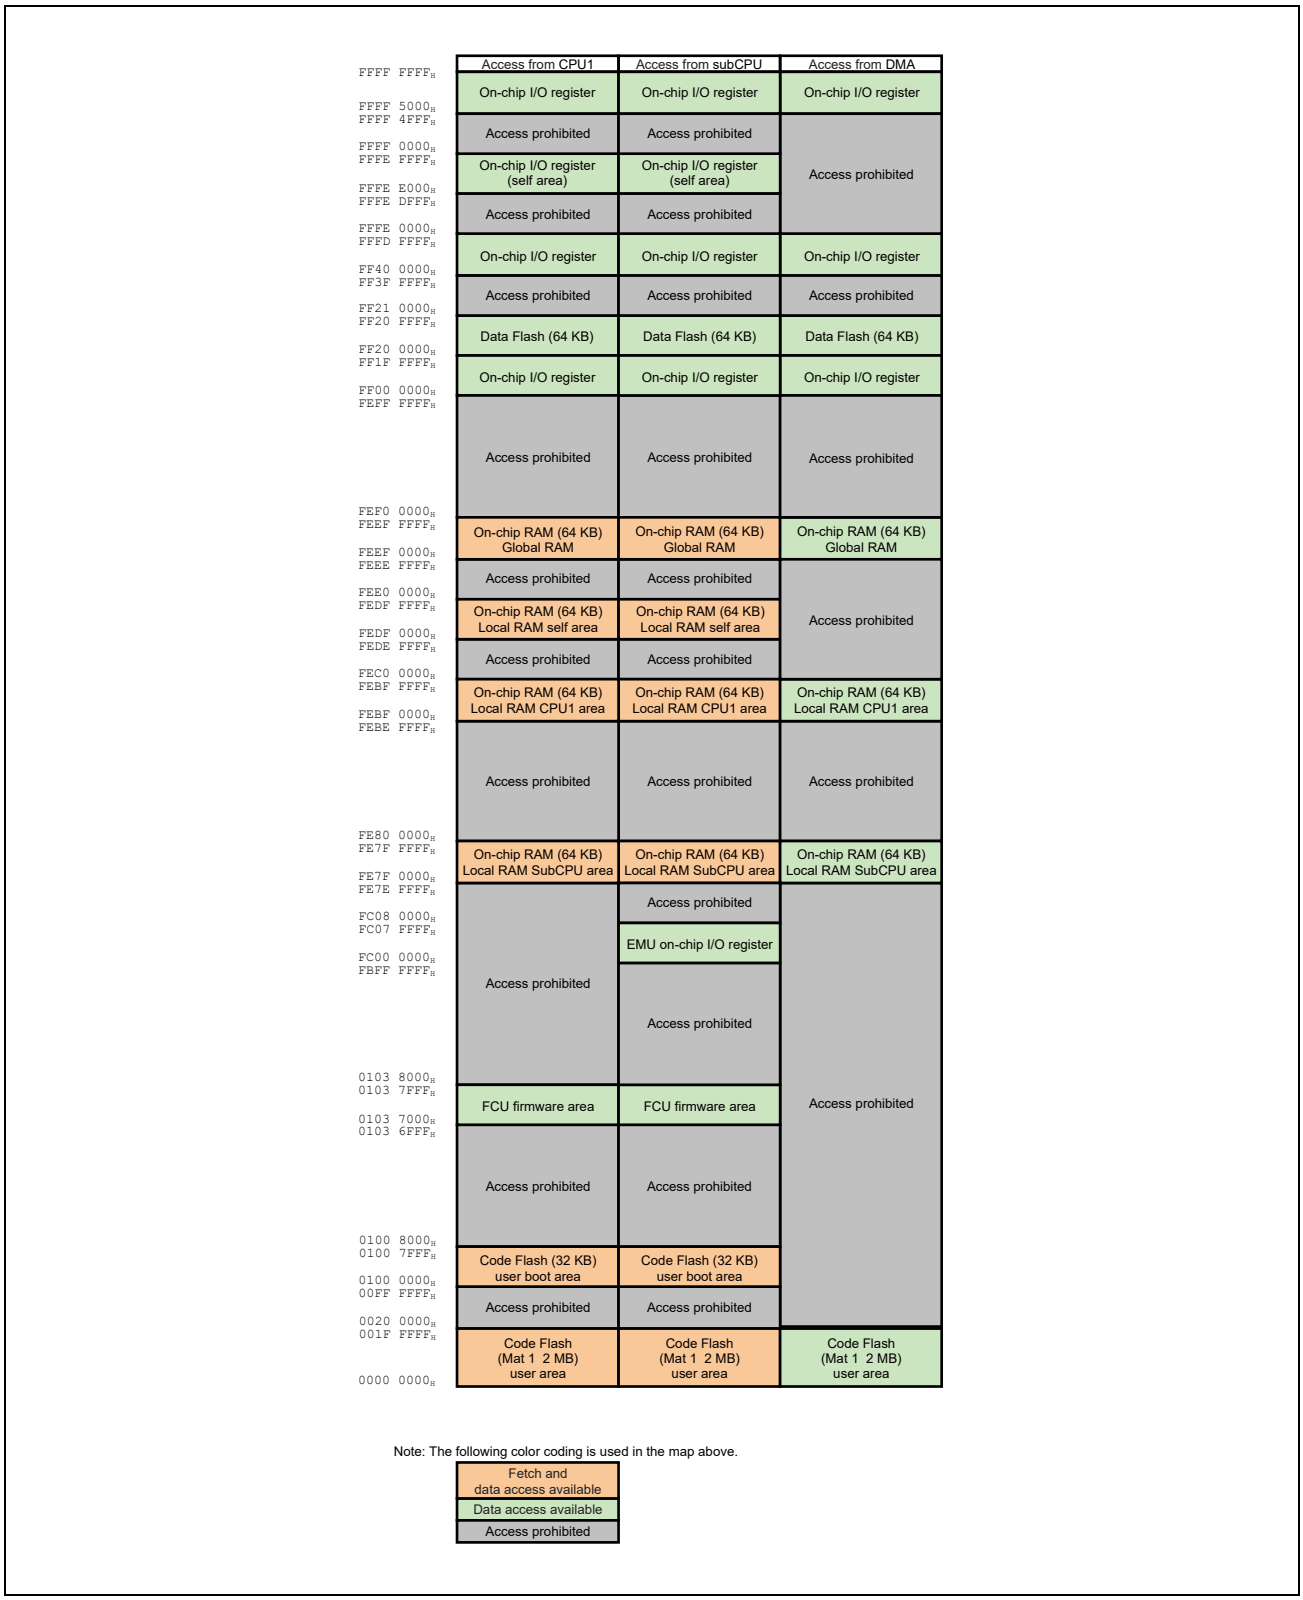

Figure 4.2 Address Space Viewed from Each Bus Master (C1M-A1)

4.1.4 Global RAM Area

Figure 4.3 and **Figure 4.4** show the address map of the global RAM of C1M-A2 and C1M-A1, respectively. The global RAM of C1M-A2 is divided into two, bank A and bank B. Different banks can be accessed concurrently.

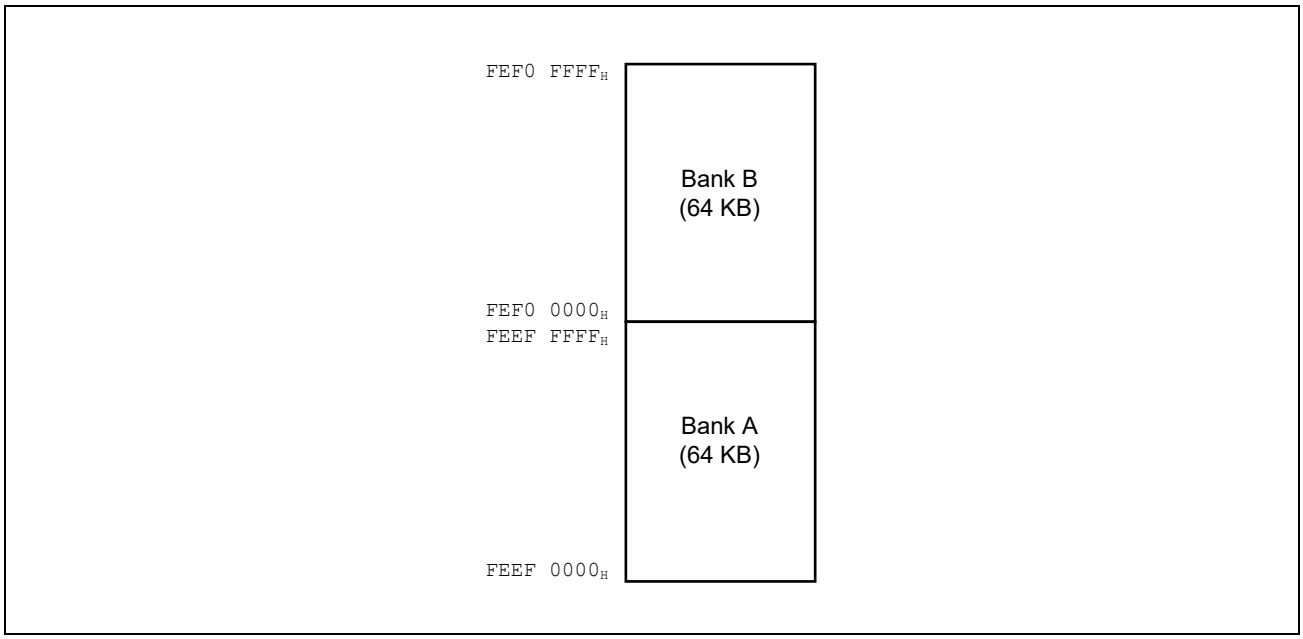

Figure 4.3 GRAM Bank Area (C1M-A2)

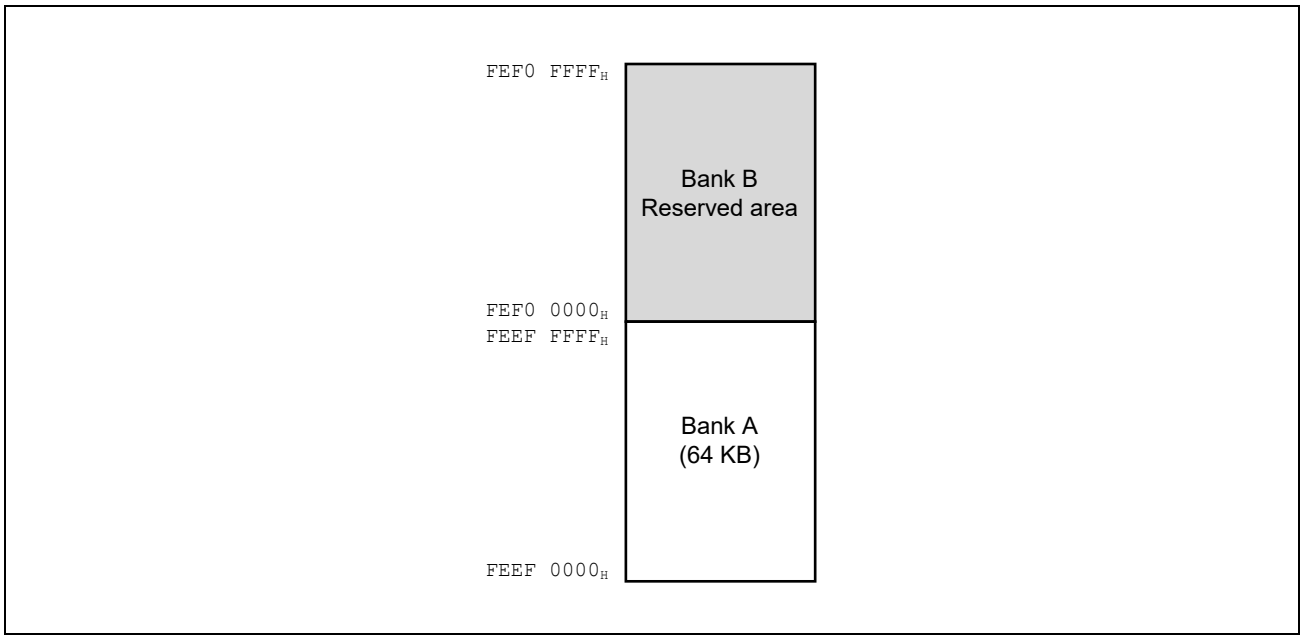

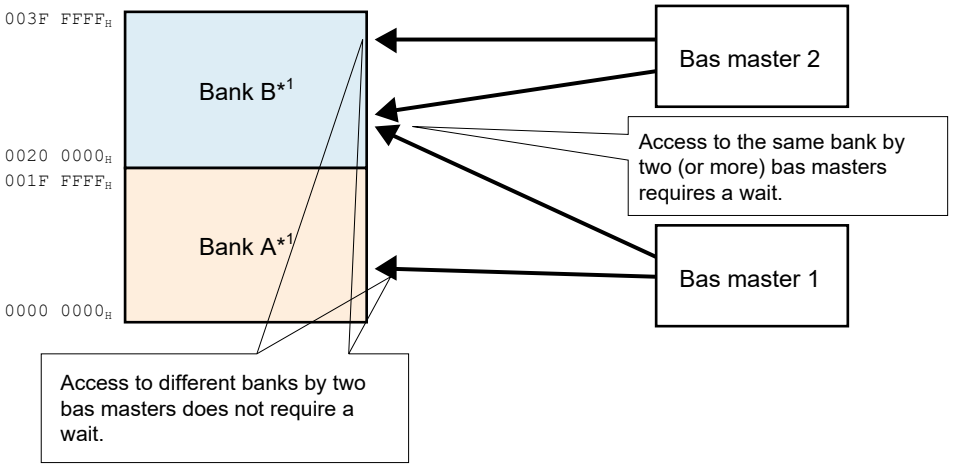

Figure 4.4 GRAM Bank Area (C1M-A1)

4.2 Code Flash Space

4.2.1 Parallel Access to the User Area (C1M-A2)

The user area of the code flash memory is in a two-mat configuration.These two mats are respectively assigned to as bank A and bank B. If one bus master accesses to bank A and another accesses bank B, they can do so without a wait for arbitration of contention for one access path. When multiple bus masters access the same bank, bank A or bank B, access is arbitrated in round-robin fashion.

Note 1. See **Table 4.1** and **Table 4.2** for the memory size of each bank.

Figure 4.5 Access Competition between Bank A and Bank B

Section 5 Operating Mode

5.1 Features

This LSI has three mode pins to determine the operating mode (MD1, MD0, and FLMODE).

5.2 Operating Mode

This LSI has multiple operating modes, which can be selected with the three pins (MD1, MD0, and FLMODE) and the setting of STMSEL1/STMSEL0 in option byte 0. For the procedures to set STMSEL1/STMSEL0, see **Section 35, Flash Memory**. **Table 5.1** shows the list of the operating modes.

Table 5.1 Selection of Operating Mode

Value Set in the Pin			Value Set in the Option Byte Register 0		Operating Mode	Startup Area	Type of IF*1	Remark
MD1	MD0	FLMODE	STMSEL1	STMSEL0				
0	0	0	0	0	User boot mode	User area	The interface can be selected by OPBT2 in the option byte area. For details, see **Section 35.9.2 OPBT2 — Option Byte 2 Register**.	On-chip debug is available.
0	0	0	0	1	User boot mode	User boot area		
0	0	0	1	X	Serial programming mode	Boot area	Writer I/F (2-line UART)	Serial programming is available.
0	0	1	X	X	Boundary scan mode	—	JTAG	Boundary scan is available.
0	1	0	X	X	Serial programming mode	Boot area	Writer I/F (2-line UART)	Serial programming is available.
0	1	1	X	X	Serial programming mode	Boot area	Writer I/F (3-line clock synchronous connection)	Serial programming is available.

Note: X = Don't care

Note 1. See **Section 2.4.3, Pin State** for the functions and states of pins when each interface is selected.

5.2.1 User Boot Mode

After release from the reset state, instruction fetch is carried out from the user boot area or the user area.

5.2.2 Serial Programming Mode

After release from the reset state, the LSI boots up from the on-chip boot program and starts connection in the specified transmission method. For details, see **Section 35, Flash Memory**.

5.2.3 Boundary Scan Mode

This is a mode to use the boundary scan function in accordance with the standard of IEEE1149.1. For details, see **Section 38, Boundary Scan**.

Section 6 Interrupt

The interrupt controllers (INTC) judge the priority levels of interrupt sources and control interrupt requests for the CPU. The INTC has registers for setting the order of priority for all of the interrupts, and processing of the interrupts is in accord with the order of priority set by the user in these registers.

6.1 Overview

- Distribution of interrupt requests from one source to more than one core is supported.
  - Interrupt requests from one source are distributable to more than one CPU core (specifically, to CPU1 and CPU2)
  - Target interrupt sources: 1 FE level interrupt and EI level interrupt C1M-A1: 21 sources/C1M-A2: 26 sources
  - Some interrupt sources can be distributed to the SubCPU in EMU3 simultaneously.
- Interrupt sources
  - FE level interrupts
    ECM interrupt (FEINT) (1 source)
  - EI level interrupts (maskable) (EIINT)
    High-speed interrupts (EIINT0 to EIINT31) C1M-A1: 21 sources/C1M-A2: 26 sources
    - Inter-processor interrupts
    - ECM interrupts
    - External interrupts (IRQ)
    - Software interrupts (SINT)
    - Interrupts from the fixed-period timer (OSTM)
    - DMA error notification interrupts
  - Low-speed interrupts (EIINT32 to EIINT383) C1M-A1: 221 sources/C1M-A2: 287 sources
    - Interrupts from timers
    - Transfer-related interrupts
    - Interrupts from the ADC
    - Interrupts from the DMAC and DTS
    - ICU-S interrupt
- Able to set up the order of priority for interrupts
  384 interrupt control registers are provided so that one of 16 priority levels is assignable to the IRQ (external) and other maskable interrupts thus placing each of the interrupt requests in an order of priority.
- Sensing of external interrupts (IRQ)For IRQ sources, the low level, the high level, falling edges, and rising edges are selectable.
- Two ways to specify the addresses of the interrupt handlers:
  through direct branching or with reference to a table.
- Inter-processor interrupts
  High-speed interrupts between CPU1 and CPU2 are available.
- Software interrupts (SINT)
  The software interrupt registers are accessible from programs and can be used to generate changes to the order of priority as desired.
- Sharing interrupt sources
  Exception handler addresses are reduced by merging multiple interrupt sources.

Interrupts are controlled by the following interrupt controllers.

- INTC1
  CPU1, CPU2, and the SubCPU in EMU3 have their own interrupt controllers.
  Each CPU accesses to the INTC1 register that corresponds to respective CPUs.
  INTC1 controls high-speed interrupts, and has the following functions:
  - Priority order setting
  - Interrupt mask setting
- INTC2
  INTC2 is a common interrupt controller that CPU1, CPU2, and the SubCPU in EMU3 share.
  INTC2 controls low-speed interrupts, and has the following functions:
  - Priority order setting
  - Interrupt mask setting
  - Binding setting

6.2 Register Specifications

The INTC contains the registers listed in the table below. These registers are used to specify the interrupt priority and control the detection of external interrupt input signals.

6.2.1 Configuration of Registers

Table 6.1 Interrupt Control

Module Name	Address	Register Symbol	Register Name	R/W	Value after Reset
INTC1 (EIC0 to EIC31)	FFFE EA00$_H$ to FFFE EA3E$_H$ (EIC0 to EIC31)	EICn*1	EI level interrupt control register	R/W	008F$_H$*2 808F$_H$*3
INTC2 (EIC32 to EIC383)	FFFF B040$_H$ to FFFF B2FE$_H$ (EIC32 to EIC383)				
INTC1 (IMR0)	FFFE EAF0$_H$ (IMR0)	IMRn*4	EI level interrupt mask register	R/W	FFFF FFFF$_H$
INTC2 (IMR1 to IMR11)	FFFF B404$_H$ to FFFF B42C$_H$ (IMR1 to IMR11)				
INTC1 (EIBD0 to EIBD031)	FFFE EB00$_H$ to FFFE EB7C$_H$ (EIBD0 to EIBD31)	EIBDn*5	EI level interrupt bind register	R/W	*6
INTC2 (EIBD32 to EIBD383)	FFFF B880$_H$ to FFFF BDFC$_H$ (EIBD32 to EIBD383)				

Note 1. n = 0 to 383

Note 2. This is the case when an edge is detected.

Note 3. This is the case when a level signal is detected.

Note 4. n = 0 to 11

Note 5. n = 0 to 383

Note 6. n = 0 to 31: Same as the PEID bits
n = 32 to 383: 0000 0001$_H$

Among the registers shown in **Table 6.1**, the EIC0 to EIC31, IMR0, and EIBD0 to EIBD31 are located in INTC1 of the CPU Peripheral area included in each CPU. Each register of these only can be accessed from CPU1, CPU2, or the SubCPU in EMU3 which includes it. Writing is only possible in supervisor mode (PSW.UM = 0).
Of the registers listed in **Table 6.1**, EIC32 to EIC383, IMR1 to IMR11, and EIBD32 to EIBD383 are located in INTC2 in Peripheral Group 0. Writing to these registers is only possible in supervisor mode for CPU bound to EIBDn (n = 32 to 383). When writing to IMR1 to IMR11, only the bits corresponding to the conditions described above are overwritten; other bits are not updated.

In the register areas listed in **Table 6.1**, the values of those listed as reserved for the given channel numbers in **Table 6.11** must retain their initial values.

Table 6.2 External Interrupts and Software Interrupts

Module Name	Address	Register Symbol	Register Name	R/W	Value after Reset
EINT	FFC0 0010$_H$	EXINTCTL	External interrupt control register	R/W	0000$_H$
EINT	FFC0 0014$_H$	EXINTSTR	External interrupt status register	R	00$_H$
EINT	FFC0 0018$_H$	EXINTSTC	External interrupt status clear register	W	00$_H$
EINT	FFC0 0020$_H$	SINTR0	Software interrupt register	R/W	00$_H$
EINT	FFC0 0024$_H$	SINTR1	Software interrupt register 1	R/W	00$_H$
EINT	FFC0 0028$_H$	SINTR2	Software interrupt register 2	R/W	00$_H$
EINT	FFC0 002C$_H$	SINTR3	Software interrupt register 3	R/W	00$_H$
EINT	FFC0 0030$_H$	SINTR4	Software interrupt register 4	R/W	00$_H$
EINT	FFC0 0034$_H$	SINTR5	Software interrupt register 5	R/W	00$_H$
EINT	FFC0 0038$_H$	SINTR6	Software interrupt register 6	R/W	00$_H$
EINT	FFC0 003C$_H$	SINTR7	Software interrupt register 7	R/W	00$_H$
EMUEINT	FFC0 1020$_H$	ESINTR0	EMU software interrupt register	R/W	00$_H$
EMUEINT	FFC0 1024$_H$	ESINTR1	EMU software interrupt register 1	R/W	00$_H$
EMUEINT	FFC0 1028$_H$	ESINTR2	EMU software interrupt register 2	R/W	00$_H$
EMUEINT	FFC0 102C$_H$	ESINTR3	EMU software interrupt register 3	R/W	00$_H$
EMUEINT	FFC0 1030$_H$	ESINTR4	EMU software interrupt register 4	R/W	00$_H$
EMUEINT	FFC0 1034$_H$	ESINTR5	EMU software interrupt register 5	R/W	00$_H$
EMUEINT	FFC0 1038$_H$	ESINTR6	EMU software interrupt register 6	R/W	00$_H$
EMUEINT	FFC0 103C$_H$	ESINTR7	EMU software interrupt register 7	R/W	00$_H$

Table 6.3 Interrupt Merge Functions

Module Name	Address	Register Symbol	Register Name	R/W	Value after reset
INTIF	FFF9 8000$_H$	PINT0	Peripheral interrupt status register 0	R	0000 0000$_H$
INTIF	FFF9 8004$_H$	PINT1	Peripheral interrupt status register 1	R	0000 0000$_H$
INTIF	FFF9 8008$_H$	PINT2	Peripheral interrupt status register 2	R	0000 0000$_H$
INTIF	FFF9 800C$_H$	PINT3	Peripheral interrupt status register 3	R	0000 0000$_H$
INTIF	FFF9 8010$_H$	PINT4	Peripheral interrupt status register 4	R	0000 0000$_H$
INTIF	FFF9 8014$_H$	PINT5	Peripheral interrupt status register 5	R	0000 0000$_H$
INTIF	FFF9 8018$_H$	PINT6	Peripheral interrupt status register 6	R	0000 0000$_H$
INTIF	FFF9 801C$_H$	PINT7	Peripheral interrupt status register 7	R	0000 0000$_H$
INTIF	FFF9 8020$_H$	PINTCLR0	Peripheral interrupt status clear register 0	W	0000 0000$_H$
INTIF	FFF9 8024$_H$	PINTCLR1	Peripheral interrupt status clear register 1	W	0000 0000$_H$
INTIF	FFF9 8028$_H$	PINTCLR2	Peripheral interrupt status clear register 2	W	0000 0000$_H$
INTIF	FFF9 802C$_H$	PINTCLR3	Peripheral interrupt status clear register 3	W	0000 0000$_H$
INTIF	FFF9 8030$_H$	PINTCLR4	Peripheral interrupt status clear register 4	W	0000 0000$_H$
INTIF	FFF9 8034$_H$	PINTCLR5	Peripheral interrupt status clear register 5	W	0000 0000$_H$
INTIF	FFF9 8038$_H$	PINTCLR6	Peripheral interrupt status clear register 6	W	0000 0000$_H$
INTIF	FFF9 803C$_H$	PINTCLR7	Peripheral interrupt status clear register 7	W	0000 0000$_H$

6.2.2 EI Level Interrupt Control Registers 0 to 383 (EIC0 to EIC383)

One of these registers is provided for every EI level interrupt source. The registers are used to configure the conditions of control for each source. For each source, see **Table 6.11** and **Table 6.12**.

CAUTION

If 0 is written to the EIRFn bit immediately after a peripheral module generates the corresponding interrupt request upon detection of an edge (before an interrupt is accepted by the CPU), the request may be lost.

Writing 1 to the EIRFn bit immediately after an interrupt is accepted by the CPU may lead to re-issuing of the request.

This includes the use of bit-manipulation instructions (set1, clr1, and not1) for writing to any of these registers. For bit-manipulation instructions, see also **Section 3.4.2, Access to Registers by Bit-Manipulation Instructions.**

Executing a bit-manipulation instruction to the lower bytes including the EIMKn bit has no effect on the EIRFn bit.

Note 1. 0: Edge detection
1: Level detection

Table 6.4 EIC0-EIC383 EIC Register Contents (1/2)

Bit Position	Bit Name	Function
15	EICTn	This is the interrupt channel type bit. The values listed below are read in accord with the interrupt input interface. The bit is read-only. 0: Edge detection 1: Level detection When writing to this bit, write the value after reset.
14, 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12	EIRFn	This is an interrupt request flag. The operation of the flag depends on the interrupt input interface. 0: No interrupt request is made (initial value) 1: Interrupt request is made. • Edge detection When the CPU core has accepted an interrupt request on its own channel, the request is automatically cleared. This bit may be set and cleared by software. • Level detection Setting and clearing of the bit by software is not possible. That is, the bit is read-only in this case.
11 to 8	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Table 6.4 EIC0-EIC383 EIC Register Contents (2/2)

Bit Position	Bit Name	Function
7	EIMKn	This is an interrupt mask bit. Setting this bit masks interrupt requests set in the interrupt request flag (EIRFn), i.e. it may be used to obstruct interrupt requests from the given channel to the CPU core. Furthermore, clearing of the PMEI bit in the ICSR does not proceed in response to notification of the presence of an interrupt that has not been processed on the channel for which this bit has been set. This bit does not mask input from an interrupt input pin, so the interrupt request flag still gets set even if this bit is set. The setting of this bit also reflects the setting in the interrupt mask register (IMR). 0: Interrupt processing is enabled. 1: Interrupt processing is disabled (initial value)
6	EITBn	This bit is used to select the method of detection for the interrupt. 0: Direct jumping to an address determined from the level of priority 1: Reference to a table
5, 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3 to 0	EIPn	These bits specify the interrupt priority as one of 16 levels, with 0 as the highest and 15 as the lowest. When multiple EI level-interrupt requests are made simultaneously, the interrupt from the source with the highest priority setting in these bits is selected and conveyed to the CPU core. When these bits specify the same priority level for simultaneously occurring interrupt requests, the source with the lower channel number takes priority. This order is fixed.

Note: n = 0 to 383

Leave registers corresponding to channel numbers listed as reserved in **Table 6.11** and **Table 6.12** at their values following a reset.

6.2.3 EI Level Interrupt Mask Registers 0 to 11 (IMR0 to IMR11)

These registers are a collection of the EIMK bits of the EIC registers. Each bit of IMRn reflects the setting of the corresponding EIMK bit. Setting IMRn is reflected in the corresponding EIMK bit.

IMR0

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

6.2.4 EI Level Interrupt Bind Registers 0 to 383 (EIBD0 to EIBD383)

An EIBD register is provided per EI level INT source and establishes association between the sources and CPUs. For each source, see **Table 6.11** and **Table 6.12.**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. EIBD32 to 383: 001

Table 6.5 EIBD0-EIBD383 Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
17, 16	GPID	These bits are only present in EIBD32 to EIBD383. Used them to check the PEID settings as listed below. 00: The PEID bits are selecting CPU1 as the target for binding. 01: The PEID bits are selecting CPU2 as the target for binding. 02: The PEID bits are selecting the SubCPU in EMU3 as the target for binding. These bits are reserved in registers EIBD0 to EIBD31. When writing, set the value for these bits to 0. When read, the bits are always read as 0.
15 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2 to 0	PEID	These bits specify the destination to which the interrupt request is bound. However, the PEID bits in the EIBD0 to EIBD31 registers are fixed, and so the values of these bits cannot be changed in those registers. 001: The interrupt is bound to CPU1. 010: The interrupt is bound to CPU2. 011: The interrupt is bound to the SubCPU in EMU3. Always make either of the above settings if interrupts from the corresponding source are to be executed.

Note: Leave registers corresponding to channel numbers listed as reserved in **Table 6.11** at their values following a reset.

CAUTION

Changing the value of the corresponding EIBDn register during the processing of an EIINT request is prohibited.

6.2.5 EXINTCTL — External Interrupt Control Register

This 16-bit register is used to specify the low level, the high level, falling edges, or rising edges as the sense for detection of the individual external interrupts input through the IRQ0 to IRQ7 pins.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IRQ7S		IRQ6S		IRQ5S		IRQ4S		IRQ3S		IRQ2S		IRQ1S		IRQ0S	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 6.6 EXINTCTL Register Contents

Bit Position	Bit Name	Function
15, 14	IRQ7S	External Interrupt Sense Select Each pair of bits is used to select the low level, the high level, falling edges, or rising edges as the sense for detection of interrupt signals on a pin from among IRQ0 to IRQ7. 00: Interrupt requests are detected as the low level on the IRQn input.*1 01: Interrupt requests are detected as the high level on the IRQn input.*1 10: Interrupt requests are detected as falling edges on the IRQn input. 11: Interrupt requests are detected as rising edges on the IRQn input.
13, 12	IRQ6S	
11, 10	IRQ5S	
9, 8	IRQ4S	
7, 6	IRQ3S	
5, 4	IRQ2S	
3, 2	IRQ1S	
1, 0	IRQ0S	

Note 1. When the sense setting is for level detection, the active level should be retained until an interrupt request is accepted.

6.2.6 EXINTSTR — External Interrupt Status Register

EXINTSTR is an eight-bit register that indicates interrupt requests via the external interrupt input pins (IRQ0 to IRQ7). When the sense setting for a given interrupt from among IRQ0 to IRQ7 is for edge detection, register EXINTSTC can be used to clear the corresponding flag in this register.

Bit	7	6	5	4	3	2	1	0
	IRQ7F	IRQ6F	IRQ5F	IRQ4F	IRQ3F	IRQ2F	IRQ1F	IRQ0F
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 6.7 EXINTSTR Register Contents

Bit Position	Bit Name	Function
7	IRQ7F	External Interrupt Request These bits form a table that indicates the states of interrupt requests from IRQ0 to IRQ7. • When level detection is selected 0: An interrupt request is not present on IRQn. 1: An interrupt request is present on IRQn. [Clearing condition] The level selected by the IRQn1S and IRQn0S bits in the EXINTCTL register not being on the corresponding IRQn. [Setting condition] The level selected by the IRQn1S and IRQn0S bits in the EXINTCTL register being on the corresponding IRQn. • When edge detection is selected 0: An IRQn interrupt request has not been detected. 1: An IRQn interrupt request has been detected. [Clearing condition] 1 is written to an IRQnC bit in the EXINTSTC register. [Setting condition] The edge selected by the IRQn1S and IRQn0S bits in the EXINTCTL register having been generated.
6	IRQ6F	
5	IRQ5F	
4	IRQ4F	
3	IRQ3F	
2	IRQ2F	
1	IRQ1F	
0	IRQ0F	

Note: n = 0 to 7

6.2.7 EXINTSTC — External Interrupt Status Clear Register

Register EXINTSTC is an eight-bit register that is used to clear IRQnF bits in EXINTSTR for which edge detection has been selected as the method of sensing. When this is the case, writing 1 to an IRQnC bit clears the corresponding IRQnF in EXINTSTR if the interrupt has been detected.

Bit	7	6	5	4	3	2	1	0
	IRQ7C	IRQ6C	IRQ5C	IRQ4C	IRQ3C	IRQ2C	IRQ1C	IRQ0C
Value after reset	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W

Table 6.8 EXINTSTC Register Contents

Bit Position	Bit Name	Function
7	IRQ7C	External Interrupt Request Clear When edge detection has been selected as the method of sensing for an IRQ0 to IRQ7, the corresponding bit is used to clear the status flag that indicates the interrupt request. • When level detection is selected The bits have no function. • When edge detection is selected Writing 1 to an IRQnC bit clears the corresponding IRQnF in EXINTSTR.
6	IRQ6C	
5	IRQ5C	
4	IRQ4C	
3	IRQ3C	
2	IRQ2C	
1	IRQ1C	
0	IRQ0C	

Note: n = 0 to 7

6.2.8 SINTR0 to SINTR7 — Software Interrupt Register

These eight-bit registers are used to control software interrupts 0 to 7 (SINT0 to SINT7).

Writing 01_H to one of these registers increments the value in the counter; writing 00_H decrements it. If the resulting counter value is one or more, the corresponding interrupt from among software interrupts 0 to 7 (SINT0 to SINT7) is generated.

Reading produces the current value of the counter.

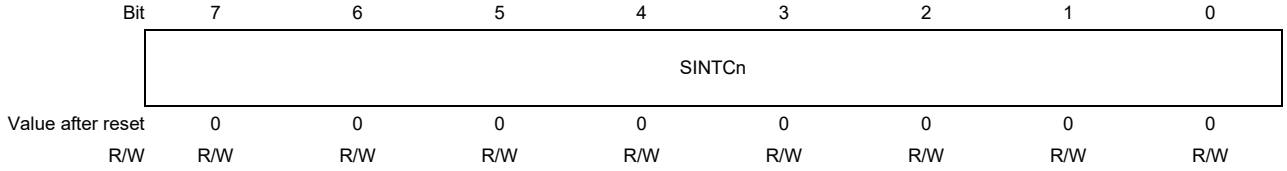

Table 6.9 SINTR0 to SINTR7 Register Contents

Bit Position	Bit Name	Function
7 to 0	SINTCn[7:0]	Software Interrupt Request These bits are used to generate software interrupt requests. [Reading] The value counted number of times counted by the SINTn interrupt request counter is read out. [Writing] Writing 01_H increments the counter.*1 Writing 00_H decrements the counter.*2

Note 1. When 01_H is written to the register while the value of the counter is FF_H, the counter is not incremented and its value remains FF_H.

Note 2. When 00_H is written to the register while the value of the counter is 00_H, the counter is not decremented and its value remains 00_H.

6.2.9 ESINTR0 to ESINTR7 — EMU Software Interrupt Register

These eight-bit registers are used to control EMU software interrupts 0 to 7 (ESINT0 to ESINT7).

Writing 01_H to one of these registers increments the value in the counter; writing 00_H decrements it. If the resulting counter value is one or more, the corresponding interrupt from among EMU software interrupts 0 to 7 (ESINT0 to ESINT7) is generated.

Reading produces the current value of the counter.

Bit	7	6	5	4	3	2	1	0
	ESINTCn7	ESINTCn6	ESINTCn5	ESINTCn4	ESINTCn3	ESINTCn2	ESINTCn1	ESINTCn0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 6.10 ESINTR0 to ESINTR7 Register Contents

Bit Position	Bit Name	Function
7 to 0	ESINTCn[7:0]	EMU Software Interrupt Request These bits are used to generate EMU software interrupt requests. [Reading] The value counted number of times counted by the ESINTn interrupt request counter is read out. [Writing] Writing 01_H increments the counter.*1 Writing 00_H decrements the counter.*2

Note 1. When 01_H is written to the register while the value of the counter is FF_H, the counter is not incremented and its value remains FF_H.

Note 2. When 00_H is written to the register while the value of the counter is 00_H, the counter is not decremented and its value remains 00_H.

6.2.10 PINT0 to PINT7, PINTCLR0 to PINTCLR7 — Peripheral Interrupt Status Registers and Peripheral Interrupt Status Clear Registers

The DTS transfer completion interrupts and transfer count match interrupts are merged in 32-channel units. PINT0 to PINT7 contain the interrupt status flags to indicate the originating channels for the actual interrupts. When multiple interrupt sources are generated within the same register among PINT0 to PINT7, only the single bit on the lower-order side is set.

Interrupt request flags that have been set are cleared from within the interrupt handlers by reading the value of a peripheral interrupt status register (from PINT0 to PINT7) and writing that value to the interrupt clear register (from PINTCLR0 to PINTCLR7) that corresponds to the interrupt channel.

PINT0

Bit Position	Bit Name	Function
31 to 0	INTDTS[31:0]	States of DTS transfer completion interrupts from channel 31 to channel 0

PINT1

Bit Position	Bit Name	Function
31 to 0	INTDTS[63:32]	States of DTS transfer completion interrupts from channel 63 to channel 32

PINT2

Bit Position	Bit Name	Function
31 to 0	INTDTS[95:64]	States of DTS transfer completion interrupts from channel 95 to channel 64

PINT3

Bit Position	Bit Name	Function
31 to 0	INTDTS[127:96]	States of DTS transfer completion interrupts from channel 127 to channel 96

PINT4

Bit Position	Bit Name	Function
31 to 0	INTCTDTS[31:0]	States of DTS transfer count match interrupts from channel 31 to channel 0

PINT5

Bit Position	Bit Name	Function
31 to 0	INTCTDTS[63:32]	States of DTS transfer count match interrupts from channel 63 to channel 32

PINT6

Bit Position	Bit Name	Function
31 to 0	INTCTDTS[95:64]	States of DTS transfer count match interrupts from channel 95 to channel 64

PINT7

Bit Position	Bit Name	Function
31 to 0	INTCTDTS[127:96]	States of DTS transfer count match interrupts from channel 127 to channel 96

PINTCLR0

Bit Position	Bit Name	Function
31 to 0	INTCLR[31:0]	The respective bits clear the corresponding flags for the DTS channel 31 to channel 0 transfer completion interrupts. Write the value read from PINT0 to this register from within the interrupt handler.

PINTCLR1

Bit Position	Bit Name	Function
31 to 0	INTCLR[63:32]	The respective bits clear the corresponding flags for the DTS channel 63 to channel 32 transfer completion interrupts. Write the value read from PINT1 to this register from within the interrupt handler.

PINTCLR2

Bit Position	Bit Name	Function
31 to 0	INTCLR[95:64]	The respective bits clear the corresponding flags for the DTS channel 95 to channel 64 transfer completion interrupts. Write the value read from PINT2 to this register from within the interrupt handler.

PINTCLR3

Bit Position	Bit Name	Function
31 to 0	INTCLR[127:96]	The respective bits clear the corresponding flags for the DTS channel 127 to channel 96 transfer completion interrupts. Write the value read from PINT3 to this register from within the interrupt handler.

PINTCLR4

Bit Position	Bit Name	Function
31 to 0	INTCTCLR[31:0]	The respective bits clear the corresponding flags for the DTS channel 31 to channel 0 transfer count match interrupts. Write the value read from PINT4 to this register from within the interrupt handler.

PINTCLR5

Bit Position	Bit Name	Function
31 to 0	INTCTCLR[63:32]	The respective bits clear the corresponding flags for the DTS channel 63 to channel 32 transfer count match interrupts. Write the value read from PINT5 to this register from within the interrupt handler.

PINTCLR6

Bit Position	Bit Name	Function
31 to 0	INTCTCLR[95:64]	The respective bits clear the corresponding flags for the DTS channel 95 to channel 64 transfer count match interrupts. Write the value read from PINT6 to this register from within the interrupt handler.

PINTCLR7

Bit Position	Bit Name	Function
31 to 0	INTCTCLR[127:96]	The respective bits clear the corresponding flags for the DTS channel 127 to channel 96 transfer count match interrupts. Write the value read from PINT7 to this register from within the interrupt handler.

6.3 Interrupt Sources

The six types of interrupt source are external interrupts (IRQ), ECM interrupts, inter-processor interrupts, software interrupts, EMU software interrupts, and peripheral module interrupts.

6.3.1 IRQ Interrupts

IRQ interrupts refers to interrupt requests input via pins IRQ0 to IRQ7. The settings of the external interrupt sense select bits (IRQ7S to IRQ0S) in the external interrupt control (EXINTCTL) register select the low level, the high level, falling edges, or rising edges for detection as the IRQ interrupt on each of the corresponding pins. Furthermore, the interrupt control registers set the priority up to 16 levels for each interrupt source.

When the low level is selected for detection as an IRQ interrupt, an interrupt request signal is conveyed to the interrupt controller (INTC) while the low level is on the corresponding pin from among IRQ0 to IRQ7. The request signal is not conveyed when the level becomes high. The active level should be retained until acceptance of the interrupt request. Checking for requests can be done by reading the corresponding IRQ interrupt request bit (IRQ0F to IRQ7F) in the external interrupt status register (EXINTSTR).

When edge detection is selected for an IRQ interrupt, an interrupt request signal is conveyed to the interrupt controller (INTC) when the corresponding change in the level on the given pin from among IRQ0 to IRQ7 occurs.

Reading bits EXINTSTR.IRQ7F to EXINTSTR.IRQ0F checks whether the corresponding IRQ interrupt request is detected. In addition, the IRQ interrupt request can be cleared by writing 1 to the bit corresponding to EXINTSTC when an edge is detected.

When returning from the IRQ interrupt exception handler, clear the external interrupt status register (EXINTSTR) to prevent re-acceptance by mistake, and then issue an instruction to return from interrupt.

6.3.2 ECM Interrupts

The Error Control Module (ECM) generates ECM interrupt requests by merging error interrupts from multiple sources. For details, refer to **Section 30, Error Control Module (ECM)**.

6.3.3 Inter-Processor Interrupts

Four registers (IPIR_CHn) for conveying interrupts between CPU1 and CPU2 are provided. IPIR_CH0 to IPIR_CH3 are assigned to CH0 to CH3 of user interrupt (EIINT). An interrupt for specific CPUs (including own CPU) can be requested by manipulating bits corresponding to respective CPUs.

The order of priority can be set for each source in 16 levels by using the interrupt control registers.

6.3.4 Software Interrupts

The software interrupt (SINT) is generated by setting the SINTR0 to SINTR7 registers. Multiple interrupt requests can be queued.

The order of priority for software interrupts is set for each source in 16 levels by using interrupt control registers.

6.3.5 EMU Software Interrupts

The EMU software interrupt (ESINT) is generated by setting the ESINTR0 to ESINTR7 registers. It is an interrupt source used specifically for the SubCPU in EMU3. Multiple interrupt requests can be queued.

The order of priority for software interrupts is set for each source in 16 levels by using interrupt control registers.

6.3.6 Internal Peripheral Module Interrupts

Internal peripheral module interrupts are interrupts from the internal peripheral modules listed below.

- Code flash and data flash
- Serial communications interface 3 (SCI3)
- OS Timer (OSTM)
- Window watchdog timer (WDTA)
- Motor control timer (TSG3)
- A/D converter (ADCC)
- Clocked Serial Interface H (CSIH)
- CAN interface (RS-CANFD)
- LIN/UART interface (RLIN3)
- Direct memory access controller (DMAC, DTS)
- Enhanced motor control unit (EMU3)
- R/D converter (RDC3A)
- Timer array unit J (TAUJ)
- Timer array unit D (TAUD)
- Encoder timer (ENCA)
- Timer option (TAPA)
- Timer pattern buffer (TPBA)
- Peripheral interconnection 1 (PIC1B)
- A/D converter option (ADPA)
- Intelligent cryptographic unit (ICU-S)

Since each source is allocated a different interrupt vector, there is no need to determine the source from the interrupt exception handling routines. The order of priority for interrupts is set for each source in 16 levels.

6.4 Description of Operations in Terms of Interrupt Exception Handlers and Order of Priority

Interrupt sources, the corresponding source codes, address offsets of the handlers, and interrupt priority levels for CPU1 and CPU2 are listed in **Table 6.11.** EIINT interrupt channel numbers 0 to 7 for the SubCPU in EMU3 differ from those for CPU1 and CPU2. Interrupt sources, the corresponding source codes, address offsets of the handlers, and interrupt priority levels for channel numbers 0 to 7 of the SubCPU in EMU3 are listed in **Table 6.12.** The other channel numbers for CPU1 and CPU2 are the same as those for the SubCPU in EMU3.

Along with the standard specification for the addresses of handlers, where these are determined by the settings of the PSW.EBV bits and the RBASE and EBASE registers within the CPU core, an extended specification where fixed addresses of the handlers for each of the interrupts are set per channel is also available.

In the standard specification, the address of each exception handler is the offset address plus the base address (set in the RBASE and EBASE registers) within the CPU core. Interrupt offsets are determined through the two methods described below. Put briefly, the offset address is specified or determined by the interrupt channel.

- In one method, the address is determined as the priority level set for each channel (0 to 15) plus a value in the range from 100_H to $1F0_H$ regardless of the interrupt channel number (see note 1 under **Table 6.11** and **Table 6.12**)
- In the other method, the addresses are evenly spread across the range of offsets up to 100_H regardless of the priority level. This method has the advantage of reducing the amount of memory taken up for exception handling (see note 2 under **Table 6.11** and **Table 6.12**)

In the extended specification, a table of the addresses of the exception handlers for each of the interrupt channels is kept, and the addresses of the handlers are extracted from this table. The locations for reference in the table are obtained from the formula below (see note 3 under **Table 6.11** and **Table 6.12**). INTBP is the value in the register of that name within the CPU core.

Location for reading the address of the exception handler
= value in the INTBP register + the channel number × 4 (in bytes)

For information about RH850G3MH exceptions, see the *RH850G3MH Series User's Manual: Software*.

For system error exceptions, see **Section 3, CPU System**.

The orders of priority are set per channel to values. When the same priority level is set for two sources, the channel numbers are used to provide fixed priority levels for the sources, and that with the smaller channel number is selected.

Table 6.11 Interrupt Exception Handlers and Orders of Priority (CPU1, CPU2) (1/13)

Function/ Module	Interrupt Source Name	Level Interrupt*	EIINT Interrupt Channel No.	Source Code	Offset Address			Interrupt Priority Order (Initial Value)	Target Device		Default Priority Order

	Reserved		383	117F	*4	*5	+5FCH	0 to 15 (15)	×	×	*6

Note: Withdrawing an interrupt request in the form of a level interrupt requires clearing the given bit in the status register of the corresponding module from within the interrupt processing routing. For information about clearing the status register, see **Section 3.4.1, Synchronizing Completion of Store Instruction and Generation of Subsequent Instruction**. The EICn.EICTn bit is 1. Software cannot clear the EICN.EIRFn bit.

Note 1. See **Section 6.4, Description of Operations in Terms of Interrupt Exception Handlers and Order of Priority**.

Note 2. See **Section 6.4, Description of Operations in Terms of Interrupt Exception Handlers and Order of Priority**.

Note 3. See **Section 6.4, Description of Operations in Terms of Interrupt Exception Handlers and Order of Priority**.

Note 4. The offset address does not vary depending on the channel. It should be selected from addresses $+100_H$ to $+1F0_H$ based on the order of priority.

Note 5. All the offset addresses are $+100_H$ regardless of the order of priority because of offset address reduction.

Note 6. Items are in descending order of priority from top to bottom.

Note 7. See the *RH850/C1M-A Flash Memory User's Manual: Hardware Interface*.

Function/ Module	Interrupt Source Name	Level Interrupt*	EIINT Interrupt Channel	Source Code	Offset Address			Interrupt Priority Order (Initial Value)	Default Priority Order
					Direct Branching RINT=0*1	Direct Branching RINT=1*2	Reference to a Table*3		
ESINT (EMU software interrupt)	ESINT0 interrupt	√	0	1000	*4	*5	$+000_H$	0 to 15 (15)	*6
	ESINT1 interrupt	√	1	1001	*4	*5	$+004_H$	0 to 15 (15)	*6
	ESINT2 interrupt	√	2	1002	*4	*5	$+008_H$	0 to 15 (15)	*6
	ESINT3 interrupt	√	3	1003	*4	*5	$+00C_H$	0 to 15 (15)	*6
	ESINT4 interrupt	√	4	1004	*4	*5	$+010_H$	0 to 15 (15)	*6
	ESINT5 interrupt	√	5	1005	*4	*5	$+014_H$	0 to 15 (15)	*6
	ESINT6 interrupt	√	6	1006	*4	*5	$+018_H$	0 to 15 (15)	*6
	ESINT7 interrupt	√	7	1007	*4	*5	$+01C_H$	0 to 15 (15)	*6

Remark: For information about channels other than EIINT interrupt channels 0 to 7, see **Table 6.11**.

Note: Withdrawing an interrupt request in the form of a level interrupt requires clearing the given bit in the status register of the corresponding module from within the interrupt processing routing. For information about clearing the status register, see **Section 3.4.1, Synchronizing Completion of Store Instruction and Generation of Subsequent Instruction**. The EICn.EICTn bit is 1. Software cannot clear the EICN.EIRFn bit.

Note 1. See **Section 6.4, Description of Operations in Terms of Interrupt Exception Handlers and Order of Priority**.

Note 2. See **Section 6.4, Description of Operations in Terms of Interrupt Exception Handlers and Order of Priority**.

Note 3. See **Section 6.4, Description of Operations in Terms of Interrupt Exception Handlers and Order of Priority**.

Note 4. The offset address does not vary depending on the channel. It should be selected from addresses $+100_H$ to $+1F0_H$ based on the order of priority.

Note 5. All the offset addresses are $+100_H$ regardless of the order of priority because of offset address reduction.

Note 6. Items are in descending order of priority from top to bottom.

6.5 Operation

6.5.1 External Interrupts(IRQ)

Externally input interrupts are IRQ. Four sensing methods are available for IRQ. Regarding the flow of interrupt, see **Section 6.5.6, Flow of Interrupt Processing**.

6.5.2 Inter-Processor Interrupts

For operational description, see **Section 3.2.3.1, Inter-Processor Interrupt Control Registers** and **Section 6.5.6.2, Inter-Processor Interrupt Flow**.

6.5.3 Software Interrupts

Regarding operations in relation to these interrupts, see **Section 6.2.8, SINTR0 to SINTR7 — Software Interrupt Register** for a description of the registers, and **Section 6.5.6, Flow of Interrupt Processing**.

6.5.4 EMU Software Interrupts

Regarding operations in relation to these interrupts, see **Section 6.2.9, ESINTR0 to ESINTR7 — EMU Software Interrupt Register** and **Section 6.5.6, Flow of Interrupt Processing**.

6.5.5 Merging of DTS Interrupts

Each set of 32 of the 128 transfer completion interrupts and 128 transfer count match interrupts from the DTS is gathered to produce a single interrupt signal.

When multiple interrupt source conditions are satisfied, only the single bit on the lower-order side of the corresponding bits in the status registers (PINT0 to PINT7) is set to judge which interrupt is accepted. For the flow of interrupts in the merging of DTS interrupts, see **Section 6.5.6, Flow of Interrupt Processing**.

Table 6.13 Interrupt Related Registers of the DTS

Interrupt Sources	Channel	Status Register	Clear Register
DTS transfer completion interrupt	0 to 31	PINT0	PINTCLR0
	32 to 63	PINT1	PINTCLR1
	64 to 95	PINT2	PINTCLR2
	96 to 127	PINT3	PINTCLR3
DTS transfer count match interrupt	0 to 31	PINT4	PINTCLR4
	32 to 63	PINT5	PINTCLR5
	64 to 95	PINT6	PINTCLR6
	96 to 127	PINT7	PINTCLR7

6.5.6 Flow of Interrupt Processing

6.5.6.1 Flow of Processing for External Interrupts

Figure 6.1 shows an example of the flow of IRQ (external interrupt) processing.

- Set the EXINTCTL register to select the method of detection (edge detection or level detection) for the IRQ.
- After detection of an IRQ, an interrupt request is issued to the INTC.
- After recovery on completion of interrupt processing within the INTC in the case of level detection, confirm that the IRQn pin is negated before issuing the instruction to return from the interrupt.
- After recovery on completion of interrupt processing within the INTC in the case of edge detection, clear the interrupt request bit in the EXINTSTR register, and then issue the instruction to return from the interrupt.

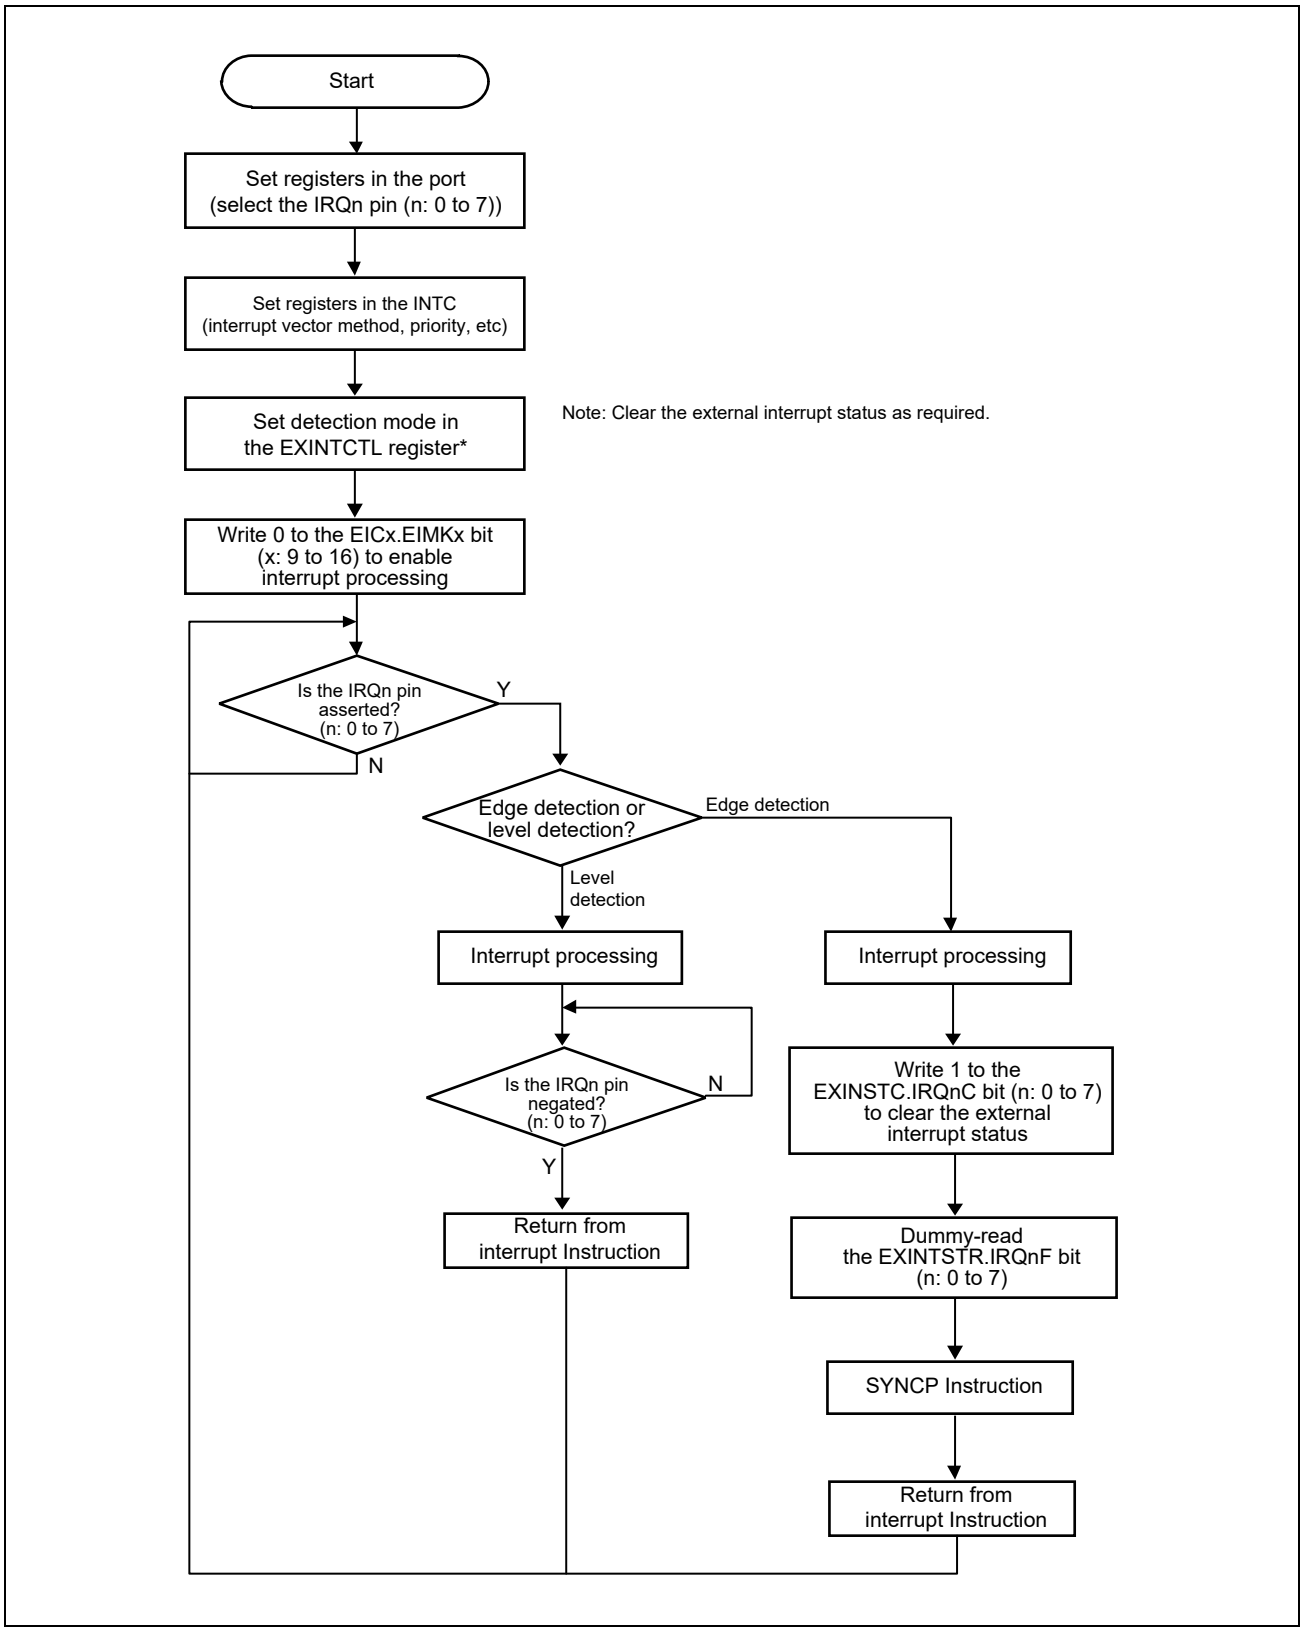

Figure 6.1 Example of External Interrupt Processing Flow

6.5.6.2 Inter-Processor Interrupt Flow

Figure 6.2 shows an example of the flow of inter-processor interrupt processing.

- Inter-processor interrupting generates an interrupt request by writing 1 to applicable bits of CPU to which interrupts of the inter-PE interrupt registers (IPIR0 to IPIR3) are requested.
- The settings of interrupt request of the inter-PE interrupt registers (IPIR0 to IPIR3) are automatically cleared to 0 after notification of an interrupt request is complete.

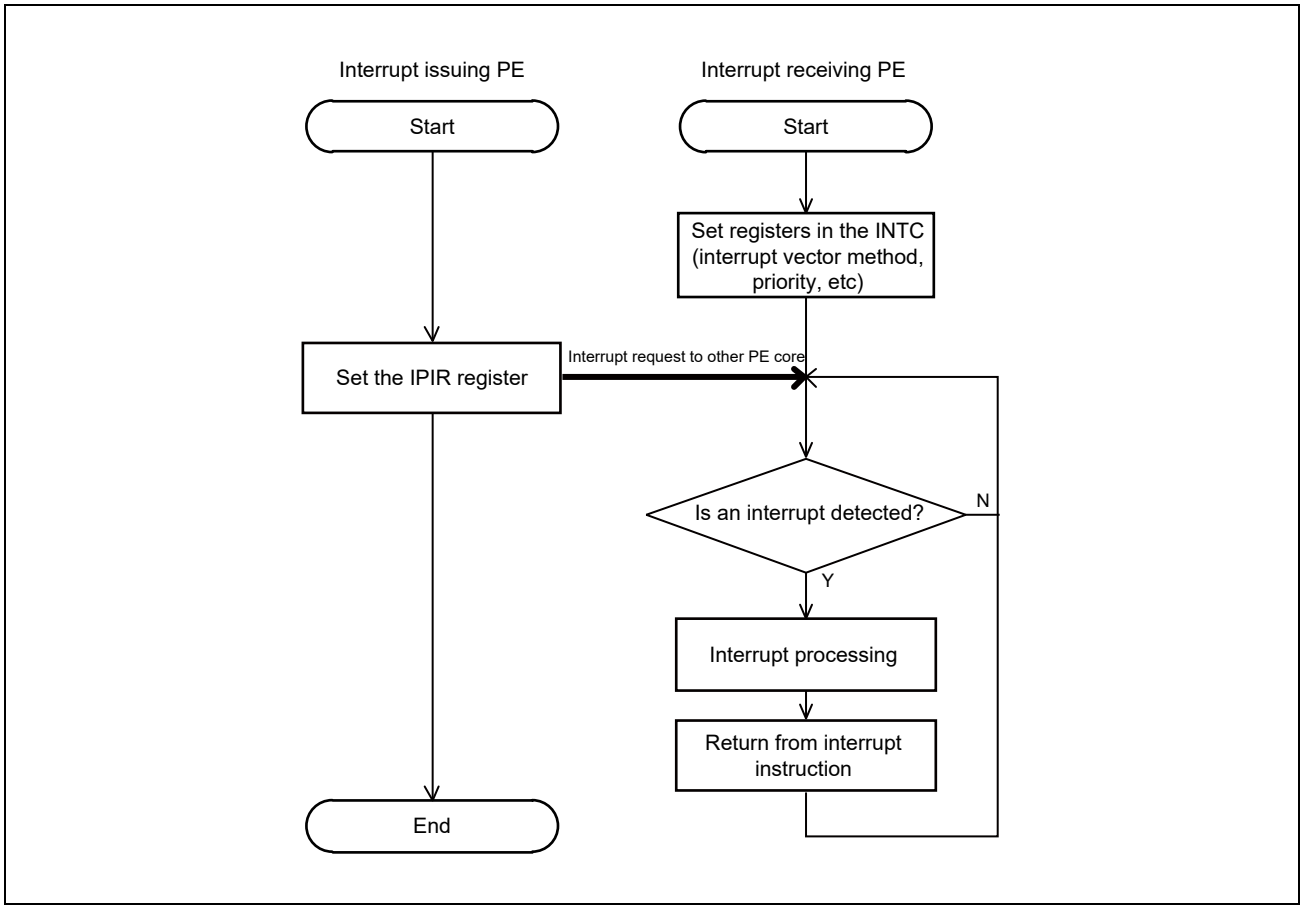

Figure 6.2 Example of Inter-Processor Interrupt Processing Flow

6.5.6.3 Software Interrupt Processing Flow

Figure 6.3 shows an example of the flow of software interrupt processing.

- Software interrupt requests are controlled by writing 00_H or 01_H to the counter registers (SINTR0 to SINTR7).
- Writing 00_H leads to the counter's value being decremented by 1.
- Writing 01_H leads to the counter's value being incremented by 1.
- If the incremented counter value is 1 or greater, an interrupt request for the INTC is generated.
- Decrement the counter by 1 during interrupt processing in the INTC, and if SINTRn is 00_H after issuing the instruction to return from the interrupt, wait for access to SINTRn. Wait for the writing of 01_H to SINTRn.
- The operations above are also performed for EMU software interrupt processing.

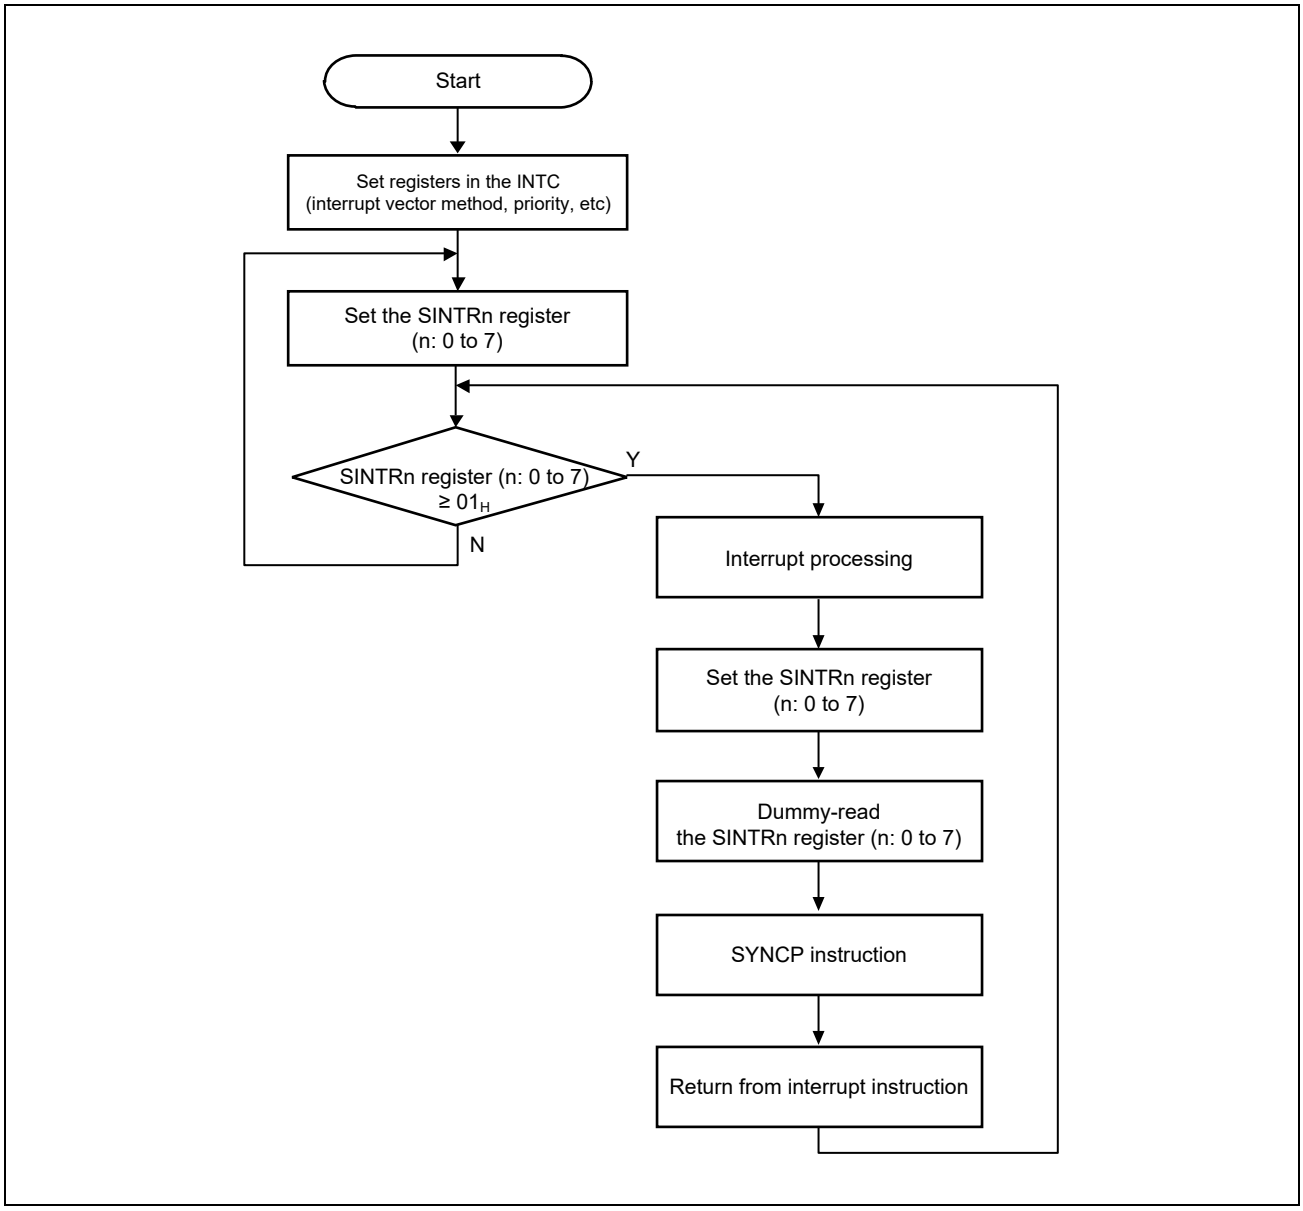

Figure 6.3 Example of Software Interrupt Processing Flow

6.5.6.4 Flow of Processing for DTS Interrupts

Figure 6.4 shows an example of the flow of DTS interrupt processing.

- In the case of a single interrupt request from a set of 32 actual sources
  - After the bit corresponding to the interrupt request in a PINTn register is set to 1, the interrupt request is output.
  - On completion of interrupt processing, 1 is written to the corresponding bit in a clearing register (PINTCLRn), the interrupt request is cleared before issuing the return from interrupt instruction, then waiting for a next interrupt commences.
- In the case of multiple interrupt requests from a set of 32 actual sources
  - The bit on the lower-order side among the multiple bits for the interrupt requests is extracted, only the corresponding bit in a PINTn register is set to 1, and the interrupt request is output.
  - On completion of interrupt processing, 1 is written to the corresponding bit in a clearing register (PINTCLRn), clearing the interrupt request bits, then issuing the return from interrupt instruction.
  - After clearing the interrupt request bits for which interrupt processing has proceeded, the bit on the lower-order side of the PINTn register that corresponds to an interrupt request is extracted and an interrupt request is issued in the same way as described for the previous operation.
  - This process is repeated until none of the 32 bits for the set of interrupt sources remains set.

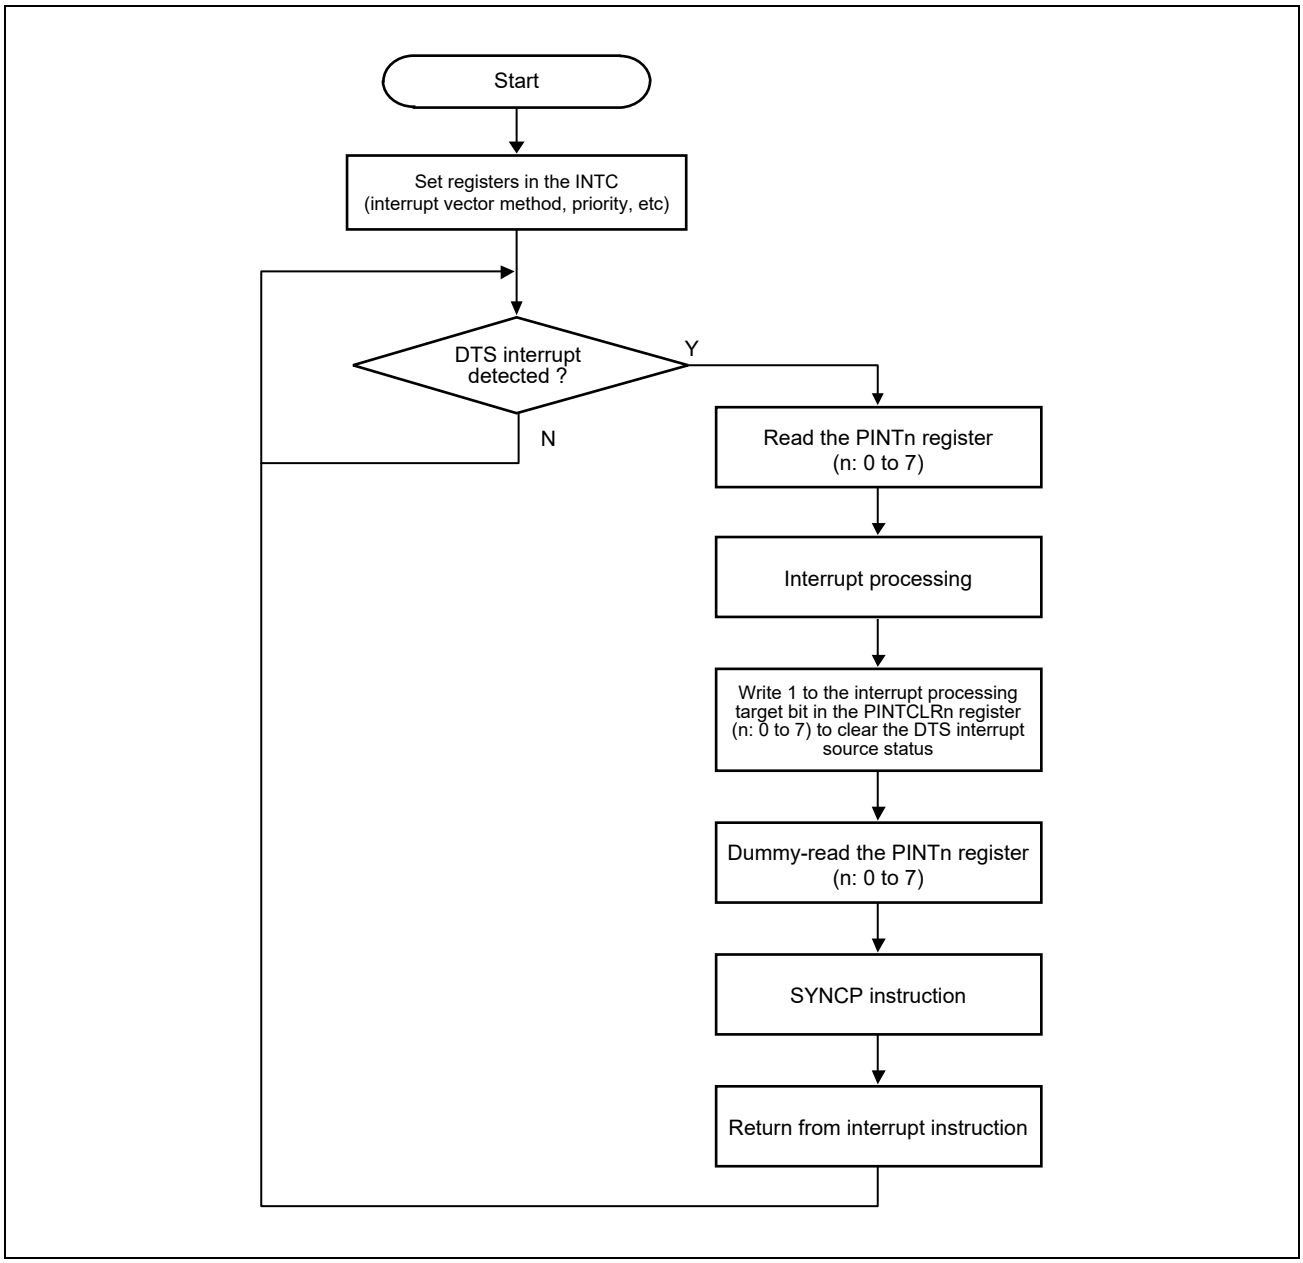

Figure 6.4 Example of DTS Interrupt Processing Flow

6.6 Interrupt Response Times

6.6.1 Interrupt Response Times

Table 6.14 Interrupt Response Times (Min)

Target	Interrupt Request Source		Number of Cycles for Processing				
	INTC Connection	Operating Clock	Synchro -nization	INTC2	INTC1	In CPU1/ CPU2/ SubCPU	Total (in the case of edge detection by fixed vector method a)
CPU1/ CPU2/ SubCPU	Directly input to INTC1	High-speed/Low-speed peripheral clock	0	—	2 × Iϕ <1 × Iϕ>	See the description under “In CPU1/CPU2/SubCPU” below.	7 × Iϕ
		Unmodulated High-speed peripheral clock	—				—
		Unmodulated Low-speed peripheral clock	5 × Pϕ <2 × Pϕ>				5 × Pϕ + 7 × Iϕ
	Input via INTC2	High-speed/Low-speed peripheral clock	0	3 × Pϕ + 1 × Iϕ <2 × Pϕ + 1 × Iϕ>	—		3 × Pϕ + 6 × Iϕ
		Unmodulated High-speed peripheral clock	4 × Pϕ <2 × Pϕ>				7 × Pϕ + 6 × Iϕ
		Unmodulated Low-speed peripheral clock	5 × Pϕ <2 × Pϕ>				5 × Pϕ + 6 × Iϕ

Note: The numbers in < > indicate the numbers of cycles in the case of level detection.

Note 1. Pϕ = 4Iϕ at 320 MHz, Pϕ = 3Iϕ at 240 MHz

Iϕ: CPU clock (CPU1, CPU2: CLK_CPU, SubCPU: CLK_EMU_H), Pϕ: High-speed peripheral clock (CLK_HSB)

Vector Method	Cache HIT/MISS	In CPU1/CPU2/SubCPU	Vector method
Fixed vector method	a) ISR ENTRY I$ HIT	5 × Iϕ	a) Fixed vector method
	b) ISR ENTRY I$ MISS	9 × Iϕ	
Vector table reference method	c) Vector code flash assigned, ISR ENTRY I$ HIT	13 × Iϕ	b) Vector table reference method Code flash assigned
	d) Vector code flash assigned, ISR ENTRY I$ MISS	18 × Iϕ	

Note: Pϕ = 4Iϕ at 320 MHz, Pϕ = 3Iϕ at 240 MHz

6.7 Data Transfer in Response to Interrupt Request Signals

An interrupt request signal can be used to activate the DMAC or DTS for handling data transfer. For details, see **Section 7, DMA Controller**.

Section 7 DMA Controller

7.1 Overview

7.1.1 Overview

The direct memory access (DMA) controller is used to move data without using the CPU.

DMA consists of two types of DMA transfer modules: DMAC and DTS. A DMAC includes registers for storing transfer information, and a DTS stores transfer information in the dedicated RAM (DTSRAM). DMA has two 8-channel DMAC modules and one 128-channel DTS module.

In this manual, DTFR denotes the function to select among hardware DMA transfer sources for a DMAC and retain the DMA transfer request, and DTSFSL denotes the function to retain a DMA transfer request for each DTS channel. The DTFR and DTSFSL can respectively handle 128 types of hardware DMA transfer sources.

The address space that can be used for DMA transfer is a 4 GB address space represented by a 32-bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DMA, see **Section 4, Address Space**.

7.1.2 Term Definition

Table 7.1 shows the terms used in this section.

Table 7.1 List of Term Definitions

Term	Meaning
DMA transfer	A general term for data transfer carried out by DMA.
DMA cycle	A series of actions that consist of reading an amount of data specified by the transfer size (8/16/32/64/128 bits) from the address specified by the source address and writing it to the address specified by the destination address. The first half of the DMA cycle (reading part) is called a read cycle, and the second half (writing part) is called a write cycle.
Hardware DMA transfer source	A trigger for a DMA transfer request given by an internal peripheral device.
Hardware DMA transfer request	A DMA transfer request generated by a hardware DMA transfer source
Software DMA transfer request	A DMA transfer request generated by software writing to a register.
DMA transfer request	A trigger to start DMA transfer with a DMAC and DTS.
Transfer information (TI)	The information required for DMA transfer, including the source address, destination address, transfer data size, and transfer count. The transfer information for a DTS is specifically termed as TI.
DTSRAM	RAM used by a DTS to store the transfer information.
Single transfer	DMA transfer consisting of one DMA cycle started by one DMA transfer request.
Block transfer 1	DMA transfer consisting of a number of DMA cycles specified by the transfer count in the transfer information, started by one DMA transfer request.
Block transfer 2	DMA transfer consisting of a number of DMA cycles specified by the address reload count in the transfer information, started by one DMA transfer request.
Block transfer	A general term for both block transfer 1 and block transfer 2.
Last transfer	The DMA cycle carried out when the transfer count in the transfer information is 1.
Address reload transfer	The DMA cycle carried out when the address reload count in the transfer information is 1 if the reload function 2 is used.
Suspension	An action of pausing DMA transfer during block transfer. You can resume DMA transfer after suspension.
Resume	An action of resuming suspended DMA transfer.
Transfer abort	An action of aborting DMA transfer in the middle. You cannot resume DMA transfer after that.

7.2 DMA Function

7.2.1 Basic Operation of DMA Transfer

7.2.1.1 Transfer Mode

DMA has three transfer modes.

Single Transfer

One DMA cycle is executed when a DMA transfer request is accepted.

Block Transfer 1

A number of DMA cycles specified in the transfer count register are executed when a DMA transfer request is accepted.

Block Transfer 2

A number of DMA cycles specified by the address reload count are executed when a DMA transfer request is accepted. If the address reload count is larger than the value in the transfer count register, a number of DMA cycles specified in the transfer count register are executed.

7.2.1.2 Executing a DMA Cycle

DMA always executes a write cycle after a read cycle is complete. For example, if the transfer data size is 128 bits, a write cycle is executed after a read cycle for the 128-bit data is finished. A write cycle never starts in the middle of a read cycle.

7.2.1.3 Updating Transfer Information

When a DMA cycle is executed, DMA updates transfer information as follows.

Source Address and Destination Address

Transfer information will be updated as described in **Table 7.2** according to the settings for the source address and destination address and the settings in the transfer control register such as the direction of counting for source and destination addresses and transfer data size.

Table 7.2 Updating the Source Address and the Destination Address

Direction of Counting	Transfer Data Size	Address after Update
Up	8 Bits	(address before update) + 0000_0001_H
	16 Bits	(address before update) + 0000_0002_H
	32 Bits	(address before update) + 0000_0004_H
	64 Bits	(address before update) + 0000_0008_H
	128 Bits	(address before update) + 0000_0010_H
Down	8 Bits	(address before update) – 0000_0001_H
	16 Bits	(address before update) – 0000_0002_H
	32 Bits	(address before update) – 0000_0004_H
	64 Bits	(address before update) – 0000_0008_H
	128 Bits	(address before update) – 0000_0010_H
Fixed	–	Same as the address before update.

When you use the reload function, a special update rule is applied other than the one described in **Table 7.2** for the last transfer and the address reload transfer. For details, see **Section 7.2.3, Reload Function**.

Transfer Count and Address Reload Count

The transfer count is decremented by one for every DMA cycle.

The address reload count is decremented by one for every DMA cycle when the reload function 2 or block transfer 2 is used. When the reload function 2 or block transfer 2 is not used, it is not updated.

When you use the reload function, a special update rule is applied for the last transfer and the address reload transfer. For details, see **Section 7.2.3, Reload Function**.

Other transfer information

Other transfer information is not updated during execution of a DMA cycle.

7.2.1.4 Last Transfer and Address Reload Transfer

The last transfer means a DMA cycle executed when the value in the transfer count register, which shows the remaining number of transfers, is one. The last transfer differs in operation compared to other DMA cycles as follows.

- The transfer completion flag (DCSTn.TC) is set when the last transfer is complete. (Only applicable for a DMAC)
- The channel operation enable (DCENn.DTE) bit is cleared when the last transfer is complete.(Only applicable for a DMAC. When the continuous transfer is disabled.)
- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When the reload function 1 is enabled, the reload function 1 is executed at the timing of the last transfer. For details, see **Section 7.2.3, Reload Function**.

The address reload transfer means a DMA cycle executed when the reload function 2 is enabled and the address reload count is one. The reload function 2 is executed during the address reload transfer. For details, see **Section 7.2.3, Reload Function**.

7.2.1.5 Transfer Completion Interrupt and Transfer Count Match Interrupt Outputs

DMA can output a transfer completion interrupt and a transfer count match interrupt.

Transfer Completion Interrupt Output

When the transfer completion interrupt output enable (DTCTn.TCE) is set in the transfer control register, a DMAC requests a DMAC transfer completion interrupt when the last transfer is complete.

When the transfer completion interrupt output enable (DTTCTn.TCE) is set in the transfer control register, a DTS requests a DTS transfer completion interrupt when the last transfer is complete.

Transfer Count Match Interrupt Output

When the transfer count match interrupt enable (DTCTn.CCE) is set in the transfer control register, a DMAC requests a DMAC transfer count match interrupt when the DMA cycle in which the transfer count compare register and the transfer count have the same value is complete.

When the transfer count match interrupt enable (DTTCTn.CCE) is set in the transfer control register, a DTS requests a DTS transfer count match interrupt at the completion of the DMA cycle in which the transfer count compare register and the transfer count have the same value.

Figure 7.1 shows the operation of the transfer completion interrupt and the transfer count match interrupt.

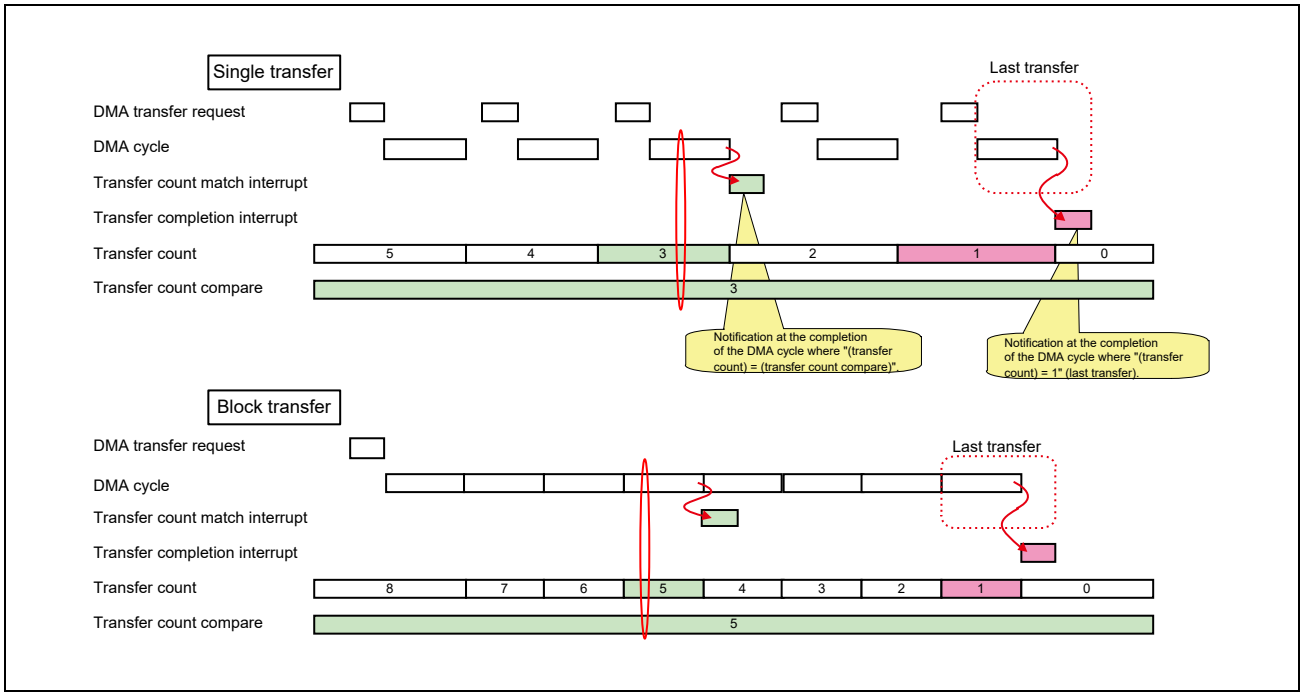

Figure 7.1 Transfer Completion Interrupt and Transfer Count Match Interrupt

7.2.1.6 Continuous Transfer

If the continuous transfer is not used, a DMAC sets the transfer completion flag (DCSTn.TC) and clears the channel operation enable (DCENn.DTE) bit when the last transfer is complete. In this case, a DMA transfer request is not accepted when the request is generated after the completion of the last transfer.

If the continuous transfer is used, the channel operation enable (DCENn.DTE) bit is not cleared when the last transfer is complete, and a DMA transfer request can be accepted even when the transfer completion flag is set. If DMA is used for a case where a specified number of DMA transfers are executed repetitively, software overhead associated with clearing the transfer completion flag and setting the channel operation enable bit after the completion of the last transfer can be reduced by using the continuous transfer.

The continuous transfer is enabled by setting the continuous transfer enable (DTCTn.MLE) in the DMAC transfer control register.

The continuous transfer is designed to work with the reload function 1. The continuous transfer function itself does not update the source address register, destination address register, and transfer count register. If, after the last transfer is complete, you want to restore the source address register, destination address register, and transfer count register to the state before the DMA transfer starts, use the reload function 1 and set the values of the source address register, destination address register, and the transfer count register before the DMA transfer starts to the reload source address register, reload destination address register, and reload transfer count register respectively.

A DTS does not have a setting corresponding to the continuous transfer enable (DTCTn.MLE) for a DMAC. This is because a DTS does not have bits like the transfer completion flag (DCSTn.TC) and the channel operation enable (DCENn.DTE) a DMAC has.

A DTS does not start DMA transfer when a DMA transfer request is generated while the transfer count is 0. (This corresponds to the case for a DMAC where the continuous transfer is not used.)

If the reload function 1 is used for a DTS and the value other than 0 is reloaded to the transfer count when the last transfer is complete, DMA transfer can start when the next DMA transfer request is accepted. (This corresponds to the case for a DMAC where the continuous transfer is used.)

Figure 7.2 shows an operation of continuous transfer by a DMAC.

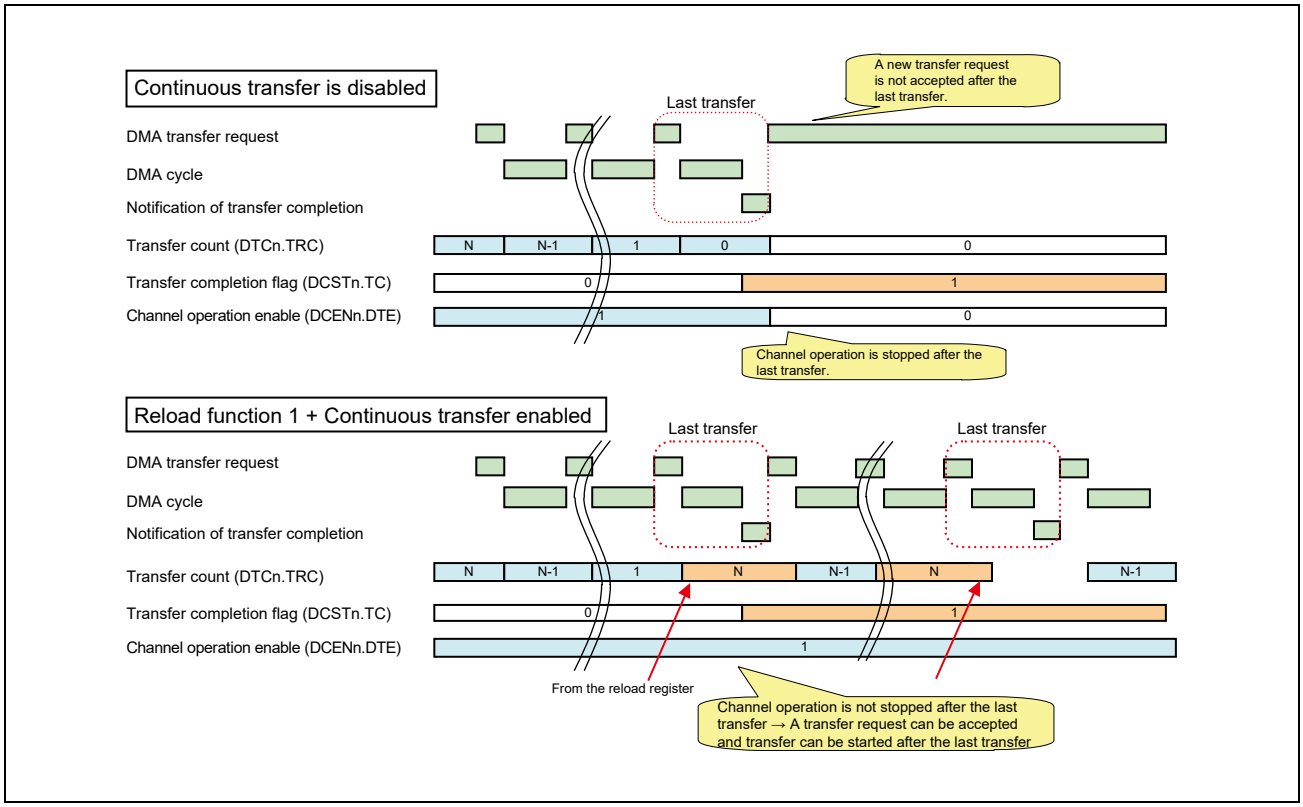

Figure 7.2 Operation of Continuous Transfer by a DMAC

7.2.2 Channel Priority Order

This subsection explains arbitration between multiple DMA channels.

7.2.2.1 DMAC Channel Arbitration

A DMAC select one channel out of eight channels with arbitration. Arbitration is done according to the fixed priority order. The priority order is “channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7” for DMAC0, and “channel 8 > channel 9 > channel 10 > channel 11 > channel 12 > channel 13 > channel 14 > channel 15” for DMAC1.

Arbitration is done for every DMA cycle. No arbitration occurs between the read and write of a DMA cycle.

If, at the timing when one DMA cycle in the middle of a block transfer of a channel is complete, there is a DMA transfer request from a channel with a higher priority than the channel, a DMA cycle of the channel with the higher priority will be executed next as the result of arbitration.
If a DMAC executes the block transfer 1 or block transfer 2, DMAC channel arbitration is done for every DMA cycle, and possibly a DMA cycle of another DMAC channel with a higher priority can cut in.

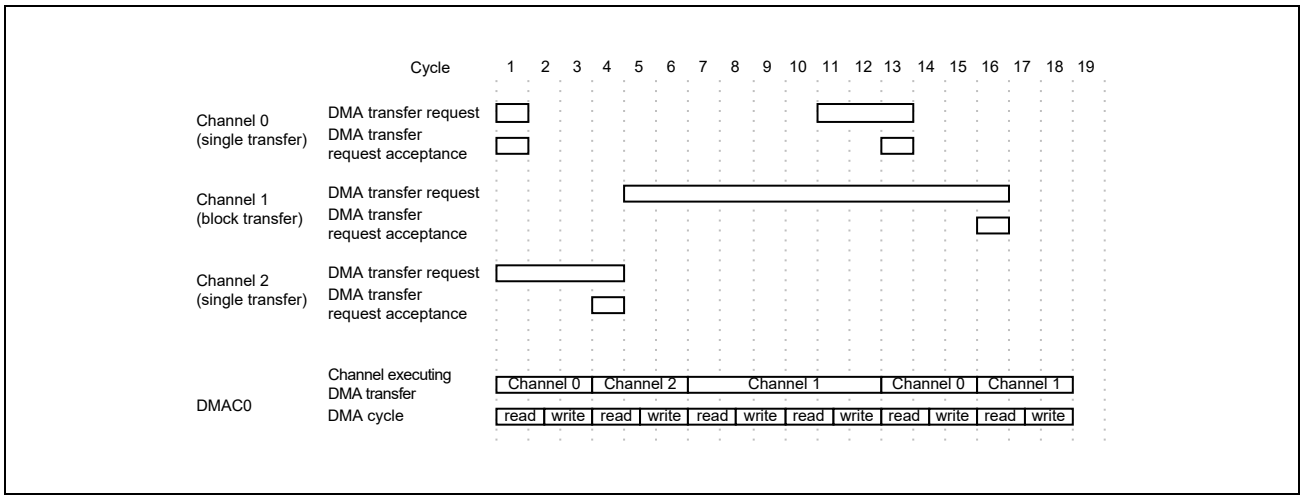

Figure 7.3 DMAC Channel Arbitration

Cycle numbers shown in **Figure 7.3** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 7.3**, DMA transfer requests for channels 0 and 2 are generated at Cycle 1. As a result of arbitration, a DMA cycle for channel 0 starts because its priority is higher. At Cycle 4, a DMA cycle for channel 2 starts. At Cycle 5, a DMA transfer request for channel 1 is generated. The DMA cycle for channel 2 is still ongoing and no arbitration is done at this point. At Cycle 7, a DMA cycle for channel 1 starts. Channel 1 uses block transfer. Another DMA cycle continues at Cycle 10 because there are no DMA transfer requests from other channels. At Cycle 11, a DMA transfer request for channel 0 is generated. The DMA cycle for channel 1 is still ongoing and no arbitration is done at this point. At Cycle 12, the DMA cycle for channel 1 is complete. At Cycle 13, a DMA cycle for channel 0 starts as a result of arbitration between DMA channels 0 and 1.

It should be noted that, even though a block transfer of channel 1 has been already started, a DMA cycle of not channel 1 but channel 0 is executed at Cycle 13 because the priority of the latter is higher. At Cycle 15, the DMA cycle for channel 0 is complete. At Cycle 16, a DMA cycle for channel 1 starts again. At Cycle 18, the last DMA cycle of the block transfer of channel 1 is complete.

7.2.2.2 DTS Channel Arbitration

If there are DMA transfer requests from multiple DTS channels, the DTSFSL arbitrates those DTS channels. For each DTS channel, a priority can be selected from four levels using DTS channel priority setting registers.

If there are DMA transfer request from multiple DTS channels, the arbitration is done as follows.

1. A channel with a higher priority level in the setting of DTS channel priority setting registers has a priority.
2. If two channels have the same priority level in the setting of DTS channel priority setting registers, a channel with a lower channel number has a priority.

The DTSFSL sends the DTS a DMA transfer request for the channel selected by arbitration. The DTS executes DMA transfer when it accepts the DMA transfer request.

Unlike DMA transfer with a DMAC, DMA transfer with a DTS does not allow arbitration between DTS channels in the middle of a block transfer. That means, even if a DMA transfer request with a higher priority comes during a block transfer for a channel with a lower priority, the DMA transfer with a higher priority does not start until the current block transfer for the channel with a lower priority is complete*[1].

Note 1. The timing of completion of the block transfer is when the last transfer for the block transfer 1 or the last transfer or address reload transfer for the block transfer 2 occurs.

When a DTS executes the block transfer 1 or block transfer 2, a DMA cycle of a DTS channel with a higher priority does not take over the ongoing block transfer until the last transfer.

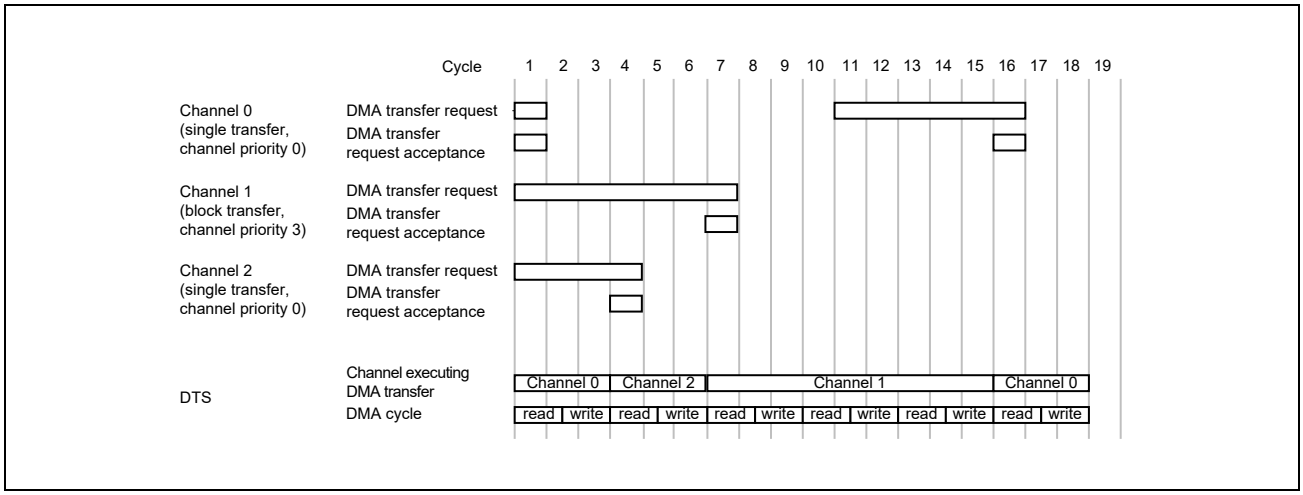

Figure 7.4 DMAC Channel Arbitration

Cycle numbers shown in **Figure 7.4** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 7.4**, DMA transfer requests for channels 0, 1, and 2 are generated at Cycle 1. The channel priority for channels 0 and 2 is 0 and is higher than the channel priority for channel 1, which is 3. In addition, if two channels have the same priority, the channel with the smaller channel number has a higher priority. Consequently, the priority order for arbitration is “channel 0 > channel 2 > channel 1”, and a DMA cycle for channel 0 starts because its priority is the highest. At Cycle 4, as a result of arbitration between channels 1 and 2, a DMA cycle for channel 2 starts. At Cycle 7, a DMA cycle for channel 1 starts. Channel 1 uses block transfer. Another DMA cycle continues at Cycle 10 because there are no DMA transfer requests from other channels. At Cycle 11, a DMA transfer request for channel 0 is generated. The DMA cycle for channel 1 is still ongoing and no arbitration is done until the block transfer of channel 1 is complete.

At Cycle 15, the block transfer of channel 1 is complete. At Cycle 16, a DMA cycle for channel 0 starts.

7.2.2.3 Interface Arbitration

DMAC0, DMAC1, and DTS work independently and execute DMA transfer.

If there is a conflict between requests from DMAC0, DMAC1, and DTS, round-robin arbitration is performed.

7.2.3 Reload Function

7.2.3.1 Overview of the Reload Function

The reload function updates a portion of transfer information, more specifically, the source address, destination address, transfer count, and address reload count, to the predefined values during DMA transfer.

The reload function has two types of functions: reload function 1 and reload function 2.

7.2.3.2 Operation of Reload Function 1

When the reload function 1 is enabled, actions described in **Table 7.3** are executed at the timing of the last transfer according to the reload function 1 setting.

Table 7.3 Operation of Reload Function 1

Reload Function 1 Setting (DTCTn.RLD1M[1:0])	Register	Action at the Last Transfer
00 (Reload function 1 disabled)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Transfer count	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 1 enabled. Reloading source address and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded. • If the reload function 2 is enabled: The reload address reload count is copied to this.
10 (Reload function 1 enabled. Reloading destination address and transfer count.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded. • If the reload function 2 is enabled: The reload address reload count is copied to this.
11 (Reload function 1 enabled. Reloading source address, destination address, and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded • If the reload function 2 is enabled: The reload address reload count is copied to this.

Figure 7.5 shows an operation of the reload function 1.

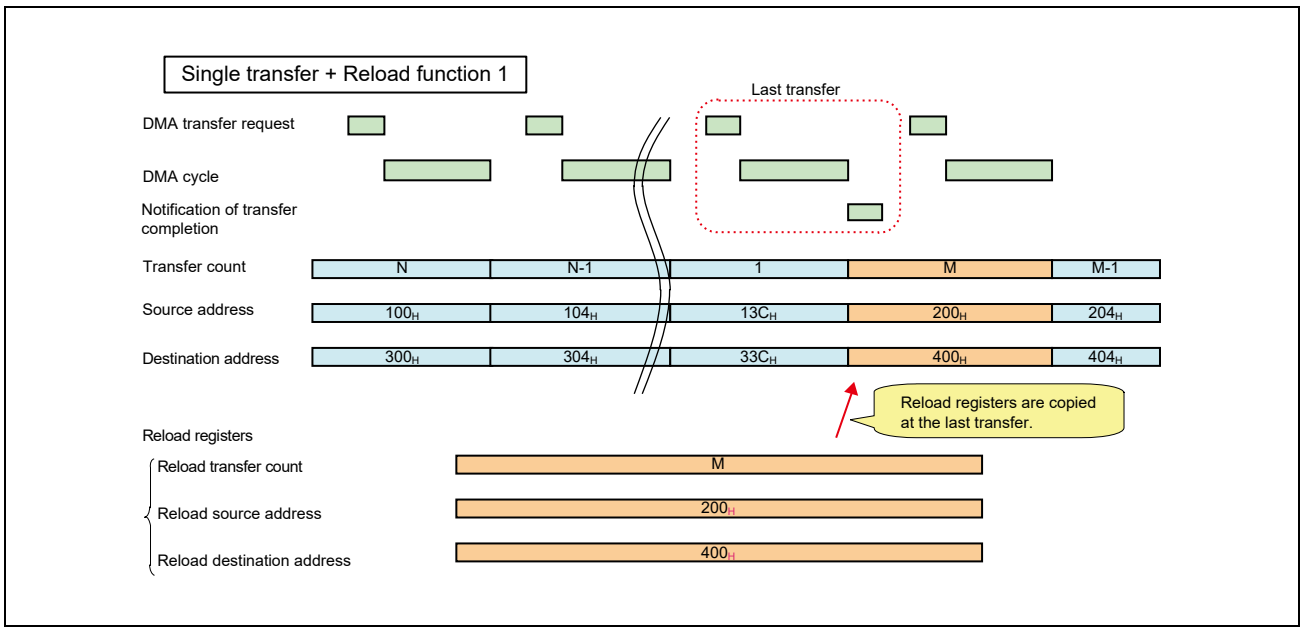

Figure 7.5 Operation of Reload Function 1

7.2.3.3 Reload Function 2

When the reload function 2 is enabled, actions described in **Table 7.4** are executed at the timing of the address reload transfer according to the reload function 2 setting.

Table 7.4 Operation of Reload Function 2

Reload Function 2 Setting (DTCTn.RLD2M[1:0])	Register	Action at the Address Reload Transfer
00 (Reload function 2 disabled)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 2 enabled. Reloading source address.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Address reload count	The reload address reload count is copied to this.
10 (Reload function 2 enabled. Reloading destination address.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.
11 (Reload function 2 enabled. Reloading source address and destination address.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.

Figure 7.6 shows an operation of the reload function 2.

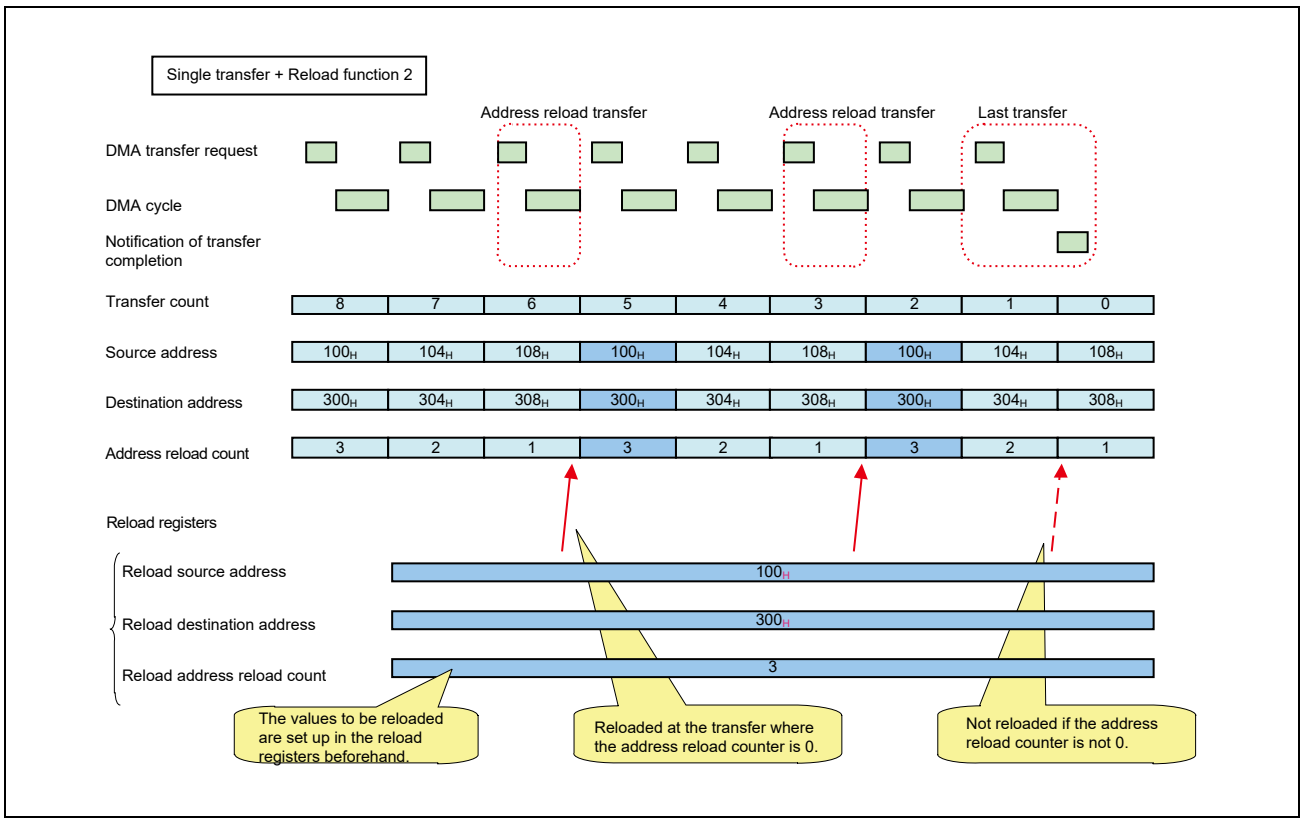

Figure 7.6 Operation of Reload Function 2

Figure 7.7 shows an operation when both the reload function 1 and the reload function 2 are used simultaneously.

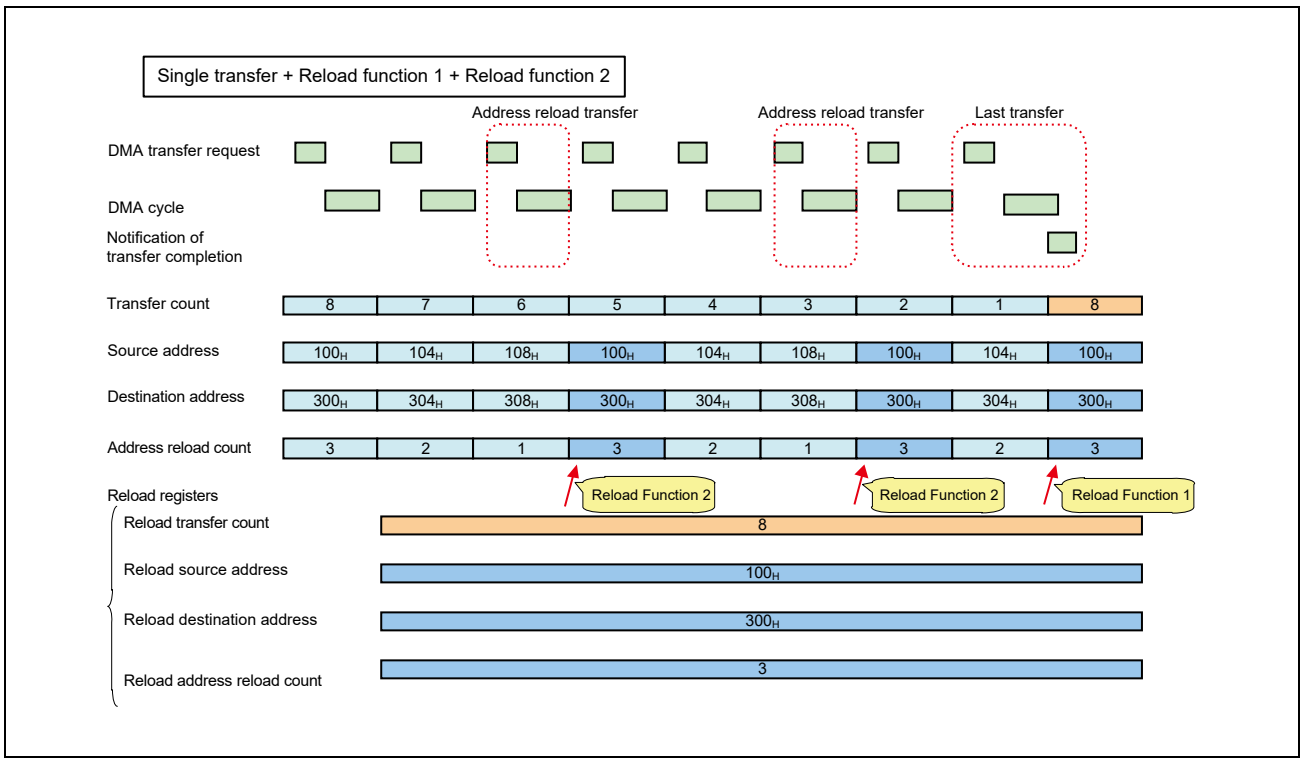

Figure 7.7 Operation when Combining Reload Function 1 and Reload Function 2

7.2.3.4 Timing of Setting DMAC Reload Registers

You can set up the reload source address register, reload destination address register, and reload transfer count register any time (even during DMA transfer). As an exception, if you update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, there may be a conflict between reloading at the last transfer or address reload transfer and updating the reload register. In order to avoid this conflict, setting up reload registers must be completed before the last transfer or address reload transfer starts.

If you need to update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, one way to know the right timing of update is to use a DMA transfer count match interrupt. In this case, you must set up the DMA transfer count compare register (DTCCn) so that you can have enough margin for the time necessary to update the reload registers.

7.2.3.5 Timing of Setting DTS Reload Registers

It should be noted that the right timing of setting up the reload source address information, reload destination address information, and reload transfer count information differs depending on the transfer mode.

In single-transfer mode, the TI fetched at the beginning of the last transfer or address reload transfer is used for reload at the completion of the DMA cycle. Therefore, if you use the reload function for single transfer, the reload source address information, reload destination address information, and reload transfer count information in the TI must be set up before the beginning of the last transfer or address reload transfer.

During block transfer, TI is fetched only at the beginning of DMA transfer. The TI fetched at the beginning of the DMA transfer is used for reload at the last transfer or address reload transfer. Therefore, if you use the reload function for block transfer, the reload source address information, reload destination address information, and reload transfer count

information in the TI must be set up before the beginning of the DMA transfer. If you update the reload source address information, reload destination address information, and reload transfer count information in the TI in the middle of a block transfer, those new settings will not be used for reload at the completion of the block transfer.

7.2.4 Chain Function

7.2.4.1 Overview

DMA offers a function called chain function. If you use the chain function, the completion of the DMA cycle or last transfer for one channel can trigger a DMA transfer request for another channel. A DMA transfer request for another channel initiated by the chain function is called a chain request.

You can select the condition for generating a chain request from the following two options.

- Always chain: A chain request is generated at the completion of every DMA cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

Figure 7.8 shows an operation of the case “always chain”.

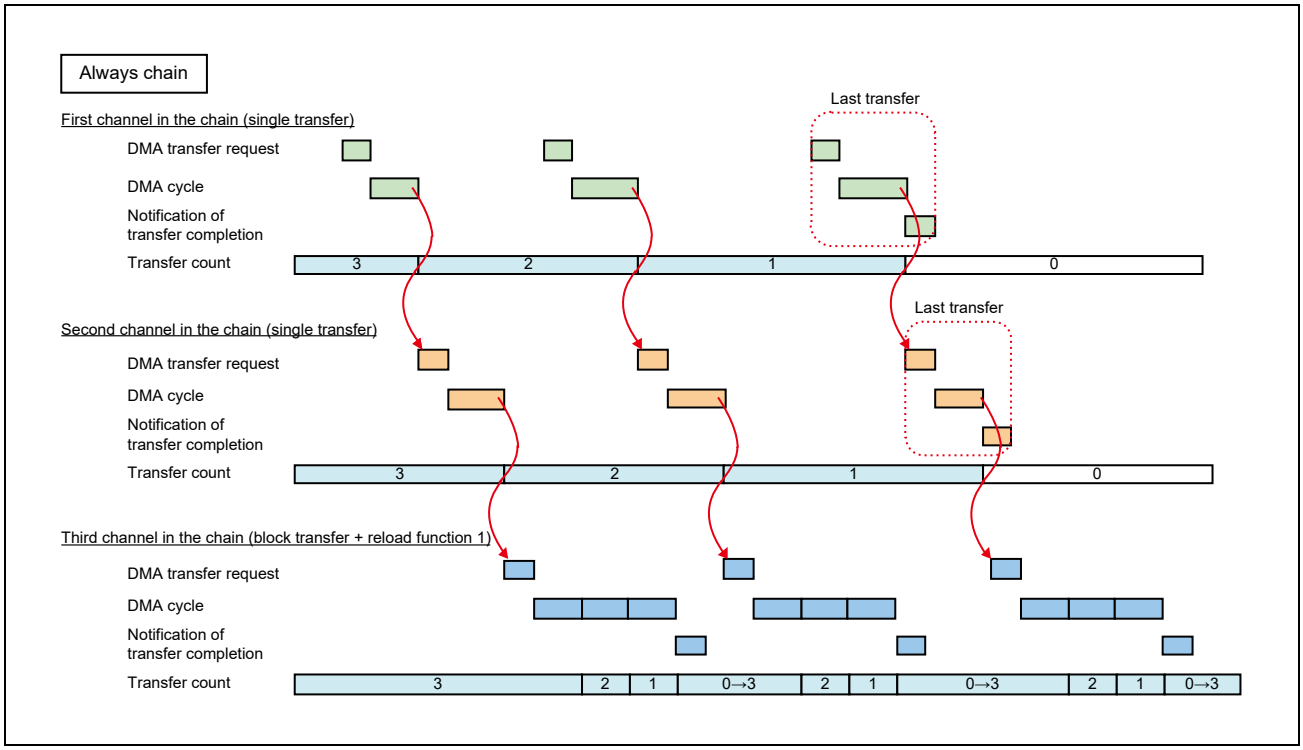

Figure 7.8 Operation of the Case “Always Chain”

Figure 7.9 shows an operation of the case “chain at the last transfer”.

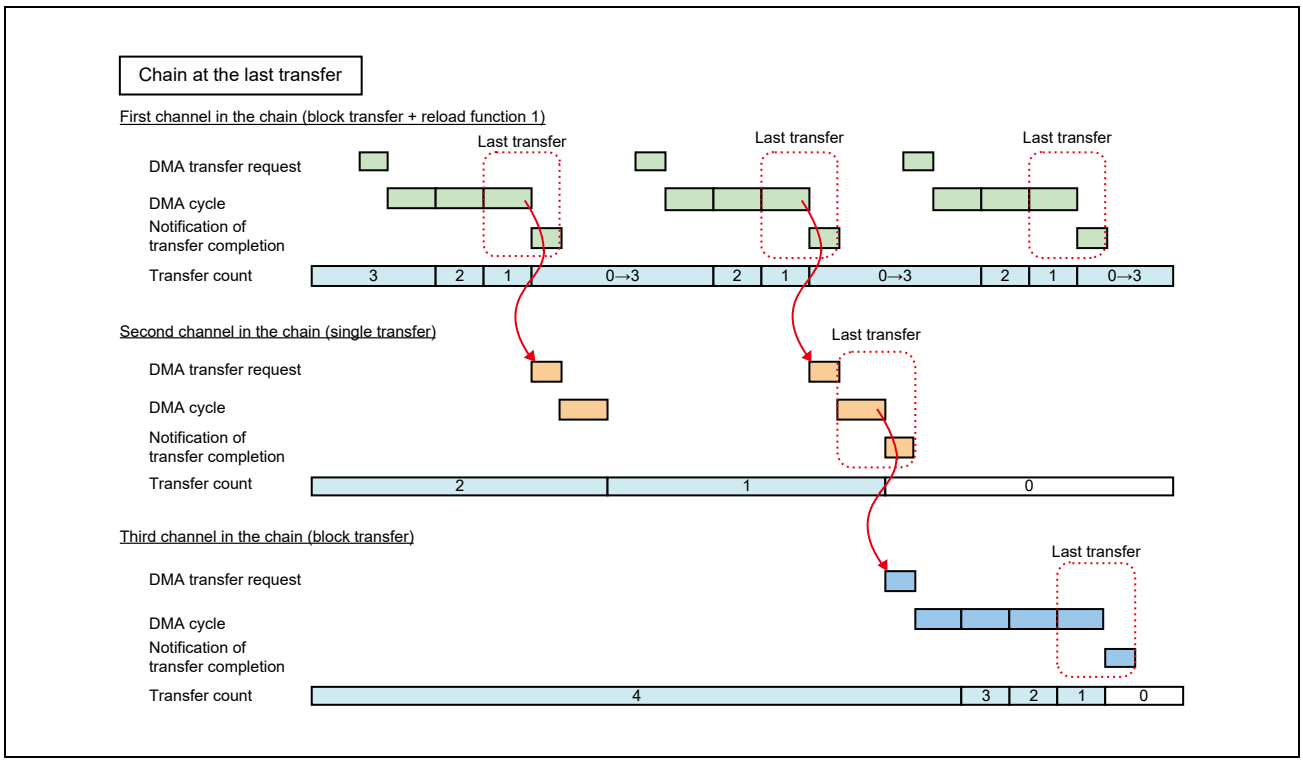

Figure 7.9 Operation of the Case “Chain at the Last Transfer”

7.2.4.2 Setting Up the Chain Function

For a DMAC, you need to write to the chain enable (DTCTn.CHNE) and the next channel in the chain selection (DTCTn.CHNSEL) in the DMAC transfer control register in order to set up the type of chain function and the next channel number in the chain.

For a DTS, you need to write to the chain enable (DTTCTnnn.CHNE) and the next channel in the chain selection (DTTCTnnn.CHNSEL) in the DTS transfer control register in order to set up the type of chain function and the next channel number in the chain.

7.2.4.3 Caution for Using the Chain Function

The chain function sets the software DMA transfer request flag of the next channel in the chain as a part of its function. Therefore, you need to set up the channel settings of the next channel in the chain in the same way as when the software DMA transfer request is used. If you specify a channel using the hardware DMA transfer request for the next channel in the chain, the chain function does not work.

A channel and its next channel in the chain must belong to the same module (DMAC0, DMAC1, and DTS). You cannot specify a channel in another module for its next channel in the chain.

7.2.5 DMAC Operation

7.2.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request selection assignment (DRS) bit in the DMAC transfer control register (DTCTn) determines whether a hardware DMA transfer request or a software DMA transfer request is used.

In the case of a hardware DMA transfer request for a DMAC, one out of 128 hardware DMA transfer sources is selected and assigned for each channel of the DMAC in the DTFR. This assignment is configured in the DTFR setting registers.

7.2.5.2 Generating and Accepting a Software DMA Transfer Request

By setting the software DMA transfer request flag (SR) in the DMAC transfer status register (DCSTn) using the DMAC transfer status set register (DCSTSn), a software DMA transfer request can be generated.

The software DMA transfer request flag is automatically cleared when the DMAC processes the DMA transfer request. The timing when the software DMA transfer request flag is automatically cleared differs depending on the transfer mode of the DMA transfer to be executed.

- In single-transfer mode, the software DMA transfer request flag is cleared whenever the software DMA transfer request is accepted.
- In block transfer 1 mode, the software DMA transfer request flag is cleared when the last transfer starts.
- In block transfer 2 mode, the software DMA transfer request flag is cleared when the last transfer or address reload transfer starts.

The software DMA transfer request flag can also be cleared by software using the DMAC transfer status clear register (DTSTCn). When you abort a DMA transfer of a DMAC channel, you must clear the software DMA transfer request flag.

7.2.6 DTS Operation

7.2.6.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DTS starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request.

A transfer request for a DTS is retained in the transfer request pending bit of the DTSFSL for each channel. As for the DTSFSL, both a hardware DMA transfer request and a software DMA transfer request are retained in the same transfer request pending bit. When executing DMA transfer, a DTS does not care whether a DMA transfer request is a hardware DMA transfer request or software DMA transfer request.

In the case of a hardware DMA transfer request for a DTS, each of 128 hardware DMA transfer sources is assigned to one of 128 channels in the DTSFSL in the fixed manner. You cannot change this assignment by, for example, register settings.

7.2.6.2 Generating and Accepting a DMA Transfer Request

When the DTSFSL detects a hardware DMA transfer source input, the DTSFSL sets the transfer request pending bit and retains the hardware DMA transfer source as a DMA transfer request. If the transfer request pending bit is set and the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register is set, the DTSFSL notifies the DTS of the DMA transfer request.

Software can also generate a DMA transfer request by setting the transfer request pending bit (DTFSTnnn.DRQ) using the DTSFSL transfer request set register (DTFSSnnn).

The DTSFSL can retain only one DMA transfer request per channel. If, while the transfer request pending bit for a channel is set, a new hardware DMA transfer source input for the same channel comes, the new hardware DMA transfer source input is ignored.

When the DTS accepts a DMA transfer request, it notifies of the acceptance of the DMA transfer request.

The transfer request pending bit is automatically cleared when the DTS accepts the DMA transfer request. The DTSFSL clears the transfer request pending bit automatically when the DTS accepts the DMA transfer request regardless of the type of the DMA transfer to be executed by the DTS.

The transfer request pending bit can also be cleared using the DTSFSL transfer request clear register (DTFSCnnn). If the transfer request pending bit of a channel is cleared before the DTS accepts the DMA transfer request, DMA transfer of the channel is not executed.

7.2.6.3 Executing DMA Transfer

When the DTS accepts a DMA transfer request for a channel, the DTS executes DMA transfer of the channel. If there are DMA transfer requests from multiple channels, the DTSFSL arbitrates the DTS channels and picks up one channel for a DMA transfer request.

While the DTS is executing DMA transfer, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is set. In addition, the channel number of the currently ongoing DMA transfer is set in the DTS transfer channel (DTSSTS.DTSACH).

When the DMA transfer is complete or aborted because of DMA transfer error or writing to registers and no channel is currently executing DMA transfer, the DTS transfer status (DTSSTS.DTSACT) bit is cleared.

7.2.6.4 DTSRAM Access

A DTS accesses the DTSRAM when DMA transfer starts and finishes.

A DTS's action of reading transfer information from the DTSRAM when DMA transfer starts is called TI fetch.

A DTS's action of updating the transfer information on the DTSRAM when DMA transfer finishes is called TI write back.

A single transfer performs a TI fetch at the beginning of a DMA cycle and a TI write back at the end of a DMA cycle.

A block transfer performs a TI fetch at the beginning of the first DMA cycle and a TI write back at the end of the DMA cycle that satisfies the block transfer completion condition (the last transfer or address reload transfer).

Therefore, in the case of single transfer, the transfer information on the DTSRAM is updated for each DMA cycle. In the case of block transfer, the transfer information on the DTSRAM is updated after the completion of the block transfer. If software reads the transfer information on the DTSRAM during execution of a block transfer, the transfer information at the beginning of the block transfer is read.

7.3 Suspension, Resume, Transfer Abort, and Clearing a DMA Transfer Request

7.3.1 DMA Suspension and Resume by Software Control

The DMA control register (DMACTL) is used to suspend DMA transfer for all channels.

When the DMA suspension bit (DMACTL.DMASPD) in the DMA control register is set, DMA puts all channels into the suspended state. If all channels are in the suspended state and the DMA suspension bit (DMASPD) in the DMA control register is cleared, DMA restores all channels from the suspended state to the normal state and resumes the DMA transfer of the suspended channel.

When all channels are put into the suspended state, DMA transfer is suspended for all channels without changing the value of the DCENn.DTE bit of each DMAC channel and the DTSCTL1.DTSUST bit of the DTS.

CAUTION

In order to suspend or resume the DMA transfer being executed by a DTS, it is necessary to perform enabling or disabling operation by using the DMA transfer request enable bit (DTFSLnnn.REQEN). For details, refer to notes in **Section 7.3.3, Suspension, Resume, and Transfer Abort of a DTS**.

7.3.2 Suspension, Resume, and Transfer Abort of a DMAC Channel

You can suspend the DMA transfer of a DMAC channel by clearing the channel operation enable bit (DCENn.DTE) in the DMAC channel operation enable setting register or by setting the DMA suspension bit (DMACTL.DMASPD) in the DMA control register. If a DMA cycle is ongoing, the DMA transfer is suspended after the currently ongoing DMA cycle is finished. If you set the DCENn.DTE bit again or clear the DMACTL.DMASPD bit during suspension, the DMA transfer of the suspended DMA channel is resumed.

If you want to abort the currently ongoing DMA transfer of a DMAC channel, clear the channel operation enable bit (DCENn.DTE) in the DMAC channel operation enable setting register, and then clear the hardware DMA transfer request in the DTFR in the case of a hardware DMA transfer request, and clear the software DMA transfer request flag (DCSTn.SR) using the software DMA transfer request flag clear bit (DCSTCn.SRC) in the DMAC transfer status clear register in the case of a software DMA transfer request.

Figure 7.10 shows an example of suspension, resume, and transfer abort of a DMAC channel.

In **Figure 7.10**, both channels 0 and 1 are executing block transfer. At time tick 1, DMA transfer of channel 1 starts. At time tick 2, a DMA transfer request for channel 0 is accepted. As a result of DMAC channel arbitration, DMA transfer of channel 0 starts because channel 0 has a higher priority than channel 1. At time tick 3, the last transfer of channel 0 is complete, and the remaining DMA transfer in the block transfer of channel 1 starts. At time tick 4, the last transfer of channel 1 is complete. After time tick 5, DMA transfer of channel 0 and DMA transfer of channel 1 are executed similarly. At time tick 7, the DMA transfer of channel 0 is suspended and, as a result of DMAC channel arbitration, the DMA transfer of channel 1 starts. At time tick 8, the last transfer of channel 1 is complete, and then, at time tick 9, the DMA transfer of channel 0 resumes. At time tick 10, the last transfer of channel 0 is suspended again, and then, at time tick 11, the DMA transfer of channel 0 is aborted. At time tick 12, the suspended state for channel 0 is cleared, but DMA transfer is not executed because the DMA transfer is aborted at time tick 11.

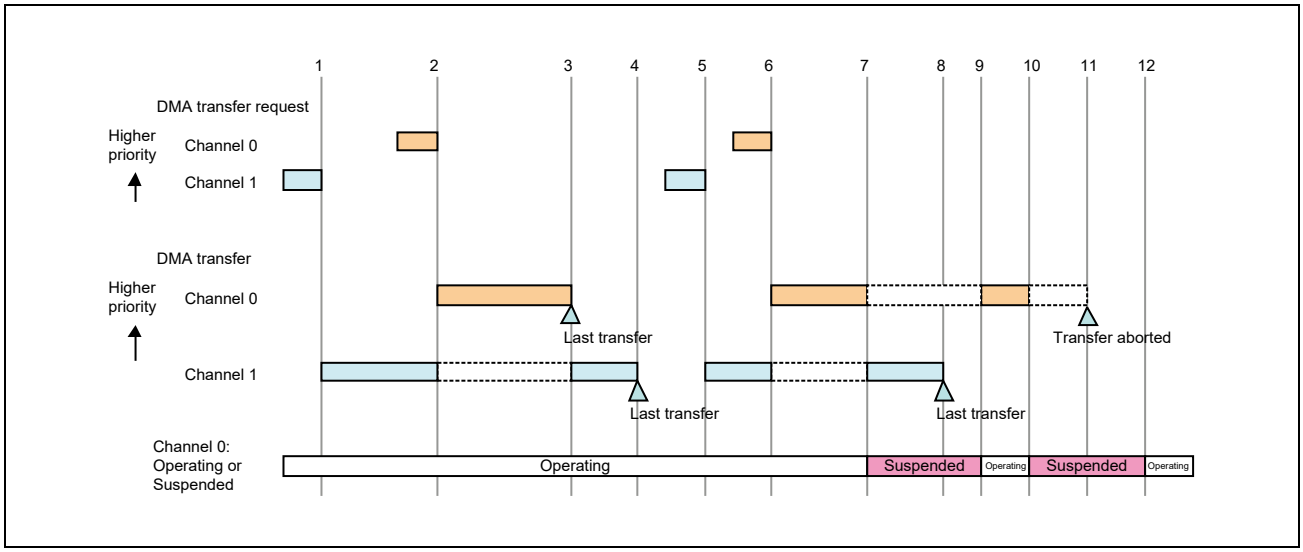

Figure 7.10 Example of Suspension, Resume, and Transfer Abort of a DMAC Channel

7.3.3 Suspension, Resume, and Transfer Abort of a DTS

You can suspend the DMA transfer executed by a DTS by setting the DTS suspend bit (DTSCTL1.DTSUST) in the DTS control register 1 or by setting the DMA suspension bit (DMACTL.DMASPD) in the DMA control register*[1]. If a DMA cycle is ongoing, the DMA transfer is suspended at the timing when the DMA cycle is finished. If the ongoing DMA cycle is a single transfer or a transfer that completes a block transfer (the last transfer or address reload transfer), the DMA transfer is suspended after a TI write back after the completion of the DMA cycle. If the ongoing DMA cycle is a type other than the above, the DMA transfer is suspended after the completion of the DMA cycle without a TI write back. If you resume the DMA transfer while the DMA transfer is suspended, clear the DTS suspend bit in the DTS control register 1, or clear the DMA suspension bit in the DMA control register*[1].

Note 1. Before suspending or resuming the DMA transfer being executed by a DTS, it is necessary to perform enabling or disabling operation by using the DMA transfer request enable bit (DTFSLnnn.REQEN). To suspend or resume it, perform the following operations.

(a) Procedure for suspending DTSs

1. Clear all the DMA transfer request enable bits (DTFSLnnn.REQEN) that are set for their respective DTS channels.
2. Set the DTSCTL1.DTSUST bit or the DMACTL.DMASPD bit.

(b) Procedure for resuming DTSs

1. Set the DMA transfer request enable bits (DTFSLnnn.REQEN) for DTS channels that are cleared in 1 of (a).
2. Clear the DTSCTL1.DTSUST bit or the DMACTL.DMASPD bit, which is set in 2 of (a).

If you want to abort the DMA transfer being executed by a DTS, suspend the DTS using the DTS suspend bit (DTSCTL1.DTSUST) in the DTS control register 1 as described above, and then set the DTS transfer abort request bit (DTSCTL2.DTSTIT) in the DTS control register 2 to abort the currently suspended DMA transfer. If transfer is aborted, no TI write back is executed. In addition, aborting the DMA transfer does not change the value of the DTS suspend bit (DTSCTL1.DTSUST). If you want the DTS to accept another DMA transfer request after the abort, clear the DTS suspend bit after setting the DMA transfer request enable bit (DTFSLnnn.REQEN) of the DTS channel.

Figure 7.11 shows an example of suspension, resume, and transfer abort of a DTS.

In **Figure 7.11**, channels 0, 1, and 2 are executing block transfer. At time tick 1, a DMA transfer request for channel 1 is accepted and DMA transfer starts. At time tick 2, DMA transfer requests for channels 0 and 2 are generated. At time tick 3, the last transfer of channel 1 is complete, and as a result of DTS channel arbitration, a DMA transfer request for channel 0 is accepted, and DMA transfer of channel 0 starts because channel 0 has a higher priority than channel 2. At time tick 4, the last transfer of channel 0 is complete, and DMA transfer of channel 2 starts. At time tick 5, the DTS is put into the suspended state, and the DMA transfer of channel 2 is suspended. At time tick 6, DMA transfer requests for channels 0 and 1 are generated. At time tick 7, the suspended state for the DTS is cleared, and the DMA transfer of channel 2, which has been suspended in the middle of a block transfer, is resumed. If DMA transfer is suspended in the middle of a block transfer, no DTS channel arbitration is done when it is resumed. At time tick 8, the last transfer of channel 2 is complete, and as a result of DTS channel arbitration, a DMA transfer request for channel 0 is accepted and the DMA transfer starts because channel 0 has a higher priority than channel 1. At time tick 9, the DTS is put into the suspended state, and at time tick 10, the suspended DMA transfer of channel is aborted. When the suspended state of the DTS 0 is cleared at time tick 11, DMA transfer of channel 1 starts because there is no currently ongoing DMA transfer and channel 1 is the only channel with a DMA transfer request.

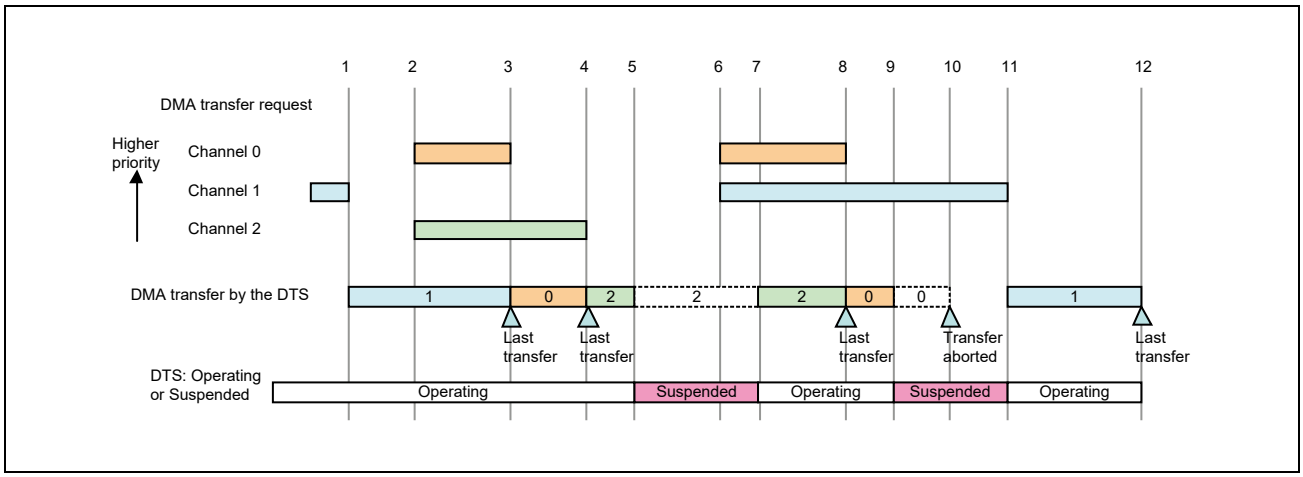

Figure 7.11 Example of Suspension, Resume, and Transfer Abort of a DTS

7.3.4 Masking and Clearing a Hardware DMA Transfer Request by the DTFR

If a DMAC uses a hardware DMA transfer request, you can temporarily disable (mask) the hardware DMA transfer request output from the DTFR to the DMAC by clearing the hardware DMA transfer source selection enable bit (DTFRn.REQEN) in the DTFR setting register.

Also, if a hardware DMA transfer source is used, you can clear a hardware DMA transfer request retained in the DTFR by using the hardware DMA transfer request clear (DTFRRQCn.DRQC) bit in the DTFR transfer request clear register.

Even if you suspend or abort DMA transfer of a DMAC channel, the hardware DMA transfer request selection/hold circuit of the DTFR is still running, and consequently, the DTFR may retain a hardware DMA transfer request that came to the DTFR during the suspension or transfer abort period of the DMAC channel. When you resume or start DMA transfer of a DMAC channel, clear the hardware DMA transfer request retained in the DTFR as required.

When DMAC uses a hardware transfer request and the block transfer 1 or block transfer 2, if software disables the hardware transfer source selection bit of DTFR (DTFRn.REQEN = 0) while DMAC is executing block transfer, the block transfer in progress is suspended.

7.3.5 Masking and Clearing a Hardware DMA Transfer Request by the DTSFSL

As for a DTS, you can temporarily disable (mask) a DMA transfer request from a channel to the DTS by clearing the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register. (The masking is actually done by excluding the channel from the candidates in DTS channel arbitration in the DTSFSL.)

Also, you can clear a DMA transfer request retained in the DTSFSL by using the transfer request clear (DTFSCnnn.DRQC) bit in the DTSFSL transfer request clear register.

Regardless of the state of the DTS and the transfer request enable bit (DTFSLnnn.REQEN) of the DTSFSL, the DTSFSL always monitors the hardware transfer source input, and a DMA transfer request for a channel is set when a hardware transfer source for the channel is input to the DTSFSL. When you resume or start DTS transfer, clear the hardware DMA transfer request retained in the DTSFSL as required.

7.3.6 List of Suspend, Resume, and Transfer Abort Functions

Table 7.5 List of Suspend, Resume, and Transfer Abort Functions

Function	How to execute the function	Operation	Possibility of DMA transfer abort	Master that can execute the function (See **Section 7.5, Reliability Function**)
DMA suspension and resume by software control	Setting and clearing the DMACTL.DMASPD*1	All channels are in the suspended state.	Not possible*2	Special master
Suspension and resume of a DMAC channel	Clearing and setting the DCENn.DTE in each channel register.	DMA transfer of a channel is suspended.	Possible (by clearing the DMA transfer request flag during suspension)	Special master, and general master assigned to the channel.
Suspension and resume of a DTS	Setting and clearing the DTSCTL1.DTSUST*1	DMA transfer of a DTS is suspended.	Possible (by setting the DTSCTL2.DTSTIT during suspension)	Special master

Note 1. In order to suspend or resume the DMA transfer being executed by a DTS, it is necessary to perform enabling or disabling operation by using the DMA transfer request enable bit (DTFSLnnn.REQEN). For details, refer to **Section 7.3.3, Suspension, Resume, and Transfer Abort of a DTS**.

Note 2. In order to abort DMA transfer, you need to either abort transfer for the DMAC channel or abort transfer for the DTS.

7.4 Error Control

7.4.1 Type of Error

DMA can generate the following two types of errors.

- DMA Transfer Error
  This error is generated when error is detected in the read cycle or write cycle in a DMA cycle. This error can be generated in all DMAC and DTS channels during execution of DMA transfer.
- DTSRAM Error
  This error is generated when ECC error is detected in the DTSRAM read access by a DTS. This error can be generated in the TI fetch during execution of DMA transfer for a DTS or while software is accessing the DTS channel registers.

7.4.2 DMA Transfer Error

7.4.2.1 Operation of a DMAC When DMA Transfer Error Occurs

When DMA transfer error occurs in a DMAC, the transfer error flag (DCSTn.ER) in the DMAC transfer status register of the channel with the DMA transfer error. The DMAC error register (DMACER) shows the transfer error flags of all 16 DMAC channels.

While the transfer error flag of a channel is set, a new DMA cycle is not executed if the transfer error case DMA transfer disable setting (DTCTn.ESE) bit is set. On the other hand, a DMA cycle is executed regardless of the value of the transfer error flag if the transfer error case DMA transfer disable setting (DTCTn.ESE) bit is cleared.

If you want to abort the DMA transfer of a channel with DMA transfer error, follow the procedure to abort DMA transfer of the DMAC channel.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the write is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address, destination address, transfer count, and address reload count registers are updated.

7.4.2.2 Operation of a DTS When DMA Transfer Error Occurs

When DMA transfer error occurs in a DTS, the DTS error flag (DTSER1.DTSER) in the DTS error register is set, and the DTS channel number with the DMA transfer error is stored in the DTS error channel (DTSER1.DTSERCH) in the same register.

If DMA transfer error occurs in a single transfer, a TI write back is executed to finish the DMA cycle.

If DMA transfer error occurs in the middle of a block transfer and the transfer error case DMA transfer abort setting (DTTCTnnn.ESE) is set, the remaining DMA cycles in the block transfer are not executed, but a TI write back is executed to finish the DMA cycle. At the same time, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is cleared. If DMA transfer error occurs in the middle of a block transfer and the transfer error case DMA transfer abort setting (DTTCTnnn.ESE) is cleared, the block transfer continues regardless of the DMA transfer error.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the write is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address, destination address, transfer count, and address reload count registers are updated, and the TI is updated by a TI write back.

If the DTS error flag in the DTS error register is set, a TI fetch is executed when the DTS accepts a DMA transfer request for the channel with the same channel number as the one stored in the DTS error channel. If, as a result of the TI fetch, the transfer error case DMA transfer abort setting (DTTCTnnn.ESE) is found to be set, a DMA cycle and a TI write back are not executed. If the transfer error case DMA transfer abort setting (DTTCTnnn.ESE) is cleared, DMA transfer is executed.

If the DTS error flag in the DTS error register is set, DMA transfer is executed when the DTS accepts a DMA transfer request for a channel with a channel number other than the one stored in the DTS error channel.

7.4.3 DTSRAM Error

There are two types of DTSRAM errors detected in the DTSRAM read access: 1-bit and 2-bit ECC error.

If a 1-bit ECC error is detected during a TI fetch, error corrected data is used, and DMA transfer continues. If a 1-bit ECC error is detected during DTS channel register access from software, error corrected data is returned as read data. In either case, the DTSRAM1 bit error flag (DTSER2.RAMSED) in the DTS error register 2 is set, and the address of the error location in the DTSRAM is stored to the DTSRAM1 bit error address (DTSER2.RAMSEDAD).

In addition, the error is notified to the ECM.

If a 2-bit ECC error is detected during a TI fetch, handling of the DMA transfer request is terminated without executing a DMA cycle and TI write back. If a 2-bit ECC error is detected during DTS channel register access from software, peripheral bus error is notified. In either case, the DTSRAM2 bit error flag (DTSER2.RAMDED) in the DTS error register 2 is set, and the address of the error location is stored to the DTSRAM2 bit error address (DTSER2.RAMDEDAD). In addition, the error is notified to the ECM.

7.5 Reliability Function

7.5.1 Overview

In this product, DMA is a resource used by multiple masters (CPU1, CPU2, or the internal EMU3 SubCPU). In order for DMA to support multi-core configuration, the following reliability functions are offered.

- Register access protection function
- Master information inherit function

7.5.2 Register Access Protection Function

This product is designed to assign each DMA channel to CPU1, CPU2, or the internal EMU3 SubCPU.

The register access protection function allows access to the transfer information of each DMA channel from the master (CPU1, CPU2, or the internal EMU3 SubCPU) assigned to the channel but prohibits access from other masters.

The register access protection function enables you, for example, to prevent the settings of the channel from being read or updated by masters other than the one assigned to the channel.

7.5.2.1 Identifying the Accessing Master

DMA identifies a master based on the ID of the accessing CPU (PEID), and whether the CPU is in supervisor mode (PSW.UM = 0) or user mode (PSW.UM = 1).

7.5.2.2 Master Access

There are the following two types of master accesses:

- Special master access (CPU1, CPU2, or the internal EMU3 SubCPU is in supervisor mode (UM = 0))
- General master access (access other than special master access)

In special master access, access to all registers is allowed.

In general master access, read access is allowed to all registers, but write access is allowed only to channel registers of channels assigned by means of channel assignment (See **Section 7.5.2.3, Channel Assignment**).

7.5.2.3 Channel Assignment

To each channel, DMA can assign a master (CPU1, CPU2, or the internal EMU3 SubCPU) so that the master is allowed to use the channel. Channel assignment is configured in the channel master setting register (DMnnCM in the case of a DMAC and DTSnnnCM in the case of a DTS) in supervisor mode by CPU1, CPU2, or the internal EMU3 SubCPU (UM = 0).

In general master access, the master assigned to a channel by channel assignment is allowed write access to the channel registers of the channel. If the channel registers of a channel is accessed for write by a master other than the master assigned to the channel, the access is called illegal access. For information about illegal access, see **Section 7.5.2.4, Illegal Access**.

7.5.2.4 Illegal Access

DMA handles the following access as illegal access.

(1) Write access from a general master to the global registers

(2) Write access to the channel registers of a channel from a general master other than the master assigned to the channel by means of channel assignment

In DMA, read access from any master is not treated as illegal access.

DMA's actions against illegal access are as follows.

For both (1) and (2),

- Write access is ignored.

Only for (2),

- The information about the illegal access is stored in a register access protection violation register.
- The DMAC0, DMAC1, and DTS have their own register access protection violation registers (DM0CMV, DM1CMV, and DTSCMV respectively).

Only the special master can access, for write, the register access protection violation registers. The special master can check whether illegal access has occurred by checking the register access protection violation registers periodically.

In addition, it is recommended that, when a master tries to use DMA and configures transfer information in the channel registers, the master should check whether the configuration has been successfully completed without illegal access by, for example, reading back the settings.

7.5.3 Master Information Inherit Function

In this product, DMA access inherits master information that is equivalent to the master information of the CPU1, CPU2, or the internal EMU3 SubCPU assigned to the DMA channel.

The master information that is output from DMA is as in **Table 7.6.**

Table 7.6 Master Information Output from DMA

Meaning	Value that is output from DMA
UM	Same as the UM bit value in the channel master setting register
SPID	Same as the SPID bit value in the channel master setting register
PEID	7
DMA access	1

7.5.4 Other Reliability Functions

7.5.4.1 Restriction on the Next Channel in the Chain

The reliability function limits the channels you can select as the next channel in the chain.

When you use the chain function, the channel master settings of a channel and its next channel in the chain must be the same.

The chain function is designed so that a channel and its next channel in the chain are managed by the same master.

When DMA detects that different masters are assigned to a channel and its next channel in the chain, it is deemed illegal and the chain function is suppressed. More specifically, when DMA tries to execute the chain function, DMA compares the chain master settings of the channel and its next channel in the chain, and if the settings are all the same for PEID and UM, the chain function is allowed and a chain request is sent to the next channel. If the settings are not the same for PEID or UM, a chain request is not sent.

7.6 Setting Up DMA Transfer

7.6.1 Overview of Setting Up DMA

Table 7.7 Channel Assignment (1/2)

No.	Master that configures the setting	Description	Register		Necessity of the setting
1	Special master (supervisor mode of CPU1, CPU2, or the internal EMU3 SubCPU (UM = 0))	Overall DMA operation setting	DTSPR0 to DTSPR7	DTS channel priority setting register	Mandatory (if a DTS is used)
2			DM00CM to DM17CM	DMAC channel master setting register	Mandatory (if a DMAC is used)
3			DTS0CM to DTS127CM	DTS channel master setting register	Mandatory (if a DTS is used)
4		Status clear	DTSERC	DTS error clear register	Recommended
5			CMVC	Channel protection violation clear register	Recommended
6	General master	Channel setting	DMATRGSELn	DMA trigger source select register	Mandatory
7	Master assigned to the DMAC channel		DSAn	DMAC source address register	Mandatory
8			DDAn	DMAC destination address register	Mandatory
9			DTCn	DMAC transfer count register	Mandatory
10			DTCTn	DMAC transfer control register	Mandatory
11			DRSAn	DMAC reload source address register	Mandatory if the reload function is used
12			DRDAn	DMAC reload destination address register	Mandatory if the reload function is used
13			DRTCn	DMAC reload transfer count register	Mandatory if the reload function is used
14			DTCCn	DMAC transfer count compare register	Mandatory if the transfer count match interrupt is used
15			DTFRn	DTFR setting register	Mandatory
16		Status clear	DCSTCn	DMAC transfer status clear register	Mandatory
17			DTFRRQCn	DTFR transfer request clear register	Recommended
18		Channel operation enable	DCENn	DMAC channel operation enable setting register	Mandatory

Table 7.7 Channel Assignment (2/2)

No.	Master that configures the setting	Description	Register		Necessity of the setting
19	General master	Channel setting	DTSTRGSELn	DTS trigger source select register	Mandatory
20	Master assigned to the DTS channel		DTSAnnn	DTS source address register	Mandatory
21			DTDAnnn	DTS destination address register	Mandatory
22			DTTCnnn	DTS transfer count register	Mandatory
23			DTTCTnnn	DTS transfer control register	Mandatory
24			DTRSAnnn	DTS reload source address register	Mandatory if the reload function is used
25			DTRDAnnn	DTS reload destination address register	Mandatory if the reload function is used
26			DTRTCnnn	DTS reload transfer count register	Mandatory if the reload function is used
27			DTTCCnnn	DTS transfer count compare register	Mandatory if the transfer count match interrupt is used
28		Status clear	DTFSCnnn	DTSFSL transfer request clear register	Recommended
29		Transfer request enable	DTFSLnnn	DTSFSL operation setting register	Mandatory

7.6.2 Setting Up the Overall DMA Operation

You need to set up the overall DMA operation before you start using DMA.

To configure the overall DMA operation, the special master (supervisor mode of CPU1, CPU2, or the internal EMU3 SubCPU (UM = 0)) needs to set up global registers. Global registers can be set up only by special master access. For details, see **Section 7.5, Reliability Function**.

The following registers must be set up to configure the overall DMA operation.

- DTS channel priority setting registers (DTSPRn, n = 0 to 7)
  Those registers configure the priority level of each DTS channel used for DTS channel arbitration.
- DMAC channel master setting registers (DMnnCM)
- DTS channel master setting registers (DTSnnnCM)
  Those registers configure channel assignment. (For details, see **Section 7.5, Reliability Function**.)

If the DMAC channel master setting registers and the DTS channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

Also, if errors are detected in the following registers while the overall DMA operation is set up, clearing the errors is recommended.

- DTS error register 1 (DTSER1)
- DTS error register 2 (DTSER2)
- DMAC0 register access protection violation register (DM0CMV)
- DMAC1 register access protection violation register (DM1CMV)
- DTS register access protection violation register (DTSCMV)

7.6.3 Setting Up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC and DTS channel.

To configure the DMA channel setting, the master assigned to each channel by the channel assignment needs to set up channel registers.

7.6.3.1 Setting Up the DMAC Channel Setting

Follow the procedure below to set up the DMAC channel setting and use the DMAC.

(1) Disabling the DMAC Channel Operation

If the channel operation enable (DTE) in the DMAC channel operation enable setting register (DCENn) is set, clear the DTE bit to disable the channel operation.

(2) Setting Up the Transfer Information

When you set up the transfer information of the DMAC, the following registers need to be set up.

- DMAC source address register (DSAn)
- DMAC destination address register (DDAn)
- DMAC transfer count register (DTCn)
- DMAC transfer control register (DTCTn)
- DMAC reload source address register (DRSAn)
- DMAC reload destination address register (DRDAn)
- DMAC reload transfer count register (DRTCn)
- DMAC transfer count compare register (DTCCn)

(3) Setting Up the DMA Transfer Request

While setting the transfer information, you need to set up the DMA transfer request selection assignment (DTCTn.DRS) bit in the DMAC transfer control register (DTCTn) to define whether the hardware or software DMA transfer request is used.

You cannot use both the hardware and software DMA transfer requests for the same channel at the same time.

If you use the hardware DMA transfer request, you need to select from Primary channel/Secondary channel using the DMA trigger source selection register, and then to select one source used as the hardware DMA transfer request out of 128 hardware DMA transfer sources using the hardware DMA transfer source selection (DTFRn.REQSEL) in the DTFR setting register. Also, you need to enable the hardware DMA transfer source selection (DTFRn.REQEN) in the same register.

The DTFR may retain a hardware DMA transfer request that came before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (DTFRRQn.DRQ) retained in the DTFR using the DTFR transfer request clear register (DTFRRQCn) if necessary.

If you use the software DMA transfer request, disable the hardware DMA transfer source selection (DTFRn.REQEN) in the DTFR setting register.

(4) Clearing the Transfer Status

The DMAC transfer status register (DCSTn) may retain the result of the previous DMA transfer. You need to clear the flags in the DMAC transfer status register using the DMAC transfer status clear register (DCSTCn).

(5) Enabling the DMAC Channel Operation

Set the channel operation enable (DCENn.DTE) bit in the DMAC channel operation enable setting register to enable the channel operation.

After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and start DMA transfer.

7.6.3.2 Setting Up the DTS Channel Setting

Follow the procedure below to set up the DTS channel setting and use the DTS.

(1) Disabling the Transfer Request by the DTSFSL

Clear the transfer request enable (DTFSLnnn.REQEN) bit in the DTSFSL operation setting register of the DTS channel you want to set up the channel setting for. This procedure is not mandatory but recommended in order to prevent a DMA transfer request from being sent mistakenly to the DTS channel currently being configured.

It is also recommended to check the DTS status register (DTSSTS) and confirm that DMA transfer is not ongoing for the DTS channel currently being configured.

(2) Setting Up the Transfer Information

When you set up the transfer information of the DTS, the following registers need to be set up to configure the transfer information.

- DTS source address register (DTSAnnn)
- DTS destination address register (DTDAnnn)
- DTS transfer count register (DTTCnnn)
- DTS transfer control register (DTTCTnnn)
- DTS reload source address register (DTRSAnnn)
- DTS reload destination address register (DTRDAnnn)
- DTS reload transfer count register (DTRTCnnn)
- DTS transfer count compare register (DTTCCnnn)

(3) Setting Up the DMA Transfer Request

Unlike a DMAC, a DTS does not care whether a DMA transfer request is a hardware DMA transfer request or software DMA transfer request. A DTS has a transfer request pending bit for each channel in the DTSFSL, and both a hardware and software DMA transfer requests are retained in the same transfer request pending bit (DTFSTnnn.DRQ). Therefore, a DTS has no setting for selecting whether the hardware or software transfer request is used.

The DTSFSL may retain a DMA transfer request that came before the transfer information is set up. Clear the DMA transfer request (DTFSTnnn.DRQ) retained in the DTSFSL if necessary, using the DTSFSL transfer request clear register (DTFSCnnn).

If you use the hardware DMA transfer request, you need to select from Primary channel/Secondary channel using the DTS trigger source register.

(4) Enabling the Transfer Request by the DTSFSL

Set the transfer request enable (DTFSLnnn.REQEN) bit in the DTSFSL operation setting register to enable the DMA transfer request for the DTS channel.

After the transfer request enable bit for the DTSFSL is set, the DTS can accept a DMA transfer request and start DMA transfer.

7.7 DMA Trigger Source

7.7.1 List of DMA Trigger Sources

The DMA trigger source assignment for DMA channel n is set in the DTFR setting register (DTFRn).

Table 7.8 List of DMA Trigger Sources (1/4)

DMASS	0134_H	DM15CM	DMAC1 channel 5 channel master setting register	√	*2	*3
DMASS	0138_H	DM16CM	DMAC1 channel 6 channel master setting register	√	*2	*3
DMASS	$013C_H$	DM17CM	DMAC1 channel 7 channel master setting register	√	*2	*3
DMASS	0200_H + 4 × [DTS channel number]*1 (0200_H to $03FC_H$)	DTSnnnCM*1	DTS channel nnn channel master setting register*1	√	*2	

Note 1. [DTS channel number] and "nnn" in the register symbols and meanings are numbers in the range from 000 to 127

Note 2. Only read access is allowed.

Note 3. At secure boot, write access is masked. For details on secure boot, refer to **Section 32, Intelligent Cryptographic Unit E (ICUSE)**.

7.9.2 Details of Global Registers

7.9.2.1 DMACTL — DMA Control Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMASPD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.11 DMACTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	DMASPD	DMA suspension This bit shows whether DMA transfer for all channels is suspended. If a user writes 1 to this bit, DMA transfer for all channels can be suspended. If a user writes 0 to this bit, suspension of DMA transfer for all channels can be cleared. The suspension controlled by this bit is independent from the suspension controlled by the transfer enable bit (DTE) of each DMAC channel and the suspension setting bit (DTSUST) for a DTS. That means, if this bit is 1, all DMA transfers are suspended regardless of the values of the DTE bit of each channel and the DTSUST bit of the DTS. Writing to this bit does not affect the DTE bit of each channel and the DTSUST bit of the DTS. 0: DMA suspension cleared 1: DMA suspension request/DMA suspension ongoing

CAUTION

In order to suspend or resume the DMA transfer being executed by a DTS, it is necessary to perform enabling or disabling operation by using the DMA transfer request enable bit (DTFSLnnn.REQEN). For details, refer to notes in **Section 7.3.3, Suspension, Resume, and Transfer Abort of a DTS**.

7.9.2.2 DTSCTL1 — DTS Control Register 1

Access: This register can be read/written in 32-bit units.

Address: FFFF 8010$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTSUST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.12 DTSCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	DTSUST	DTS suspension This bit shows whether DMA transfer of a DTS is suspended. If a user writes 1 to this bit, DMA transfer of a DTS can be suspended. 0: DTS suspension cleared 1: DTS suspension request/DTS suspension ongoing

CAUTION

In order to suspend or resume the DMA transfer being executed by a DTS, it is necessary to perform enabling or disabling operation by using the DMA transfer request enable bit (DTFSLnnn.REQEN). For details, refer to notes in **Section 7.3.3, Suspension, Resume, and Transfer Abort of a DTS**.

7.9.2.3 DTSCTL2 — DTS Control Register 2

Access: This register can be read/written in 32-bit units.

Address: FFFF 8014$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTSTIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.13 DTSCTL2 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	DTSTIT	DTS transfer abort request While the DTS is suspended, a user can write 1 to this bit to abort the suspended DMA transfer. When the suspended DMA transfer of a DTS is aborted, the DTSSTS.DTSACT bit is cleared to 0. This bit is always read as 0.

7.9.2.4 DTSSTS — DTS Status Register

Access: This register can be read in 32-bit units.

Address: FFFF 8018$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DTSCYC	DTSACH[6:0]							DTSACT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.14 DTSSTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned.
8	DTSCYC	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in the DTS. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing.
7 to 1	DTSACH[6:0]	DTS transfer channel If there is a channel in the DTS executing DMA transfer, the channel number is shown. If there is no channel in the DTS executing DMA transfer, the channel number of the last DMA transfer is shown.
0	DTSACT	DTS transfer status This bit shows whether there is a channel in the DTS executing DMA transfer. 0: There is a channel in the DTS executing DMA transfer. 1: There is no channel in the DTS executing DMA transfer. If the DTS is put into the suspended state while there is a channel executing DMA transfer, this bit remains 1. If a DTS transfer abort request is made using the DTSCTL2.DTSTIT bit, the suspended DTS transfer is aborted, and this bit is cleared to 0. When DMA transfer error occurs and the DMA transfer is aborted, this bit is cleared.

7.9.2.5 DMACER — DMAC Error Register

Access: This register can be read in 32-bit units.

Address: FFFF 8020$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DM1ER[7:0]								DM0ER[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.15 DMACER Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 8	DM1ER[7:0]	DMAC1 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC1. Each bit is mapped from the DCSTn.ER bit of each channel of the DMAC1 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated
7 to 0	DM0ER[7:0]	DMAC0 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC0. Each bit is mapped from the DCSTn.ER bit of each channel of the DMAC0 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated

7.9.2.6 DTSER1 — DTS Error Register 1

Access: This register can be read in 32-bit units.

Address: FFFF 8024$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DTSERCH[6:0]							—	—	—	—	—	—	DTSERWR	DTSER
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.16 DTSER1 Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	When read, the value after reset is returned.
14 to 8	DTSERCH[6:0]	DTS error channel These bits show the DTS channel number of the first DMA transfer error after the DTSER bit is cleared to 0. These bits are read-only and cannot be cleared.
7 to 2	Reserved	When read, the value after reset is returned.
1	DTSERWR	DTS DMA transfer error occurring cycle This bit is updated at the same time as setting of the DTS DMA transfer error flag (DTSER), indicating which cycle of read or write the DMA transfer error occurs in. This bit is not updated when a new DMA transfer error occurs after the DTSER bit has been set. If the DTSER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in read cycle. 1: DMA transfer error occurs in write cycle.
0	DTSER	DTS DMA transfer error flag This bit shows whether DMA transfer error is generated in the DTS. 0: DMA transfer error is not generated 1: DMA transfer error is generated If DMA transfer error is generated in the DTS while this bit is 0, this bit is set, and DTSERCH6 to DTSERCH0 retain the DTS channel number of the DMA transfer error. If DMA transfer error is generated in the DTS while this bit is 1, this bit remains 1, and TSERCH6 to DTSERCH0 do not change. This bit can be cleared by using the DTSERC register.

7.9.2.7 DTSER2 — DTS Error Register 2

Access: This register can be read in 32-bit units.

Address: FFFF 8028$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RAMDED	RAMDEDOV	—	—	RAMDEDAD[11:0]

Table 7.17 DTSER2 Register Contents (1/2)

Bit Position	Bit Name	Function
31	RAMDED	DTSRAM 2-bit error flag This bit shows whether the 2-bit error is generated in the read access to the DTSRAM. 0: 2-bit error is not generated in the DTSRAM 1: 2-bit error is generated in the DTSRAM If the 2-bit error occurs in DTSRAM read access while this bit is 0, this bit is set, and RAMDEDAD11 to RAMDEDAD0 retain the DTSRAM address of the error. If the 2-bit error occurs in DTSRAM read access while this bit is 1, this bit remains 1, and RAMDEDAD11 to RAMDEDAD0 do not change. This bit can be cleared by using the DTSERC register
30	RAMDEDOV	DTSRAM 2-bit error overflow flag This bit is set when the RAMDED bit is 1 and the 2-bit error occurs in DTSRAM read access whose address is different from that specified by the RAMDEDAD11 to RAMDEDAD0 bits. This bit can be cleared by operation of the DTSERC register.
29, 28	Reserved	When read, the value after reset is returned.
27 to 16	RAMDEDAD[11:0]	DTSRAM 2-bit error address These bits show the DTSRAM address at which the first 2-bit error occurs in DTSRAM read access after the RAMDED bit is cleared to 0. These bits are read-only and cannot be cleared.
15	RAMSED	DTSRAM 1-bit error flag This bit shows whether the 1-bit error is generated in the read access to the DTSRAM. 0: 1-bit error is not generated in the DTSRAM 1: 1-bit error is generated in the DTSRAM If the 1-bit error occurs in the DTSRAM while this bit is 0, this bit is set, and RAMSEDAD11 to RAMSEDAD0 retain the DTSRAM address of the error. If the 1-bit error occurs in DTSRAM read access while this bit is 1, this bit remains 1, and RAMSEDAD11 to RAMSEDAD0 do not change. This bit can be cleared by using the DTSERC register.

Table 7.17 DTSER2 Register Contents (2/2)

Bit Position	Bit Name	Function
14	RAMSEDOV	DTSRAM 1-bit error overflow flag This bit is set when the RAMSED bit is 1 and the 1-bit error occurs in DTSRAM read access whose address is different from that specified by the RAMSEDAD11 to RAMSEDAD0 bits. This bit can be cleared by operation of the DTSERC register.
13, 12	Reserved	When read, the value after reset is returned.
11 to 0	RAMSEDAD[11:0]	DTSRAM 1-bit error address These bits show the DTSRAM address of the first DTSRAM 1-bit error after the RAMSED bit is cleared to 0. These bits are read-only and cannot be cleared.

7.9.2.8 DTSERC — DTS Error Clear Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 802C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RAMDEDC	RAMDEDOVC	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RAMSEDC	RAMSEDOVC	—	—	—	—	—	—	—	—	—	—	—	—	—	DTSERC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.18 DTSERC Register Contents

Bit Position	Bit Name	Function
31	RAMDEDC	DTSRAM 2-bit error flag clear If a user writes 1 to this bit, the DTSRAM 2-bit error flag (DTSER2.RAMDED) is cleared. 0 is always read from this bit.
30	RAMDEDOVC	DTSRAM 2-bit error overflow flag clear When the user writes 1 to this bit, the DTSRAM 2-bit error overflow flag (DTSER2.RAMDEDOV) is cleared. The read value of this bit is always 0.
29 to 16	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
15	RAMSEDC	DTSRAM 1-bit error flag clear If a user writes 1 to this bit, the DTSRAM 1-bit error flag (DTSER2.RAMSED) is cleared. 0 is always read from this bit.
14	RAMSEDOVC	DTSRAM 1-bit error overflow flag clear When the user writes 1 to this bit, the DTSRAM 1-bit error overflow flag (DTSER2.RAMSEDOV) is cleared. The read value of this bit is always 0.
13 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	DTSERC	DTS error flag clear If a user writes 1 to this bit, the DTS DMA error flag (DTSER1.DTSER) is cleared. 0 is always read from this bit.

7.9.2.9 DM0CMV — DMAC0 Register Access Protection Violation Register

Access: This register can be read in 32-bit units.

Address: FFFF 8030$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	MINF[6:1]						—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	VCH[2:0]			—	—	—	VF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.19 DM0CMV Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
22 to 17	MINF[6:1]	Illegal access master information These bits show the master information of the originator of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. The following master information of the originator of the access is retained in MINF6 to MINF1. MINF6 to 4: The PEID of the originator of the access MINF3, 2: The SPID of the originator of the access MINF1: The UM of the originator of the access
16 to 7	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
6 to 4	VCH[2:0]	Illegal access channel These bits show the channel number (0 to 7) of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	VF	Illegal access flag This bit shows whether illegal access occurs in the DMAC0. 0: No illegal access has occurred in the DMAC0 1: Illegal access has occurred in the DMAC0 If an illegal access occurs in the DMAC0 while this bit is 0, this bit is set, and MINF6 to MINF1 and VCH2 to VCH0 store their respective information. If an illegal access occurs in the DMAC0 while this bit is 1, this bit remains 1, and MINF6 to MINF1 and VCH2 to VCH0 do not change. This bit can be cleared by using the CMVC register.

7.9.2.10 DM1CMV — DMAC1 Register Access Protection Violation Register

Access: This register can be read in 32-bit units.

Address: FFFF 8034$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	MINF[6:1]						—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.20 DM1CMV Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned.
22 to 17	MINF[6:1]	Illegal access master information These bits show the master information of the originator of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. The following master information of the originator of the access is retained in MINF6 to MINF1. MINF6 to 4: The PEID of the originator of the access MINF3, 2: The SPID of the originator of the access MINF1: The UM of the originator of the access
16 to 7	Reserved	When read, the value after reset is returned.
6 to 4	VCH[2:0]	Illegal access channel These bits show the channel number (0 to 7) of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is returned.
0	VF	Illegal access flag This bit shows whether illegal access occurs in the DMAC1. 0: No illegal access has occurred in the DMAC1 1: Illegal access has occurred in the DMAC1 If an illegal access occurs in the DMAC1 while this bit is 0, this bit is set, and MINF6 to MINF1 and VCH2 to VCH0 store their respective information. If an illegal access occurs in the DMAC1 while this bit is 1, this bit remains 1, and MINF6 to MINF1 and VCH2 to VCH0 do not change. This bit can be cleared by using the CMVC register.

7.9.2.11 DTSCMV — DTS Register Access Protection Violation Register

Access: This register can be read in 32-bit units.

Address: FFFF 8038$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	MINF[6:1]						—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCH[6:0]							—	—	—	VF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.21 DTSCMV Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned.
22 to 17	MINF[6:1]	Illegal access master information These bits show the master information of the originator of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared. The following master information of the originator of the access is retained in MINF6 to MINF1. MINF6 to 4: The PEID of the originator of the access MINF3, 2: The SPID of the originator of the access MINF1: The UM of the originator of the access
16 to 11	Reserved	When read, the value after reset is returned.
10 to 4	VCH[6:0]	Illegal access channel These bits show the channel number (0 to 127) of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is returned.
0	VF	Illegal access flag This bit shows whether illegal access occurs in the DTS. 0: No illegal access has occurred in the DTS 1: Illegal access has occurred in the DTS If an illegal access occurs in the DTS while this bit is 0, this bit is set, and MINF6 to MINF1 and VCH6 to VCH0 store their respective information. If an illegal access occurs in the DTS while this bit is 1, this bit remains 1, and MINF6 to MINF1 and VCH6 to VCH0 do not change. This bit can be cleared by using the CMVC register.

7.9.2.12 CMVC — Register Access Protection Violation Clear Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 803C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.30 DTSPR7 Register Contents

Bit Position	Bit Name	Function
31 to 0	DTS[127:112] PR[1:0]	DTS channel [127:112] priority setting These bits configure the priority level of each DTS channel used for DTS channel arbitration. 00 is the highest priority, and 11 is the lowest.

7.9.2.14 DTRECCTL — DTSRAM ECC Control Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8080H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.31 DTRECCTL Register Contents

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	These bits enable or disable writing to the ECCDIS and SECDIS bits. The written data is not retained. The read value is always 0. These bits should be written when (PROT1, PROT0) = (0, 1)
29 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	SECDIS	DTSRAM SEC error correction disable This bit enables or disables SEC error correction when the ECCDIS bit is 0. 1-bit ECC error detection operation is always executed when ECCDIS bit is 0 regardless of the state of this bit. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: Error correction is enabled when the SEC error is detected. 1: Error correction is disabled when the SEC error is detected.
0	ECCDIS	DTSRAM ECC disable This bit enables or disables DTSRAM ECC error detection and correction. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: Error detection and correction are enabled. 1: Error detection and correction are disabled. **Note**: The encoding function is effective when error detection and correction are disabled.

7.9.2.15 DTRERINT — DTSRAM Error Notification Control Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8084$_H$

Value after reset: 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.32 DTRERINT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	DEDIE	DTSRAM 2-bit error notification enable This bit enables or disables notification of 2-bit error detection to the ECM when the ECCDIS bit in DTRECCTL is 0. 0: Notification of 2-bit error to ECM is disabled. 1: Notification of 2-bit error to ECM is enabled.
0	SEDIE	DTSRAM 1-bit error notification enable This bit enables or disables notification of 1-bit error detection to the ECM when the ECCDIS bit in DTRECCTL is 0. 0: Notification of 1-bit error to ECM is disabled. 1: Notification of 1-bit error to ECM is enabled.

7.9.2.16 DTRTSCTL — DTSRAM Test Control Register

This register is used for ECC test (self-diagnosis). It enables setting of ECC test mode and selection of ECC data to be written to the DTSRAM.

Access: This register can be read/written in 32-bit units.

Address: FFFF 8094$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST	DATSEL
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.33 DTRTSCTL Register Contents

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	These bits enable or disable writing to the ECCTST and DATSEL bits. The written data is not retained. The read value is always 0. These bits should be written when (PROT1, PROT0) = (0, 1)
29 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	ECCTST	DTSRAM ECC Test Mode This bit enables or disables DTSRAM ECC test mode. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: ECC test mode is enabled. 1: ECC test mode is disabled.
0	DATSEL	ECC Test Data Selection This bit is valid when ECCTST is 1 and selects ECC data to be written to the DTSRAM. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: ECC encoded from the written data is used. 1: The value specified by the DTSRAM test write data register (DTRTWDAT) is used.

7.9.2.17 DTRTWDAT — DTSRAM Test Write Data Register

This register is used for ECC test (self-diagnosis). It specifies ECC data to be written to the DTSRAM after ECC test mode is enabled (ECCTST = 1).

Access: This register can be read/written in 32-bit units.

Address: FFFF 8098$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	TWDAT[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.34 DTRTWDAT Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
6 to 0	TWDAT[6:0]	ECC Test Write Data These bits specify ECC data to be written to the DTSRAM when DTRTSCTL.ECCTST = 1 and DTRTSCTL.DATSEL = 1. Writing to these bits is enabled when DTRTSCTL.ECCTST = 1 When DTRTSCTL.ECCTST = 0, these bits cannot be written and their read value is 0.

7.9.2.18 DTRTRDAT — DTSRAM Test Read Data Register

This register is used for ECC test (self-diagnosis). It reads out ECC data of the DTSRAM after ECC test mode is enabled (ECCTST = 1).

Access: This register can be read in 32-bit units.

Address: FFFF 809C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	TRDAT[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.35 DTRTRDAT Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned.
6 to 0	TRDAT[6:0]	ECC Test Read Data These bits retain the last ECC data read out from the DTSRAM when DTRTSCTL.ECCTST = 1. When DTRTSCTL.ECCTST = 0, the read value of these bits is 0.

7.9.2.19 DMnnCM — DMAC Channel Master Setting Register (nn = 00 to 07, 10 to17)

Access: This register can be read/written in 32-bit units.

Address: FFFF 8100_H + 4 × Ch. No. n (n = 0 to 7)

FFFF 8120_H + 4 × Ch. No. n - 10 (n = 10 to 17)

Value after reset: $0000\ 0010_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	PEID[2:0]			SPID[1:0]		UM	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 7.36 DMnnCM Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
6 to 4	PEID[2:0]	Channel master PEID setting Specify the PEID information of the master assigned to the channel.
3, 2	SPID[1:0]	Channel master SPID setting Specify the SPID information used by the master assigned to the channel.
1	UM	Channel master UM setting Specifies the UM information of the master assigned to the channel.
0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

CAUTION

DM00CM to DM07CM configure the channel master information of the DMAC0 channels 0 to 7 respectively.

DM10CM to DM17CM configure the channel master information of the DMAC1 channels 0 to 7 respectively.

For information about the functions this register offers, see **Section 7.5, Reliability Function**.

7.9.2.20 DTSnnnCM — DTS Channel Master Setting Register (nnn = 000 to 127)

Access: This register can be read/written in 32-bit units.

Address: FFFF 8200$_H$ + 4$_H$ × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	PEID[2:0]			SPID[1:0]		UM	—
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMC[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.37 DTSnnnCM Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value returned is undefined. When writing to these bits, write 0.
22 to 20	PEID[2:0]	Channel master PEID setting Specify the PEID information of the master assigned to the channel.
19, 18	SPID[1:0]	Channel master SPID setting Specify the SPID information used by the master assigned to the channel.
17	UM	Channel master UM setting Specifies the UM information of the master assigned to the channel.
16	Reserved	When read, the value returned is undefined. When writing to these bits, write 0.
15 to 0	CMC[15:0]	Transfer count compare In terms of contents, this field is the same as bits [15:0] of the Section **7.11.3.8, DTTCCnnn — DTS Transfer Count Compare Register**.

CAUTION

DTS000CM to DTS127CM configure the channel master information of the DTS channels 0 to 127 respectively.

For information about the functions this register offers, see **Section 7.5, Reliability Function**.

CAUTION

The 16 low-order bits of this register are shared with the DTS transfer count compare register, one of the DTS channel registers.

If you write to this register, the DTS transfer count compare register is updated as well.

Recommended setup procedure of the DTS channel master setting register

When the special master configures the overall DMA operation, the channel master setting must be configured in bits 22 to 17 in this register, and 0 must be specified in bits 15 to 0 and reserved bits 31 to 23 and 16.

When the master assigned to the channel updates the value of the transfer count compare, use the DTS transfer count compare register instead.

Reserved bits of this register can be read or written. Our recommendation is as follows. When you write to those bits, write 0. When you read from those bits, discard the read value by software.

7.10 DMAC Channel Register

7.10.1 DMAC Channel Register Address

Address = Base address "FFFF 8000_H" + Offset address

Table 7.38 DMAC Channel Register Address

Module Name	Offset Address	Register Symbol	Meaning	Accessed Permission		
				Special Master	General Master	At secure boot
DMASS	$0400_H + 40_H \times$ [channel number]*1	DSAn	DMAC source address	√	√	*2
DMASS	$0404_H + 40_H \times$ [channel number]*1	DDAn	DMAC destination address	√	√	*2
DMASS	$0408_H + 40_H \times$ [channel number]*1	DTCn	DMAC transfer count	√	√	*2
DMASS	$040C_H + 40_H \times$ [channel number]*1	DTCTn	DMAC transfer control	√	√	*2
DMASS	$0410_H + 40_H \times$ [channel number]*1	DRSAn	DMAC reload source address	√	√	*2
DMASS	$0414_H + 40_H \times$ [channel number]*1	DRDAn	DMAC reload destination address	√	√	*2
DMASS	$0418_H + 40_H \times$ [channel number]*1	DRTCn	DMAC reload transfer count	√	√	*2
DMASS	$041C_H + 40_H \times$ [channel number]*1	DTCCn	DMAC transfer count compare	√	√	*2
DMASS	$0420_H + 40_H \times$ [channel number]*1	DCENn	DMAC channel operation enable setting	√	√	*2
DMASS	$0424_H + 40_H \times$ [channel number]*1	DCSTn	DMAC transfer status	√	√	
DMASS	$0428_H + 40_H \times$ [channel number]*1	DCSTSn	DMAC transfer status set	√	√	*2
DMASS	$042C_H + 40_H \times$ [channel number]*1	DCSTCn	DMAC transfer status clear	√	√	*2
DMASS	$0430_H + 40_H \times$ [channel number]*1	DTFRn	DTFR setting	√	√	*2
DMASS	$0434_H + 40_H \times$ [channel number]*1	DTFRRQn	DTFR transfer request status	√	√	
DMASS	$0438_H + 40_H \times$ [channel number]*1	DTFRRQCn	DTFR transfer request clear	√	√	*2

Note 1. The [channel number] in the offset addresses and "n" in the register symbols are numbers in the range from 0 to 15, and the correspondence between the channel number n and the channel is as follows.

Note 2. At secure boot, write access on DMAC0 channels 0 to 7 is masked. For details on secure boot, refer to **Section 32, Intelligent Cryptographic Unit E (ICUSE)**.

Channel number n	Channel	Channel number n	Channel
0	DMAC0 channel 0	8	DMAC1 channel 0
1	DMAC0 channel 1	9	DMAC1 channel 1
2	DMAC0 channel 2	10	DMAC1 channel 2
3	DMAC0 channel 3	11	DMAC1 channel 3
4	DMAC0 channel 4	12	DMAC1 channel 4
5	DMAC0 channel 5	13	DMAC1 channel 5
6	DMAC0 channel 6	14	DMAC1 channel 6
7	DMAC0 channel 7	15	DMAC1 channel 7

7.10.2 Details of DMAC Channel Registers

The “n” in the register symbols indicates the DMA channel number (n = 0 to 15).

7.10.2.1 DSAn — DMAC Source Address Register

Access: This register can be read/written in 32-bit units.

Address: $FFFF8400_H + 40_H \times$ Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.39 DSAn Register Contents

Bit Position	Bit Name	Function
31 to 0	SA[31:0]	Source address Specify the DMA transfer source address. Those bits are updated whenever a DMA cycle is executed. If you read from those bits, the transfer source address for the next DMA cycle is read.

CAUTIONS

1. Writing to this register is prohibited while the channel operation is enabled (DTE bit = 1). If it is written, correct operation is not guaranteed.
2. The address must be set up while the DTE bit is 0.
3. DMA transfer of misaligned data is not supported. The 4 lower-order bits of addresses corresponding to the transfer data size are as follows (× indicates any bit).
   Correct operation is not guaranteed if settings do not comply with the following table.

Data Size	SA3	SA2	SA1	SA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.10.2.2 DDAn — DMAC Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8404_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.40 DDAn Register Contents

Bit Position	Bit Name	Function
31 to 0	DA[31:0]	Destination address Specify the DMA transfer destination address. Those bits are updated whenever a DMA cycle is executed. If you read from those bits, the transfer destination address for the next DMA cycle is read.

CAUTIONS

1. Writing to this register is prohibited while the channel operation is enabled (DTE bit = 1). If it is written, correct operation is not guaranteed.
2. The address must be set up while the DTE bit is 0.
3. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
4. DMA transfer of misaligned data is not supported. The 4 lower-order bits of addresses corresponding to the transfer data size are as follows (× indicates any bit).
   Correct operation is not guaranteed if settings do not comply with the following table.

Data Size	DA3	DA2	DA1	DA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.10.2.3 DTCn — DMAC Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8408_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.41 DTCn Register Contents

Bit Position	Bit Name	Function
31 to 16	ARC[15:0]	Address reload count Specify the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. If you read from those bits during DMA transfer, the address reload count for the next DMA cycle is read. When the reload function 2 or block transfer 2 is used, ARC[15:0] is decremented by one for every DMA cycle. When the reload function 2 or block transfer 2 is not used, ARC[15:0] bits are not updated. If the value is 0000_H, it means that the number of transfers until the address reload when the reload function 2 is used and the number of transfers when the block transfer 2 is used are 65536.
15 to 0	TRC[15:0]	Transfer count Configure the number of transfers. TRC[15:0] is decremented by one whenever a DMA cycle is executed. If you read from those bits, the remaining number of transfers for the next DMA cycle is read. If the reload function is not used, after the last transfer is complete, the value at the completion (0000_H) is retained.

TRC15-0	Operation
0000_H	The number of transfers is 65536, or the transfer is complete.
0001_H	The number of transfers or remaining transfers is 1.
:	:
$FFFF_H$	The number of transfers or remaining transfers is 65535.

CAUTION

1. Writing to this register is prohibited while the channel operation is enabled (DTE bit = 1). If it is written, correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.

7.10.2.4 DTCTn — DMAC Transfer Control Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 840C$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	ESE	DRS	—	—	—	—	—	CHNSEL[2:0]			CHNE[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CCE	TCE	MLE	RLD2M[1:0]		RLD1M[1:0]		DACM[1:0]		SACM[1:0]		DS[2:0]			TRM[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.42 DTCTn Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
27	ESE	Transfer error case DMA transfer disable setting Configures whether a DMA cycle is executed when the DCSTn.ER bit is set due to DMA transfer error. If this bit is cleared to 0, even when the DCSTn.ER bit is set due to DMA transfer error, the following DMA cycles can be executed. If this bit is set to 1, the following DMA cycles are not executed when the DCSTn.ER bit is set due to DMA transfer error. 0: DMA cycles are executed while the DCSTn.ER bit is set. 1: DMA cycles are not executed while the DCSTn.ER bit is set.
26	DRS	DMA transfer request selection assignment Selects the type of DMA transfer requests to be accepted. 0: Software DMA transfer request 1: Hardware DMA transfer request
25 to 21	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
20 to 18	CHNSEL[2:0]	Next channel in the chain Specify the next channel in the chain. The next channel must be another channel in the same DMAC. You cannot specify a channel in the different DMAC or in the DTS. You cannot specify the same channel for the next channel. (If you do, correct operation is not guaranteed.)
17, 16	CHNE[1:0]	Chain enable Select the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle in which the remaining transfer count is one. 10: Setting prohibited (No guarantee of operation) 11: Always chain A chain request is generated at the completion of every DMA cycle.

Table 7.42 DTCTn Register Contents (2/3)

Bit Position	Bit Name	Function
15	CCE	Transfer count match interrupt enable If this bit is set, a transfer count match interrupt is generated at the completion of the DMA cycle in which the transfer count compare register and the remaining transfer count have the same value.
14	TCE	Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer.
13	MLE	Continuous transfer enable If this bit is set, the DTE bit is not cleared at the completion of DMA transfer. In addition, even if the TC bit is not cleared, DMA transfer starts when there is a DMA transfer request. 0: The DTE bit is cleared at the completion of DMA transfer. In addition, the next DMA transfer can start only after the TC bit is cleared. 1: The DTE bit is not cleared at the completion of DMA transfer. In addition, even if the TC bit is not cleared, DMA transfer starts when there is a DMA transfer request.
12, 11	RLD2M[1:0]	Reload function 2 setting Configure the reload function 2. 00: Reload function 2 is disabled. 01: Reload function 2 is enabled. The source address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 10: Reload function 2 is enabled. The destination address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 11: Reload function 2 is enabled. The source address, destination address, and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1.
10, 9	RLD1M[1:0]	Reload function 1 setting Configure the reload function 1. 00: Reload function 1 is disabled. 01: Reload function 1 is enabled. The source address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 10: Reload function 1 is enabled. The destination address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 11: Reload function 1 is enabled. The source address, destination address, and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.)
8, 7	DACM[1:0]	Destination address count direction Specify the direction of counting for the destination address.

DACM1	DACM0	Direction of Counting
0	0	Up
0	1	Down
1	0	Fixed
1	1	Setting prohibited (No guarantee of operation)

Table 7.42 DTCTn Register Contents (3/3)

Bit Position	Bit Name	Function
6, 5	SACM[1:0]	Source address count direction Specify the direction of counting for the source address.

SACM1	SACM0	Direction of Counting
0	0	Up
0	1	Down
1	0	Fixed
1	1	Setting prohibited (No guarantee of operation)

Bit Position	Bit Name	Function
4 to 2	DS[2:0]	Transfer data size Specify the transfer data size.

DS2	DS1	DS0	Transfer Data Size
0	0	0	8 bits
0	0	1	16 bits
0	1	0	32 bits
0	1	1	64 bits
1	0	0	128 bits
Other than the above			Setting prohibited (No guarantee of operation)

Bit Position	Bit Name	Function
1, 0	TRM[1:0]	Transfer mode Specify the DMA transfer mode. 00: Single transfer 01: Block transfer 1 (The number of transfers is specified by the transfer count.) 10: Block transfer 2 (The number of transfers is specified by the address reload count.) 11: Setting prohibited (No guarantee of operation)

CAUTIONS

1. Writing to this register is prohibited while the channel operation is enabled (DTE bit = 1). If it is written, correct operation is not guaranteed.
2. If prohibited settings are made to some of the bits, correct operation is not guaranteed.

7.10.2.5 DRSAn — DMAC Reload Source Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8410$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.43 DRSAn Register Contents

Bit Position	Bit Name	Function
31 to 0	RSA[31:0]	Reload source address Specify the source address to be reloaded to the DMA source address register when the reload function 1 or reload function 2 is used.

CAUTION

DMA transfer of misaligned data is not supported. The 4 lower-order bits of addresses corresponding to the transfer data size are as follows (× indicates any bit).

Correct operation is not guaranteed if settings do not comply with the following table.

Data Size	RSA3	RSA2	RSA1	RSA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.10.2.6 DRDAn — DMAC Reload Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8414$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.44 DRDAn Register Contents

Bit Position	Bit Name	Function
31 to 0	RDA[31:0]	Reload destination address Specify the destination address to be reloaded to the DMA destination address register when the reload function 1 or reload function 2 is used.

CAUTION

DMA transfer of misaligned data is not supported. The 4 lower-order bits of addresses corresponding to the transfer data size are as follows (× indicates any bit).

Correct operation is not guaranteed if settings do not comply with the following table.

Data Size	RDA3	RDA2	RDA1	RDA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.10.2.7 DRTCn — DMAC Reload Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8418$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RARC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RTRC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.45 DRTCn Register Contents

Bit Position	Bit Name	Function
31 to 16	RARC[15:0]	Reload address reload count Specify the value to be loaded to the address reload count in the transfer count register at the timing of reload when the reload function 2 is used.
15 to 0	RTRC[15:0]	Reload transfer count Specify the value to be loaded to the transfer count in the transfer count register at the timing of reload when the reload function 1 is used.

7.10.2.8 DTCCn — DMAC Transfer Count Compare Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 841C$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.46 DTCCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
15 to 0	CMC[15:0]	Transfer count compare Configure the transfer count to be compared to the transfer count register. At the completion of the DMA cycle in which the remaining transfer count is the same as the value in this register, the transfer count match flag (DCSTn.CC) in the DMAC transfer status register is set. Furthermore, if the transfer count match interrupt enable (DTCTn.CCE) bit is 1, a transfer count match interrupt is generated. If 0000$_H$ is set, comparison with the transfer count is disabled. In this case, the transfer count match flag in the DMAC transfer status register is never set, and a transfer count match interrupt is never generated.

CAUTION

Writing to this register is prohibited while the channel operation is enabled (DTE bit = 1). If it is written, correct operation is not guaranteed.

7.10.2.9 DCENn — DMAC Channel Operation Enable Setting Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8420$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.47 DCENn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	DTE	Channel operation enable Specifies whether to enable or disable the transfer operation of the channel. If the DTE bit is 1, DMA transfer starts when there is a DMA transfer request. If the MLE bit is 0, the DTE bit is cleared automatically at the completion of the DMA transfer. In addition, if 0 is written to the DTE bit during DMA transfer, the DMA transfer is suspended. If 1 is written to the DTE bit during suspension, the suspension is cleared and the DMA transfer resumes. 0: Channel operation is disabled/Channel suspended 1: Channel operation is enabled/Channel suspension cleared

7.10.2.10 DCSTn — DMAC Transfer Status Register

Access: This register can be read in 32-bit units.

Address: FFFF 8424$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	ERWR	—	—	CY	ER	—	CC	TC	—	—	DR	SR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.48 DCSTn Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned.
11	ERWR	DMA Transfer Error occurring cycle This bit is updated at the same time as setting of the DMA transfer error flag (ER), indicating which cycle of read or write the DMA transfer error occurs in. This bit is not updated when a new DMA transfer error occurs after the ER bit has been set. If the ER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in read cycle. 1: DMA transfer error occurs in write cycle.
10, 9	Reserved	When read, the value after reset is returned.
8	CY	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing.
7	ER	Transfer error flag This bit is set when DMA transfer error is generated. If this bit is 1 and the DTCTn.ESE bit is set, a DMA cycle is not executed when a DMA transfer request is generated. 0: No DMA transfer error is generated 1: DMA transfer error is generated
6	Reserved	When read, the value after reset is returned.
5	CC	Transfer count match flag This bit is set at the completion of the DMA cycle in which the remaining transfer count is the same as the value set in the transfer compare register. 0: No compare match has occurred with the transfer count compare register. 1: Compare match has occurred with the transfer count compare register.

Table 7.48 DCSTn Register Contents (2/2)

Bit Position	Bit Name	Function
4	TC	Transfer completion flag This bit is set at the completion of the last transfer and shows whether the DMA transfer is complete. If the MLE bit is 0 and this bit is 1, a DMA cycle is not executed when a DMA transfer request is generated. 0: DMA transfer incomplete 1: DMA transfer complete
3, 2	Reserved	When read, the value after reset is returned.
1	DR	Hardware DMA transfer request status This bit shows whether there is a hardware DMA transfer request (DMARQ) from the DTFR. This bit changes regardless of the value of the DTE bit when a hardware DMA transfer request from the DTFR is generated. If the software DMA transfer request is selected by the transfer request selection bit (DRS) in the DMAC transfer control register, this bit is not set even when a hardware DMA transfer request is input from the DTFR. 0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request
0	SR	Software DMA transfer request flag This bit shows whether there is a software DMA transfer request (DMARQ). This bit is automatically cleared when DMA transfer is executed. A user can set this bit by writing 1 to the SRS bit in the DMAC transfer status set register (DCSTSn). In addition, a user can clear this bit by writing 1 to the SRC bit in the DMAC transfer status clear register (DCSTCn), but if this is done, the ongoing DMA transfer is aborted and cannot be resumed. 0: There is no software DMA transfer request 1: There is a software DMA transfer request

7.10.2.11 DCSTSn — DMAC Transfer Status Set Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8428$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 7.50 DCSTCn Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
7	ERC	Transfer error flag clear The DMA transfer error flag (ER) can be cleared by writing 1 to this bit. 0 is always read from this bit.
6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	CCC	Transfer count match flag clear The transfer count match flag (CC) can be cleared by writing 1 to this bit. 0 is always read from this bit.
4	TCC	Transfer completion flag clear The transfer completion flag (TC) can be cleared by writing 1 to this bit. 0 is always read from this bit.
3 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	SRC	Software DMA transfer request flag clear The software DMA transfer request flag (SR) can be cleared by writing 1 to this bit. 0 is always read from this bit.

7.10.2.13 DTFRn — DTFR Setting Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8430$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.51 DTFRn Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
7 to 1	REQSEL[6:0]	Hardware DMA transfer source selection Select one out of 128 hardware DMA transfer sources as the hardware DMA transfer request. 000_0000: Selecting the DMACTRG[0] input : 111_1111: Selecting the DMACTRG[127] input
0	REQEN	Hardware DMA transfer source selection enable This bit enables or disables the hardware DMA transfer source selection. 0: Hardware DMA transfer source selection is disabled. 1: Hardware DMA transfer source selection is enabled. If this bit is 0, even when the hardware DMA transfer source selected by the REQSEL6 to REQSEL0 bits is activated, it is not recognized as a hardware DMA transfer request, and a hardware DMA transfer request is not generated.

7.10.2.14 DTFRRQn — DTFR Transfer Request Status Register

Access: This register can be read in 32-bit units.

Address: FFFF 8434$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DRQ
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.52 DTFRRQn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	DRQ	Hardware DMA transfer request status If this bit is set, it means that a hardware DMA transfer request exists or is retained. • If the hardware DMA transfer request is an edge detection type*1 This bit shows whether a hardware DMA transfer request generated by edge detection is retained. When the DMA transfer request acceptance signal (DMAAKn) from the DMAC is asserted, this bit is automatically cleared. A user can clear this bit by writing 1 to the DTFRRQC.DRQC bit. • If the hardware DMA transfer request is a level input type*1 This bit shows whether there is a hardware DMA transfer request input. Even when the DMA transfer request acceptance signal (DMAAKn) from the DMAC is asserted, this bit is not automatically cleared. In addition, this bit is not cleared even when a user writes to the DTFRRQC.DRQC bit. This bit changes regardless of the value of the DTFRn.REQEN bit when a hardware DMA transfer request is generated. 0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request

Note 1. Whether the hardware DMA transfer request is an edge detection type or level input type depends on the hardware DMA transfer source selected by DTFRn.REQSEL. The hardware DMA transfer request is only an edge detection type.

7.10.2.15 DTFRRQCn — DTFR Transfer Request Clear Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8438$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DRQC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.53 DTFRRQCn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	DRQC	Hardware DMA transfer request clear If the hardware DMA transfer request is an edge detection type*1, a user can clear the DTFRRQ.DRQ bit by writing 1 to this bit. If the hardware DMA transfer request is a level input type*1, the DTFRRQ.DRQ bit cannot be cleared by writing to this bit. 0 is always read from this bit.

Note 1. Whether the hardware DMA transfer request is an edge detection type or level input type depends on the hardware DMA transfer source selected by DTFRn.REQSEL. The hardware DMA transfer request is only an edge detection type.

7.11 DTS Channel Register

7.11.1 Transfer information of the DTS (TI)

7.11.1.1 Structure of the TI

The transfer information of the DTS is called TI. One set of TI consists of 32 bits. 8 sets of TI are assigned for each channel. The 8 sets of TI is called TI-A, TI-B, TI-C, TI-D, TI- E, TI-F, TI-G, and TI-H.

Figure 7.12 shows the structure of the TI.

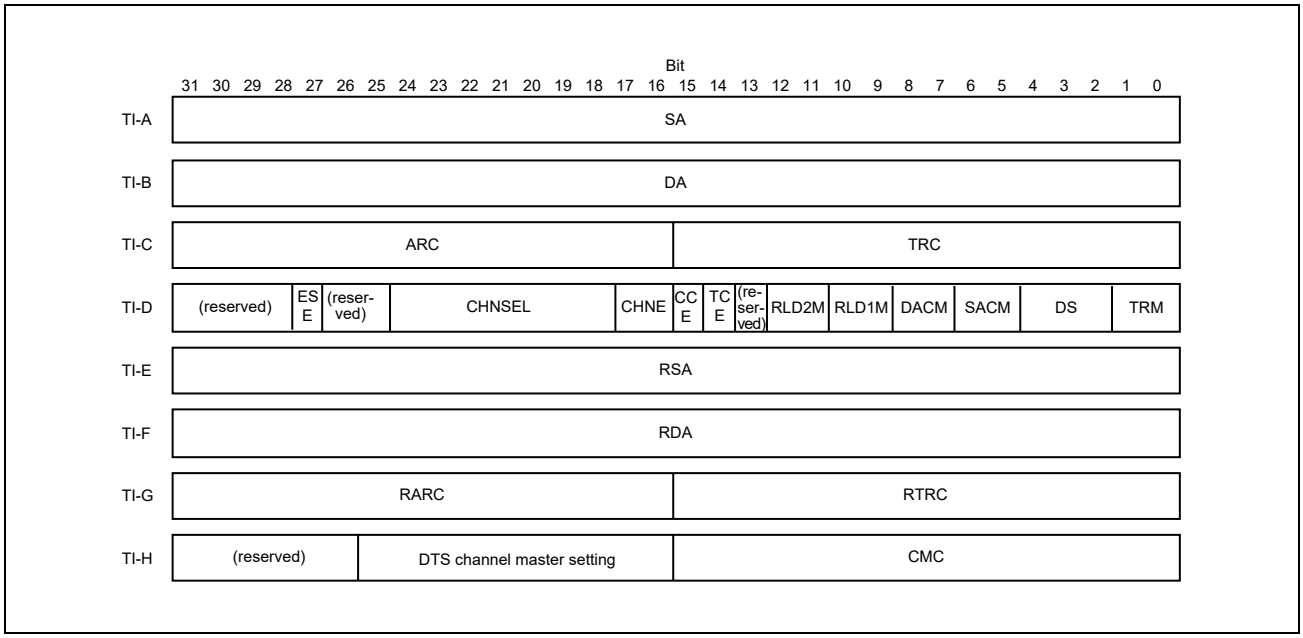

Figure 7.12 Structure of the TI

7.11.1.2 Organization of the TI in the DTSRAM

A user indirectly accesses the DTSRAM by way of the DTS channel registers for each channel and the DTS channel master setting registers.

Therefore, usually, a user does not have to think about the address organization of the TI in the DTSRAM. As an exception, when ECC error occurs while the DTSRAM is read, the address of the ECC error in the DTSRAM is stored to the DTSRAM error register 2 (DTSER2), one of the global registers. In order to know which channel and TI have generated the error, you need to understand the address organization of the TI in the DTSRAM.

Figure 7.13 shows the address organization of the TI in the DTSRAM.

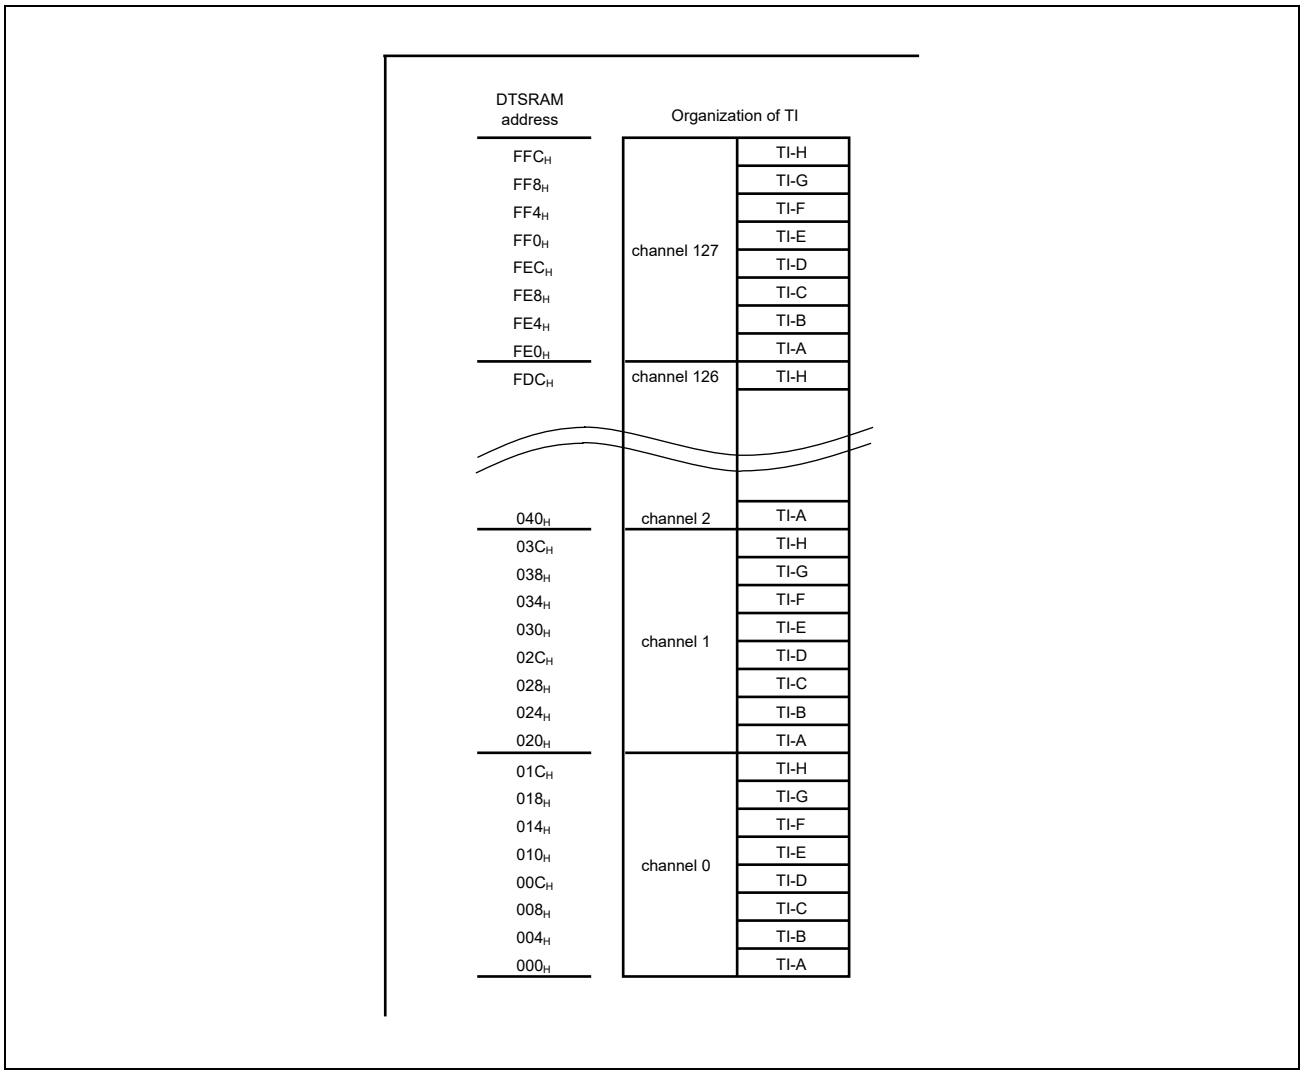

Figure 7.13 Organization of the TI in the DTSRAM

7.11.1.3 Accessing the TI

TI-A can be accessed by way of the DTS source address register (DTSAnnn) for each channel.

TI-B can be accessed by way of the DTS destination address register (DTDAnnn) for each channel.

TI-C can be accessed by way of the DTS transfer count register (DTTCnnn) for each channel.

TI-D can be accessed by way of the DTS transfer control register (DTTCTnnn) for each channel.

TI-E can be accessed by way of the DTS reload source address register (DTRSAnnn) for each channel.

TI-F can be accessed by way of the DTS reload destination address register (DTRDAnnn) for each channel.

TI-G can be accessed by way of the DTS reload transfer count register (DTRTCnnn) for each channel.

TI-H can be accessed by way of the channel master setting register (DTSnnnCM), which is a global register, and the transfer count compare register (DTTCCnnn) for each channel.

7.11.1.4 Caution about accessing the TI

The data of the DTS channel master setting register and the data of the DTS transfer count compare register are stored to the same TI-H.

Access to the DTS channel master setting register (DTSnnnCM) is actually 32-bit access to the whole TI-H. Therefore, when you write to the DTS channel master setting register, the values of the 16 lower-order bits of the DTS transfer count compare (CMC) are updated at the same time. When you read from the DTS channel master setting register, the value of the DTS transfer count compare (CMC) is read into the 16 lower-order bits.

When you read from the DTS transfer count compare register (DTTCCnnn), 32-bit data is read from the TI-H, but only data of the 16 lower-order bits is actually seen in the result of the register read. When you write to the DTS transfer count compare register (DTTCCnnn), read-modify-write access to the 16 lower-order bits for the 32-bit TI-H is made. Data in the TI immediately after the reset is undefined. It should be noted that, if you try to write to the DTS transfer count compare register (DTTCCnnn) before setting up the DTS channel master setting register, ECC error may be detected during the read of the read-modify-write access.

Bits 31 to 26 of the TI-H are not used, but you can read and write those bits by accessing the DTS channel master setting register. Our recommendation is as follows. When you write to those bits, write 0.When you read from those bits, discard the read value by software.

After the reset, the values in the DTSRAM, which stores the TI, are undefined. After the reset, if you read TI before you write to the TI, ECC error is generated. Therefore, the first access to the following registers after the reset must be write access. The first access after the reset should never be read access.

- DTS source address register (DTSAnnn)
- DTS destination address register (DTDAnnn)
- DTS transfer count register (DTTCnnn)
- DTS transfer control register (DTTCTnnn)
- DTS reload source address register (DTRSAnnn)
- DTS reload destination address register (DTRDAnnn)
- DTS reload transfer count register (DTRTCnnn)
- Channel master setting registers (DTSnnnCM)

In addition, after the reset, the first access to the DTS transfer count compare register (DTTCCnnn) must be always after write access to the channel master setting register (DTSnnnCM).

You can access the TI from a CPU while the DTS is executing DMA transfer. But if you do so, the following should be noted.

- While a channel is executing DMA transfer, the TI of the channel should not be updated by TI access from a CPU. If this situation happens, the result of the DMA transfer and the contents of the TI may mismatch.
- If TI access is requested from a CPU while a TI fetch or TI write back is executed, the TI access is executed after the completion of the TI fetch or TI write back. If a TI fetch or TI write back is requested while a TI access request from a CPU is processed, the TI fetch or TI write back is executed after the processing of the TI access is complete.

7.11.2 DTS Channel Register Address

Address = Base address "FFFF 9000_H" + Offset address

Table 7.54 DTS Channel Register Address

Module Name	Offset Address	Register Symbol	Meaning	Accessed Permission	
				Special Master	General Master
DMASS	$0000_H + 40_H \times$ [channel number]*1	DTSAnnn	DTS source address	√	√
DMASS	$0004_H + 40_H \times$ [channel number]*1	DTDAnnn	DTS destination address	√	√
DMASS	$0008_H + 40_H \times$ [channel number]*1	DTTCnnn	DTS transfer count	√	√
DMASS	$000C_H + 40_H \times$ [channel number]*1	DTTCTnnn	DTS transfer control	√	√
DMASS	$0010_H + 40_H \times$ [channel number]*1	DTRSAnnn	DTS reload source address	√	√
DMASS	$0014_H + 40_H \times$ [channel number]*1	DTRDAnnn	DTS reload destination address	√	√
DMASS	$0018_H + 40_H \times$ [channel number]*1	DTRTCnnn	DTS reload transfer count	√	√
DMASS	$001C_H + 40_H \times$ [channel number]*1	DTTCCnnn	DTS transfer count compare	√	√
DMASS	$0020_H + 40_H \times$ [channel number]*1	DTFSLnnn	DTSFSL operation setting	√	√
DMASS	$0024_H + 40_H \times$ [channel number]*1	DTFSTnnn	DTSFSL transfer request status	√	√
DMASS	$0028_H + 40_H \times$ [channel number]*1	DTFSSnnn	DTSFSL transfer request set	√	√
DMASS	$002C_H + 40_H \times$ [channel number]*1	DTFSCnnn	DTSFSL transfer request clear	√	√

Note 1. The [channel number] in the offset addresses is a number in the range from 0 to 127.
The "nnn" in the register symbols is a 3-digit number in the range from 000 to 127.

7.11.3 Details of DTS Channel Registers

The “nnn” in the register symbols indicates the DTS channel number (nnn = 000 to 127).

7.11.3.1 DTSAnnn — DTS Source Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9000_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA[31:16]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.55 DTSAnnn Register Contents

Bit Position	Bit Name	Function
31 to 0	SA[31:0]	Source address Specify the DMA transfer source address. SA[31:0] is updated at the timing of the TI write back and retains the DMA transfer source address for the next DMA transfer.

CAUTION

DMA transfer of misaligned data is not supported. The 4 lower-order bits of addresses corresponding to the transfer data size are as follows (× indicates any bit). Correct operation is not guaranteed if settings do not comply with the following table.

Data Size	SA3	SA2	SA1	SA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.11.3.2 DTDAnnn — DTS Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9004_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA[31:16]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DA[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.56 DTDAnnn Register Contents

Bit Position	Bit Name	Function
31 to 0	DA[31:0]	Destination address Specify the DMA transfer destination address. DA[31:0] is updated at the timing of the TI write back and retains the DMA transfer destination address for the next DMA transfer.

CAUTIONS

1. If DMA transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
2. DMA transfer of misaligned data is not supported. The 4 lower-order bits of addresses corresponding to the transfer data size are as follows (× indicates any bit). Correct operation is not guaranteed if settings do not comply with the following table.

Data Size	DA3	DA2	DA1	DA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.11.3.3 DTTCnnn — DTS Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9008_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARC[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRC[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.57 DTTCnnn Register Contents

Bit Position	Bit Name	Function
31 to 16	ARC[15:0]	Address reload count Specify the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. When the reload function 2 or block transfer 2 is used, ARC[15:0] is decremented by one for every DMA cycle and updated at the timing of the TI write back. When the reload function 2 or block transfer 2 is not used, ARC[15:0] is not updated. If 0000_H is set, address reload is disabled. If the value at the start of a DMA cycle is 0000_H, subtraction from the address reload count does not proceed even after the DMA cycle.
15 to 0	TRC[15:0]	Transfer count Configure the number of transfers. TRC[15:0] is decremented by one whenever a DMA cycle is executed. It is updated at the timing of the TI write back. If the reload function is not used, after the last transfer is complete, the value at the completion (0000_H) is retained. If 0000_H is set, DMA transfer is not executed even when a DMA transfer request is accepted.

TRC[15:0]	Operation
0000_H	Transfer is disabled or complete.
0001_H	The number of transfers or remaining transfers is 1.
:	:
$FFFF_H$	The number of transfers or remaining transfers is 65535.

CAUTIONS

1. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.
2. Unlike a DMAC, "0000_H" in the transfer count of the DTS does not mean "65536 transfers" but means that transfer is disabled or complete.

7.11.3.4 DTTCTnnn — DTS Transfer Control Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 900C$_H$ + 40$_H$ × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	ESE	—	—	CHNSEL[6:0]							CHNE[1:0]	
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CCE	TCE	—	RLD2M[1:0]		RLD1M[1:0]		DACM[1:0]		SACM[1:0]		DS[2:0]			TRM[1:0]	
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.58 DTTCTnnn Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value returned is undefined. When writing to these bits, write 0.
27	ESE	Transfer error case DMA transfer abort setting Specifies whether to abort DMA transfer when DMA transfer error is generated. If this bit is cleared to 0, DMA transfer continues when DMA transfer error is generated. If this bit is set to 1, DMA transfer is aborted when DMA transfer error is generated. 0: DMA transfer continues when DMA transfer error is generated. 1: DMA transfer is aborted when DMA transfer error is generated.
26, 25	Reserved	When read, the value returned is undefined. When writing to these bits, write 0.
24 to 18	CHNSEL[6:0]	Next channel in the chain Specify the next channel in the chain. The next channel must be another channel in the DTS. You cannot specify a channel in a DMAC. You cannot specify the same channel for the next channel. (If you do, correct operation is not guaranteed.)
17, 16	CHNE[1:0]	Chain enable Select the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle in which the remaining transfer count is one. 10: Setting prohibited (No guarantee of operation) 11: Always chain A chain request is generated at the completion of every DMA cycle.
15	CCE	Transfer count match interrupt enable If this bit is set, a transfer count match interrupt is generated at the completion of the DMA cycle in which the transfer count compare register and the remaining transfer count have the same value.
14	TCE	Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer.

Table 7.58 DTTCTnnn Register Contents (2/3)

Bit Position	Bit Name	Function
13	Reserved	When read, the value returned is undefined. When writing to these bits, write 0.
12, 11	RLD2M[1:0]	Reload function 2 setting Configure the reload function 2. 00: Reload function 2 is disabled. 01: Reload function 2 is enabled. The source address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 10: Reload function 2 is enabled. The destination address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 11: Reload function 2 is enabled. The source address, destination address, and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1.
10, 9	RLD1M[1:0]	Reload function 1 setting Configure the reload function 1. 00: Reload function 1 is disabled. 01: Reload function 1 is enabled. The source address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 10: Reload function 1 is enabled. The destination address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 11: Reload function 1 is enabled. The source address, destination address, and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1.(If the reload function 2 is enabled, the address reload count is also reloaded.)
8, 7	DACM[1:0]	Destination address count direction Specify the direction of counting for the destination address.

DACM1	DACM0	Direction of Counting
0	0	Up
0	1	Down
1	0	Fixed
1	1	Setting prohibited (No guarantee of operation)

6, 5	SACM[1:0]	Source address count direction Specify the direction of counting for the source address.

SACM1	SACM0	Direction of Counting
0	0	Up
0	1	Down
1	0	Fixed
1	1	Setting prohibited (No guarantee of operation)

Table 7.58 DTTCTnnn Register Contents (3/3)

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>4 to 2</td><td>DS[2:0]</td><td>Transfer data size
Specify the transfer data size.
<table>
<tr><th>DS2</th><th>DS1</th><th>DS0</th><th>Transfer Data Size</th></tr>

<tr><td>0</td><td>0</td><td>1</td><td>16 bits</td></tr>
<tr><td>0</td><td>1</td><td>0</td><td>32 bits</td></tr>
<tr><td>0</td><td>1</td><td>1</td><td>64 bits</td></tr>
<tr><td>1</td><td>0</td><td>0</td><td>128 bits</td></tr>
<tr><td colspan="3">Other than the above</td><td>Setting prohibited (No guarantee of operation)</td></tr>
</table></td></tr>
<tr><td>1, 0</td><td>TRM[1:0]</td><td>Transfer mode
Specify the DMA transfer mode.
00: Single transfer
01: Block transfer 1 (The number of transfers is specified by the transfer count.)
10: Block transfer 2 (The number of transfers is specified by the address reload count.)
11: Setting prohibited (No guarantee of operation)</td></tr>
</table>

CAUTIONS

1. If prohibited settings are made to some of the bits, correct operation is not guaranteed.
2. Bits 31 to 28, 26, 25, and 13 are unused, but you can read and write those bits. Our recommendation is as follows. When you write to those bits, write 0. When you read from those bits, discard the read value.

7.11.3.5 DTRSAnnn — DTS Reload Source Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9010_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSA[31:16]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.59 DTRSAnnn Register Contents

Bit Position	Bit Name	Function
31 to 0	RSA[31:0]	Reload source address Specify the source address to be reloaded when the reload function 1 or reload function 2 is used.

CAUTION

DMA transfer of misaligned data is not supported. The 4 lower-order bits of addresses corresponding to the transfer data size are as follows (× indicates any bit). Correct operation is not guaranteed if settings do not comply with the following table.

Data Size	RSA3	RSA2	RSA1	RSA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.11.3.6 DTRDAnnn — DTS Reload Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9014_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDA[31:16]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.60 DTRDAnnn Register Contents

Bit Position	Bit Name	Function
31 to 0	RDA[31:0]	Reload destination address Specify the destination address to be reloaded when the reload function 1 or reload function 2 is used.

CAUTION

DMA transfer of misaligned data is not supported. The 4 lower-order bits of addresses corresponding to the transfer data size are as follows (× indicates any bit). Correct operation is not guaranteed if settings do not comply with the following table.

Data Size	RDA3	RDA2	RDA1	RDA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.11.3.7 DTRTCnnn — DTS Reload Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9018$_H$ + 40$_H$ × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RARC[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	CMC[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.62 DTTCCnnn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value returned is undefined. When writing to these bits, write 0.
15 to 0	CMC[15:0]	Transfer count compare Configure the transfer count to be compared to the transfer count register. If the transfer count match interrupt enable (DTTCTnnn.CCE) bit in the DTS transfer control register is 1, a transfer count match interrupt is generated at the completion of the DMA cycle in which the remaining transfer count is the same as the value in this register. If 0000$_H$ is set, comparison with the transfer count is disabled. In this case, a transfer count match interrupt is not generated.

CAUTION

This register must be accessed after the DTS channel master setting register is set up.

If you access this register without setting up the DTS channel master setting register after the reset, ECC error may be generated during access to this register.

7.11.3.9 DTFSLnnn — DTSFSL Operation Setting Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9020$_H$ + 40$_H$ × Ch. No. n (n = 0 to 127)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	REQEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.63 DTFSLnnn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	REQEN	DMA transfer request enable This bit selects whether a DMA transfer request from this channel retained in the DTSFSL is used as a candidate in DTS channel arbitration. 0: A DMA transfer request from this channel is not used as a candidate in DTS channel arbitration. 1: A DMA transfer request from this channel is used as a candidate in DTS channel arbitration. If this bit is 0, even if the DTSFSL retains a DMA transfer request, this channel is not a candidate in DTS channel arbitration inside the DTSFSL, and consequently a DMA transfer request from this channel is not generated.

7.11.3.10 DTFSTnnn — DTSFSL Transfer Request Status Register

Access: This register can be read in 32-bit units.

Address: FFFF 9024$_H$ + 40$_H$ × Ch. No. n (n = 0 to 127)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DRQ
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.64 DTFSTnnn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	DRQ	DMA transfer request pending This bit shows whether a DMA transfer request of this channel is pending. This bit is set when input of a hardware transfer source is detected, or when software writes “1” to the DTFSSnnn.DRQ bit. This bit is automatically cleared when the DTS receives the DMA transfer request signal while the DTSFSL is requesting DMA transfer of this channel. Alternatively, software can clear this bit by writing 1 to the DTFSCnnn.DRQC bit. 0: A DMA transfer request is not pending. 1: A DMA transfer request is pending.

7.11.3.11 DTFSSnnn — DTSFSL Transfer Request Set Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9028$_H$ + 40$_H$ × Ch. No. n (n = 0 to 127)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DRQS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.65 DTFSSnnn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	DRQS	DMA transfer request set A user can set the DTFSTnnn.DRQ bit by writing 1 to this bit. 0 is always read from this bit.

7.11.3.12 DTFSCnnn — DTSFSL Transfer Request Clear Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 902C$_H$ + 40$_H$ × Ch. No. n (n = 0 to 127)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DRQC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.66 DTFSCnnn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	DRQC	DMA transfer request clear A user can clear the DTFSTnnn.DRQ bit by writing 1 to this bit. 0 is always read from this bit.

7.12 DMA/DTS Trigger Source Select Registers

7.12.1 DMA/DTS Trigger Source Select Register Addresses

DMA/DTS trigger sources are each selected from two trigger sources: Primary trigger source and Secondary trigger source. For DMA trigger sources, refer to **Table 7.8** For DTS trigger sources, refer to **Table 7.9** When setting up DMA transfer, configure these registers.

Table 7.67 DMA/DTS Trigger Source Select Register Addresses

Offset Address	Register Abbreviation	Meaning	Access Permission	
			Special Master	General Master
$FFD41000_H$	DTSTRGSEL0	DTS Primary/Secondary select register 0	√	√
$FFD41004_H$	DTSTRGSEL1	DTS Primary/Secondary select register 1	√	√

Section 8 Resets

8.1 Features of the RH850/C1M-A Reset

- The $\overline{\text{RESET}}$ pin incorporates a noise canceller.
- The source of a reset can be determined by referring to the reset source determination register.
- The CPU can assert a reset signal by setting a register.

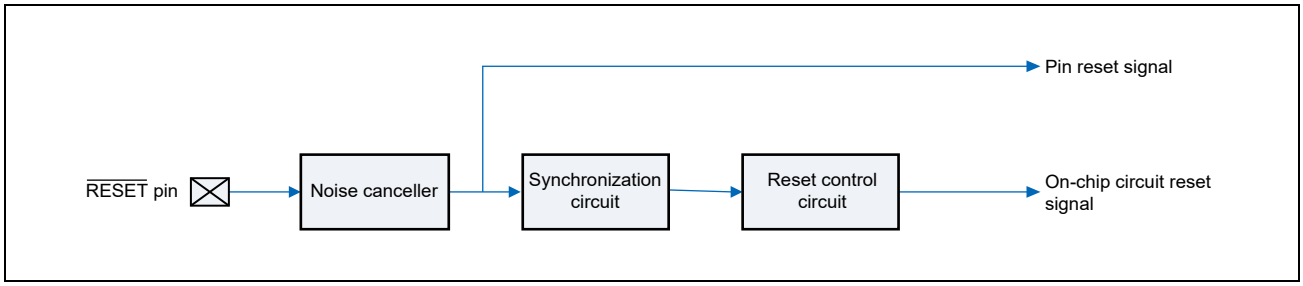

Figure 8.1 Reset Circuit

8.2 Reset State

8.2.1 External Reset State

When a low-level pulse longer than the noise cancel width (t_{RESNCW}) is input to the $\overline{\text{RESET}}$ pin, external reset is received and this LSI transits to the external reset state. When external reset is received, individual pins transit to the external reset state. Refer to **Table 2.63** in **Section 2, Pins**, for the state of individual pins during external reset.

The low-level pulse width of the input signal must be longer than t_{RESW} (t_{cyc}) because the $\overline{\text{RESET}}$ pin incorporates a noise cancelling circuit. This LSI transits to the internal reset state by driving the $\overline{\text{RESET}}$ pin to the high-level after the required low-level period.

CAUTION

Refer to **Section 39, Electrical Characteristics**, for t_{RESNCW} and t_{RESW}.

8.2.2 Internal Reset State

When a high-level signal longer than the noise cancel width (t_{RESNCW}) is input to the $\overline{\text{RESET}}$ pin in the external reset state, this product transits to the internal reset state. Refer to **Table 2.63** in **Section 2, Pins**, for the state of individual pins.

The internal reset state is released after external reset release, and the CPU starts the reset exception process.

CAUTION

Refer to **Section 39, Electrical Characteristics**, for t_{RESNCW}.

8.3 Reset Sources

The following are the reset sources of this product.

Some registers are only initialized by the external reset state. That is, they are only initialized by input of the low level on the $\overline{\text{RESET}}$ pin.

However, most registers are initialized by either an external or internal reset state. This means that they are initialized by a reset from any source.

Regarding sources for the initialization of registers, see the descriptions of the registers in the relevant sections. Where there is no explicit description of the sources for resetting and initializing a register, the register is initialized by either an external or internal reset state. That is, such registers are initialized by a reset from any source. However, the value after resets of some registers are undefined. Take care since the values of such registers following a reset are not fixed.

Source	Description
When the $\overline{\text{RESET}}$ pin is driven to the low level	Transits to the external reset state.
When a reset request is issued from the ECM	Transits to the internal reset state.
When a reset is issued from the debugger (when a forced reset is issued)	Transits to the external reset state.
When the CPU sets the software reset request register	Transits to the internal reset state

8.4 Register Specifications

8.4.1 List of Registers

Reset registers are listed in the following table.

Table 8.1 Registers

Module Name	Register Name	Symbol	Address	Access Protection
SYS	Reset source determination register	RESF	FFF8 2800_H	
SYS	Reset source clear register	RESFC	FFF8 2808_H	
SYS	Software reset request register	SWRESA	FFF8 $AC18_H$	PROT1PHCMD

8.4.2 RESF — Reset Source Determination Register

This register determines the reset source.

The flags of this register can be cleared by the RESFC register and can only be initialized by an external reset, but not an internal reset.

Access: This register is readable in 32-bit units.

Address: FFF8 2800$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.2 RESF Register Contents

Bit Position	Bit Name	Function
1	RESF1	ECM Reset Indicates that a reset event occurred. 0: Event not occurred 1: Event occurred
0	RESF0	Software Reset Indicates that a reset event occurred. 0: Event not occurred 1: Event occurred

8.4.3 RESFC — Reset Source Clear Register

This register clears the reset source indicated by the RESF register.

This register is always read as 0000 0000_H, and can only be initialized by an external reset, but not an internal reset.

Access: This register is readable/writable in 32-bit units.

Address: FFF8 2808_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 8.3 RESFC Register Contents

Bit Position	Bit Name	Function
1	RESFC1	ECM reset Clears the status bit. 0: Do not clear 1: Clear
0	RESFC0	Software reset Clears the status bit. 0: Do not clear 1: Clear

8.4.4 SWRESA — Software Reset Request Register

This register generates an internal reset when accessed. A software reset is issued when 1 is written to SWRESA.

This register can be protected by the PROT1PHCMD register.

This register can be reset by either an internal or external reset.

Access: This register is readable/writable in 32-bit units.

Address: FFF8 AC18$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SWRESA
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.4 SWRESA Register Contents

Bit Position	Bit Name	Function
0	SWRESA	0: — (default) 1: Internal reset enabled (internal reset triggered)

Example) Sequence of writing to the SWRESA register

Writing to SWRESA requires the special sequence to unlock protection described below.

A protection error is displayed in the PROTIPS register if the following steps are not observed.

For details of the PROT1PS register, see **Section 10.2.11, PROT1PS — Protect 1 Status Register**.

Step 1. Write the fixed value (0000 00A5$_H$) to the PROT1PHCMD register.

Step 2. Write the setting value (0000 0001$_H$) to the SWRESA register.

Step 3. Write the inverse (FFFF FFFE$_H$) to the SWRESA register.

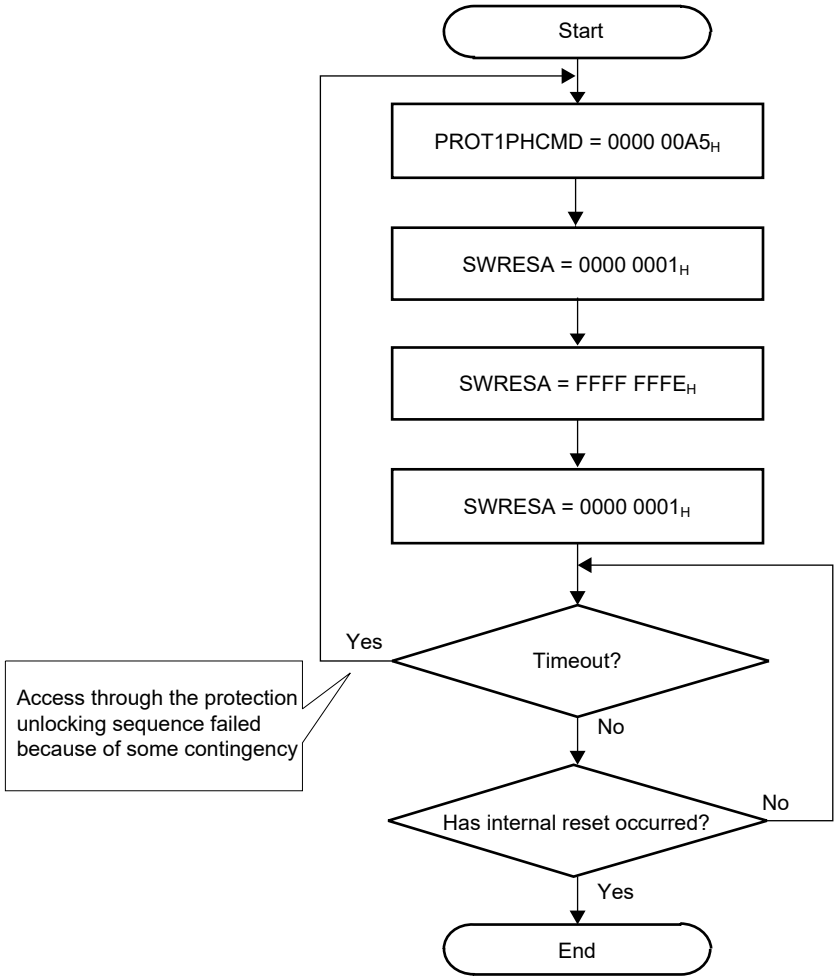
Step 4. Write the new setting value (0000 0001$_H$) to the SWRESA register.

The value 0000 0001_H can be written to the SWRESA register by following the steps described above.

If the above steps are not followed correctly, the sequence to unlock protection fails. The value 0000 0001_H will not be set to the SWRESA register and 1 is set to the PROT1PS. PROTERR bit. In a case of failure, repeat the sequence from the beginning.

If writing to a different register is attempted during the unlocking sequence, or if an access to a different register is made in response to the interrupt occurred during the unlocking sequence, writing to the protected registers is handled as follows.

- When the writing is to another register in the same module*1, writing to the protected register fails and the PROT1PS.PROTERR bit is set to 1.
- When writing is to a register in another module, writing to the protected register will successfully proceed to completion, if the remainder of the procedure is followed correctly.



Reading of another register while the sequence is in progress does not lead to failure.

Note 1. For the target registers, see the note in **Section 10.2.10, PROT1PHCMD — Protect 1 Command Register**.

8.5 Procedure

8.5.1 Software Reset

Figure 8.2 shows the flow for setting a software reset.

Note: Timeout time should be 5 µs or longer.

Figure 8.2 Flow of Software Reset

8.6 Notes

The debug function includes a reset masking function. To prevent unexpected operations of this function, fix the $\overline{\text{DCUTRST}}$ pin to the low level when the debug function is not used.

Section 9 Power Supply Circuit

This section contains a generic description of the RH850/C1M-A power supply circuit.

9.1 Features of the RH850/C1M-A Power Supply Circuit

- Power supply

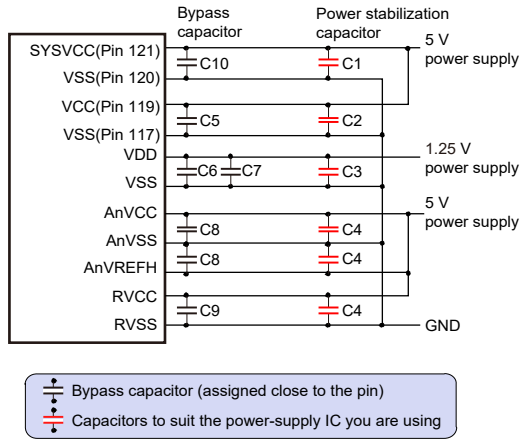
  The power supply pins and the power supply voltages to be used are listed in the following table.
  During operations, supply the specified voltages to all power lines. When stopping operation, turn off all of the power supplies.

  – Connect AnVCC and RVCC to the same electric potential.

Table 9.1 List of Power Supply Pins

Power Supply Name for Power Supply Pin	Pin Name	Power Supply Voltage in Operation	Use of Power Supply
SYSVCC		4.5 V to 5.5 V	Power for system logic, PLL
VCC		4.5 V to 5.5 V	Power for oscillator, flash programming, and ports (5 V)
VDD		1.15 V to 1.35 V	Power for the core (direct power supply) and connection of the stabilizing capacitor for core power
AnVCC		4.5 V to 5.5 V	Power for SAR AD
	AnVREFH	4.5 V to 5.5 V	Reference voltage for SAR AD
RVCC		4.5 V to 5.5 V	Power for RDC

9.2 Procedure



9.2.1 Power-On Sequence

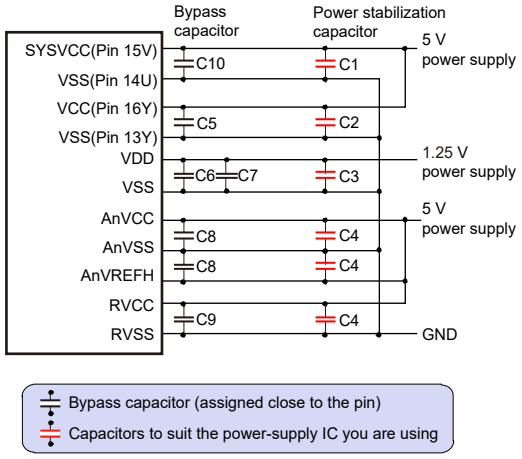
For power-on and -off specifications, see **Section 39, Electrical Characteristics**.

9.3 Notes

9.3.1 Example of Connections between Power-Supply Pins and External Capacitors

The example shown below is for reference only. Take the voltage fluctuations seen under the actual conditions of your system into consideration in evaluating and assigning optimal capacitors in terms of bringing the power supply pins of the microcomputer into accord with the voltage levels in the product specifications.

The following are reference values of the power stabilization capacitors for the power-supply IC.
Determine the optimal capacitances to suit the power-supply IC you are using.



Essential Component	Reference Value
C1	≥ 10 µF
C2	≥ 10 µF
C3	≥ 10 µF
C4	≥ 10 to 100 µF

The following are reference values of the bypass capacitors for this device.

Essential Component*1	Reference Value
C5	≥ 0.22 µF or 0.1 µF × 2
C6	≥ 0.1 µF
C7	≥ 1.0 µF
C8	≥ 0.1µF
C9	≥ 0.1µF
C10	≥ 0.1µF

Note 1. We recommend adding a bypass capacitor for each power supply pin.

Figure 9.1 Example of Connections between Power-Supply Pins and External Capacitors (RH850/C1M-A1 (QFP))

The following are reference values of the power stabilization capacitors for the power-supply IC.
Determine the optimal capacitances to suit the power-supply IC you are using.

Essential Component	Reference Value
C1	≥ 10 µF
C2	≥ 10 µF
C3	≥ 10 µF
C4	≥ 10 to 100 µF

The following are reference values of the bypass capacitors for this device.

Essential Component*1	Reference Value
C5	≥ 0.22 µF or 0.1 µF × 2
C6	≥ 0.1 µF
C7	≥ 1.0 µF
C8	≥ 0.1µF
C9	≥ 0.1µF
C10	≥ 0.1µF

Note 1. We recommend adding bypass capacitors directly under the package.

Figure 9.2 Example of Connections between Power-Supply Pins and External Capacitors (RH850/C1M-A2 (BGA))

Section 10 Clock Controller

This section contains a generic description of the Clock Controller.

The first part of this section describes all RH850/C1M-A specific properties, such as the types of clock, the block diagrams, and the input/output pins. The remainder of the section describes the functions and registers of the clock controller.

10.1 Features of RH850/C1M-A Clock Controller

- An oscillation circuit is included (Main OSC).
- Oscillation at 20 MHz is possible without using external capacitors (only with limited oscillators).
- On-chip PLLs are included and can be used to multiply clock frequencies.
- PLL0 is capable of operating as a spread spectrum clock generator (SSCG) for reducing radiated noise.
  The clock signal produced by PLL1 is not frequency modulated (i.e. is a clean clock signal) and so is suitable for use with timers and communications modules.
- A low-speed internal oscillator (LS IntOSC) is included.
- Error notifications to ECM can be generated when the Main OSC goes outside the frequency range specified by the clock monitor.
- Inrush currents after release from the reset state can be suppressed by having software increase the clock frequencies in a stepwise manner. The division ratios for the CPU clock and the peripheral clocks can be selected with register settings (1/4, 1/2, and 1/1)*[1].

Note 1. Correct operations of ADCC and RDC3A are not guaranteed if 1/4 or 1/2 is selected. Other peripheral circuits operate by using the clock frequency that was input, but their electrical characteristics are not guaranteed. Therefore, only use the product after the sequence for shifting the clock gear up has reached the point where the division ratio for dividers 0A and 1A is 1/1 (no division).

10.1.1 Type of Clocks

Table 10.1 shows list of clocks, **Table 10.2** shows the operation clocks of each unit functional module, and **Figure 10.1** shows the block diagram of clocks.

Table 10.1 List of Clocks

When operating at 20 MHz input frequency (Main OSC)

Clock Name	Symbol	Clock Frequency*1			Remarks
		Division Ratio of Divider 0A/ Divider 1A			
		1/1	1/2	1/4	
CPU clock	CLK_CPU	320 MHz(*1) 240 MHz(*2)	160 MHz(*1) 120 MHz(*2)	80 MHz(*1) 60 MHz(*2)	PLL0 (SSCG can be selected)
GRAM clock	CLK_GRAM	160 MHz(*1) 120 MHz(*2)	80 MHz(*1) 60 MHz(*2)	40 MHz(*1) 30 MHz(*2)	
High speed peripheral clock	CLK_HSB	80 MHz	40 MHz	20 MHz	
Low speed peripheral clock	CLK_LSB	40 MHz	20 MHz	10 MHz	
Sub-CPU clock	CLK_EMU_H	320 MHz(*1) 240 MHz(*2)	160 MHz(*1) 120 MHz(*2)	80 MHz(*1) 60 MHz(*2)	
Motor control hardware accelerator clock	CLK_EMU_L	160 MHz(*1) 120 MHz(*2)	80 MHz(*1) 60 MHz(*2)	40 MHz(*1) 30 MHz(*2)	*1: For C1M-A2 *2: For C1M-A1
Unmodulated high speed peripheral clock	CLKC_HSB	80 MHz	40 MHz	20 MHz	PLL1 (SSCG cannot be selected)
Unmodulated low speed peripheral clock	CLKC_LSB	40 MHz	20 MHz	10 MHz	
Low speed internal clock	CLK_LIOSC	240 kHz			
WDTA counter clock	WDTCLKI	250 kHz/240 kHz			1/80 of main OSC or CLK LIOSC, selectable

Note 1. Only use the product after the sequence for shifting the clock gear up has reached the point where the division ratio for dividers 0A and 1A is 1/1 (no division).

Table 10.2 Clocks and Functional Modules

Clock Name	Functional Module Name
CPU clock	CPU1, CPU2
GRAM clock	GRAM
High speed peripheral clock	INTC, INTIF, DMAC, DTS, CSIH, RS-CANFD, EMU3, RDC3A
Low speed peripheral clock	ECM, DCRA, PORT, Data FLASH, FLASH Controller, FLSCI3, EINT, RLIN3, ADCC, ADPA
Sub-CPU clock	EMU3
Motor control hardware accelerator clock	EMU3
Unmodulated high speed peripheral clock	TAUD, TAUJ, TSG3, TAPA, TPBA, PIC1B, PIC2D, ENCA, EMU3
Unmodulated low speed peripheral clock	RS-CANFD, RLIN3, SCI3, WDTA, SWDTA, OSTM, RDC3A, ADCC, RSENT
Low speed internal clock	CLMA
WDTA counter clock	WDTA, SWDTA

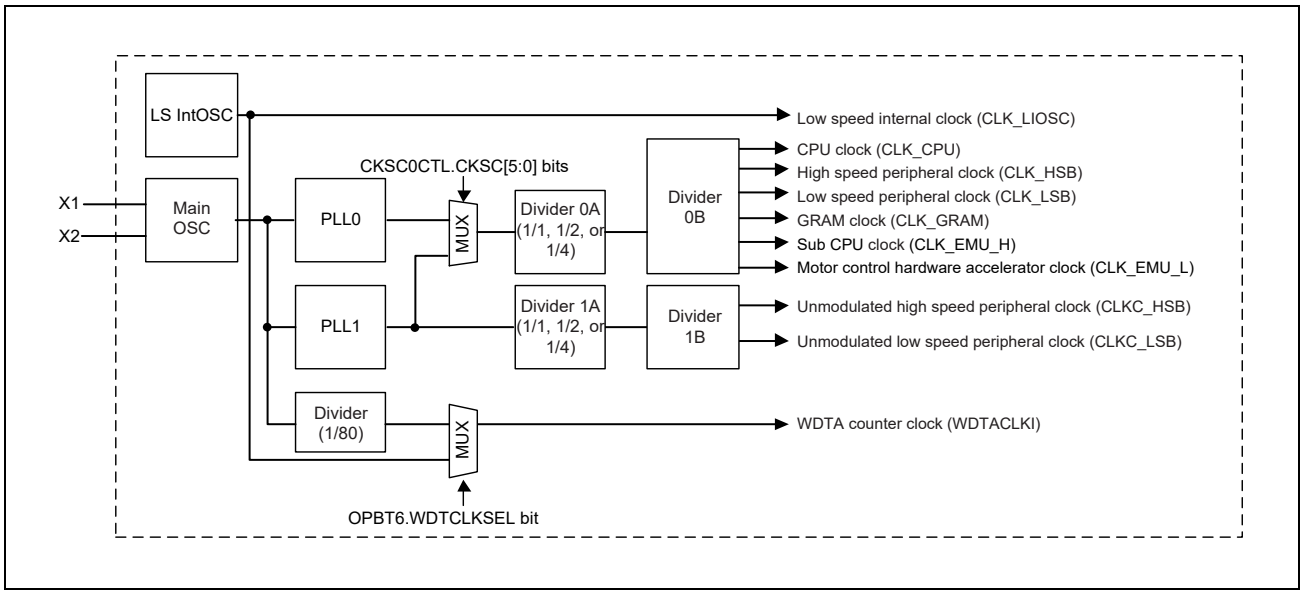


Figure 10.1 Clock Controller Block Diagram

10.1.2 External Input/Output Pins

Table 10.3 shows the pins related to the clock controller.

Table 10.3 Pins Related to the Clock Controller

Name	Pin Name	Input/Output	Function
Crystal input	X1	Input	Connected to a crystal oscillator
Crystal output	X2	Output	Connected to a crystal oscillator

10.1.3 How to Connect a Crystal Oscillator

Figure 10.2 shows how to connect a crystal oscillator. When the oscillator recommended by the company is used (the detail information is separately provided), any external component such as a load capacitor and a dumping resistor is not necessarily required for oscillation in general. However, proper operation should be verified under actual conditions prior to use.

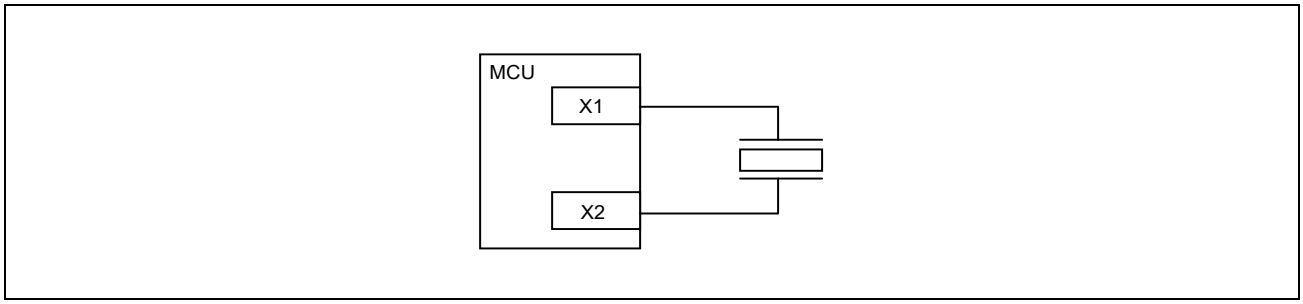

Figure 10.2 Connection Example of Crystal Oscillator

10.2 Register

10.2.1 List of Registers

Table 10.4 shows the list of registers.

Table 10.4 Registers Related to the Clock Controller

Module Name	Register Name	Symbol	Address	Access Protection

10.2.2 PLL0CLKS – PLL0 Status Register

This register indicates the state of the PLL0 clock effective, active, or stable.

This register is initialized by either an internal or external reset.

Access: This register can be read in 32-bit units.

Address: FFF8 8004$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 10.5 PLL0CLKS Register Contents

Bit Position	Bit Name	Function
31 to 3	—	Reserved These bits are always read as 0.
2	CLKACT	PLL0 Clock Source State 0: PLL0 clock source is inactive. 1: PLL0 clock source is active.
1	CLKSTAB	PLL0 Clock Stable State 0: PLL0 is unstable. 1: PLL0 is stable.
0	CLKEN	PLL0 Clock Operating State 0: PLL0 is stopped. 1: PLL0 is operating.

10.2.3 PLL0CLKC1 ─ PLL0 Control Register 1

This register controls the operation of the spread spectrum clock generator (SSCG) for PLL0.

This register can be set when PLL0 is running.

This register is protected by the PROT1PHCMD register.

This register is initialized by either an internal or external reset.

Access: This register can be read/written in 32-bit units.

Address: FFF8 8200$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 10.6 PLL0CLKC1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 10	—	Reserved These bits are always read as 0. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
9	SSMODE1	SSCG Control 0: Modulation disabled 1: Modulation enabled
8	—	Reserved This bit is always read as 0. When writing to this bit, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.

Table 10.6 PLL0CLKC1 Register Contents (2/2)

Bit Position	Bit Name	Function
7 to 3	SELMFREQ [4:0]	SSCG Cycle Setting The modulation cycle of SSCG can be selected by setting these bits. Selectable settings are as follows: 10000_B : 80.65 kHz 10001_B : 75.76 kHz 10010_B : 69.44 kHz 10011_B : 65.79 kHz 10100_B : 62.50 kHz 10101_B : 59.52 kHz 10110_B : 58.14 kHz 10111_B : 50.00 kHz 11000_B : 41.67 kHz 11001_B : 39.68 kHz 11010_B : 37.31 kHz 11011_B : 33.33 kHz 11100_B : 30.12 kHz 11101_B : 25.00 kHz 11110_B : 20.00 kHz When SSMODE1 is set to 1, do not set the values other than the above.
2 to 0	SELMPERCENT[2:0]	SSCG Modulation Range Setting The modulation range of SSCG can be selected by setting these bits. Selectable settings are as follows: 100_B: – 5.0% When SSMODE1 is set to 1, do not set the values other than the above.

When changing the modulation depth of PLL0, turn off the SSCG (PLL0CLKC1.SSMODE1 = 0) and then wait for at least 1.6 ms.

10.2.4 CKSC0CTL ─ Clock 0 Selection Control Register

This register is used for selection of a clock source for the frequency divider 0A.

This register is protected by the PROT1PHCMD register.

This register is initialized by either an internal or external reset.

Access: This register can be read/written in 32-bit units.

Address: FFF8 9000$_H$

Value after reset: 0000 0020$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

5 to 0	CLKACT[5:0]	These bits indicate that switching of an output clock for the frequency divider 1A is completed when their values are the same as those specified in the CKSC[5:0] bits in the CKSC1CTL register. 100001_B: 1/4 x PLL1 100010_B: 1/2 x PLL1 100100_B: 1/1 x PLL1

10.2.10 PROT1PHCMD ─ Protect 1 Command Register

PROT1PHCMD is a protection command register to start the protection unlocking sequence necessary for access to write-protected registers.

This register is initialized by either an internal or external reset.

Access: This register can be read/written in 32-bit units.

Address: FFF8 B000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 10.13 PROT1PHCMD Register Contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved These bits are always read as 0.
7 to 0	PCMD[7:0]	Write protection command register

This register is used in protecting against inadvertent access to write-protected registers, i.e. registers to which writing raises the possibility of serious effects on application systems, such as programs crashing and the like.

Writing to the write-protected registers is only possible with the protection unlocking sequence described below.

Step 1. Write the fixed value (0000 00A5$_H$) to the PROT1PHCMD register.

Step 2. Write the new setting to the write-protected register. Write the value after a reset to the reserved bits.

Step 3. Write the bitwise inverse of the setting value to the same register as in step 2. Write the inverse of the value after a reset to the reserved bits.

Step 4. Write the new setting to the same register as in step 2. Write the value after a reset to the reserved bits.

A value can only be written to a write-protected register by following the procedure above.

Protection is not unlocked if the procedure is not followed correctly, the setting is not written to the write-protected register, and the PROT1PS.PROTERR bit is set to 1. (Although this is not a requirement, you can confirm if the values set in the targeted register was correctly written by checking that the setting of the PROT1PS.PROTERR bit is 0 after step 4.)

In case of failure to follow the sequence, repeat the procedure from the beginning.

In case of writing to another register during steps 1 to 4 of the sequence, the protection function operates as follows. Operation is also as described when any interrupt is accepted during the sequence and the interrupt handling includes access to another register.

- When the writing is to another register in the same module*[1], writing to the protected register fails and the PROT1PS.PROTERR bit is set to 1.
- When writing is to a register in another module, writing to the protected register will successfully proceed to completion, if the remainder of the procedure is followed correctly.

Reading of another register while the sequence is in progress does not lead to failure.

Note 1. PROT1PHCMD applies to the registers allocated to the addresses in the range from FFF8 8004_H to FFF8 $B004_H$. For the register names, register symbols, and module names, see the list of registers in **Table 8.1**, **Table 10.4**, **Table 29.122** to **Table 29.124**. and **Table 35.10**.

10.2.11 PROT1PS ─ Protect 1 Status Register

PROT1PS is a status register of the protection unlocking sequence. This register indicates whether an error occurs or not in access to write-protected registers.

This register is initialized by either an internal or external reset.

Access: This register can be read in 32-bit units.

Address: FFF8 B004$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 10.14 PROT1PS Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0.
0	PROTERR	Protection Error Flag 0: Protection error does not occur. 1: Protection error occurs.

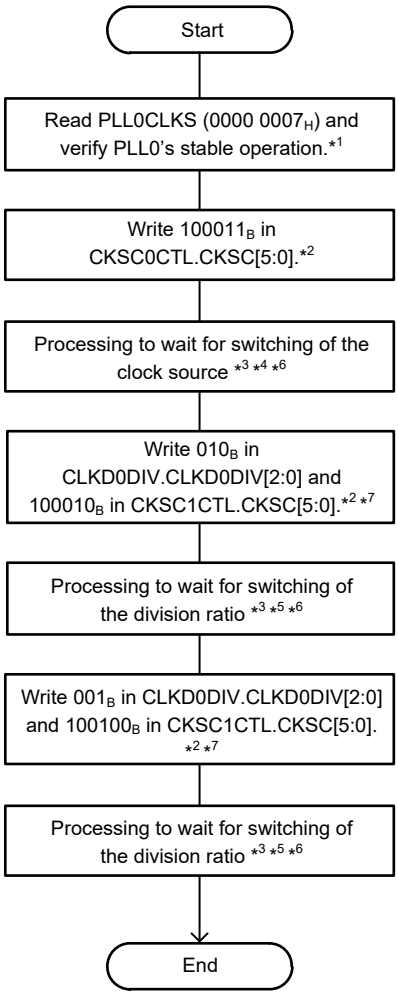
Operating conditions of the PROTERR bit

[Setting Condition]

Access to a write-protected register without executing the step of the protection unlocking sequence that involves the PROT1PHCMD register.

[Clearing Condition]

Writing of 0000 00A5$_H$ to the PROT1PHCMD register (step 1 in the protection unlocking sequence).



10.3 Function

10.3.1 Operation When the Divide Function is Used

Follow the procedure given below to switch the clock signals.

1. When a user program is running after release from the reset state, PLL0 and PLL1 will be oscillating and PLL1 will be in use as the internal operating clock. Also, the division ratio of divider 0A is set to 1/4.
   Read the PLL0CLKS register and verify that its value is 07_H, indicating that PLL0 operation is stable.
2. Write 23_H to the CKSC0CTL.CKSC[5:0] bits to select PLL0 as the clock source.
3. When switching the clock source, wait for at least 140 or 105 cycles of the CPU clock in the respective cases of products with CPUs having maximum operating frequencies of 320 MHz or 240 MHz. After that, read CKSC0ACT and verify that the value of the CKSC0ACT.CLKACT[5:0] bits is 23_H.
4. Write 010_B to the CLKD0DIV.CLKD0DIV[2:0] bits to select 1/2 as the division ratio for the divider.
5. For switching of the division ratio, wait for at least 140 or 105 cycles of the CPU clock in the respective cases of products with CPUs having maximum operating frequencies of 320 MHz or 240 MHz. Then read CLKD0STAT and verify that the value of the CLKD0SYNC is 1.
6. Write 001_B to the CLKD0DIV.CLKD0DIV[2:0] bits to select 1/1 as the division ratio for the divider.
7. For switching of the division ratio, wait for at least 140 or 105 cycles of the CPU clock in the respective cases of products with CPUs having maximum operating frequencies of 320 MHz or 240 MHz. Then read CLKD0STAT and verify that the value of the CLKD0SYNC is 1.

Change the division ratio of the divider 1A of the PLL1 side by following steps 4 to 7 above.

[Step 1]
The clock source for the SSCG clock domain is changed from PLL1 to PLL0.

[Step 2]
Division ratio of clock source PLL0 is changed from 1/4 to 1/2.
Division ratio of clock source PLL1 is changed from 1/4 to 1/2.

[Step 3]
Division ratio of clock source PLL0 is changed from 1/2 to 1/1.
Division ratio of clock source PLL1 is changed from 1/2 to 1/1.

Note 1. After release from the reset state, verify that PLL0 operation is stable before executing the sequence to shift the clock gear up. PLL0CLKS = 07_H indicates that PLL0 is stable.

Note 2. The CKSC0CTL and CLKD0DIV registers are protected by the PROT1PHCMD register. Execute the protection unlocking sequence (see the description of the protect 1 command register) when setting these registers.

Note 3. This processing is required because actual switching of the clock source or division ratio from the previous register settings takes time. The processing must produce periods of waiting of at least 140 or 105 cycles of the CPU clock in the respective cases of products with CPUs having maximum operating frequencies of 320 or 240 MHz.

Note 4. Verify that the value of the CKSC0ACT.CLKACT[5:0] bits is the same as that specified by the CKSC0CTL.CKSC[5:0] bits after switching the source clock for frequency divider 0A.
Similarly, verify that the value of the CKSC1ACT.CLKACT[5:0] bits is the same as that specified by the CKSC1CTL.CKSC[5:0] bits after switching the source clock for frequency divider 1A.

Note 5. Verify that the CLKD0STAT.CLKD0SYNC bit is 1 after changing the division ratio of divider 0A.

Note 6. Switching of clock sources or division ratios produces transient voltage fluctuations which last for a certain time, so measures such as processing to add more cycles of waiting may be required. Whether or not this is the case will depend on evaluation of the actual environment where the LSI chip is used.

Note 7. In the procedure described above, the division ratios of both PLL0 and PLL1 are set at the same time. When minimizing the transient voltage fluctuations during this procedure is crucial, separate the register settings and subsequent periods of waiting for PLL0 and PLL1 to achieve this (which also prolongs the procedure).

Figure 10.3 Example of Sequence for Shifting the Clock Gear Up

10.4 Notes

Avoid using commands that employ the computing unit, such as FPU operations, while the division ratio is being changed. Increased current fluctuation may make the operation unstable.

10.4.1 Board Design Notes

As shown in **Figure 10.4**, do not cross any other signal lines over the signal lines to the X1 and X2 pins. Induction may inhibit proper oscillation.

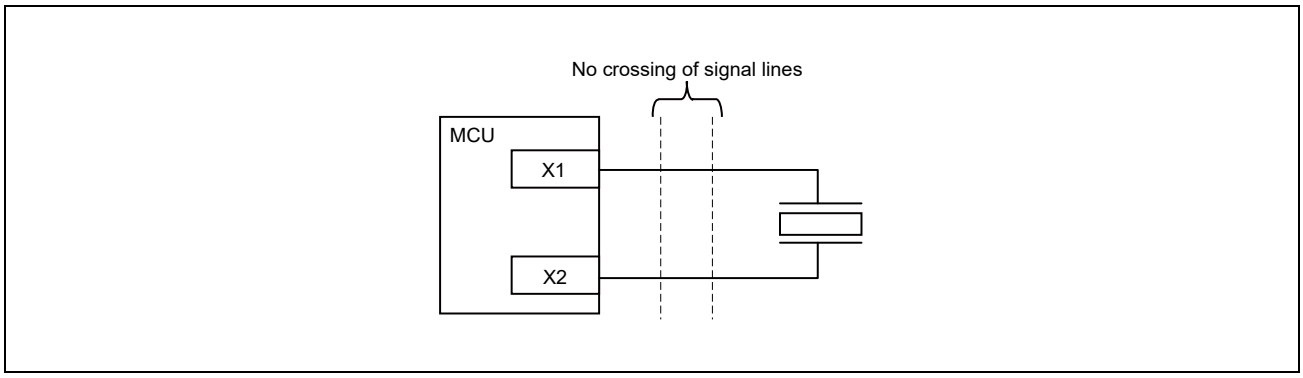


Figure 10.4 Board Design Notes

Section 11 Clocked Serial Interface H (CSIH)

This section contains a generic description of the Clocked Serial Interface H (CSIH).

The first part of this section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of CSIH.

11.1 Features of RH850/C1M-A CSIH

11.1.1 Units

This LSI has the following number of CSIH units.

CSIH Each unit has one channel interface.

Table 11.1 Number of Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of units	3	3
Name	CSIHn (n = 0 to 2)	CSIHn (n = 0 to 2)

Table 11.2 Indices

Index	Meaning
n	Throughout this section, the individual CSIH units are identified by the index “n” (n = 0 to 2); for example, CSIHnCTL0 is the CSIHn control register 0.
x	CSIHn has up to 4 chip select signals. Throughout this section, the individual chip select signals are identified by the index “x”: that is, CSx denotes a non-specified chip select signal.
y	A variable used for explanation is identified by the index “y”; for example, CSIHnBRSy is a non-specified baud rate setting register of CSIHn.

The number of chip select signals for each channel of CSIH is given in the following table:

Table 11.3 Number of Chip Select Signals

	Number of Chip Select Signals	
Unit Name	RH850/C1M-A2	RH850/C1M-A1
CSIH0	CSx (x = 0 to 3)	CSx (x = 0 to 3)
CSIH1	CSx (x = 0 to 3)	CSx (x = 0 to 3)
CSIH2	CSx (x = 0 to 3)	CSx (x = 3)*1

Note 1. The number of chip select signals provided for CSIH2 in RH850/C1M-A1 is one.

11.1.2 Register Base Addresses

CSIH base addresses are listed in the following table.

CSIH register addresses are given as offsets from the base addresses in general.

Table 11.4 Register Base Address

Base Address Name	Base Address
<CSIH0_base>	FFD8 0000_H
<CSIH1_base>	FFD8 2000_H
<CSIH2_base>	FFD8 4000_H

11.1.3 Clock Supply

CSIH interrupt requests are listed in the following table.

Table 11.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
CSIHn	PCLK	CLK_HSB (high-speed peripheral clock)

11.1.4 Interrupt Requests

CSIH interrupt requests are listed in the following table.

Table 11.6 Interrupt Requests

Unit Interrupt Name	Outline	Interrupt Number	DMA Trigger Number*1		DTS Trigger Number*1	
			1st	2nd	1st	2nd
CSIH0						
INTCSIHTIC	Communication status interrupt	301	111	—	111	—
INTCSIHTIR	Receive status interrupt	302	112	—	112	—
INTCSIHTIRE	Communication error interrupt	303	—	—	—	—
INTCSIHTIJC	Job completion interrupt	304	113	—	113	—
CSIH1						
INTCSIHTIC	Communication status interrupt	305	114	—	114	—
INTCSIHTIR	Receive status interrupt	306	115	—	115	—
INTCSIHTIRE	Communication error interrupt	307	—	—	—	—
INTCSIHTIJC	Job completion interrupt	308	116	—	116	—
CSIH2						
INTCSIHTIC	Communication status interrupt	309	117	—	117	—
INTCSIHTIR	Receive status interrupt	310	118	—	118	—
INTCSIHTIRE	Communication error interrupt	311	—	—	—	—
INTCSIHTIJC	Job completion interrupt	312	119	—	119	—

—: No number is assigned.

Note 1. 1st: Primary channel, 2nd: Secondary channel

11.1.5 Reset Sources

The CSIHn and the CSIHn registers are initialized by the following reset signal.

Table 11.7 Reset Sources

Unit Name	Reset Sources
CSIHn	All reset sources

11.1.6 External Input/Output Signals

External input/output signals of CSIH are listed in the following table.

Table 11.8 External Input/Output Signals of RH850/C1M-A2 and RH850/C1M-A1

CSIHn Signal	Function	Alternative Port Pin Signal
CSIH0		
CSIHTSCK	Serial clock input signal	CSIH0SC
CSIHTSI	Serial data input signals	CSIH0SI
$\overline{\text{CSIHTSSI}}$	Slave select input signals	$\overline{\text{CSIH0SSI}}$
CSIHTRYI	Ready / Busy input signal	CSIH0RYI
CSIHTSO	Serial data output signals	CSIH0SO
CSIHTRYO	Ready / Busy output signal	CSIH0RYO
CSIHTCSS[3:0]	Chip select signals	CSIH0CSS[3:0]
CSIH1		
CSIHTSCK	Serial clock input signal	CSIH1SC
CSIHTSI	Serial data input signals	CSIH1SI
$\overline{\text{CSIHTSSI}}$	Slave select input signals	$\overline{\text{CSIH1SSI}}$
CSIHTRYI	Ready / Busy input signal	CSIH1RYI
CSIHTSO	Serial data output signals	CSIH1SO
CSIHTRYO	Ready / Busy output signal	CSIH1RYO
CSIHTCSS[3:0]	Chip select signals	CSIH1CSS[3:0]
CSIH2		
CSIHTSCK	Serial clock input signal	CSIH2SC
CSIHTSI	Serial data input signals	CSIH2SI
$\overline{\text{CSIHTSSI}}$	Slave select input signals	$\overline{\text{CSIH2SSI}}$
CSIHTRYI	Ready / Busy input signal	CSIH2RYI
CSIHTSO	Serial data output signals	CSIH2SO
CSIHTRYO	Ready / Busy output signal	CSIH2RYO
CSIHTCSS[3:0]	Chip select signals	CSIH2CSS[3:0]*1

Note 1. The number of chip select signals provided for CSIH2 in RH850/C1M-A1 is one for CSIH2CSS[3].

11.1.7 Data Consistency Check

The following table lists data consistency checking for the port on which CSIHnSO pin functions are multiplexed. See **Section 11.4.18, Error Detection** for details on data consistency checking.

Table 11.9 Data Consistency Checking and Port Pins

CSIHn Signal	Port Pin Name	Alternative Function
CSIH0		
CSIHTSO	P4_8	ALT_OUT6
CSIH1		
CSIHTSO	P4_1	ALT_OUT7
CSIH2		
CSIHTSO	P7_2	ALT_OUT7

11.2 Overview

11.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode and slave mode selectable
- Multiple slaves configuration plus RCB (Recessive Configuration for Broadcasting) thanks to 4 configurable chip select output signals
- Slave select input signal ($\overline{\text{CSIHTSSI}}$) included
- Built-in baud rate generator
- Transfer clock frequency adjustable in master mode; determined by input clock in slave mode
- Maximum transfer clock frequency:
  - in master mode: PCLK/8
  - in slave mode: PCLK/16
- Phase of clock and data selectable
- Data transfer with MSB or LSB first selectable
- Transfer data length selectable from 2 to 16 bits in 1-bit units
- EDL (Extended Data Length) function for transferring data with more than 16 bits included
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Handshake function included
- Error detection (data consistency check, parity, time-out, overflow, and overrun) included
- Support of job concept
- 128 words I/O buffer memory
- Selectable direct access mode and memory mode (FIFO, dual buffer, and transmit-only buffer)
- Four different interrupt request signals (INTCSIHTIC, INTCSIHTIR, INTCSIHTIRE, INTCSIHTIJC)
- LBM (Loop Back Mode) function for self-test included
- CPU-controlled high-priority communication function
- Enforced chip select idle setting
- RCB (Recessive Configuration for Broadcasting) bit included
- Job enable control bit for AUTOSAR included

11.2.2 Functional Overview Description

The Clocked Serial Interface uses three signals for communication:

- Transmission clock CSIHTSCK (output in master mode, input in slave mode)
- Data output signal CSIHTSO
- Data input signal CSIHTSI

Additional signals are available for external control and monitoring.

- $\overline{\text{CSIHTSSI}}$: Slave select input signal
- CSIHTRYO: Ready/busy output signal (handshake signal)
- CSIHTRYI: Ready/busy input signal (handshake signal)
- CSIHTCSS[3:0]: Chip select signals

Data transmission is bit-wise and serial, and synchronous to the transmission clock.

The following table shows the most important registers for setting up the CSIH.

Table 11.10 Main Registers of CSIH

Register	Function
CSIHnCTL0	Enables or disables transmission clock, and permits or prohibits data transmission and data reception. Defines end-of-job behavior and enables or disables buffering (bypass of the buffer).
CSIHnCTL1	Controls options like interrupt timing, extended data length, job feature, data consistency check, loop-back mode, handshake, etc.
CSIHnCTL2	Selects master or slave mode, and the transfer clock frequency of the on-chip baud rate generator (BRG) in master mode.
CSIHnBRSy	Registers to configure the transfer clock frequency for each chip select signal
CSIHnMCTL0	Selects memory mode and specifies the time-out value
CSIHnMCTL1	Controls the memory in FIFO mode
CSIHnMCTL2	Controls the memory in dual buffer mode or transmit-only buffer mode
CSIHnCFGx	Registers to configure the communication protocol for each chip select signal

11.2.3 Block Diagram

The block diagram shows the main components of the CSIH.

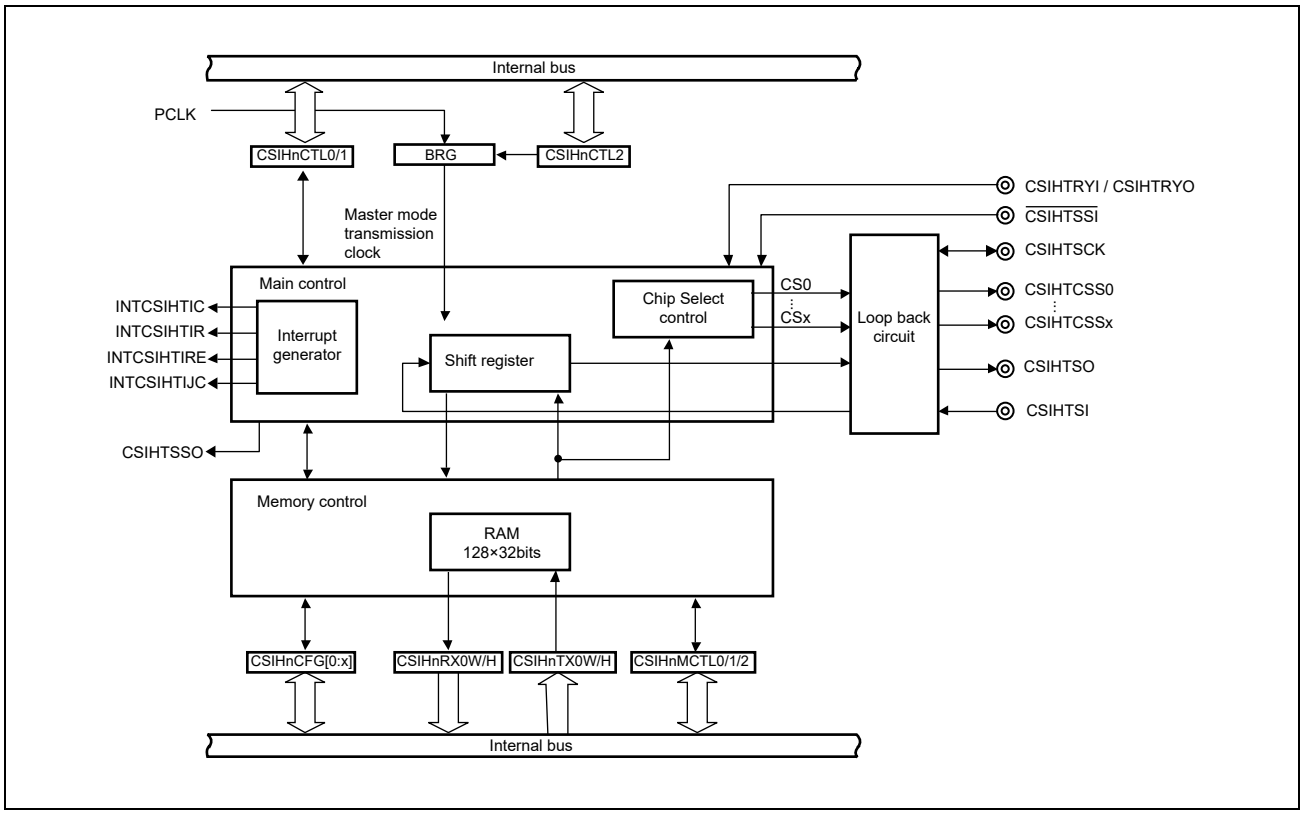

Figure 11.1 CSIH Block Diagram

In master mode, the transmission clock CSIHTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is provided from an external source.

The built-in memory can be configured as FIFO, dual buffer (separate transmit and receive buffers), or transmit-only buffer. It can also be bypassed for data transmission and reception without buffering.

The loop back circuit disconnects the CSIH completely from the ports and handles internal self-test.

NOTE

This section describes the following modes:

- The “operating mode” separates between master and slave mode. In this context, only a master can control and communicate with several slaves (for details, see **Section 11.4.7, Operating Modes (Master/Slave)**).
- The “job mode” is related to the AUTOSAR job concept (for details see **Section 11.4.9.3, Job Concept**).
- The “memory mode” takes the various configurations of the associated buffer memory into account (for details see **Section 11.4.12, CSIH Buffer Memory**).
- The “data transfer mode” specifies the kind of the communication – transmit-only, receive only, or transmit/receive (for details see **Section 11.4.13, Data Transfer Modes**).

11.3 Registers

11.3.1 List of Registers

CSIH registers are listed in the following table.

For information on <CSIHn_base>, see **Section 11.1.2, Register Base Addresses.**

Table 11.11 List of Registers

Module Name	Register Name	Symbol	Address
CSIHn	CSIHn control register 0	CSIHnCTL0	<CSIHn_base> + 0000_H
CSIHn	CSIHn control register 1	CSIHnCTL1	<CSIHn_base> + 0010_H
CSIHn	CSIHn control register 2	CSIHnCTL2	<CSIHn_base> + 0014_H
CSIHn	CSIHn status register 0	CSIHnSTR0	<CSIHn_base> + 0004_H
CSIHn	CSIHn status clear register 0	CSIHnSTCR0	<CSIHn_base> + 0008_H
CSIHn	CSIHn memory control register 0	CSIHnMCTL0	<CSIHn_base> + 1040_H
CSIHn	CSIHn memory control register 1	CSIHnMCTL1	<CSIHn_base> + 1000_H
CSIHn	CSIHn memory control register 2	CSIHnMCTL2	<CSIHn_base> + 1004_H
CSIHn	CSIHn memory read/write pointer register 0	CSIHnMRWP0	<CSIHn_base> + 1018_H
CSIHn	CSIHn configuration register 0	CSIHnCFG0	<CSIHn_base> + 1044_H
CSIHn	CSIHn configuration register 1	CSIHnCFG1	<CSIHn_base> + 1048_H
CSIHn	CSIHn configuration register 2	CSIHnCFG2	<CSIHn_base> + $104C_H$
CSIHn	CSIHn configuration register 3	CSIHnCFG3	<CSIHn_base> + 1050_H
CSIHn	CSIHn transmit data register 0 for word access	CSIHnTX0W	<CSIHn_base> + 1008_H
CSIHn	CSIHn transmit data register 0 for half-word access	CSIHnTX0H	<CSIHn_base> + $100C_H$
CSIHn	CSIHn receive data register 0 for word access	CSIHnRX0W	<CSIHn_base> + 1010_H
CSIHn	CSIHn receive data register 0 for half-word access	CSIHnRX0H	<CSIHn_base> + 1014_H
CSIHn	CSIHn baud rate setting register 0	CSIHnBRS0	<CSIHn_base> + 1068_H
CSIHn	CSIHn baud rate setting register 1	CSIHnBRS1	<CSIHn_base> + $106C_H$
CSIHn	CSIHn baud rate setting register 2	CSIHnBRS2	<CSIHn_base> + 1070_H
CSIHn	CSIHn baud rate setting register 3	CSIHnBRS3	<CSIHn_base> + 1074_H

11.3.2 CSIHnCTL0 — CSIHn Control Register 0

This register controls the operation clock and enables/disables transmission/reception and the memory part for transmission and/or reception. It forces the stop of communication at the end of the current job.

Access: Readable/writable in 8- or 1-bit units.

Address: <CSIHn_base> + 0000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CSIHnPWR	CSIHnTXE	CSIHnRXE	—	—	—	CSIHnJOBE	CSIHnMBS
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R/W	R/W

Table 11.12 CSIHnCTL0 Register Contents

Bit Position	Bit Name	Function
7	CSIHnPWR	Controls the operational clock. 0: Stops the operational clock. 1: Supplies the operational clock. Clearing CSIHnPWR to 0 resets the internal circuits, stops operation, and sets CSIH to standby state. No clock is provided to internal circuits. If CSIHnPWR is cleared during communication, ongoing communication is immediately aborted. In this case, communication setting must be started over.
6	CSIHnTXE	Enables or disables transmission. 0: Disables transmission. 1: Enables transmission.
5	CSIHnRXE	Enables or disables reception. 0: Disables reception. 1: Enables reception.
4 to 2	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
1	CSIHnJOBE	Stops communication at the end of the current job. (Communication ends if data is written to the transmission buffer when CSIHnTX0W.CSIHnEOJ = 1 (job completion)). 0: Communication stop is not requested. 1: Stops communication. This bit can be used to abort an ongoing job. This bit is cleared to 0 automatically. If this bit is set to 1, the read value is always 0. In FIFO mode, the pointer must be cleared by setting CSIHnSTCR0.CSIHnPCT = 1 before the next communication is started.
0	CSIHnMBS	Bypasses the memory for transmission and/or reception data. 0: Memory mode CSIH memory is used for transmission and/or reception data. 1: Direct access mode CSIH memory is bypassed.

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.3 CSIHnCTL1 — CSIHn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables or disables extended data length control, data consistency check, loop-back mode, handshake functionality, and job mode. It selects the active level of the output of each chip select signal and the behavior of the chip select signals after the transfer of the final data.

Access: Readable/writable in 32-bit units.

Address: <CSIHn_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	CSIHn PHE	CSIHn CKR	CSIHn SLIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CSIHn CSL3	CSIHn CSL2	CSIHn CSL1	CSIHn CSL0	CSIHn EDLE	CSIHn JE	CSIHn DCS	CSIHn CSRI	CSIHn LBM	CSIHn SIT	CSIHn HSE	CSIHn SSE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 11.13 CSIHnCTL1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
18	CSIHnPHE	Sets the CPU-controlled priority-based communication function. 0: The CPU-controlled high-priority communication function is disabled. 1: The CPU-controlled high-priority communication function is enabled. To enable the CPU-controlled high-priority communication function, set this bit to 1 and set CSIHnJE = 1. This bit can only be set in transmit-only buffer mode.
17	CSIHnCKR	CSIHTSCK clock inversion function 0: The default level of CSIHTSCK is high 1: The default level of CSIHTSCK is low For details, see **Section 11.3.11, CSIHnCFGx — CSIHn Configuration Register x**.
16	CSIHnSLIT	Selects the timing of interrupt INTCSIHTIC. 0: Normal interrupt timing (interrupt is generated after the transfer) 1: As soon as the contents of the CSIHnTX0W/H register are transferred to the shift register, an interrupt is generated (this function is activated only in direct access memory mode/transmit-only buffer mode). For details, see **Section 11.4.3, INTCSIHTIC (Communication Status Interrupt)**.
15 to 12	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.

Table 11.13 CSIHnCTL1 Register Contents (2/2)

Bit Position	Bit Name	Function
11 to 8	CSIHnCSLx	Selects the active output level of chip select signal x (CSIHTCSSx) (x = 0 to 3). 0: Chip select is active low. 1: Chip select is active high. For details, see **Section 11.4.9, Chip Selection (CS) Features**.
7	CSIHnEDLE	Enables/disables extended data length (EDL) mode. 0: Disables extended data length mode. 1: Enables extended data length mode. For details, see **Section 11.4.14.2, Data length greater than 16 bits**.
6	CSIHnJE	Enables/disables job mode. 0: Disables job mode. 1: Enables job mode. For details, see **Section 11.4.9.3, Job Concept**. The CSIHnCTL0.CSIHnJOBE, CSIHnTX0W.CSIHnEOJ, and CSIHnTX0W.CSIHnCIRE bits are enabled only when CSIHnJE = 1. Setting this bit in slave mode is prohibited. In addition, to enable the CPU-controlled high-priority communication function, set CSIHnPHE = 1 and this bit to 1.
5	CSIHnDCS	Enables/disables data consistency check. 0: Disables data consistency check. 1: Enables data consistency check. For details, see **Section 11.4.18.1, Data consistency check**.
4	CSIHnCSRI	Defines chip select signal behavior after last data transfer. 0: Chip select signal holds the active level. 1: Chip select signal returns to the inactive level. The last data is determined at the interrupt timing in direct access mode or FIFO mode. When CSIHnCTL1.CSIHnSLIT = 1, the last data is determined in direct access mode.
3	CSIHnLBM	Controls loop-back mode (LBM). 0: Deactivates loop-back mode. 1: Activates loop-back mode. For details, see **Section 11.4.19, Loop-back Mode**.
2	CSIHnSIT	Selects interrupt delay mode. 0: No delay is generated. 1: Delay of half a clock cycle is generated for all interrupts. This bit is only valid in master mode. In slave mode, no delay is generated. For details, see **Section 11.4.2, Interrupt Delay**.
1	CSIHnHSE	Enables/disables the handshake function. 0: Disables the handshake function. 1: Enables the handshake function. For details refer to **Section 11.4.17, Handshake Function**.
0	CSIHnSSE	Enables/disables the slave select function. 0: Input signal $\overline{\text{CSIHTSSI}}$ is disabled. 1: Input signal $\overline{\text{CSIHTSSI}}$ is enabled. If the slave select function is not used, this bit must be set to 0 (see also **Section 11.4.8, Master/Slave Connections**).

Details about CSIHnCTL1.CSIHnSSE are shown in the following tables.

Table 11.14 Operation of the Slave Select Function During Reception

CSIHnCTL0.CSIHnRXE	CSIHnCTL1.CSIHnSSE	$\overline{\text{CSIHTSSI}}$	Receive Operation
0	—	—	Reception is prohibited
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

Table 11.15 Operation of the Slave Select Function During Transmission

CSIHnCTL0.CSIHnTXE	CSIHnCTL1.CSIHnSSE	$\overline{\text{CSIHTSSI}}$	Transmit Operation
0	—	—	Transmission is prohibited
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.4 CSIHnCTL2 — CSIHn Control Register 2

This register selects operating mode and the basic clock value, and specifies the transfer clock frequency.

For details see **Section 11.4.11, Transmission clock selection**.

Access: Readable/writable in 16-bit units.

Address: <CSIHn_base> + 0014_H

Value after reset: $E000_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnPRS[2:0]			—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 11.16 CSIHnCTL2 Register Contents

Bit Position	Bit Name	Function
15 to 13	CSIHnPRS[2:0]	These bits select the operation mode and the reference clock value.
12 to 0	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.

CSIHnPRS2	CSIHnPRS1	CSIHnPRS0	Selection of Reference Clock (PRSOUT)
0	0	0	PCLK (Master mode)
0	0	1	PCLK/2 (Master mode)
0	1	0	PCLK/4 (Master mode)
0	1	1	PCLK/8 (Master mode)
1	0	0	PCLK/16 (Master mode)
1	0	1	PCLK/32 (Master mode)
1	1	0	PCLK/64 (Master mode)
1	1	1	External clock via CSIHTSCK (in) (Slave mode)

In master mode, the following bits are used to set the transfer clock frequency:

CSIHnCTL2.CSIHnPRS[2:0],

CSIHnCFGx.CSIHnBRSSx[1:0],

CSIHnBRSy.CSIHnBRS[11:0]

In addition, any of the four different transfer clock frequency settings that are specified by the CSIHnBRSy.CSIHnBRS[11:0] bits is selected according to the chip select signal. To select the transfer clock frequency setting for each chip select signal, use the CSIHnCFGx.CSIHnBRSSx[1:0] bits.

The following table shows the relationship between CSIHnCFGx.CSIHnBRSSx[1:0] and CSIHnBRSy.CSIHnBRS[11:0].

CSIHnCFGx.CSIHnBRSSx[1:0]	Baud Rate Setting Bit to be Selected
00	CSIHnBRS0.CSIHnBRS[11:0]
01	CSIHnBRS1.CSIHnBRS[11:0]
10	CSIHnBRS2.CSIHnBRS[11:0]
11	CSIHnBRS3.CSIHnBRS[11:0]

The following table shows the relationship between the transfer clock frequency and the transfer clock frequency setting (CSIHnBRS[11:0]) selected by the CSIHnBRSSx[1:0] bits when the bit value of the CSIHnPRS[2:0] bits is α.

CSIHnBRS[11:0]	Transfer Clock Frequency
0	BRG stopped
1	PCLK / (2^{α} × 1 × 2)
2	PCLK / (2^{α} × 2 × 2)
3	PCLK / (2^{α} × 3 × 2)
4	PCLK / (2^{α} × 4 × 2)
:	:
4095	PCLK / (2^{α} × 4095× 2)

When a time-out error is used in slave mode, the clock selected by this setting is used. In slave mode, the CSIHnPRS[2:0] bits are set to 111_B. In this case, the prescaler has the same setting as when the CSIHnPRS[2:0] bits are set to 000_B. If you are using a time-out error, set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000_H.

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.5 CSIHnSTR0 — CSIHn Status Register 0

This register indicates the status of CSIH.

Access: Readable in 32-bit units.

Address: <CSIHn_base> + 0004_H

Value after reset: $0000\ 0010_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHnSRP[7:0]								CSIHnSPF[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn TMOE	CSIHn OFE	—	—	—	—	—	CSIHn HPST	CSIHn TSF	—	CSIHn FLF	CSIHn EMF	CSIHn DCE	—	CSIHn PE	CSIHn OVE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 11.17 CSIHnSTR0 Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 24	CSIHnSRP[7:0]	Indicates the number of received data packets in FIFO mode. CSIHnSRP[7:0] / Description 00_H / Number of received data packets (0 to 128) : / 80_H / Other than the above / Undefined These bits are cleared by CSIHnSTCR0.CSIHnPCT. In direct access mode, dual buffer mode, or transmit-only buffer mode, this value is fixed to 00_H. In direct access mode, this bit is fixed to 0 because there is no pointer. In buffer mode, this bit is fixed to 0 because the number of data packets is managed by CSIHnMCTL2.CSIHnND[7:0].
23 to 16	CSIHnSPF[7:0]	Indicates the number of unsent data in FIFO mode. (The number of data written by the CPU is the number of sent data.) CSIHnSPF[7:0] / Description 00_H / Number of unsent data packets (0 to 128) : / 80_H / Other than the above / Undefined These bits are cleared by CSIHnSTCR0.CSIHnPCT. In direct access mode, dual buffer mode, or transmit-only buffer mode, this value is fixed to 00_H. In direct access mode, this bit is fixed to 0 because there is no pointer. In buffer mode, this bit is fixed to 0 because the number of data packets is managed by CSIHnMCTL2.CSIHnND[7:0].

Table 11.17 CSIHnSTR0 Register Contents (2/3)

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>15</td><td>CSIHnTMOE</td><td>Time-out error flag in FIFO mode
Indicates whether a time-out error was detected in FIFO mode.
0: No time out error is detected.
1: A time out error is detected.
For details, see Section 11.4.18.3, Time-out error.
This bit is cleared by CSIHnSTCR0.CSIHnTMOEC.
When this bit is set to 1 by the detection of time-out error and cleared to 0 by CSIHnSTCR0.CSIHnTMOEC simultaneously, setting to 1 is prioritized.
This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.</td></tr>
<tr><td>14</td><td>CSIHnOFE</td><td>Overflow error flag in FIFO mode
Indicates whether an overflow error was detected in FIFO mode.
0: No overflow error is detected.
1: An overflow error is detected.
For details, see Section 11.4.18.4, Overflow error.
This bit is cleared by CSIHnSTCR0.CSIHnOFEC.
When this bit is set to 1 by the detection of overflow error and cleared to 0 by CSIHnSTCR0.CSIHnOFEC simultaneously, setting to 1 is prioritized.
This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.</td></tr>
<tr><td>13 to 9</td><td>Reserved</td><td>When read, the value after a reset is read.</td></tr>
<tr><td>8</td><td>CSIHnHPST</td><td>Communication priority indication flag
0: Indicates low-priority communication is in progress.
1: Indicates high-priority communication is in progress.
This bit always reads 0 if CPU-controlled high-priority communication is disabled (CSIHnCTL1.CSIHnPHE = 0).</td></tr>
<tr><td>7</td><td>CSIHnTSF</td><td>Transfer status flag
0: Idle state
1: Communication is in progress or being prepared.

The timing to set or clear this bit is as follows:
<table>
<tr><th rowspan="2">Master Mode</th><th colspan="2">Timing to Set</th><th rowspan="2">Timing to Clear</th></tr>
<tr><th>Direct Access Mode, FIFO Mode</th><th>Dual Buffer Mode, Transmit-Only Buffer Mode</th></tr>
<tr><td>Transmit-only mode</td><td rowspan="3">Data is written to a transmit register (CSIHnTX0W/CSIHnTX0H)</td><td rowspan="3">Bit CSIHnMCTL2.CSIHnBTST is set</td><td rowspan="3">Within a half clock of the last serial clock edge</td></tr>
<tr><td>Transmit/receive mode</td></tr>

</table>
<table>
<tr><th rowspan="2">Slave Mode</th><th colspan="2">Timing to Set</th><th rowspan="2">Timing to Clear</th></tr>
<tr><th>Direct Access Mode, FIFO Mode</th><th>Dual Buffer Mode, Transmit-Only Buffer Mode</th></tr>
<tr><td>Transmit-only mode</td><td rowspan="2">Data is written to a transmit register (CSIHnTX0W/CSIHnTX0H)</td><td rowspan="3">Bit CSIHnMCTL2.CSIHnBTST is set</td><td rowspan="3">Within a half clock of the last serial clock edge</td></tr>
<tr><td>Transmit/receive mode</td></tr>
<tr><td>Receive-only mode</td><td>Input timing of CSIHTSCK</td></tr>
</table></td></tr>
<tr><td>6</td><td>Reserved</td><td>When read, the value after a reset is read.</td></tr>
</table>

Table 11.17 CSIHnSTR0 Register Contents (3/3)

Bit Position	Bit Name	Function
5	CSIHnFLF	A flag indicating that the buffer is full in FIFO mode 0: FIFO buffer is not full. 1: FIFO buffer is full. This bit is cleared to 0 by CSIHnSTCR0.CSIHnPCT. The FIFO buffer might be filled with unsent data or received data.
4	CSIHnEMF	A flag indicating that the buffer is empty in FIFO mode 0: FIFO buffer is not empty. 1: FIFO buffer is empty. This bit is set to 1 by CSIHnSTCR0.CSIHnPCT. This bit is set to 1 when value of “CSIHnSTR0.CSIHnSRP[7:0] + CSIHnSTR0.CSIHnSPF[7:0]” matches to 00_H. The FIFO buffer might be filled with unsent data or received data.
3	CSIHnDCE	Data consistency check error flag 0: No data consistency error is detected. 1: Data consistency error is detected. This bit is cleared to 0 by writing 1 to CSIHnSTCR0.CSIHnDCEC. When this bit is set to 1 by the detection of data consistency check error and cleared to 0 by CSIHnSTCR0.CSIHnDCEC simultaneously, setting to 1 is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.
2	Reserved	When read, the value after a reset is read.
1	CSIHnPE	Parity error flag 0: No parity error is detected. 1: Parity error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnPEC. When this bit is set to 1 by the detection of parity error and cleared to 0 by CSIHnSTCR0.CSIHnPEC simultaneously, setting to 1 is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.
0	CSIHnOVE	Overrun error flag (Fixed to 0 in dual buffer mode) 0: No overrun error is detected. 1: Overrun error is detected. This bit is cleared to 0 by writing 1 to CSIHnSTCR0.CSIHnOVEC. When this bit is set to 1 by overrun error and cleared to 0 by CSIHnSTCR0.CSIHnOVEC simultaneously, setting to 1 is prioritized. This bit is Initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.

Table 11.18 Behavior in Memory Mode

Bit Name	Bit Position	Direct Access Mode	FIFO Mode	Transmit-Only Buffer Mode	Dual Buffer Mode
CSIHnSRP[7:0]	31 to 24	Fixed to 0	Number of received words	Fixed to 0	Fixed to 0
CSIHnSPF[7:0]	23 to 16	Fixed to 0	Number of unsent data	Fixed to 0	Fixed to 0
CSIHnTMOE	15	Fixed to 0	0: No error is detected. 1: An error is detected.	Fixed to 0	Fixed to 0
CSIHnOFE	14	Fixed to 0	0: No error is detected. 1: An error is detected.	Fixed to 0	Fixed to 0
CSIHnTSF	7	0: Idle state 1: Communication is in progress or being prepared			
CSIHnFLF	5	Fixed to 0	0: FIFO is not full 1: FIFO is full	Fixed to 0	Fixed to 0
CSIHnEMF	4	Fixed to 1	0: FIFO is not empty 1: FIFO is empty	Fixed to 1	Fixed to 1
CSIHnDCE	3	0: No error is detected. 1: An error is detected.			
CSIHnPE	1	0: No error is detected. 1: An error is detected.			
CSIHnOVE	0	0: No error is detected. 1: An error is detected.	0: No error is detected. 1: An error is detected.	0: No error is detected. 1: An error is detected.	Fixed to 0

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.6 CSIHnSTCR0 — CSIHn Status Clear Register 0

This register clears the status flags of the CSIHnSTR0 status register.

Access: Readable/writable in 16-bit units.

When read, the value 0000_H is always returned.

Address: <CSIHn_base> + 0008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn TMOEC	CSIHn OFEC	—	—	—	—	—	CSIHn PCT	—	—	—	—	CSIHn DCEC	—	CSIHn PEC	CSIHn OVEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R	R	R/W	R	R/W	R/W

Table 11.19 CSIHnSTCR0 Register Contents

Bit Position	Bit Name	Function
15	CSIHnTMOEC	Controls the time-out error flag clear command. 0: No operation. The read value is always 0. 1: Clears the time out error flag (CSIHnSTR0.CSIHnTMOE).
14	CSIHnOFEC	Controls the overflow error flag clear command. 0: No operation. The read value is always 0. 1: Clears the overflow error flag (CSIHnSTR0.CSIHnOFE).
13 to 9	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
8	CSIHnPCT	Controls the FIFO pointer clear command. 0: No operation. The read value is always 0. 1: Clears the FIFO buffer pointers below (in FIFO mode, dual buffer mode, and transmit-only buffer mode) and the status bits.

FIFO Buffer Pointer	Status Bit
CSIHnMRWP0.CSIHnTRWA[6:0]	CSIHnSTR0.CSIHnSPF[7:0]
CSIHnMRWP0.CSIHnRRA[6:0]	CSIHnSTR0.CSIHnSRP[7:0]
CSIHnMCTL2.CSIHnSOP[6:0]	CSIHnSTR0.CSIHnFLF
	CSIHnSTR0.CSIHnTSF

Also, the CSIHnSTR0.CSIHnEMF bit is set to 1 (FIFO empty) (only in FIFO mode).

7 to 4	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
3	CSIHnDCEC	Controls the data consistency error flag clear command. 0: No operation. The read value is always 0. 1: Clears the data consistency error flag (CSIHnSTR0.CSIHnDCE).
2	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
1	CSIHnPEC	Controls the parity error flag clear command. 0: No operation. The read value is always 0. 1: Clears the parity error flag (CSIHnSTR0.CSIHnPE).
0	CSIHnOVEC	Controls the overrun error flag clear command. 0: No operation. The read value is always 0. 1: Clears the overrun error flag (CSIHnSTR0.CSIHnOVE).

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.7 CSIHnMCTL0 — CSIHn Memory Control Register 0

This register selects the memory mode and the time-out setting.

Access: Readable/writable in 16-bit units.

Address: <CSIHn_base> + 1040_H

Value after reset: $001F_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CSIHnMMS[1:0]		—	—	—	CSIHnTO[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 11.20 CSIHnMCTL0 Register Contents

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
9, 8	CSIHnMMS[1:0]	Selects the memory mode. CSIHn MMS1 / CSIHn MMS0 / Description 0 / 0 / FIFO mode 0 / 1 / Dual buffer mode 1 / 0 / Transmit-only buffer mode 1 / 1 / Prohibited After a change of the memory mode, the respective buffer pointers must be cleared by setting the CSIHnSTCR0.CSIHnPCT bit to 1. In direct access mode, the setting of these bits is ignored.
7 to 5	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
4 to 0	CSIHnTO[4:0]	Selects the time-out setting in FIFO mode. CSIHnTO[4:0] / Description 00000_B / No time-out is detected 00001_B / Time-out is (1 × 8 × BRG output clocks) 00010_B / Time-out is (2 × 8 × BRG output clocks) : 11111_B / Time-out is (31 × 8 × BRG output clocks) **CAUTION:** Changing the time-out setting is only permitted when CSIHnCTL0.CSIHnPWR = 0. Set the CSIHnTO[4:0] bits to 00000_B in direct access mode, dual buffer mode, or transmit-only buffer mode (except FIFO mode). For details about time-out detection, see also **Section 11.4.18.3, Time-out error**.

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.8 CSIHnMCTL1 — CSIHn Memory Control Register 1

This register selects the conditions to generate the interrupt requests, INTCSIHTIC and INTCSIHTIR in FIFO mode.

Access: Readable/writable in 32-bit units.

Address: <CSIHn_base> + 1000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CSIHnFES[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnFFS[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 11.21 CSIHnMCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
22 to 16	CSIHnFES[6:0]	Selects the conditions to generate the INTCSIHTIC interrupt (transmit data empty) in FIFO mode. When the number of unsent data to be transmitted in FIFO (checked by the CSIHnSTR0.CSIHnSPF[7:0] bit) and CSIHnMCTL1.CSIHnFES[6:0] match, the INTCSIHTIC interrupt request is generated.
15 to 7	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
6 to 0	CSIHnFFS[6:0]	Selects the conditions to generate the INTCSIHTIR interrupt (receive data full) in FIFO mode. When the number of received data in FIFO (checked by the CSIHnSTR0.CSIHnSRP[7:0] bit) and (128 - CSIHnMCTL1.CSIHnFFS[6:0]) match, the INTCSIHTIR interrupt request is generated.

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.9 CSIHnMCTL2 — CSIHn Memory Control Register 2

This register controls the operation of the memory in dual buffer or transmit-only buffer mode and triggers to start communication in buffer mode.

Access: Readable/writable in 32-bit units.

Address: <CSIHn_base> + 1004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHn BTST	—	—	—	—	—	—	—	CSIHnND[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnSOP[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 11.22 CSIHnMCTL2 Register Contents (1/2)

Bit Position	Bit Name	Function
31	CSIHnBTST	Provides a start trigger for buffer transfer. 0: No operation. 1: Issues the start transfer command. The read value is always 0. **CAUTION:** This bit can only be used in dual buffer mode and transmit-only buffer mode.
30 to 24	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
23 to 16	CSIHnND[7:0]	Specifies the number of data for each memory mode. The read value indicates the number of remaining communication data.

CSIHnND[7:0]	Dual Buffer Mode	Transmit-Only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	Send 0 data	Send 0 data	No influence	No influence
01_H	Send 1 data	Send 1 data	No influence	No influence
:	:	:	No influence	No influence
$3F_H$	Send 63 data	Send 63 data	No influence	No influence
40_H	Send 64 data	Send 64 data	No influence	No influence
:	Prohibited	:	No influence	No influence
$7F_H$	Prohibited	Send 127 data	No influence	No influence
80_H	Prohibited	Send 128 data	No influence	No influence
Other than the above	Setting is prohibited.			

The values are automatically decremented after data transfer (Not decremented in direct access mode).

Table 11.22 CSIHnMCTL2 Register Contents (2/2)

Bit Position	Bit Name	Function
15 to 7	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
6 to 0	CSIHnSOP[6:0]	Selects the pointer of the data to be sent. If communication is forced to stop by setting CSIHnCTL0.CSIHnPWR to 0 or CSIHnSTCR0.CSIHnPCT to 1, these bits are cleared by hardware. In FIFO mode, these bits indicate the send address.

CSIHnSOP[6:0]	Dual Buffer Mode	Transmit-Only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	0000_H	0000_H	0000_H	No influence
01_H	0004_H	0004_H	0004_H	No influence
:	:	:	:	No influence
$3F_H$	$00FC_H$	$00FC_H$	$00FC_H$	No influence
40_H	Prohibited	0100_H	0100_H	No influence
:	Prohibited	:	:	No influence
$7F_H$	Prohibited	$01FC_H$	$01FC_H$	No influence

CAUTION: In direct access mode, these bits are not incremented.

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.10 CSIHnMRWP0 — CSIHn Memory Read/Write Pointer Register 0

This register sets the pointers for reading from and writing to the dual or transmit-only buffer.

Access: Readable/writable in 32-bit units.

Address: <CSIHn_base> + 1018_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CSIHnRRA[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnTRWA[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 11.23 CSIHnMRWP0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
22 to 16	CSIHnRRA[6:0]	These bits select the read pointer of the receive buffer

CSIHnRRA[6:0]	Dual Buffer Mode	Transmit-Only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	0000_H	No influence	0000_H	No influence
01_H	0004_H	No influence	0004_H	No influence
:	:	No influence	:	No influence
$3F_H$	$00FC_H$	No influence	$00FC_H$	No influence
40_H	Prohibited	No influence	0100_H	No influence
:	Prohibited	No influence	:	No influence
$7F_H$	Prohibited	No influence	$01FC_H$	No influence

These bits are automatically incremented when received data is read.

If an overrun error is generated while reading the CSIHnRX0W or CSIHnRX0H register, the read pointer is not incremented.

These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.

In direct access mode and transmit-only buffer mode, these bits are not incremented.

To perform write access in transmit-only buffer mode, set 0000_H to these bits.

In FIFO mode, these bits indicate the read address of the received data.

15 to 7	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.

Table 11.23 CSIHnMRWP0 Register Contents (2/2)

Bit Position	Bit Name	Function
6 to 0	CSIHnTRWA[6:0]	These bits select the read/write pointer of the transmit buffer.

CSIHn TRWA[6:0]	Dual Buffer Mode	Transmit-Only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	0000_H	0000_H	0000_H	No influence
01_H	0004_H	0004_H	0004_H	No influence
:	:	:	:	No influence
$3F_H$	$00FC_H$	$00FC_H$	$00FC_H$	No influence
40_H	Prohibited	0100_H	0100_H	No influence
:	Prohibited	:	:	No influence
$7F_H$	Prohibited	$01FC_H$	$01FC_H$	No influence

These bits are automatically incremented when the transmission data is written or read.
These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.
In direct access mode, these bits are not incremented.
In FIFO mode, these bits indicate the read/write address of transmission data.

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.11 CSIHnCFGx — CSIHn Configuration Register x

These four registers specify for each chip select signal CSIHTCSSx prescaler, parity, data length, recessive configuration for broadcasting, serial data direction, clock and data phase, idle enforcement configuration, idle time, hold time, inter-data time and setup time.

Slave mode

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is effective.

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock and data phase

In slave mode, set 0 to all the bits other than above in the CSIHnCFG0 register, and the CSIHnCFG1 to CSIHnCFG3 registers.

Access: Readable/writable in 32-bit units.

Address: CSIHnCFG0: <CSIHn_base> + 1044_H
CSIHnCFG1: <CSIHn_base> + 1048_H
CSIHnCFG2: <CSIHn_base> + $104C_H$
CSIHnCFG3: <CSIHn_base> + 1050_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.12 CSIHnTX0W — CSIHn Transmit Data Register 0 for Word Access

This register stores transmission data. In addition, it specifies the communication interrupt request, the end-of-job, the extended data length, and the chip select activation.

Access: Readable/writable in 32-bit units.

Address: <CSIHn_base> + 1008_H

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 11.25 CSIHnTX0W Register Contents (1/2)

Bit Position	Bit Name	Function
31	CSIHnCIRE	Enables the communication interrupt request INTCSIHTIC in dual buffer or transmit-only buffer mode, or the job completion interrupt INTCSIHTIJC request in FIFO mode. 0: No interrupt is requested. 1: An interrupt is requested. Generates interrupt INTCSIHTIC or INTCSIHTIJC after transmission. For details, see **Section 11.4.3, INTCSIHTIC (Communication Status Interrupt)** and **Section 11.4.6, INTCSIHTIJC (Job Completion Interrupt)**. **CAUTION:** This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
30	CSIHnEOJ	Specifies the end of a job. 0: Indicates that the job does not end. The job continues. 1: Indicates end-of-job data. **CAUTION:** This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). This bit must be set to 0 in slave mode.

Table 11.25 CSIHnTX0W Register Contents (2/2)

Bit Position	Bit Name	Function
29	CSIHnEDL	Specifies whether the associated data requires the extended data length (EDL) option. 0: Normal operation 1: Enables the extended data length. The associated data is transmitted as a 16-bit packet. No inter-data time or idle time will be inserted after the data is transmitted. If CSIHnCTL1.CSIHnEDLE = 1 and CSIHnTX0W.CSIHnEDL = 1, the subsequent data must have the same CS selection. If CS is modified for the subsequent data, the correct operation is not assured. **CAUTION:** This bit is only available if CSIHnCTL1.CSIHnEDLE = 1.
28 to 20	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
19 to 16	CSIHnCS[3:0]	Activates one or several chip select signals. 0: Activates chip select x for the associated transmission. 1: Deactivates chip select x for the associated transmission. Setting CSIHnTX0W.CSIHnCS[3:0] = F_H is prohibited. **CAUTION:** If several chip select signals are enabled for broadcasting, the configuration of one with CSIHnCFGx.CSIHnRCBx = 0 (dominant) is used. In this case, all dominant chip select signals must be set to precisely the same value. In slave mode, set the CSIHnCS[3:0] bits to E_H.
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.13 CSIHnTX0H — CSIHn Transmit Data Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of register CSIHnTX0W.

The 16 high-order bits of CSIHnTX0W are applied for transfer. Set transmit data to CSIHnTX0W before using this register because the value of CSIHnTX0W is undefined after a reset.

Access: Readable/writable in 16-bit units.

Address: <CSIHn_base> + $100C_H$

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 11.26 CSIHnTX0H Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.14 CSIHnRX0W — CSIHn Receive Data Register 0 for Word Access

This register stores the received data.

Access: Readable in 32-bit units.

Address: <CSIHn_base> + 1010_H

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 11.27 CSIHnRX0W Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after a reset is read.
25	CSIHnRPE	Indicates whether a reception data parity error was detected. 0: No parity error was detected on the associated reception data. 1: A parity error was detected on the associated reception data.
24	CSIHnTDCE	Indicates whether a transmission data consistency error was detected. 0: No consistency error was detected on the associated transmission data. 1: A consistency error was detected on the associated transmission data.
23 to 20	Reserved	When read, the value after a reset is read.
19 to 16	CSIHnCSx (x = 3 to 0)	Indicates which chip select signal was activated. 0: Chip select x was activated for the associated reception. 1: Chip select x was deactivated for the associated reception.
15 to 0	CSIHnRX [15:0]	Stores the received data.

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.15 CSIHnRX0H — CSIHn Receive Data Register 0 for Half Word Access

This register stores the received data. This register is the same as bits 15 to 0 of register CSIHnRX0W.

Access: Readable in 16-bit units.

Address: <CSIHn_base> + 1014_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnRX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 11.28 CSIHnRX0H Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIHnRX [15:0]	Stores the received data.

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.3.16 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y = 0 to 3)

This register sets the transfer clock frequency for each chip select signal.

With CSIHnCFG0 (to 3).CSIHnBRSSx[1:0] bits, one of the four types of transfer clock frequency settings can be selected for each chip select signal. For details of transfer clock frequency setting, refer to **Section 11.4.11, Transmission clock selection**.

Access: Readable/writable in 16-bit units.

Address: CSIHnBRS0: <CSIHn_base> + 1068_H

CSIHnBRS1: <CSIHn_base> + $106C_H$

CSIHnBRS2: <CSIHn_base> + 1070_H

CSIHnBRS3: <CSIHn_base> + 1074_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CSIHnBRS[11:0]

R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 11.29 CSIHnBRSy Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
11 to 0	CSIHnBRS [11:0]	0: BRG stopped 1: PCLK / (2^{α} × 1 × 2) 2: PCLK / (2^{α} × 2 × 2) 3: PCLK / (2^{α} × 3 × 2) 4: PCLK / (2^{α} × 4 × 2) . . . 4095: PCLK / (2^{α} × 4095 × 2) α is the value of CSIHnCTL2.CSIHnPRS[2:0].

CAUTION

When setting this register, see **Table 11.43, Notes on Setting Registers**.

11.4 Functions

11.4.1 Overview of Interrupt Function

CSIH can generate the interrupt requests listed in the table below:

Table 11.30 Interrupt Generation

Memory mode	Interrupt	Cause of Interrupt	
		Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	INTCSIHTIC (communication status interrupt)	Tx data empty*1	Tx data empty*1 except job abortion*4
	INTCSIHTIR (reception status interrupt)	Rx data full*2 and CSIHnCTL0.CSIHnRXE = 1	Rx data full*2 and CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE (communication error interrupt)	Error detected	Error detected
	INTCSIHTIJC*3 (job completion interrupt)	Not applicable	CSIHnTX0W.CSIHnCIRE = 1, (when it is not Tx data empty) or job abortion*4
Transmit-only buffer	INTCSIHTIC (communication status interrupt)	End of communication	CSIHnTX0W.CSIHnCIRE = 1 and (CSIHnCTL0.CSIHnJOBE = 0 or CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHTIR (reception status interrupt)	Data received and CSIHnCTL0.CSIHnRXE = 1	Data received and CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE (communication error interrupt)	Error detected	Error detected
	INTCSIHTIJC*3 (job completion interrupt)	Not applicable	Job abortion*4
Dual buffer	INTCSIHTIC (communication status interrupt)	End of communication	CSIHnTX0W.CSIHnCIRE = 1 and (CSIHnCTL0.CSIHnJOBE = 0 or CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHTIR (reception status interrupt)	End of communication and CSIHnCTL0.CSIHnRXE = 1	Data received and CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE (communication error interrupt)	Error detected	Error detected
	INTCSIHTIJC*3 (job completion interrupt)	Not applicable	Job abortion*4
Direct access	INTCSIHTIC (communication status interrupt)	1 data transferred	1 data transferred, (except the state of job abortion*4)
	INTCSIHTIR (reception status interrupt)	Data received and CSIHnCTL0.CSIHnRXE = 1	Data received and CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE (communication error interrupt)	Error detected	Error detected
	INTCSIHTIJC*3 (job completion interrupt)	Not applicable	Job abortion*4

Note 1. “Tx data empty” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFES[6:0].

Note 2. “Rx data full” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFFS[6:0].

Note 3. INTCSIHTIJC is not available in slave mode.

Note 4. Job abortion condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1.
During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

The communication error interrupt INTCSIHTIRE is generated when an error is detected. The generation of the other interrupts depends on the memory mode, the job mode, and - in case of the job completion interrupt INTCSIHTIJC - also the operating mode.

The job completion interrupt INTCSIHTIJC is only generated when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). It is not available in slave mode.

11.4.2 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by one half period of the transmission clock, CSIHTSCK. This is not possible in slave mode.

The delay is specified by setting bit CSIHnCTL1.CSIHnSIT = 1.

The following example illustrates the interrupt delay function, assuming a setting of CSIHnCTL1.CSIHnSIT = 1 (interrupt delay enabled), CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0 (Normal clock and data phases), and CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B (data length 8 bits).

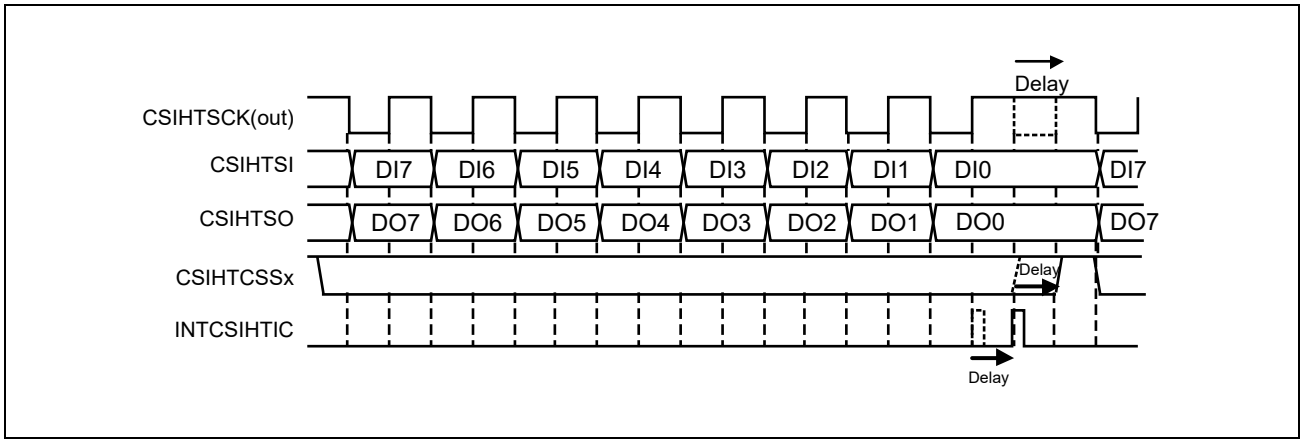

Figure 11.2 Interrupt Delay Function (CSIHnCTL1.CSIHnSIT = 1)

Setting CSIHnCTL1.CSIHnSIT = 1 adds half period delay to the transmission clock. This delays also the end of the present chip select signal (CSIHTCSSx).

11.4.3 INTCSIHTIC (Communication Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions shown in the following table.

Table 11.31 INTCSIHTIC Interrupt Generation

Memory Mode	Cause of Interrupt	
	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	This interrupt is generated when transmission data is about to be missing in the FIFO, indicating to the application that new data should be added. INTCSIHTIC is generated, if the number of data to be sent remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMTCL1.CSIHnFES[6:0].	Similar to “when CSIHnJE is 0”, an interrupt is generated when the number of transmit data remained in the FIFO CSIHnSTR0.CSIHnSPF[7:0] is the same number as CSIHnMCTL1.CSIHnFES[6:0]. At the time of job abortion, no interrupt is generated.
Transmit-only buffer, Dual buffer	Generated at the End of communication. (Specified by the CSIHnMTLC2.CSIHnND[7:0] bit)	Generated when data with CSIHnTX0W.CSIHnCIRE = 1 is sent. Note that if data with CSIHnTX0W.CSIHnCIRE = 1 and job abortion*1 are sent, the INTCSIHTIJC interrupt is generated instead of INTCSIHTIC.
Direct access	Generated after every data transfer.	Generated after every data transfer, except when the communication was aborted.

Note 1. Job abortion condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1.
During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

11.4.3.1 INTCSIHTIC in direct access mode

The examples below show the INTCSIHTIC behavior in direct access mode.

The examples assume:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

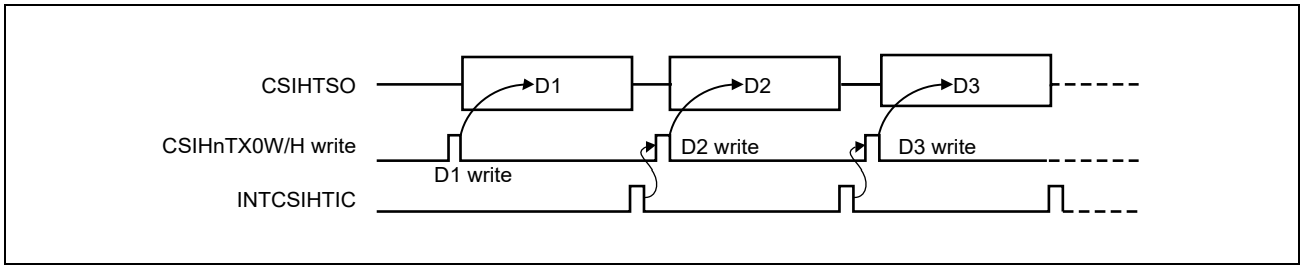

Figure 11.3 Generation of INTCSIHTIC after Transfer (CSIHnCTL1.CSIHnSLIT = 0)

If job mode is enabled (CSIHnCTL1.CSIHnJE = 1) and a job ends because data is sent with CSIHnTX0W.CSIHnEOJ = 1 and communication stop is requested (CSIHnCTL0.CSIHnJOBE = 1), then INTCSIHTIC is replaced by the job completion interrupt INTCSIHTIJC.

INTCSIHTIC can also be set up to occur as soon as the CSIHnTX0W/H register is free for the next data.

This is specified by setting CSIHnCTL1.CSIHnSLIT = 1.

The effect is illustrated in the figure below.

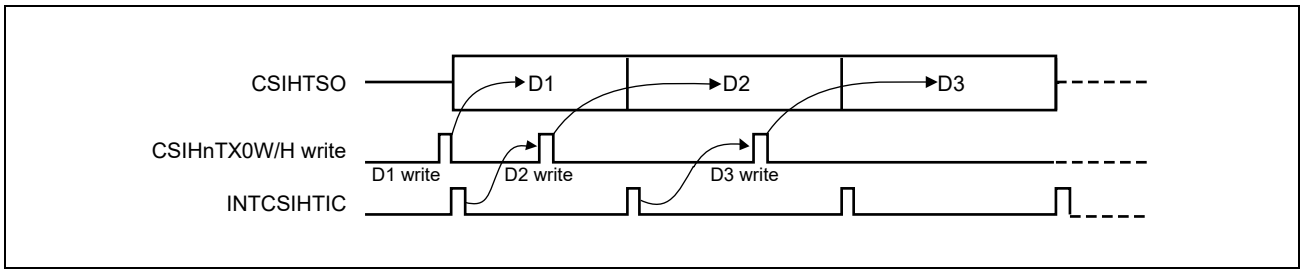

Figure 11.4 Immediate Generation of INTCSIHTIC (CSIHnCTL1.CSIHnSLIT = 1)

Thus, the new data can be written in advance.

NOTE

During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

11.4.3.2 INTCSIHTIC in FIFO mode

The example below shows the INTCSIHTIC behavior in FIFO mode.

The example assumes:

- Master mode
- FIFO mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

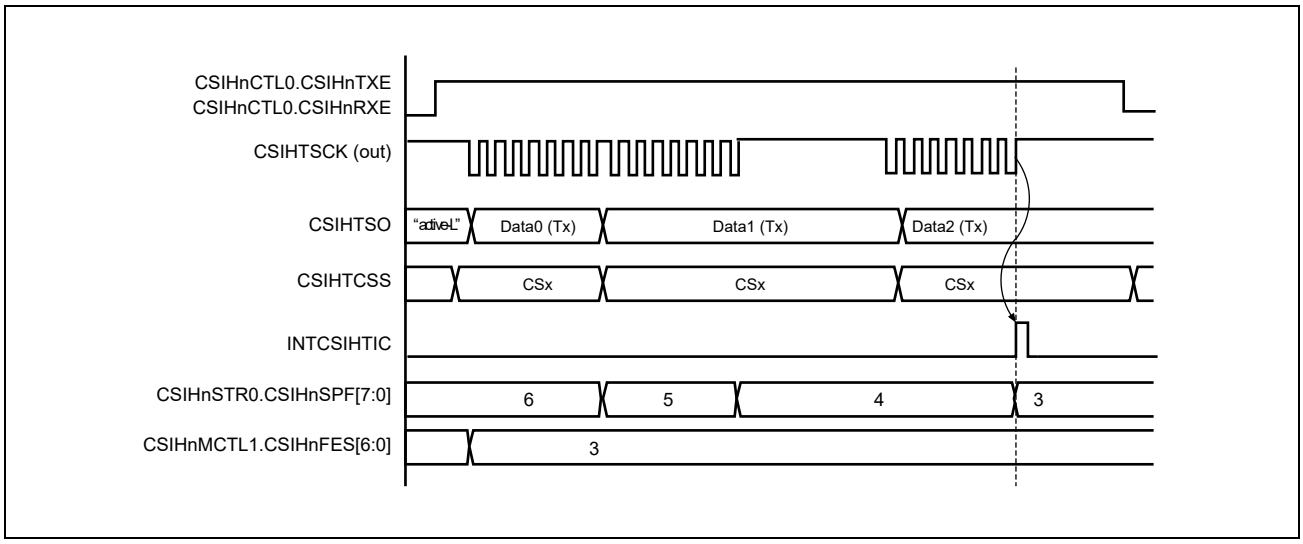

Figure 11.5 Generation of INTCSIHTIC in FIFO Memory Mode

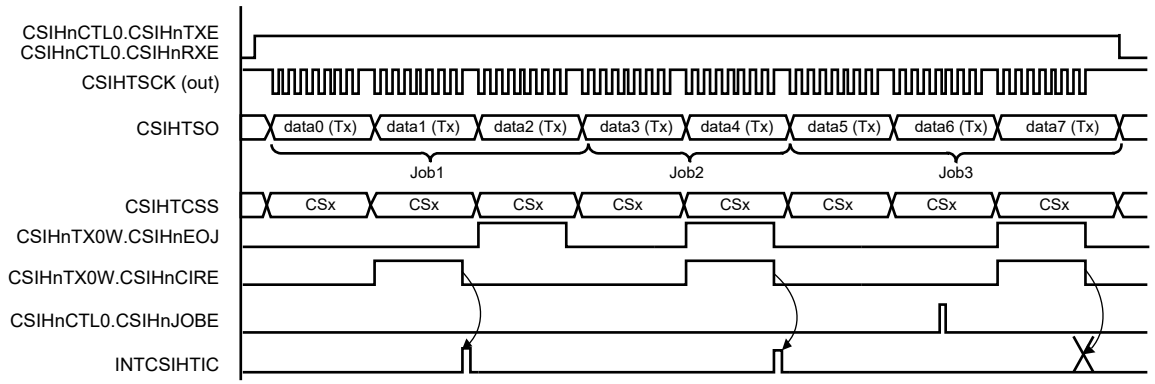

The condition for “FIFO empty” is specified in CSIHnMCTL1.CSIHnFES[6:0]. In the example of the diagram above, the number of unsent data in FIFO is set to 3. CSIHnSTR0.CSIHnSPF[7:0] indicates the number of unsent data. When both match, the interrupt INTCSIHTIC occurs.

11.4.3.3 INTCSIHTIC in job mode

The example below shows the INTCSIHTIC behavior in job mode.

The example assumes:

- Master mode
- Job mode enabled (CSIHnCTL1.CSIHnJE = 1)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

Note: CSx can be changed per data transfer.

Figure 11.6 Generation of INTCSIHTIC in Job Mode

The rules for generating INTCSIHTIC in job mode are shown in the following table.

Table 11.32 Generation of INTCSIHTIC in Job Mode

CSIHnTX0W. CSIHnEOJ	CSIHnTX0W. CSIHnCIRE	INTCSIHTIC
0	0	Not generated
0	1	Generated
1	0	Not generated
1	1	CSIHnCTL0.CSIHnJOBE = 0: Generated
		CSIHnCTL0.CSIHnJOBE = 1: Not generated, replaced by interrupt INTCSIHTIJC

11.4.4 INTCSIHTIR (Reception Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions below.

Table 11.33 INTCSIHTIR Interrupt Generation

Memory Mode	Cause of Interrupt	
	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	This interrupt occurs when CSIHnCTL0.CSIHnRXE is 1 and the FIFO buffer is almost full with received data, indicating to the application that the FIFO must be emptied. INTCSIHTIR is generated, if the number of received data in the FIFO (CSIHnSTR0.CSIHnSRP[7:0]) equals (128 – CSIHnMCTL1.CSIHnFFS[6:0]).	
Dual buffer	Generated when the communication has finished (as specified by the CSIHnMCTL2.CSIHnND[7:0] bit) and CSIHnCTL0.CSIHnRXE = 1.	Generated after every data transfer.
Transmit-only buffer, Direct access	Generated after every data transfer.	

11.4.4.1 INTCSIHTIR in direct access mode

The example below shows the INTCSIHTIR behavior in direct access mode.

The example below assumes

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

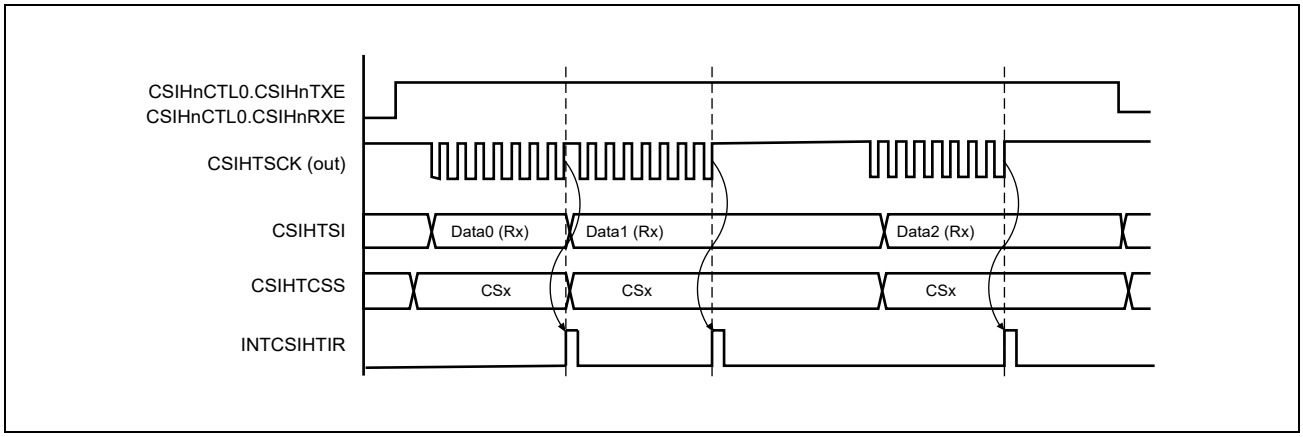

Figure 11.7 Generation of INTCSIHTIR in Direct Access Memory Mode

11.4.4.2 INTCSIHTIR in dual buffer mode

The example below shows the INTCSIHTIR behavior in dual buffer mode.

The example assumes:

- Master mode
- Dual buffer mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Default clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

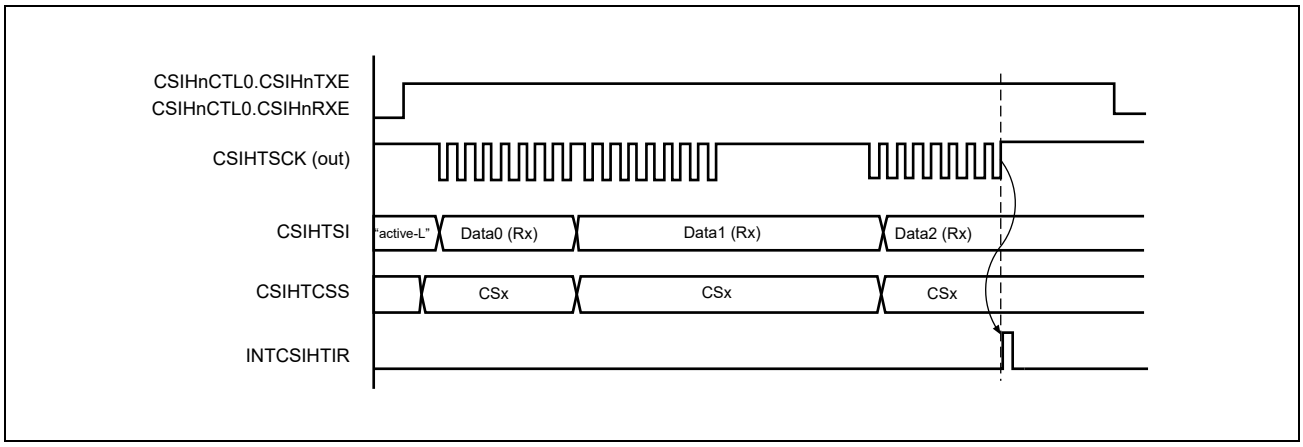

Figure 11.8 Generation of INTCSIHTIR in Dual Buffer Mode

11.4.5 IINTCSIHTIRE (Reception Error Interrupt)

This interrupt is generated whenever an error is detected.

For details about generation interruption timing, see **Section 11.4.18, Error Detection**.

Table 11.34 Data Error Types

Error Type	Communication Status after Communication Error Interrupt	Comment
FIFO overflow error	Interrupt is generated and communication continues	The data are not written to the FIFO buffer and the overflow of data is lost, but communications started before the error is continued.
Parity error	Interrupt is generated and communication continues.	—
Data consistency error	Interrupt is generated and communication continues.	—
Time-out error	Interrupt is generated and communication continues.	—
Overrun error	Condition for errors 1: In FIFO mode, when the number of received data is 0 and CPU reads the CSIHnRX0W/H register, an interrupt is generated and communication continues.	—
	Condition for errors 2: In slave mode, when CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled): (1) In direct access mode or transmit-only buffer mode, when reception is completed while the previous received data is remained in the CSIHnRX0W/H register, an interrupt is generated, and communication continues. (2) In FIFO mode, when reception by the FIFO buffer is completed and the buffer is in the full state, an interrupt is generated. Communication continues.	In slave mode, when CSIHnCTL1.CSIHnHSE = 1 (handshake function enabled), communication is suspended due to handshake, an overrun error is not generated.

The type of error that caused the generation of INTCSIHTIRE is flagged in register CSIHnSTR0.

Additionally a parity error flag and a data consistency error flag are attached to the received data in CSIHnRX0W.

For details about the various error types, see **Section 11.4.18, Error Detection**.

11.4.6 INTCSIHTIJC (Job Completion Interrupt)

This interrupt supports the handling of jobs, see **Section 11.4.9.3, Job Concept**. This interrupt is only available in master mode.

Job mode is enabled by setting CSIHnCTL1.CSIHnJE = 1. When CSIHnCTL1.CSIHnJE = 0, INTCSIHTIJC is not generated.

Depending on the memory mode, this interrupt is generated according to the condition shown in the following table.

Table 11.35 INTCSIHTIJC Interrupt Generation

Memory Mode	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	Not applicable	Indicates that the communication has stopped at the end of a job after a job abortion*1 was triggered. If FIFO empty is not detected and when CSIHnCIRE is 1, INTCSIHTIJC is generated.
Transmit-only buffer		Indicates that the communication has stopped at the end of a job after a job abortion*1 was triggered
Dual buffer		
Direct access		

Note 1. Job abortion condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1

11.4.7 Operating Modes (Master/Slave)

For a particular CSIH module, the master or slave mode determines the source of the serial clock.

11.4.7.1 Master mode

In master mode, the serial transmission clock is generated by the internal baud rate generator (BRG) and provided to the slave(s) by signal CSIHTSCK.

Master mode is enabled by setting CSIHnCTL2.CSIHnPRS[2:0] to any value other than 111_B. In master mode, the BRG frequency can be set by combining the CSIHnCTL2.CSIHnPRS[2:0] bits and the CSIHnBRSy.CSIHnBRS[11:0] bits.

(1) Chip select signals

In master mode, one or several chip select signals can be used. If several slaves are connected to the master, the chip select signals can be used to address one or several of the slaves. Only a selected slave is then enabled for communication.

The communication protocol as well as additional parameters are stored separately for each chip select signal. This makes it possible to adapt the data transfer individually to the requirements of each slave.

For details, see **Section 11.4.9, Chip Selection (CS) Features**.

(2) Clock default setting

The default level of CSIHTSCK depends on the CSIHTSCK clock inversion function bit: It is high when CSIHnCTL1.CSIHnCKR = 0, and is low when CSIHnCTL1.CSIHnCKR = 1.

The example below shows the communication in master mode for data length 8 bits, CSIHnCTL1.CSIHnCKR = 0, CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0, and MSB first:

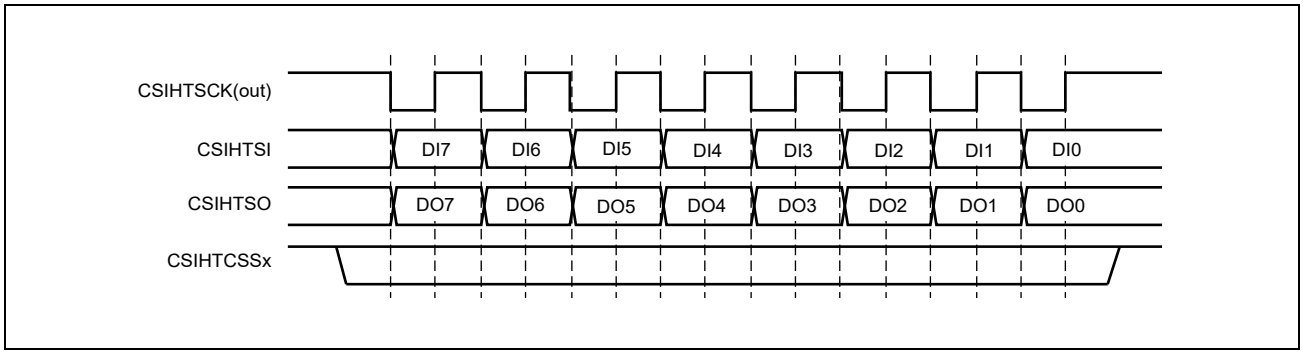

Figure 11.9 Transmission/Reception in Master Mode

11.4.7.2 Slave mode

In slave mode, another device is the communication master and provides the transmission clock. Send/receive operation normally starts as soon as a clock signal is detected.

Slave mode is selected by setting the CSIHnCTL2.CSIHnPRS[2:0] bits to 111_B.

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is enabled (setting of the CSIHnCFG1 to CSIHnCFG3 registers is disabled).

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock and data phase

NOTE

When using slave mode, disable the baud rate generator (BRG) by setting the CSIHnBRSy.CSIHnBRS[11:0] bits to 000_H. However, if you are using a time-out error, set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000_H.

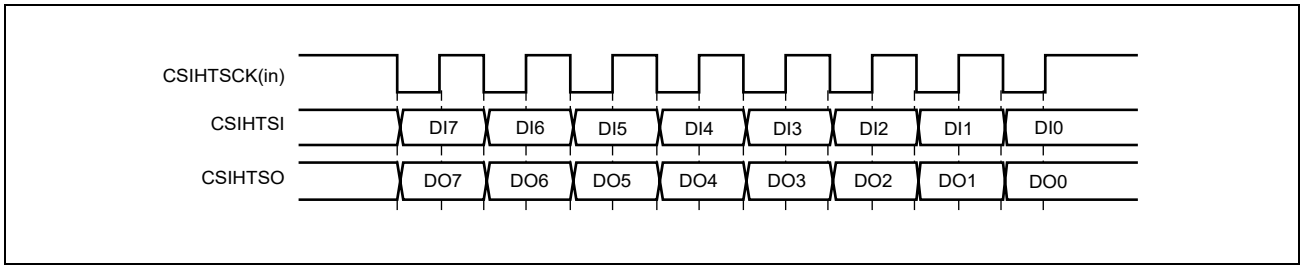

Figure 11.10 Transmission/Reception in Slave Mode

11.4.8 Master/Slave Connections

11.4.8.1 One master and one slave

The following figure illustrates the connections between one master and one slave.

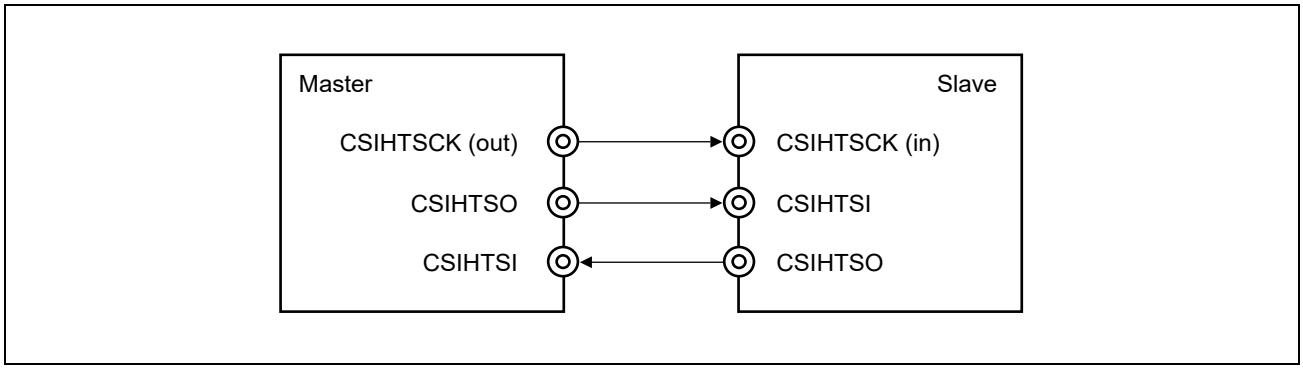

Figure 11.11 Direct Master/Slave Connection

11.4.8.2 One master and multiple slaves

The following figure illustrates the connections between one master and multiple slaves. In this example, the master provides one chip select (CS) signal to each of the slaves. This signal is connected to the slave select input $\overline{\text{CSIHTSSI}}$ of the slave.

The $\overline{\text{CSIHTSSI}}$ signal can be enabled or disabled by using the CSIHnCTL1.CSIHnSSE bit.

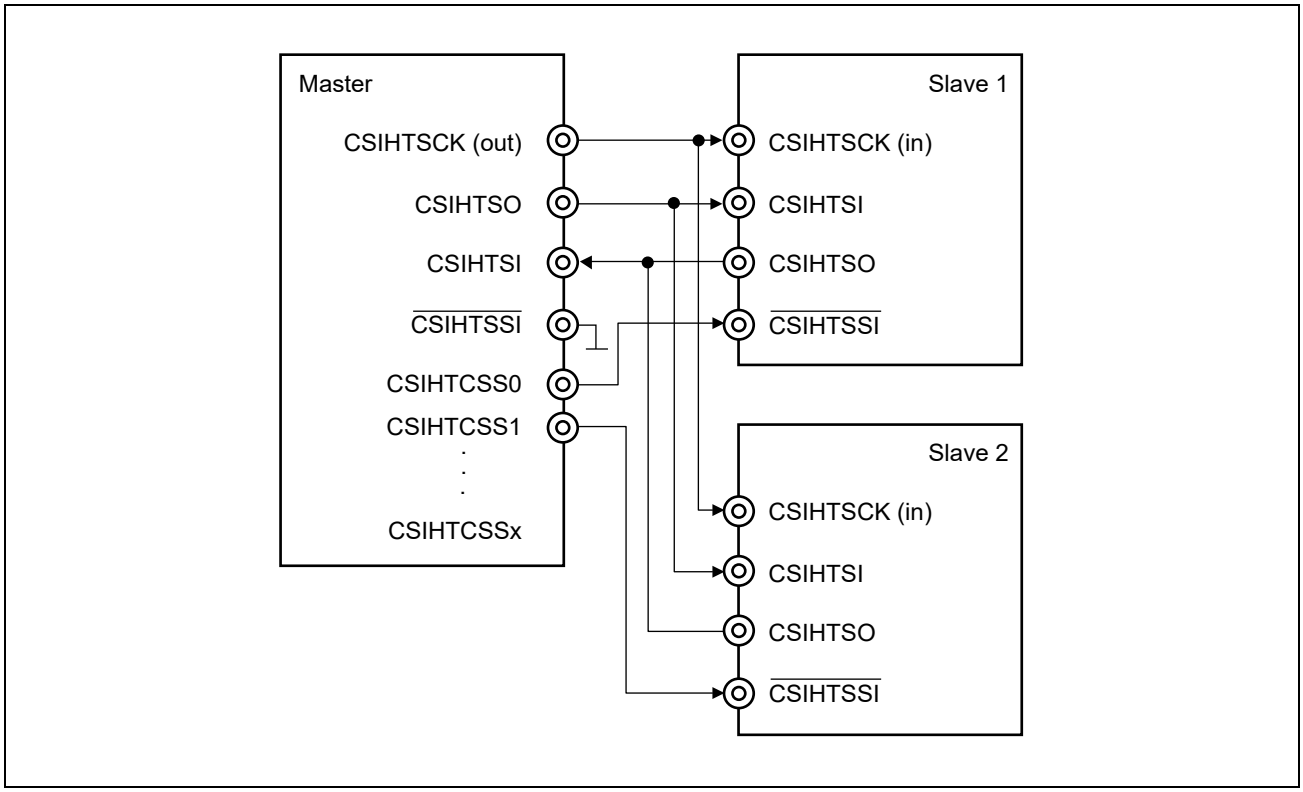

Figure 11.12 Master to Multiple Slaves Connection

By default, the chip select level is active low. That means, a slave is selected (enabled) as a CSIH slave when its $\overline{\text{CSIHTSSI}}$ signal has low level. However, to adapt the CS to other devices, the output level of each chip select signal can also be programmed to be active high.

If a slave is not selected, it will neither receive nor transmit data. In addition, its output CSIHTSO of a slave that is not selected is set to input mode in order to avoid interference with the output of another slave that was selected, in transmit-only mode or transmit/receive mode (CSIHnCTL0.CSIHnTXE = 1).

11.4.9 Chip Selection (CS) Features

The chip select signal, CSIHTCSSx can be used by the master to select one or several slaves for communication.

11.4.9.1 Configuration Registers

The parameters for each chip select signal CSIHTCSSx are defined in the corresponding configuration register CSIHnCFGx. The parameters include the communication protocol and additional CS parameters.

The communication protocol specifies:

- Data length: The number of bits to be sent or received. (CSIHnCFGx.CSIHnDLSx[3:0])
- Transfer direction: MSB or LSB first. (CSIHnCFGx.CSIHnDIRx)
- Parity usage: Odd, even, 0 parity or none. (CSIHnCFGx.CSIHnPSx[1:0])
- Clock phase and data phase: (CSIHnCFGx.CSIHnCKPx, CSIHnCFGx.CSIHnDAPx)

Additional parameters for each chip select signal that is only available in master mode are:

- Prescaler selection of the baud-rate generator separately for each chip select signal (CSIHnCFGx.CSIHnBRSSx[1:0])
- Chip select priority: Separates between “dominant” and “recessive” chip select signals. The priority applies if two or more chip selects signals with different configurations are simultaneously activated for message broadcasting. In this case, the configuration that is set as dominant is used. (CSIHnCFGx.CSIHnRCBx)

The principle is also called “Recessive Configuration for Broadcasting” (RCB).

CAUTION

It is forbidden to specify several chip select signals as dominant with different configurations unless all dominant chip selects have the same configuration.

- Chip select timing:
  - Setup time T_{setup}: The time from setting the CS signal active to starting data output. (CSIHnCFGx.CSIHnSPx[3:0])
  - Inter-data time T_{inter}: The time between one data and the next following data while the CS signal is active. (CSIHnCFGx.CSIHnINx[3:0])
  - Hold time T_{hold}: Hold time of CS signal active level before changing the CS signal. (CSIHnCFGx.CSIHnHDx[3:0])
  - Idle time T_{idle}: Inactive time after every data transfer is completed. (CSIHnCFGx.CSIHnIDx[2:0])

The CS timings of the setup time, the inter-data time, the hold time, and the idle time are illustrated in the figure below. When the CSIHnCFGx.CSIHnIDLx bit set to 1, idle time is inserted per transfer regardless of the CS signal.

Figure 11.13 provides an example when the default CSIHTCSS1 and CSIHTCSS2 signals are active low (CSIHnCTL1.CSIHnCSL1 bit = 0, CSIHnCTL1.CSIHnCSL2 bit = 0). The active level can be specified individually for each CS.

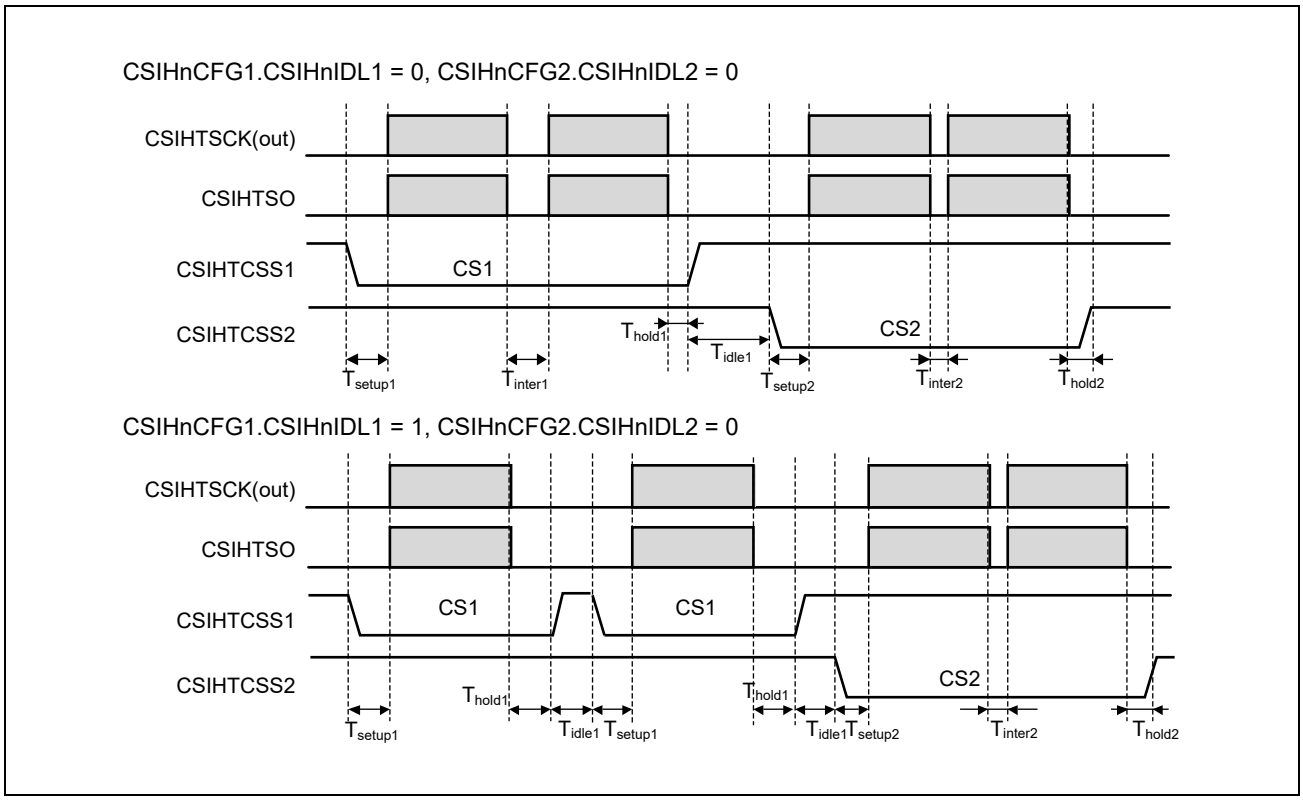

Figure 11.13 Chip Select Timings

Note that each CS signal can have a different value for setup, inter-data time, hold time, and idle time.

A particular chip select signal is activated by setting the appropriate bit in the transmission register CSIHnTX0W.CSIHnCSx.

CSIHnRX0W.CSIHnCSx in the reception register indicates the chip select signal associated with the received data.

CAUTION

If high priority communication function controlled by CPU is enabled (CSIHnCTL1.CSIHnPHE = 1), when mode is switched from low priority communication mode to high priority communication mode or from high priority communication mode to low priority communication mode, idle state is inserted regardless of the setting of the CSIHnCFGx.CSIHnIDLx bit.

11.4.9.2 CS Example

The following figure shows an example of two consecutive data transmissions.

The first communication uses CS0 to communicate with one single slave. The second enables CS0 and CS1 to broadcast a message to two slaves. The priority of CS0 is set to “recessive: low priority”, the priority of CS1 to “dominant: high priority”. Therefore, the second communication uses CS1 set in dominant to communicate.

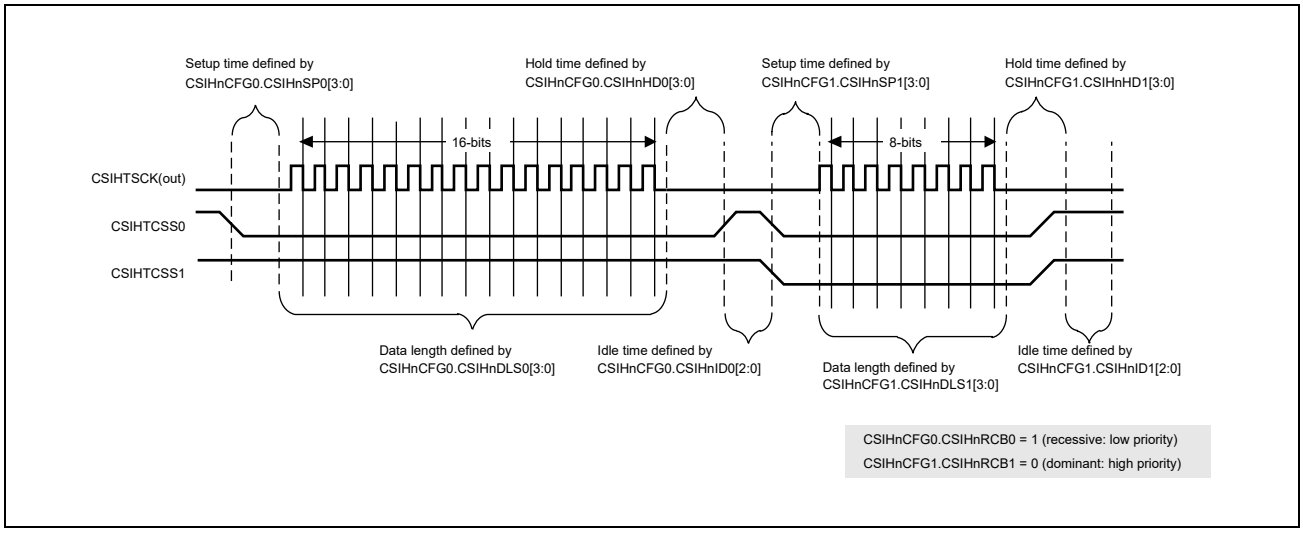

Figure 11.14 Chip Select and RCB Example

11.4.9.3 Job Concept

In terms of CSIH, a job consists of a number of data that are transferred.

Enabling job mode

The job mode can only be enabled in master mode. The job mode is enabled and disabled by CSIHnCTL1.CSIHnJE, while the CSIH is disabled by CSIHnCTL0.CSIHnPWR = 0.

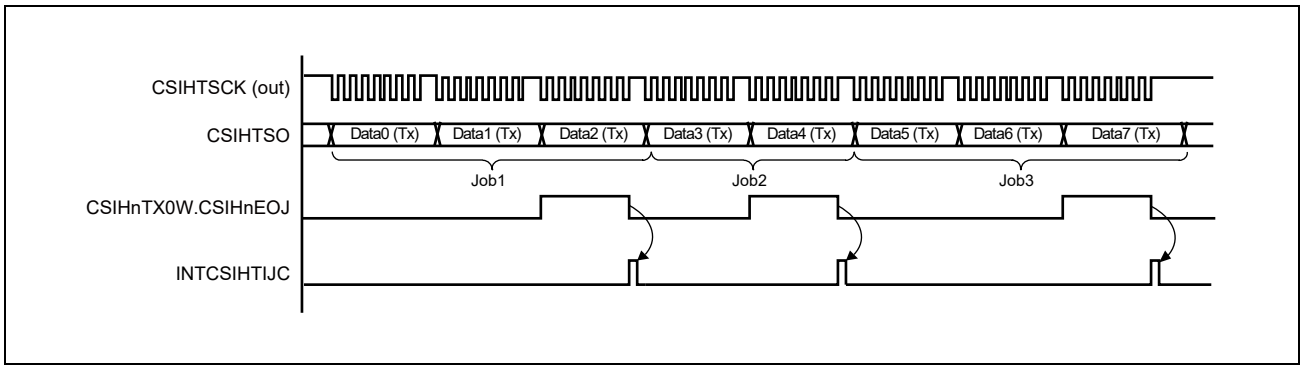

Figure 11.15 Job Examples

A job ends when data set with CSIHnTX0W.CSIHnEOJ = 1 is transmitted.

A communication stop can be specified to occur after a job has finished. This is done by setting CSIHnCTL0.CSIHnJOBE. When CSIHnJOBE is set, the communication continues until data is sent, for which the

CSIHnEOJ bit was set. After this data is sent, the communication is stopped and the interrupt INTCSIHTIJC is generated.

11.4.10 Chip Select Timing Details

11.4.10.1 Changing the Clock Phase

The serial clock level specified by CSIHnCFGx.CSIHnCKPx may be changed when communication is disabled. The minimum value of an idle time is one period of transmission clock (CSIHTSCK (out)).

If the idle time is set to 0.5 transmission clock periods (in CSIHnCFGx.CSIHnIDx[2:0]) and two consecutive data are sent with different CSIHnCFGx.CSIHnCKPx configuration, the idle time is extended to one period of CSIHTSCK (out).

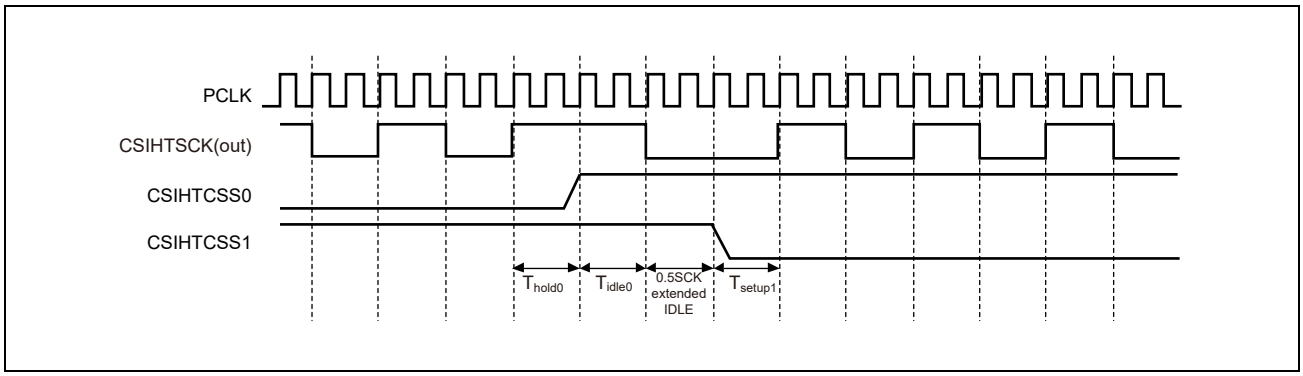

Figure 11.16 Clock Phase Timing
PCLK/4, T_{hold0} = T_{setup1} = 0.5CSIHTSCK, T_{idle0} = 0.5CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)

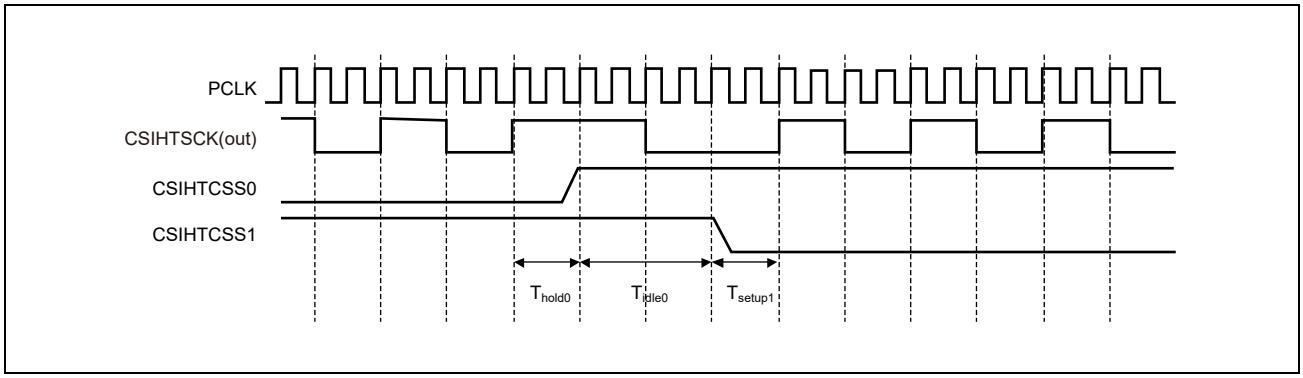

Figure 11.17 Clock Phase Timing
PCLK/4, T_{hold0} = T_{setup1} = 0.5CSIHTSCK, T_{idle0} = 1CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)

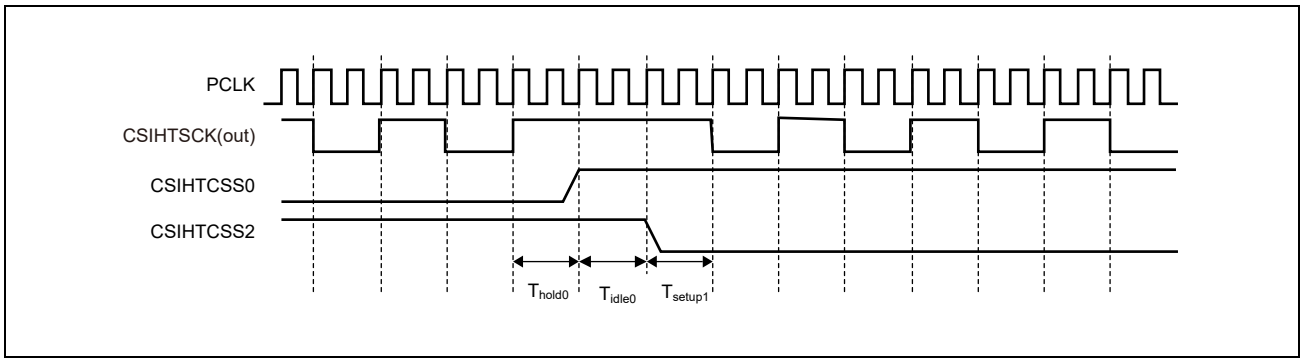

Figure 11.18 Clock Phase Timing
PCLK/4, $T_{hold0} = T_{setup1} = 0.5$CSIHTSCK, $T_{idle0} = 0.5$CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG2.CSIHnCKP2 = 0 (CSIHTCSS2)

11.4.10.2 Changing the Data Phase

The CSIHnCFGx.CSIHnDAPx bit defines the phase of the data bits relative to the clock.

The value of the CSIHnCFGx.CSIHnDAPx bit affects the hold and setup times as described below.

The hold time is the time from the last edge of the serial clock (CSIHTSCK) to the point where CSIHTCSSx goes to the inactive level regardless of the CSIHnCFGx.CSIHnDAPx bit setting.

The setup time is the time from the point where CSIHTCSSx goes to the active level until output of the data for transmission (CSIHTSO).

Therefore, timing of the output of the next edge of the serial clock (CSIHTSCK) varies by 0.5 CSIHTSCK according to the setting of CSIHnCFGx.CSIHnDAPx.

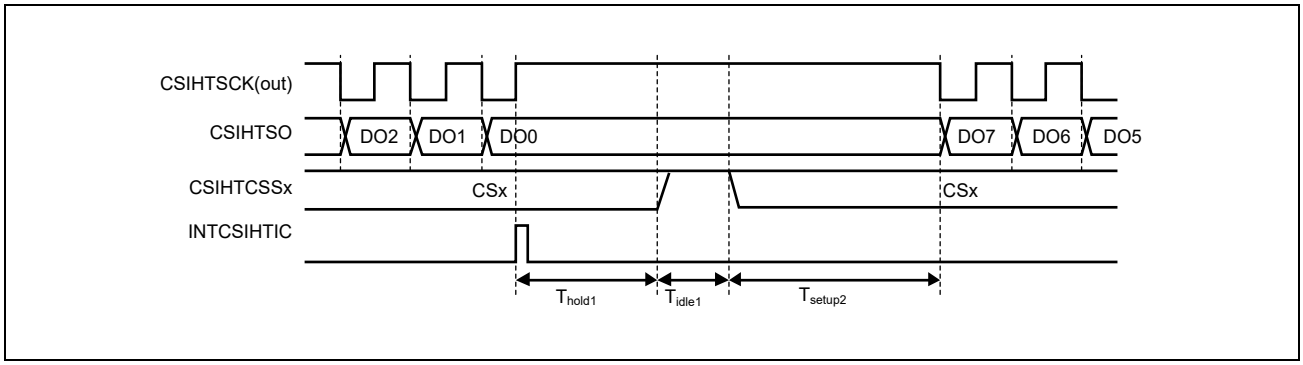

Figure 11.19 Data Phase Timing with
CSIHnCFG1.CSIHnCKP1 = 0, CSIHnCFG1.CSIHnDAP1 = 0 and
CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 0

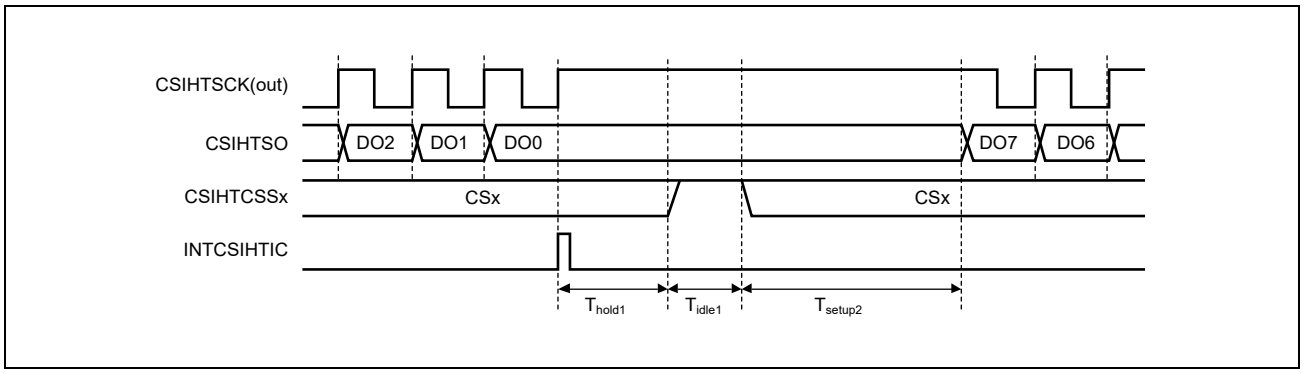

Figure 11.20 Data Phase Timing with
CSIHnCFG1.CSIHnCKP1 = 1, CSIHnCFG1.CSIHnDAP1 = 0 and
CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 1

11.4.11 Transmission clock selection

In master mode, the transfer clock frequency is selectable using the following bits:

- CSIHnCTL2.CSIHnPRS[2:0]
- CSIHnBRSy.CSIHnBRS[11:0]
- CSIHnCFGx.CSIHnBRSSx[1:0]

The transfer clock frequency of transmission clock CSIHTSCK is determined by the setting of the CSIHnCTL2.CSIHnPRS[2:0] bits and the setting of the CSIHnBRSy.CSIHnBRS[11:0] bits, but any one of CSIHnBRS3 to CSIHnBRS0 can be selected for each chip select signal with the CSIHnCFGx.CSIHnBRSSx[1:0] bits.

The following figure shows a block diagram of the baud-rate generator.

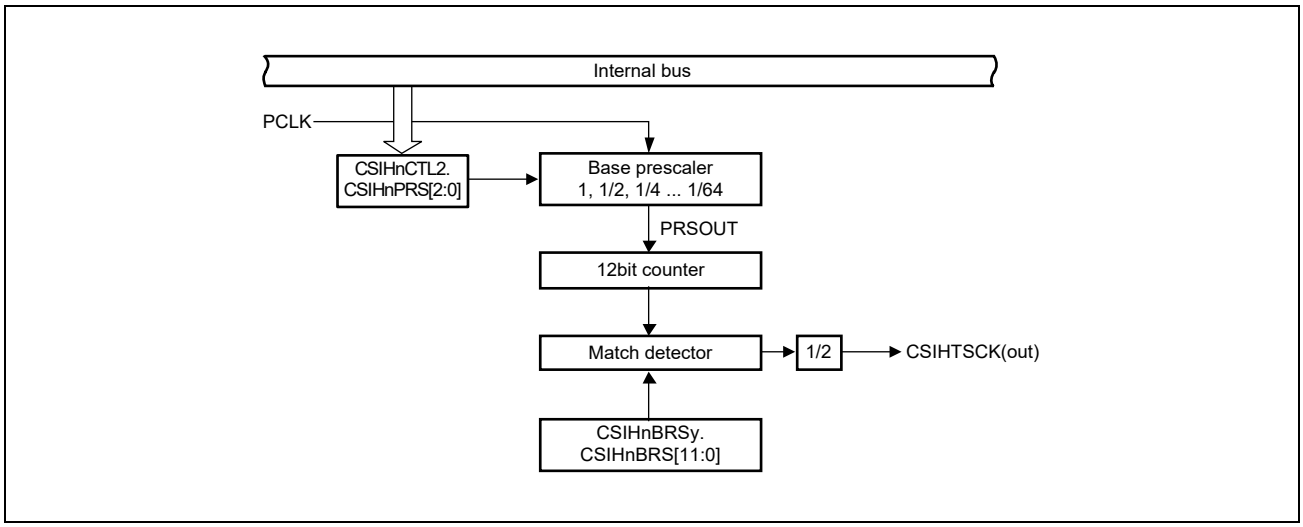

Figure 11.21 Baud Rate Generator Block Diagram

Setting CSIHnBRSy.CSIHnBRS[11:0] to 000_H disables the baud-rate generator, and thus all CSIHTSCK are stopped.

Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated as:

Transfer clock frequency (CSIHTSCK) = PCLK / (division ratio of PCLK) = PCLK / ($2^{\alpha} \times k \times 2$),

where

α = CSIHnCTL2.CSIHnPRS[2:0] = 0 to 6

k = CSIHnBRS0.CSIHnBRS0[11:0] = 1 to 4095 (when CSIHnCFGx.CSIHnBRSSx[1:0] = 0)
CSIHnBRS1.CSIHnBRS1[11:0] = 1 to 4095 (when CSIHnCFGx.CSIHnBRSSx[1:0] = 1)
CSIHnBRS2.CSIHnBRS2[11:0] = 1 to 4095 (when CSIHnCFGx.CSIHnBRSSx[1:0] = 2)
CSIHnBRS3.CSIHnBRS3[11:0] = 1 to 4095 (when CSIHnCFGx.CSIHnBRSSx[1:0] = 3)

Transfer clock frequency upper and lower limits

When setting the transfer clock frequency, please note:

- The minimum transfer clock frequency in both master and slave mode is PCLK / 524160.
- The maximum transfer clock frequency is as below:
  - In master mode: PCLK / 8
  - In slave mode: PCLK / 16

11.4.12 CSIH Buffer Memory

The CSIH has a configurable RAM that can be used for buffered I/O. The size is 128 words. One word is comprised of 32 bits data plus 7 bits ECC.

The following configurations are available:

Mode	CSIHnCTL0.CSIHnMBS	CSIHnMCTL0.CSIHnMMS[1:0]
FIFO mode	0	00_B
Dual buffer mode		01_B
Transmit-only buffer mode		10_B
Direct access mode	1	X

11.4.12.1 FIFO mode

In FIFO mode, data can be written to the CSIHnTX0W register without waiting for completion of the transmission, and data can be received without reading the CSIHnRX0W register immediately, provided the FIFO is not full.

Data to be transmitted is stored to the FIFO memory. Transmission and reception occur simultaneously – one data is sent, one data is received. That means, received data overwrites the transmitted data in the FIFO.

The CSIH automatically updates the respective FIFO memory pointers when a data is rewritten to, read from, sent to, or received from the FIFO memory:

Table 11.36 FIFO Mode

Pointer Description	Control Bit*1	Range
Number of unsent words	CSIHnSTR0.CSIHnSPF[7:0]	0 to 128
Number of words received and stored in the FIFO	CSIHnSTR0.CSIHnSRP[7:0]	0 to 128
Address of data to be written/read	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $01FC_H$
Address of received data to be read	CSIHnMRWP0.CSIHnRRA[6:0]	0000_H to $01FC_H$
Address to be sent	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $01FC_H$

Note 1. The value is automatically updated after each read/write or data transmit/receive operation.

The CSIH status register contains also two FIFO status flags:

- CSIHnSTR0.CSIHnFLF: FIFO full
- CSIHnSTR0.CSIHnEMF: FIFO empty

When this mode is started, bit CSIHnSTCR0.CSIHnPCT must be set. Only CSIHnSTR0.CSIHnEMF is set, but not reset.

All FIFO pointers and FIFO flags excluding CSIHnSTR0.CSIHnEMF are reset and CSIHnSTR0.CSIHnEMF is set.

11.4.12.2 Dual buffer mode

In this mode, the memory is divided into two parts of equal size – this means 64 words for transmit data and 64 words for received data. In dual buffer mode, the respective buffer pointers indicate the values shown in the following table.

Table 11.37 Dual Buffer Mode

Pointer Description	Pointer*1	Range
Address for data written to or read from the transmit buffer	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $00FC_H$
Address of data read from the receive buffer	CSIHnMRWP0.CSIHnRRA[6:0]	0000_H to $00FC_H$
The number of transmit data remained in the transmit buffer	CSIHnMCTL2.CSIHnND[7:0]	0 to 64
Address to which data is sent to	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $00FC_H$

Note 1. Both pointers are automatically incremented after each read/write.

11.4.12.3 Transmit-only buffer mode

In this mode, the entire memory is used to save transmission data.

Received data must be read directly from CSIHnRX0W/H.

In transmit-only buffer mode, the respective buffer pointer indicates the values shown in the following table.

Table 11.38 Transmit-only Buffer Mode

Pointer Description	Pointer*1	Range
Address for data written to or read from the transmit buffer	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $01FC_H$
The number of transmit data remained in the transmit buffer	CSIHnMCTL2.CSIHnND[7:0]	0 to 128
Address to which data is sent to	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $01FC_H$

Note 1. The pointers are automatically incremented after each read/write.

11.4.12.4 Direct access mode

In direct access mode, the CSIH memory is completely bypassed:

- Transmission data provided by the CPU to the transmission register CSIHnTX0W or CSIHnTX0H is directly copied to the shift register.
- Reception data is directly copied from the shift register to the reception register CSIHnRX0W or CSIHnRX0H.

11.4.13 Data Transfer Modes

11.4.13.1 Transmit-only mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 0 puts the CSIH in transmit-only mode. Start of transmission depends on the memory mode:

- In case of FIFO or direct access mode, transmission starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, transmission starts when the CSIHnMCTL2.CSIHnBTST bit is set.

11.4.13.2 Receive-only mode

Setting CSIHnCTL0.CSIHnTXE = 0 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in receive-only mode.

In master mode, start of reception depends on the memory mode:

- In case of FIFO or direct access mode, reception starts when dummy data is written in the CSIHnTX0W or CSIHnTX0H register.

In slave mode, reception starts as soon as the transmission clock CSIHTSCK from the master is received. It is not necessary to write data to the CSIHnTX0W or CSIHnTX0H register of the slave.

- In case of dual buffer mode or transmit-only buffer mode, reception starts when the CSIHnMCTL2.CSIHnBTST bit is set.

11.4.13.3 Transmit/receive mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in transmit/receive mode.

Start of communication (transmission and reception) depends on the memory mode:

- In case of FIFO or direct access mode, communication starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, communication starts when the CSIHnMCTL2.CSIHnBTST bit is set.

11.4.13.4 Summary

The following table summarizes this section. It shows how data transfer is started in the various memory, operating, and transfer modes.

Table 11.39 Start of Data Transfer

Memory and Operating Mode		Transfer Mode	
		Transmit-Only Transmit/Receive	Receive-Only
FIFO, direct access	Master	Writing to the CSIHnTX0W register or the CSIHnTX0H register	Writing to the CSIHnTX0W register or the CSIHnTX0H register
	Slave	Reception of clock from the master	Incoming clock from the master
Transmit-only buffer, dual buffer	Master	CSIHnMCTL2.CSIHnBTST = 1	CSIHnMCTL2.CSIHnBTST = 1
	Slave	Reception of clock from the master	Incoming clock from the master

11.4.14 Data Length Selection

11.4.14.1 Data length between 2 and 16 bits

The length of a data packet is selectable for each chip select signal from 2 to 16 bits by using CSIHnCFGx.CSIHnDLSx[3:0]. The examples below show the communication with MSB first (CSIHnCFGx.CSIHnDIRx = 0).

Data length = 16 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 0000_B)

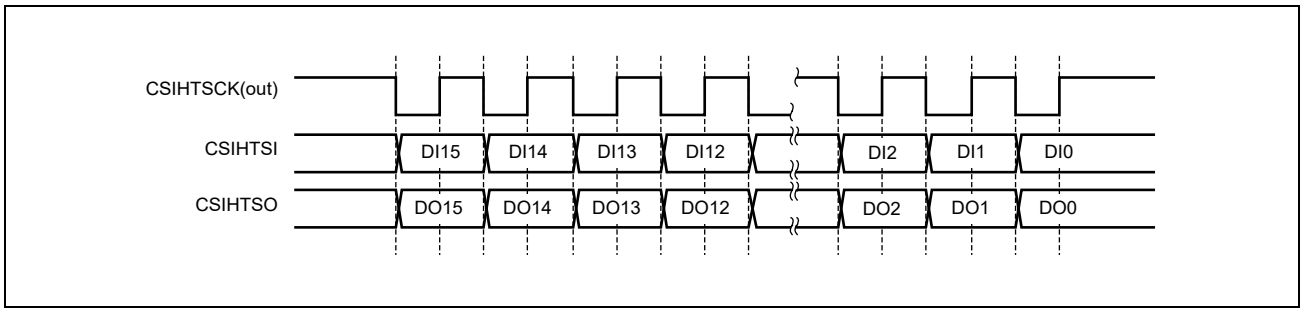

Figure 11.22 16 Bit Data Length, MSB First

Data length = 14 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1110_B)

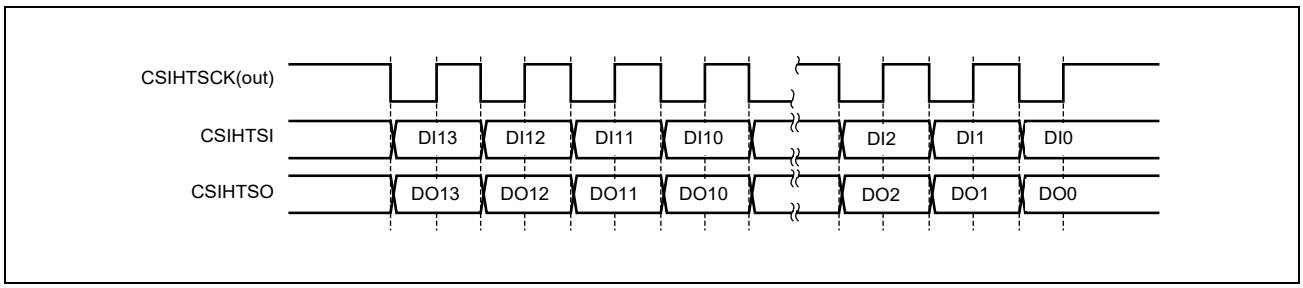

Figure 11.23 14 Bit Data Length, MSB First

11.4.14.2 Data length greater than 16 bits

If the data to be sent/received exceeds 16 bits, the extended data length (EDL) feature can be used.

EDL function is enabled by setting the CSIHnCTL1.CSIHnEDLE bit to 1.

EDL function works as follows:

- The data has to be broken into 16-bit blocks plus remainder. For example, 42-bit data would be broken into two 16-bit blocks plus 10 bits.
- The bit length of the remainder is set as “data length” in CSIHnCFGx.CSIHnDLSx[3:0].
- For transmitting the 16-bit blocks, CSIHnTX0W.CSIHnEDL must be set to 1. In this case, the data written to CSIHnTX0W is sent as a 16-bit data length regardless of the CSIHnCFGx.CSIHnDLSx[3:0] bit setting.
- The transfer is complete after a block with the specified data length (the remainder of data specified with CSIHnTX0W.CSIHnEDL = 0) has been sent.

Example

Example for sending 40-bit data ($123456789A_H$) to CS0:

40 bits are split into 2 to 16 bits plus 8 bits.

- Initialize CSIHnCFG0.CSIHnDLS0[3:0] = 8.
- To send $123456789A_H$with MSB first, write the following sequence to CSIHnTX0W:
  - $20FE\ 1234_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - $20FE\ 5678_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - $00FE\ 009A_H$ (CSIHnTX0W.CSIHnEDL = 0)

The following figure illustrates the timing.

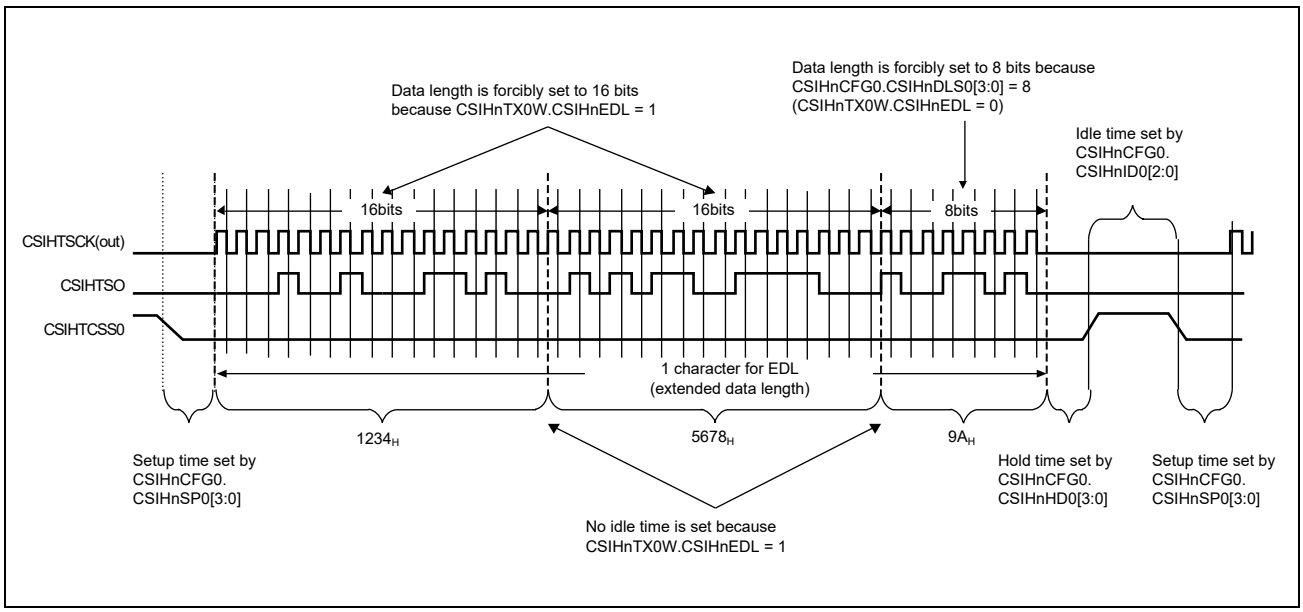

Figure 11.24 EDL Timing Diagram

NOTES

1. A data length of 1 bit can only be selected when EDL mode is in use.
2. It is not possible to send two consecutive data with a data length of less than 2 bits.
3. If parity is enabled, the parity bit is added after the last bit.
4. When extended data length (EDL) function is used, use the same chip selection signal.
5. To consider the data direction, pay attention to the following example:
   - Data to be sent: 12 3456_H
   - MSB first:
     Set CSIHnCFGx.CSIHnDIRx = 0
     Write CSIHnTX0W = 20FE 1234_H(EDL bit = 1)
     Write CSIHnTX0W = 00FE 0056_H(EDL bit = 0)
   - LSB first:
     Set CSIHnCFGx.CSIHnDIRx = 1
     Write CSIHnTX0W = 20FE 3456_H(EDL bit = 1)
     Write CSIHnTX0W = 00FE 0012_H(EDL bit = 0)
6. If CSIHnTX0W.CSIHnEOJ = 1 and CSIHnTX0W.CSIHnEDL = 1 are set simultaneously while CSIHnCTL1.CSIHnJE = 1 and CSIHnCTL1.CSIHnEDLE = 1, the behavior and performance are not guaranteed.
7. EDL mode cannot be used in receive-only mode of slave mode.(CSIHnCTL2.CSIHnPRS[2:0] = 111_B, CSIHnCTL0.CSIHnTXE = 0, CSIHnCTL0.CSIHnRXE = 1)

11.4.15 Serial Data Direction Selection

The serial data direction is selectable for each chip select signal by using the CSIHnDIRx bit in the CSIHnCFGx register.

The examples below show communication for a data length of 8 bit (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).

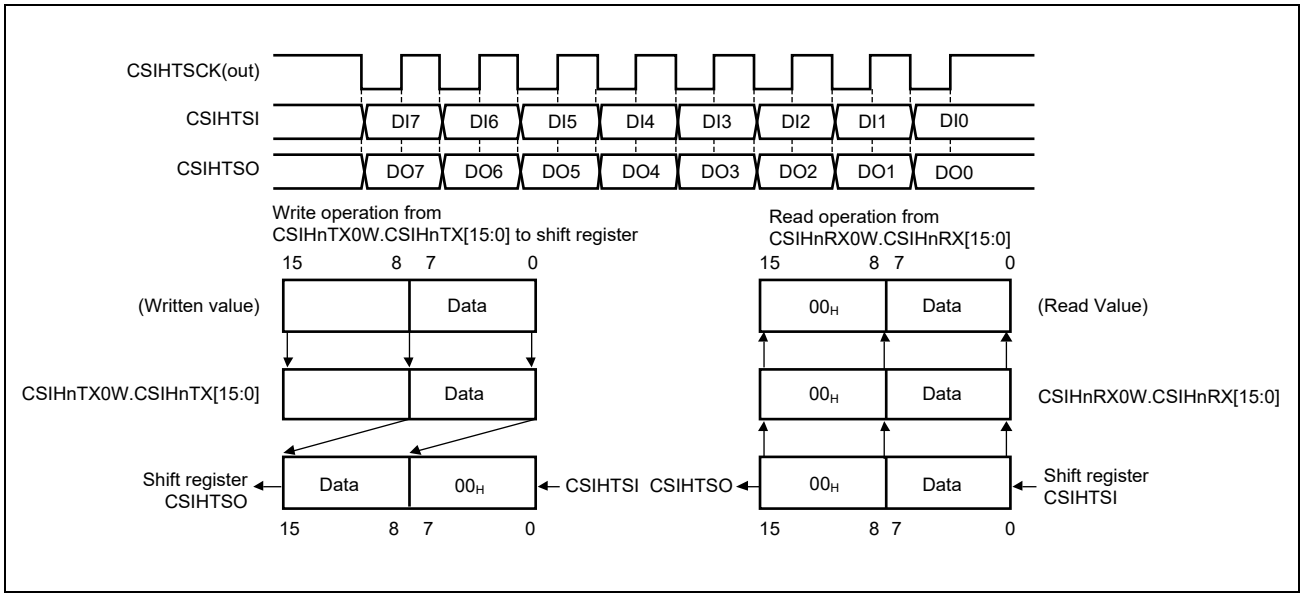

Figure 11.25 Serial Data Direction Select Function - MSB First (CSIHnDIRx = 0)

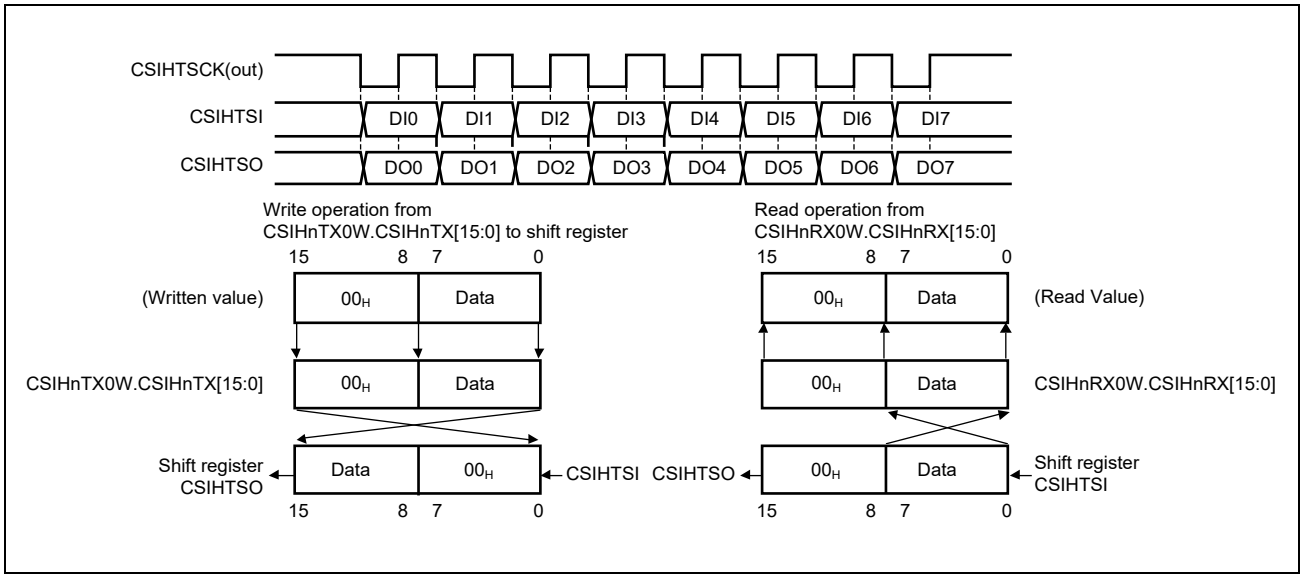

Figure 11.26 Serial Data Direction Select Function - LSB First (CSIHnDIRx = 1)

11.4.16 SS (Slave Select) Function

The SS function realizes communication between one master and multiple slaves.

In master mode, the master device outputs the slave select signal (CSIHTCSSx) to select a single slave. Communication by a device in slave mode is enabled when the slave input select signal ($\overline{\text{CSIHTSSI}}$) is at the low level.

Refer to the **Section 11.4.8, Master/Slave Connections**, for an example of a connection using the SS function.

11.4.16.1 Communication timing using SS function

The following figure illustrates the communication signal using the SS function and timings. In slave mode, the data transfer configuration is determined by the CSIHnCFG0 register.

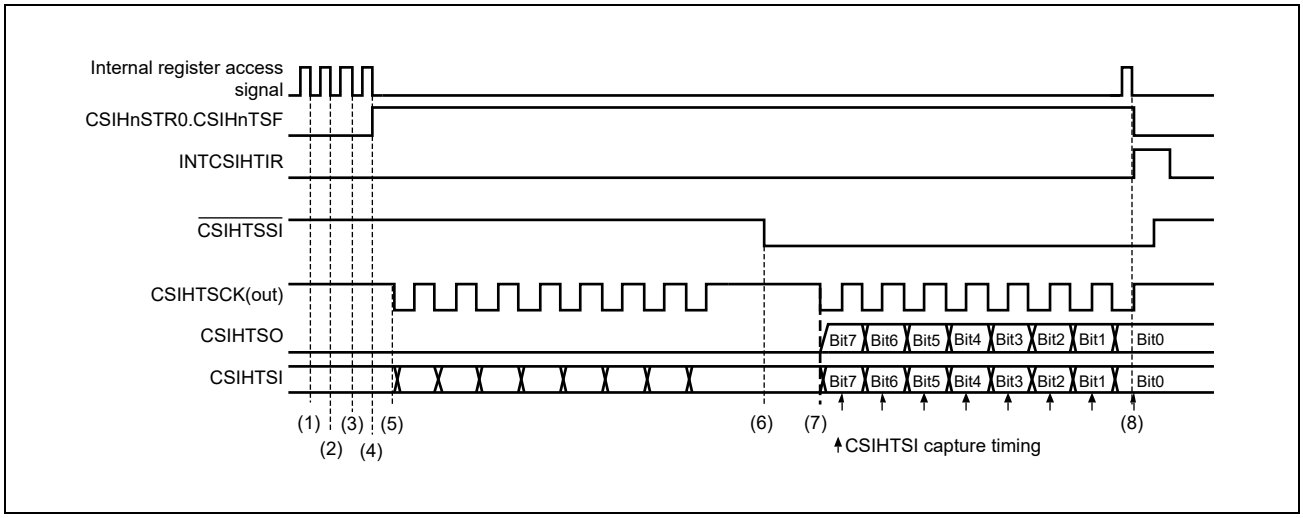

Figure 11.27 Tx/Rx Timing of Communication Using SS Function

(1) CSIH is put into slave mode by setting CSIHnCTL2.CSIHnPRS[2:0] = 111_B. CSIHnCFG0.CSIHnCKP0 and CSIHnCFG0.CSIHnDAP0 are 0.

(2) The data length is 8 bits (CSIHnCFG0.CSIHnDLS0[3:0] = 1000_B). The data direction is MSB first (CSIHnCFG0.CSIHnDIR0 = 0).

(3) The transmit/receive mode is set (CSIHnCTL0.CSIHnTXE = 1, CSIHnCTL0.CSIHnRXE = 1, CSIHnCTL0.CSIHnPWR = 1). Communication start is permitted.

(4) The transfer status flag CSIHnSTR0.CSIHnTSF is automatically set when transfer data is written to the CSIHnTX0W or CSIHnTX0H transmission register during direct access mode or FIFO mode.

(5) As long as signal $\overline{\text{CSIHTSSI}}$ is high, transmission/reception is not started, even if an external transmission clock CSIHTSCK is applied. Input at CSIHTSI is ignored.

(6) When $\overline{\text{CSIHTSSI}}$ falls to low level, indicating that CSIHTSO is enabled, transmission is enabled.

(7) Now, as soon as the external clock signal CSIHTSCK appears, the slave transmits data to CSIHTSO and simultaneously captures data from CSIHTSI.

(8) Interrupt INTCSIHTIR indicates when the reception is complete. The CSIHnRX0W/H register can be read.

11.4.16.2 CSIHTSSO operation

CSIHnPWR	CSIHnTXE	CSIHnRXE	CSIHnSSE	CSIHTSSO
0	—	—	—	H
1	—	—	0	H
	0		1	H
	1		1	Reversed value of $\overline{\text{CSIHTSSI}}$ level

The CSIHTSSO pin is a signal to control the I/O function of the chip's SO pin in case of using the SS function.

The CSIHTSO pin is enabled when the CSIHTSSO pin is "High" (the chip's SO pin is being driven).

The CSIHTSO pin is disabled when the CSIHTSSO pin is "Low" (the chip's SO pin is not being driven).

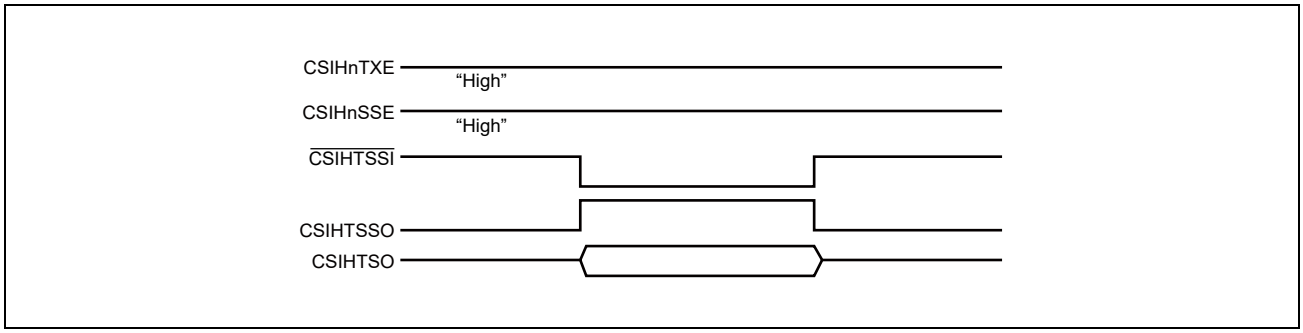

Figure 11.28 Operation of CSIHTSSO

CAUTION

If $\overline{\text{CSIHTSSI}}$ pin is changed during communication (CSIHnSTR0.CSIHnTSF = 1), current communication is not assured.

11.4.17 Handshake Function

CSIH features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by the CSIHnCTL1.CSIHnHSE bit. For handshake, the signals CSIHTRYI and CSIHTRYO are used.

The busy timing depends on the data phase selection bit CSIHnCFGx.CSIHnDAPx.

11.4.17.1 Slave mode

When CSIHnCTL1.CSIHnHSE = 1 and the slave is busy, the CSIHTRYO signal outputs low level.

This can happen in two cases:

1. When the next data to be sent is not ready:
   When the slave is in transmit-only mode or transmit/receive mode (CSIHnCTL0.CSIHnTXE = 1) and is in the states listed below, the CSIHTRYO output indicates the busy state (is at the low level).

Table 11.40 Memory Mode and Slave Transfer State

Memory Mode	Transmission State of Slave
Direct access mode	No data for the next transfer
FIFO mode	No data for the next transfer (CSIHnSTR0.CSIHnEMF = 1)
Dual buffer mode	When CSIHnMCTL2.CSIHnBTST is not set to 1
Transmit-only buffer mode	

The example below is on the assumption of an eight-bit data length.

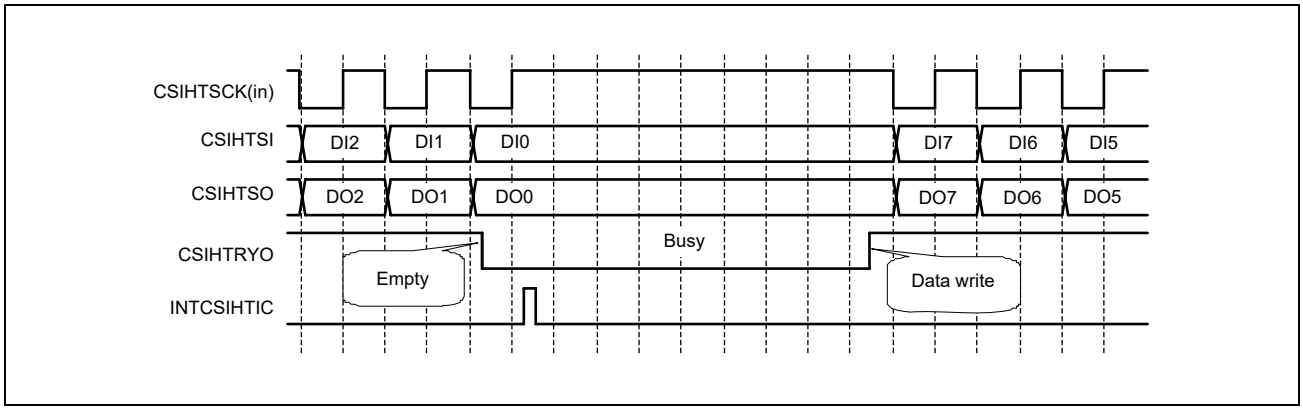

Figure 11.29 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 0)

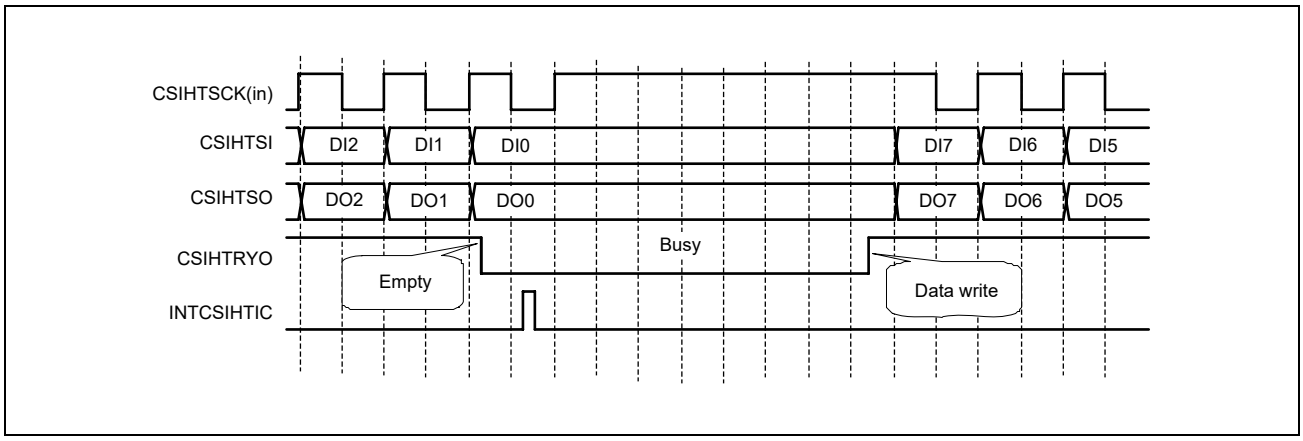

Figure 11.30 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 1)

2. When transmit register is full:
   When slave is set in receive-only mode or transmit/receive mode (CSIHnCTL0.CSIHnRXE = 1), and new data cannot be copied from a shift register to CSIHnRX0W/H (CSIHnRX0W/H is full) because the previously received data is still in the CSIHnRX0W/H register. When CSIHnCTL0.CSIHnRXE is 1 and is in the following states, CSIHTRYO outputs busy state (low level).

Table 11.41 Memory Mode and Slave Transfer State

Memory Mode	Transmission State of Slave
Direct access mode	When CSIHnRX0W or CSIHnRX0H is full
FIFO mode	Receive data remains in the buffer (when CSIHnSTR0.CSIHnFLF = 1)
Dual buffer mode	No applicable state
Transmit-only buffer mode	When CSIHnRX0W or CSIHnRX0H is full

The example below is on the assumption of an eight-bit data length.

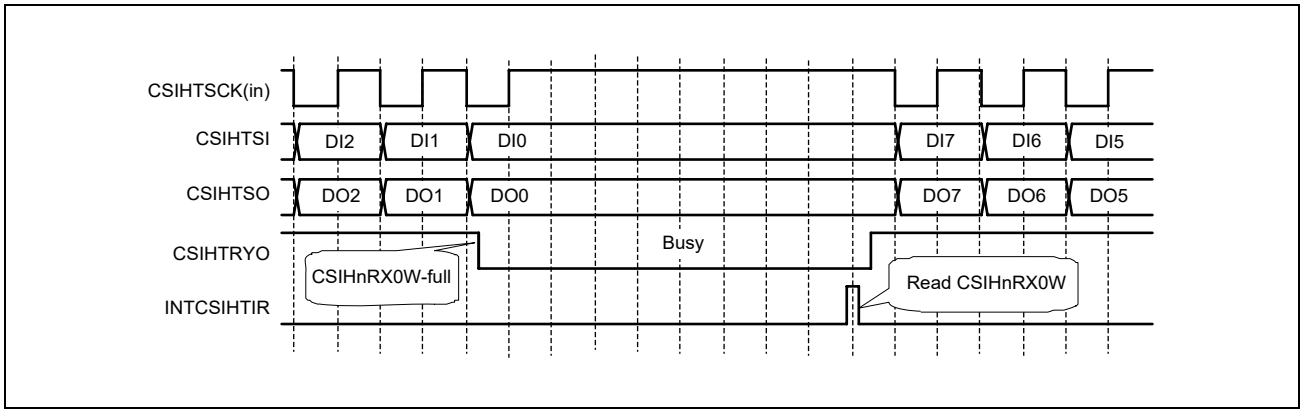

Figure 11.31 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 0)

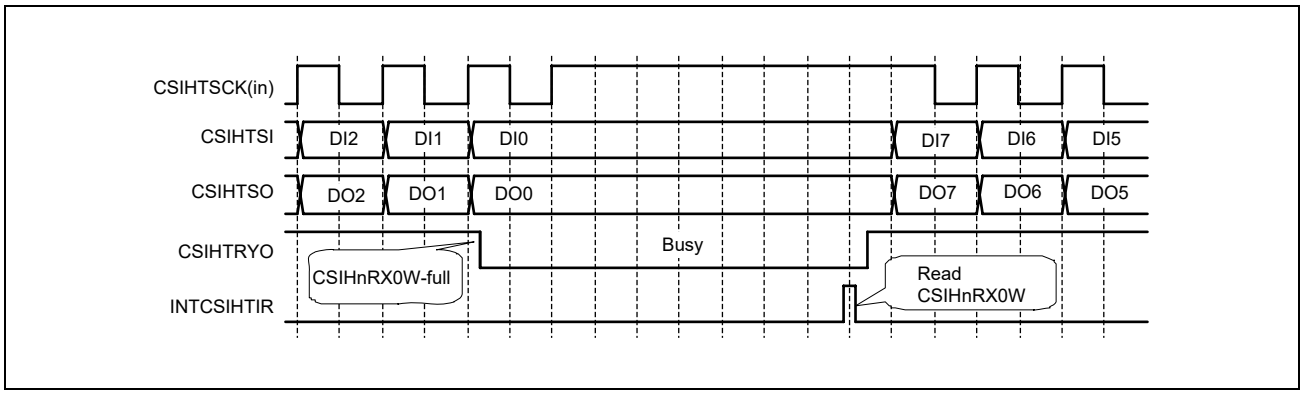

Figure 11.32 Busy Signal from the Slave (CSIHnCFGx.CSIHnDAPx = 1)

11.4.17.2 Master mode

When the master detects CSIHTRYI = 0 while CSIHnCTL1.CSIHnHSE = 1, the following transfer is put on hold, and the master goes into wait status. It suspends the CSIHTSCK clock.

The CSIHTRYI level is checked at each half clock cycle of CSIHTSCK.

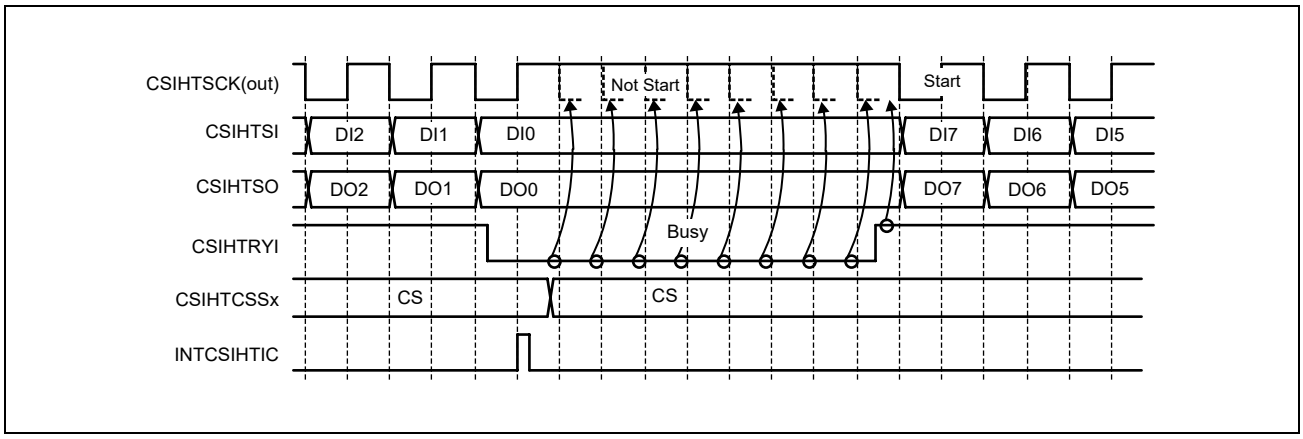

Figure 11.33 Master's Reaction on CSIHTSHSG (CSIHnCFGx.CSIHnDAPx = 0)

The CSIHTRYI signal must be pulled down by the slave before the next transfer starts. If this is done on the slave while data transfer is in progress, the serial clock from the master is suspended after the transfer is complete.

The master resumes the communication as soon as CSIHTRYI becomes high level (the slave is "ready").

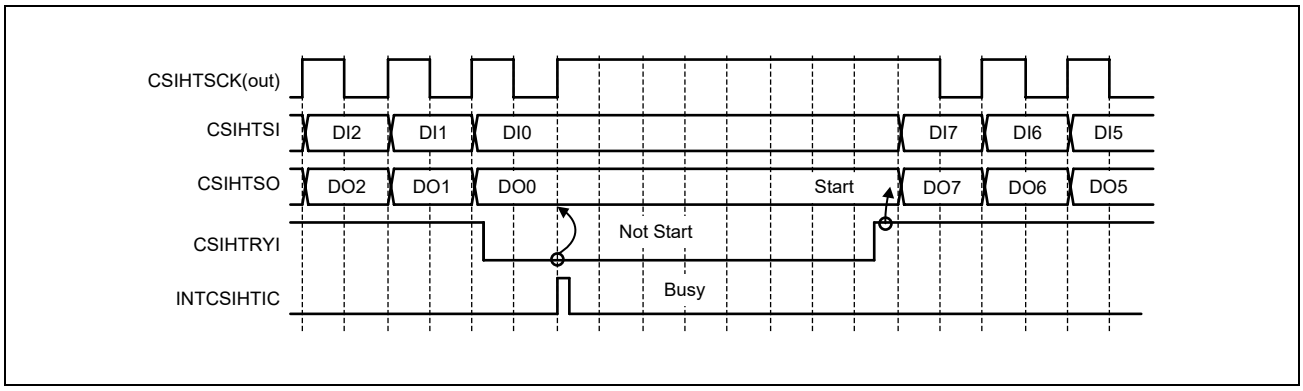

Figure 11.34 Master's Reaction on CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 1)

CAUTIONS

1. If multiple slaves are connected, the master must only detect the CSIHTRYI signal from the slave it has selected for communication.
2. Even when the CSIHTRYI pin of the master detects a CSIHTRYO signal from the slave during data transfer, the communication is not made to wait but continues until the data transfer is completed.

11.4.18 Error Detection

CSIH can detect five error types:

- Data consistency error (transmission data)
- Parity error (received data)
- Overrun error (received data)
- Time-out error (in FIFO mode)
- Overflow error (in FIFO mode)

Check for parity, data consistency and time-out errors can be enabled/disabled individually.

If one of these errors is detected, the interrupt request, INTCSIHTIRE is generated and the corresponding flags are set.

11.4.18.1 Data consistency check

The purpose of the data consistency check is to ensure that the data physically sent as output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIHnCTL1.CSIHnDCS bit. When checking data consistency, always set the PIPCn.PIPCn_m to 1. It is not active if data transmission is disabled (CSIHnCTL0.CSIHnTXE = 0).

When the data consistency check is active, the data transferred from CSIHnTX0W or CSIHnTX0H to the shift register is copied to a separate register.

After completion of the transmission, the sent data is compared with the original transmission data.

Mismatch is considered as a data consistency error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnDCE bit is set.

Additionally, CSIHnRX0W.CSIHnTDCE of data that contains the error is set.

The data consistency check function is illustrated in the following block diagram.

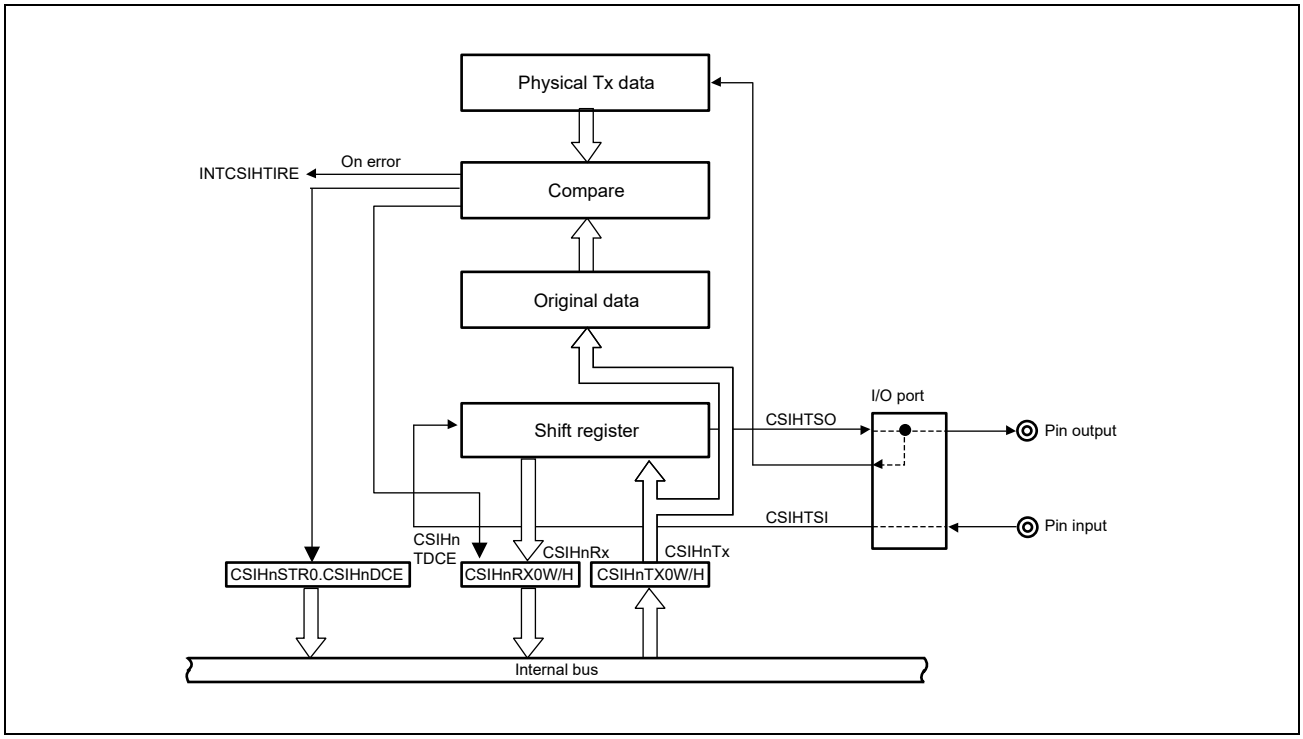

Figure 11.35 Data Consistency Check Functional Block Diagram

11.4.18.2 Parity check

CSIH can append a parity bit to the last data bit (even if extended data length is used). The use and type of parity is specified in CSIHnCFGx.CSIHnPSx[1:0].

Parity check is enabled if CSIHnCFGx.CSIHnPSx[1] = 1.

The parity bit is checked after a reception is complete. In case of parity error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnPE bit is set.

Additionally, CSIHnRX0W.CSIHnRPE of data that contains the error is set. The figure below shows an example.

- Data length is 8 bits.
- The data to be transmitted is 05_H and 35_H.
- Data direction is LSB first.
- Parity type is odd.

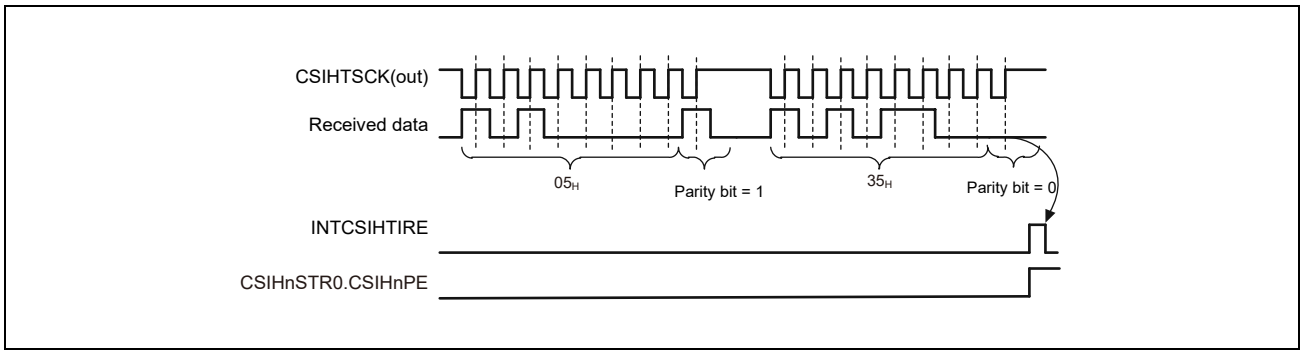

Figure 11.36 Parity Check Example

The parity bit of the first data is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

The parity bit of the second data is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last bit of the data.

11.4.18.3 Time-out error

Time-out errors can be checked only in slave FIFO mode.

This error occurs if neither of the following occurred within a certain period of time:

- Received data in FIFO is read
- FIFO receives data from CSIHTSI

The time is defined in CSIHnMCTL0.CSIHnTO[4:0] in multiples of 8 times the transmission clock, CSIHTSCK. A time-out error occurs when the specified time is exceeded (The time-out time is not detected when CSIHnMCTL0.CSIHnTO[4:0] = 00000_B).

A dedicated time-out counter measures the time between the last and the next read operation.

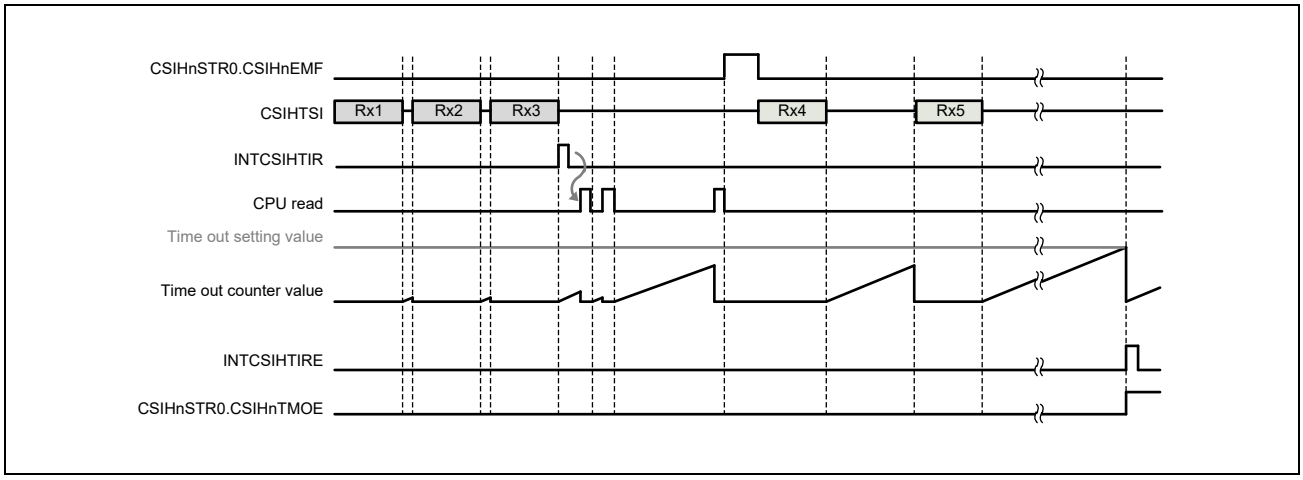

Figure 11.37 Time-Out Check Functional Timing Diagram

The start timing of the time-out counter is as follows:

- When reception is completed
- When data read from the CPU completes (The counter does not start if the buffer is empty.)
- When a time-out error is detected

After a time-out error is detected, if data is still available in FIFO, the time-out counter restarts.

If the value set by bit CSIHnMCTL0.CSIHnTO[4:0] is reached again, the INTCSIHTIRE interrupt is output again.

The timeout counter continues to count until received data is read. To stop the counter, read all received data or set CSIHnSTCR0.CSIHnPCT to 1. Note that the pointer is cleared if you perform the latter.

The counter is reset at the following timing:

- Data is read once.
- New data is received.
- A timeout error is detected.
- The CSIHnSTCR0.CSIHnPCT bit is set to 1.

If a timeout error occurs, the following occurs:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnTMOE bit is set.

The dedicated time-out counter is set by the CSIHnCTL2.CSIHnPRS[2:0] and CSIHnBRSy.CSIHnBRS[11:0] bits. If the value of the CSIHnBRSy.CSIHnBRS[11:0] bits is left as 000_H, the dedicated time-out counter does not operate.

11.4.18.4 Overflow error

An overflow error can happen in FIFO mode. It occurs when transmission data is written to the CSIHnTX0W register while the FIFO buffer is filled with received data.

Example

100 data have been transmitted. That means, the FIFO contains 100 received data. The application starts to read the received data.

While the read operation is in progress, the application begins to write another set of 50 transmission data to the FIFO. However, only 10 received data have been read up to now, 90 are still in the FIFO.

In this case, only 38 cells are available for new transmission data packets. When the CPU tries to write the 39th data, an overflow error happens.

This is illustrated in the following figure.

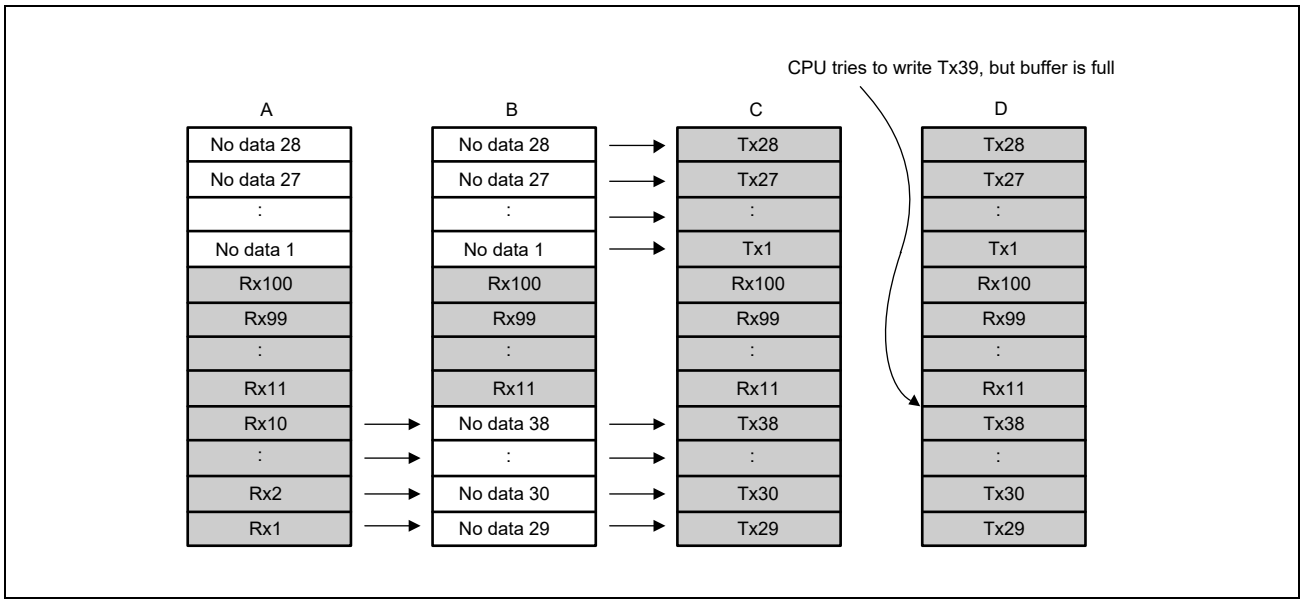

Figure 11.38 FIFO Overview

The data after 39 are discarded. The figure below shows the overflow timing.

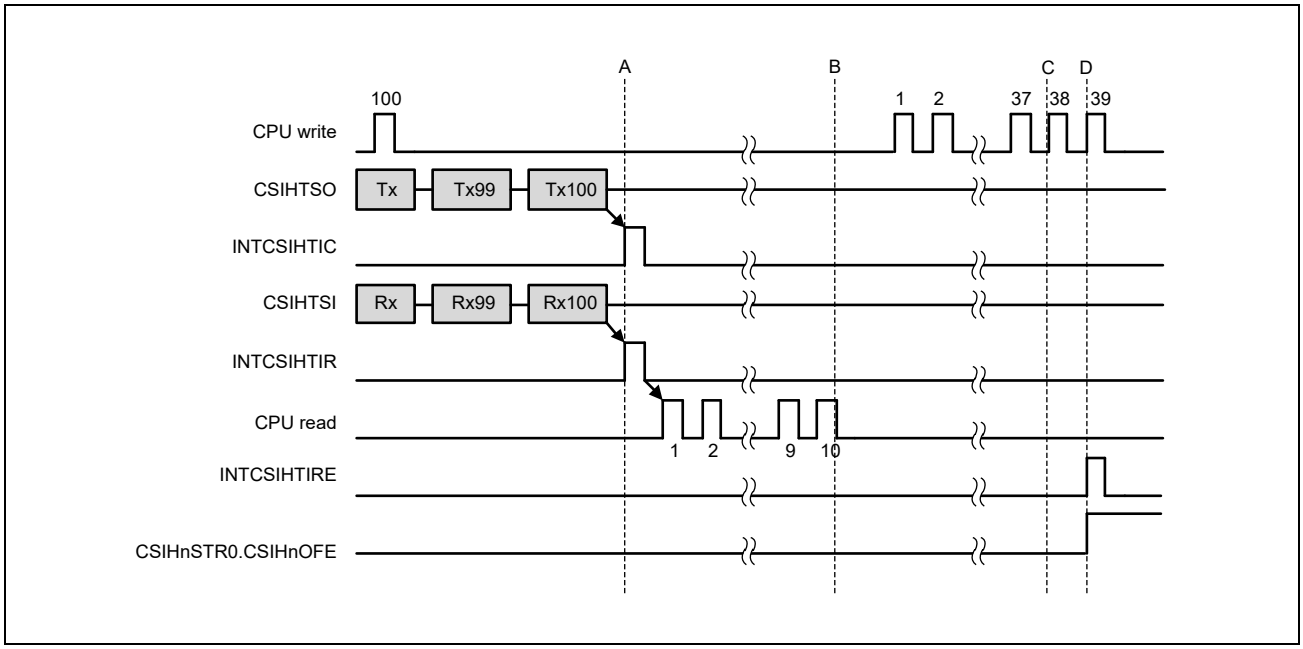

Figure 11.39 FIFO Overflow Timing

In case of overflow error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnOFE bit is set.

11.4.18.5 Overrun error

An overrun error can happen in direct access, transmit-only buffer, and FIFO modes. It cannot happen in dual buffer mode. The overrun error is not generated if data reception is disabled (CSIHnCTL0.CSIHnRXE = 0).

There are two conditions for overrun errors.

Condition for errors 1

- In FIFO mode, while the number of received data is 0 and CPU reads the CSIHnRX0W/H register

Condition for errors 2

- In slave mode, when CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled):
  - In direct access mode or transmit-only buffer mode, when reception is completed while the previous received data is remained in the CSIHnRX0W/H register.
  - In FIFO mode, when FIFO buffer completes receiving data in the full state.

(1) Direct access/transmit-only buffer

In direct access and transmit-only buffer mode, this error occurs when newly received data cannot be transferred from the shift register to the reception register CSIHnRX0W/H. This happens when CSIHnRX0W/H was not read and therefore contains previous reception data.

The following figure illustrates the function.

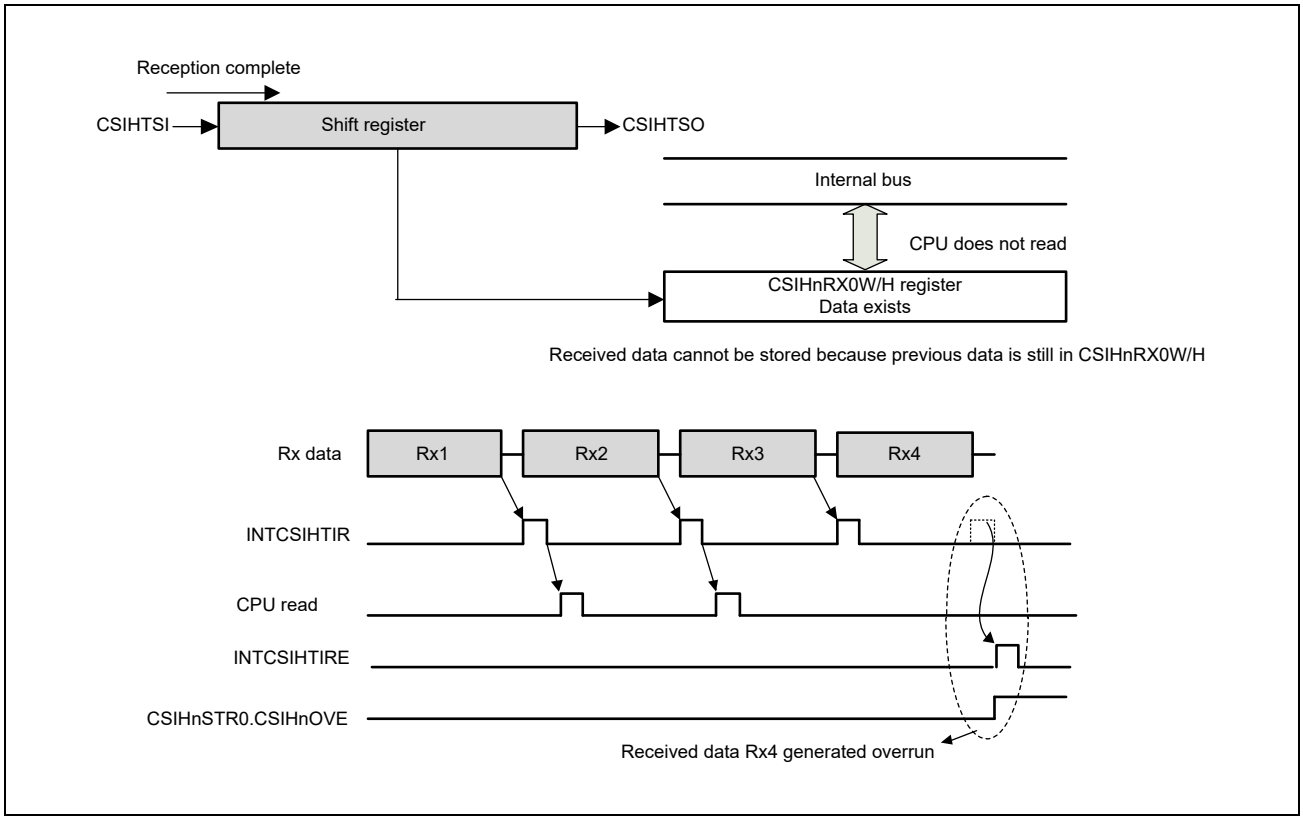

Figure 11.40 Overrun Error Detection in Direct Access and Transmit-only Buffer Mode

NOTE

An overrun error can be avoided in slave mode by using the handshake function.

When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver has read its reception register and is ready again.

(2) FIFO mode

In FIFO mode, this error occurs if:

1. Newly received data cannot be transferred from the shift register to the FIFO because the FIFO is full.

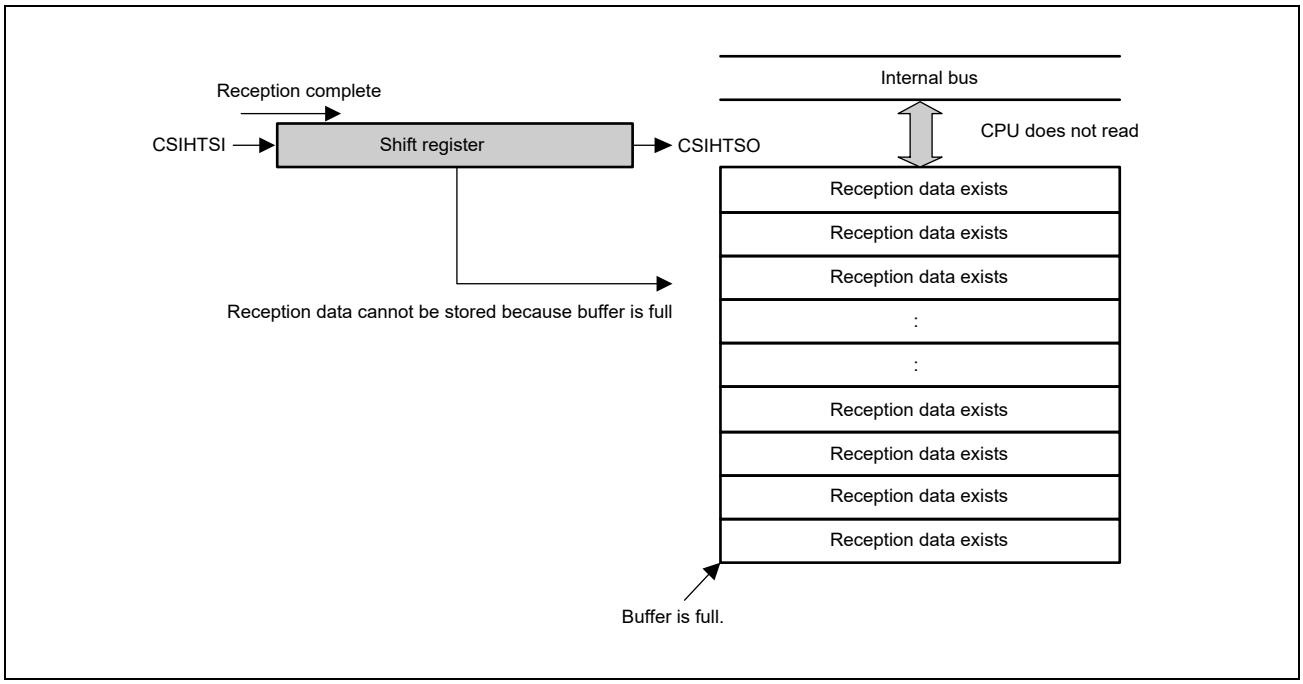

Figure 11.41 Overrun Error Detection in FIFO Mode (FIFO Full)

NOTE

An overrun error can be avoided in slave mode by using the handshake function.

When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver has read its reception register and is ready again.

2. The CPU attempts to read non existing reception data.

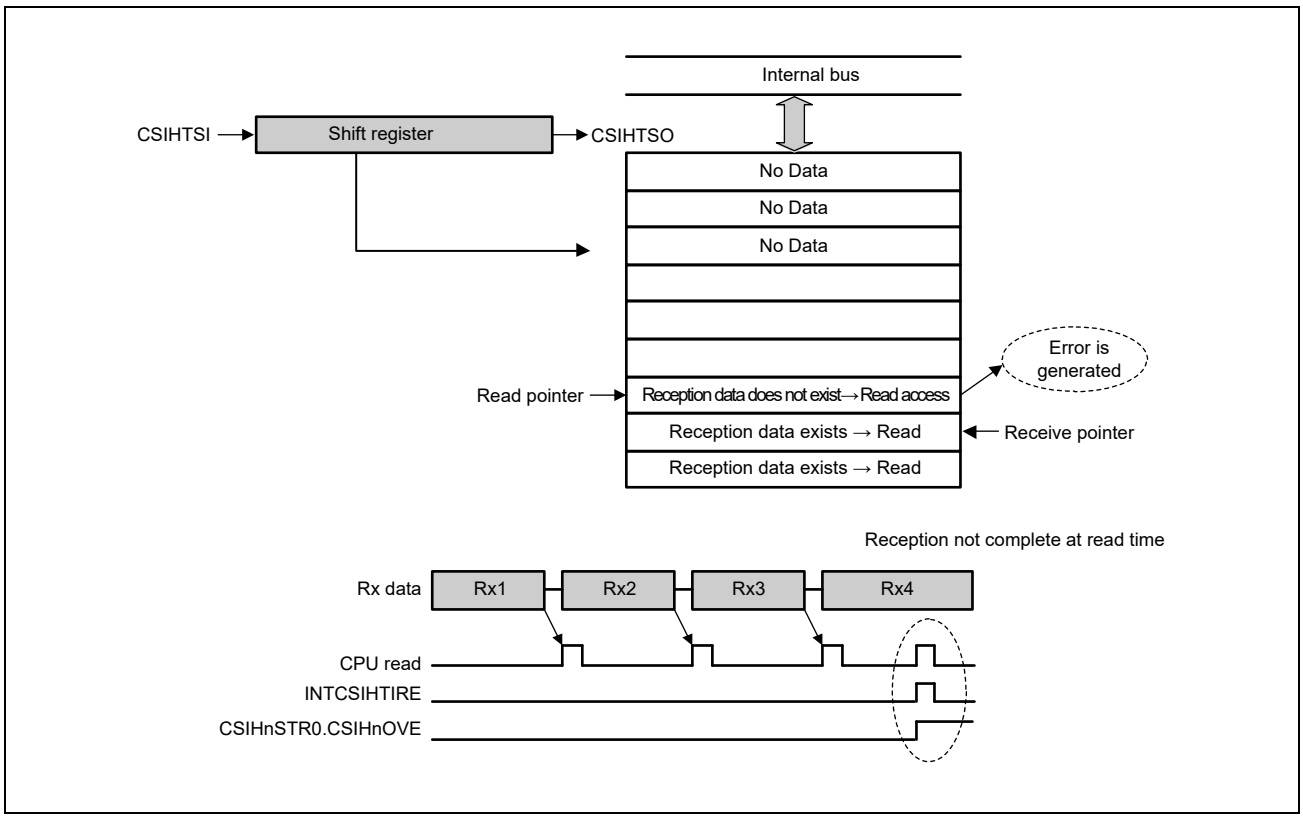

Figure 11.42 Overrun Error Detection in FIFO Mode (No Data)

In case of overrun error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnOVE bit is set.
- Received data is overwritten and the communication continues.
  (When the CPU tries to read non-existent data, the CPU starts reading again after a wait until reception is completed.)

For details see **Section 11.4.17, Handshake Function**.

11.4.19 Loop-back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active (CSIHnCTL1.CSIHnLBM = 1), CSIHTCSSx is fixed to the inactive level (the active level is defined by the CSIHnCTL1.CSIHnCSLx value). The transmit and receive signals are internally connected, as shown in the figures below. The signals CSIHTSCK, CSIHTSO, CSIHTSI, and CSIHTCSSx are disconnected from the ports. In addition, the CSIHTSO output level is fixed to low, and CSIHTSCK is set to reset level (High) regardless of the value of the CSIHnCFGx.CSIHnCKPx. The rest of CSIH works as in normal operation. Loop-back test has no effect on the device connected to.

In order to test CSIH, put it in loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data.

Table 11.42 Pin Output Level in Loop-back Mode

Pin Name	Output Level
CSIHTSCK (out)	High level
CSIHTCSS[x]	Inactive level
CSIHTSO	Low level (does not depend on the previous values)
Interrupt	Normal function
CSIHTRYO	Normal function (low level)

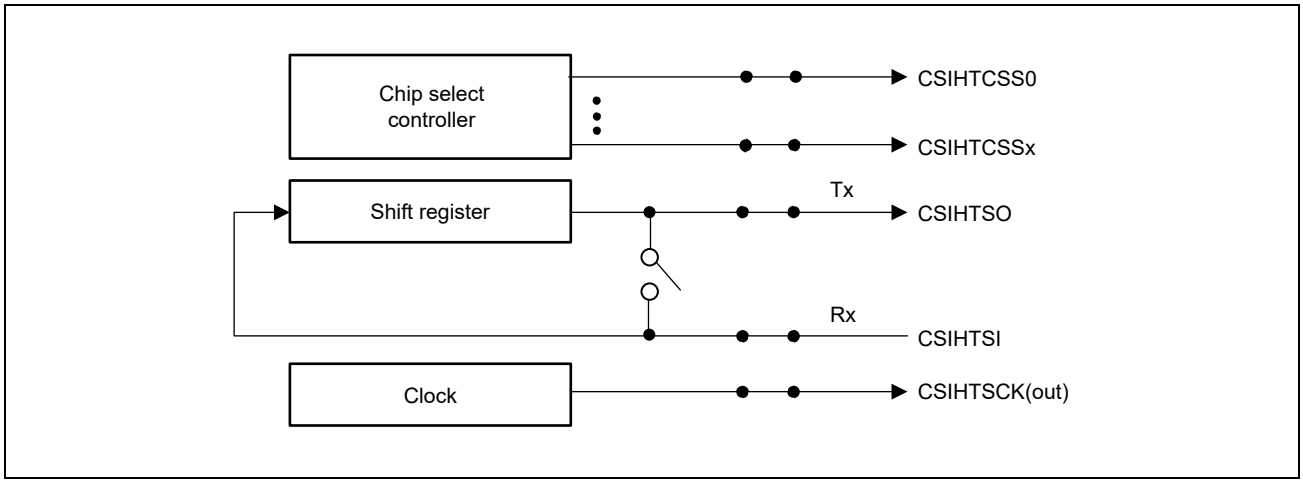

Figure 11.43 Normal Operation

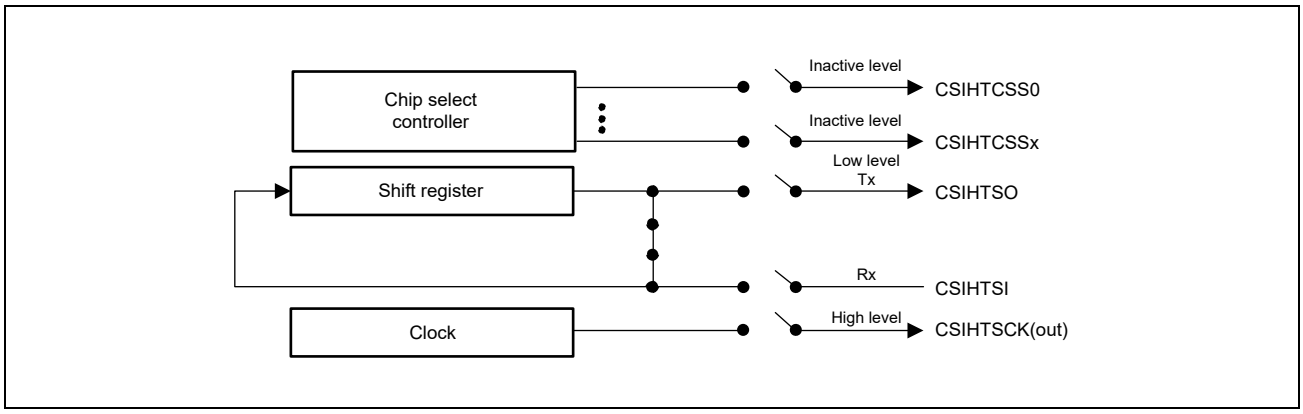

Figure 11.44 Loop-Back Operation

11.4.20 CPU-controlled High Priority Communication Function

CSIH has a function to abort low priority communication to perform high priority communication if it receives a high-priority communication request from the CPU while low-priority communication is being used. This function supports transmit-only buffer mode as low priority communication and direct access mode as high-priority communication only.

To enable this function, CSIHnCTL1.CSIHnPHE and CSIHnCTL1.CSIHnJE must be set to 1.

The following figure illustrates CPU-controlled high-priority communication.

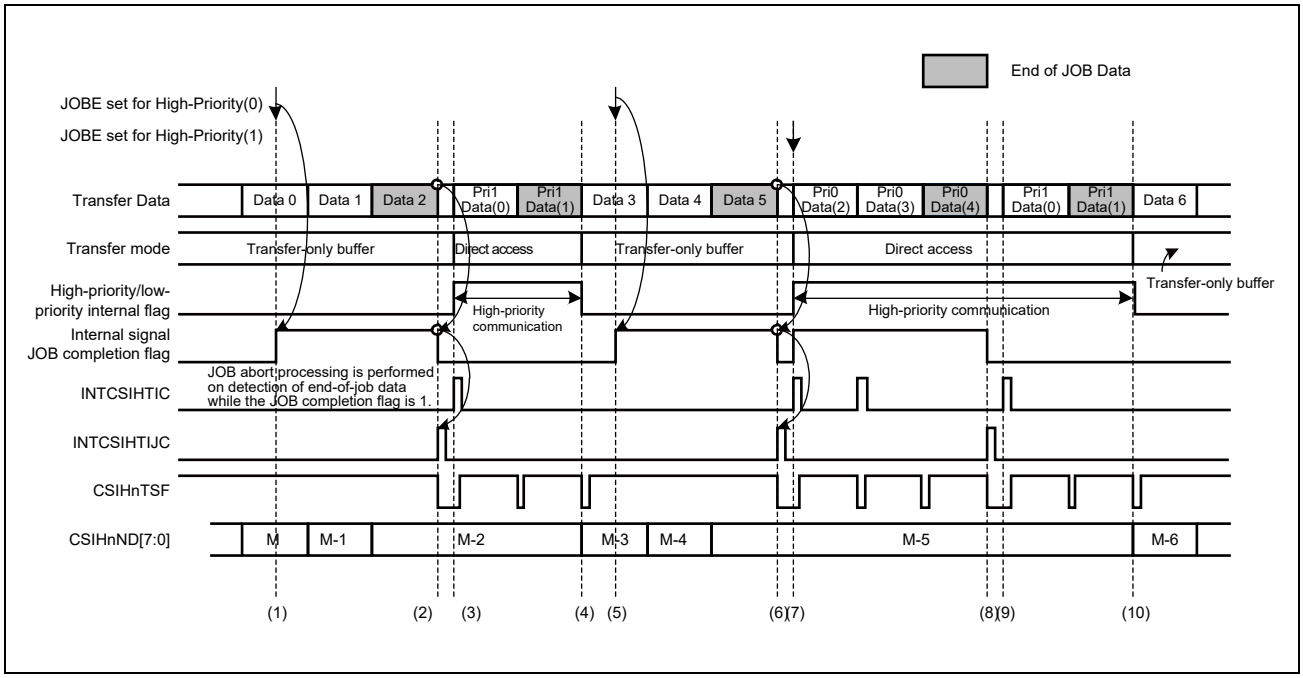

Figure 11.45 Example of CPU-Controlled High-Priority Communications, when CSIHnCTL1.CSIHnSLIT = 1

(1) By setting CSIHnCTL0.CSIHnJOBE = 1 during low-priority communication, start of high-priority communication following end-of-job data is notified, and the internal signal flag is set.

(2) When end-of-job data is detected, the current low-priority communication is aborted and the INTCSIHTIJC interrupt occurs. An internal signal, the JOB completion flag is cleared due to the abortion of communication, and memory mode is automatically switched to direct access mode for the subsequent high-priority communication.

(3) The CPU detects the interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H.

(4) When end-of-job data is detected, communication is aborted. At this time, because the internal signal, end-of-job flag is set to 0, the CSIH determines that the next communication is low priority and switches memory mode to transmit-only buffer mode automatically, and then resumes the aborted low-priority communication.

(5) Same as (1) above.

(6) Same as (2) above.

(7) The CPU detects an interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H. The CPU sets CSIHnCTL0.CSIHnJOBE = 1 again to notify that the next communication is high-priority.

(8) When end-of-job data is detected, communication is aborted and the INTCSIHTIJC interrupt is generated. At this time, the CPU determines that the subsequent communication is high-priority because the internal signal JOB completion flag is 1, and waits for communication to start.

(9) Same as (3) above.

(10) Same as (4) above.

CAUTION

Memory mode is switched automatically when communication is changed from low priority to high priority (switch from transmit-only buffer mode to direct access mode) and from high priority to low priority (switch from direct access mode to transmit-only buffer mode).

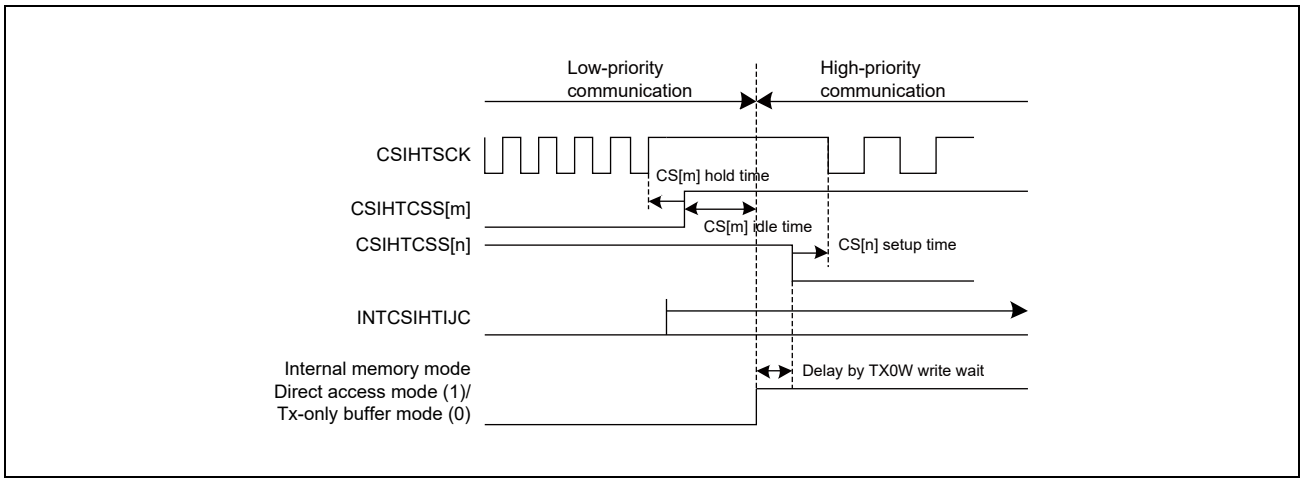

Figure 11.46 Transition from Low-Priority Mode to High-Priority Mode

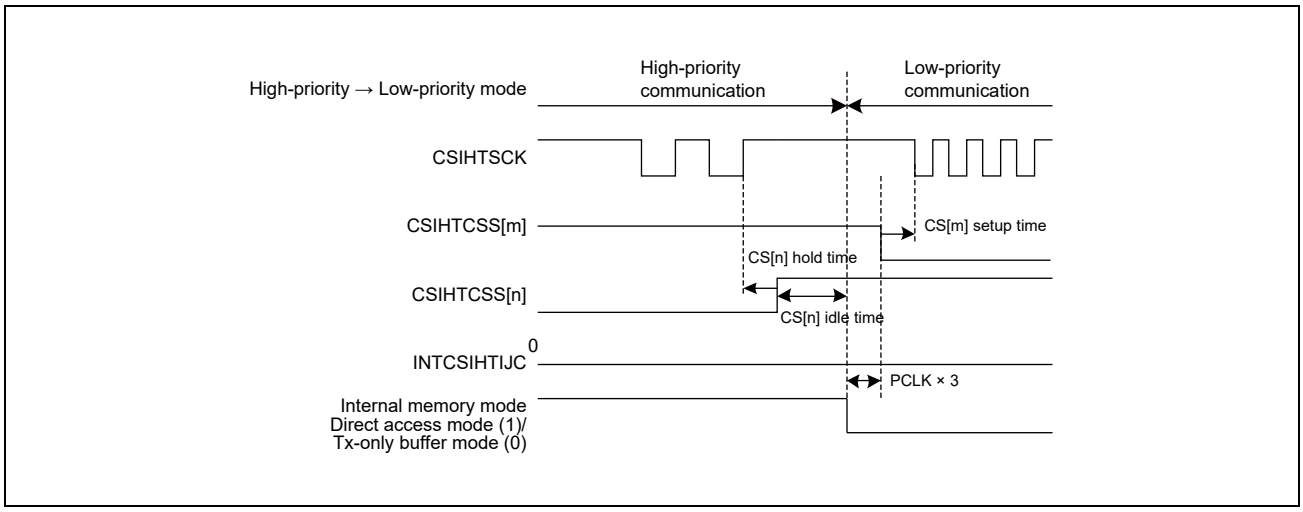

Figure 11.47 Transition from High-Priority Mode to Low-Priority Mode

Do not conduct write operation of communication data or CSIHnCTL0.CSIHnJOBE bit operation during setting prohibit period to switch low and high priority communication mode correctly.

CSIHnTX0W register write inhibited period:

- Period from when CSIHnJOBE bit is set for switching to high priority communication mode to when the INTCSIHTIJC interrupt is detected.
- Period from when the last data of high priority communication (End of JOB data) is written to when the CSIHnHPST state = 0 is detected.

CSIHnJOBE register write inhibited period:

- Period from when CSIHnJOBE bit is set for switching to high priority communication mode to when the INTCSIHTIJC interrupt is detected.

During high communication mode period, there is no setting prohibit period for CSIHnJOBE bit. It is possible to set CSIHnJOBE bit before writing communication data. For example, to communicate multiple JOB data in high priority mode, it is possible to set CSIHnJOBE bit before writing the first communication data.

CAUTION

When CSIHnJOBE bit is set right before the last communication of high priority communication ends, different operations are required depending on the internal detection timing of CSIHnJOBE bit setting. When CSIHnJOBE bit setting is detected before the last bit communication, high priority communication mode continues.

When setting of the CSIHnJOBE bit is detected after the transfer of the last bit is completed, the mode temporarily returns to low priority communications. After detection of End of JOB data in low priority communications, the mode changes back to high priority communications.

11.4.21 Enforced Chip Select Idle Setting

This macro is able to insert an idle state between the two consecutive transfer data by the setting of CSIHnCFGx.CSIHnIDLx. Detail is as follows.

1. When CSIHnCFGx.CSIHnIDLx = 0:
   If a next CSIHTCSSx is the same as the previous one, an idle state is not inserted and an inter-data time is inserted.
   An idle state is always inserted if a next CSIHTCSSx is different from the previous one.
2. When CSIHnCFGx.CSIHnIDLx = 1:
   An idle state is always inserted even if a next CSIHTCSSx is same with the previous one.

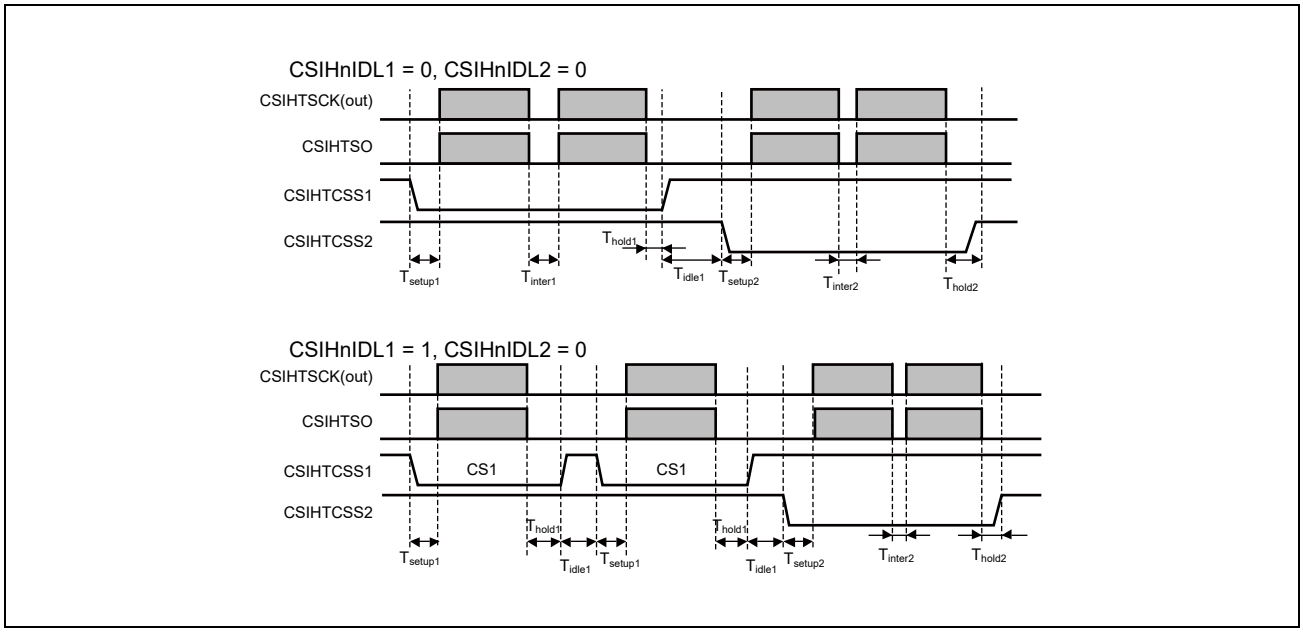

Figure 11.48 Enforced Chip Select Idle Example

CAUTION

If high priority communication function controlled by CPU is validated (CSIHnCTL1.CSIHnPHE = 1), when switch from low priority communication mode to high priority communication mode or switch from high priority communication mode to low priority communication mode, idle state is inserted regardless of the setting of CSIHnCFGx.CSIHnIDLx bit.

11.5 Procedures

The examples and procedures below are described according to the memory mode in the following order:

- Direct access mode
- Transmit-only buffer mode
- Dual buffer mode
- FIFO mode

11.5.1 Procedures in Direct Access Mode

Two examples for a master are provided, one with job mode being disabled, and the other with job mode being enabled.

11.5.1.1 Transmission/reception in master mode when job mode is disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)

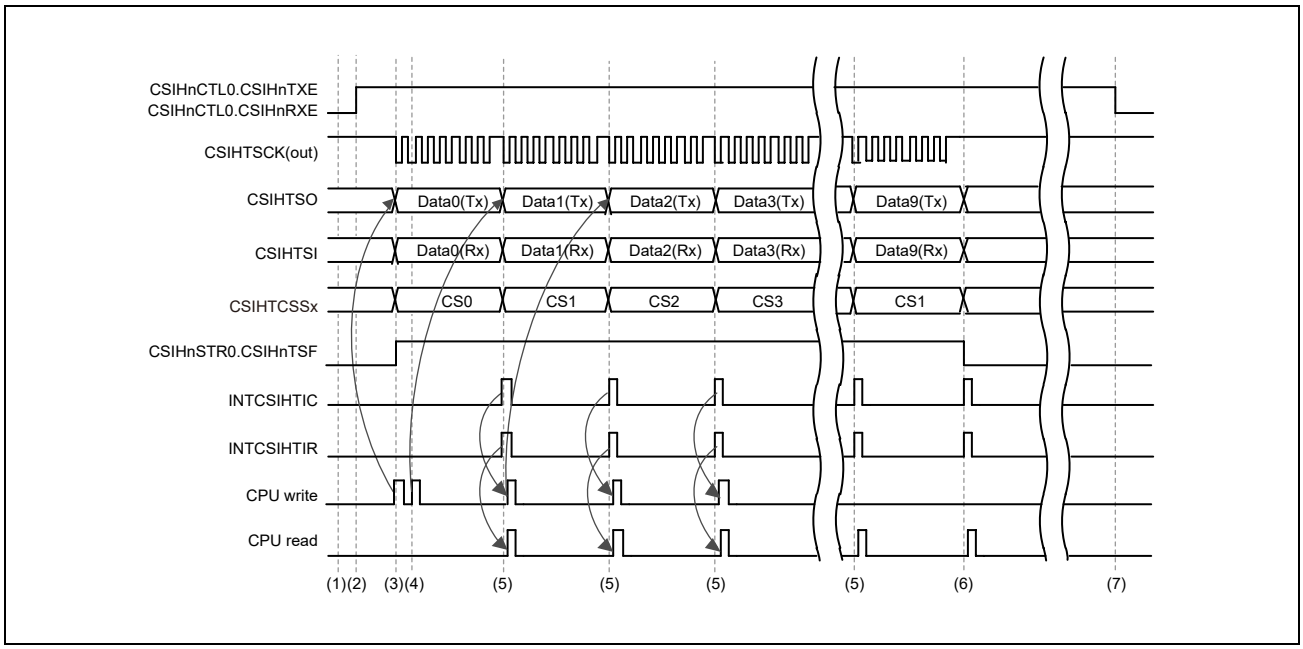

Figure 11.49 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first data to be sent to the transmission register, CSIHnTX0W. Within the same write operation, activate CS0. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIHnTX0W. If required, you can change the CS to address a different device. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every transmission/reception of a data the interrupts INTCSIHTIC and INTCSIHTIR are generated:
   - INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
   - INTCSIHTIR indicates that the reception register, CSIHnRX0W must be read.
6. No further actions of writing are required after the completion of transmission of data 8. Writing of data 9 (the last data) will have been completed at the time of the transmission completed interrupt for data 7. However, reception register CSIHnRX0W must be read after the completion of writing data 8 and data 9.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

11.5.1.2 Transmission/reception in master mode when job mode is enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0).
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0).
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1).
- Two jobs, each of them sends three data.

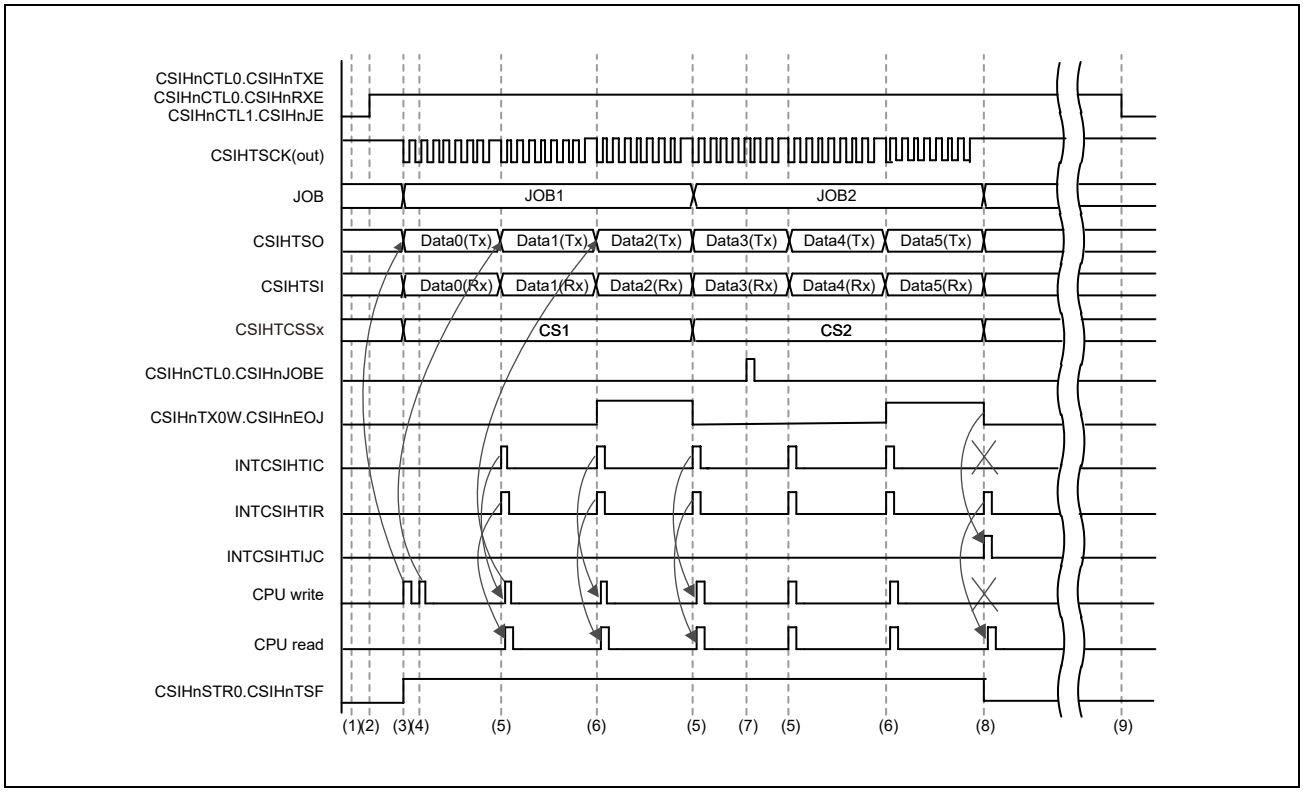

Figure 11.50 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 1

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS1 and CSIHTCSS2.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits the reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first data to be sent to the transmission register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
   The CSIHnSTR0.CSIHnTSF flag indicates that communication is in progress.
4. Write the second data to CSIHnTX0W. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every data transmission/reception, the interrupt requests, INTCSIHTIC and INTCSIHTIR are generated.
   - INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
   - INTCSIHTIR indicates that the reception register, CSIHnRX0W must be read.
6. Setting CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is sent. After that, the next job may begin.
7. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of the current job (JOB2).
8. After the forced stop of communication, the interrupt request, INTCSIHTIC is replaced by INTCSIHTIJC. INTCSIHTIR is generated as usual.
   The interrupt request, INTCSIHTIJC indicates a forced stop of communication at the end of the current job.
   The interrupt request, INTCSIHTIC is not generated. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
9. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.
   To start another transmission without stopping communication, perform steps 3 and later.

11.5.2 Procedures in Transmit-only Buffer Mode

Two examples for a master is provided, one with job mode being disabled, and the other with job mode being enabled.

11.5.2.1 Transmission/reception in master mode when job mode is disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0,CSIHnMCTL0.CSIHnMMS[1:0] = 10_B)

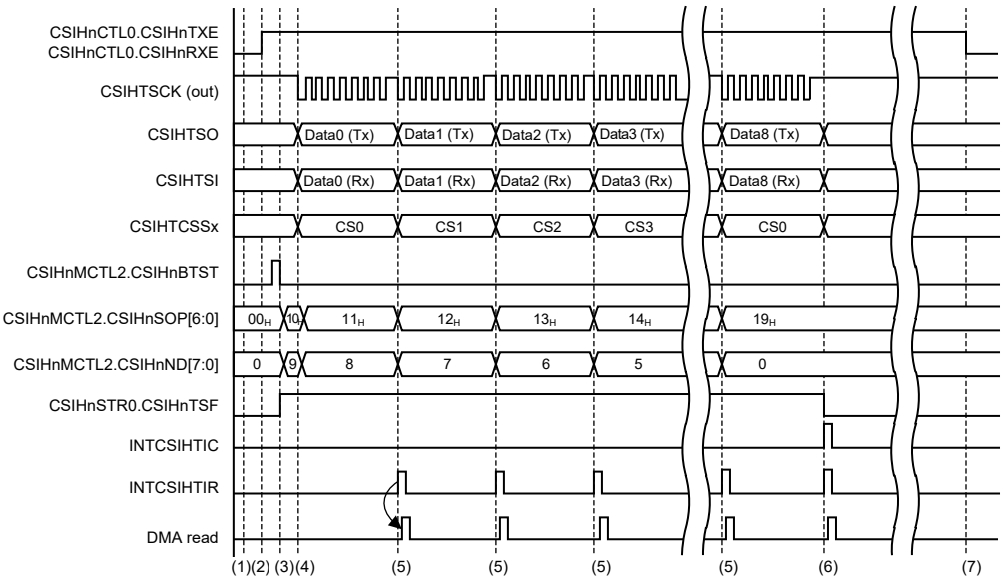

Figure 11.51 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   CSIHnMCTL0.CSIHnMMS[1:0] is set to 10_B (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission) and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the send pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission/reception is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data packet transmission.
5. After every data reception, the interrupt request, INTCSIHTIR is generated. INTCSIHTIR indicates necessity of reading reception register CSIHnRX0W.
6. When all transmissions are complete, the interrupt request, INTCSIHTIC is generated.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

11.5.2.2 Transmission/reception in master mode when job mode is enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data is 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 10_B)

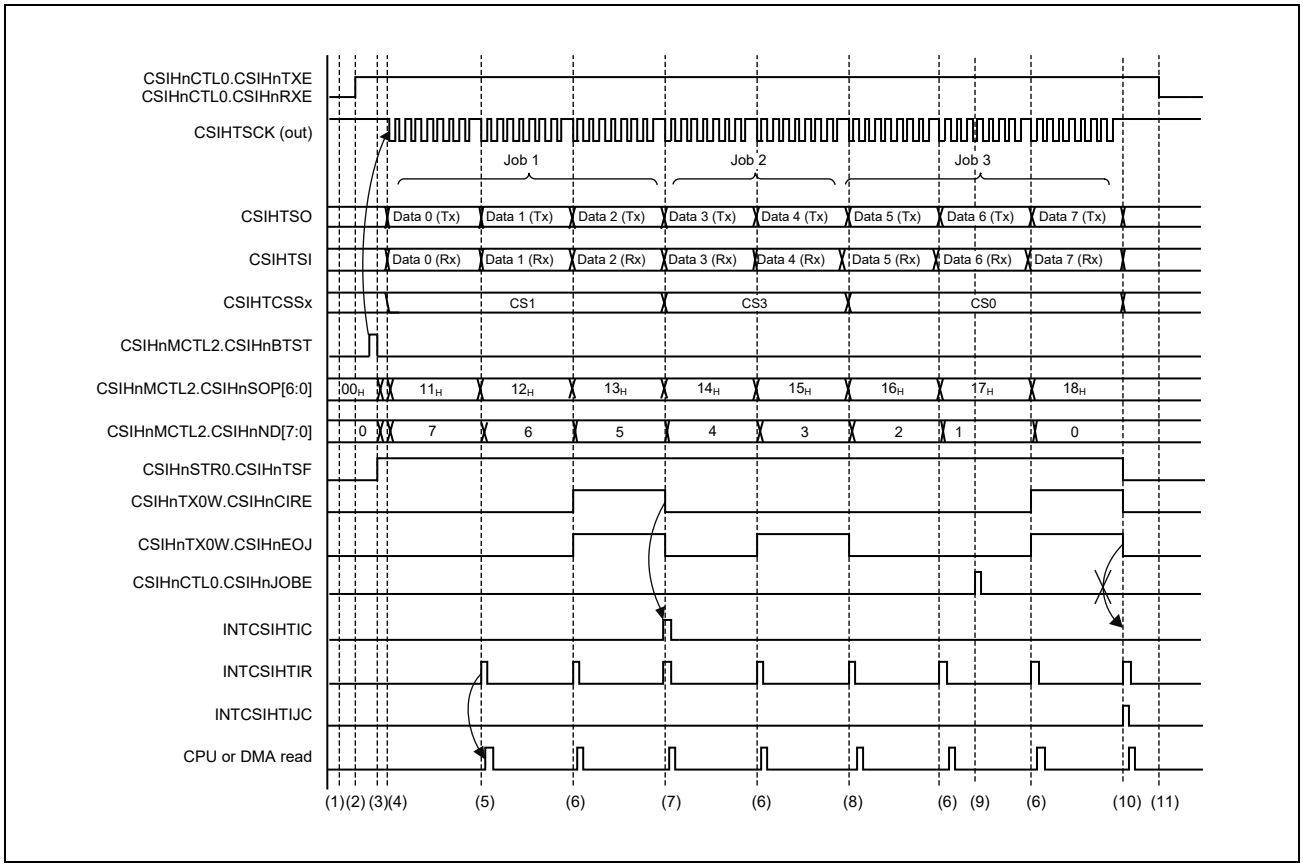

Figure 11.52 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 1

NOTE

The process of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 10_B (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the send pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission/reception is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. After every data reception, the interrupt request, INTCSIHTIR is generated. INTCSIHTIR indicates necessity of reading reception register CSIHnRX0W.
6. The CSIHnTX0W.CSIHnEOJ = 1 setting indicates that the last data of the current job is sent.
7. The interrupt request INTCSIHTIC is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
8. The INTCSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
10. After the forced stop of communication, interrupt requests INTCSIHTIJC and INTCSIHTIR are generated at the end of job3.
    The INTCSIHTIJC interrupt request indicates a forced stop of communication at the end of the current job.
    The INTCSIHTIC interrupt request is not generated because the INTCSIHTIJC interrupt request is generated instead of the INTCSIHTIC interrupt request. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

11.5.3 Procedures in Dual Buffer Mode

Examples when job mode is enabled in master mode, disabled in master mode, and disabled in slave mode are provided below.

11.5.3.1 Transmission/reception in master mode when job mode is disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Default clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)

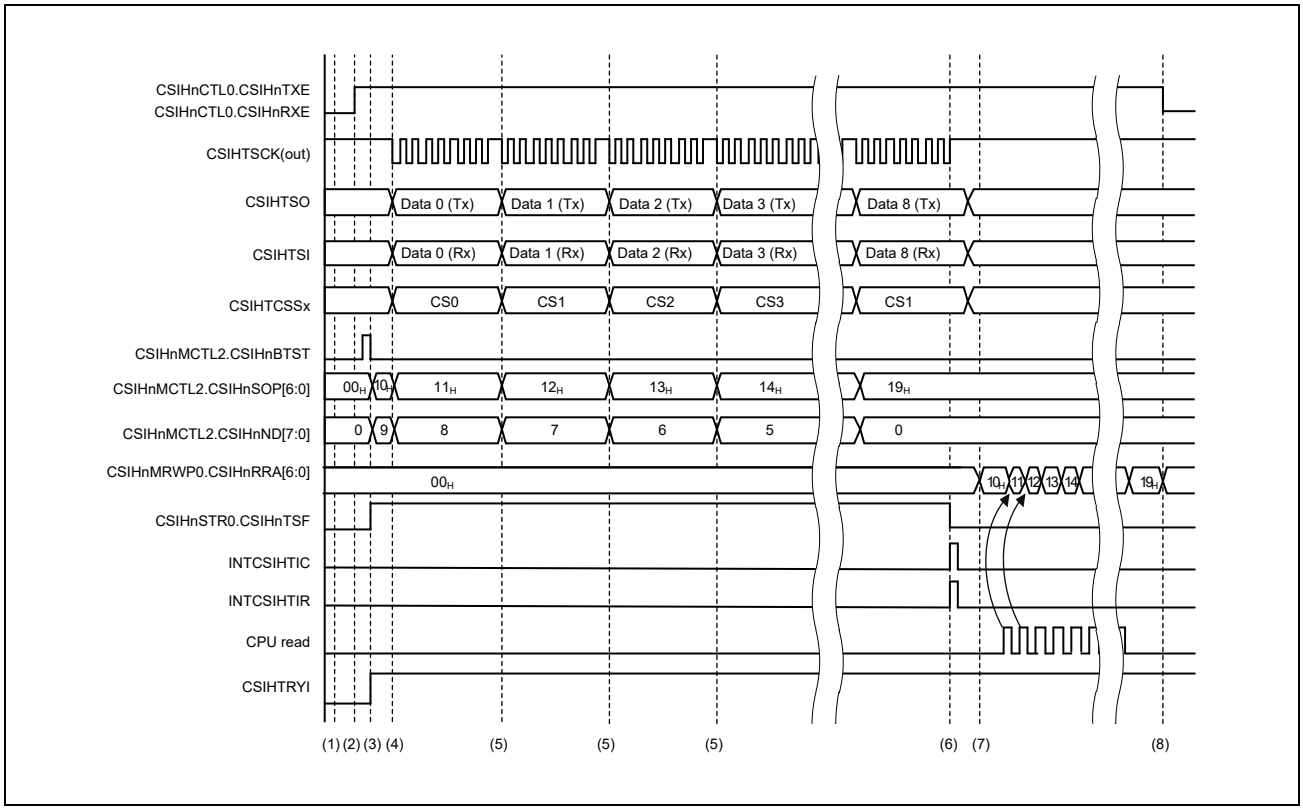

Figure 11.53 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The process of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits the reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0]. Permit buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.
   The interrupt requests, INTCSIHTIC and INTCSIHTIR are not generated.
6. When the last data is transmitted/received, the interrupt requests, INTCSIHTIC and INTCSIHTIR are generated. The CPU starts to read the received data from the Rx buffer.
7. Set CSIHnMRWP0.CSIHnRRA[6:0] to specify the address where reading is to start (use software to set CSIHnRRA[6:0] to 10_H).
   The value of CSIHnRRA[6:0] is incremented every time a byte is read.
8. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

11.5.3.2 Transmission/reception in master mode when job mode is enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data is 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 00_H (CSIHnMCTL2.CSIHnSOP[6:0] = 00_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)

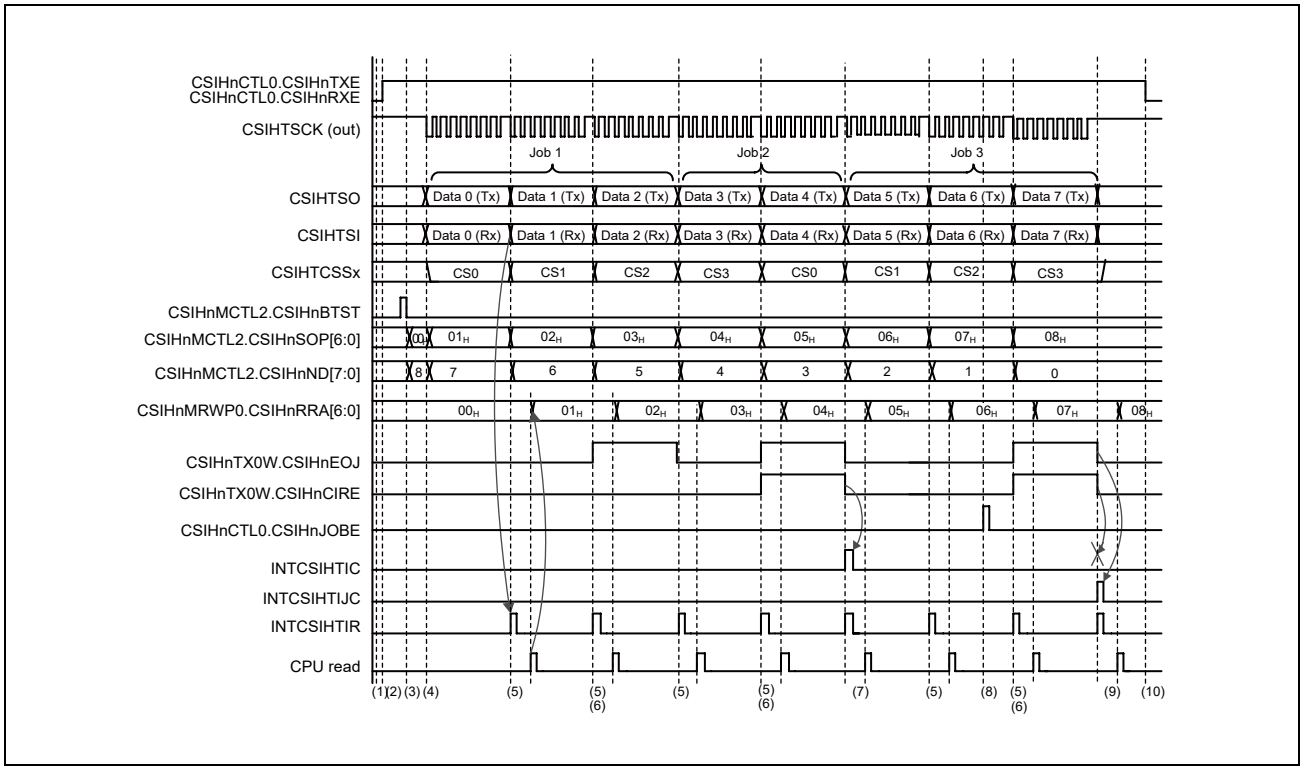

Figure 11.54 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 1

NOTE

The process of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented, and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission. This is repeated until the last data is transmitted/received.
5. The INTCSIHTIR interrupt request is generated every time a data is received.
   The INTCSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
6. CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is sent.
7. The INTCSIHTIC interrupt request is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) is sent with CSIHnTX0W.CSIHnCIRE = 1.
8. CSIHnCTL0.CSIHnJOBE = 1 indicates that communication is forced to stop at the end of JOB3.
9. After the forced stop of communication, interrupt requests, INTCSIHTIJC and INTCSIHTIR are generated at the end of JOB3.
   The INTCSIHTIJC interrupt request indicates a forced stop of communication at the end of the current job.
   The INTCSIHTIC interrupt request is not generated because the INTCSIHTIJC interrupt request is generated instead of the INTCSIHTIC interrupt request. The transmit data available in CSIHnTX0W register is not transmitted this time.
10. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

11.5.3.3 Transmission/reception in slave mode when job mode is disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phases (CSIHnCTL1.CSIHnCKR = 0, CSIHnCFG0.CSIHnDAP0 = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)
- Handshake function is enabled (CSIHnCTL1.CSIHnHSE = 1).

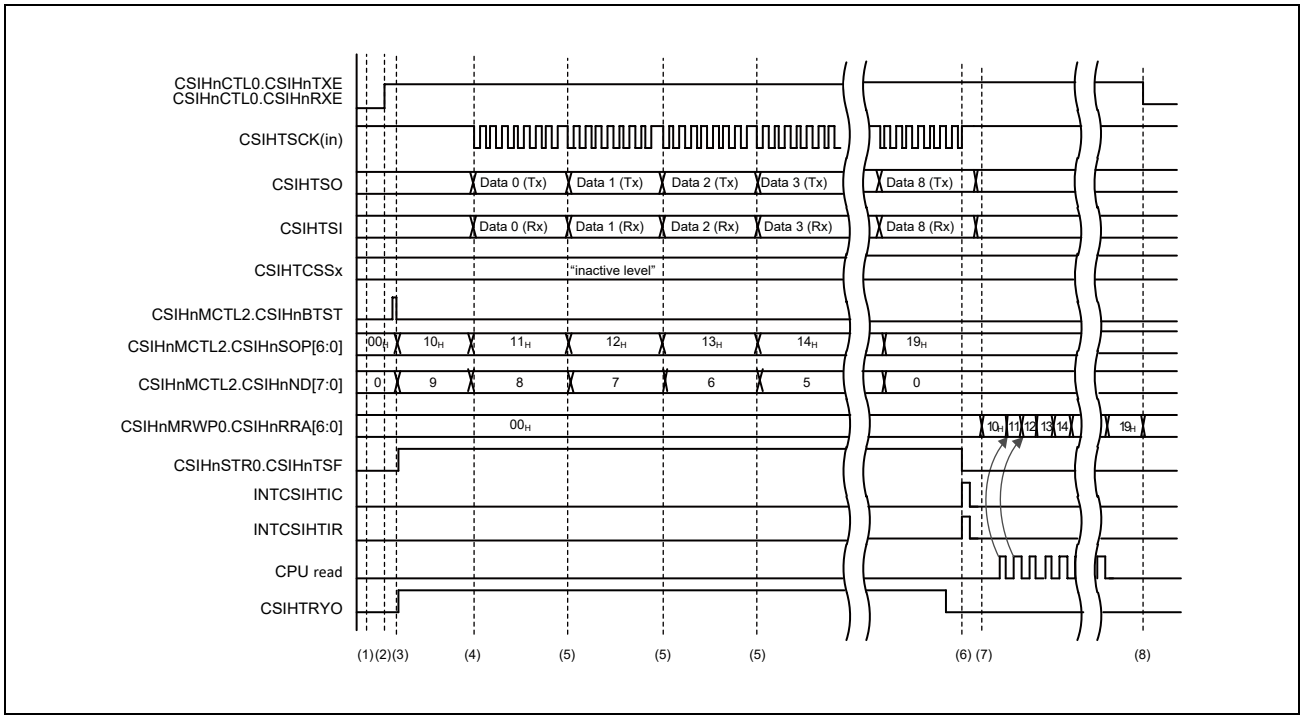

Figure 11.55 Slave in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The process of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFG0 register.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Specify the transfer start address by setting CSIHnMCTL2.CSIHnSOP[6:0] and the number of data by setting CSIHnMCTL2.CSIHnND[7:0]. Permit the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started when the input clock from the master is received.
   The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.
   The interrupt requests, INTCSIHTIC and INTCSIHTIR are not generated because transmission data is sent from the buffer, and received data is stored in the buffer.
6. When the last data is transmitted/received, the interrupt requests, INTCSIHTIC and INTCSIHTIR are generated.
   The CPU starts to read the received data that is stored in the receive buffer.
7. Set CSIHnMRWP0.CSIHnRRA[6:0] to specify the address where reading is to start (use software to set CSIHnRRA[6:0] to 10_H).
   The value of CSIHnRRA[6:0] is incremented every time a byte is read.
8. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.
   When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

11.5.4 Procedures in FIFO Mode

Two examples for a master is provided, one with job mode disabled, the other one with job mode enabled.

11.5.4.1 Transmission/reception in master mode when job mode is disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00_B)

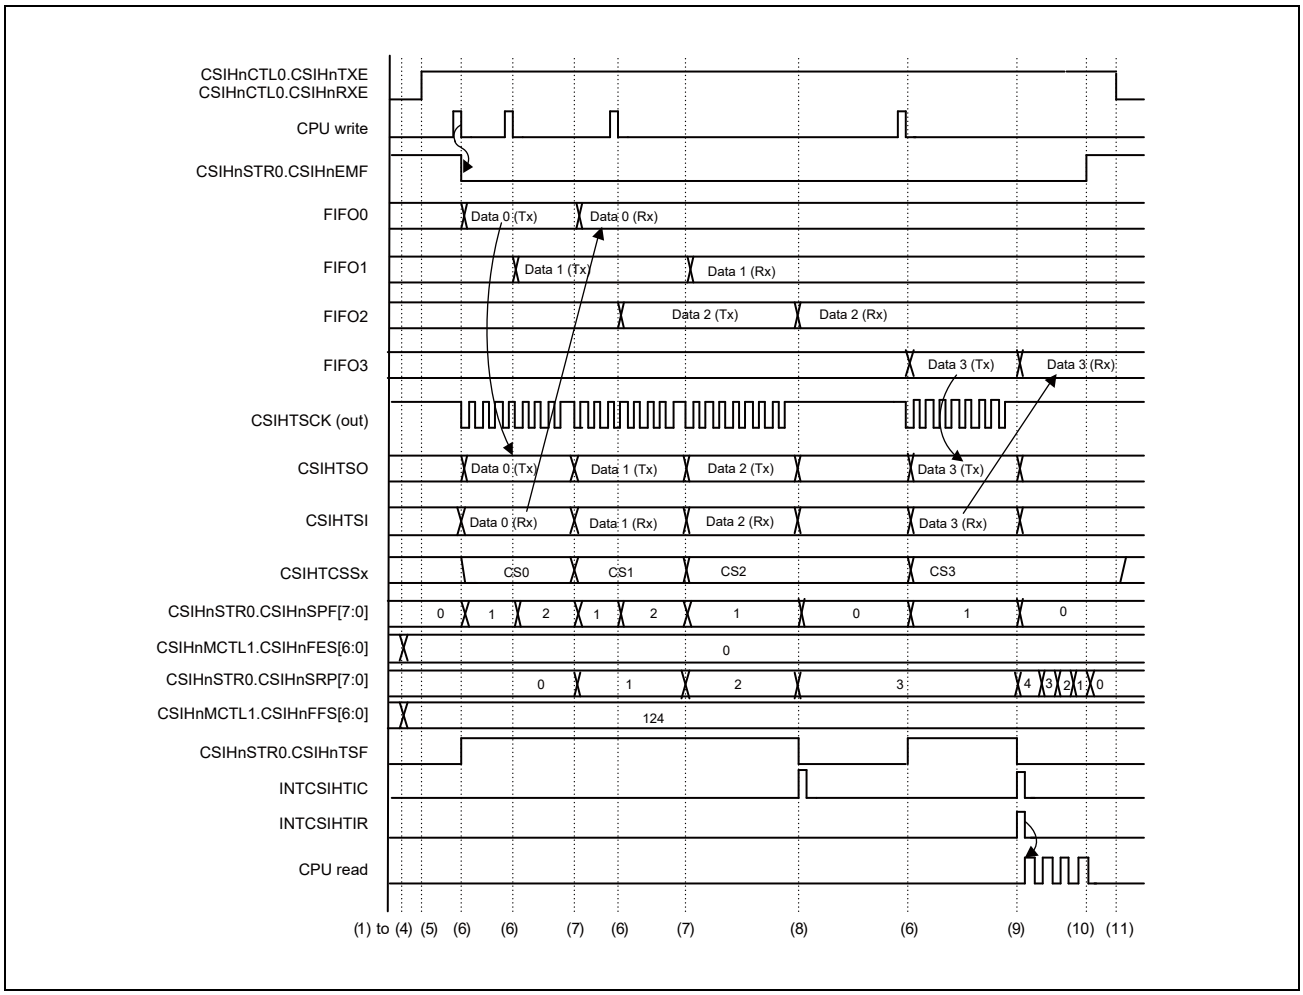

Figure 11.56 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. Specify the job mode disable and master mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Specify the FIFO mode by CSIHnMCTL0.CSIHnMMS[1:0] = 00_B. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
2. Set CSIHnSTCR0.CSIHnPCT = 1 to clear all buffer pointers.
3. Check that CSIHnSTR0.CSIHnFLF = 0, CSIHnSTR0.CSIHnEMF = 1, and CSIHnSTR0.CSIHnSPF[7:0] = 00_H.
4. The CSIHnMCTL1.CSIHnFES[6:0] bits specify the condition for the INTCSIHTIC interrupt output.
   The CSIHnFFS[6:0] bits in the same register specify the condition for the INTCSIHTIR interrupt.
5. Set CSIHnCTL0.CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the first transmit data packet to the transmit register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
7. The current transmission is completed.
   As the CSIHnFES[6:0] bits are not the same as the CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is not generated.
8. As the CSIHnFES[6:0] bits = CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is generated.
9. When CSIHnFFS[6:0] = 128-CSIHnSRP[7:0], the interrupt request INTCSIHTIR is generated. As CSIHnFES[6:0] = CSIHnSRF[7:0], the interrupt request INTCSIHTIC is generated. After the generation of the interrupt, the CPU starts reading received data that is stored in the receive buffer.
10. When the CPU completes reading the received data that is stored in the receive buffer, CSIHnSTR0.CSIHnEMF is set to 1 and the FIFO buffer will be empty.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

11.5.4.2 Transmission/reception in master mode when job mode is enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0)
- Normal clock and data phases (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- JOB1 consists of four data, JOB2 consists of three data, and JOB3 consists of five data packets.
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00_B)

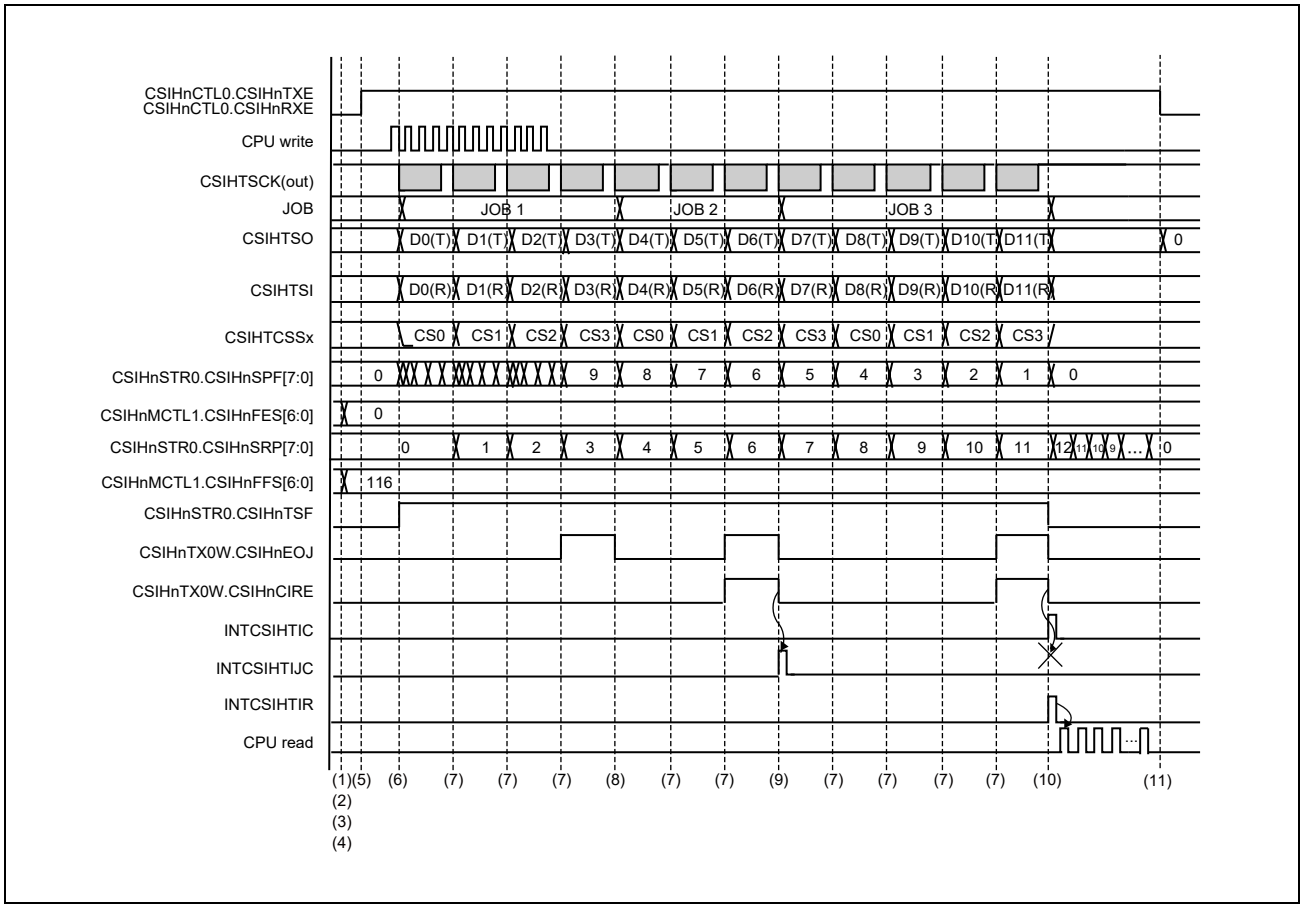

Figure 11.57 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 1

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register.
   Disable the job mode and select the memory mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Select the FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] = 00_B.
2. Set CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
3. Make sure CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to 00_H.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating the INTCSIHTIC interrupt request.
   With CSIHnMCTL1.CSIHnFFS[6:0], specify the conditions for generating the INTCSIHTIR interrupt request.
5. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the first data to be sent to the CSIHnTX0W transmission register. Transmission starts automatically when the first data becomes available.
7. The current transmission is completed.
   As CSIHnFES[6:0] are not the same as CSIHnSPF[7:0], the interrupt request INTCSIHTIC is not generated.
8. The INTCSIHTIJC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. The INTCSIHTIJC interrupt request is generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
10. As the CSIHnFES[6:0] bits = the CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is generated. As INTCSIHTIC is generated, INTCSIHTIJC is not generated.
    When CSIHnFFS[6:0] = 128-CSIHnSRP[7:0], the interrupt request INTCSIHTIR is generated. After the generation of the interrupt, the CPU starts reading received data that is stored in the receive buffer.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.
    When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

11.6 Notes

Table 11.43 Notes on Setting Registers (1/3)

Register	Bit	Content
CSIHnCTL0	CSIHnPWR	If this bit is cleared during communication, ongoing communication is suspended. After that, the communication must be restarted.
CSIHnCTL0	CSIHnTXE CSIHnRXE	Do not modify any of these bits while CSIHnCTL0.CSIHnPWR=0. (These bits can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Do not modify these bits while CSIHnSTR0.CSIHnTSF = 1, because the specified operation is not guaranteed if ongoing communication is suspended.
CSIHnCTL0	CSIHnJOBE	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid when CSIHnCTL1.CSIHnJE = 1. Setting this bit is prohibited in slave mode.
CSIHnCTL0	CSIHnMBS	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. (This bit can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Modification of this bit is only allowed while CSIHnSTR0.CSIHnTSF = 0. Do not change the mode between FIFO mode and direct access mode while CSIHnCTL0.CSIHnPWR = 1. When the CPU-controlled high-priority communication function is enabled, the operation is the same as that in direct access mode regardless of the CSIHnMBS bit setting.
CSIHnCTL1	CSIHnCKR	Modification of this bit is only allowed while CSIHnCTL0.CSIHnPWR = 0. If CS is not used, use this bit instead of setting the CSIHnCFGx.CSIHnCKPx bit, and set the CSIHnCFGx.CSIHnCKPx bit to 0. This bit must be used in slave mode.
CSIHnCTL1	CSIHnSLIT CSIHnCSL[3:0] CSIHnEDLE CSIHnDCS CSIHnCSRI CSIHnHSE	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.
CSIHnCTL1	CSIHnPHE CSIHnJE CSIHnLBM	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of this bit is prohibited in slave mode.
CSIHnCTL1	CSIHnSSE	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of this bit is prohibited in master mode.
CSIHnCTL1	CSIHnSIT	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated.
CSIHnCTL2	CSIHnPRS[2:0]	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of the max baud rate is as follows. Master mode: PCLK/8 Slave mode: PCLK/16
CSIHnSTR0	CSIHnSRP[7:0] CSIHnSPF[7:0] CSIHnFLF CSIHnEMF CSIHnTSF	Writing these bits is prohibited, and only reading is permitted.
CSIHnSTR0	CSIHnTMOE CSIHnOFE CSIHnDCE CSIHnPE CSIHnOVE	Writing these bits is prohibited, and only reading is permitted. These bits are initialized when CSIHnCTL0.CSIHnPWR is changed from 0 to 1 or 1 to 0.
CSIHnSTCR0	CSIHnPCT	If this bit is set to1 during communication, ongoing communication is suspended.
CSIHnMCTL0	CSIHnMMS[1:0]	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0 and CSIHnCTL0.CSIHnMBS = 0.

Table 11.43 Notes on Setting Registers (2/3)

Register	Bit	Content
CSIHnMCTL0	CSIHnTO[4:0]	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. Set these bits to 0 in master mode. Set these bits to 0 in direct access, dual buffer, and transmit-only buffer mode.
CSIHnMCTL1	CSIHnFES[6:0] CSIHnFFS[6:0]	Write to these bits during communication is permitted.
CSIHnMCTL2	CSIHnBTST CSIHnND[7:0] CSIHnSOP[6:0]	Writing these bits is prohibited when CSIHnCTL0.CSIHnPWR = 0. Writing these bits is prohibited when CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0. Writing these bits is prohibited when CSIHnSTR0.CSIHnTSF = 1. Writing these bits is prohibited in direct access or FIFO mode.
CSIHnMRWP0	CSIHnRRA[6:0]	Write to these bits during communication is permitted. Writing these bits is prohibited in direct access or FIFO mode. When writing is required, set "0000_H" to these bits in transmit-only buffer mode.
CSIHnMRWP0	CSIHnTRWA[6:0]	Write to these bits during communication is permitted. Writing these bits is prohibited in direct access or FIFO mode.
CSIHnCFGx	CSIHnBRSSx[1:0] CSIHnRCBx CSIHnIDLx CSIHnIDx[2:0] CSIHnHDx[3:0] CSIHnINx[3:0] CSIHnSPx[3:0]	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. These bits must be set to 0 in slave mode.
CSIHnCFGx	CSIHnPSx[1:0] CSIHnDLSx[3:0] CSIHnDIRx CSIHnDAPx	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. In slave mode, the CSIHnCFG0 setting is used. Therefore, all the bits in CSIHnCFG1 to CSIHnCFG3 must be set to 0.
CSIHnCFGx	CSIHnCKPx	Modification of this bit is only allowed while CSIHnCTL0.CSIHnPWR = 0. As CSIHnCTL1.CSIHnCKR must be used in slave mode, set these bits to 0. If CS is not used, use the CSIHnCTL1.CSIHnCKR bit instead of these bits, and clear the bits to 0.
CSIHnTX0W	CSIHnEOJ CSIHnCIRE	This bit is only valid when CSIHnCTL1.CSIHnJE = 1. While CSIHnCTL1.CSIHnJE = 0, the value of this bit is ignored even if 1 is read. Set these bits to 0 in slave mode.
CSIHnTX0W	CSIHnEDL	This bit is only valid when CSIHnCTL1.CSIHnEDLE = 1. While CSIHnCTL1.CSIHnEDLE = 0, the value of this bit is ignored even if 1 is read.
CSIHnTX0W	CSIHnCS[3:0]	In master mode, setting these bits to F_H is prohibited. In slave mode, set these bits to E_H.
CSIHnTX0W CSIHnTX0H		Reading these bits during communication is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0 and in FIFO mode, read/write access to these bits is prohibited. While CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0, write access to these bits are prohibited in direct access mode.
CSIHnRX0W		These bits are initialized when CSIHnCTL0.CSIHnPWR is changed from 0 to 1 or from 1 to 0. When CSIHnCTL0.CSIHnPWR = 0, reading these bits is prohibited in FIFO mode. When CSIHnCTL0.CSIHnPWR = 1, writing to these bits has no effect in FIFO mode. Reading is only effective. When CSIHnCTL0.CSIHnPWR = 0, writing to and reading from these bits is effective in modes other than FIFO mode (transmit-only buffer mode, dual buffer mode, or direct access mode). When CSIHnCTL0.CSIHnPWR = 1, writing to these bits has no effect in modes other than FIFO mode (transmit-only buffer mode, dual buffer mode, or direct access mode). Reading is only effective.

Table 11.43 Notes on Setting Registers (3/3)

Register	Bit	Content
CSIHnRX0H		These bits are initialized when CSIHnCTL0.CSIHnPWR is changed from 0 to 1 or from 1 to 0. When CSIHnCTL0.CSIHnPWR = 0, writing to and reading from these bits is prohibited in FIFO mode. When CSIHnCTL0.CSIHnPWR = 1, writing to these bits has no effect in FIFO mode. Reading is only effective. Writing to these bits has no effect in modes other than FIFO mode (transmit-only buffer mode, dual buffer mode, or direct access mode) regardless of the setting of CSIHnCTL0.CSIHnPWR. Reading is only effective.
CSIHnBRSy		Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0.

Section 12 Serial Communication Interface 3 (SCI3)

This section contains a generic description of the serial communication interface (SCI3).

The first part of this section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of SCI3.

12.1 Features of RH850/C1M-A SCI3

12.1.1 Units

This LSI has the following number of SCI3 units.

Table 12.1 Number of Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of Units	3	3
Name	SCI3n (n = 0 to 2)	SCI3n (n = 0 to 2)

Table 12.2 Index

Index	Meaning
n	Throughout this section, the individual SCI3 units are identified by the index “n” (n = 0 to 2); for example, SCI3nRSR is the receive shift register.

12.1.2 Register Base Address

SCI3 base addresses are listed in the following table.

SCI3 register addresses are given as offsets from the base addresses in general.

Table 12.3 Register Base Address

Base Address Name	Base Address
<SCI30_base>	FFD9 0000_H
<SCI31_base>	FF79 1000_H
<SCI32_base>	FFD9 2000_H

12.1.3 Clock Supply

SCI3 clock is listed in following table.

Table 12.4 Clock Supply

Unit Name	Clock for the Unit	Internal Clock Name
SCI3n	PCLK	CLKC_LSB (non-modulated low-speed peripheral clock)
	SCKn	SCInSCK pins (for operation with external clock signals)

12.1.4 Interrupts and DMA

SCI3 interrupt requests are listed in the following table.

Table 12.5 Interrupt Requests

Unit Interrupt Signal	Outline	Interrupt Number	DMAC Trigger Number*1		DTS Trigger Number*1	
			1st	2nd	1st	2nd
SCI30						
ERI	Receive error	289	—	—	—	—
RXI	Receive data full	290	120	—	120	—
TXI	Transmit data empty	291	121	—	121	—
TEI	Transmit complete	292	—	—	—	—
SCI31						
ERI	Receive error	293	—	—	—	—
RXI	Receive data full	294	122	—	122	—
TXI	Transmit data empty	295	123	—	123	—
TEI	Transmit complete	296	—	—	—	—
SCI32						
ERI	Receive error	297	—	—	—	—
RXI	Receive data full	298	124	—	124	—
TXI	Transmit data empty	299	125	—	125	—
TEI	Transmit complete	300	—	—	—	—

Note: —: No number is assigned.

Note 1. 1st: Primary channel, 2nd: Secondary channel

12.1.5 Reset Sources

SCI3 reset sources are listed in the following table. SCI3 is initialized by these reset sources.

Table 12.6 Reset Source

Unit Name	Reset Source
SCI3n	Reset by any reset source

12.1.6 External Input/Output Signals

External input/output signals of SCI3 are listed in the following table.

Table 12.7 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
SCKn	Serial clock input/output signal	SCInSCK
RxDn	Receive data input signal	SCInRXD
TxDn	Transmit data output signal	SCInTXD

12.2 Overview

12.2.1 Functional Overview

The SCI3 can handle two methods of serial communications: asynchronous and clock synchronous. Asynchronous serial data transfer can be handled with standard LSI chips for asynchronous communication such as Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communication Interface Adapter (ACIA). Asynchronous mode also provides for serial communications between multiple processors (multi-processor communications).

In clock synchronous transfer, the interface serves as the master in communications through the output of its internal clock signal for synchronization, or as the slave in communications, where transfer is synchronized with the signal from an external clock.

Table 12.8 List of Functions

Function	Asynchronous Communications	Clock Synchronous Communications	
		Internal Clock (Master Mode)	External Clock (Slave Mode)
Full-duplex communication	Possible Independent transmitter unit and receiver unit allow simultaneous transmission and reception. Both the transmitter and receiver have a double-buffered structure, enabling continuous data transmission and reception.		
SCKn pin	Possible of clock output	Clock output	Clock input
Transmit/receive clock source	Internal clock by the on-chip baud rate generator		External clock
LSB/MSB first	Selectable (except for 7-bit length data)	Selectable	
Interrupt and DMA/DTS transfer	• Transmission complete • Transmission data empty • Reception data full • Reception error DMA and DTS can be activated by a transmit data empty interrupt signal or reception data full interrupt signal.		
Bit rate modulation	Possible	Possible (except for setting of the maximum speed)	
Data length	Selectable: 7- or 8-bit	8-bit	
Stop bit length	Selectable: 1- or 2-bit	—	
Parity	Selectable: with even/odd parity or none	—	
Detection of reception errors	• Parity error • Overrun error • Framing error	• Overrun error	
Break detection	Detectable by reading a register when a framing error occurs	—	
Serial input data pin level check	Possible		
Multi-processor communication	Possible	—	
Double-speed operation	Possible	—	
Maximum bit rate	5 Mbps (PCLK/8)	5 Mbps (PCLK/8)	3.3 Mbps (PCLK/12)

12.2.2 Block Diagram

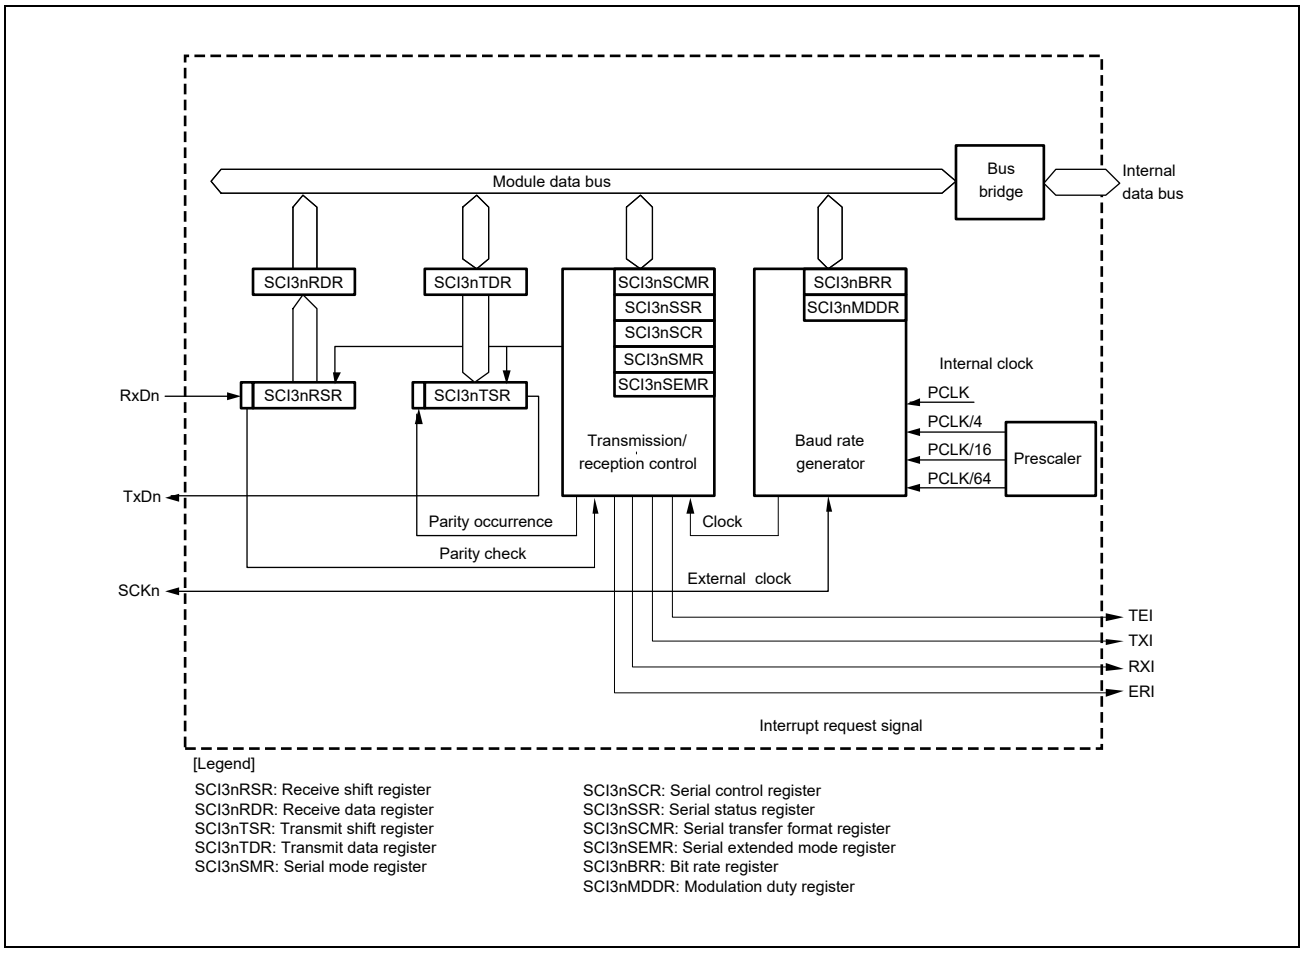

Figure 12.1 SCI3 Block Diagram

12.3 Registers

12.3.1 List of Registers

SCI3 registers are listed in the following table.

For information on <SCI3n_base>, see **Section 12.1.2, Register Base Address**.

Table 12.9 Register Configuration

Module Name	Register Name	Symbol	Address
SCI3n	Serial mode register	SCI3nSMR	<SCI3n_base>+ 00_H
SCI3n	Bit rate register / Modulation duty register*1	SCI3nBRR/ SCI3nMDDR	<SCI3n_base>+ 04_H
SCI3n	Serial control register	SCI3nSCR	<SCI3n_base>+ 08_H
SCI3n	Transmit data register	SCI3nTDR	<SCI3n_base>+ $0C_H$
SCI3n	Serial status register	SCI3nSSR	<SCI3n_base>+ 10_H
SCI3n	Receive data register	SCI3nRDR	<SCI3n_base>+ 14_H
SCI3n	Serial transfer format register	SCI3nSCMR	<SCI3n_base>+ 18_H
SCI3n	Serial extended mode register	SCI3nSEMR	<SCI3n_base>+ $1C_H$

Note 1. SCI3nBRR and SCI3nMDDR are assigned to the same address. These registers are switched by using the SCI3nSEMR.MDDRS bit.

12.3.2 SCI3nRDR — Receive Data Register

This register is used to store receive data. When one frame of data has been received, it is transferred from SCI3nRSR to this register allowing SCI3nRSR to receive the next data. SCI3nRSR and SCI3nRDR function as a double-buffer in this way, allowing continuous receive operations. Be sure to check that the SCI3nSSR.RDRF bit is set to 1 before reading SCI3nRDR. When the data length is 7 bits, receive data is stored in bit 0 to 6 and bit 7 is fixed to 0 regardless of the SCI3nSCMR.SINV bit.

Access: This register can be read in 8-bit units.

Address: <SCI3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	SCI3nRDR							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 12.10 SCI3nRDR Register Contents

Bit Position	Bit Name	Function
7 to 0	SCI3nRDR	Receive Data Register These bits store receive data.

12.3.3 SCI3nTDR — Transmit Data Register

This register is used to store transmit data. When SCI3nTSR empty is detected, the transmit data written to SCI3nTDR is transferred to SCI3nTSR and transmission starts. The double-buffered structure of SCI3nTDR and SCI3nTSR allows continuous serial transmission. If the next transmit data has been written to SCI3nTDR when one frame of data is sent, the transmit data is transferred to SCI3nTSR to continue transmission. Be sure to check that the SCI3nSSR.TDRE bit is set to 1 before writing transmit data to SCI3nTDR.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + $0C_H$

Value after reset: FF_H

Bit	7	6	5	4	3	2	1	0
	SCI3nTDR							
Value after reset	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 12.11 SCI3nTDR Register Contents

Bit Position	Bit Name	Function
7 to 0	SCI3nTDR	Transmit Data Register These bits store transmit data.

12.3.4 SCI3nSMR — Serial Mode Register

SCI3nSMR is a register used to select the transfer format and the clock source for the on-chip baud rate generator.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CM	CHR	PE	PM	STOP	MP	CKS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Note 1. Writable only when TE = RE = 0.

Table 12.12 SCI3nSMR Register Contents (1/2)

Bit Position	Bit Name	Function
7	CM	Communications Mode 0: Asynchronous mode 1: Clock synchronous mode
6	CHR	Character Length (Valid only in asynchronous mode) 0: Selects 8 bits as the data length. 1: Selects 7 bits as the data length. LSB-first is fixed and the MSB (bit 7) in SCI3nTDR is not transmitted in transmission. In clock synchronous mode, the data length is fixed to 8 bits.
5	PE	Parity Enable (Valid only in asynchronous mode) When this bit is set to 1, a parity bit is added to transmit data and the parity bit is checked in reception. Regardless of the setting of this bit, no parity bit is added or checked in the multi-processor format.
4	PM	Parity Mode (Valid only when PE = 1 in asynchronous mode) 0: Even parity 1: Odd parity When even parity is set, the value of the appended parity bit causes the total number of 1-valued bits in a transmitted or received character plus the parity bit to be even. Similarly, when odd parity is set, the value of the appended parity bit causes the total number of 1-valued bits in a transmitted or received character plus the parity bit to be odd.
3	STOP	Stop Bit Length (Valid only in asynchronous mode) 0: 1 stop bit for transmission 1: 2 stop bits for transmission In reception, only the first stop bit is checked regardless of the setting of this bit. If the second stop bit is 0, it is treated as the start bit of the next transmission frame.
2	MP	Multi-Processor Mode (Valid only in asynchronous mode) When this bit is set to 1, the multi-processor communication function is enabled. In multi-processor mode, settings of the PE and PM bits are invalid.

Table 12.12 SCI3nSMR Register Contents (2/2)

Bit Position	Bit Name	Function
1, 0	CKS[1:0]	Clock Select 1, 0 These bits select the clock source for the on-chip baud rate generator. 00: PCLK clock (m = 0) 01: PCLK/4 clock (m = 1) 10: PCLK/16 clock (m = 2) 11: PCLK/64 clock (m = 3) For the relation between the setting of these bits and the baud rate, see **Section 12.3.9, SCI3nBRR — Bit Rate Register**. The character m is the decimal notation of the value of m in **Section 12.3.9, SCI3nBRR — Bit Rate Register**.

12.3.5 SCI3nSCR — Serial Control Register

SCI3nSCR is a register used for the transmission/reception control, interrupt control, and transmission/reception clock source selection listed below. For interrupt requests, see **Section 12.4.5, Interrupt Sources**.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W*1	R/W*1	R/W	R/W	R/W*2	R/W*2

Note 1. While the CM bit in SCI3nSMR is 1, a value of 1 can be written only when TE = 0 and RE = 0. After the TE or RE bit is set to 1, only 0 can be written to TE and RE. While the CM bit in SCI3nSMR is 0, writing is enabled at any timing.

Note 2. Writable only when TE = 0 and RE = 0. Also, writable at the same time when TE = 0 and RE = 0 are written.

Table 12.13 SCI3nSCR Register Contents (1/2)

Bit Position	Bit Name	Function
7	TIE	Transmit Interrupt Enable When this bit is set to 1, TXI interrupt request is enabled. TXI interrupt request can be cancelled by reading 1 from the TDRE flag and then clearing the flag to 0, or clearing the TIE bit.
6	RIE	Receive Interrupt Enable When this bit is set to 1, RXI and ERI interrupt requests are enabled. RXI and ERI interrupt requests can be cancelled by reading 1 from the RDRF, FER, PER, or ORER flag and then clearing the flag to 0, or clearing the RIE bit.
5	TE	Transmit Enable When this bit is set to 1, transmission is enabled. In this state, serial transmission is started by writing transmit data to SCI3nTDR and clearing the TDRE flag in SCI3nSSR to 0. Be sure to set SCI3nSMR before setting the TE bit to 1 to determine the transmission format. When this bit is set to 0 to disable transmission, the TDRE flag in SCI3nSSR is fixed to 1.

Table 12.13 SCI3nSCR Register Contents (2/2)

Bit Position	Bit Name	Function
4	RE	Receive Enable When this bit is set to 1, reception is enabled. In this state, serial reception is started by detecting a start bit in asynchronous mode or the input of synchronous clock in clock synchronous mode. Be sure to set SCI3nSMR before setting the RE bit to 1 to determine the reception format. Even if reception is disabled by clearing this bit, the RDRF, FER, PER, and ORER flags are not affected and the previous value is retained.
3	MPIE	Multiprocessor Interrupt Enable (Valid only when MP in SCI3nSMR = 1 in asynchronous mode) When this bit is set to 1 and the data with the multi-processor bit set to 0 is received, the data is not read and setting the RDRF, FER, and ORER flags in SCI3nSSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, this bit is automatically cleared to 0, and normal reception is resumed. For details, see **Section 12.4.2, Multi-Processor Communication Function**. When the receive data includes MPB = 0 in SCI3nSSR, the receive data is not transferred from SCI3nRSR to SCI3nRDR, a receive error is not detected, and setting the RDRF, FER, and ORER flags in SCI3nSSR to 1 is disabled. When the receive data includes MPB = 1 in SCI3nSSR, the MPB bit in SCI3nSSR is set to 1, the MPIE bit is automatically cleared to 0, the RXI and ERI interrupt requests are enabled (if the RIE bit in SCI3nSCR is set to 1), and setting the FER and ORER flags to 1 is enabled.
2	TEIE	Transmit End Interrupt Enable When this bit is set to 1, TEI interrupt request is enabled. TEI interrupt request can be cancelled by reading 1 from the TDRE flag and then clearing the flag to 0 to clear the TEND flag to 0, or clearing the TEIE bit.
1, 0	CKE[1:0]	Clock Enable 1, 0 These bits select the clock source and the SCKn pin function. For asynchronous mode 00: On-chip baud rate generator (The SCKn pin functions as an input/output port.) 01: On-chip baud rate generator (The clock with the same frequency as the bit rate is output from the SCKn pin.) 1X: Setting prohibited For clock synchronous mode 0X: Internal clock (The SCKn pin functions as a clock output pin.) 1X: External clock (The SCKn pin functions as a clock input pin.)

Note: X: Don’t care.

NOTE

When writing to any bit other than the MPIE bit of this register, use a store instruction such that the value of the MPIE bit becomes 0.

Note that when using a bit-manipulation instruction for writing to this register, the read-modify-write operation may inadvertently set the MPIE bit to 1.

12.3.6 SCI3nSSR — Serial Status Register

SCI3nSSR consists of SCI3 status flags and transfer multi-processor bits. The TDRE, RDRF, ORER, PER, and FER flags can only be cleared.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 10_H

Value after reset: 84_H

Bit	7	6	5	4	3	2	1	0
	TDRE	RDRF	ORER	FER	PER	TEND	MPB	MPBT
Value after reset	1	0	0	0	0	1	0	0
R/W	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R/W

Note 1. Only 0 can be written to clear the flag.

Table 12.14 SCI3nSSR Register Contents (1/2)

Bit Position	Bit Name	Function
7	TDRE	Transmit Data Register Empty Indicates whether or not transmit data exists in SCI3nTDR. [Setting conditions] • When the TE bit in SCI3nSCR is 0 • When the data in SCI3nTDR has been transferred to SCI3nTSR so that new data can be written to SCI3nTDR [Clearing condition] • Writing 0 to TDRE after reading TDRE = 1 • When transmit data is written to SCI3nTDR while TE = 1
6	RDRF	Receive Data Register Full Indicates whether or not receive data exists in SCI3nRDR [Setting condition] • When reception finishes successfully and the receive data is transferred from SCI3nRSR to SCI3nRDR [Clearing conditions] • Writing 0 to RDRF after reading RDRF = 1 • When data is read from SCI3nRDR Even when the RE bit in SCI3nSCR is cleared, the RDRF flag is not affected and the previous value is retained. Note that completing the reception of the next data with the RDRF flag set to 1 will cause an overrun error, resulting in the loss of the receive data.
5	ORER	Overrun Error Indicates that an overrun error has occurred during reception and the reception abended. [Setting condition] • When the next data is received while RDRF = 1 In SCI3nRDR, receive data prior to an overrun error is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be continued. In clock synchronous mode, serial transmission also cannot be continued. [Clearing condition] • Writing 0 to ORER after reading ORER = 1 Even when the RE bit in SCI3nSCR is cleared, the ORER flag is not affected and the previous value is retained.

Table 12.14 SCI3nSSR Register Contents (2/2)

Bit Position	Bit Name	Function
4	FER	Framing Error Indicates that a framing error has occurred during reception in asynchronous mode and the reception abended. [Setting condition] • When the stop bit is 0 In 2-stop-bit mode, only whether the first stop bit is 1 is checked but the second stop bit is not checked. Although the receive data when a framing error has occurred is transferred to SCI3nRDR, the RDRF flag is not set. In addition, while the FER flag is set to 1, the subsequent receive data is not transferred to SCI3nRDR. [Clearing condition] • Writing 0 to FER after reading FER = 1 Even when the RE bit in SCI3nSCR is cleared to 0, the FER flag is not affected and the previous value is retained.
3	PER	Parity Error Indicates that a parity error has occurred during reception in asynchronous mode and the reception abended. [Setting condition] • Although the receive data when a parity error has occurred is transferred to SCI3nRDR, the RDRF flag is not set. In addition, while the PER flag is set to 1, the subsequent receive data is not transferred to SCI3nRDR. [Clearing condition] • Writing 0 to PER after reading PER = 1 Even when the RE bit in SCI3nSCR is cleared to 0, the PER flag is not affected and the previous value is retained.
2	TEND	Transmit End [Setting conditions] • When the TE bit in SCI3nSCR is 0 • When the TDRE flag is 1 while the last bit of a transmit character is being transmitted [Clearing condition] • Writing 0 to the TDRE flag after reading TDRE = 1 • When transmit data is written to SCI3nTDR while TE = 1
1	MPB	Multi-processor Bit Holds the value of the multi-processor bit in the received frame.
0	MPBT	Multi-processor Bit Transfer Sets the value of the multi-processor bit to be added to the transmit frame.

12.3.7 SCI3nSCMR — Serial Transfer Format Register

SCI3nSCMR is a register to select transfer format for both asynchronous mode and clock synchronous mode.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 18_H

Value after reset: $F2_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SDIR	SINV	ASTLS	—
Value after reset	1	1	1	1	0	0	1	0
R/W	R	R	R	R	R/W*1	R/W*1	R/W*1	R

Note 1. Writable only when TE = 0 and RE = 0.

Table 12.15 SCI3nSCMR Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	SDIR	Serial Data Transfer Direction (Valid in asynchronous mode and clock synchronous mode) This bit is used to select the direction of serial/parallel conversion. 0: Transfer with LSB-first 1: Transfer with MSB-first This bit is valid only when the transfer format is 8-bit data. For 7-bit data, LSB first transfer is used.
2	SINV	Serial Data Invert (Valid in asynchronous mode and clock synchronous mode) This bit is used to invert the transfer data logic level. The SINV bit does not affect the logic level of the parity bit. To invert the parity bit, invert the PM bit in SCI3nSMR. 0: SCI3nTDR data is transmitted as it is, and receive data is stored in SCI3nRDR as it is. 1: SCI3nTDR data is inverted and transmitted, and receive data is inverted and stored in SCI3nRDR.
1	ASTLS	Asynchronous start bit level detection select (Valid only in asynchronous mode) 0: The beginning of a start bit is detected as a falling edge of the signal on the RxDn input pin. 1: The beginning of a start bit is detected as the low level of the signal on the RxDn input pin.
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

12.3.8 SCI3nSEMR — Serial Extended Mode Register

SCI3nSEMR is a register to select a 1-bit period.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + $1C_H$

Value after reset: 04_H

Bit	7	6	5	4	3	2	1	0
	BRME	MDDRS	—	BGDM	ABCS	RXDMON	—	—
Value after reset	0	0	0	0	0	1	0	0
R/W	R/W*1	R/W*1	R	R/W*1	R/W*1	R	R	R

Note 1. Writable only when TE = 0 and RE = 0.

Table 12.16 SCI3nSEMR Register Contents

Bit Position	Bit Name	Function
7	BRME	Bit Rate Modulation Enable When this bit is set to 1, the bit rate modulation function is enabled.
6	MDDRS	Modulation Duty Register Select This bit is used to select an accessible register. 0: SCI3nBRR is accessible. 1: SCI3nMDDR is accessible.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4	BGDM	Baud Rate Generator Double-Speed Mode Select (only valid in asynchronous mode) This bit selects the frequency of the clock output from the baud rate generator. 0: The Baud rate generator outputs the clock with its normal frequency. 1: The Baud rate generator outputs the clock with its frequency doubled (double-speed operation).
3	ABCS	Asynchronous Reference Clock Select (only valid in asynchronous mode) This bit is used to select the reference clock for 1-bit period. 0: Operates on the reference clock with a frequency of 16 times the transfer rate. 1: Operates on the reference clock with a frequency of 8 times the transfer rate (double-speed operation).
2	RXDMON	Serial Input Data Monitor This bit indicates the RxDn pin state. 0: RxDn pin state is the low level. 1: RxDn pin state is the high level.
1, 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

12.3.9 SCI3nBRR — Bit Rate Register

SCI3nBRR is an 8-bit register to adjust the bit rate. Since each SCI3 channel has an independent baud rate generator, different bit rates can be set for each channel. **Table 12.18** shows the relationship between the setting (N) in SCI3nBRR and the bit rate (B) in normal asynchronous mode and clock synchronous mode. The value after reset of SCI3nBRR is FF_H. SCI3nBRR is allocated at the same address as SCI3nMDDR and is selected when MDDRS in SCI3nSEMR is 0. This register is writable only when TE = 0 and RE = 0.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 04_H

Value after reset: FF_H

Bit	7	6	5	4	3	2	1	0
	BRR							
Value after reset	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 12.17 SCI3nBRR Register Contents

Bit Position	Bit Name	Function
7 to 0	BRR	Baud rate generator setting (0 ≤ N ≤ 255)

Table 12.18 Relationship between Setting N in SCI3nBRR and Bit Rate B

Mode	SCI3nSEMR Setting		Bit Rate	Mean Error
	BGDM Bit	ABCS Bit		
Asynchronous	0	0	$B=\frac{PCLK\times10^6}{64\times2^{2m-1}\times(N+1)}$	$Error\ (\%)=\left\{\frac{PCLK\times10^6}{B\times64\times2^{2m-1}\times(N+1)}-1\right\}\times100$

12.3.10 SCI3nMDDR — Modulation Duty Register

SCI3nMDDR is a register to correct the bit rate adjusted by SCI3nBRR. The value after reset of SCI3nMDDR is FF_H. When the BRME bit in SCI3nSEMR is set to 1, the bit rate generated by the on-chip baud rate generator is corrected to SCI3nMDDR/256 on average. **Table 12.24** shows the relationship between the SCI3nMDDR setting and the bit rate B. SCI3nMDDR is allocated at the same address as SCI3nBRR and is selected when MDDRS in SCI3nSEMR is 1. This register is writable only when TE = 0 and RE = 0. Bit 7 is fixed to 1.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 04_H

Value after reset: FF_H

Bit	7	6	5	4	3	2	1	0
	MDDR							
Value after reset	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

12.4 Functions

12.4.1 Operation in Asynchronous Mode

Figure 12.2 shows the general format for asynchronous serial communications. One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level). In asynchronous serial communications, the communication line is usually held in the mark state (high level). The SCI3 monitors the communication line, and when the SCI3 detects the space state (low level), it recognizes a start bit and starts serial communications. Inside the SCI3, the transmitter and the receiver are independent, enabling full-duplex communications. Both the transmitter and the receiver have a double-buffered structure so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

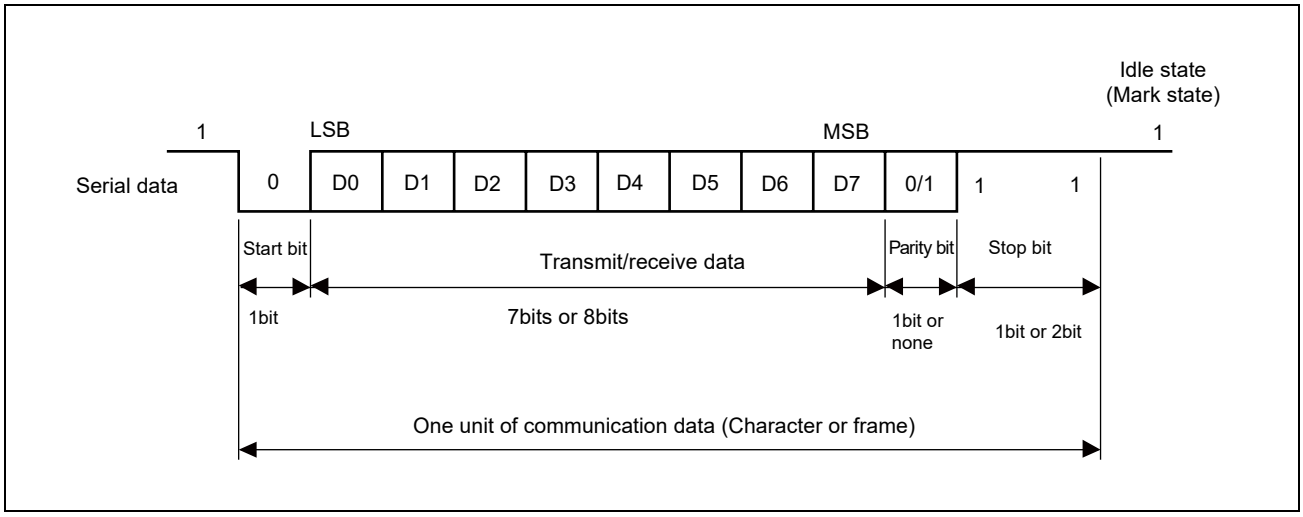

Figure 12.2 Data Format in Asynchronous Serial Communications (Example with 8- Bit Data, Parity, Two Stop Bits)

12.4.1.1 Transmission/Reception Format

Table 12.25 lists settable transmission/reception formats in asynchronous mode. Any of 12 transmission/reception formats can be selected according to the SCI3nSMR setting. For details of the multi-processor bit, see **Section 12.4.2, Multi-Processor Communication Function**.

Table 12.25 Serial Transmission/Reception Formats (Asynchronous Mode)

SMR Setting				Serial Transmission/Reception Format and Frame Length
CHR	PE	MP	STOP	1 2 3 4 5 6 7 8 9 10 11 12
0	0	0	0	S 8-bit data STOP
0	0	0	1	S 8-bit data STOP STOP
0	1	0	0	S 8-bit data P STOP
0	1	0	1	S 8-bit data P STOP STOP
1	0	0	0	S 7-bit data STOP
1	0	0	1	S 7-bit data STOP STOP
1	1	0	0	S 7-bit data P STOP
1	1	0	1	S 7-bit data P STOP STOP
0	–	1	0	S 8-bit data MPB STOP
0	–	1	1	S 8-bit data MPB STOP STOP
1	–	1	0	S 7-bit data MPB STOP
1	–	1	1	S 7-bit data MPB STOP STOP

Note: S: Start bit
STOP: Stop bit
P: Parity bit
MPB: Multi-processor bit

12.4.1.2 Receive Data Sampling Timing and Reception Margin

In asynchronous mode, the SCI3 operates on a reference clock with a frequency of 16 times (8 times when SCI3nSEMR.ABCS = 1) the bit rate. In reception, the SCI3 samples the falling edge of the beginning of the start bit (low level) using the reference clock and performs internal synchronization. As shown in **Figure 12.3**, data is latched at the middle of each bit by sampling receive data at the rising edge of the eighth pulse (fourth pulse when SCI3nSEMR.ABCS = 1) of the reference clock.

Thus the reception margin in asynchronous mode is determined by formula (1) below.

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1+F) \right| \times 100\ [\%] \quad \cdots \text{ Formula (1)}$$

M: Reception margin
N: Ratio of bit rate to clock (N = 16 when ABCS in SCI3nSEMR = 0, N = 8 when ABCS = 1)
D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 12)
F: Absolute value of clock frequency deviation

Assuming that F (absolute value of clock frequency deviation) = 0, D (duty cycle of clock) = 0.5, and N = 16 in formula (1), the reception margin is obtained by the formula below.

$M = \{0.5 - 1 / (2 \times 16)\} \times 100\ [\%] = 46.875\%$

However, this is only the calculated value, and a margin of 20% to 30% should be allowed in system design.

When the bit rate modulation function is used, the reference clock frequency is corrected on average.

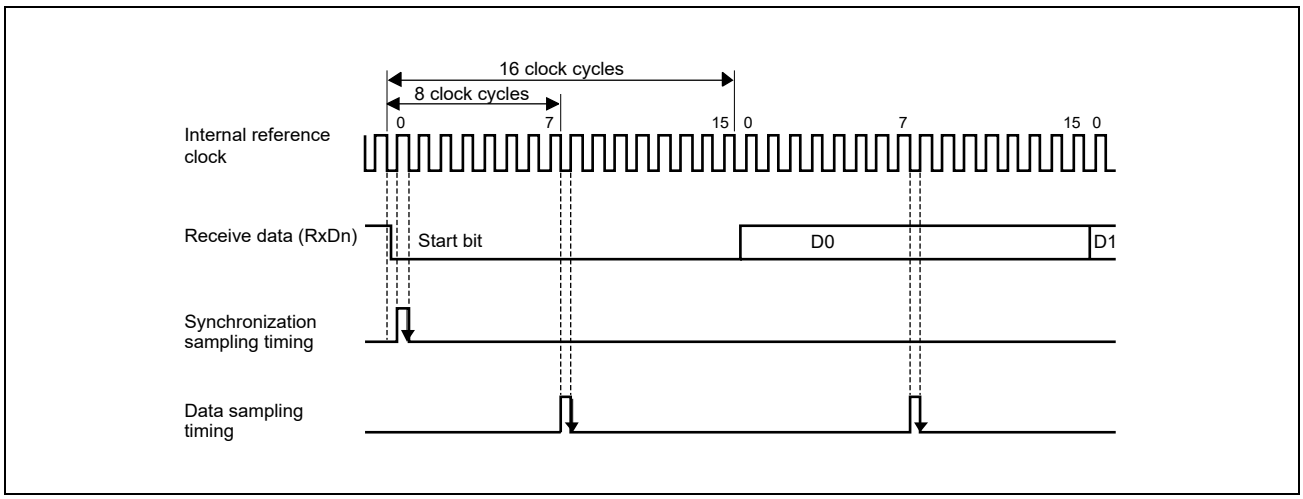

Figure 12.3 Receive Data Sampling Timing in Asynchronous Mode

12.4.1.3 Clock

An internal clock generated by the on-chip baud rate generator can be selected as the SCI3's transmission/reception clock according to the settings of the CM bit in SCI3nSMR and the CKE1 and CKE0 bits in SCI3nSCR. When the SCI3 is operated on an internal clock, the clock can be output from the SCKn pin.

For details of clock synchronous mode, see **Section 12.4.3, Operation in Clock Synchronous Mode**.

In asynchronous mode, the frequency of the clock output is equal to the bit rate and the phase is such that the rising edge of the clock comes at the center of the transmit data, as shown in **Figure 12.4**.

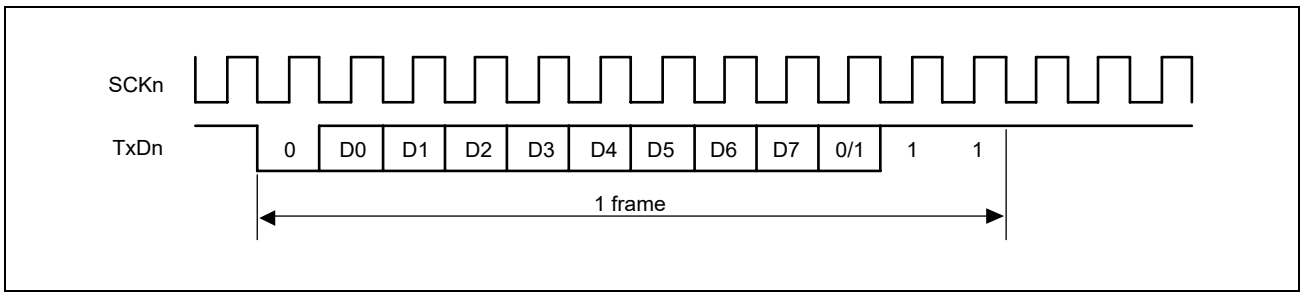

Figure 12.4 Phase Relationship between Output Clock and Transmit Data (Asynchronous Mode)

12.4.1.4 Double-Speed Operation

In addition to the operation described in **Section 12.4.1.3, Clock**, double-speed operation is enabled by the setting of the ABCS bit in SCI3nSEMR.

In double-speed operation, the same operation on a clock with a frequency of 16 times the bit rate in normal operation can be conducted on a clock with a frequency of 8 times the bit rate, meaning that the SCI3 operates on a double transfer rate using the same reference clock.

Setting the BGDM bit of the SCI3nSEMR register to 1 produces a signal derived by halving the frequency period of the reference clock, meaning that the SCI3 operates at double the bit rate when the setting of the BGDM bit is 0.

Selection of double-speed operation by the ABCS and BGDM bits has a multiplicative effect when the on-chip baud rate generator is selected while SCI3nSCR.CKE1 = 0. That is, setting the ABCS and BGDM bits to 1 enables operation at four times the bit rate when the ABCS and BGDM bits are both set to 0.

12.4.1.5 SCI3 Initialization (Asynchronous Mode)

Before transmitting and receiving data, clear the TE and RE bits in SCI3nSCR and then initialize the SCI3 according to the sample flowchart in **Figure 12.5**. Before changing the operating mode or transfer format, be sure to clear the TE and RE bits to 0. Note that clearing the TE bit to 0 sets the TDRE flag to 1, but clearing the RE bit to 0 initializes neither the RDRF, PER, FER, and ORER flags nor SCI3nRDR.

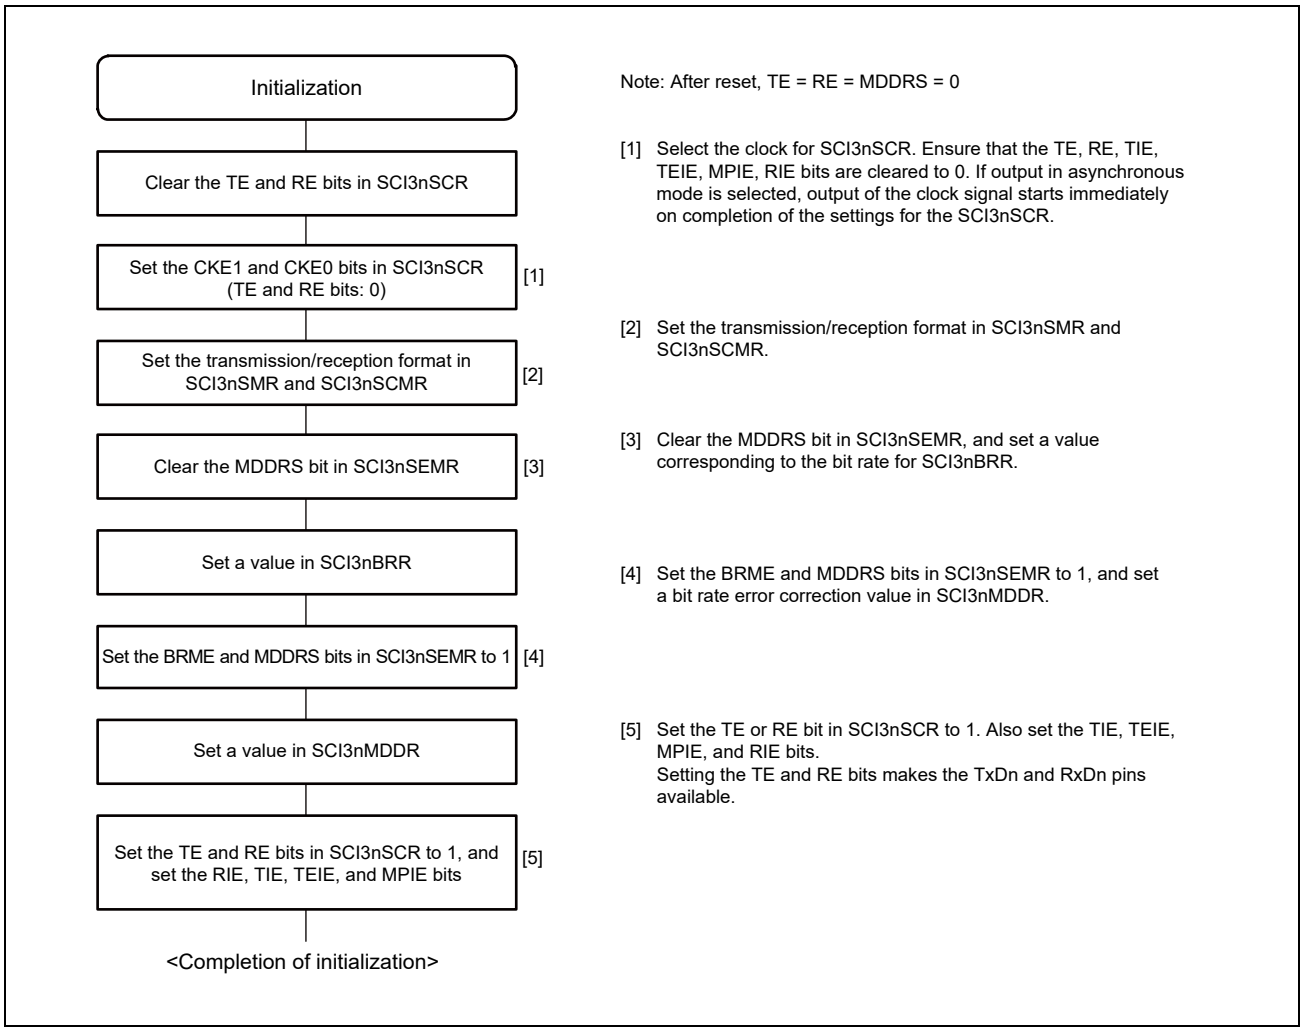

Figure 12.5 Sample Flowchart for SCI3 Initialization

12.4.1.6 Serial data transmission (asynchronous mode)

Figure 12.6 shows an example of operation for data transmission in asynchronous mode. In data transmission, the SCI3 operates as described below.

1. When transmit data is written to SCI3nTDR, the TDRE flag is automatically cleared to 0. The SCI3 monitors the TDRE flag in SCI3nSSR. When the flag is cleared, the SCI3 recognizes that data has been written to SCI3nTDR and transfers data from SCI3nTDR to SCI3nTSR. When writing transmit data to SCI3nTDR at a trigger of TXI interrupt request, set the TIE bit to 1 and then set the TE bit to 1 or set both TIE and TE bits simultaneously with one instruction to generate a TXI interrupt request for starting data transfer.
2. Transmission starts after data is transferred from SCI3nTDR to SCI3nTSR and the TDRE flag is set to 1. If the TIE bit in SCI3nSCR is set to 1 at this time, a TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to SCI3nTDR in this TXI interrupt processing routine before transmission of the previously transferred data is completed. When using a TEI interrupt request, write the last transmit data to SCI3nTDR and then clear the TIE bit to 0 and set the TEIE bit to 1.
3. Data is sent from the TxDn pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The TDRE flag is checked when the stop bit is output.
5. When the TDRE flag is 0, the next transmit data is transferred from SCI3nTDR to SCI3nTSR. After the stop bit has been sent, transmission of the next frame starts.
6. When the TDRE flag is 1, the TEND flag in SCI3nSSR is set to 1, the stop bit is sent, and then 1 is output to enter the mark state. If the TEIE bit in SCI3nSCR is set to 1 at this time, a TEI interrupt request is generated.

Figure 12.7 shows a sample flowchart for data transmission. **Figure 12.8** shows a sample flowchart for stopping the SCI3 after data transmission.

Supplementary note on operation when data transmission in asynchronous mode is enabled

When the TE bit is set to 1, the high level (preamble) is output for a frame. When transmit data is written to SCI3nTDR while the preamble is output, the data is transferred from SCI3nTDR to SCI3nTSR following the completion of the preamble output.

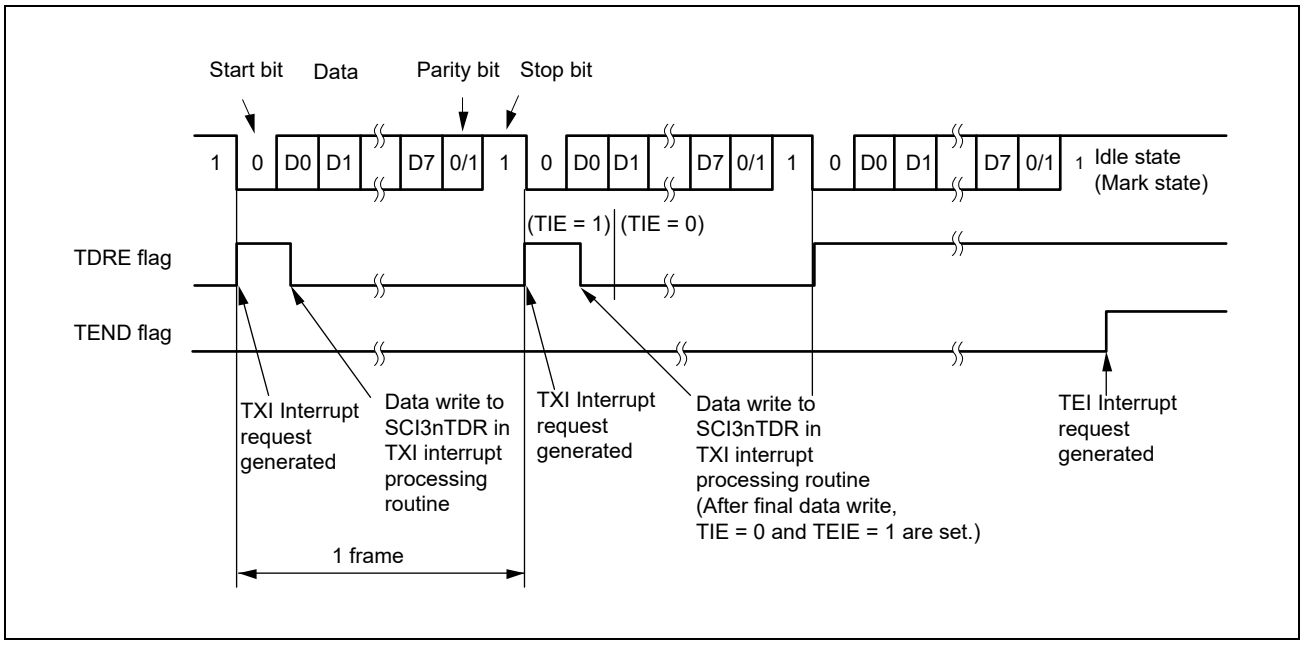

Figure 12.6 Example of Operation for Transmission in Asynchronous Mode (Example with 8-Bit Data, Parity, One Stop Bit)

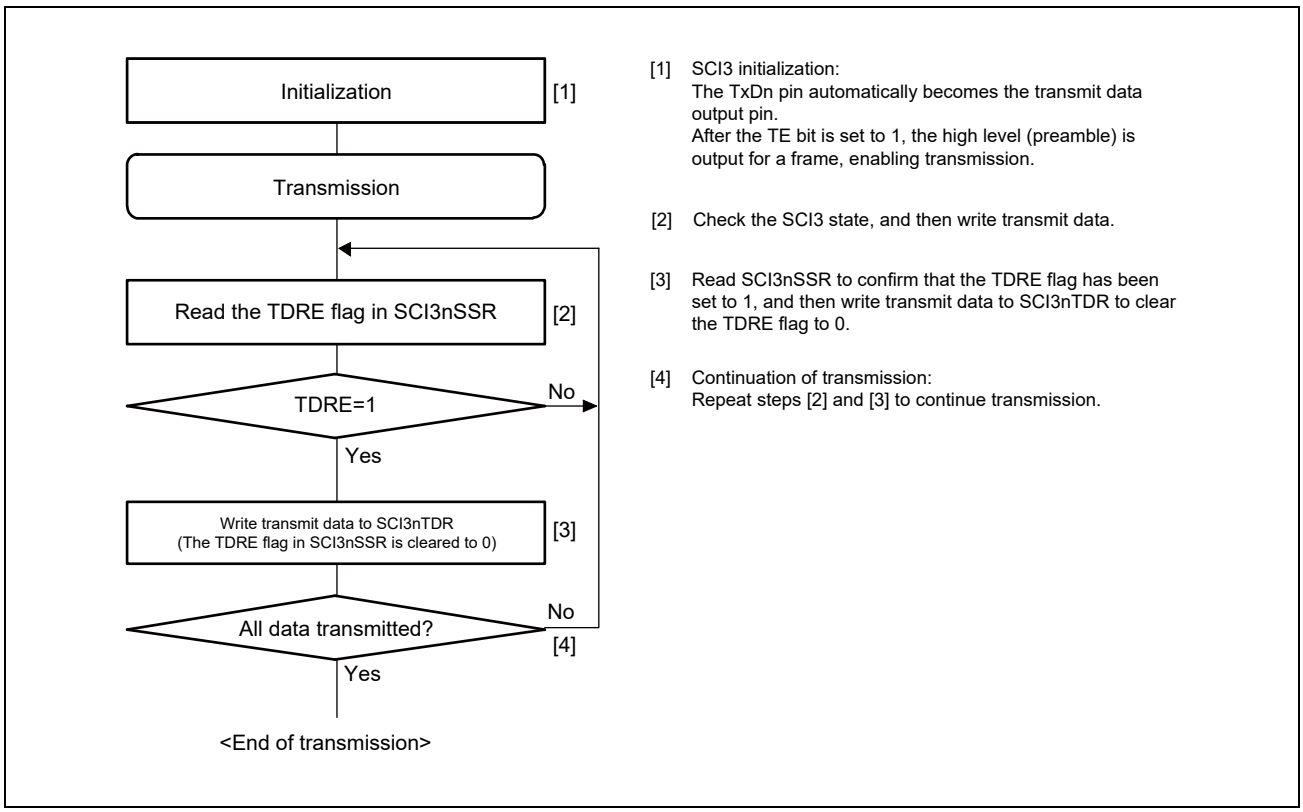

Figure 12.7 Example of Serial Transmission Flowchart

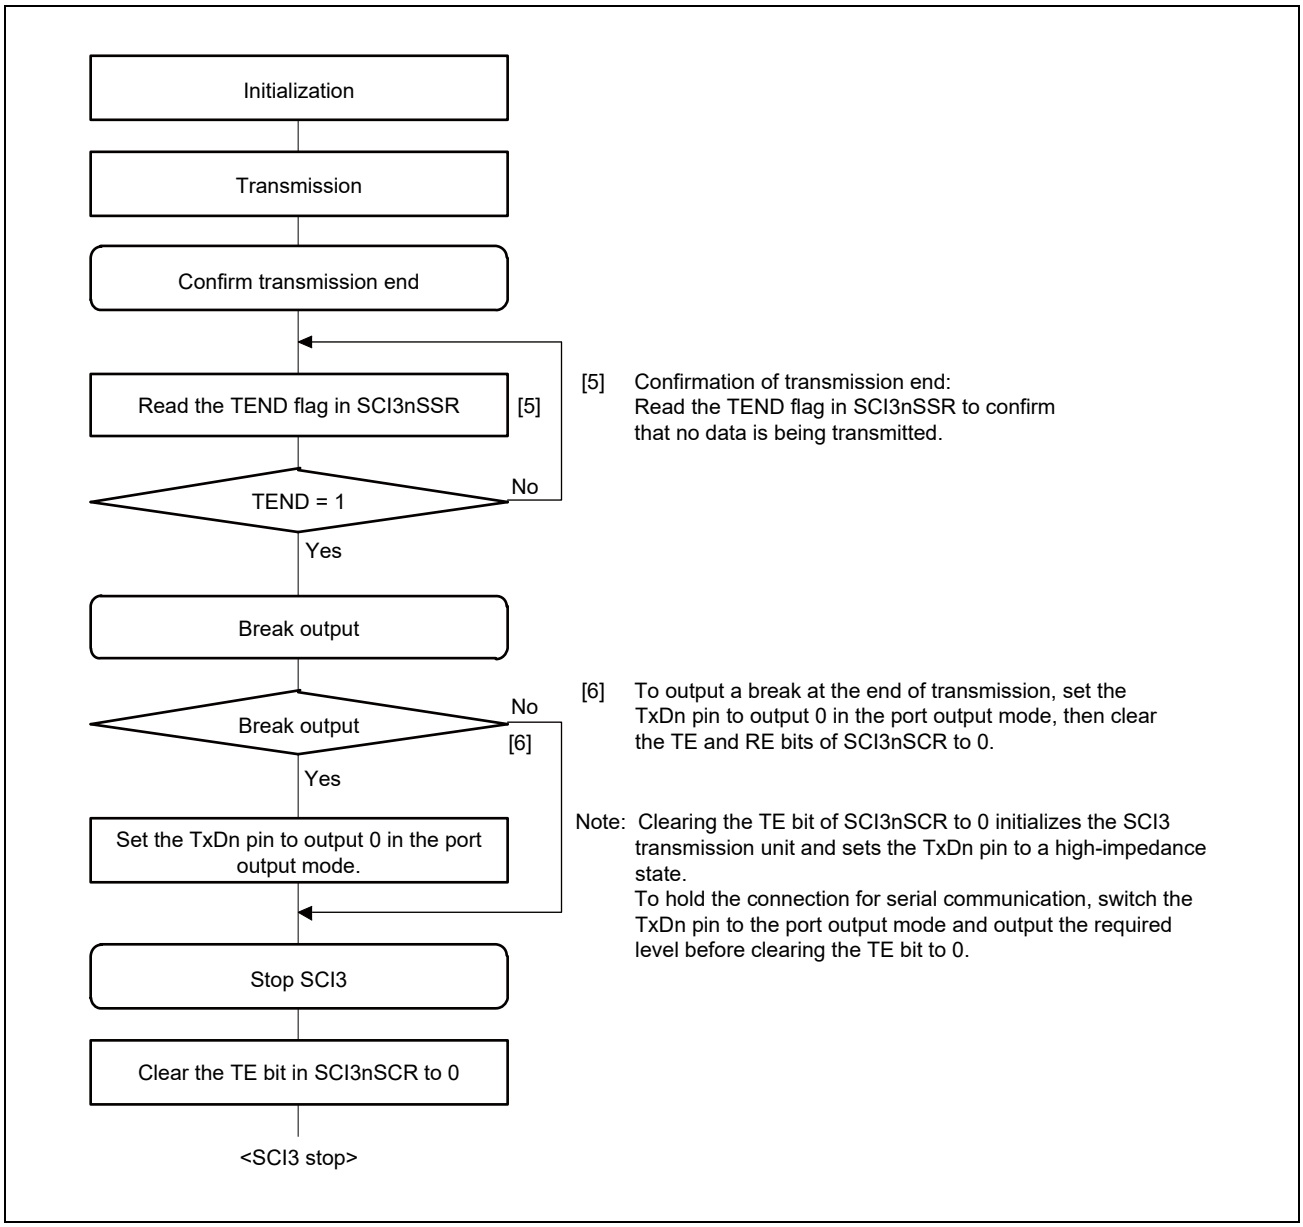

Figure 12.8 Example Flowchart for Stopping the SCI3 after Serial Transmission

12.4.1.7 Serial Data Reception (Asynchronous Mode)

Figure 12.9 shows an example of the operation for data reception in asynchronous mode. In data reception, the SCI3 operates as described below.

1. When the SCI3 monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in SCI3nRSR, and checks the parity bit and the stop bit.
2. When an overrun error occurs (the next data has been received with the RDRF flag in SCI3nSSR set to 1), the ORER flag in SCI3nSSR is set to 1. If the RIE bit in SCI3nSCR is set to 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to SCI3nRDR. The RDRF flag retains the state of being set to 1.
3. When a parity error is detected, the PER flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an ERI interrupt request is generated.
4. When a framing error (when the stop bit is 0) is detected, the FER flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an ERI interrupt request is generated.
5. When reception finishes successfully, the RDRF flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to SCI3nRDR in this RXI interrupt processing routine before reception of the next receive data is completed. Reading SCI3nRDR automatically clears the RDRF flag to 0.

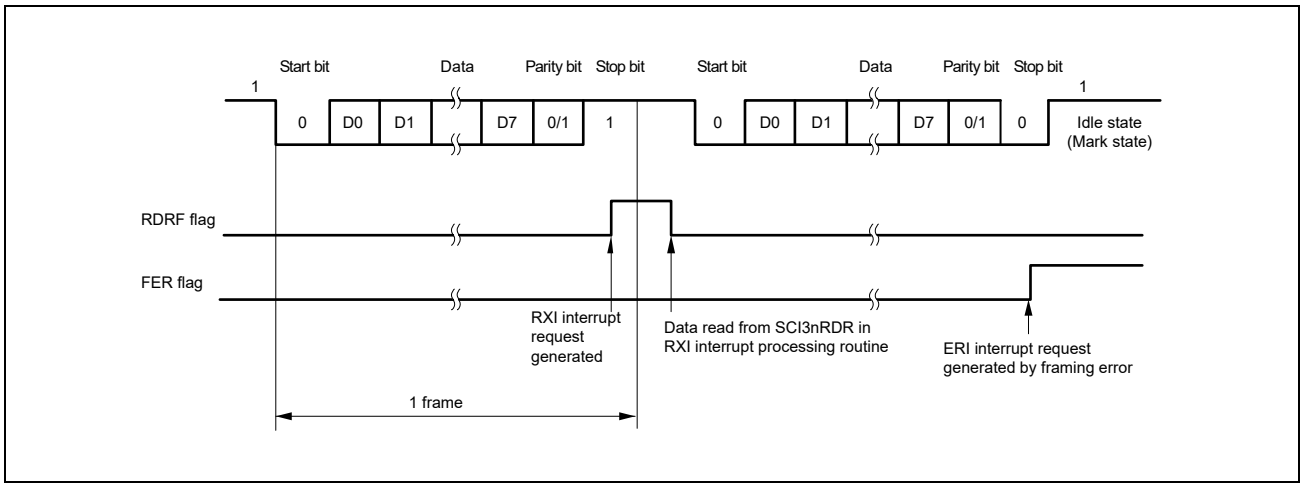

Figure 12.9 Example of SCI3 Reception (Example with 8-Bit Data, Parity, One Stop Bit)

Table 12.26 lists the states of the SCI3nSSR status flags and receive data handling when a receive error is detected. When a receive error is detected, the RDRF flag retains the status before receiving the data. Subsequent data reception is disabled while a receive error flag is set to 1. Accordingly, clear the ORER, FER, PER, and RDRF flags before continuing data reception. **Figure 12.10** shows a sample flowchart for data reception.

Table 12.26 SCI3nSSR Status Flags and Receive Data Handling

SCI3nSSR Status Flags					
RDRF*1	ORER	FER	PER	Receive Data	Receive Status
1	0	0	0	Transferred to SCI3nRDR	Successful reception
0	0	1	0	Transferred to SCI3nRDR	Framing error
0	0	0	1	Transferred to SCI3nRDR	Parity error
0	0	1	1	Transferred to SCI3nRDR	Framing error + parity error
1*	1	0	0	Lost	Overrun error
1*	1	1	0	Lost	Overrun error + framing error
1*	1	0	1	Lost	Overrun error + parity error
1*	1	1	1	Lost	Overrun error + framing error + parity error

Note 1. In the case of an overrun error, the RDRF flag retains the state before the data reception.

Note: A sign “+” indicates that two or more receive states occur simultaneously in a single reception operation.

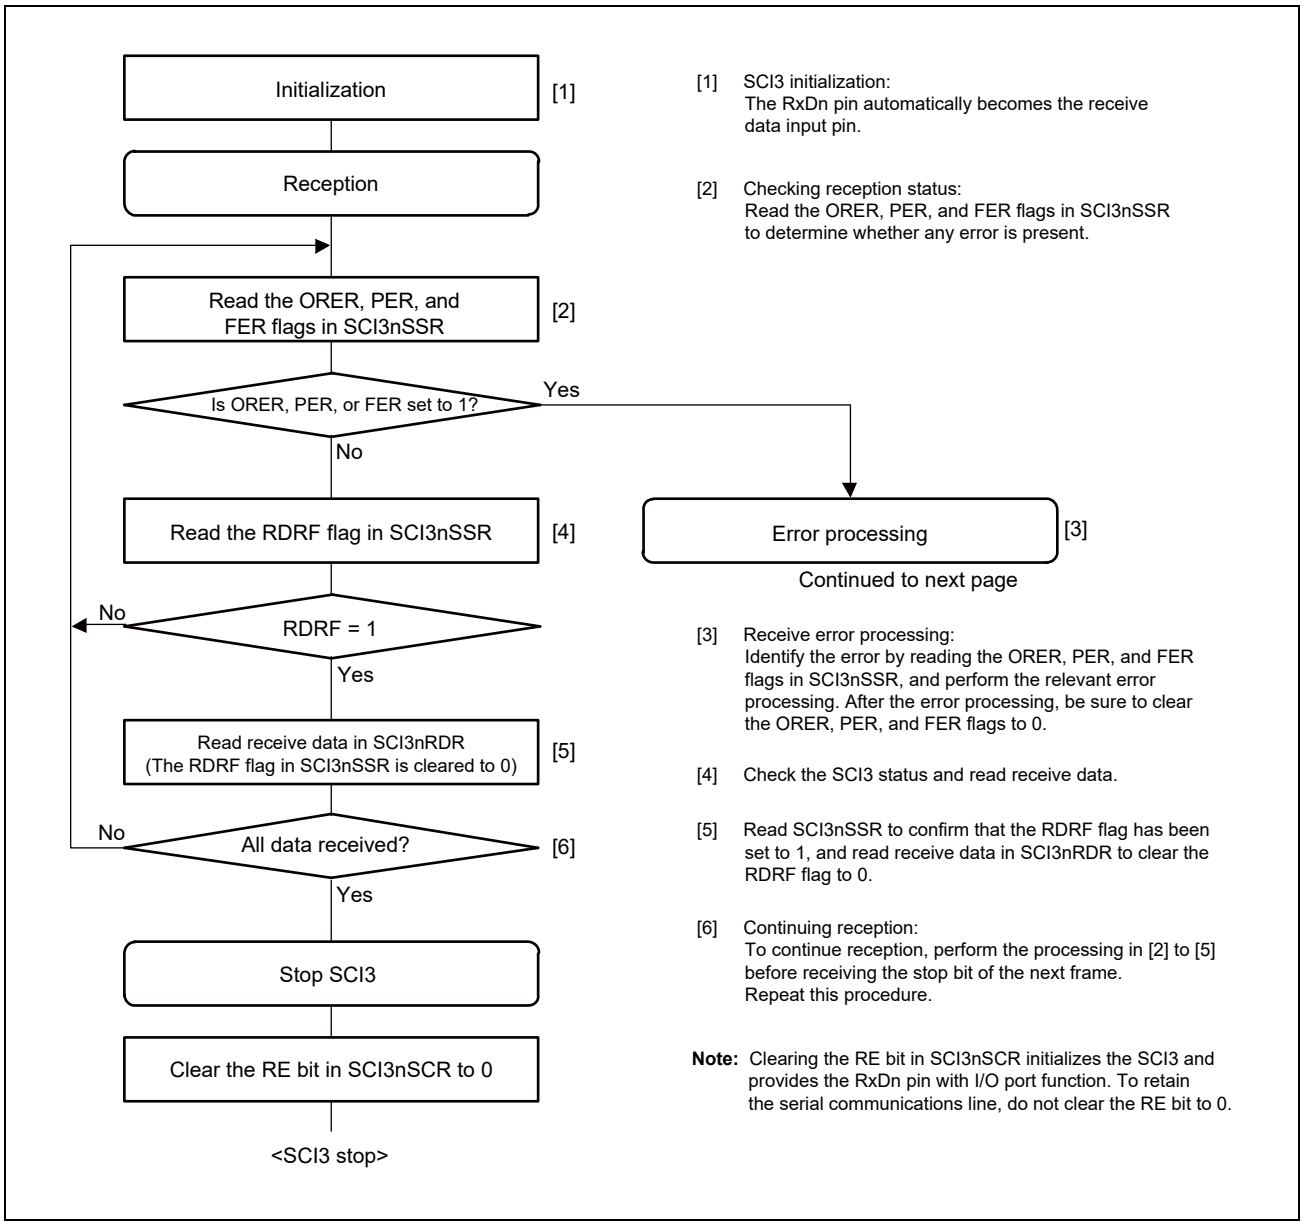

Figure 12.10 Example of Serial Reception Flowchart (1)

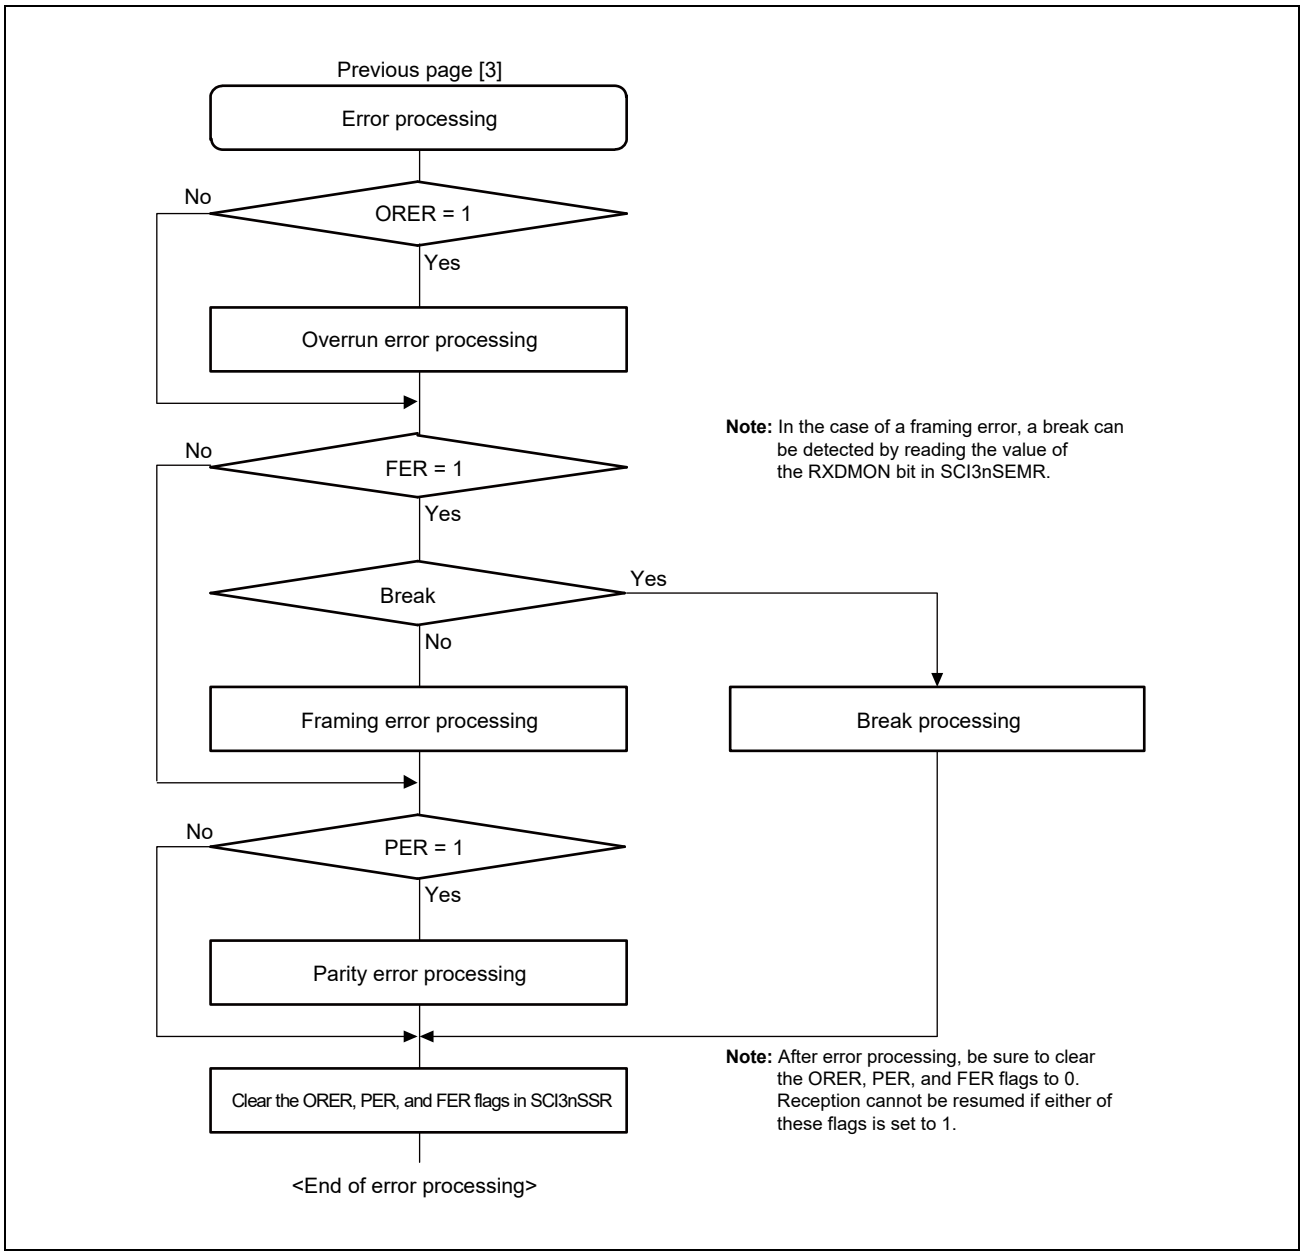

Figure 12.11 Example of Serial Reception Flowchart (2)

12.4.2 Multi-Processor Communication Function

12.4.2.1 Overview and Sample Connection

Using the multi-processor communication function allows data transmission and reception by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish the ID transmission cycle from the data transmission cycle. When the multi-processor bit is set to 1, it indicates the ID transmission cycle. When the multi-processor bit is set to 0, it indicates the data transmission cycle. **Figure 12.12** shows an example of communication between processors by using the multi-processor format. First, a transmitting station sends communication data in which the multi-processor bit (= 1) is added to the ID code of the receiving station. Next, the transmitting station sends communication data in which the multi-processor bit (= 0) is added to the transmit data. Upon receiving the communication data in which the multi-processor bit is set to 1, the receiving station compares the received ID with the ID of the receiving station itself. When these IDs match, the receiving station receives communication data that is subsequently transmitted. If these IDs do not match, the receiving station skips communication data until it receives communication data in which the multi-processor bit is set to 1.

To support this function, the SCI3 provides the MPIE bit in SCI3nSCR. When the MPIE bit is set to 1, transfer of receive data from SCI3nRSR to SCI3nRDR, detection of a receive error, and setting the RDRF, FER, and ORER flags in SCI3nSSR are disabled until data in which the multi-processor bit is set to 1 is received. Upon receiving a character in which the multi-processor bit is set to 1, the MPB bit in SCI3nSSR is set to 1 and the MPIE bit is automatically cleared to 0, thus returning to a normal reception operation. When the RIE bit in SCI3nSCR is set to 1 at this time, an RXI interrupt request is generated. While the MPIE bit is cleared to 0, reception operation is conducted regardless of the multi-processor bit value. The multi-processor bit is stored in the MPB bit in SCI3nSSR.

When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the normal asynchronous mode. A clock that is used for multi-processor communications is also the same as the clock used in the normal asynchronous mode.

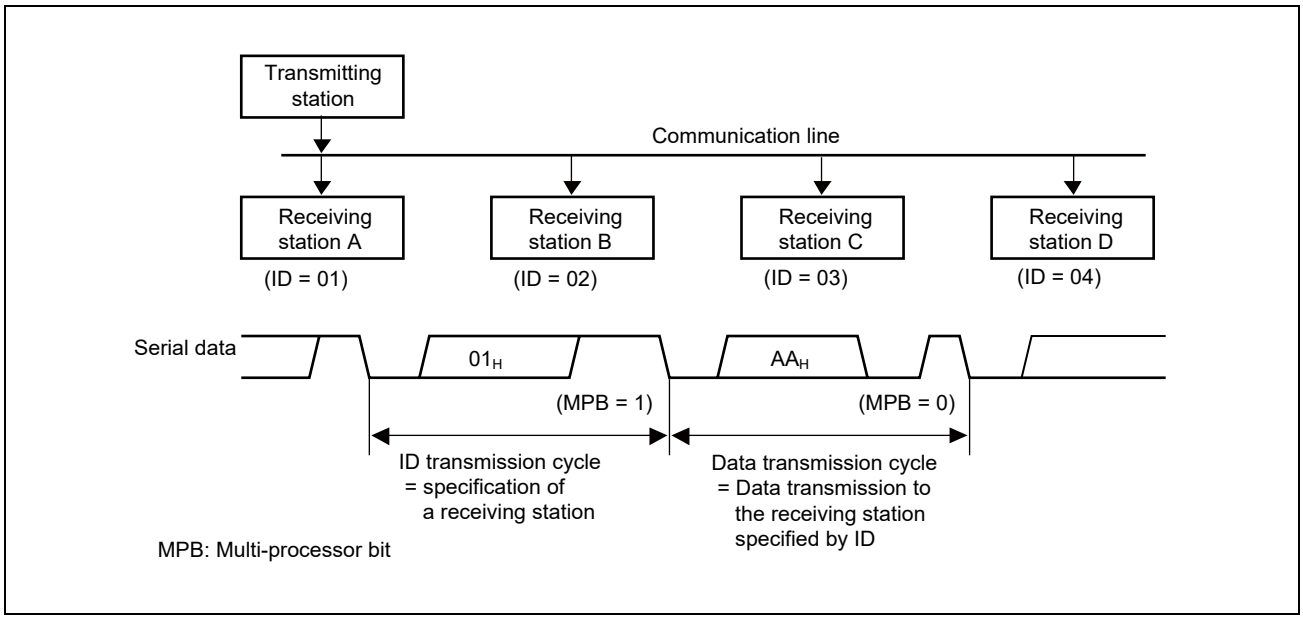

Figure 12.12 Example of Communication Using the Multi-Processor Format (Example of Transmission of Data AA_H to Receiving Station A)

12.4.2.2 Multi-processor serial data transmission

Figure 12.13 shows a sample flowchart of multi-processor data processing. In the ID transmission cycle, send the ID with the MPBT bit in SCI3nSSR set to 1. In the data transmission cycle, send data with the MPBT bit in SCI3nSSR cleared to 0. Other operations are the same as operations in asynchronous mode.

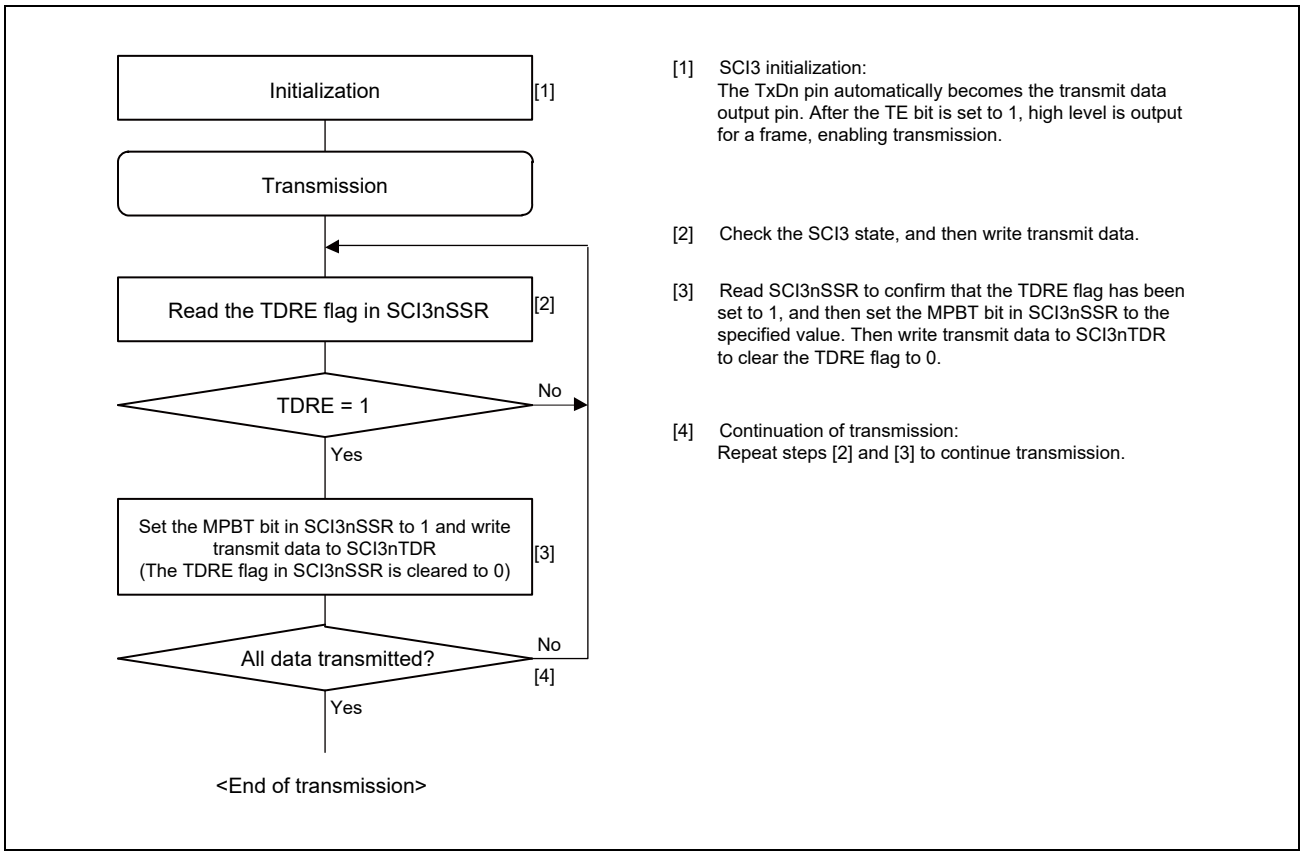

Figure 12.13 Example of Multi-Processor Serial Transmission Flowchart

12.4.2.3 Multi-processor serial data reception

Figure 12.15 to **Figure 12.17** shows sample flowcharts of multi-processor data reception. When the MPIE bit in SCI3nSCR is set to 1, reading the communication data is skipped until communication data in which the multi-processor bit is set to 1 is received. When communication data in which the multi-processor bit is set to 1 is received, the receive data is transferred to SCI3nRDR. At this time, an RXI interrupt request is generated. Other operations are the same as operations in asynchronous mode. **Figure 12.14** shows an example of operation for reception.

CAUTION

Do not write data to SCI3nSCR when communication data in which the multi-processor bit is set to 1 is received. The MPIE bit may not become the desired state.

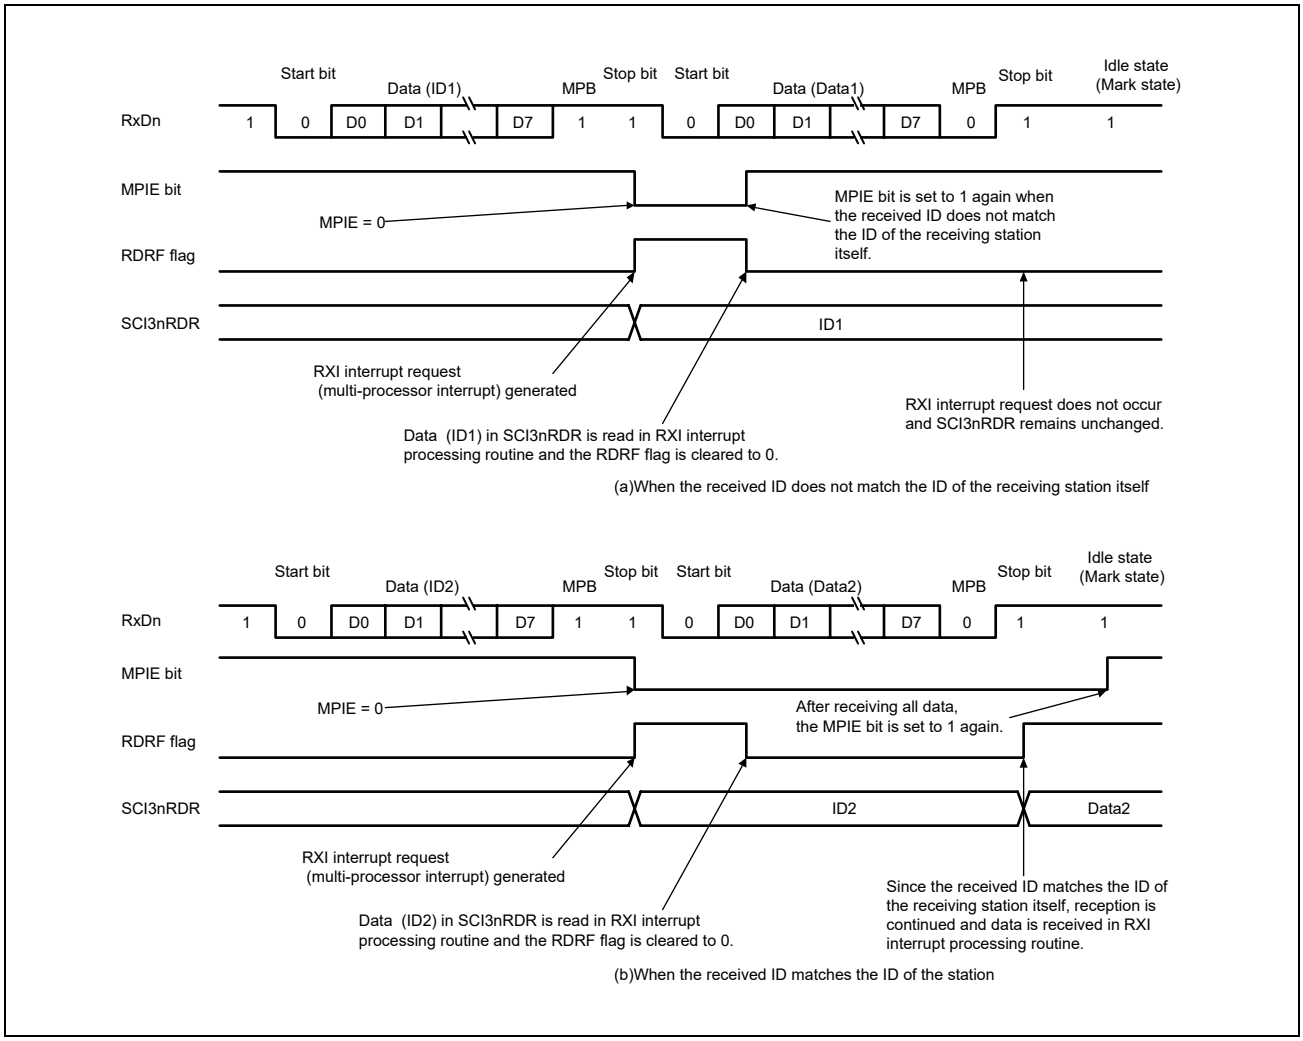

Figure 12.14 Example of SCI3 Reception (8-Bit Data, Multi-Processor Bit, One Stop Bit)

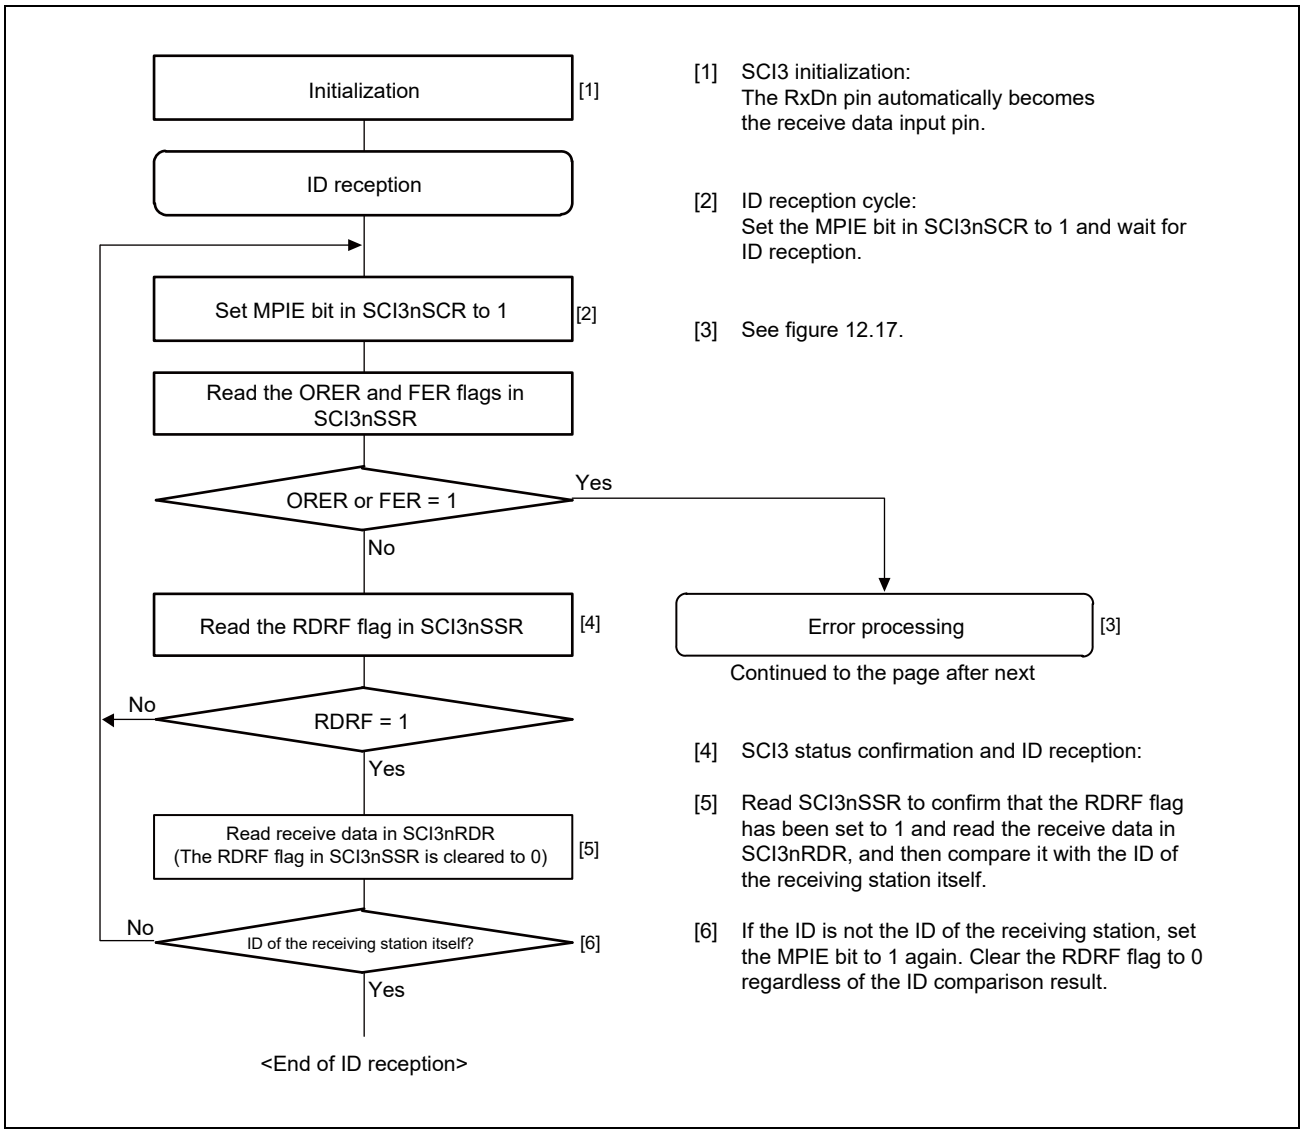

Figure 12.15 Example of Multi-Processor Serial Reception Flowchart (1)

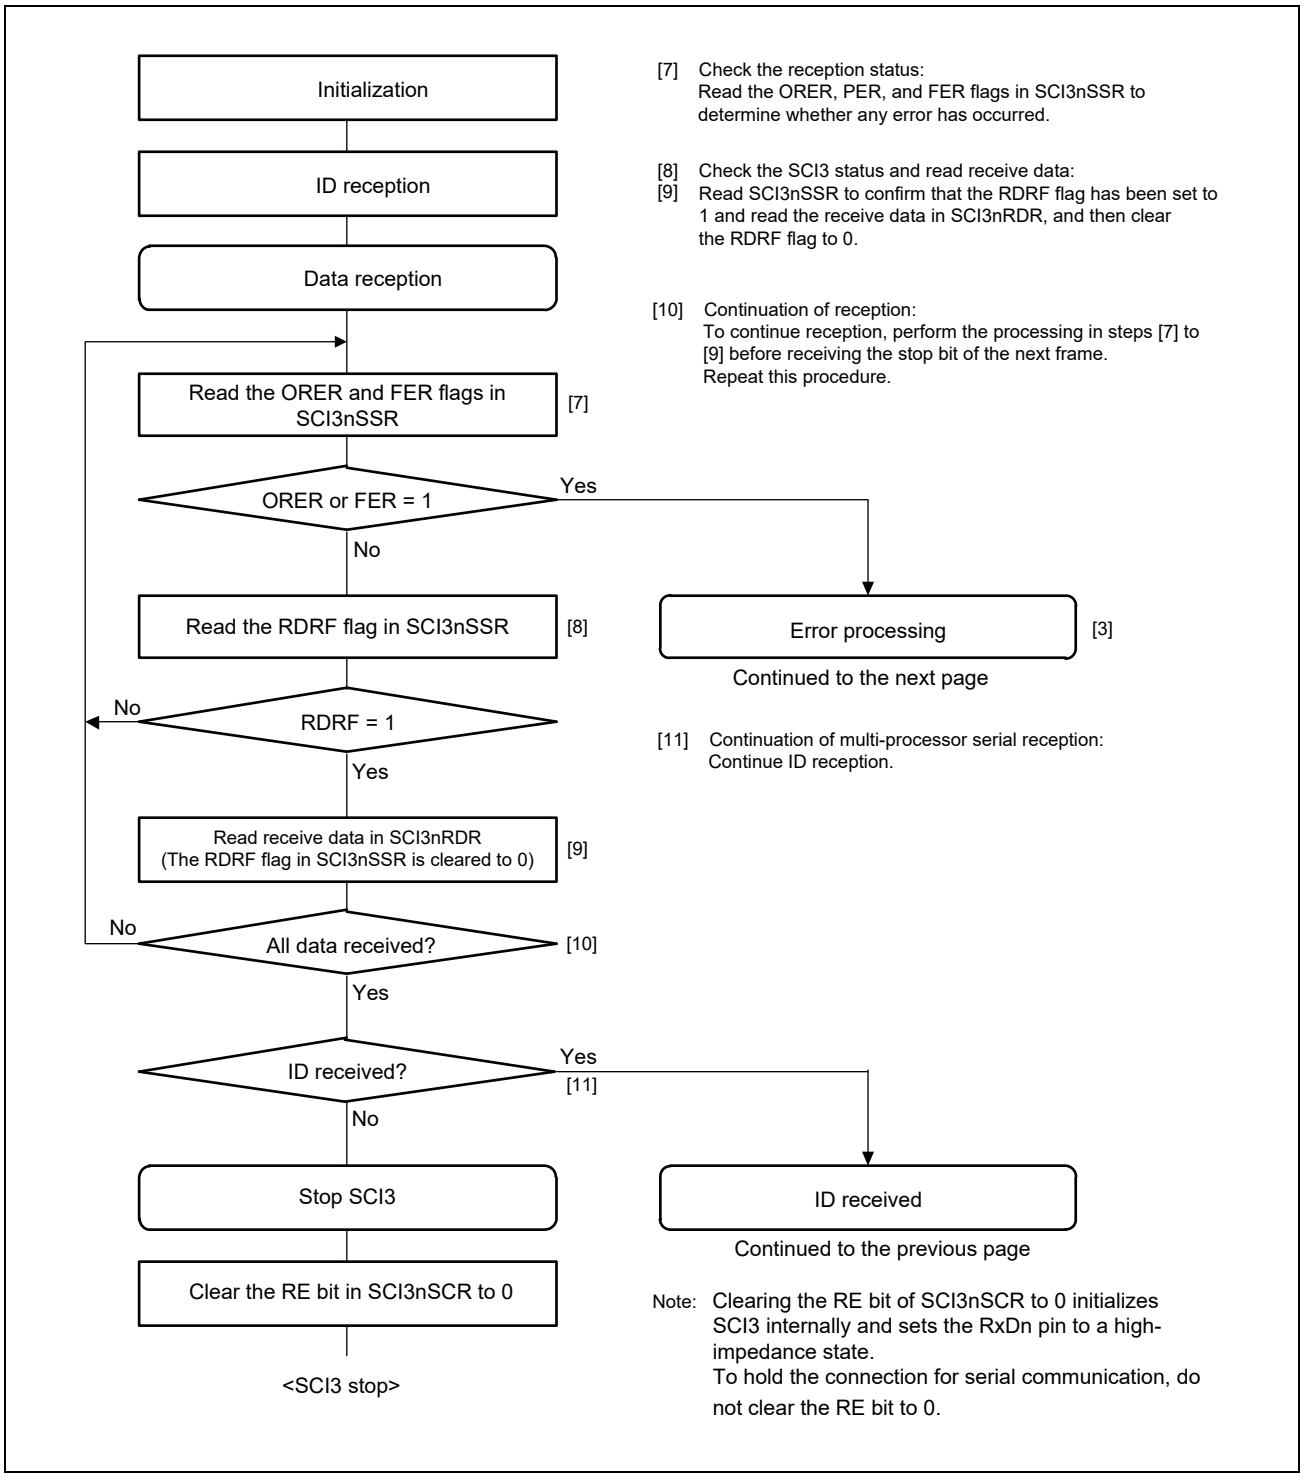

Figure 12.16 Example of Multi-Processor Serial Reception Flowchart (2)

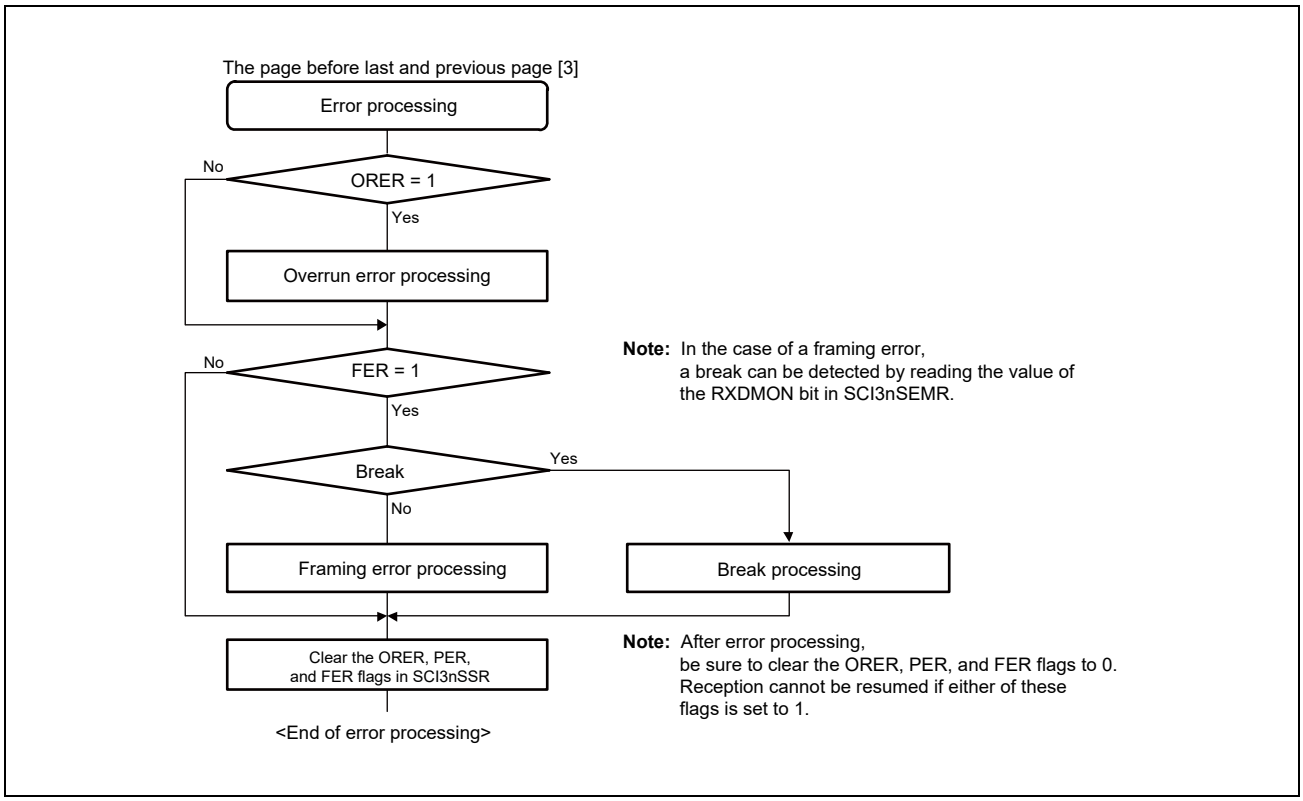

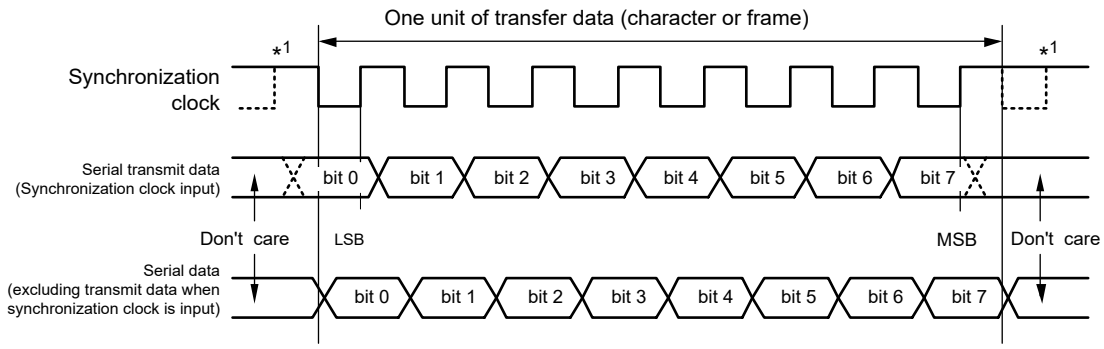

Figure 12.17 Example of Multi-Processor Serial Reception Flowchart (3)

12.4.3 Operation in Clock Synchronous Mode

Figure 12.18 shows the data format for clock synchronous serial data communication. In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In data transmission with the synchronization clock output, the SCI3 outputs data from one falling edge to the next falling edge of the synchronization clock. In data transmission with the synchronization clock input, the SCI3 outputs the first data (bit 0) after starting transfer immediately after clearing the TDRE bit in SCI3nSSR to 0, and then outputs the next bit data after 2 to 3 PCLK clock cycles from the falling edge of the synchronization clock. In data reception, the SCI3 receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the communication line holds the last-bit output state. In clock synchronous mode, neither parity bit nor multi-processor bit can be added. The transmitter and the receiver are independent in the SCI3, enabling full-duplex communication by using a common clock. Both the transmitter and the receiver have a double-buffered structure so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.

Note 1. Holds a high level except during continuous transmission/reception.

Figure 12.18 Data Format in Clock Synchronous Mode (LSB-First)

12.4.3.1 Clock

An internal clock generated by the on-chip baud rate generator or an external synchronous clock that is input from the SCKn pin can be selected by the setting of the CKE1 and CKE0 bits in SCI3nSCR. When operating the SCI3 on the internal clock, a synchronous clock is output from the SCKn pin. Eight pulses of the synchronous clock are output during transfer of one character, and the clock is held high while no data is transferred.

12.4.3.2 SCI3 initialization (clock synchronous mode)

Before transmitting and receiving data, clear the TE and RE bits in SCI3nSCR to 0 and then initialize the SCI3 according to the sample flowchart in **Figure 12.19**. To switch the operation between transmission, reception, and transmission/reception, clear the TE and RE bits to 0 and then set these bits to the desired value. Before changing the transfer format, be sure to clear the TE and RE bits to 0. Note that clearing the TE bit to 0 sets the TDRE flag to 1, but clearing the RE bit to 0 initializes neither the RDRF, PER, FER, and ORER flags nor SCI3nRDR.

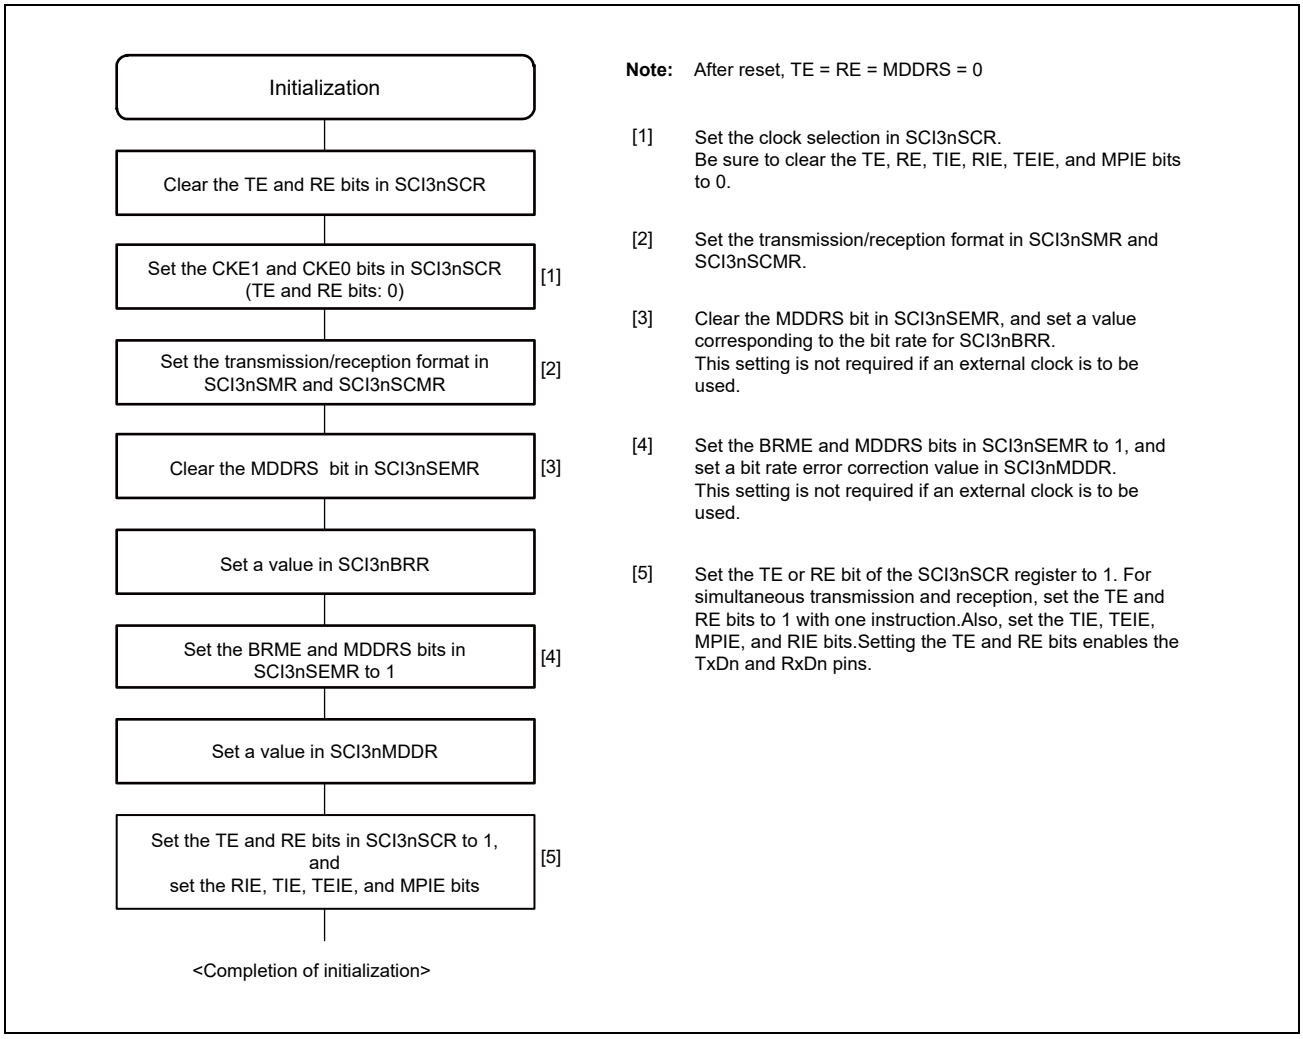

Figure 12.19 Example of SCI3 Initialization Flowchart

12.4.3.3 Serial data transmission (clock synchronous mode)

Figure 12.20 shows an example of the operation for serial transmission in clock synchronous mode. In serial data transmission, the SCI3 operates as described below.

1. When transmit data is written to SCI3nTDR, the TDRE flag is automatically cleared to 0. The SCI3 monitors the TDRE flag in SCI3nSSR. When the flag is cleared, the SCI3 recognizes that data has been written to SCI3nTDR and transfers data from SCI3nTDR to SCI3nTSR, starting output of the first bit when the synchronization clock is input. To write transmit data to SCI3nTDR at a trigger of TXI interrupt request, set the TIE bit to 1 and then set the TE bit to 1 or set both TIE and TE bits simultaneously with one instruction to generate a TXI interrupt request for starting data transfer.
2. Transmission starts after data is transferred from SCI3nTDR to SCI3nTSR, and the TDRE flag is set to 1. When the TIE bit in SCI3nSCR is set to 1 at this time, a TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to SCI3nTDR in this TXI interrupt processing routine before the previously transferred data has been transmitted. When a TEI interrupt request is used, the TIE bit is cleared to 0 after the last transmit data has been written to SCI3nTDR, and the TEIE bit is set to 1.
3. 8-bit data is output from the TxDn pin in synchronization with the output clock (when clock output mode has been specified) or in synchronization with the input clock (when external clock has been specified).
4. The SCI3 checks for the TDRE flag at the time of the last bit output.
5. When the TDRE flag is 0, the next transmit data is transferred from SCI3nTDR to SCI3nTSR, and serial transmission of the next frame starts.
6. When the TDRE flag is 1, the TEND flag in SCI3nSSR is set to 1 and the TxDn pin retains the output state of the last bit. If the TEIE bit in SCI3nSCR is set to 1 at this time, a TEI interrupt request is generated. The SCKn pin is held high.

Figure 12.21 shows a sample flowchart of serial data transmission. Also, **Figure 12.22** shows a sample flowchart for stopping the SCI3 after data transmission. Transmission will not start even if the TDRE flag is cleared while a receive error flag (ORER) is set to 1. Be sure to clear the receive error flags to 0 before starting transmission. Note that clearing the RE bit to 0 does not clear the receive error flags.

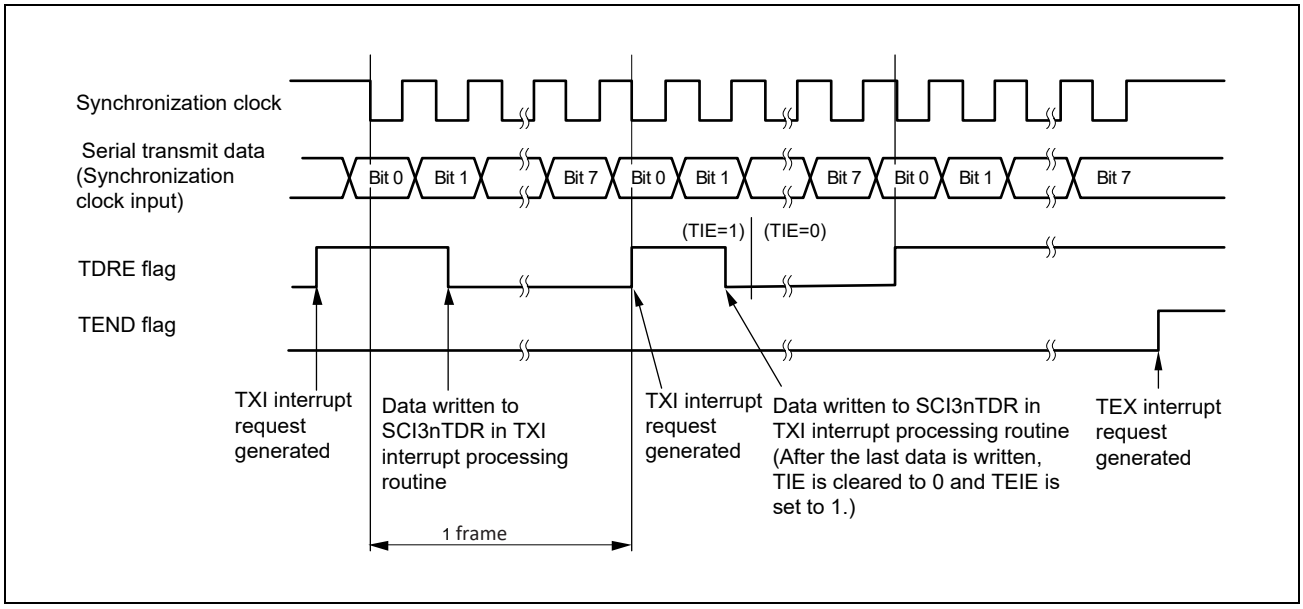

Figure 12.20 Example of Operation for Transmission in Clock Synchronous Mode

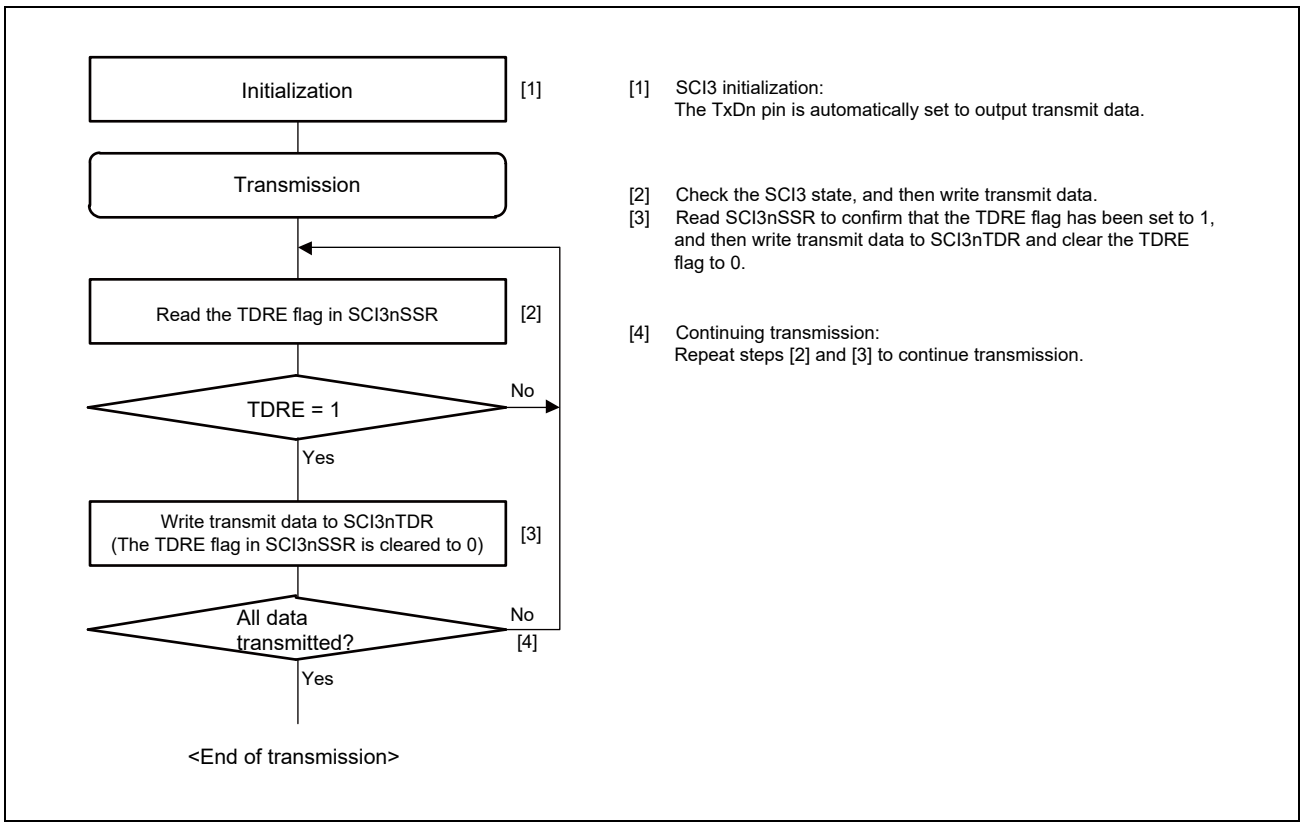

Figure 12.21 Example of Serial Transmission Flowchart

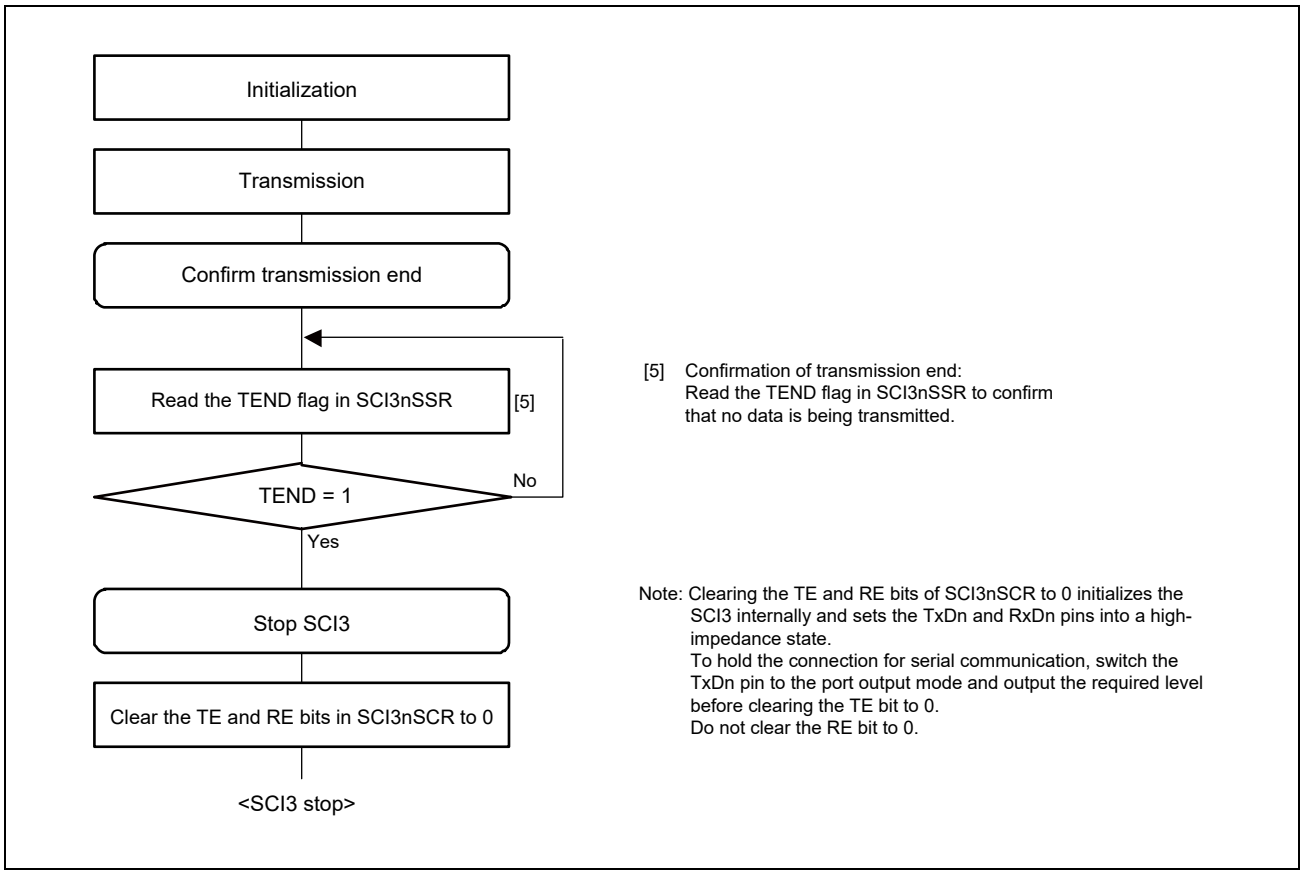

Figure 12.22 Example Flowchart for Stopping the SCI3 after Serial Transmission

12.4.3.4 Serial data reception (clock synchronous mode)

Figure 12.23 shows an example of SCI3 operation for serial reception in clock synchronous mode. In serial data reception, the SCI3 operates as described below.

1. The SCI3 performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores receive data in SCI3nRSR.
2. When an overrun error occurs (the reception of the next data is completed with the RDRF flag in SCI3nSSR set to 1), the ORER flag in SCI3nSSR is set to 1. If the RIE bit in SCI3nSCR is set to 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to SCI3nRDR. The RDRF flag retains the state of being set to 1.
3. When data has been successfully received, the RDRF flag in SCI3nSSR is set to 1 and the receive data is transferred to SCI3nRDR. When the RIE bit in SCI3nSCR is set to 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to SCI3nRDR in this RXI interrupt processing routine before reception of the next data is completed. Reading SCI3nRDR automatically clears the RDRF flag to 0.

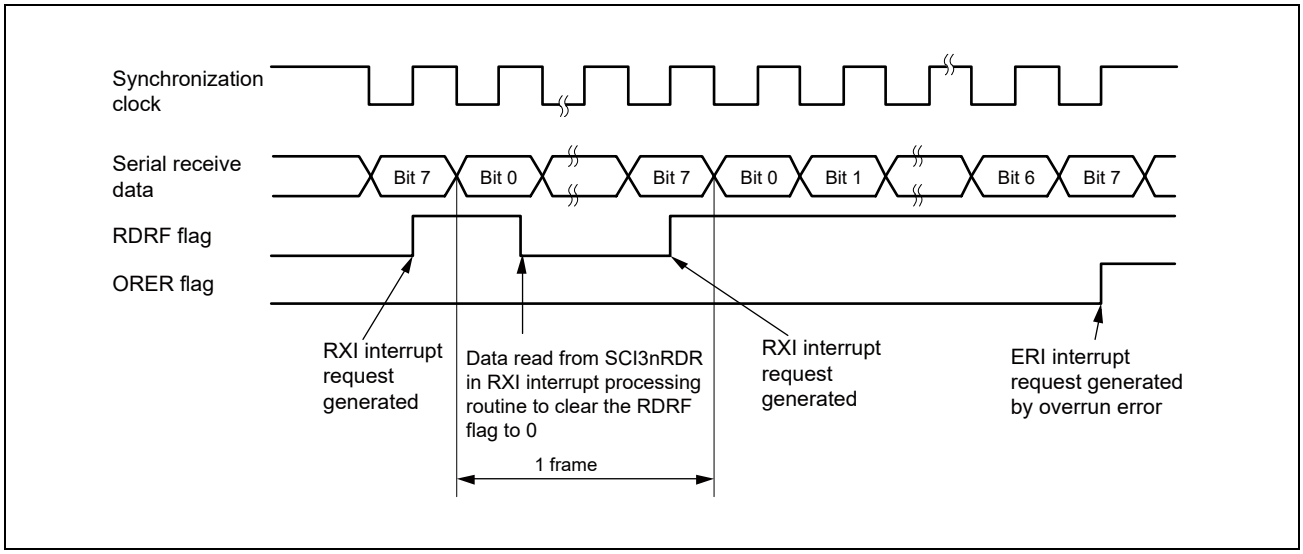

Figure 12.23 Example of SCI3 Reception

Subsequent transmission and reception are disabled with a receive error flag set to 1. Therefore, be sure to clear the ORER, FER, PER, and RDRF flags before continuing reception. **Figure 12.24** shows an example of flowchart for data reception.

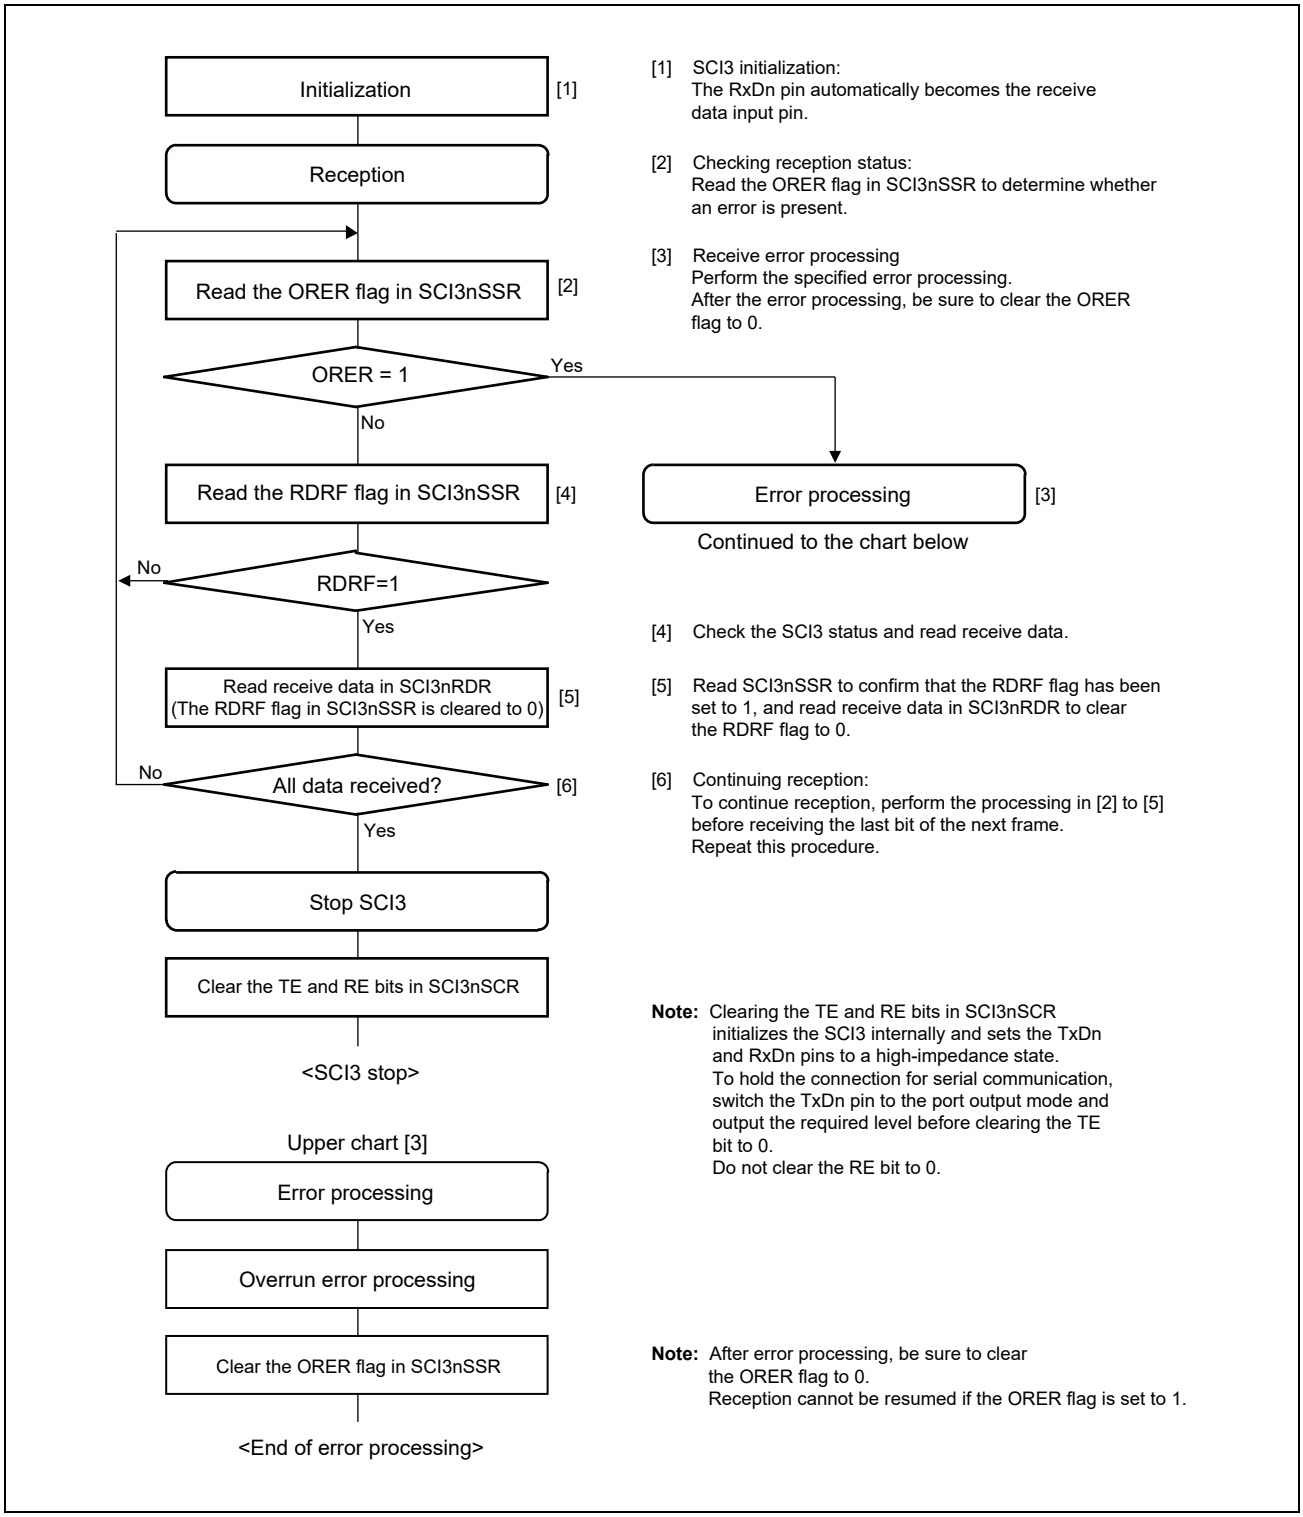

Figure 12.24 Example of Serial Reception Flowchart

12.4.3.5 Simultaneous serial data transmission and reception (clock synchronous mode)

Figure 12.25 shows a sample flowchart for simultaneous data transmit and receive operations. After the SCI3 is initialized, perform the following procedure for simultaneous data transmit and receive operations.

1. To change transmit mode to simultaneous transmit and receive mode, check that the SCI3 has finished transmission and the TDRE and TEND flags are set to 1. Then clear the TE bit to 0 and then set the TE and RE bits to 1 with a single instruction.
2. To change receive mode to simultaneous transmit and receive mode, check that the SCI3 has finished reception and clear the RE bit to 0. Then check that the RDRF and error flags (ORER, FER, and PER) are cleared to 0 and then set the TE and RE bits to 1 with a single instruction.

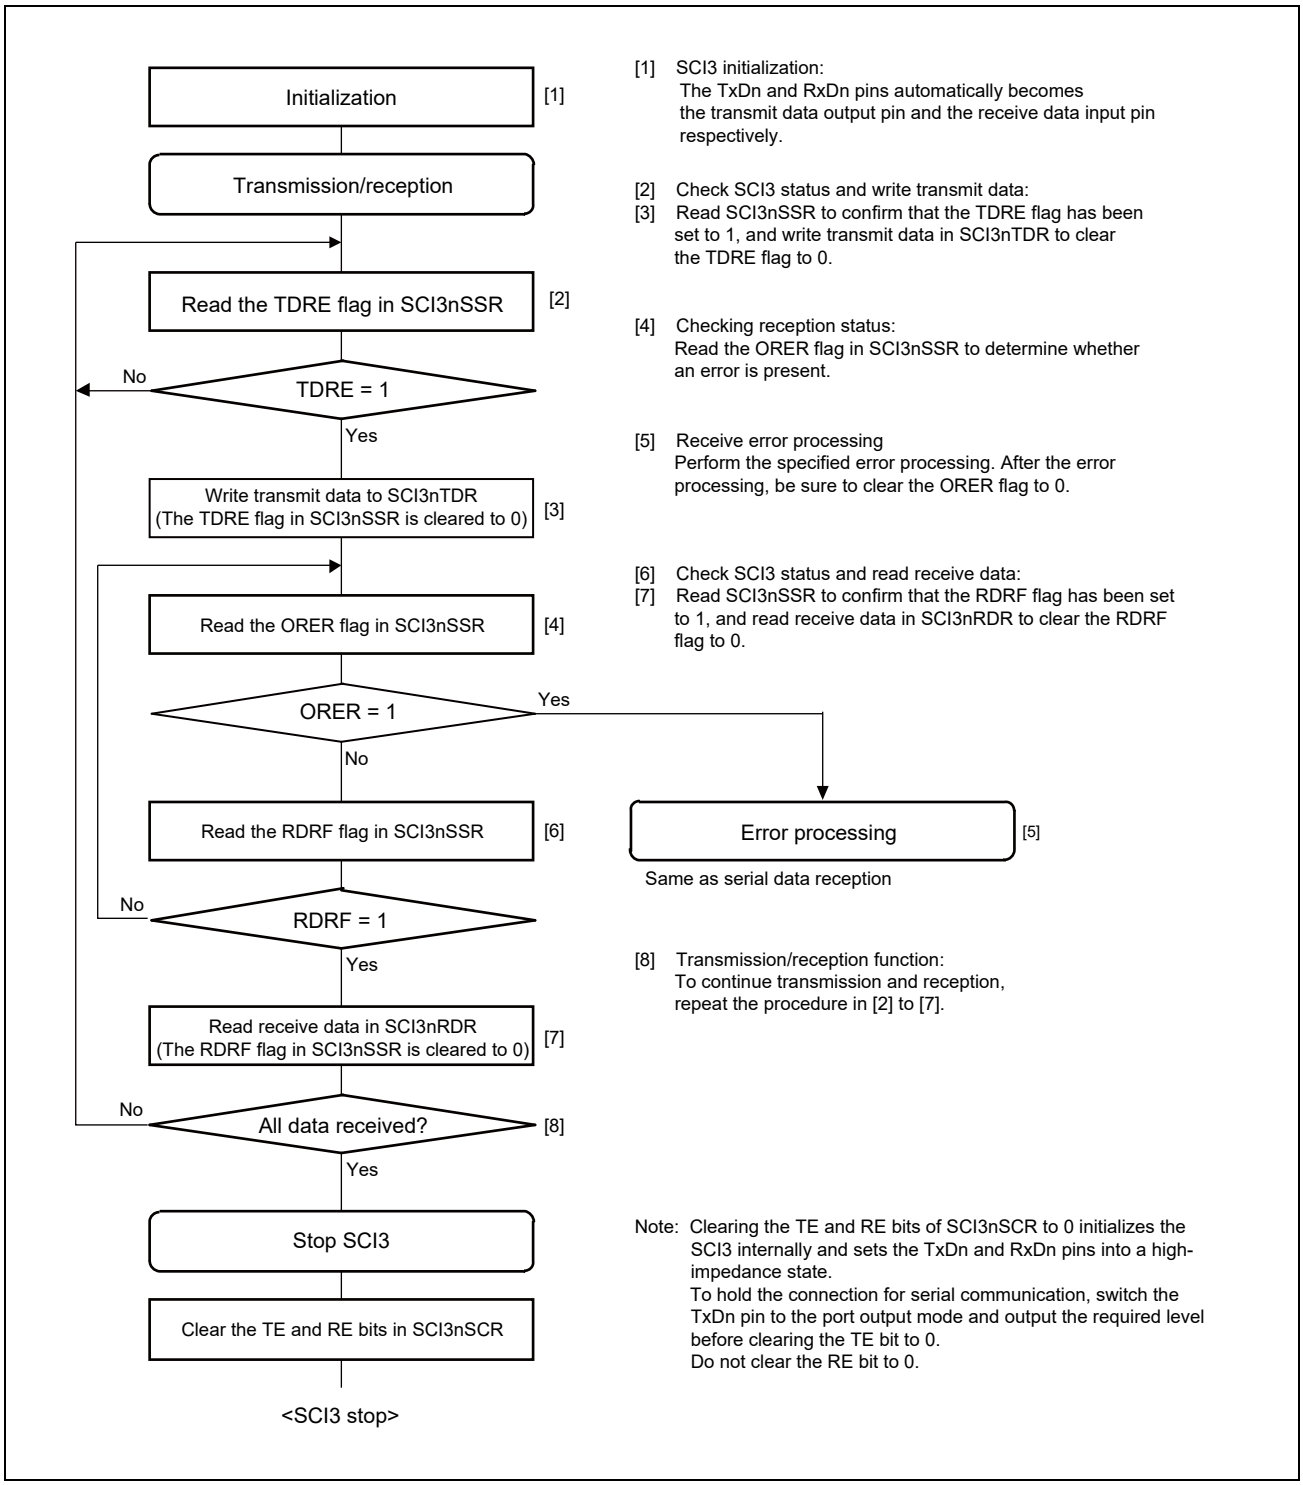

Figure 12.25 Example of Simultaneous Serial Transmission and Reception Flowchart

12.4.4 Bit Rate Modulation Function

The bit rate modulation function corrects a bit rate by enabling the internal clocks for the number specified by SCI3nMDDR, in a manner that they are enabled approximately even out of the 256 internal clocks specified by the CKS1 and CKS0 bits in SCI3nSMR.

Figure 12.26 shows an example of asynchronous mode in which PCLK clock is selected with the CKS1 and CKS0 bits, SCI3nBRR is set to 0, and SCI3nMDDR is set to 160. In this example, the reference clock cycle is corrected to 256/160 approximately evenly and the bit rate is corrected to 160/256. Note that the pulse widths of the internal reference clock expand or contract for the amount of the selected internal clocks because there is a deviation in the enabling of the internal clocks.

Do not use this function with the maximum speed settings (CKS1 and CKS0 bits = 0 in SCI3nSMR, CKE1 bit = 0 in SCI3nSCR, and SCI3nBRR = 0) for clock synchronous mode.

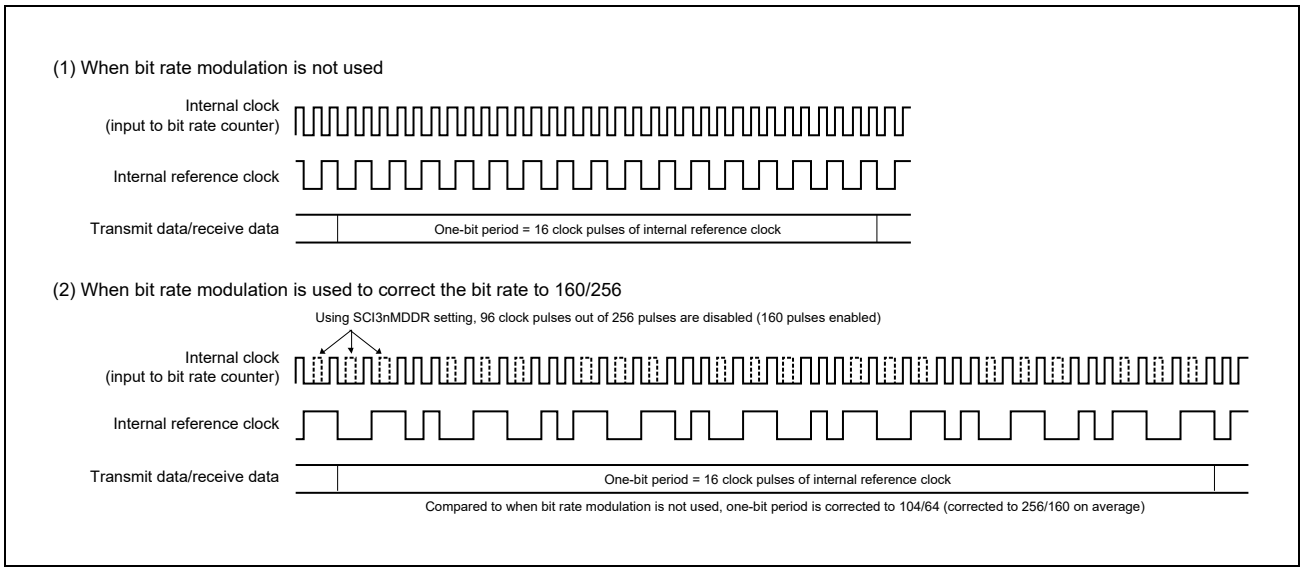

Figure 12.26 Example of Internal Reference Clock when the Bit Rate Modulation Function is Used

12.4.5 Interrupt Sources

Table 12.27 lists interrupt sources. Each interrupt source outputs an individual interrupt request signal. These interrupt sources can be enabled independently with the enable bit in SCI3nSCR.

A TXI interrupt request is generated when the TDRE flag in SCI3nSSR is set to 1. A TEI interrupt request is generated when the TEND flag in SCI3nSSR is set to 1. A TXI interrupt request can activate the DMAC to handle data transfer. The TDRE flag is automatically cleared to 0 when data is transferred using the DMAC.

CAUTION

The TDRE and TEND flags cannot be cleared to 0 while the TE bit in SCI3nSCR is 0. Since the TEND flag is the level interrupt request flag for a TEI interrupt, do not set the TEIE bit in SCI3nSCR to 1 while the TE bit is 0.

An RXI interrupt request is generated when the RDRF flag in SCI3nSSR is set to 1. An ERI interrupt is generated when either of the ORER, PER, and FER flags in SCI3nSSR is set to 1. An RXI interrupt request can activate the DMAC to handle data transfer. The RDRF flag is automatically cleared to 0 when data is transferred using the DMAC.

A TEI interrupt request is generated when the TEND flag is set to 1 with the TEIE bit set to 1.

CAUTION

If a TEI interrupt request and a TXI interrupt request are generated at the same time, the TXI interrupt request is accepted first. Note that clearing the TDRE flag to 0 at this time in the TXI interrupt processing routine also clears the TEND flag to 0 automatically, disabling the branch to the TEI interrupt processing routine.

Table 12.27 SCI3 Interrupt Sources

Name	Interrupt Source	Interrupt Flag	DMAC/DTS Activation
ERI	Receive error	ORER, FER, PER	Not possible
RXI	Receive data full	RDRF	Possible
TXI	Transmit data empty	TDRE	Possible
TEI	Transmit end	TEND	Not possible

12.5 Notes

12.5.1 Break Detection and Processing

A break can be detected by reading the RXDMON bit in SCI3nSEMR at the time of detection of a framing error. Since all inputs from the RxDn pin are 0 in the break state, the FER flag is set to 1 and the PER flag may also be set to 1. When the ASTLS bit in SCI3nSCMR is 1, the SCI3 continues data reception even after it receives a break. For this reason, note that the FER flag is set to 1 again even after having been cleared to 0.
After the end of the break state, retain the input from the RxDn pin at the high level over one frame to avoid a disparity in bit timing between the transmission and reception sides. Meanwhile, when the ASTLS bit in SCI3nSCMR is 0, the SCI3 stops reception in the state of waiting to detect the start bit of the next frame after the FER flag has been set to 1. If the FER flag is cleared to 0 at this time, the FER flag retains the value 0 in the break state. If the input from the RxDn pin becomes 1 and the break state ends, the beginning of the start bit is detected on a falling edges of the input on the RxDn pin and reception starts.

12.5.2 Mark State and Break Output

While the TE bit is 0 (transmission/reception disabled), the TxDn pin can output any level by switching the TxDn pin to a general output port. This allows the TxDn pin to be the mark state or break output during data transmission.

12.5.3 Receive Error Flags and Transmit Operations in Clock Synchronous Mode

During the clock synchronous simultaneous data transmit/receive operation, transmission cannot be started when a receive error flag (ORER) is set to 1, even if the TDRE flag is cleared to 0. Be sure to clear the receive error flags to 0 before starting transmission. Note that the receive error flags cannot be cleared to 0 even by clearing the RE bit to 0.

12.5.4 Relationship between Writing to SCI3nTDR and the TDRE Flag

The TDRE flag in SCI3nSSR is a status flag indicating that transmit data in SCI3nTDR has been transferred to SCI3nTSR. The TDRE flag is set to 1 when the SCI3 transfers data from SCI3nTDR to SCI3nTSR.

Data can be written to SCI3nTDR regardless of the status of the TDRE flag. However, writing new data to SCI3nTDR while the TDRE flag is 0 will make the data stored in SCI3nTDR lost because it has not been transferred to SCI3nTSR. Therefore, make sure to check that the TDRE flag is set to 1 before writing transmit data to SCI3nTDR.

12.5.5 Restrictions on Using an External Clock for Transmission in Clock Synchronous Mode

When using an external synchronization clock, clear the TDRE flag to 0 and then input a transmission clock (**Figure 12.27**). Also in continuous transmission mode, clear the TDRE flag to 0 and then input a transmission clock for the next frame.

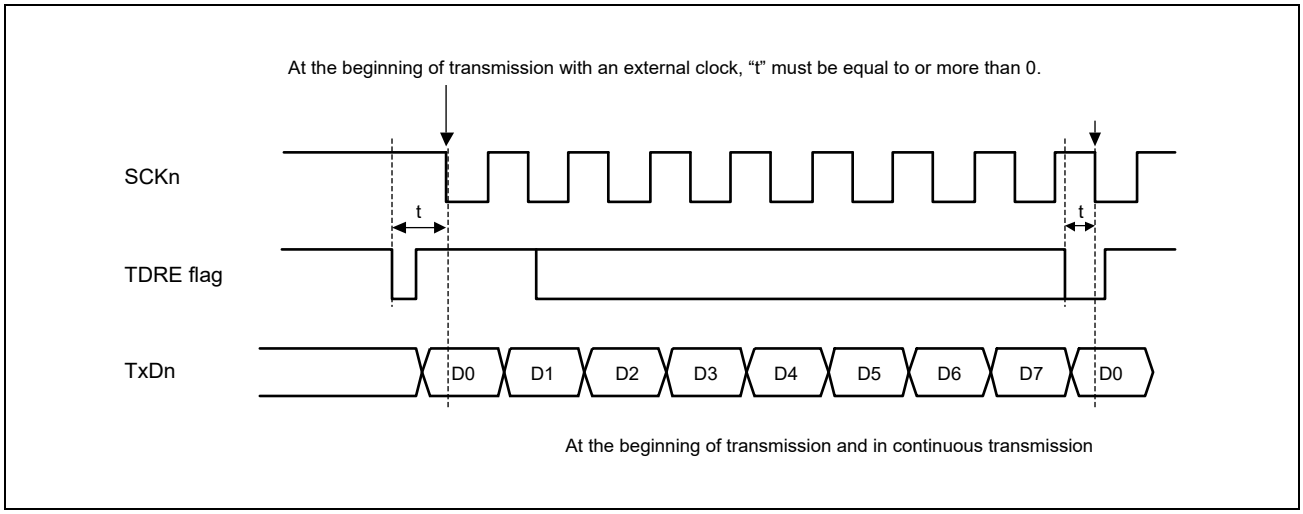

Figure 12.27 Restrictions on Using an External Clock for Transmission in Clock Synchronous Mode

12.5.6 External Clock Input in Clock Synchronous Mode

For input of the external clock SCInSCK in clock synchronous mode, see **Section 39.3.6, SCI/FLSCI Timing**.

Section 13 LIN/UART Interface (RLIN3)

This section contains a generic description of the LIN/UART interface (RLIN3).

The first part of this section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RLIN3.

13.1 Features of RH850/C1M-A RLIN3

13.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN3 units.

RLIN3 unit has one channel interface. “Number of channels” is used with the same meaning as “number of units” in this section

Table 13.1 Number of Units

Product Name	RH850/C1M-A2	RH850/C1M-A1
Number of units	3	3
Name	RLIN3n (n = 0 to 2)	RLIN3n (n = 0 to 2)

Table 13.2 Unit Configurations and Channels

Unit Name (Channel Name) RLIN3n	Channels per Unit	RH850/C1M-A2	RH850/C1M-A1
RLIN30	1	√	√
RLIN31	1	√	√
RLIN32	1	√	√

Note: The channel names are same as those of the corresponding units.

Table 13.3 Indices

Index	Description
n	Throughout this section, the individual RLIN3 units are identified by the index “n” (n = 0 to 2): for example, RLIN3nLCUC is the LIN control register.
b	Throughout this section, the individual transmit/receive data buffers of RLIN3n are identified by the index “b” (b = 1 to 8): for example, RLN3nLDBRb is the data buffer register.

13.1.2 Register Base Address

RLIN3 base addresses are listed in the following table.

RLIN3 register addresses are given as offsets from the base addresses in general.

Table 13.4 Register Base Addresses

Base Address Name	Base Address
<RLIN30_base>	FFCE 0000$_H$
<RLIN31_base>	FF6E 1000$_H$
<RLIN32_base>	FFCE 2000$_H$

13.1.3 Clock Supply

The RLIN3 clock supply is shown in the following table.

Table 13.5 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
RLIN3n	clkc*1	1/2 x CLKC_LSB (unmodulated low-speed peripheral clock divided by 2)
	pclk	CLK_LSB (low-speed peripheral clock)

Note 1. LIN communication clock source

13.1.4 Interrupt Request

RLIN3 interrupt requests are listed in the following table.

Table 13.6 Interrupt Requests

Unit Interrupt Signal	Outline	Interrupt Number	DMA Trigger Number*1		DTS Trigger Number*1	
			1st	2nd	1st	2nd
RLIN30						
INTRLIN3n (n = 0)	RLIN30 interrupt	277	—	—	—	—
INTRLIN3nUR0 (n = 0)	RLIN30 transmit interrupt	278	—	121	—	121
INTRLIN3nUR1 (n = 0)	RLIN30 receive completion interrupt	279	—	120	—	120
INTRLIN3nUR2 (n = 0)	RLIN30 status interrupt	280	—	—	—	—
RLIN31						
INTRLIN3n (n = 1)	RLIN31 interrupt	281	—	—	—	—
INTRLIN3nUR0 (n = 1)	RLIN31 transmit interrupt	282	—	123	—	123
INTRLIN3nUR1 (n = 1)	RLIN31 receive completion interrupt	283	—	122	—	122
INTRLIN3nUR2 (n = 1)	RLIN31 status interrupt	284	—	—	—	—
RLIN32						
INTRLIN3n (n = 2)	RLIN32 interrupt	285	—	—	—	—
INTRLIN3nUR0 (n = 2)	RLIN32 transmit interrupt	286	—	125	—	125
INTRLIN3nUR1 (n = 2)	RLIN32 receive completion interrupt	287	—	124	—	124
INTRLIN3nUR2 (n = 2)	RLIN32 status interrupt	288	—	—	—	—

—: Not assigned.

Note 1. 1st: Primary channel , 2nd: Secondary channel

13.1.5 Reset Sources

RLIN3 reset sources are listed in the following table. RLIN3 is initialized by these reset sources.

Table 13.7 Reset Sources

Unit Name	Reset Source
RLIN3n	All reset sources

13.1.6 External Input/Output Signals

External input/output signals of RLIN3 are listed below.

Table 13.8 I/O signals of RLIN3

Unit Signal Name	Outline	Alternative Port Pin Signal
RLIN30		
RLIN3nRX (n = 0)	RLIN30 receive data input	RLIN30RX
RLIN3nTX (n = 0)	RLIN30 transmit data output	RLIN30TX
RLIN31		
RLIN3nRX (n = 1)	RLIN31 receive data input	RLIN31RX
RLIN3nTX (n = 1)	RLIN31 transmit data output	RLIN31TX
RLIN32		
RLIN3nRX (n = 2)	RLIN32 receive data input	RLIN32RX
RLIN3nTX (n = 2)	RLIN32 transmit data output	RLIN32TX

13.2 Overview

13.2.1 Functional Overview

The LIN/UART interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602, and automatically performs frame communication and error determination.

The LIN/UART interface is provided with UART mode and can also be used as a UART.

The appropriate mode should be used for the LIN/UART interface according to the application: LIN master, LIN slave, or UART.

LIN master

- LIN reset mode
- LIN mode (LIN master mode)
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

LIN slave

- LIN reset mode
- LIN mode (LIN slave mode [auto baud rate] or LIN slave mode [fixed baud rate])
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

UART

- LIN reset mode
- UART mode

Table 13.9 gives the LIN/UART interface specifications.

Table 13.9 LIN/UART Interface Specifications (1/3)

Item			Specifications
	Channel count		3 channels
LIN communication function	Protocol		LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, SAE J2602
	Variable frame structure	Master	• Break transmission width: 13 to 28 Tbit • Break delimiter transmission width: 1 to 4 Tbit • Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*1 • Transmission response space width: 0 to 7 Tbit*1 • Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) • Transmission wake-up width: 1 to 16 Tbits
		Slave	• Break reception width : 9.5 or 10.5 Tbits [for fixed baud rate] : 10 or 11 Tbits [for auto baud rate] • Transmission response space width: 0 to 7 Tbits • Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) • Transmission wake-up width: 1 to 16 Tbits
	Checksum		• Automatic operation for both transmission and reception • Classic or enhanced selectable (for each frame)
	Response field data byte count		Variable from 0 to 8 bytes Multi-byte (9 or more bytes) response transmission and reception also possible
	Frame communication modes	Master	• Mode in which header transmission and response transmission/reception is started with a single transmission start request • Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode)
		Slave	• Mode in which header is automatically received with fixed baud rate • Mode in which header is automatically received with the baud rate set according to the sync field measurement result of the sync field and break field detected
	Wake-up transmission and reception		LIN wake-up mode provided • Wake-up transmission (1 to 16 Tbits) • Wake-up reception Low-level width of input signals measured
	Status	Master	• Successful frame/wake-up transmission • Successful header transmission • Successful frame/wake-up reception* *2 • Successful data 1 reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)
		Slave	• Successful response/wake-up transmission • Successful response/wake-up reception*2 • Successful header reception • Successful data 1 reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)

Table 13.9 LIN/UART Interface Specifications (2/3)

Item		Specifications	
LIN communication function	Error status	Master	• Bit error • Checksum error • Frame timeout error/response timeout error • Physical bus error • Framing error • Response preparation error
		Slave	• Bit error • Checksum error • Frame timeout error/response timeout error • Sync field error • ID parity error • Framing error • Response preparation error
	Baud rate selection	Baud rate conforming to the LIN specifications generated using baud rate generator	
	Test mode	Self-test mode for user evaluation	
	Interrupt function	Master	• Successful header/frame/wake-up transmission • Successful frame/wake-up reception*2*[2] • Error detection
		Slave	• Successful response/wake-up transmission • Header/response/wake-up reception*2*[2] • Error detection
UART communication function	Data buffer	• Transmission data buffer/transmission data buffer for wait • UART buffer (exclusively for transmission; variable data length from 1 to 9 bits; character length of 7 and 8 bits supported) • Reception data buffer (exclusively for reception; data length of 1. Character length of 7, 8, and 9 bits supported)	
	Data format	Character length: 7 or 8 bits 9 bits including the expansion bit supported.	
		Transmission stop bit: 1 or 2 bits	
		Parity function: odd, even, 0, or none	
		LSB- or MSB-first transfer selectable	
		Reverse input/output of transmission/reception data	
	Status	• Transmission status • Reception status • Successful UART buffer transmission • Error detection • Expansion bit detection • ID match • Reset mode status	

Table 13.9 LIN/UART Interface Specifications (3/3)

Item		Specifications
UART communication function	Error status	• Bit error • Framing error • Parity error • Overrun error
	Baud rate selection	With the baud rate generator incorporated, any baud rate can be set.
	When a certain expansion bit is at the expected level, the data received can be compared to the 8-bit data preset in the register.	
	The stop bit received is guaranteed (start of transmission can be delayed when start of transmission is attempted during reception of the stop bit).	
	Interrupt function	• Transmission start/complete • Reception complete • Status/error detection

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the low level width of the input signal is indicated.

13.2.2 Block Diagram

Figure 13.1 shows a block diagram of the LIN/UART interface.

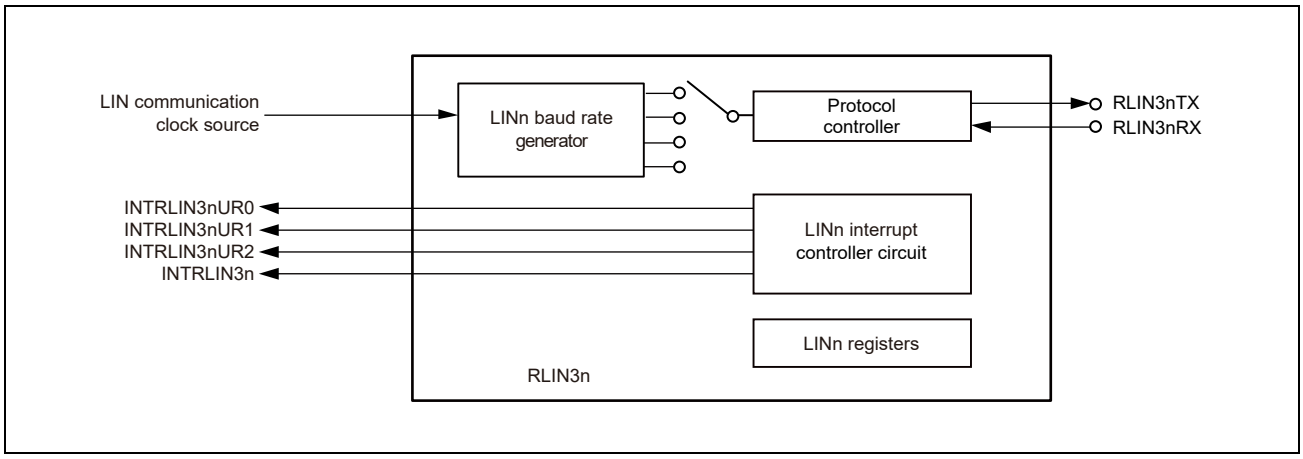

Figure 13.1 LIN/UART Interface Block Diagram

13.2.3 Description of Blocks

- RLIN3nTX, RLIN3nRX: LIN/UART interface I/O pins
- LINn baud rate generator: Generates the LIN/UART interface communication clock signal.
- LINn registers: LIN/UART interface registers
- LINn interrupt controller circuit: Controls interrupt requests generated by the LIN/UART interface

13.3 Registers

13.3.1 List of Registers

RLIN3 registers are listed in the following table.

For details about <RLIN3n_base>, see **Section 13.1.2, Register Base Address**.

Table 13.10 Registers

Module	Register	Symbol	Address	LIN Master	LIN Slave	UART
RLN3n	LIN wake-up baud rate selector register	RLN3nLWBR	<RLIN3n_base> + 01_H	√	√	√
RLN3n	LIN/UART baud rate prescaler 01 register	RLN3nLBRP01	<RLIN3n_base> + 02_H	—	√	√
RLN3n	LIN/UART baud rate prescaler 0 register	RLN3nLBRP0	<RLIN3n_base> + 02_H	√	√	√
RLN3n	LIN/UART baud rate prescaler 1 register	RLN3nLBRP1	<RLIN3n_base> + 03_H	√	√	√
RLN3n	LIN self-test control register	RLN3nLSTC	<RLIN3n_base> + 04_H	√	√	—
RLN3n	LIN/UART mode register	RLN3nLMD	<RLIN3n_base> + 08_H	√	√	√
RLN3n	LIN break field configuration register/ UART configuration register	RLN3nLBFC	<RLIN3n_base> + 09_H	√	√	√
RLN3n	LIN/UART space configuration register	RLN3nLSC	<RLIN3n_base> + $0A_H$	√	√	√
RLN3n	LIN wake-up configuration register	RLN3nLWUP	<RLIN3n_base> + $0B_H$	√	√	—
RLN3n	LIN interrupt enable register	RLN3nLIE	<RLIN3n_base> + $0C_H$	√	√	—
RLN3n	LIN / UART error detection enable register	RLN3nLEDE	<RLIN3n_base> + $0D_H$	√	√	√
RLN3n	LIN/UART control register	RLN3nLCUC	<RLIN3n_base> + $0E_H$	√	√	√
RLN3n	LIN/UART transmission control register	RLN3nLTRC	<RLIN3n_base> + 10_H	√	√	√
RLN3n	LIN/UART mode status register	RLN3nLMST	<RLIN3n_base> + 11_H	√	√	√
RLN3n	LIN/UART status register	RLN3nLST	<RLIN3n_base> + 12_H	√	√	√
RLN3n	LIN/UART error status register	RLN3nLEST	<RLIN3n_base> + 13_H	√	√	√
RLN3n	LIN/UART data field configuration register	RLN3nLDFC	<RLIN3n_base> + 14_H	√	√	√
RLN3n	LIN/UART ID buffer register	RLN3nLIDB	<RLIN3n_base> + 15_H	√	√	√
RLN3n	LIN checksum buffer register	RLN3nLCBR	<RLIN3n_base> + 16_H	√	√	—
RLN3n	UART data buffer 0 register	RLN3nLUDB0	<RLIN3n_base> + 17_H	—	—	√
RLN3n	LIN/UART data buffer 1 register	RLN3nLDBR1	<RLIN3n_base> + 18_H	√	√	√
RLN3n	LIN/UART data buffer 2 register	RLN3nLDBR2	<RLIN3n_base> + 19_H	√	√	√
RLN3n	LIN/UART data buffer 3 register	RLN3nLDBR3	<RLIN3n_base> + $1A_H$	√	√	√
RLN3n	LIN/UART data buffer 4 register	RLN3nLDBR4	<RLIN3n_base> + $1B_H$	√	√	√
RLN3n	LIN/UART data buffer 5 register	RLN3nLDBR5	<RLIN3n_base> + $1C_H$	√	√	√
RLN3n	LIN/UART data buffer 6 register	RLN3nLDBR6	<RLIN3n_base> + $1D_H$	√	√	√
RLN3n	LIN/UART data buffer 7 register	RLN3nLDBR7	<RLIN3n_base> + $1E_H$	√	√	√
RLN3n	LIN/UART data buffer 8 register	RLN3nLDBR8	<RLIN3n_base> + $1F_H$	√	√	√
RLN3n	UART operation enable register	RLN3nLUOER	<RLIN3n_base> + 20_H	—	—	√
RLN3n	UART option register 1	RLN3nLUOR1	<RLIN3n_base> + 21_H	—	—	√
RLN3n	UART transmission data register	RLN3nLUTDR	<RLIN3n_base> + 24_H	—	—	√
RLN3n	UART transmission data register L	RLN3nLUTDRL	<RLIN3n_base> + 24_H	—	—	√
RLN3n	UART transmission data register H	RLN3nLUTDRH	<RLIN3n_base> + 25_H	—	—	√
RLN3n	UART reception data register	RLN3nLURDR	<RLIN3n_base> + 26_H	—	—	√
RLN3n	UART reception data register L	RLN3nLURDRL	<RLIN3n_base> + 26_H	—	—	√
RLN3n	UART reception data register H	RLN3nLURDRH	<RLIN3n_base> + 27_H	—	—	√
RLN3n	UART wait transmission data register	RLN3nLUWTDR	<RLIN3n_base> + 28_H	—	—	√
RLN3n	UART wait transmission data register L	RLN3nLUWTDRL	<RLIN3n_base> + 28_H	—	—	√
RLN3n	UART wait transmission data register H	RLN3nLUWTDRH	<RLIN3n_base> + 29_H	—	—	√

Note: √: Used, —: Not used

When writing to a register not used, write the value after reset.

13.3.2 LIN Master Related Registers

13.3.2.1 RLN3nLWBR ─ LIN Wake-Up Baud Rate Select Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			LWBR0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.11 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified in the LCKS bit of the RLN3nLMD register is used. (for LIN1.3) 1: In LIN wake-up mode, the clock fa is used regardless of the setting in the LCKS bit of the RLN3nLMD register. (for LIN2.x)

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In LIN master mode (LIN/UART mode select bits in LIN mode register = 00_B), set these bits to 0000_B or 1111_B (16 sampling).

LPRS[2:0] Bits (Prescaler Clock Select)

These bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

LWBR0 Bit (Wake-up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.

When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects the LIN system clock (fLIN) as fa regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.

Setting the baud rate to 19200 bps while fa is selected allows the 130 µs or longer low-level width of the input signal to be detected during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

13.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 02_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.12 RLN3nLBRP0 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1. Setting range: 00_H to FF_H

Set the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits by N + 1.

13.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 03_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.13 RLN3nLBRP1 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1. Setting range: 00_H to FF_H

Set the RLN3nLBRP1 register when the OMM0 bit in the RLN3LMST register is 0_B (in LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M + 1.

13.3.2.4 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSTM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.14 RLN3nLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	LSTM[7:0]	LIN Self-Test Mode 00_H: The module is not in LIN self-test mode. 01_H: The module is in LIN self-test mode. Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed thus placing LIN self-test mode to be entered, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 13.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return "000000_B", and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For leaving LIN self-test mode, see **Section 13.9, LIN Self-Test Mode**
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

13.3.2.5 RLN3nLMD — LIN Mode Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	LCKS[1:0]		LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.15 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filtering Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: RLIN3n interrupt is used. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are used.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 0: LIN master mode

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode)

LRDNFS Bit (LIN Reception Data Noise Filtering Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, the RLIN3 interrupt is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are generated from the LIN/UART interface.
For each interrupt source, see **Section 13.4, Interrupt Sources**.

LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.

With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).
With 01_B set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).
With 10_B set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).
With 11_B set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).
With 1_B is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), and the RLN3nLMST register is 01_H (LIN wake-up mode), the protocol controller is provided with fa regardless of the setting of the bit (the LCKS bit is not changed)

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an LIN master, set these bits to 00_B.

13.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.16 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5, 4	BDT[1:0]	Transmission Break Delimiter (High Level) Width Select b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmission Break (Low Level) Width Select b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

This bit is used to set the break high level width of transmission frame header. 1 Tbit to 4 Tbits can be set.

BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

This BLT bits set the break low level width of transmission frame header.
13 Tbits to 28 Tbits can be set.

13.3.2.7 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 13.17 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.
0 Tbit to 3 Tbits can be set.
These bits are enabled only during response transmission; these are disabled during response reception.

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.
0 Tbit to 7 Tbits can be set.
The response space setting is enabled only during response transmission; setting is disabled during response reception.
The inter-byte space (header) is equal to the response space.

13.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 13.18 RLN3nLWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low Level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.
1 Tbit to 16 Tbits can be set.

With 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), fa is selected as the LIN system clock (fLIN) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

13.3.2.9 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 13.19 RLN3nLIE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	SHIE	Successful Header Transmission Interrupt Request Enable 0: Disables successful header transmission interrupt request. 1: Enables successful header transmission interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Request Enable 0: Disables successful frame/wake-up reception interrupt request. 1: Enables successful frame/wake-up reception interrupt request.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Request Enable 0: Disables successful frame/wake-up transmission interrupt request. 1: Enables successful frame/wake-up transmission interrupt request.

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

SHIE Bit (Successful Header Transmission Interrupt Request Enable)

The SHIE bit enables or disables interrupt request upon successful transmission of a header.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n transmission is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.
Error types that are interrupt sources are the bit error, physical bus error, frame/response timeout error, framing error, checksum error, and response preparation error. Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE Bit (Successful Frame/Wake-up Reception Interrupt Request Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a frame or a wake-up signal (counting of low level width of the input signal).
With 0 set, the interrupt request for successful RLIN3n reception is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for successful RLIN3n reception is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE Bit (Successful Frame/Wake-up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a frame or a wake-up signal.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

13.3.2.10 RLN3nLEDE — LIN Error Detection Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	—	—	—	FERE	FTERE	PBERE	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 13.20 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	FERE	Framing Error Detection Enable*1 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable*1 0: Disables bit error detection. 1: Enables bit error detection.

Note 1. Bits FERE and BERE must be set to 1.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode)

LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function applies to frame timeout.
With 1 set, the timeout function applies to response timeout.
For details on the timeout error, see **Section 13.7.7, Error Status**.

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
With this device, always set this bit to 1. The detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 13.7.7, Error Status**.

FTERE Bit (Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.
When this bit is set to 1, the detection result is indicated in the FTER flag in the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected. Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received. For details on the timeout error, see **Section 13.7.7, Error Status**.

PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.
With 0 set, the physical bus error is not detected.
With 1 set, the physical bus error is detected.
When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN3nLEST register. For details on the physical bus error, see **Section 13.7.7, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
With this device, always set this bit to 1. The detection result is indicated in the BER flag in the RLN3nLEST register. For details on the bit error, see **Section 13.7.7, Error Status**.

13.3.2.11 RLN3nLCUC — LIN Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 13.21 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode is caused. 1: LIN operation mode is caused.
0	OM0	LIN Reset 0: LIN reset mode is caused. 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to cause a transition to LIN wake-up mode after canceling LIN reset mode, and set the register to 03_H to cause a transition to LIN operation mode.

In LIN self-test mode, set the RLN3nLCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
With 0 set, LIN wake-up mode is caused.
With 1 set, LIN operation mode is caused.
This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
With 0 set, LIN reset mode is caused.
With 1 set, LIN reset mode is canceled.

13.3.2.12 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 13.22 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped in frame separate mode. 1: Response transmission/reception is started in frame separate mode.
0	FTS	Frame Transmission/Wake-up Transmission /Reception Start 0: Frame Transmission/wake-up transmission/reception is stopped. 1: Frame Transmission/wake-up transmission reception is started.

RTS Bit (Response Transmission/Reception Start)

Set the RTS bit to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 at the end of communication or transition to LIN reset mode.

FTS Bit (Frame Transmission/Wake-up Transmission/Reception Start)

Set the FTS bit to 1 to start frame transmission and reception.
Also set this bit to 1 to allow wake-up transmission and reception (counting of the low level width of the input signal).
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
This bit is set to 0 upon error detection of frame or wake-up communication (including error detection) and transition to LIN reset mode.

13.3.2.13 RLN3nLMST — LIN Mode Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 13.23 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: The module is in LIN wake-up mode. 1: The module is in LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: The module is in LIN reset mode. 1: The module is not in LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

13.3.2.14 RLN3nLST — LIN Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 13.24 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag These bits are always read as 0. The write value should always be 0.
4, 5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	FRC	Frame/Wake-up Reception Complete Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Frame/Wake-up Transmission Complete Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt request for RLN3n transmission is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. Here, an interrupt is not generated. To clear the bit to 0 before the next communication Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. Here, an interrupt is not generated. To clear the bit to 0 before the next communication

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when the value of at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC Flag (Frame/Wake-up Reception Complete Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for RLN3n reception complete is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC Flag (Frame/Wake-up Transmission Complete Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for RLN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

13.3.2.15 RLN3nLEST — LIN Error Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RPER	—	CSER	—	FER	FTER	PBER	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 13.25 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: checksum error has been detected.
4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the value of the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FTER Flag (Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), the FTER flag is set to 1 upon frame timeout error or response timeout error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled), the PBER flag is set to 1 upon physical bus error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

13.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	FSM	CSM	RFT	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.26 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received.

With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

FSM Bit (Frame Separate Mode Select)

The FSM bit sets the response communication mode.
With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without the RTS bit in the RLN3nLTRC register being set.
With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.
For response reception which is 8 bytes or less (the RFT bit is 0), set the FSM bit to 0. When causing a transition to LIN self-test mode, set this bit to 0 before transition.
For details on frame separate mode, see **Section 13.7.4.1, Transmission of LIN Frames**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

CSM Bit (Checksum Select)

The CSM bit sets the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error is used (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details on the bit error, see **Section 13.7.7, Error Status**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.
During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

RFT Bit (Response Field Communication Direction Select)

The RFT bits set the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low level width of the input signal is counted).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the RTS bit in the RLN3nLTRC register is 0).
To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).

Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

13.3.2.17 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.27 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bits (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bits (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

In LIN self-test mode, this register operates as described below.
Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 13.9, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 for P0 and IDP1 for P1.
Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

ID[5:0] Bits (ID Setting)

The ID bit sets the 6-bit ID value to be transmitted in the ID field of the LIN frame.

13.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register can only be read in 8-bit units. In LIN self-test mode, this register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.28 RLN3nLCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see Section **13.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of at least 9 bytes is to be transmitted or received, the checksum is only appended to the last data group, so this register is not updated for the other data groups.

13.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.29 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data for transmission or holds the received data. Setting range: 00_H to FF_H

- For response transmission:
  The LDBRn registers set the data to be transmitted in the response field. Use these registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 0 (not frame separate mode)
  - FTS bit in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted)

  or
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)
- For response reception:
  The LDBRn registers hold the data received in the response field.
  Any previously received data are overwritten. The data including bytes where an error was found are stored in these registers in response to the detection of an error.
  Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started).

- For transmission of response data of 9 bytes or more:
  Use the LDBRn registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)
- For reception of response data of 9 bytes or more:
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as described below.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see Section **13.9, LIN Self-Test Mode**.

13.3.3 LIN Slave Related Registers

13.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 13.30 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling 0 0 1 1: 4 sampling 0 1 1 1: 8 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
When the frame communication is performed in LIN slave mode (fixed baud rate) (LMD[1:0] bits in the RLN3nLMD register = 11_B), set these bits to "0000_B" or "1111_B" (16 sampling).
When the frame communication is performed in LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10_B), set these bits to "0011_B" (4 sampling) or "0111_B" (8 sampling).

LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler. The LIN communication clock source is divided by this prescaler.
In LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10_B), set these bits so that the prescaler clock becomes as follows according to the target baud rate.

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4 MHz*1
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

Note 1. Use the clock with NSPB bits set to "0011_B" (four samplings).

13.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register

Access: RLN3nLBRP01 can be read/written in 16-bit units.
RLN3nLBRP0 can be read/written in 8-bit units.
RLN3nLBRP1 can be read/written in 8-bit units.

Address: RLN3nLBRP01: <RLIN3n_base> + 02_H
RLN3nLBRP0: <RLIN3n_base> + 02_H
RLN3nLBRP1: <RLIN3n_base> + 03_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.31 RLN3nLBRP01 Register Contents

Bit Position	Bit Name	Function
15 to 0	BRP[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting range: 0000_H to $FFFF_H$

Set the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units by registers RLN3nLBRP0 and RLN3nLBRP1.

NOTE

In LIN slave mode [auto baud rate], the system automatically sets the result of baud rate correction to the RLN3nLBRP01 register on successful reception of the sync field.

13.3.3.3 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSTM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.32 RLN3nLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	LSTM[7:0]	LIN Self-Test Mode 00_H: The module is not in LIN self-test mode. 01_H: The module is in LIN self-test mode. Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed thus placing LIN self-test mode to be entered, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see Section **13.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return "000000_B", and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.

For leaving LIN self-test mode, see Section **13.9, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

13.3.3.4 RLN3nLMD — LIN Mode Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 13.33 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filtering Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: RLIN3 interrupt is used. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are used.
3, 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 1 0: LIN Slave mode with Auto Baud rate 1 1: LIN Slave mode with fixed Baud rate

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LRDNFS Bit (LIN Reception Data Noise Filtering Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, the RLIN3 interrupt is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are generated from the LIN/UART interface.
For each interrupt source, see Section **13.4, Interrupt Sources**.

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.

To use this module as an LIN slave, set these bits to "10_B" (auto baud rate) or "11_B" (fixed baud rate).

13.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LBLT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 13.34 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	LBLT	Reception Break (Low-Level) Detection Width Setting 0: A break (low-level) is detected in 9.5 or 10 Tbits 1: A break (low-level) is detected in 10.5 or 11 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LBLT Bit (Reception Break (Low-Level) Detection Width Setting)

- When RLN3nLMD.LMD is "10_B" (in LIN slave mode (auto baud rate))
  - 0: Low-level width of 10 Tbits or longer is detected.
  - 1: Low-level width of 11 Tbits or longer is detected.
- When RLN3nLMD.LMD is "11_B" (in LIN slave mode (fixed baud rate))
  - 0: Low-level width of 9.5 Tbits or longer is detected.
  - 1: Low-level width of 10.5 Tbits or longer is detected.

13.3.3.6 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 13.35 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2 to 0	IBHS[2:0]	Response Space Setting b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

This register is enabled only during response transmission, and disabled during response reception.

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

These bits set the width of the inter-byte space of the response transmission.
0 Tbit to 3 Tbits can be set.

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the transmission width of the response space.
0 Tbit to 7 Tbits can be set.

13.3.3.7 RLN3nLWUP — LIN Wake-Up Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 13.36 RLN3nLWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

These bits set the low-level width of the wake-up frame transmission.
1 Tbit to 16 Tbits can be set.

13.3.3.8 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 13.37 RLN3nLIE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	SHIE	Successful Header Reception Interrupt Request Enable 0: Disables successful header reception interrupt request. 1: Enables successful header reception interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Response/Wake-up Reception Interrupt Request Enable 0: Disables successful Response/wake-up reception interrupt request. 1: Enables successful Response/wake-up reception interrupt request.
0	FTCIE	Successful Response/Wake-up Transmission Interrupt Request Enable 0: Disables successful Response/wake-up transmission interrupt request. 1: Enables successful Response/wake-up transmission interrupt request.

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

SHIE Bit (Successful Header Reception Interrupt Request Enable)

The SHIE bit enables or disables an interrupt request upon successful reception of a header.
With 0 set, the interrupt request for RLIN3n reception complete is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n reception complete is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.
Error types that are interrupt sources are the bit error, frame/response timeout error, framing error, sync filed error, ID parity error, checksum error, and response preparation error.
Detection of the bit error, frame/response timeout error, sync filed error, ID parity error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE Bit (Successful Response/Wake-up Reception Interrupt Request Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a response or a wake-up frame (counting of low level width of the input signal).
With 0 set, the interrupt request for successful RLIN3n reception is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for successful RLIN3n reception is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE Bit (Successful Response/Wake-up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a response or a wake-up frame.
With 0 set, the interrupt request for successful RLIN3n transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for successful RLIN3n transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

13.3.3.9 RLN3nLEDE — LIN Error Detection Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	IPERE	—	SFERE	FERE	TERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W

Table 13.38 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6	IPERE	ID Parity Error Detection Enable 0: Disables ID Parity error detection. 1: Enables ID Parity error detection.
5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
4	SFERE	Sync Field Error Detection Enable 0: Disables Sync Field error detection. 1: Enables Sync Field error detection.
3	FERE	Framing Error Detection Enable*1 0: Disables framing error detection. 1: Enables framing error detection.
2	TERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	BERE	Bit Error Detection Enable*1 0: Disables bit error detection. 1: Enables bit error detection.

Note 1. Bits FERE and BERE must be set to 1.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function applies to frame timeout.
With 1 set, the timeout function applies to response timeout.
For details on the timeout error, see **Section 13.7.7, Error Status**.

IPERE Bit (ID Parity Error Detection Enable)

This bit enables or disables detection of the ID parity error.
With 0 set, the ID parity error is not detected.
With 1 set, the ID parity error is detected.
When this bit is set to 1, the detection result is reflected in the IPER flag in the RLN3nLEST register.
For details on the ID parity error, see **Section 13.7.7, Error Status**.

SFERE Bit (Sync Field Error Detection Enable)

This bit enables or disables detection of the sync field error.
With 0 set, the sync field error is not detected.
With 1 set, the sync field error is detected.
Regardless of the setting of this bit, when a sync field error is detected, this module waits for the next header.
When this bit is set to 1, the detection result is reflected in the SFER flag in the RLN3nLEST register.
For details on the sync filed error, see **Section 13.7.7, Error Status**.

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
With this device, always set this bit to 1. The detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 13.7.7, Error Status**.

TERE Bit (Timeout Error Detection Enable)

The TERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.
When this bit is set to 1, the detection result is indicated in the TER flag in the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected.
The timeout error should not be used in LIN slave mode [auto baud rate] (when the LMD[1:0] bits in the RLN3nLMD register are “10_B”).
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see **Section 13.7.7, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
With this device, always set this bit to 1. The detection result is indicated in the BER flag in the RLN3nLEST register.
For details on the bit error, see **Section 13.7.7, Error Status**.

13.3.3.10 RLN3nLCUC — LIN Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 13.39 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode is caused. 1: LIN operation mode is caused.
0	OM0	LIN Reset 0: LIN reset mode is caused. 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to cause a transition to LIN wake-up mode after canceling LIN reset mode, and set the register to 03_H to cause a transition to LIN operation mode.

In LIN self-test mode, set the RLN3nLCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific LIN operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
With 0 set, LIN wake-up mode is caused.
With 1 set, LIN operation mode is caused.
This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
With 0 set, LIN reset mode is caused.
With 1 set, LIN reset mode is canceled.

13.3.3.11 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	LNRR	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 13.40 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	LNRR	No LIN Response Request 0: Response for the reception ID 1: No response for the reception ID
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped. 1: Response transmission/reception is started.
0	FTS	LIN Communication Start 0: Header reception/wake-up transmission/reception is stopped. 1: Header reception/wake-up transmission reception is started.

LNRR Bit (No LIN Response Request)

After receiving the header and checking the received ID, set this bit to 1 if no response is transmitted/received.
Once set, this bit is automatically cleared to 0 upon detection of new sync field or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write 04_H using the store instruction.
Do not set this bit and the RTS bit to 1 simultaneously.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, use this bit only for the completion of the header. (Do not use this bit for the second or latter data group.)

RTS Bit (Response Transmission/Reception Start)

After receiving the header and checking the received ID, set this bit to 1 at the response transmission or at the start of response reception.
Once set, this bit is automatically cleared to 0 upon completion of response transmission or reception (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.
Do not set this bit and the LNRR bit to 1 simultaneously
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group transmission/reception or transition to LIN reset mode.

FTS Bit (LIN Communication Start)

Set this bit to 1 to start header reception or wake-up transmission/reception.
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

13.3.3.12 RLN3nLMST — LIN Mode Status Register

Access: This register can only be read in 8-bit units

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 13.41 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: The module is in LIN wake-up mode. 1: The module is in LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: The module is in LIN reset mode. 1: The module is not in LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

13.3.3.13 RLN3nLST — LIN Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 13.42 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Reception Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag These bits are always read as 0. The write value should always be 0.
5, 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	FRC	Successful Response/Wake-up Reception Flag 0: Response or wake-up reception has not been completed. 1: Response or wake-up reception has been completed.
0	FTC	Successful Response/Wake-up Transmission Flag 0: Response or wake-up transmission has not been completed. 1: Response or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, writing a value to this register is disabled. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC Flag (Successful Header Reception Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value before 1 is written. The HTRC flag is set to 1 upon completion of header reception. Here, an interrupt request for successful RLIN3n reception is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if header reception is completed while this bit is 1, an interrupt is not generated. To clear this bit to 0, write 0 to the bit.
To detect a new header in the response field upon completion of header reception, clear this bit after it is set to 1.

D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when the value of at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLIN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if an error is detected while this bit is 1, an interrupt is not generated. To clear the bit to 0, write 0 to the RPER, IPER, CSER, SFER, FER, TER, and BER flags in the RLN3nLEST register.

FRC Flag (Successful Response/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FRC flag is set to 1 upon completion of response or wake-up reception. Here, an interrupt request for successful RLIN3n reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if response reception or wake-up reception is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC Flag (Successful Response/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FTC flag is set to 1 upon completion of response or wake-up transmission. Here, an interrupt request for RLIN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if response reception or wake-up reception is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

13.3.3.14 RLN3nLEST — LIN Error Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RPER	IPER	CSER	SFER	FER	TER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 13.43 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	IPER	ID Parity Error Flag 0: ID parity error has not been detected. 1: ID parity error has been detected.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	SFER	Sync Field Error Flag 0: Sync field error has not been detected. 1: Sync field error has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	TER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. Write 0 to clear this bit.

IPER Flag (ID Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the IPERE bit of the RLN3nLEDE register is 1 (ID parity error detection enabled), this bit is set to 1 upon ID parity error detection. Write 0 to clear this bit.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The CSER flag is set to 1 upon checksum error detection. Write 0 to clear this bit.

SFER Flag (Sync Field Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the SFERE bit of the RLN3nLEDE register is 1 (sync field error detection enabled), this bit is set to 1 upon sync field error detection. Write 0 to clear this bit.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. Write 0 to clear this bit.

TER Flag (Timeout Error Flag)

Only 0 can be written to the TER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the TERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), this flag is set to 1 upon frame timeout error or response timeout error detection. Write 0 to clear this bit.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. Write 0 to clear this bit.

13.3.3.15 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	—	LCS	RCDS	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.44 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Data transmission/reception continues without waiting for reception of the next header.)
6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	LCS	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RCDS	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received.

With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

When multi-byte response transmission/reception function is not used, set it to “0”.

This should be set when the RTS bit is 0 (response transmission/reception stopped).

LCS Bit (Checksum Select)

The LCS bit sets the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error is used (the TERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details on the bit error, see **Section 13.7.7, Error Status**.
When the length of the response field data is 0 byte (the RFDL bit is 0), do not set this bit to "1" (enhanced).
When response data of 9 bytes or more is to be transmitted or received, do not change the LCS bit setting after the first data group through the last data group.
During transmission or reception of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.
This should be set when the RTS bit is 0 (response transmission/reception stopped).

RCDS Bit (Response Field Communication Direction Select)

This bit selects the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low-level width of the input signal is counted).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
This bit should be set when the RTS bit in the RLN3nLTRC register is 0 in LIN operation mode (response transmission/reception stopped) or when the FTS bit is 0 in LIN wake-up mode (header reception or wake-up transmission/reception stopped).
When response data of 9 bytes or more is to be transmitted or received, do not change this bit setting after the first data group through the last data group.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
These bits should be set when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped).
When response data of 9 bytes or more is to be transmitted or received, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit in the RLN3nLDFC register is 1) include the checksum.

13.3.3.16 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.45 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Stores the parity bits (P1) to be received in the ID field.
6	IDP0	Parity Setting (P0) Stores the parity bits (P0) to be received in the ID field.
5 to 0	ID[5:0]	ID Setting Stores the 6-bit ID value to be received in the ID field.

The value in the RLN3nLIDB register is enabled after the completion of header reception. In LIN mode (LIN operation mode, LIN wake-up mode), writing to this register is disabled.

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 13.9, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits store the parity bits (P0 and P1) to be received in the ID field of the LIN frame. IDP0 is for P0 and IDP1 is for P1.
When the IPERE bit in the RLN3nLEDE register is 1 (ID parity detection enable), the received value and the value calculated internally are checked. If they do not match, IPER (ID parity error flag) is set.

ID[5:0] Bits (ID Setting)

The ID bits store the 6-bit ID value to be received in the ID field of the LIN frame.

13.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register can only be read in 8-bit units.
However, in LIN self-test mode, this register can be read and written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.46 RLN3nLCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed. Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 13.9, LIN Self-Test Mode.**

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of at least 9 bytes is to be transmitted or received, the checksum is only appended to the last data group, so this register is not updated for the other data groups.

13.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.47 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data for transmission or holds the received data. Setting range: 00_H to FF_H

- For response transmission:
  The RLN3nLDBRb registers set the data to be transmitted in the response field.
  These registers should be set when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception is halted).
- For response reception:
  The RLN3nLDBRb registers hold the data received in the response field.
  Any previously received data are overwritten. The data including bytes where an error was found are stored in these registers in response to the detection of an error.
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started)

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 13.9, LIN Self-Test Mode**.

13.3.4 UART Related Registers

13.3.4.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 13.48 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling 0 1 0 1: 6 sampling 0 1 1 0: 7 sampling 0 1 1 1: 8 sampling 1 0 0 0: 9 sampling 1 0 0 1: 10 sampling 1 0 1 0: 11 sampling 1 0 1 1: 12 sampling 1 1 0 0: 13 sampling 1 1 0 1: 14 sampling 1 1 1 0: 15 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Set the LN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the bit rate).
In UART mode, it is possible to set the NSPB bits from 6 sampling to 16 sampling.

LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

13.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register

Access: RLN3nLBRP01 register can be read/written in 16-bit units.
RLN3nLBRP0 register can be read/written in 8-bit units.
RLN3nLBRP1 register can be read/written in 8-bit units.

Address: RLN3nLBRP01: <RLIN3n_base> + 02_H
RLN3nLBRP0: <RLIN3n_base> + 02_H
RLN3nLBRP1: <RLIN3n_base> + 03_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.49 RLN3nLBRP01 Register Contents

Bit Position	Bit Name	Function
15 to 0	BRP[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting range: 0000_H to $FFFF_H$

Set the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units by the registers RLN3nLBRP0 and RLN3nLBRP1.

13.3.4.3 RLN3nLMD — UART Mode Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	—	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R	R/W	R/W

Table 13.50 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	LRDNFS	UART Reception Data Noise Filtering Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 1: UART mode

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LRDNFS Bit (UART Reception Data Noise Filtering Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an UART, set these bits to 01_B.

13.3.4.4 RLN3nLBFC — UART Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	UTPS	URPS	UPS[1:0]		USBLS	UBOS	UBLS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.51 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
6	UTPS	UART Output Polarity Switch 0: Transmit data normal output 1: Transmit data with inversion output
5	URPS	UART Input Polarity Switch 0: Reception data normal output 1: Reception data with inversion output
4, 3	UPS[1:0]	UART Parity Select 00: Parity prohibited 01: Even Parity 10: 0 Parity 11: Odd parity
2	USBLS	UART Stop Bit length Select 0: Stop bit:1 bit 1: Stop bit: 2 bits
1	UBOS	UART Transfer Format Order Select 0: LSB First 1: MSB First
0	UBLS	UART Character Length Select 0: UART 8 bits communication 1: UART 7 bits communication

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

UTPS Bit (UART Output Polarity Switch)

Sets the output polarity for UART communication.
With 0 set, transmit data is output without inversion.
With 1 set, receive data is output with inversion.
The setting of this bit is valid in all the bits of the UART frame.
In half-duplex communication, this setting should match with the setting of URPS bit.

URPS Bit (UART Input Polarity Switch)

Sets the input polarity for UART communication.
With 0 set, receive data is input without inversion.
With 1 set, receive data is input with inversion.
The setting of this bit is valid in all the bits of the UART frame.
In half-duplex communication, this setting should match with the setting of UTPS bit.
When setting this bit to “1” and expansion bit reception ((with expansion bit comparison) or (with data comparison)) is performed, set the inverse of the expected value to the UEBDL bit in the RLN3nLUOR1 register and RLN3nLIDB register for comparison of the inverted values of the received values.

UPS[1:0] Bits (UART Parity Select)

Sets the UART parity.

- When these bits are set to 00_B, data is communicated without the parity.

  [Transmission]
  A parity bit is not added to transmit data.

  [Reception]
  Data is received without parity processing. Therefore, a parity error does not occur.

- When these bits are set to 01_B, data is communicated with the even parity.

  [Transmission]
  If the number of 1s in transmit data is odd, “1” is added to the parity bit. If the number of 1s in transmit data is even, “0” is added to the parity bit.

  [Reception]
  If the number of 1s in receive data including the parity bit is odd, a parity error occurs.

- When these bits are set to 10_B, data is communicated with 0 parity.

  [Transmission]
  Regardless of the number 1s in transmit data, “0” is added to the parity bit.

  [Reception]
  The value of the parity bit is not judged. Therefore, no parity error occurs.

- When these bits are set to 11_B, data is communicated with the odd parity.

  [Transmission]
  If the number of 1s in transmit data is odd, “0” is added to the parity bit. If the number of 1s in transmit data is even, “1” is added to the parity bit.

  [Reception]
  If the number of 1s in receive data including the parity bit is even, a parity error occurs.

USBLS Bit (UART Stop Bit Length Select)

Sets the stop bit length of data for UART communication.
With 0 set, stop bit length of 1 bit is selected.
With 1 set, stop bit length of 2 bits is selected.

UBOS Bit (UART Transfer Format Select)

Sets the bit order of data for UART communication.
With 0 set, LSB first is selected.
With 1 set, MSB first is selected.

UBLS Bit (UART Character Length Select)

Sets the character length of one frame for UART communication.
With 0 set, the character length is 8 bits.
With 1 set, the character length is 7 bits.
When the character length of one frame is 9 bits (the UEBE bit in the RLN3nLUOR1 register is 1), the setting of this bit is ignored.

13.3.4.5 RLN3nLSC — UART Space Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 13.52 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the space between the UART frame in UART buffer transmit
0 Tbit to 3 Tbits can be set.

When the UART buffer is not in use, set the IBS[1:0] bits to 00_B.

The setting of these bits has no effect when data is transferred from the UART transmit data register (RLN3nLUTDR) and UART wait transmit data register (RLN3nLUWTDR). These bits must be set to 00_B.

13.3.4.6 RLN3nLEDE — UART Error Detection Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FERE	OERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R/W

Table 13.53 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	OERE	Overrun Error Detection Enable 0: Disables overrun error detection. 1: Enables overrun error detection.
1	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 13.8.5, Error Status**.

OERE Bit (Overrun Error Detection Enable)

This bit enables or disables detection of the overrun error.
With 0 set, the overrun error is not detected.
With 1 set, the overrun error is detected.
When this bit is set to 1, the detection result is reflected in the OER flag in the RLN3nLEST register.
For details on the overrun error, see **Section 13.8.5, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is indicated in the BER flag in the RLN3nLEST register.
In full-duplex communication, do not set this bit to "1".
Do not set this register when the NSPB bits in the RLN3nLWBR register is 0101_B (6 sampling) and the LRDNFS bit in the RLN3nLMD register is 0 (noise filter is enabled).
For details on the bit error, see **Section 13.8.5, Error Status**.

13.3.4.7 RLN3nLCUC — UART Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 13.54 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	OM0	LIN Reset 0: LIN reset mode is caused. 1: LIN reset mode is canceled.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to reset mode or canceling reset mode.
With 0 set, LIN reset mode is caused.
With 1 set, LIN reset mode is canceled.

13.3.4.8 RLN3nLTRC — UART Transmission Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R

Table 13.55 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	RTS	UART Buffer Transmission Start 0: UART Buffer transmission is stopped. 1: UART Buffer transmission is started.
0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

RTS Bit (UART Buffer Transmission Start)

When transmitting data from the UART buffer, set this bit to “1”.
Only 1 can be written to this bit; 0 cannot be written.
Write to this bit when the UTOE bit in the RLN3nLUOER register is 1 (transmission enable) and the UTS bit in the RLN3nLST register is 0 (transmission is not in progress).
Once set, regardless of errors, this bit is automatically cleared to 0 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDFC register. Moreover, this bit is automatically cleared to 0 upon transition to LIN reset mode.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
When writing 1 to this bit while the UTSW bit in the RLN3nLRFC register is 1 (when UART buffer transmission is requested, the start of transmission is delayed until the stop bit of reception data is completed), write only during the reception of stop bit.

13.3.4.9 RLN3nLMST — UART Mode Status Register

Access: This register can only be read in 8-bit units

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 13.56 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	OMM0	LIN Reset Status Monitor 0: The module is in LIN reset mode. 1: The module is not in LIN reset mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

13.3.4.10 RLN3nLST — UART Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	URS	UTS	ERR	—	—	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 13.57 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	URS	Reception Status Flag 0:Reception is not operated. 1:Reception is operated.
4	UTS	Transmission Status Flag 0: Transmission is not operated. 1: Transmission is operated.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2, 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	FTC	Successful UART Buffer Transmission Flag 0: UART buffer transmission has not been completed. 1: UART buffer transmission has been completed.

The RLN3nLST register is automatically cleared to "00_H" upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains "00_H". To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

URS Flag (Reception Status Flag)

At the start of the reception, this flag is set to 1. The reception is started under the following condition.

- When the start bit is detected

At the end of reception, this flag is cleared to 0. While reception is stopped, this flag retains 0.
The reception is ended under the following conditions.

- Sampling point of the first bit of the stop bits

UTS Flag (Transmission Status Flag)

At the start of the transmission, this flag is set to 1. During the transmission, this flag retains 1.
The transmission is started under the following conditions.

- When transmission data is set to the RLN3nLUTDR or RLN3nLUWTDR register
- When the RTS bit in the RLN3nLTRC register is set to 1

This flag is cleared to 0 at the end of transmission.
The transmission is ended under the following conditions.

- When transmission of data set in the RLN3nLUTDR or RLN3nLUWTDR register is completed and next data is not set
- When transmission from UART buffer is completed (when the RTS bit in the RLN3nLTRC register is cleared to 0)

ERR Flag (Error Detection Flag)

This flag is set to 1 upon detection of an error, detection of an expansion bit, or upon ID matching (when the value of at least one of the flags of the RLN3nLEST register is 1). At this time, an interrupt request for RLIN3n status is generated. However, when this bit is 1, an interrupt is not generated upon detection of an error, detection of an expansion bit, or upon ID matching. To clear the bit to 0, write 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register.

FTC Flag (Successful UART Buffer Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
Regardless of errors, this bit is set to 1 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDFC register from the UART buffer. At this time, an interrupt request for RLIN3n transmission is generated. Write 0 to the bit to be cleared.

13.3.4.11 RLN3nLEST — UART Error Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	UPER	IDMT	EXBT	FER	OER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 13.58 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
6	UPER	Parity Error Flag 0: Parity error has not been detected. 1: Parity error has been detected.
5	IDMT	ID Matching Flag 0: The receive data does not match with the ID value. 1: The receive data matches with the ID value.
4	EXBT	Expanded Bit Detection Flag 0: Expanded bit has not been detected. 1: Expanded bit has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	OER	Overrun Error Flag 0: Overrun error has not been detected. 1: Overrun error has been detected.
1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H when the module transitions to LIN reset mode. In LIN reset mode, this register cannot be written to, and the value of 00_H is held. To clear certain bits in this register, write 0 to those bits, and write 1 to the bits not to be cleared by using the store instruction.

UPER Flag (Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written. This flag is set to 1 upon parity error detection. To clear the bit, write 0 to the bit.

IDMT Flag (ID Matching Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The IDMT flag becomes 1 when all the following conditions are met:

- The UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enabled)
- The UECD bit in the RLN3nLUOR1 register is 0 (expansion bit comparison enabled)
- The UEBDCE bit in the RLN3nLUOR1 register is 1 (expansion bit/data comparison enabled)
  - The received expansion bit and the value of the UEBDL bit of the RLN3nLUOR1 register are matched.
  - The 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register are matched.

To clear the bit, write 0 to the bit.

EXBT Flag (Expanded Bit Detection Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enable), if the received expansion bit matches with the UEBDL bit in the RLN3nLUOR1 register, this flag is set to 1.
To clear the bit, write 0 to the bit.

FER Flag (Framing Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FER flag is set to 1 upon framing error detection while the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled).
To clear the bit, write 0 to the bit.

OER Flag (Overrun Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The 0ER flag is set to 1 upon overrun error detection while the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled).
To clear the bit, write 0 to the bit.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The BER flag is set to 1 when the transmitted data and the data monitored by the receive pin do not match while the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled).
To clear the bit, write 0 to the bit.

13.3.4.12 RLN3nLDFC — UART Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	UTSW	—	MDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 13.59 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	UTSW	Transmission Start Wait 0: When UART transmission is requested, transmission is started immediately. 1: When UART transmission is requested, transmission is not started until reception of the stop bit is completed.
4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3 to 0	MDL[3:0]	UART Buffer Data Length Select b3 b0 0 0 0 0: 9 data 0 0 0 1: 1 data 0 0 1 0: 2 data 0 0 1 1: 3 data 0 1 0 0: 4 data 0 1 0 1: 5 data 0 1 1 0: 6 data 0 1 1 1: 7 data 1 0 0 0: 8 data 1 0 0 1: 9 data Settings other than the above are prohibited.

UTSW Bit (Transmission Start Wait)

This bit controls the transmission start timing of UART buffer.
With 0 set, transmission is started as soon as the start of UART buffer transmit is requested.
With 1 set, transmission is started after the completion of the stop bit reception.
Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.
This bit is enabled when the RTS bit in the RLN3nLTRC register is set to 1. In addition, writing a value to this bit is disabled when the RTS bit is 1 (UART buffer transmission started).
Set this bit to 1 only to switch from reception to transmission in half-duplex communication.

MDL[3:0] Bits (UART Buffer Data Length Select)

This bit specifies the data length of the UART buffer.
Writing a value to these bits is disabled when the RTS bit in the RLN3nLTRC register is 1 (UART buffer transmission started).

13.3.4.13 RLN3nLIDB — UART ID Buffer Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ID[7:0]							
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.60 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7 to 0	ID[7:0]	ID value that is referred for the expansion bit data comparison is set

ID Bit (ID Bit)

When the UEBE bit in the RLN3nLUOR1 register is set to 1 (expansion bit enabled), the UECD bit is set to 0 (expansion bit comparison enabled), and the UEBDCE bit is set to 1 (expansion bit/data comparison enabled), set the receive data and the value to be compared. Write to the RLN3nLIDB register when the URS bit in the RLN3nLST register is 0 (receive operation is not in progress).

13.3.4.14 RLN3nLUDB0 — UART Data 0 Buffer Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 17_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	UDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.61 RLN3nLUDB0 Register Contents

Bit Position	Bit Name	Function
7 to 0	UDB[7:0]	Transmission data is set Setting range: 00_H to FF_H

If the data length selection corresponds to 9 data bytes (RLN3nLDFC.MDL bit is "0_H" or "9_H") for multi-byte UART transmission, then the first data value for UART communication is present in this buffer.

Write to the RLN3nLUDB0 register when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

Table 13.62, Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see Section **13.8.1.2, UART Buffer Transmission, (1) UART Buffer Transmission**.

Table 13.62 Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format

13.3.4.15 RLN3nLDBRb — UART Data Buffer b Register (b = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

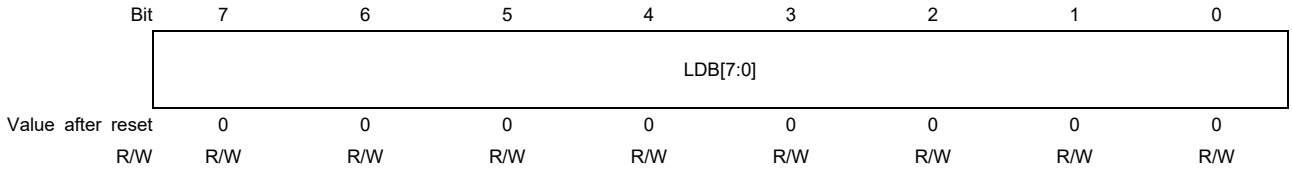

Table 13.63 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted. Setting range: 00_H to FF_H

This register specifies the data transmitted from the UART buffer.

Write to these registers when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

Table 13.64, Bit Arrangement of the RLN3nLDBRb Register According to Each Communication Format, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see **Section 13.8.1.2, UART Buffer Transmission, (1) UART Buffer Transmission**.

13.3.4.16 RLN3nLUOER — UART Operation Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	UROE	UTOE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 13.65 RLN3nLUOER Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	UROE	Reception Enable 0: Disables reception. 1: Enables reception.
0	UTOE	Transmission Enable 0: Disables transmission. 1: Enables transmission.

The RLN3nLUOER register is automatically cleared to 00_H upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to.

In LIN reset mode, the register retains 00_H.

UROE Bit (Reception Enable)

The UROE bit enables or disables reception.
With 0 set, reception is disabled.
With 1 set, reception is enabled.
Do not clear this bit during reception. If the communication is suspended during reception, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to shift to the LIN reset mode. However, the transmit operation is also suspended at this time.
Do not set this bit to 1 when data transmission from the UART buffer is in progress.

UTOE Bit (Transmission Enable)

The UTOE bit enables or disables transmission.
With 0 set, transmission is disabled.
With 1 set, transmission is enabled.
Do not clear this bit during transmission. If the communication is suspended during transmission, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to shift to the LIN reset mode. However, the receive operation is also suspended at this time.

13.3.4.17 RLN3nLUOR1 — UART Option Register 1

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 21_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	UECD	UTIGTS	UEBDCE	UEBDL	UEBE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 13.66 RLN3nLUOR1 Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
4	UECD	Expansion Bit Comparison Disable 0: Enables comparison between the received expansion bit and the UEBDL bit value. 1: Disables comparison between the received expansion bit and the UEBDL bit value.
3	UTIGTS	Transmission Interrupt Generation Timing Select 0: Transmission interrupt is generated at the start of transmission. 1: Transmission interrupt is generated at the completion of transmission.
2	UEBDCE	Expansion Bit Data Comparison Enable 0: Disables data comparison after an expansion bit is detected. 1: Enables data comparison after an expansion bit is detected.
1	UEBDL	Expansion Bit Detection Level Select 0: Selects expansion bit value 0 as the expansion bit detection level. 1: Selects expansion bit value 1 as the expansion bit detection level.
0	UEBE	Expansion Bit Enable 0: Disables expansion bit operation. 1: Enables expansion bit operation.

UECD Bit (Expansion Bit Comparison Disable)

The UECD bit enables or disables comparison between the received expansion bit and the UEBDL bit value when the UEBE bit is 1 (expansion bit operation is enabled).

With 0 set, comparison between the received expansion bit and the UEBDL bit value is enabled when the expansion bit is received.

With 1 set, comparison between the received expansion bit and the UEBDL bit value is disabled when the expansion bit is received.

Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).

Do not set this bit to 1 when the UART buffer is used.

Do not set this bit to 1 when the UEBDCE bit is 1 (expansion bit/data comparison enable).

UTIGTS Bit (Transmission Interrupt Generation Timing Select)

The UTIGTS bit sets the generation timing of the transmission interrupt.
With 0 set, the transmission interrupt is generated at the start of transmission.
With 1 set, the transmission interrupt is generated at the completion of transmission.
When transmission from the UART buffer is performed with 0 set, the transmission interrupt is generated only at the start of the transmission of the last data of the data length set with the MDL bits in the RLN3nLDFC register.
When transmission from the UART buffer is performed with 1 set, the transmission interrupt is generated only at the completion of the transmission of the last data of the data length set with the MDL bits in the RLN3nLDFC register.

UEBDCE Bit (Expansion Bit Data Comparison Enable)

After an expansion bit is detected, this bit enables or disables the comparison between the 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register.
With 0 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the receive value in the RLN3nLURDR register and the value of the RLN3nLIDB register is disabled.
With 1 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the receive value in the RLN3nLURDR register and the value of the RLN3nLIDB register is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
Do not set this bit to 1 when the UEBE bit is 0 (expansion bit operation disabled).
Do not set this bit to 1 when the UECD bit is 1 (expansion bit comparison disabled).
Do not set this bit to 1 when the UART buffer is used.

UEBDL Bit (Expansion Bit Detection Level Select)

The UEBDL bit sets the level to be detected as the expansion bit when the UEBE bit is 1 (expansion bit operation is enabled) and the UECD bit is 0 (comparison of the expansion bit is enabled).
With 0 set, expansion bit value 0 is the level to be detected as the expansion bit.
With 1 set, expansion bit value 1 is the level to be detected as the expansion bit.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

UEBE Bit (Expansion Bit Enable Bit)

The UEBE bit enables or disables expansion bit operation.
With 0 set, expansion bit operation is disabled.
With 1 set, expansion bit operation is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

13.3.4.18 RLN3nLUTDR — UART Transmission Data Register

Access: RLN3nLUTDR register can be read/written in 16-bit units.
RLN3nLUTDRL register can be read/written in 8-bit units.
RLN3nLUTDRH register can be read/written in 8-bit units.

Address: RLN3nLUTDR: <RLIN3n_base> + 24_H
RLN3nLUTDRL: <RLIN3n_base> + 24_H
RLN3nLUTDRH: <RLIN3n_base> + 25_H

Value after reset: 0000_h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	UTD[8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.67 RLN3nLUTDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
8 to 0	UTD[8:0]	Sets the data to be transmitted from the transmission buffer. Setting range: 000_H to $1FF_H$

The RLN3nLUTDR register sets the data to be transmitted from the transmit data register. Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

This register can be accessed in 8 bits.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

Also, do not write data to this register when a transmission request is being generated due to write access to the RLN3nLUWTDR register.

When transmitting data continuously, do not set another piece of transmission data in this register before the generation of transmission interrupt.

The table below shows the bit arrangement according to the set communication format.

Table 13.68 Bit Arrangement of the RLN3nLUTDR Register According to Each Communication Format

	RLN3nLUTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0

13.3.4.19 RLN3nLURDR — UART Reception Data Register

Access: RLN3nLURDR register can only be read in 16-bit units.
RLN3nLURDRL register can only be read in 8-bit units
RLN3nLURDRH register can only be read in 8-bit units

Address: RLN3nLURDR: <RLIN3n_base> + 26_H
RLN3nLURDRL: <RLIN3n_base> + 26_H
RLN3nLURDRH: <RLIN3n_base> + 27_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	URD[8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.69 RLN3nLURDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned.
8 to 0	URD[8:0]	Hold the received data. Setting range: 000_H to $1FF_H$

The RLN3nLURDR allows the reception data to be read from the receive data register.

When the UROE bit in the RLN3nLUOER register is 1, the reception data is stored in this register and can be read out.

This register is updated at the stop bit of the reception data.

This register is also updated when an error is caused by the parity or stop bit. However, the value of this register is not updated upon occurrence of an overrun error when the OERE bit of the RLN3nLEDE register is 1 (overrun detection enabled). The value of this register is updated upon occurrence of an overrun error when the OERE bit is 0 (overrun detection disabled).

Read this register upon occurrence of a receive error (overrun error, framing error, parity error) when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). If the next data is received without reading this register, an overrun error occurs.

This register can be accessed in 8 bits. However, during expansion bit use (UEBE bit of the RLN3nLUOR1 register is 1 (expansion bit operation enabled), do not attempt 8-bit access.

The table below shows the bit arrangement according to the set communication format.

Table 13.70 Bit Arrangement of the RLN3nLURDR Register According to Each Communication Format

	RLN3nLURDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0

13.3.4.20 RLN3nLUWTDR — UART Wait Transmission Data Register

Access: RLN3nLUWTDR register can be read/written in 16-bit units.
RLN3nLUWTDRL register can be read/written in 8-bit units.
RLN3nLUWTDRH register can be read/written in 8-bit units.

Address: RLN3nLUWTDR: <RLIN3n_base> + 28_H
RLN3nLUWTDRL: <RLIN3n_base> + 28_H
RLN3nLUWTDRH: <RLIN3n_base> + 29_H

Value after reset: 0000_H

Table 13.71 RLN3nLUWTDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
8 to 0	UWTD[8:0]	Sets the data to be transmitted from the wait transmit data register after waiting for the stop bit reception to be completed. Setting range: 000_H to $1FF_H$

The RLN3nLUWTDR register sets the data to be transmitted from the UART wait transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

Use this register only to switch from reception to transmission in half-duplex communication. The user should write to this register only while the stop bit is being received.

Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.

When this register is read, the RLN3nLUTDR register value is actually read.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

The table below shows the bit arrangement according to the set communication format.

Table 13.72 Bit Arrangement of the RLN3nLUWTDR Register According to Each Communication Format

	RLN3nLUWTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0

13.4 Interrupt Sources

The LIN/UART interface generates 4 types of interrupt request signals.

- RLIN3n successful transmission interrupt
- RLIN3n successful reception interrupt
- RLIN3n status interrupt
- RLIN3n interrupt

Setting the LIOS bit in the RLN3nLMD register to 0 allows to perform logical OR operation on all of the interrupt sources, outputting the interrupt request from the RLIN3n interrupt.

If the LIOS bit of the RLN3nLMD register is set to 1, either RLIN3n transmit interrupt, RLIN3n receive completion interrupt, or RLIN3n status interrupt request signal is output according to the interrupt source.

Table 13.73 lists the sources for each interrupt.

Table 13.73 Interrupt Sources

		LIOS bit in RLN3nLMD register is 0	LIOS bit in RLN3nLMD register is 1*1		
		RLIN3n Interrupt	RLIN3n Transmission Interrupt	RLIN3n Successful Reception Interrupt	RLIN3n Status Interrupt
LIN mode	LIN master mode	• Successful frame transmission • Successful frame reception • Successful wake-up transmission • Successful wake-up reception • Successful header transmission • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error	• Successful frame transmission • Successful wake-up transmission • Successful header transmission	• Successful frame reception • Successful wake-up reception	• Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error
	LIN slave mode	• Successful response transmission • Successful response reception • Successful wake-up transmission • Successful wake-up reception • Successful header reception • Bit error • Frame/response timeout error • Framing error • Sync field error • Checksum error • ID parity error • Response preparation error	• Successful response transmission • Successful wake-up transmission	• Successful response reception • Successful wake-up reception • Successful header reception	• Bit error • Frame/response timeout error • Framing error • Sync field error • Checksum error • ID parity error • Response preparation error
UART mode		—	• Transmission start/successful transmission	• Successful reception • Expansion bit mismatch	• Bit error • Overrun error • Framing error • Expansion bit match • ID match • Parity error

Note 1. The LIOS bit setting is valid in LIN Mode. In UART mode, setting the LIOS bit is not required.

In LIN mode, each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is 1.

13.5 Modes

The LIN/UART interface provides the following four modes, depending upon the specific function to be performed:

- LIN reset mode
- LIN mode
  - LIN master mode
  - LIN slave mode [auto baud rate]
  - LIN slave mode [fixed baud rate]
- UART mode
- LIN self-test mode

Figure 13.2 shows mode transitions. **Table 13.74** describes mode transition conditions. **Table 13.75** lists operations available in each mode.

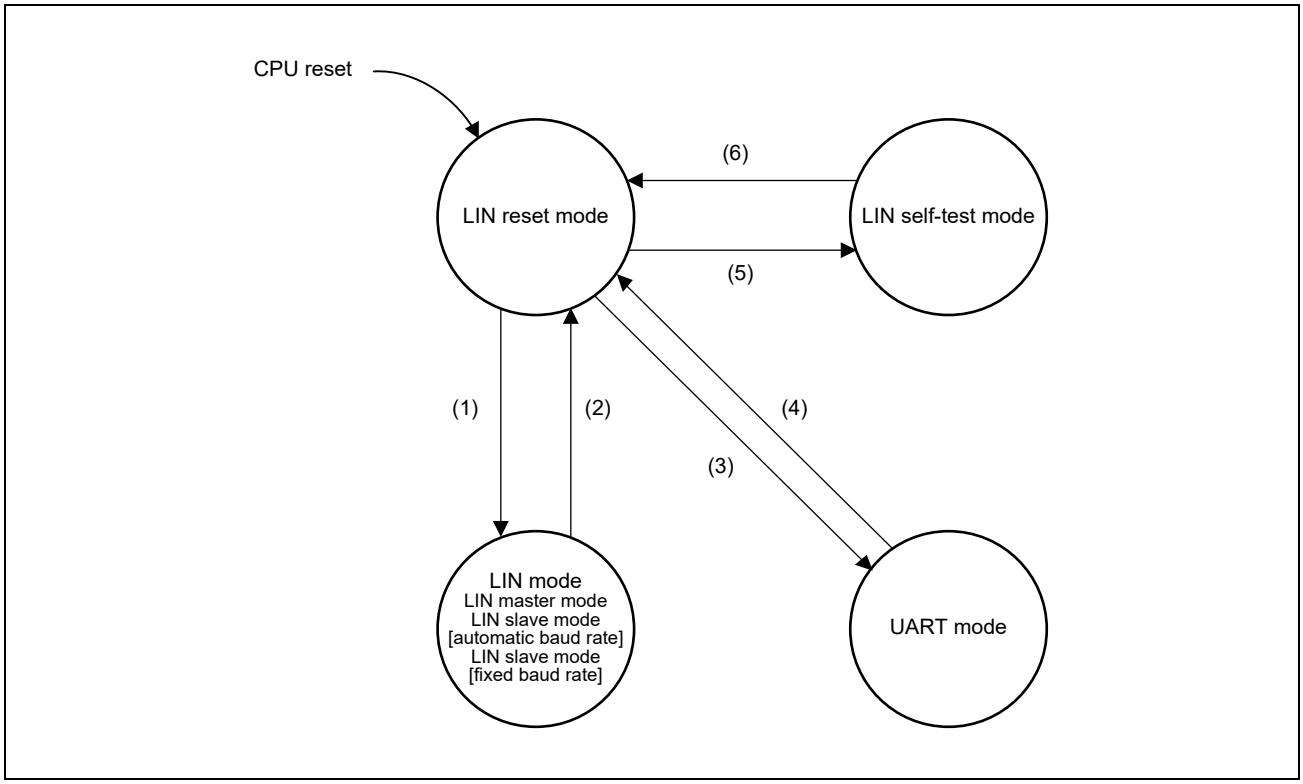

Figure 13.2 Mode Transitions

Table 13.74 Transition Condition of Each Mode

	Mode Transition			Transition Condition
(1)	LIN reset mode	→	LIN mode • LIN master mode • LIN slave mode [auto baud rate] • LIN slave mode [fixed baud rate]	• RLN3nLMD.LMD = “00_B” and RLN3nLCUC.OM1, OM0 = ”01_B” or “11_B” • RLN3nLMD.LMD = “11_B” and RLN3nLCUC.OM1,OM0 = “01_B” or “11_B” • RLN3nLMD.LMD = “10_B” and RLN3nLCUC.OM1,OM0 = “01_B” or “11_B”
(2)	LIN mode	→	LIN reset mode	RLN3nLCUC.OM0 = “0_B”
(3)	LIN reset mode	→	UART mode	RLN3nLMD.LMD = “01_B” and RLN3nLCUC.OM0 = “1_B”
(4)	UART mode	→	LIN reset mode	RLN3nLCUC.OM0 = “0_B”
(5)	LIN reset mode	→	LIN self-test mode	See **Section 13.9, LIN Self-Test Mode**.
(6)	LIN self-test mode	→	LIN reset mode	See **Section 13.9, LIN Self-Test Mode**.

Table 13.75 Operations Available in Each Mode

LIN Mode			
LIN Master Mode	LIN Slave Mode [auto baud rate] LIN Slave Mode [fixed baud rate]	UART Mode	LIN Self-Test Mode
Header transmission Response transmission Response reception Wake-up transmission Wake-up reception Error detection	Header reception Response transmission Response reception Wake-up transmission Wake-up reception Error detection	UART transmission UART reception Error detection	Self test

Whether a transition has been caused to LIN reset mode, the LIN mode, or the UART mode can be verified by reading the LMD bits in the RLN3nLMD register or the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see **Section 13.9, LIN Self-Test Mode**.

13.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The change to LIN reset mode can be verified by determining that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication and the UART communication functions are halted.

From LIN reset mode, transitions to LIN mode, UART mode, and LIN self-test mode can be made.

When the mode changes to LIN reset mode, the following registers are initialized to their reset values, and as long as LIN reset mode is in effect, they retain their initial values.

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register
- RLN3nLUOER register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLUDB0 register
- RLN3nLDBRb register (b = 1 to 8)
- RLN3nLUOR1 register
- RLN3nLUTDR register
- RLN3nLURDR register
- RLN3nLUWTDR register

13.7 LIN Mode

LIN mode can operate in the following submodes: LIN master mode, LIN slave mode [auto baud rate], and LIN slave mode [fixed baud rate].

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00_B (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01_B or 11_B sets LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01_B to 11_B.

In LIN slave mode [auto baud rate] and LIN slave mode [fixed baud rate], header reception, response transmission, response reception, wake-up transmission, wake-up reception, and error detection can be performed.

The LIN slave mode [auto baud rate] allows automatic detection of the break field and the sync field, and sets a baud rate based on the results of measurement of a sync field. The baud rate can be set to the range from 1kbps to 20kbps. Set the LPRS[2:0] bits in the RLN3nLWBR register so that the prescaler clock (with the frequency of the LIN communication clock source divided by the prescaler) becomes as follows according to the target baud rate.

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4 MHz*1
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

Note 1. Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to "0011_B" (four samplings).

In LIN slave mode [fixed baud rate] allows automatic detection of the break field, the sync field, and the ID filed at a baud rate that is set in advance by the baud rate generator.

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 10_B (LIN slave mode [auto baud rate] and setting the OM1 and OM0 bit in the RLN3nLCUC register to 01_B or 11_B sets LIN slave mode [auto baud rate]; and setting the LMD bits in the RLN3nLMD register to 11_B (LIN slave mode [fixed baud rate]), and setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B or 11_B sets LIN slave mode [fixed baud rate], turning the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B or 11_B.

When changing a submode to another submode within LIN mode, a transition to LIN reset mode should first be made and change the LMD bits in the RLN3nLMD register.

The LIN mode provides the following two operation modes:

- LIN operation mode
- LIN wake-up mode

Figure 13.3 shows the transition of operation modes. **Table 13.76** describes the transition conditions of operation modes.

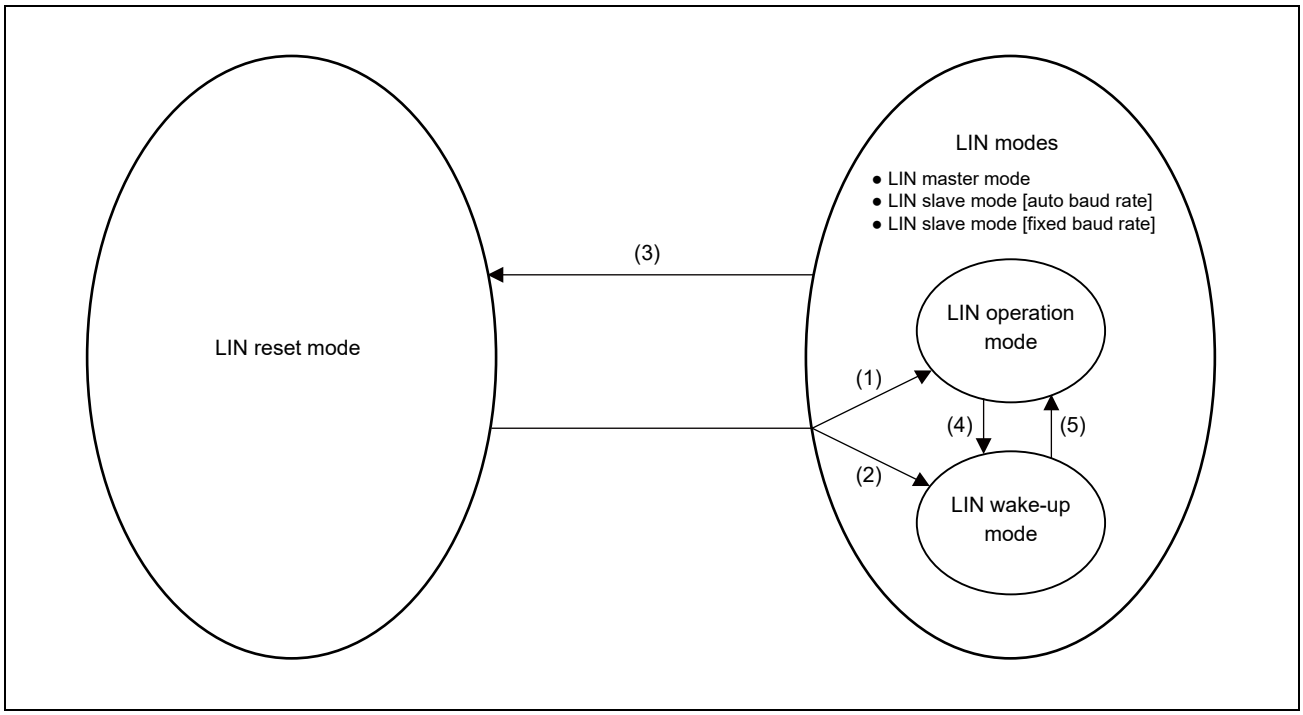

Figure 13.3 Transition of Operation Modes

Table 13.76 Transition Condition for Operation Mode

	Operation Mode Transition			Transition Condition
(1)	LIN reset mode	→	LIN mode • LIN operation mode	LMD bit in RLN3nLMD register = 00_B or 10_B or 11_B and OM1 and OM0 bits in RLN3nLCUC register = 11_B
(2)	LIN reset mode	→	LIN mode • LIN wake-up mode	LMD bit in RLN3nLMD register = 00_B or 10_B or 11_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B
(3)	LIN mode • LIN operation mode • LIN wake-up mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
(4)*1	LIN mode	→	LIN mode • LIN wake-up mode	OM1 and OM0 bits in RLN3nLCUC register = 01_B
(5)*1	LIN mode • LIN wake-up mode	→	LIN mode • LIN operation mode	OM1 and OM0 bits in RLN3nLCUC register = 11_B

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is going on (when the FTS bit in the RLN3nLTRC register is 1).

(1) LIN Operation Mode

In LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11_B changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11_B. Communication settings should be performed after the OMM1 and OMM0 bits have become 11_B.

(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B. Communication settings should be performed after the OMM1 and OMM0 bits have become 01_B.

13.7.1 LIN Master Mode

13.7.1.1 Header Transmission

Figure 13.4 shows the operation of the LIN/UART interface (LIN master mode) in header transmission. **Table 13.77** provides processing in header transmission.

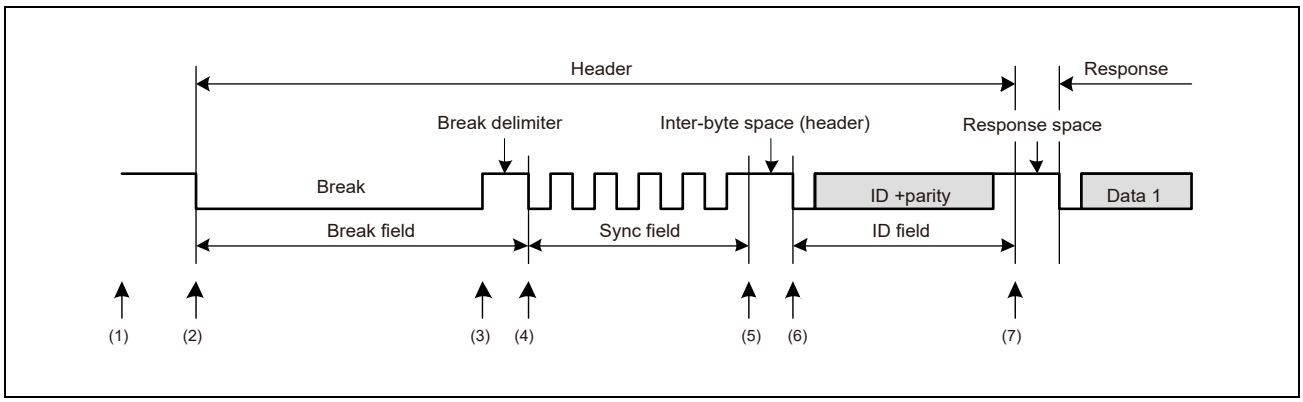

Figure 13.4 Operation in Header Transmission

Table 13.77 Processing in Header Transmission

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Changes the LIN/UART interface to the LIN maste rmode: LIN operation mode • Sets information on the frame to be transmitted (ID,parity, data length, response direction, Checksum method, and transmission data)	Waits for the setting of the FTS bit in the RLN3nLTRC register by software (idle)
(2)	Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3)	Waits for an interrupt request	Transmits a break delimiter.
(4)		Transmits a sync field (55_H).
(5)		Transmits an inter-byte space (header).
(6)		Transmits an ID field.
(7)		Sets a successful header transmission flag.

NOTE

For information about error detection conditions, see **Section 13.7.7, Error Status**.

13.7.1.2 Response Transmission

Figure 13.5 shows the operation of the LIN/UART interface (LIN master mode) in response transmission. **Table 13.78** provides processing in response transmission.

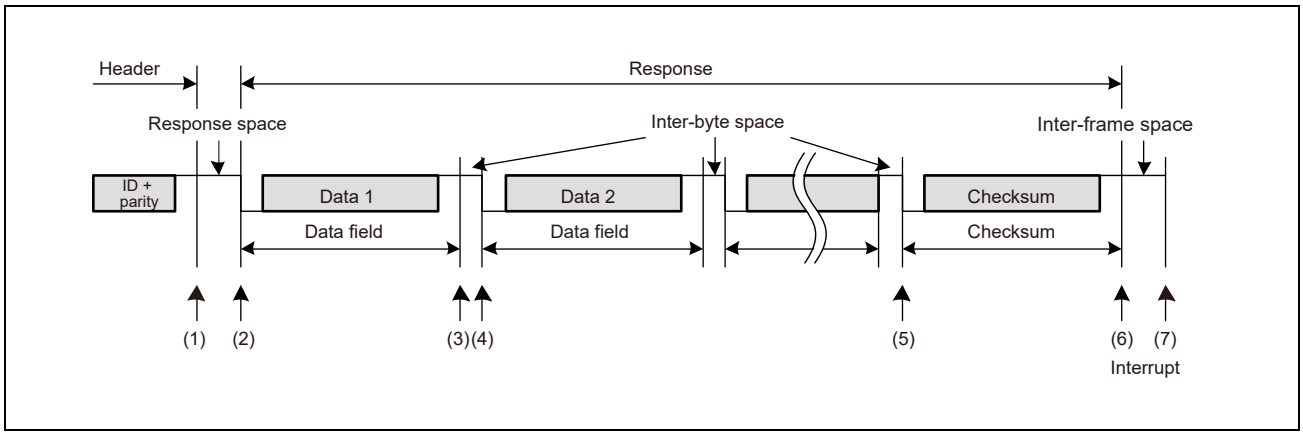

Figure 13.5 Operation in Response Transmission

Table 13.78 Processing in Response Transmission

	Software Processing	LIN/UART Interface Processing
(1)	[When in frame separate mode] • Sets the RTS bit in the RLN3nLTRCregister to 1 (response transmission/reception started) [When not in frame separate mode] • Waits for an interrupt request	[When in frame separate mode] • Waits for the setting of the RTS bit in the RLN3nLTRC register to 1 by software. • When the bit is set to 1, sends a response space. [When not in frame separate mode] • Sends a response space.
(2)	Waits for an interrupt request	Transmits data 1.
(3)		Transmits an inter-byte space.
(4)		• Transmits data 2. • Transmits an inter-byte space • Transmits data 3. • Transmits an inter-byte space (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RFC register). : :
(5)		Transmits the checksum.
(6)		• Sets a successful frame/wake-up transmission flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped) [When in frame separate mode] • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception is halted).
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 13.7.7, Error Status**.

13.7.1.3 Response Reception

Figure 13.6 shows the operation of the LIN/UART interface (LIN master mode) on response reception. **Table 13.79** provides processing in response reception.

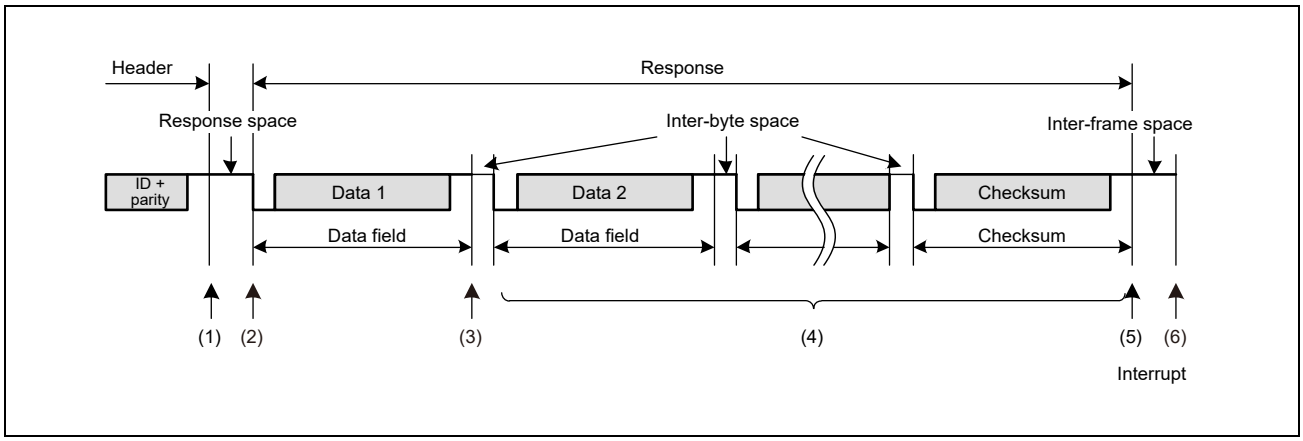

Figure 13.6 Operation in Response Reception

Table 13.79 Processing in Response Reception

	Software Processing	LIN/UART Interface Processing
(1)	Waits for an interrupt request (no processing)	Waits for detection of a start bit.
(2)		Receives data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		• Receives data 2 when the start bit is detected. • Receives data 3 when the start bit is detected. Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register). : : • Receives the checksum when the start bit is detected.
(5)		• Determines the checksum. • Sets the successful frame/wake-up reception flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmissionor wake-up transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 13.7.7, Error Status**.

13.7.2 LIN Slave Mode

13.7.2.1 Header Reception

Figure 13.7 shows the operation of the LIN/UART interface (LIN slave mode) in header reception.**Table 13.80** provides processing in header reception.

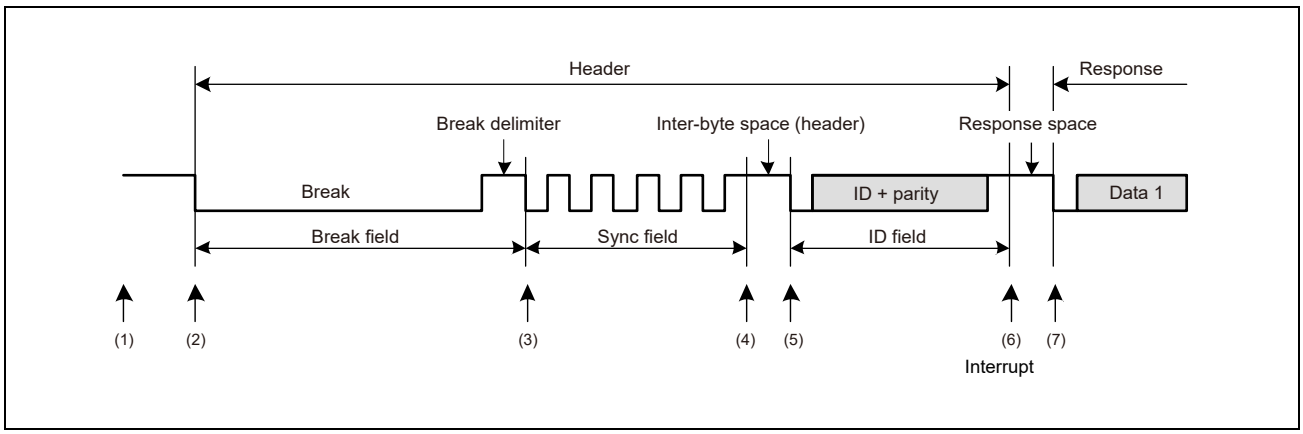

Figure 13.7 Operation in Header Reception

Table 13.80 Processing in Header Reception

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Changes the LIN/UART interface to the LIN slave mode: LIN operation mode • Sets the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started)	Waits for the setting of the FTS bit in the RLN3nLTRC register by software.
(2)	Waits for an interrupt request.	Waits for detection of break field
(3)		Detects a break field. In the case of break field detection (LIN slave mode [fixed baud rate]). For details about the break field detection timing in the case of LIN slave mode [auto baud rate], see [Auto Baud Rate Correction Function])
(4)		• Detects a sync field (55_H) • Baud rate generator setting (in the case of LIN slave mode [auto baud rate]) • Clears the no-response request bit (LNRR bit).
(5)		• Receives an ID field. • Checks an ID parity bit
(6)		Sets a header reception complete flag.
(7)	• Checks the RLN3nLST register, and clearsflags. • Checks the RLN3nLIDB register, and prepares a response.	• Completes a header reception process. • Waits for a response request.

NOTE

The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the following Sync field and ID field) continues regardless of whether an error occurred. For information about error detection conditions, see **Section 13.7.7, Error Status**.

[Auto Baud Rate Correction Function]

In LIN slave mode [auto baud rate], the system always measures the low-level widths that are received. If the first "Low level" width is 10 times (if the BLT bit of the RLN3nLBFC register is "0") or 11 times (if the BLT bit of the RLN3nLBFC register is "1") or greater calculated from the average of the starting 2 bits (the period of the consecutive fall edges from the beginning of the sync field) of the sync field, the system concludes that the detection of break field was successful, the system verifies that the data in the sync field is 55_H. If the data in the sync field is indeed 55_H and the system judges that sync field reception was successful, the system automatically sets the baud rate correction result to the RLN3nLBRP01 register.

If data is received up to the ID field without error, a successful header reception interrupt is generated at the stop bit position.

On the other hand, if the data in the sync field is not 55_H and the system judges that sync field reception failed, the system sets the sync field error flag and an error interrupt is generated. In that case, baud rate correction is not performed and the LIN/UART interface waits for the detection of the next break field (low level).

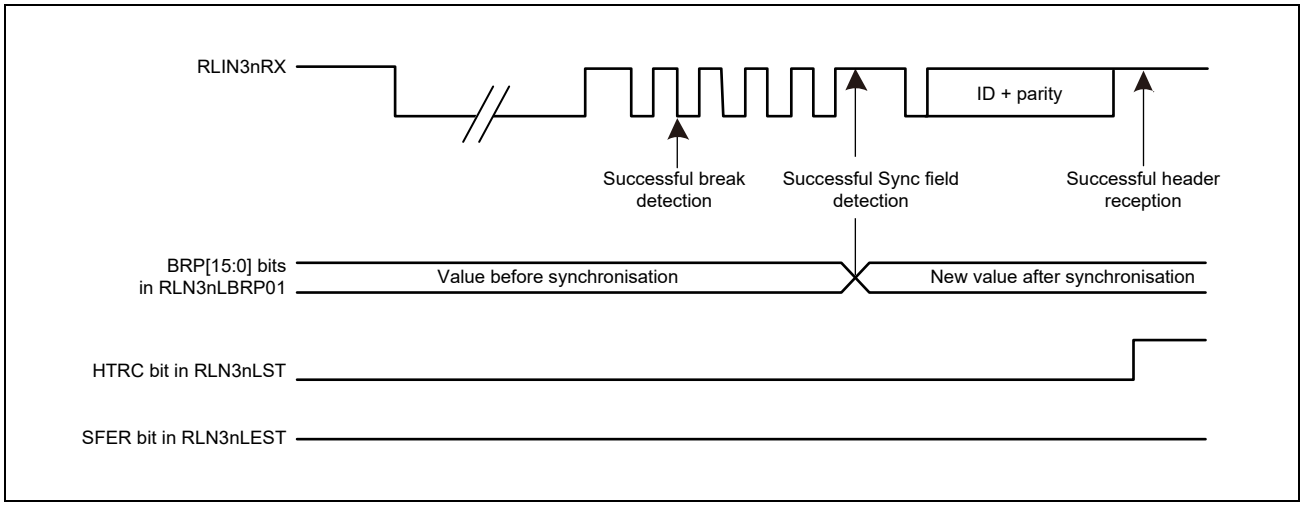

Figure 13.8 Header Reception in LIN Slave Mode [Auto Baud Rate] (in Normal Operation)

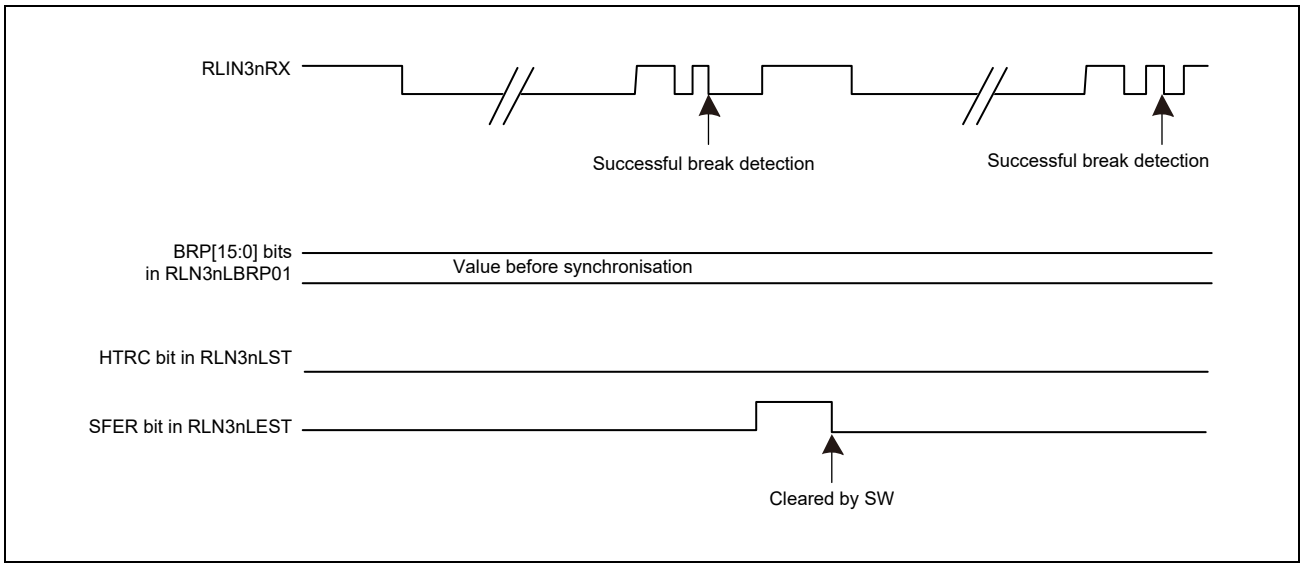

Figure 13.9 Header Reception in LIN Slave Mode [Auto Baud Rate] (Sync Field Error)

13.7.2.2 Response Transmission

Figure 13.10 shows the operation of the LIN/UART interface (in LIN slave mode) in response transmission. **Table 13.81** provides processing in response transmission.

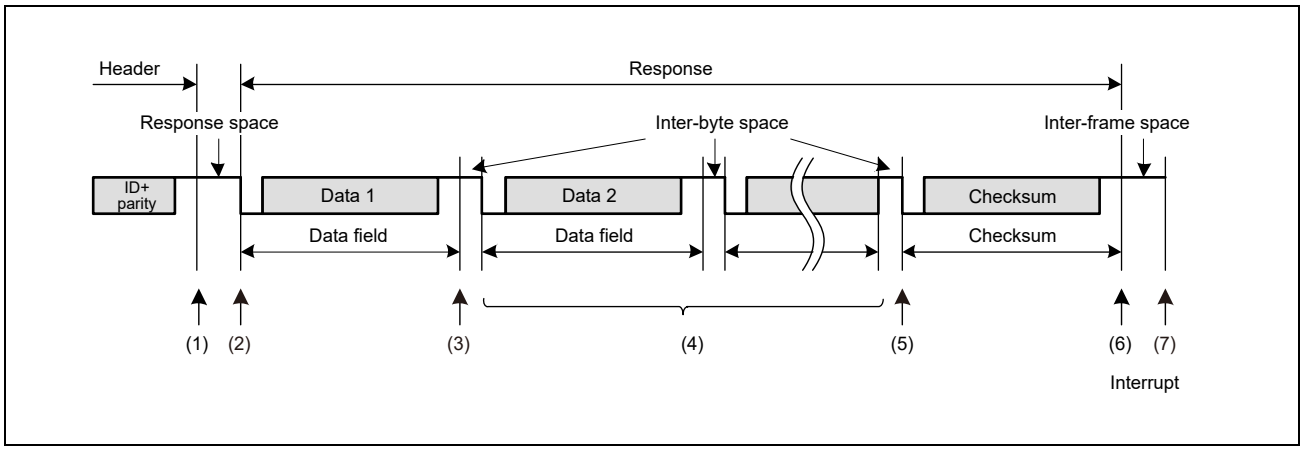

Figure 13.10 Operation in Response Transmission

Table 13.81 Processing in Response Transmission

	Software Processing	LIN/UART Interface Processing
(1)	• Sets the RLN3nLDFC register. • Sets the RLN3nLDBRbregisters.(b = 1 to 8) • Sets the RTS bit in theRLN3nLTRC register to 1 (response transmission/reception started)	• Waits for the setting of the RTS or LNRR bit of the RLN3nLTRC register by software • Transmits the response space after the RTS bit of the RLN3nLTRC register is set to 1
(2)	Waits for an interrupt request.	Transmits data 1.
(3)		Transmits the inter-byte space.
(4)		• Transmits data 2. • Transmits an inter-byte space • Transmits data 3. • Transmits an inter-byte space (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register). : :
(5)		Transmits the checksum.
(6)		• Sets a successful response/wake-up transmission flag. • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	• Completes the response transmission process. • Waits for a new break.

NOTE

- For information about error detection, see **Section 13.7.7, Error Status**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the following Sync field and ID field) continues regardless of whether an error occurred.

13.7.2.3 Response Reception

Figure 13.11 shows the operation of the LIN/UART interface (LIN slave mode) in response reception. **Table** 13.82 provides processing in response reception.

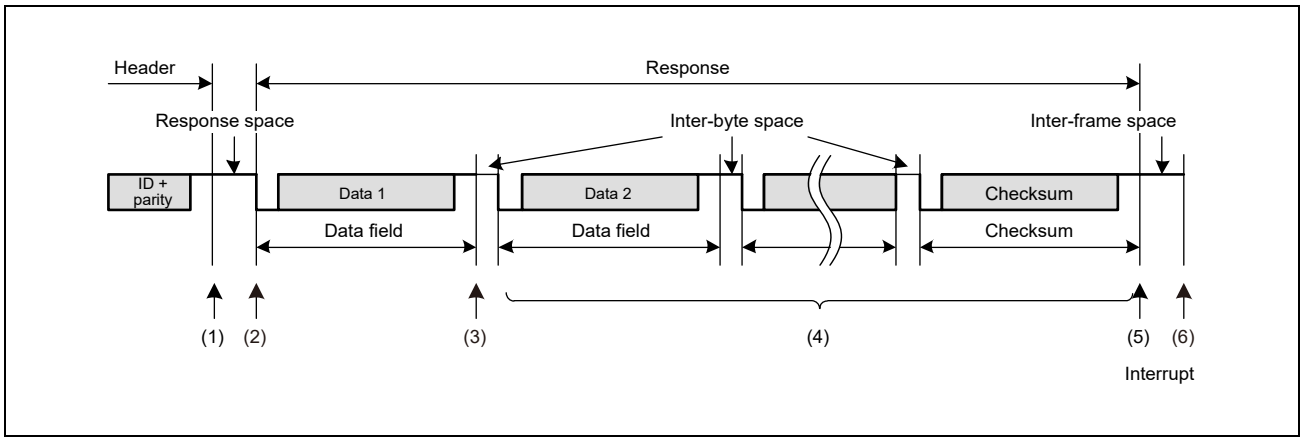

Figure 13.11 Operation in Response Reception

Table 13.82 Processing in Response Reception

	Software Processing	LIN/UART Interface Processing
(1)	• Sets the RLN3nLDFC register. • Sets the response transmission/reception start bit (RTS bit) to 1.	• Waits for the setting by software of the response transmission/reception start bit (RTS bit) or the no-response request bit (LNRR bit). • Waits for detection of the start bit.
(2)	Waits for an interrupt request.	Receives data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		• Receives data 2 when the start bit is detected. • Receives data 3 when the start bit is detected. Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register. : : • Receives the checksum when the start bit is detected.
(5)		• Determines the checksum. • Sets a successful response/wake-up reception flag or an error flag. • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	• Completes the response process. • Waits for a new break.

NOTE

- For information about error detection conditions, see **Section 13.7.7, Error Status**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the following Sync field and ID field) continues regardless of whether an error occurred.

13.7.2.4 No-Response Request

Figure 13.12 shows the operation of the LIN/UART interface (LIN slave mode) when no response is requested. **Table 13.83** shows the processing that occurs when no response is requested.

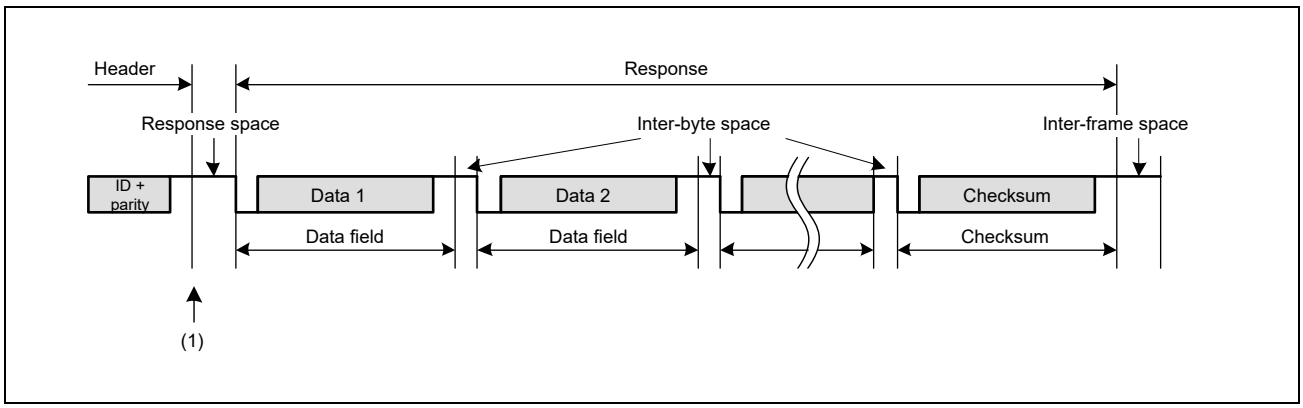

Figure 13.12 Operation when No Response is Requested

Table 13.83 Processing when No Response is Requested

	Software Processing	LIN/UART Interface Processing
(1)	• Sets the no-response request bit (LNRR bit) to 1.	• Waits for setting of the no-response request bit (LNRR bit) by software • Completes the frame reception process • Waits for a new break

13.7.3 Data Transmission/Reception

13.7.3.1 Data Transmission

One bit of data is transmitted per Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data is compared bit by bit, and the results are stored in the BER flag in the RLN3nLEST register (see **Section 13.7.7, Error Status**).

In LIN master mode and LIN slave mode [fixed baud rate], 1 Tbit is generated to be 16fLIN, and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

In LIN slave mode [auto baud rate], if 1 Tbit is generated to be 4fLIN, the sampling point for received data is at the third clock cycle (75% position). If 1 Tbit is generated to be 8fLIN, the sampling point for received data is at the 7th clock cycle (87.5% position).

Figure 13.13 shows an example of data transmission timing.

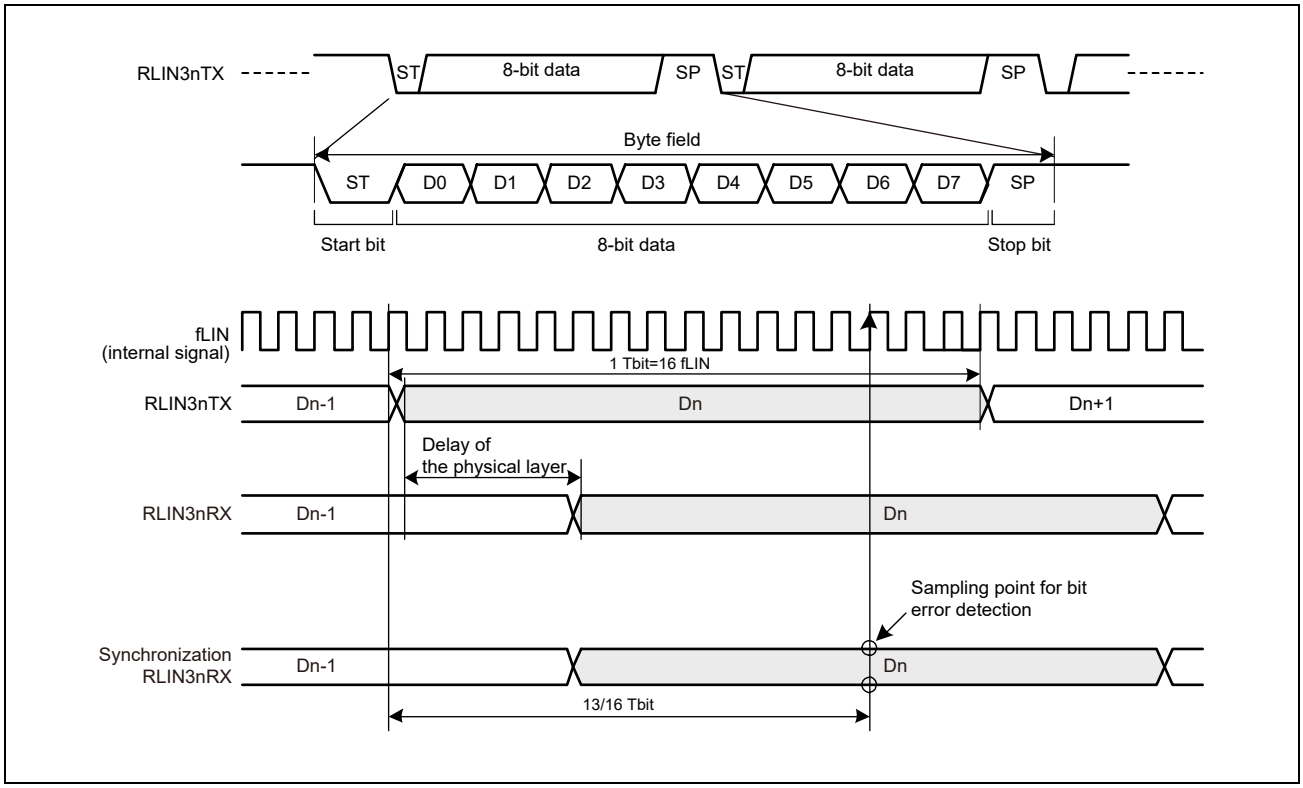

Figure 13.13 Example of Data Transmission Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

13.7.3.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the clearing of the resetting is low-level-fixed or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN/UART interface has a noise filter function with respect to reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN/UART interface uses a noise filter, and for a sampling value the value determined by a 3-sampling majority rule on prescaler clocks is used. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN/UART interface does not use a noise filter, and for a sampling value the value of the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 13.14 shows an example of data reception timing.

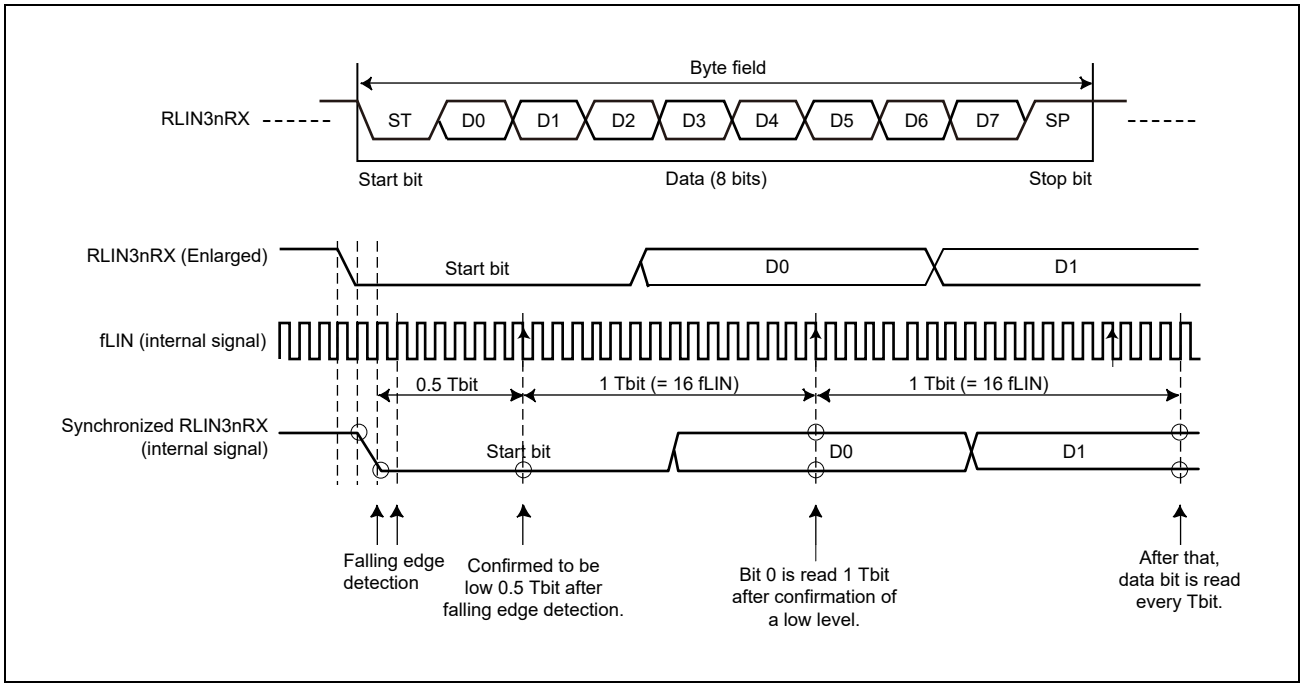

Figure 13.14 Example of Data Reception Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

13.7.4 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN/UART interface sends or receives data continuously.

13.7.4.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

Figure 13.15 depicts the LIN transmission processing and the required buffer.

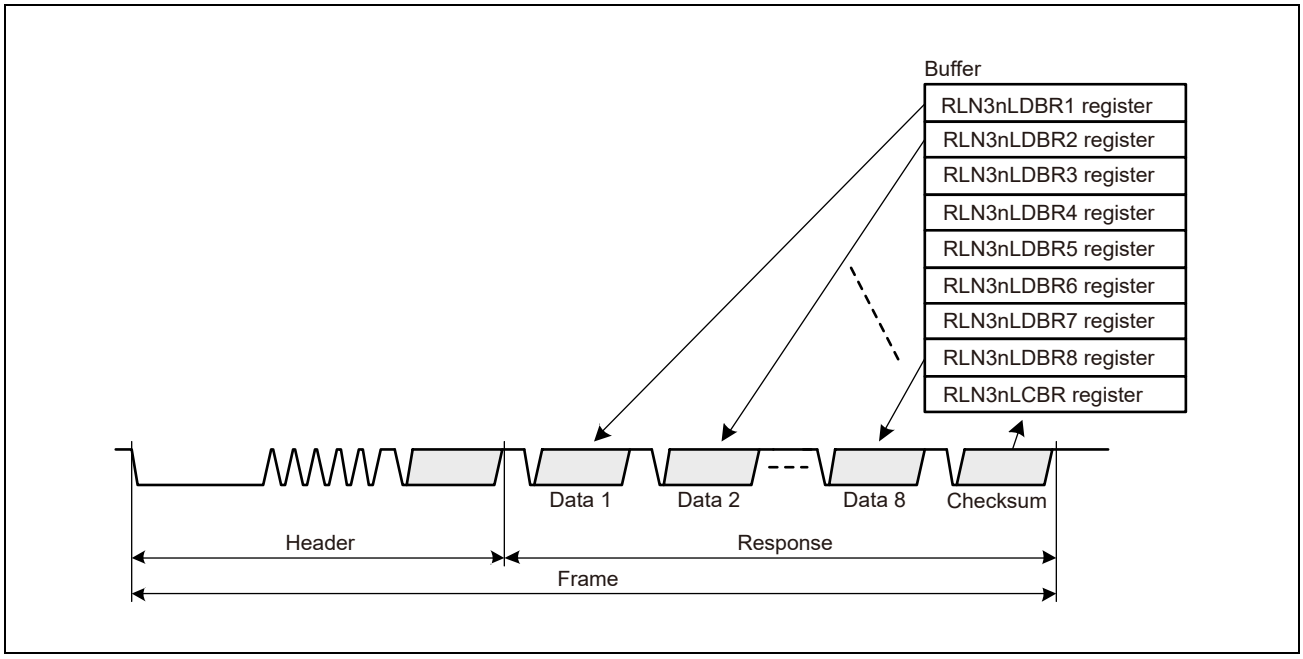

Figure 13.15 LIN Transmission Processing and Required Buffer

[Frame Separate Mode]

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN3nLST register turns 1 (successful header transmission).

Use frame separate mode when sending or receiving response data of 9 bytes or greater in LIN master mode.

13.7.4.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame is stored in registers RLN3nLDBR1 to RLN3nLDBR8, respectively, upon receipt of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; however, no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

Figure 13.16 depicts the LIN reception processing and the required buffer.

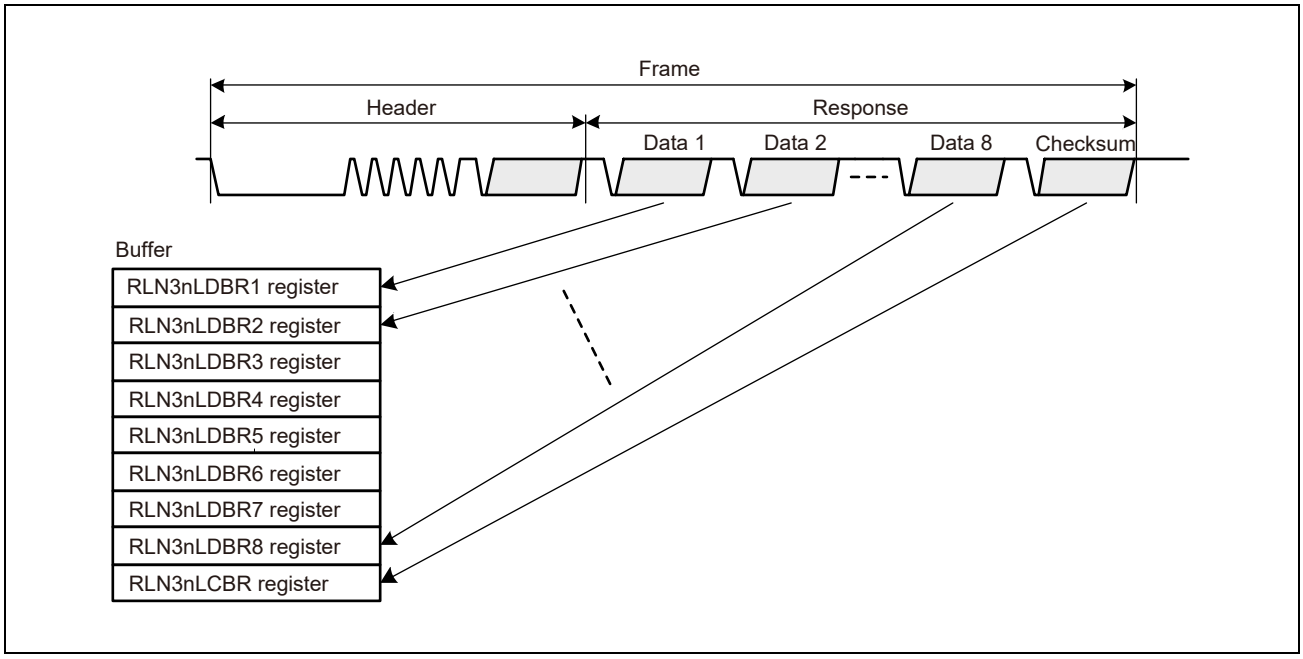

Figure 13.16 LIN Reception Processing and Required Buffer

[Reception of Data 1]

When the reception of the first byte of data is finished, the D1RC flag in the RLN3nLST register turns 1 (successful data 1 reception).

13.7.4.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses in 10 bytes or greater can also be sent and received.

In such a case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is greater than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1

(indicating that the next data group to be sent or received is not the final data group) in the first data group (variable in 0 to 8 bytes) before sending or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the final data group. If it is the final data group, the LSS bit should be set to 0 (indicating that the next data group to be sent or received is the final data group), and a checksum should be appended to the final data group.

By changing the RFDL bit in RLN3nLDFC register settings when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register in the RLN3nLDFC register to 1 (frame separate mode).

NOTE

In LIN slave mode, the LIN/UART interface can detect a new break field during the transmission or reception of a response.

13.7.5 Wake-Up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

13.7.5.1 Wake-Up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN3nLDFC register to 1 (LIN master mode: response transmission), or setting the RCDS bit in the RLN3nLDFC register to 1 (LIN slave mode: response transmission), and then the FTS bit in the RLN3nLTRC register to 1 (frame transmission, header reception or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low width of the wake-up signal should be set using the WUTL[3:0] bits in the RLN3nLWUP register. However, if the LWBR0 bit of the RLN3nLWBR register in LIN master mode is 1 (LIN2.x use), the LIN system clock (fLIN) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register. By setting the baud rate to 19200 bps while fa is selected and setting the WUTL[3:0] bit of the RLN3nLWUP register to 0100_B (5 Tbits), 260 µs low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low is output without any bit error, the FTC flag in the RLN3nLST register turns 1 (successful frame response or wake-up transmission); when the FTCIE bit in the RLN3nLIE register is 1 (successful frame response/wakeup transmission interrupt enabled), an interrupt request for RLIN3n transmission is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is canceled and the BER flag in the RLN3nLEST register is set to 1 (bit error detection).

When RLN3nLEDE.PBERE is set in LIN master mode, RLN3nLEST.PBER flag is set to 1 (physical bus error detection) at the same time of a bit error.

Figure 13.17 shows the wake-up transmission timing.

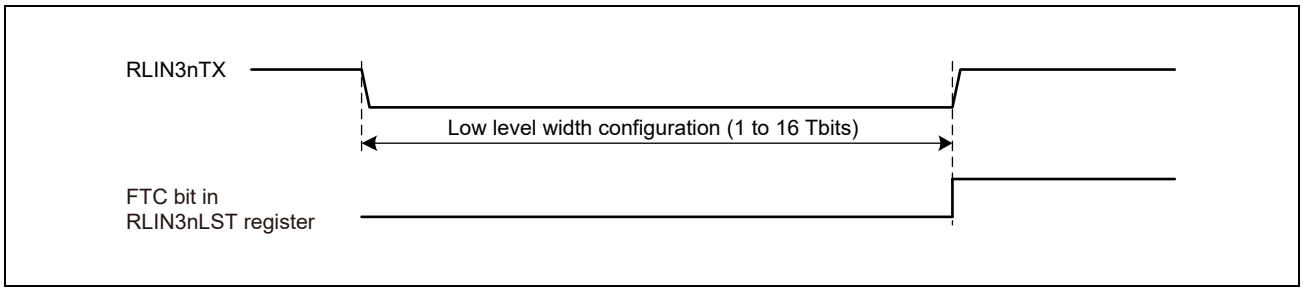

Figure 13.17 Wake-up Transmission Timing

13.7.5.2 Wake-Up Reception

The detection of a wake-up involves the use of an input signal low level width count function. The input signal low level width count function measures the low level width of the input signal to the RLIN3nRX pin, using the same sampling point as data reception. This allows the 2.5-Tbit or longer low-level width of the input signal of fLIN to be measured.

In LIN master mode, by setting the LWBR0 bit in the RLN3nLWBR register, operation is executed without changing the baud rate generator setting at a transition between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects the LIN system clock (fLIN) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200bps while fa is selected, the 130 µs or longer low-level width of the input signal to be measured regardless of the setting of the LCKS bit in the RLN3nLMD register.

When using this function, in LIN wake-up mode set the RFT bit in the RLN3nLDFC register to 0 (LIN master mode: response reception), the RCDS bit in the RLN3nLDFC register to 0 (LIN slave mode: response reception), and then the FTS bit in the RLN3nLTRC register to 1 (frame transmission (header reception) or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register turns 1 (successful frame response/wake-up reception). If the FRCIE bit in the RLN3nLIE register is 1 (successful frame response or wake-up reception interrupt enabled), an interrupt request for successful RLIN3n reception is generated.

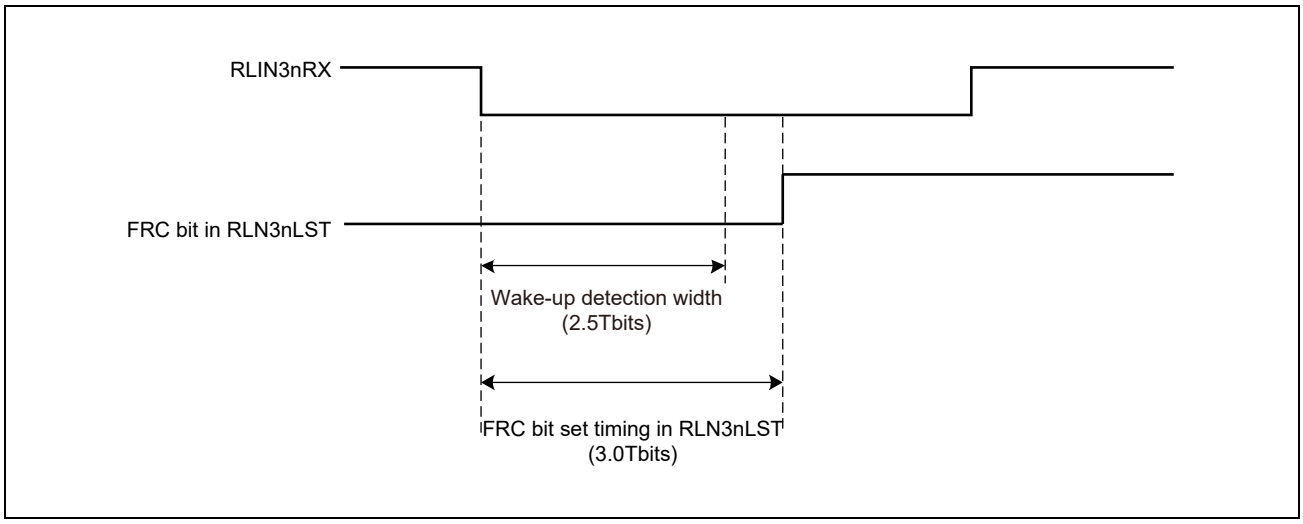

Figure 13.18 Input Signal Low level Count Function

13.7.5.3 Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, though a collision of wakeup signals is not detected in the LIN/UART interface.

13.7.6 Status

During LIN mode operation, the LIN/UART interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, successful header transmission/reception, can generate interrupt requests.

Table 13.84 shows the types of statuses available in LIN master mode. **Table 13.85** lists the types of statuses available in LIN slave mode [auto baud rate] and in LIN slave mode [fixed baud rate].

Table 13.84 Types of Statuses in LIN Master Mode

Status	Status Set Condition	Status Clear Condition	Operation Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN–reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN/UART interface enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN/UART interface enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Frame/ wake-up transmission end	When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully.	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in RLN3nLST register	√
Frame/wake-up reception end	When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully.	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in RLN3nLST register	√
Error detection	If any of the RPER flag, CSER flag,FER flag, FTER flag, PBER flag, and BER flags in the RLN3nLEST register turns 1 (error detected).	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software*1 • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in RLN3nLST register	√
Data 1 reception end	The RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte of each data group is received.*2	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Header transmission end	When a header field is transmitted successfully.	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 bywriting 0 to the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, or BER flags in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

Table 13.85 Types of Statuses in LIN Slave Mode

Status	Status Set Condition	Status Clear Condition	Operation Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN–reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode.	After the OM0 bit of the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN/UART interface enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN/UART interface enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Frame/ wake-up transmission end	When a response field, a wake-up signal, or a data group is transmitted successfully.	• When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in RLN3nLST register	√
Frame/wake-up reception end	When a response field, a wake-up signal, or a data group is received successfully.	• When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in RLN3nLST register	√
Error detection	If any of the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, and BER flag in the RLN3nLEST register turns 1 (error detected).	• When cleared by software*1 • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in RLN3nLST register	√
Data 1 reception end	The RCDS bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte for each data group is received.*2	• When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Header transmission end	When a header field is received successfully.	• When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, or BER flag in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

13.7.7 Error Status

13.7.7.1 LIN Master Mode

(1) Types of Error Statuses

The LIN/UART interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

All error statuses represent interrupt events.

Table 13.86 shows the types of error statuses.

Table 13.86 Types of Error Statuses in LIN Master Mode

Status	Error Detection Condition	Operation Mode Capable of Error Detection	Communication	Enable/ Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1*2	• LIN operation mode • LIN wake-up mode	Cancel	√	BER flag in RLN3nLEST register
Physical bus error	• LIN bus is detected to be high level when sending a break • LIN bus is detected to be low level when sending a break delimiter • LIN bus is detected to be high level when sending a wake-up	• LIN operation mode • LIN wake-up mode	Cancel	√	PBER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Cancel	√	FTER flag in RLN3nLEST register
Framing error	In response field reception, a stop bit of each data byte is low level	LIN operation mode	Cancel	√	FER flag in RLN3nLEST register
Checksum error	In response field reception, the result of checksum test gives an error	LIN operation mode	—	×	CSER flag in RLN3nLEST register
Response preparation error	One of the following conditions occurs in frame separate mode during a multi-byte response reception: • The first reception data byte is received after completion of header transmission but before a response transmission/reception request is set • The first reception data byte is received after the completion of previous data group reception before a transmission/reception request for another data group is set.	LIN operation mode	Cancel	×	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, processing is stopped after a stop bit is sent. If a bit error is detected in a non-dataarea, such as an inter-byte space, the transmission is suspended immediately after the bit which had the error is sent. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.

Note 2. In a multi-byte response transmission, bit errors are detected also between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and can be calculated from the following formula.
When the setting of the FSM bit in the RLN3nLDFC register is 1 (i.e., frame separation mode), the timeout time is that for eight bytes until the RTS bit of the RLN3nLTRC register is set. Once the RTS bit is set, the timeout time is re-set to the time based on the response field data length (the RFDL[3:0] bits in the RLN3nLDFC register).

[Frame timeout]

On classic selection (when the LCS bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

On enhanced selection (when the LCS bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is a time greater than the TFRAME_MAX of LIN Specification Package Revision 1.3 on classic selection, or the TFRAME_MAX of LIN Specification Package Revision 2.x on enhanced selection.

[Response timeout]

Timeout time = (number of data bytes + 1) × 14 [Tbit]

When en error is detected, time-out error detection function stops.

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), by software, or at a transition to LIN reset mode.

(2) Target Time Area for LIN Error Detection

Figure 13.19 shows the time domain in which the LIN/UART interface in LIN master mode performsmonitoring for error detection.

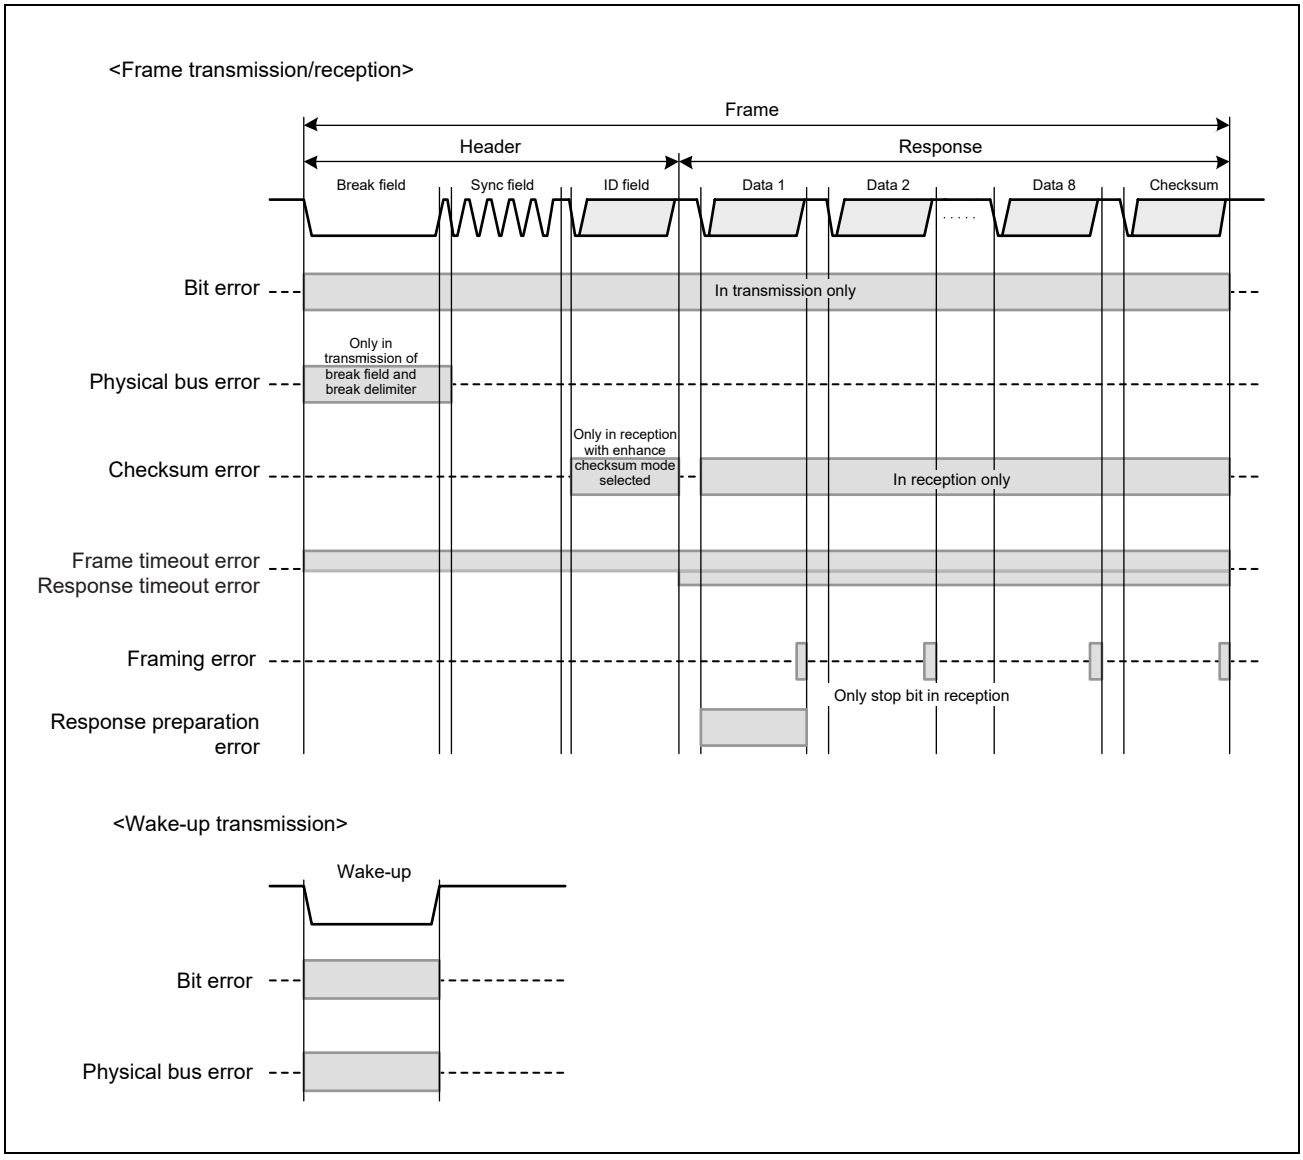

Figure 13.19 Target Time Area for LIN Error Detection (LIN Master Mode)

13.7.7.2 LIN Slave Mode

(1) Types of Error Statuses

The LIN/UART interface can detect seven types of error statuses in LIN slave mode [auto baud rate] or in LIN slave mode [fixed baud rate]. These error statuses can be verified by checking the corresponding bits in the RLN3nLEST register.

Table 13.87 shows the types of error statuses.

Table 13.87 Types of Error Statuses in LIN Slave Mode

Status	Error Detection Condition	Operation Mode Capable of Error Detection	Communication	Enable/ Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1*2	• LIN operation mode • LIN wake-up mode	Cancel	√	BER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Cancel	√	TER flag in RLN3nLEST register
Framing error	In response field reception, a stop bit of each data byte is low level	LIN operation mode	Cancel	√	FER flag in RLN3nLEST register
Sync field error	If the width of the break low level is greater than the width set by the LBLT bit in the RLN3nLBFC register and the sync field is not 55_H	LIN operation mode	Cancel	√*4	SFER flag in RLN3nLEST register
Checksum error	In response field reception, the result of checksum test gives an error	LIN operation mode	— *5	×	CSER flag in RLN3nLEST register
ID parity error	If the received ID parity bit does not match the value that is automatically calculated by the LIN/UART interface	LIN operation mode	Cancel	√	IPER flag in RLN3nLEST register
Response preparation error	• After the reception of a header, before the first reception data byte is received, response preparation is not made in time. • Before the completion of receiving the first reception data byte for the next data group in a multi-byte response reception, response preparation for the next group is not made in time	LIN operation mode	Cancel	×	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, processing is stopped after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is suspended immediately after the bit which had the error is sent. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.

Note 2. In a multi-byte response transmission, bit error can be detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the LCS bit in the RLN3nLDFC register), and this can be calculated according to the following formula. The time-out period until the RTS or LNRR bit of the RLN3nLTRC register is set is 8 data bytes. When the RTS bit is set, the timeout time is reset to the time based on the response field data length (RFDL[3:0] bit of the RLN3nLDFC register). When the LNRR bit is set, the timeout function stops.

[Frame timeout]

On classic selection (when the LCS bit in RLN3nLDFC is 0):

Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

On enhanced selection (when the LCS bit in RLN3nLDFC is 1):

Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is a time greater than the TFRAME_MAX of LIN Specification Package Revision 1.3 on classic selection, or the TFRAME_MAX of LIN Specification Package Revision 2.x on enhanced selection.

[Response timeout]

Timeout time = (number of data bytes + 1) × 14 [Tbit]

When en error is detected, time-out error detection function stops.

Note 4. Only reflection of the result to the SFER flag can be enabled/disabled. Error detection cannot be enabled/disabled.

Note 5. Checksum judgment is performed upon completion of response frame reception. In case of an error, thereceive complete flag is not set to 1.

The error status is cleared by software or at a transition to LIN reset mode.

(2) Target Time Area for LIN Error Detection

Figure 13.20 shows the time domain in which the LIN/UART interface in slave mode performs monitoring for error detection.

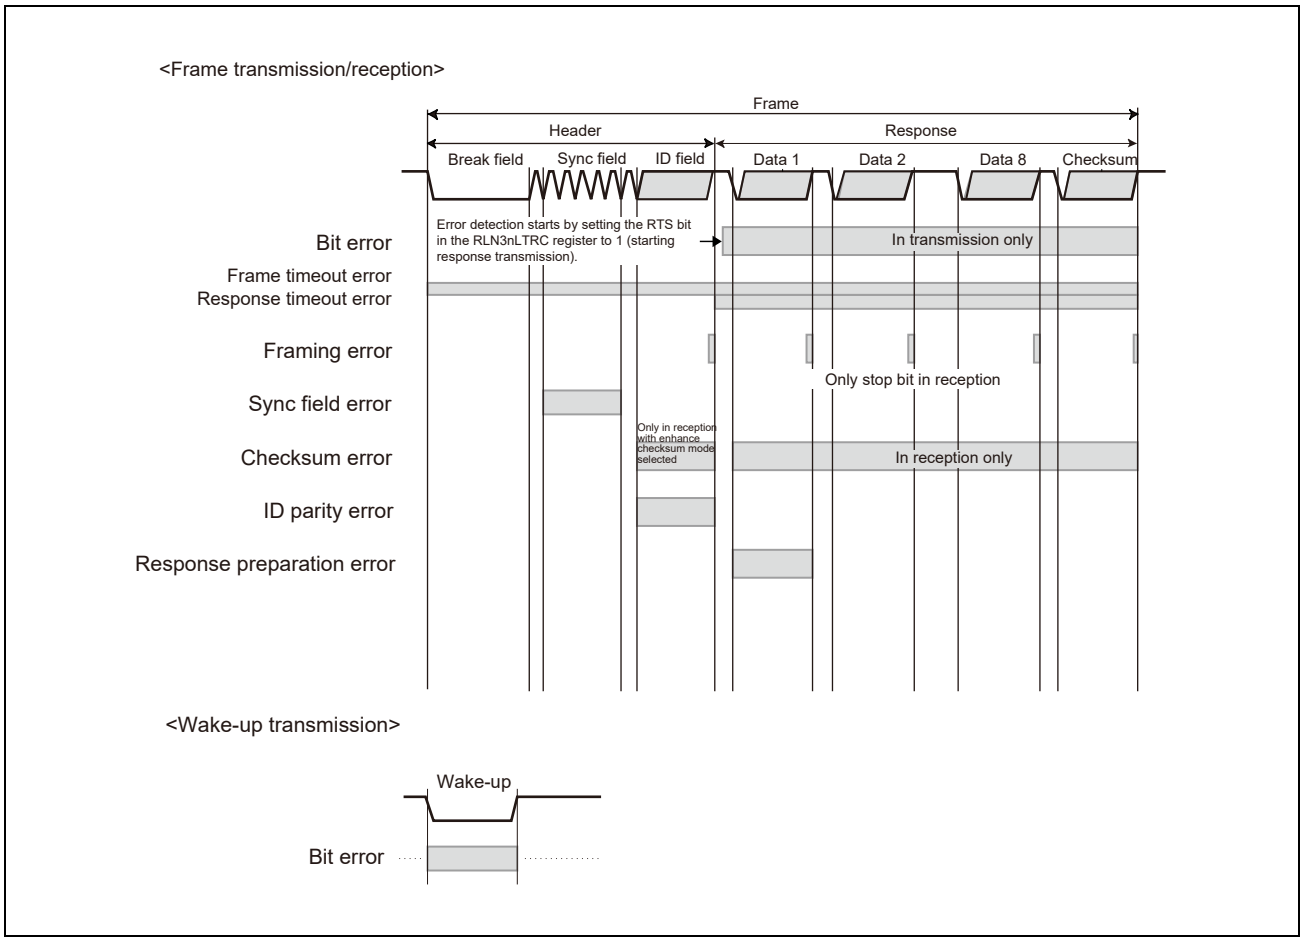

Figure 13.20 Target Time Area for LIN Error Detection (LIN Slave Mode)

13.8 UART Mode

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 01_B (UART mode) and the OM0 bit in the RLN3nLCUC register to 1 changes the mode to UART mode, turning the OMM0 bit in the RLN3nLMST register to 1.

13.8.1 Transmission

Figure 13.21 shows LIN/UART interface (in UART mode) transmission operations; **Table 13.88** shows LIN/UART interface (in UART mode) transmission processing.

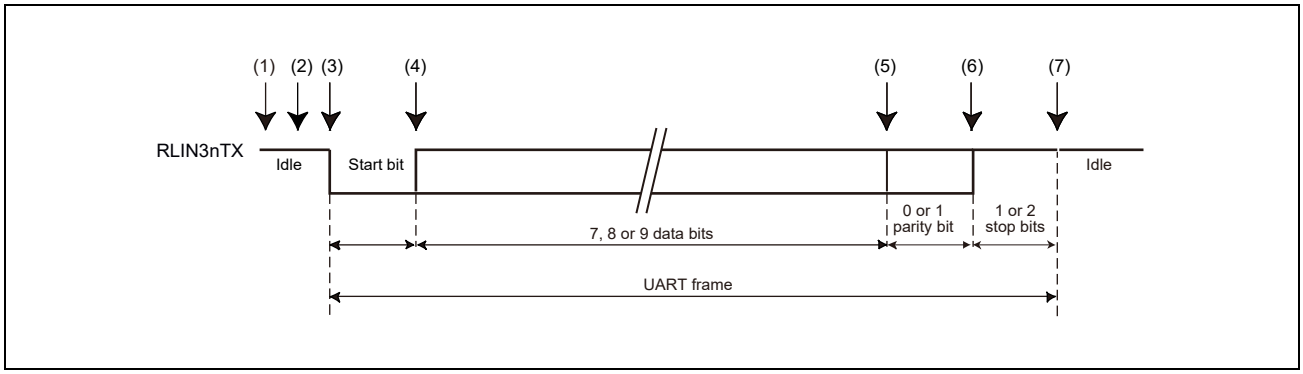

Figure 13.21 LIN/UART Interface (in UART Mode) Transmission Operation

Table 13.88 LIN/UART Interface (UART Mode) Transmission Processing (1/2)

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate. • Sets noise filter ON/OFF. • Sets error detection enable. • Sets data format. • Sets an interrupt generation timing. • Clears the LIN/UART interface from LIN reset mode. • Sets the transmit enable bit (UTOE bit) to 1.	• Waits for a transmission trigger (RLN3nLUTDR register) by software.
(2)	• Sets the transmit data to the UART transmit dataregister (RLN3nLUTDR) or UART wait transmit data register (RLN3nLUWTDR).	• Sets the transmit status flag.
(3)	• Waits an interrupt request. [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)]	• Transmits a start bit (for switching between transmission and reception in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see **Section 13.8.1.4, Transmission Start Wait Function**. [When the UTIGTS bit is 0 (a transmission interrupt is generated)] • Outputs a transmission interrupt.
(4)	• When transmitting data continuously, setsanother piece of transmission data in the UART transmit data register (RLN3nLUTDR register), waits for the generation of an interrupt request.	Transmits the data set in the UART (for wait) transmit data register.
(5)		Transmits a parity bit when parity is used.
(6)		Transmits 1 or 2 stop bits.

Table 13.88 LIN/UART Interface (UART Mode) Transmission Processing (2/2)

	Software Processing	LIN/UART Interface Processing
(7)	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • If another piece of transmission data is set, goes to step (3).	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • If another piece of transmission data is set, goes to step (3). • If another piece of transmission data is not set, clears the transmit status flag.
	[When the UTIGTS bit is 1 (a transmission interrupt is output upon end of transmission)] • When transmitting data continuously, goes to step (2).	[When the UTIGTS bit is 1 (a transmission interrupt is output upon end of transmission)] • Generates a RLIN3n transmission interrupt request. • Clears the transmission status flag.

13.8.1.1 Continuous Transmission

The LIN/UART interface (in UART mode) can transmit multiple sets of data continuously by using the RLN3nLUTDR register. **Figure 13.22** shows an operation example where the transmission interrupt generation timing is the start of transmission and an operation example where the transmission interrupt generation timing is the end of transmission.

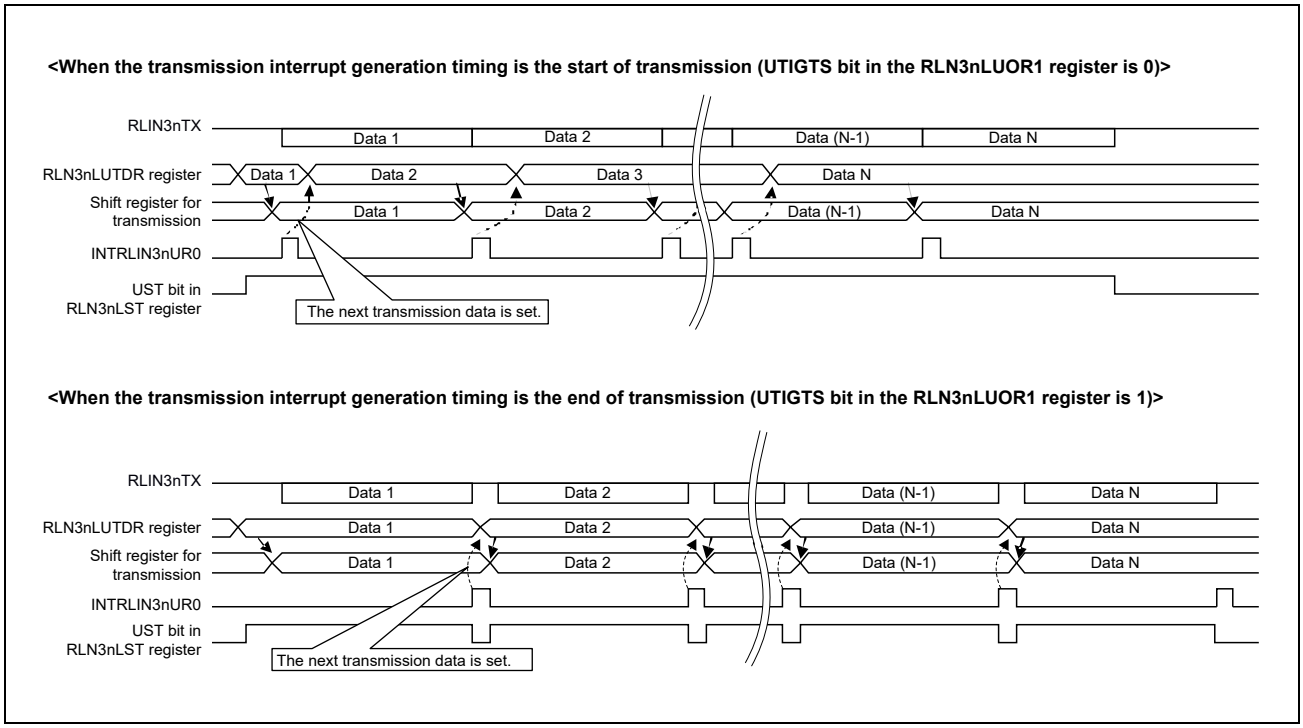

Figure 13.22 Operation Example of LIN/UART Interface (UART Mode) Continuous Transmission

An interrupt can be generated at the end of a transmission by changing the UTIGTS bit in the RLN3nLUOR1 register from 0 to 1 after the start of transmission of final data, provided only that the transmission interrupt generation timing is the start of transmission and the end of transmission of final data needs to be known.

13.8.1.2 UART Buffer Transmission

The LIN/UART interface (in UART mode) has a maximum of nine bytes of UART buffers, and thus it is capable of performing continuous transmissions through the use of UART buffers.

Figure 13.23 shows the UART buffer transmission operation in the LIN/UART interface (in UART mode). **Table 13.89** shows the UART buffer transmission processing.

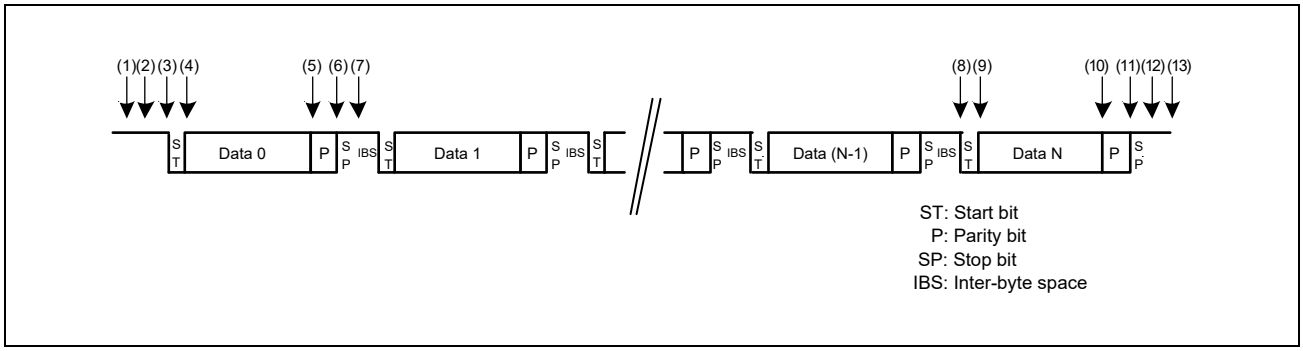

Figure 13.23 UART Buffer Transmission in LIN/UART Interface (in UART Mode)

Table 13.89 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode) (1/2)

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Sets error detection enable • Sets data format • Sets an interrupt generation timing to the end of transmission. • Clears the LIN/UART interface from LIN reset mode. • Sets the transmit enable bit (UTOE bit) to 1	• Waits for a transmission trigger (RTS bit) by software
(2)	• Sets the UART buffer data length and whether the system must wait for the start of transmission. • Sets the transmission data in the UART data 0buffer register (RLN3nLUDB0) and the LIN data buffer m register (RLN3nLDBRb). (b =1 to 8) • Sets the UART buffer transmission start bit (RTS).	• Sets the transmit status flag.
(3)	Waits for an interrupt request.	Transmits a start bit. (When switching from reception to transmission during half-duplex communication, transmits the start bit upon completion of the stop bit for reception. For details about this function, see **Section 13.8.1.4, Transmission Start Wait Function**.
(4)		Transmits the data set in the UART data buffer 0 register (RLN3nLUDB0) and the LIN/UART data buffer b register (RLN3nLDBRb).
(5)		Transmits a parity bit when parity is used.
(6)		Transmits 1 or 2 stop bits (When the number of data set in UART buffer data length select bits, proceed to (12).)
(7)		Transmits an inter-byte space (idle). Repeats steps (3) to (7) until the number of data –1 that was set in the UART buffer data length select bits is reached.
(8)		Transmits a start bit.

Table 13.89 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode) (2/2)

	Software Processing	LIN/UART Interface Processing
(9)		Transmits the data set in the LIN/UART data buffer b register (RLN3nLDBRb).
(10)		Transmits a parity bit when parity is used.
(11)		Transmits 1 or 2 stop bits.
(12)		• Sets the buffer transmission end flag. • Clears the UART buffer transmit start bit (RTS). • A transmission interrupt request signal. • Clears the transmission status flag.
(13)	• Checks the RLN3nLST register, and clears flags • In the case of continuous data transmission, goes to step (2).	

(1) UART Buffer Transmission

For a 9-byte transmission, the contents stored in the RLN3nLUDB0 and RLN3nLDBR1 to RLN3nLDBR8 registers are transmitted to data areas 0 to 8. The RLN3nLUDB0 register is used only if 9-byte transmission is set. In other cases, the RLN3nLDBR1 to RLN3nLDBR8 registers are selected depending upon the length of data involved. For a 4-byte transmission, the contents stored in the RLN3nLDBR1 to RLN3nLDBR4 registers are transmitted to data areas 1 to 4, but the contents of the RLN3nLDBR5 to RLN3nLDBR8 registers are not transmitted. An RLIN3n transmission interrupt is generated after the transmission of the data that is set in the MDL [3:0] bits of the RLN3nLDFC register. The spaces between transmission data items can be set in the IBS bit in the RLN3nLSC register.

Figure 13.24 shows a 9-byte UART buffer and the transmission processing.

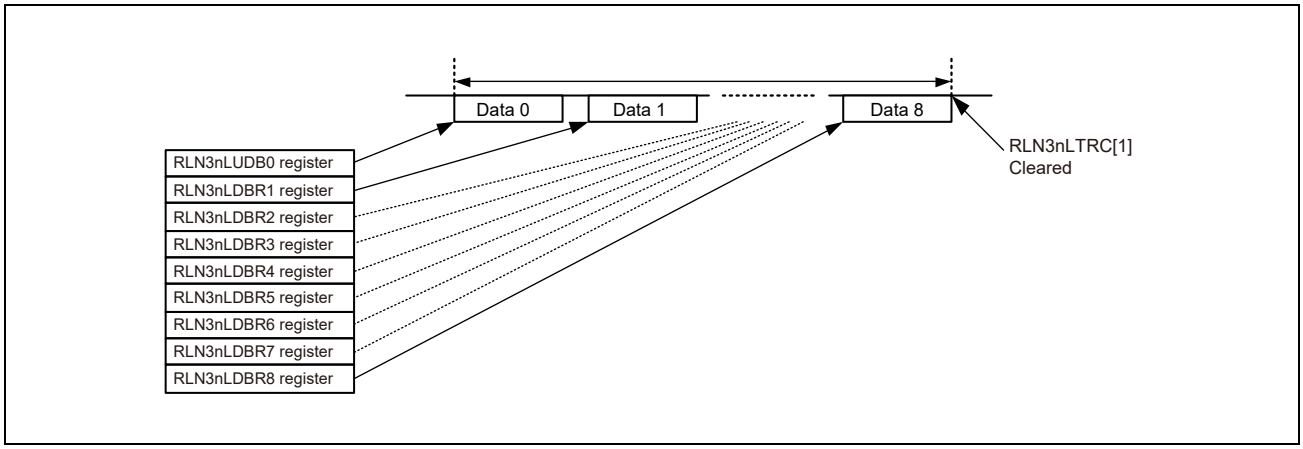

Figure 13.24 UART Buffer and Transmission Processing (for 9-Byte Transmission)

13.8.1.3 Data Transmission

One bit of data is transmitted per Tbit.

In half-duplex communication, if the BERE bit in the RLN3nLEDE register is 1 (bit error detection enabled), the transmission data and the input pin level are compared bit by bit during data transmission, and the results are stored in the BER flag in the RLN3nLEST register (see **Section 13.8.5, Error Status**). The timing at which the input pin is sampled during data transmission can vary depending upon the settings of the LPRS[2:0] and NSPB[3:0] bits in the RLN3nLWBR register.

The bit error detection timing in UART mode is shown in **Table 13.90**.

Table 13.90 Error Detection Timing in UART Mode

Sampling Count Per Bit	Bit Error Detection Timing
6 samples	3rd clock cycle + 1 prescaler clock
7 samples	4th clock cycle + 1 prescaler clock
8 samples	4th clock cycle + 1 prescaler clock
9 samples	5th clock cycle + 1 prescaler clock
10 samples	5th clock cycle + 1 prescaler clock
11 samples	6th clock cycle + 1 prescaler clock
12 samples	6th clock cycle + 1 prescaler clock
13 samples	7th clock cycle + 1 prescaler clock
14 samples	7th clock cycle + 1 prescaler clock
15 samples	8th clock cycle + 1 prescaler clock
16 samples	8th clock cycle + 1 prescaler clock

Example of Data Transmission Timing (when 1 Tbit = 16 Sampling) is shown in **Figure 13.25**.

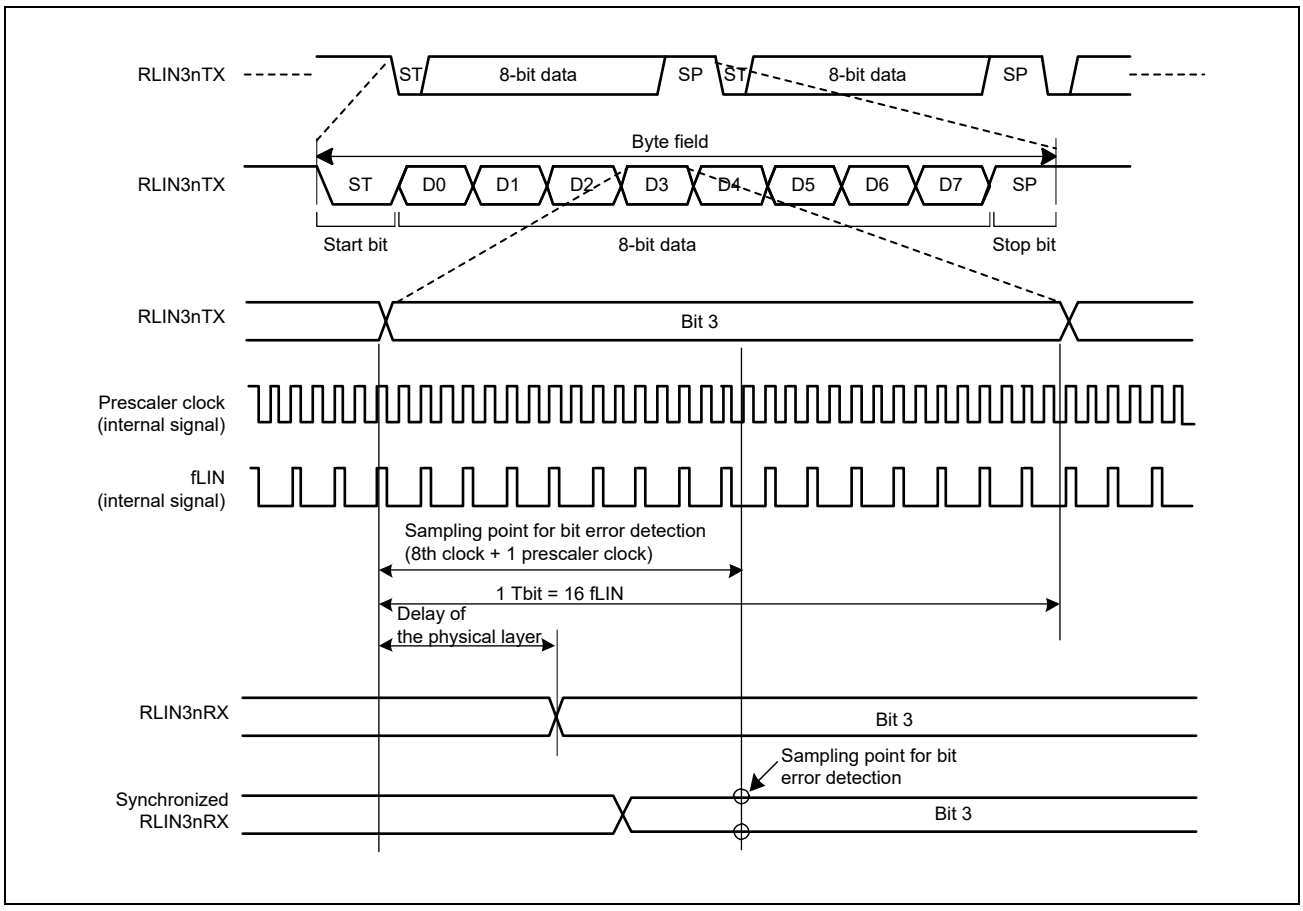

Figure 13.25 Example of Data Transmission Timing (When 1 Tbit = 16 Sampling)

13.8.1.4 Transmission Start Wait Function

For performing half-duplex communication, the LIN/UART interface (in UART mode) has the function of securing the reception stop bit length when switching from reception to transmission.

If it is desired to delay the start of transmission until the stop bits for the reception are completed, set data in the RLN3nLUWTDR register, which is used only for the wait function, instead of setting transmission data in the RLN3nLUTDR register as a start-of-transmission request. When transmitting from the UART buffer, set 1 (UART buffer transmission started) in the RTS bit in the RLN3nLTRC register with 1 set in the UTSW bit in the RLN3nLDFC register.

In such a case, the LIN/UART interface delays the start of transmission until the stop bits of reception data are completed.

It should be noted that even if the UART stop bit length select bit (USBLS) in RLN3nLBFC register is 1 (stop bits = 2 bits), delay is made only for 1 bits.

Figure 13.26 shows the operation of transmission wait function.

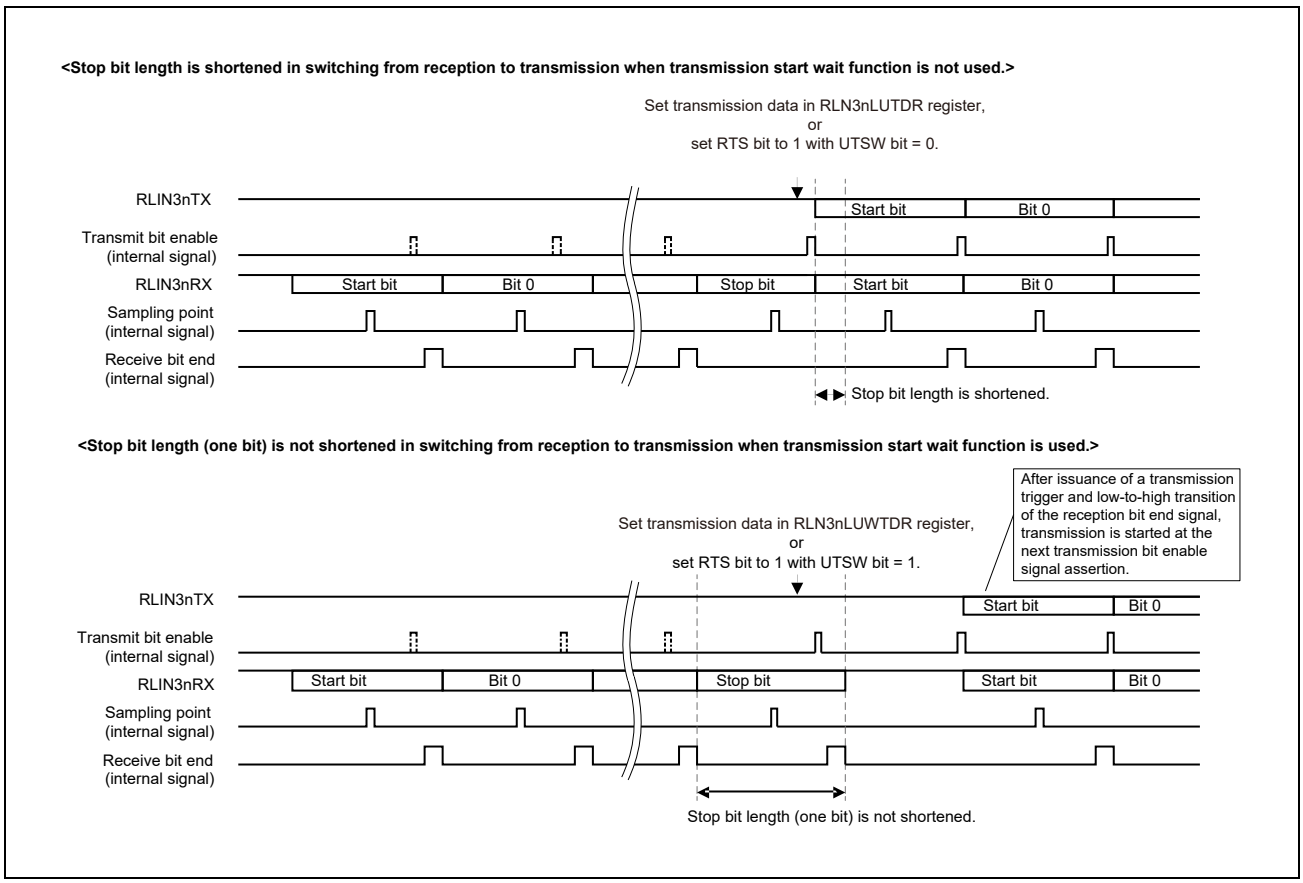

Figure 13.26 Transmission Wait Function (If Transmission Data is Set during the Stop Bits in the Received Data)

13.8.2 Reception

Figure 13.27 shows the LIN/UART interface (in UART mode) reception operation. **Table 13.91** shows the LIN/UART interface (in UART mode) reception processing.

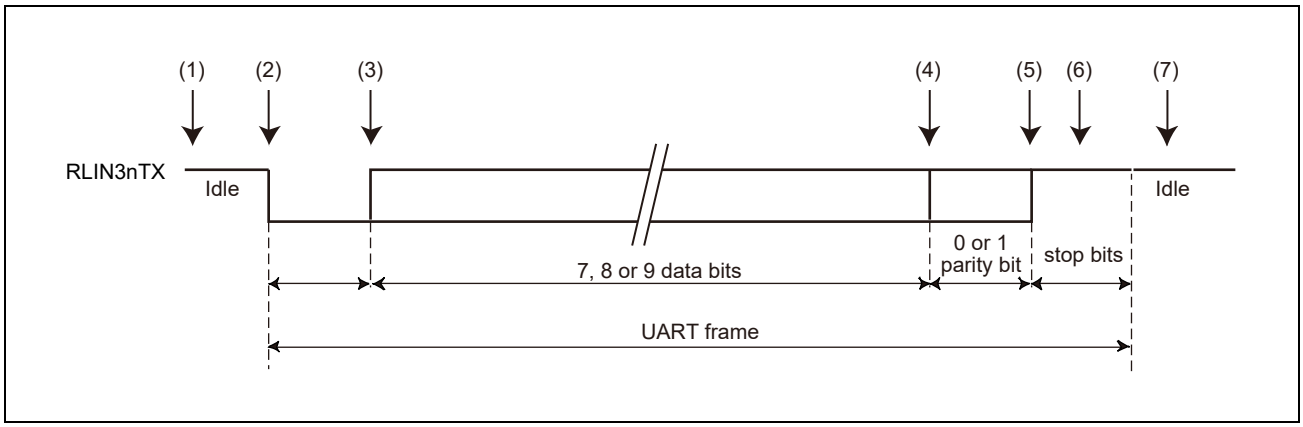

Figure 13.27 LIN/UART Interface (in UART Mode) Reception Operation

Table 13.91 LIN/UART Interface (in UART Mode) Reception Processing

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate. • Sets noise filter ON/OFF. • Sets error detection enable. • Sets data format. • Clears the LIN/UART interface from LIN reset mode. • Sets the receive enable bit (UROE bit) to1.	• Waits for reception enable state switching by software. • Waits for detection of a start bit.
(2)	Waits for an interrupt request.	• Waits for a falling edge from the reception pin, and detects a start bit. • Sets the reception status flag.
(3)		Receives data.
(4)		Receives a parity bit when parity is used.
(5)		Receives only 1 stop bit.
(6)		• Generates a successful RLIN3n reception interrupt request. • Clears the reception status flag.
(7)	Checks the RLN3nLST register, and clears flags	Waits for a falling edge from the reception pin.

13.8.2.1 Data Reception

Data reception is performed by using the synchronized RLIN3nRX (an internal signal) that is the input from the RLIN3nRX pin synchronized with the prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, resampling is performed 0.5 Tbits later when the number of the sampling per 1 Tbit is even and {(the number of the sampling + 1) / 2} / (the number of sampling) Tbits later when the number is odd. If the synchronized RLIN3nRX signal is low level, the bit is recognized as a start bit. The bit is not recognized as a start bit if the RLIN3nRX signal is fixed at low level after the reset is cleared or if a high level is detected during the resampling.

After the start bit is detected, 1 bit is sampled per Tbit. However, when the BERE bit in the RLN3nLEDE register is 1, the sampling point is the same as the bit error detection timing.

The LIN/UART interface has a noise filter function with respect to received data. If the LRDNFS bit in the RLN3nLMD register is 0, the noise filter is used. For a sampling value, the value determined by a 3-sampling majority rule by the prescaler clock is used. If the LRDNFS bit in the RLN3nLMD register is 1, the noise filter is not used. In this case, for a sampling value, the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 13.28 shows an example of data reception timing.

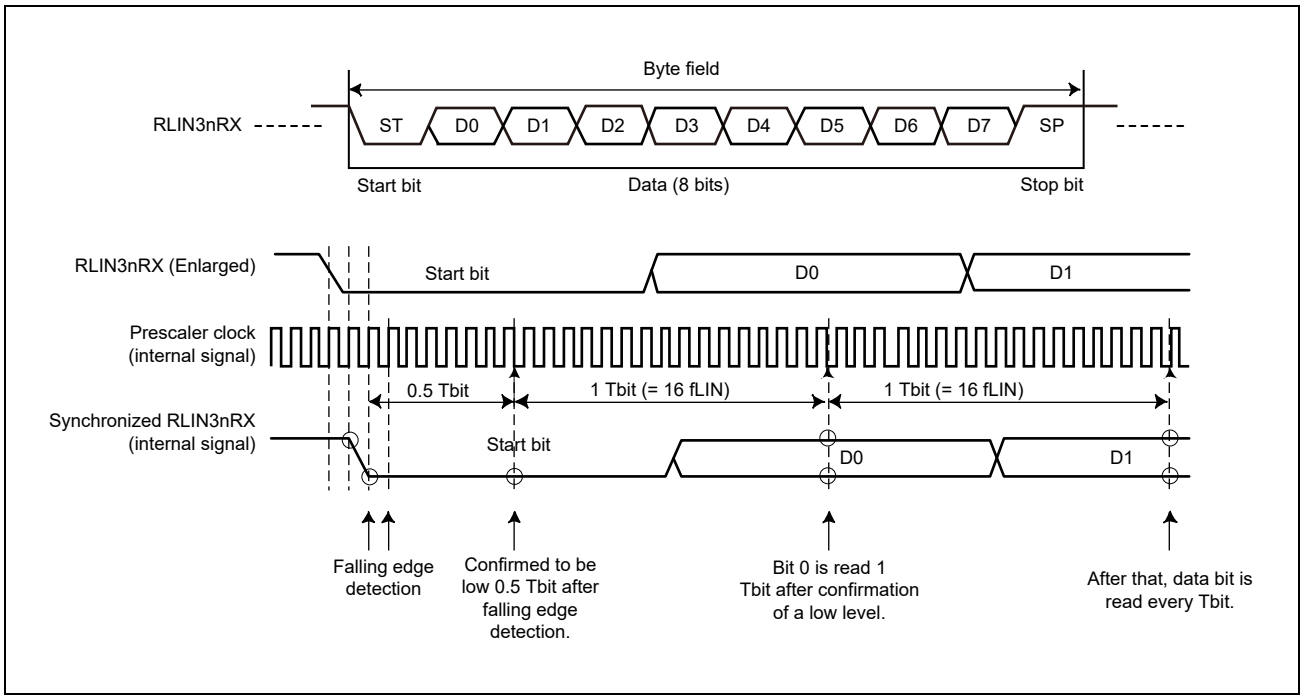

Figure 13.28 Example of Data Reception Timing (When Sampling Count is 16 in 1 Tbit)

13.8.3 Expansion Bits

The LIN/UART interface (in UART mode) can transmit and receive 9-bit long data by setting the UEBE bit in the RLN3nLUOR1 register to 1.

13.8.3.1 Expansion Bit Transmission

The LIN/UART interface (in UART mode) can transmit 9-bit long data when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and by writing the 9-bit data to either the UART transmission data register (RLN3nLUTDR) or the UART wait transmission data register (RLN3nLUWTDR).

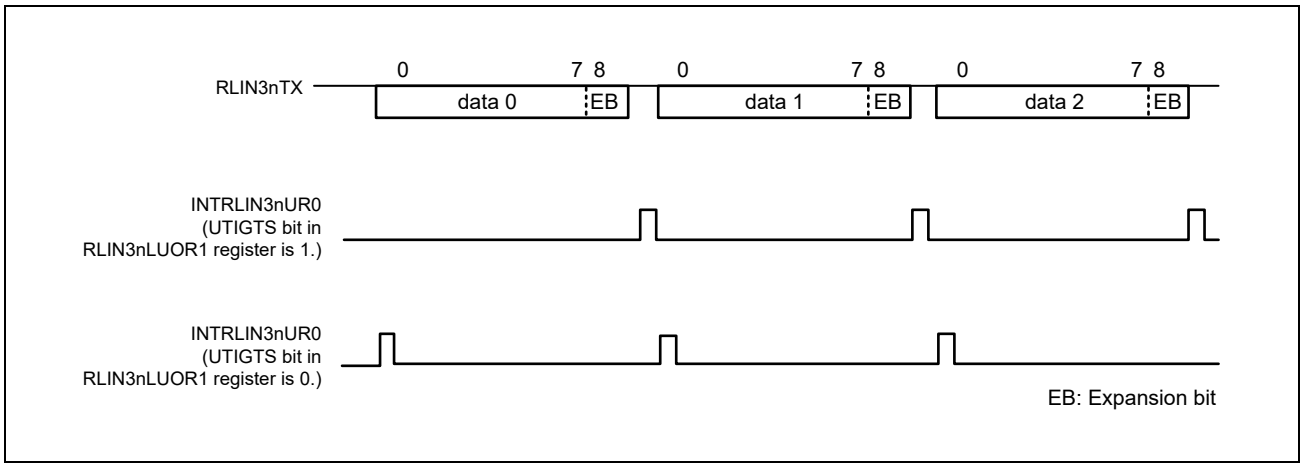

Figure 13.29 Transmission Example When Expansion Bit is Enabled (LSB First)

13.8.3.2 Expansion Bit Reception

With the LIN/UART interface (in UART mode), 9-bit data can always be received without requiring a comparison of expansion bits, provided that the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 1, and the expansion bit data comparison enable bit (UEBDCE) is 0. Irrespective of the particular setting of the expansion bit detection level select bit (UEBDL) in the UART option register 1 (RLN3nLUOR1), a successful RLIN3n reception interrupt is generated when 9-bit data is received.

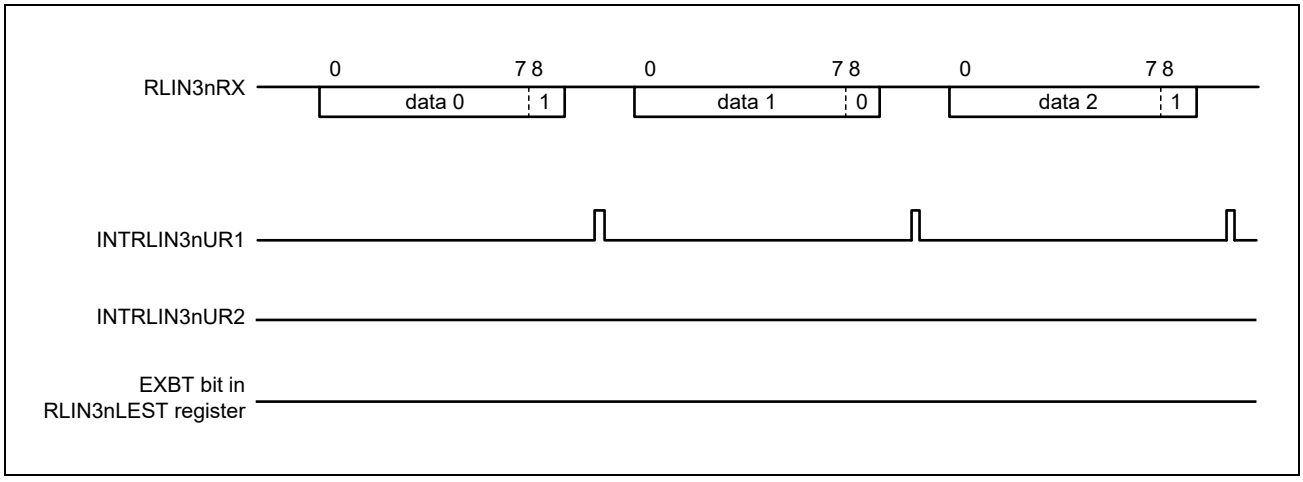

Figure 13.30 Expansion Bit Reception Example (LSB First)

13.8.3.3 Expansion Bit Reception (with Expansion Bit Comparison)

The LIN/UART interface (in UART mode) can compare received expansion bits and the UEBDL bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 0.

If the level that was set in the expansion bit detection level select bit (UEBDL) is detected, an RLIN3n status interrupt request is generated upon completion of data reception, and the expansion bit detection flag (EXBT) in the LIN error status register (RLN3nLEST) is set. If the reversed value of an expansion bit detection level is detected, a successful RLIN3n reception interrupt request is generated. In either case, the received data is stored in the UART reception data register (RLN3nLURDR), unless there was an overrun error.

Figure 13.31 shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

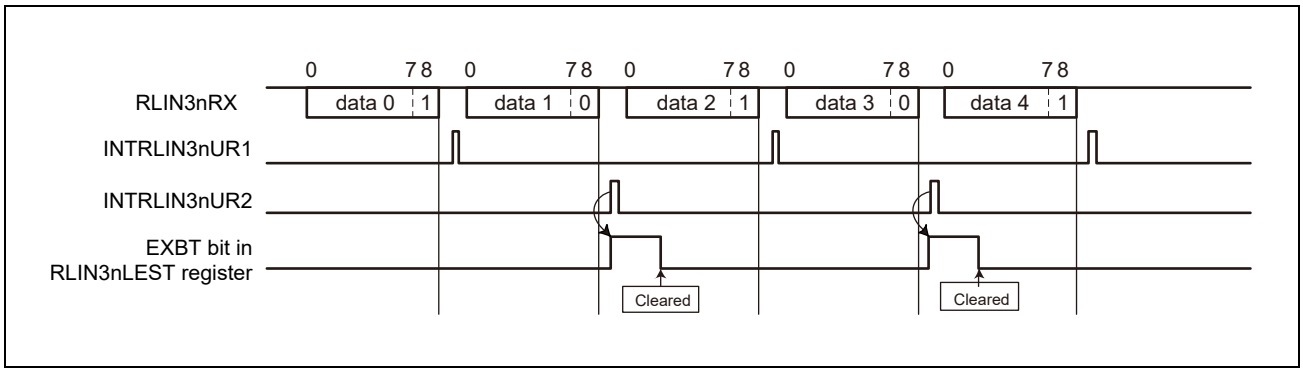

Figure 13.31 Expansion Bit Reception Example (with Expansion Bit Comparison)(LSB First, UEBDL = 0)

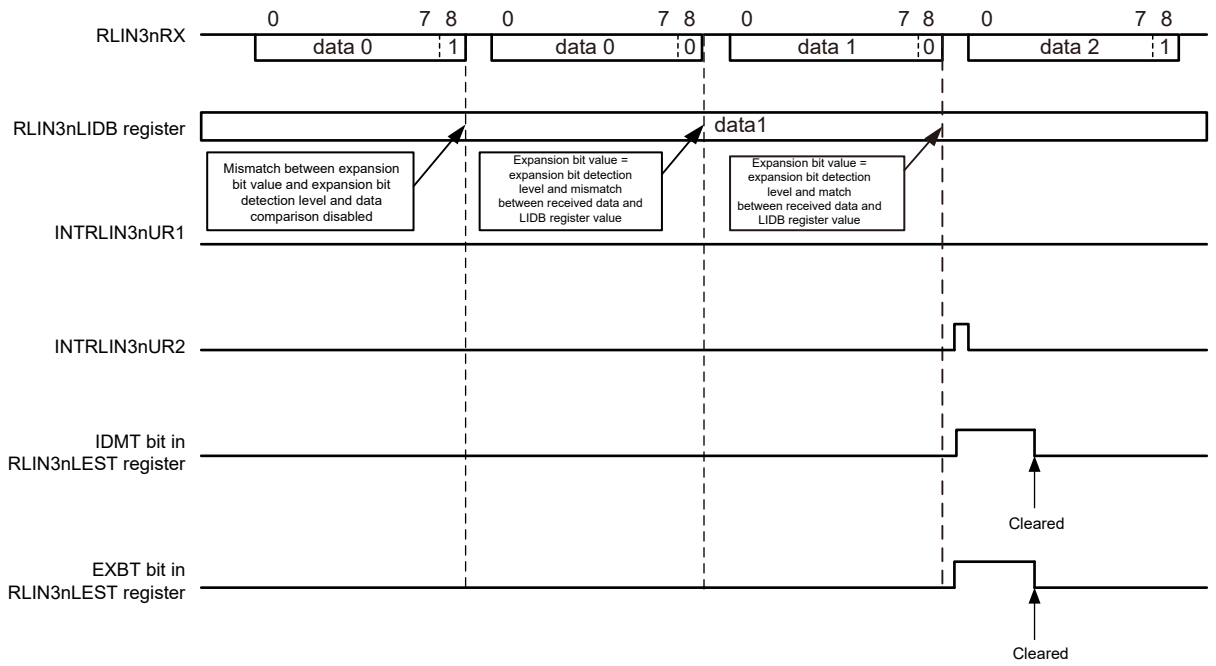
NOTE

- If a reception error (parity error, framing error, or overrun error) occurs in received data 0, 2, or 4 (if a reversed value of an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. In this case, a successful RLIN3n reception interrupt is not generated.
- If a reception error (parity error, framing error, or overrun error) occurs in received data 1 or 3 (if an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs, the expansion bit detection flag (EXBT) is also set.

13.8.3.4 Expansion Bit Reception (with Data Comparison)

If the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 1, and if the level that was set by the expansion bit detection level select bit (RLN3nUEBDL) is detected, the LIN/UART interface compares the 8 bits, exclusive of the expansion bit in the received data, with the a pre-set RLN3nLIDB register value.

If the result of the comparison is a match, the LIN/UART interface performs the following operations:



- Generates an RLIN3n status interrupt
- Sets an expansion bit detection flag (EXBT)
- Sets an ID match flag (IDMT)
- Stores the received data in the UART reception data register (RLN3nLURDR)

Even when the result of the comparison is a match, a successful RLIN3n reception interrupt is not generated.

If the result of the comparison is not a match, no successful RLIN3n reception interrupt or RLIN3n status interrupt is generated, and the EXBT and IDMT flags are not set to 1. The received data is stored in the UART reception data register (RLN3nLURDR).

When changing the UEBDCE bit to 0, make the change before the reception of another set of data is finished.

Figure 13.32 shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

Note: If a reception error (parity error, framing error, or overrun error) occurs, an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs and the result of comparison is a match, the EXBT and IDMT are also set to 1.

Figure 13.32 Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL = 0)

13.8.4 Status

In UART mode, the LIN/UART interface can detect five types of statuses.

Two statuses, successful UART buffer transmission and error detection, can generate interrupt requests.

Table 13.92 shows the types of statuses available in UART mode.

Table 13.92 Types of Statuses in UART Mode

Status	Status Set Condition	Status Clear Condition	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN–reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode.	OMM0 bit in RLN3nLMST register	—
Successful UART buffer transmission	• When the UTIGTS bit in the RLN3nLUOR1 register is 0 (transmission interrupt request is generated upon start of transmission), the transmission of the last data of the data length set by the MDL bit in the RLN3nLDFC register is started. • When the UTIGTS bit in the RLN3nLUOR1 register is 1 (transmission interrupt request is generated upon end of transmission), the transmission of the data length set by the MDL bit in the RLN3nLDFC register is ended.	• When cleared by software • After transition to LIN reset mode	FTC flag in RLN3nLST register	√
Error detection	If any of the UPER flag, IDMT flag, EXBT flag, FER flag, OER flag, and BER flags in the RLN3nLEST register turns 1 (error detected).	• When cleared by software*1 • After transition to LIN reset mode	ERR flag in RLN3nLST register	√
Transmission status	• When data is written to the RLN3nLUTDR or RLN3nLUWTDR register. • When a 1 is written to the RTS bit in the RLN3nLTRC register.	• The transmission of the data set in the RLN3nLUTDR or RLN3nLUWTDR register is complete, but another transmission data item is not set • The transmission of the data in the UART buffer is complete, and the RTS bit in the RLN3nLTRC register is cleared • After transition to LIN reset mode	UTS flag in RLN3nLST register	—
Reception status	• When a start bit is detected.	• When a sampling point for stop bits is detected • After transition to LIN reset mode	URS flag in RLN3nLST register	—

Note 1. Writing a 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register when the LIN reset mode is being canceled turns the ERR flag in the RLN3nLST register to 0.

13.8.5 Error Status

Types of Error Statuses

In UART mode, the LIN/UART interface can detect four types of errors and two types of statuses. The condition of these statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

Table 13.93 lists applicable status types.

Table 13.93 Types of Statuses in UART Mode

Status	Error Detection Condition	Communication	Enable/ Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data monitored on the receive pin do not match*1	Continues until the transmission of the set transmission data is finished.	√	BER flag in RLN3nLEST register
Overrun error	After received data is stored in the RLN3nLURDR register, another data item is received before the data is read. (In this case, no data is stored in the RLN3nLURDR register).	— (Reception is finished by the time this error is detected)	√	OER flag in RLN3nLEST register
Framing error	When the first stop bit is low level in the reception processing.	— (Reception is finished by the time this error is detected)	√	FER flag in RLN3nLEST register
Parity error	The received parity value fails to match the parity value calculated from the received data	(Reception is finished by the time this error is detected)	×*2	UPER flag in RLN3nLEST register
Expansion bit detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register.	—	√	EXBT flag in RLN3nLEST register
ID match detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register and the 8-bit receive data excluding the expansion bit matches the value of the RLN3nLIDB register.	—	√	IDMT flag in RLN3nLEST register

Note 1. In the case of transmission from the UART buffer, bit errors are detected even in the space between UARTframes (inter-byte space).

Note 2. Setting the UPS[1:0] bits in the RLN3nLBFC register to 10_B (0 parity) disables the checking of parity bit values. In this case, no parity error is generated.

The error status is cleared by software or at a transition to LIN reset mode.

13.9 LIN Self-Test Mode

The LIN/UART interface has the LIN self-test mode. When the LIN/UART interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and RLIN3nTX and RLIN3nRX are connected in the LIN/UART interface. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX. The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following four types.

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception
- LIN slave self-test mode (transmission): Header reception and response transmission
- LIN slave self-test mode (reception): Header reception and response reception

In LIN self-test mode, the operate is at the fastest baud rate, regardless of the setting of the baud rate generator.

Regardless of the setting of the baud rate related registers, the baud rate operates at the LIN communication clock source/16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to 0000_B or 1111_B.)

In addition, in LIN self-test mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- LIN slave mode (Auto baud rate)
- Frame/response timeout error

Do not use these functions.

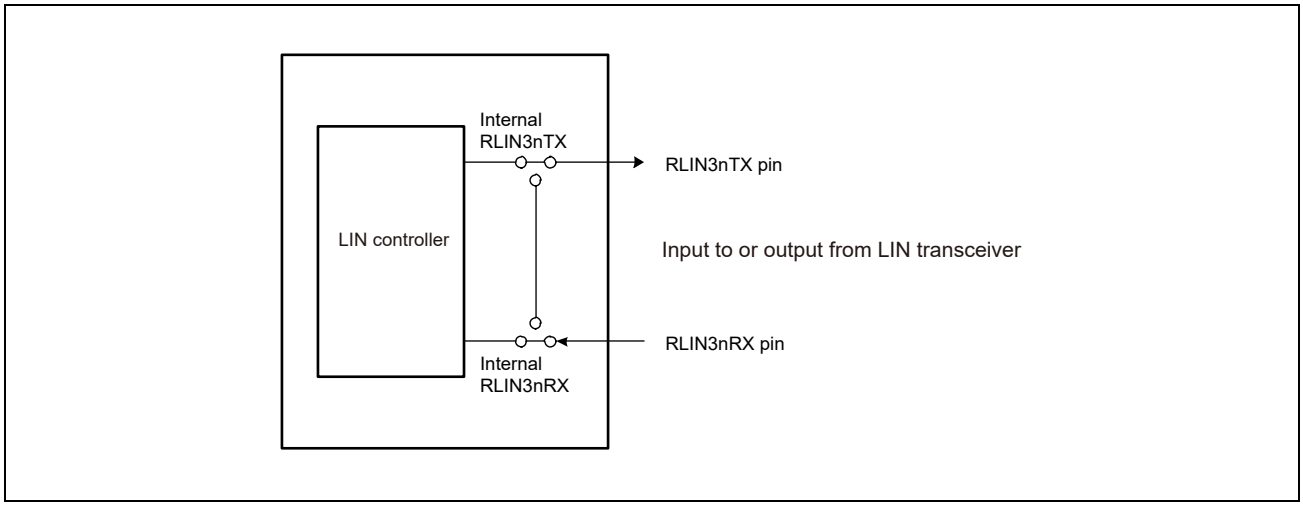


Figure 13.33 Connection in LIN Reset Mode, LIN Mode, and UART Mode

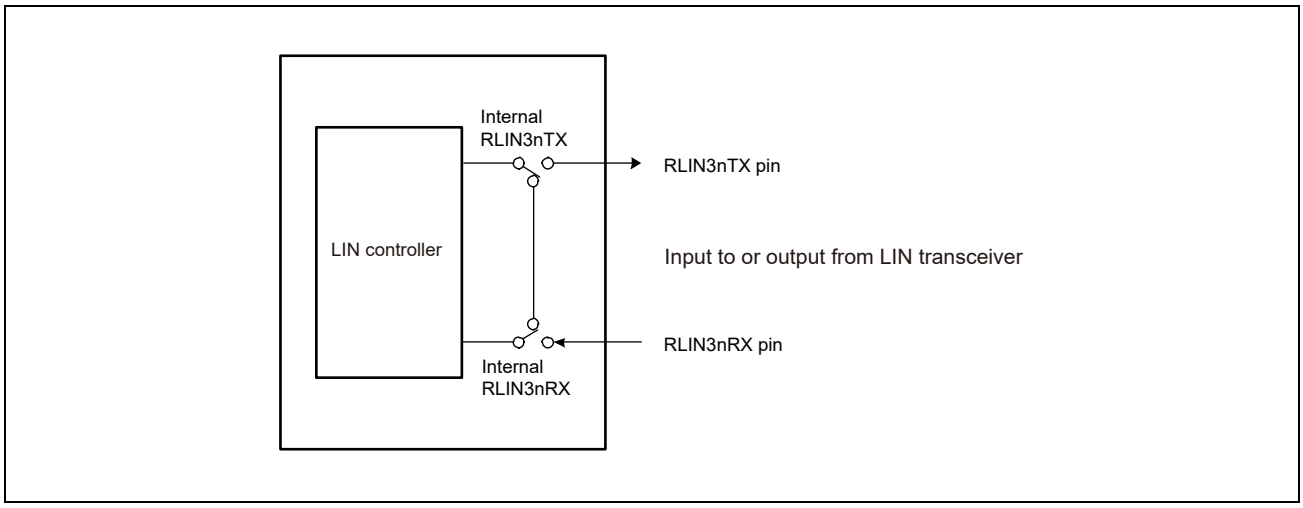

Figure 13.34 Connection in LIN Self-Test Mode

13.9.1 Change to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.

When the LSTM bit in the RLN3nLSTC register is set to 1, the shift to the LIN self-test mode is checked. When changing to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be written three times consecutively to the LIN self-test control register, as follows:

- Change to LIN reset mode
  Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
  LMD bits in RLN3nLMD = 00_B (LIN master mode) or 11_B (LIN slave mode [fixed baud rate])
- 1st write: RLN3nLSTC register = $1010\ 0111_B$ ($A7_H$)
- 2nd write: RLN3nLSTC register = $0101\ 1000_B$ (58_H)
- 3rd write: RLN3nLSTC register = $0000\ 0001_B$ (01_H)
- Verify the transition to LIN self-test mode
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the step of first write. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also canceled.

13.9.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxxx_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00xx $xx00_B$*1
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = x000 $x0xx_B$
- Set the break field and space related registers.
  RLN3nLBFC register = 00xx $xxxx_B$
  RLN3nLSC register = 00xx $0xxx_B$
- Release from the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the transmit frame related registers.
  RLN3nLDFC register = 00x1 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 register = xxxx $xxxx_B$
- Header transmission → response transmission started
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started). The LIN master self-test mode (transmission) is executed. In this mode, interrupt are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN/UART interface. To suspend the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register and the LCKS bit in the RLN3nLMD register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt**.

Note 3. interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled). The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up transmission flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of the LIN communication clock source × 16

13.9.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxxx_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00xx $xx00_B$*1
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = x000 $x0xx_B$
- Set the break field and space related registers.
  RLN3nLBFC register = 00xx $xxxx_B$
  RLN3nLSC register = 00xx $0xxx_B$*1
- Release from the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the reception frame related registers.
  RLN3nLDFC register = 00x0 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 register = xxxx $xxxx_B$
  RLN3nLCBR register = xxxx $xxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, set the calculation value to the RLN3nLCBR register. Here, by setting a wrong value, the functionality of checksum error can be tested.
- Header transmission → response reception started
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started). The LIN master self-test mode (reception) is executed. In this mode, interrupt are generated, and status and error status are also updated. To suspend the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode.
The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt**.

Note 3. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).
The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of the LIN communication clock source × 16

13.9.4 Transmission in LIN Slave Self-Test Mode

To execute a self-test on LIN slave transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 xxx0_B*1
  RLN3nLBRP0 register = xxxx xxxx$_B$*1
  RLN3nLBRP1 register = xxxx xxxx$_B$*1
  RLN3nLMD register = 00xx 0011_B
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 xxxx$_B$*2
  RLN3nLEDE register = xx0x x00x$_B$
- Set the break field and space related registers.
  RLN3nLBFC register = 0000 000x$_B$*3
  RLN3nLSC register = 00xx 0001_B
- Release from the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the transmit frame related registers.
  RLN3nLDFC register= 00x1 xxxx$_B$
  RLN3nLIDB register = xxxx xxxx$_B$
  RLN3nLDBR1～RLN3nLDBR8 register = xxxx xxxx$_B$
- Header reception → response transmission started
  Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started). (Without any setting of the RTS bit in the RLN3nLTRC register, the header reception and the response transmission are executed in this order.)
  The LIN slave self-test mode (transmission) is executed. In this mode, interrupt are generated, and status and error status are also updated.
  The checksum is automatically calculated by the LIN/UART interface. To suspend the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, and the RLN3nLBRP1 register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt**.

Note 3. According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

Note 4. When the successful header reception interrupt and the successful response transmission interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled). The time from setting of the successful header reception flag to setting of the successful response/wake-up transmission flag is calculated by using the following formula.

$$10 \times (\text{number of data bytes} + 1)\ [\text{Tbit}]$$

$$1\ \text{Tbit} = 1/\text{frequency of the LIN communication clock source} \times 16$$

13.9.5 Reception in LIN Slave Self-Test Mode

To execute a self-test on LIN slave reception, perform the procedure below:。

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxx0_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00xx 0011_B
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = xx0x $x00x_B$
- Set the break field and space related registers.
  RLN3nLBFC register = 0000 $000x_B$*3
  RLN3nLSC register = 00xx 0001_B*1
- Release from the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the reception frame related registers.
  RLN3nLDFC register = 00x0 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 register = xxxx $xxxx_B$
  RLN3nLCBR register = xxxx $xxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, set the calculation value to the RLN3nLCBR register. Here, by setting the wrong value, the functionality of checksum error can be tested.
- Header reception → response reception started
  Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started). (Without any setting of the RTS bit in the RLN3nLTRC register, the header reception and the response reception are executed in this order.)
  The LIN slave self-test mode (reception) is executed. In this mode, interrupt are generated, and status and error status are also updated. To suspend the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.

- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode.
The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, and the IBS bit in the RLN3nLSC register.
Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt**.

Note 3. According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

Note 4. When the successful header reception interrupt and the successful response reception interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).
The time required from the set of the successful header reception flag to the set of the successful response/wake-up reception flag is calculated by the following formula.

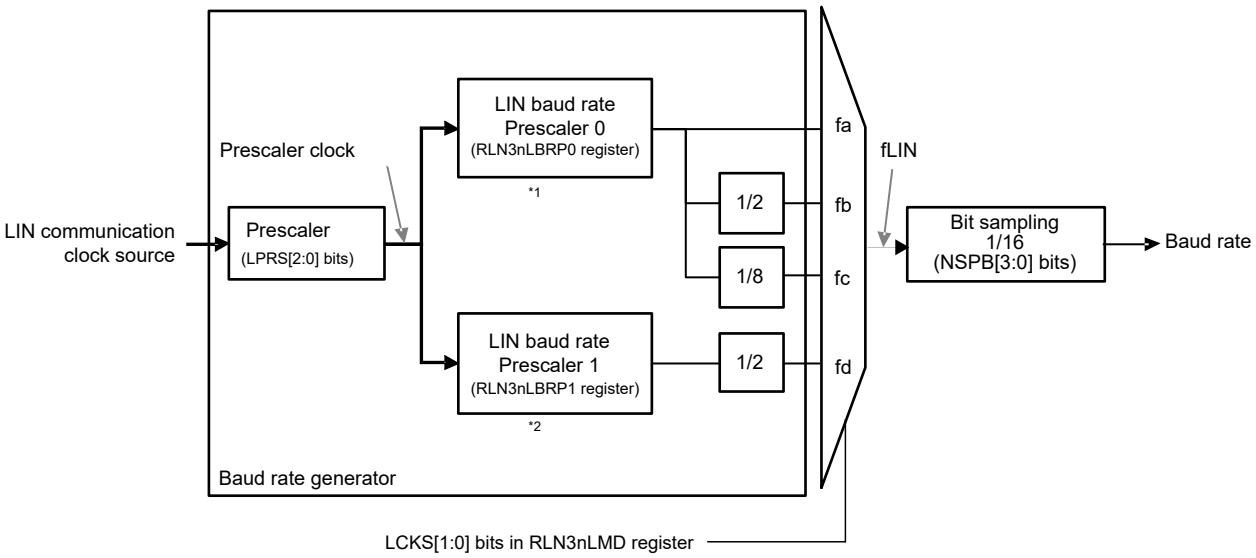
10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of the LIN communication clock source × 16

13.9.6 Terminating LIN Self-Test Mode

To terminate LIN self-test mode, perform the procedure below:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11_B, write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register have turned 11_B, change to LIN reset mode.
- Verify the cancelation of LIN self-test mode.
Read the LSTM bit in the RLN3nLSTC register; confirm that it is not 0 (not in LIN self-test mode)
- Verify the transition to LIN reset mode.
Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).



13.10 Baud Rate Generator

The prescaler clock is obtained by frequency-dividing the LIN communication clock source by the prescaler, and the LIN system clock (fLIN) is obtained by frequency-dividing the prescaler clock by the baud rate generator. The clock obtained by frequency-dividing the LIN system clock (fLIN) by the number of samples is the baud rate. The reciprocal of this baud rate is called the bit time (Tbit).

The LIN/UART interface has two kinds of baud rate generators. The baud rate generators switch over according to the mode used.

13.10.1 LIN Master Mode

Figure 13.35 shows a block diagram of baud rate generation in LIN master mode.

Note 1. When the value in RLN3nLBRP0 register is N (N = 0 to 255), the clock frequency is divided by N + 1.

Note 2. When the value in RLN3nLBRP1 register is M (M = 0 to 255), the clock frequency is divided by M + 1.

Figure 13.35 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLN3nLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting bit rates are fa = 19200 × 16, fb = 9600 × 16, and fc = 2400 × 16. These bit rates are frequency-divided by 16 in the bit timing generator, enabling bit rates of 19200 bps, 9600 bps and 2400 bps, to be generated. Also, by setting the RLN3nLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting bit rate is fd = 10417 × 16. This bit rate is frequency-divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

The formula for baud rate is described below.

Baud rate of LIN slave

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock) / (RLN3nLBRP0 + 1) /16 [bps] (When fa is selected for f_{LIN})

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock) / (RLN3nLBRP0 + 1) /2/16 [bps] (When fb is selected for f_{LIN})

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock)
/ (RLN3nLBRP0 + 1) /8/16 [bps] (When fc is selected for f_{LIN})

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock)
/ (RLN3nLBRP1 + 1) /2/16 [bps] (When fd is selected for f_{LIN})

13.10.2 LIN Slave Mode

Figure 13.36 shows a block diagram of baud rate generation in LIN slave mode.

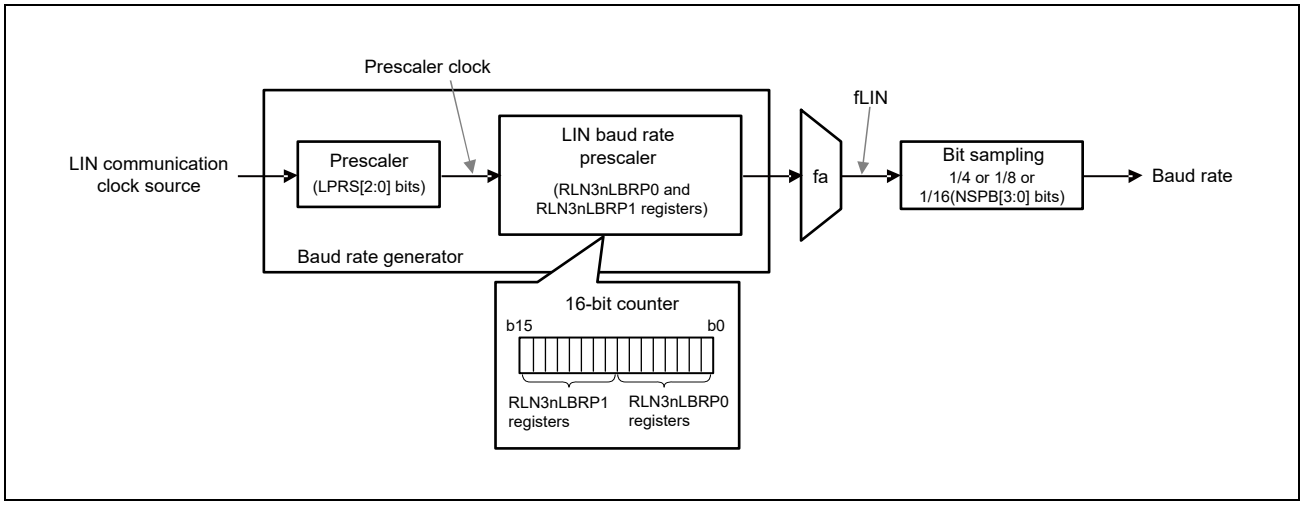


Figure 13.36 Block Diagram of Baud Rate Generation in LIN Slave Mode

In LIN slave mode (auto baud rate), the baud rate can be set to the range from 1 kbps to 20 kbps. Set the prescaler clock as follows according to the target baud rate:

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4 MHz*1
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

Note 1. Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to "0011_B" (four samplings).

The formula for baud rate is described below.

Baud rate of LIN slave

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock)
/ (RLN3nLBRP01 + 1) /16 [bps] ([Fixed baud rate])

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock)
/ (RLN3nLBRP01 + 1) /4 or 8 [bps] ([Auto baud rate])

NOTE

For a LIN slave with fixed baud rate, set the NSPB[3:0] bit to “0000_B” (16 samples) or “1111_B” (16 samples). For a LIN slave with auto baud rate, set the NSPB[3:0] bits to “0011_B” (4 samples) or “0100_B” (8 samples).

13.10.3 UART Mode

Figure 13.37 shows a block diagram of baud rate generation in UART mode.

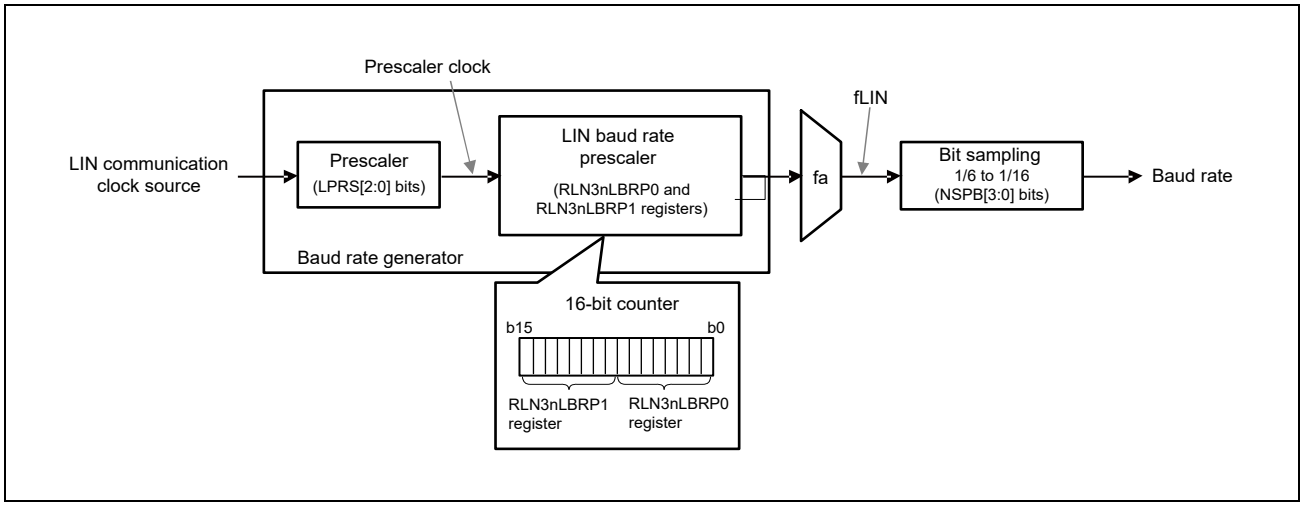

Figure 13.37 Block Diagram of Baud Rate Generation in UART Mode

UART baud rate is calculated with the following formula:

UART baud rate

= {LIN communication clock source frequency} × (RLN3nLWBR.LPRS[2:0] select clock) / (RLN3nLBRP01 + 1) / {RLN3nLWBR.NSPB[3:0] select count} [bps]

13.11 Noise Filter

The LIN/UART interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLN3nLMD register to 0 (to use the noise filter), the noise filter is activated. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

Figure 13.38 shows the configuration of the noise filter, **Figure 13.39** shows an example of a noise filter circuit, and **Figure 13.40** shows the determination of the received data when the noise filter is used.

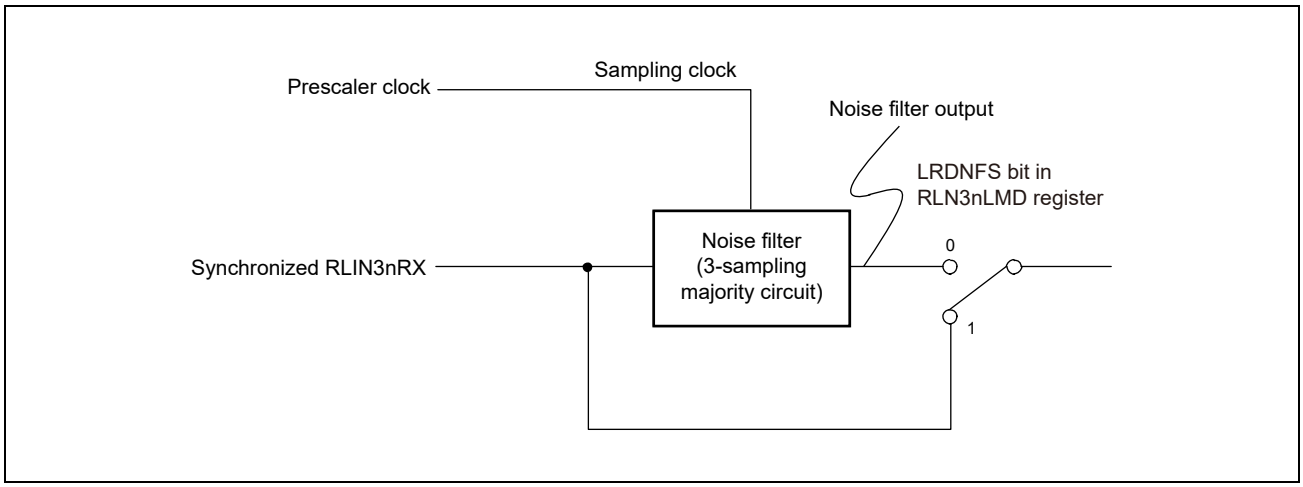

Figure 13.38 Configuration of Noise Filter

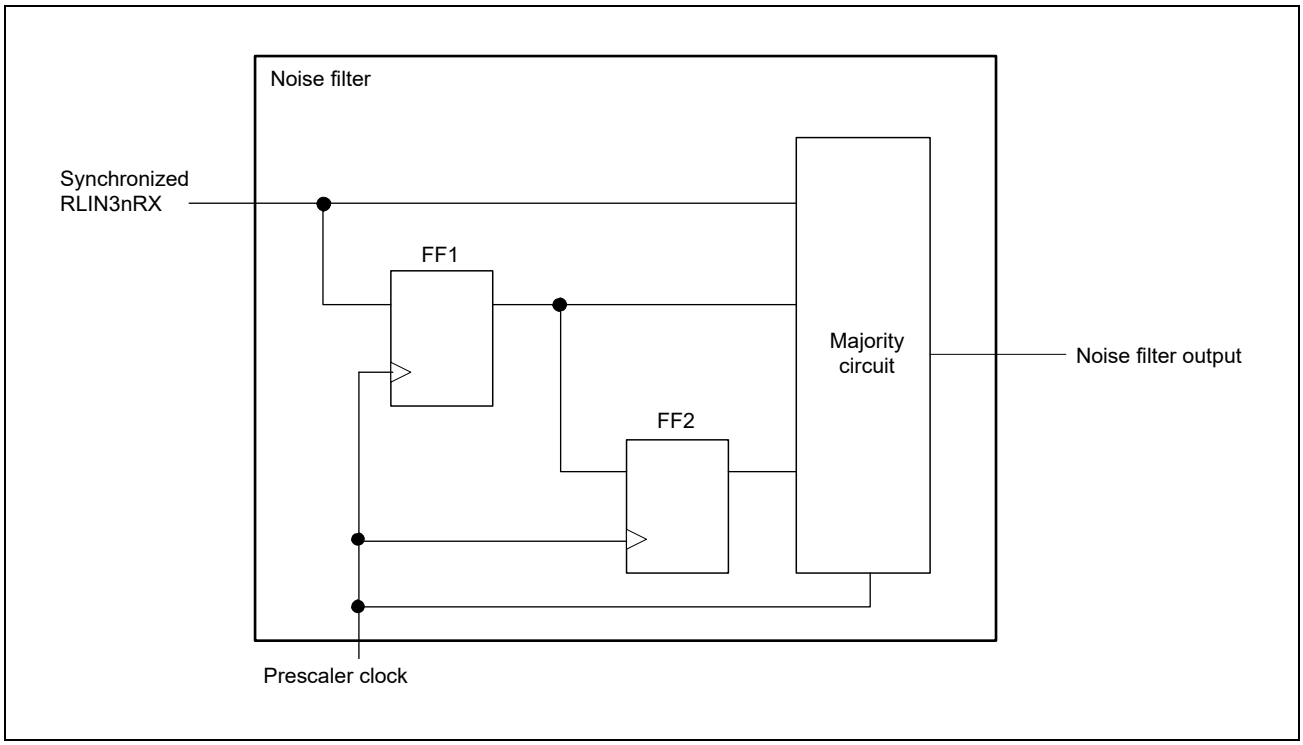

Figure 13.39 Example of Noise Filter Circuit

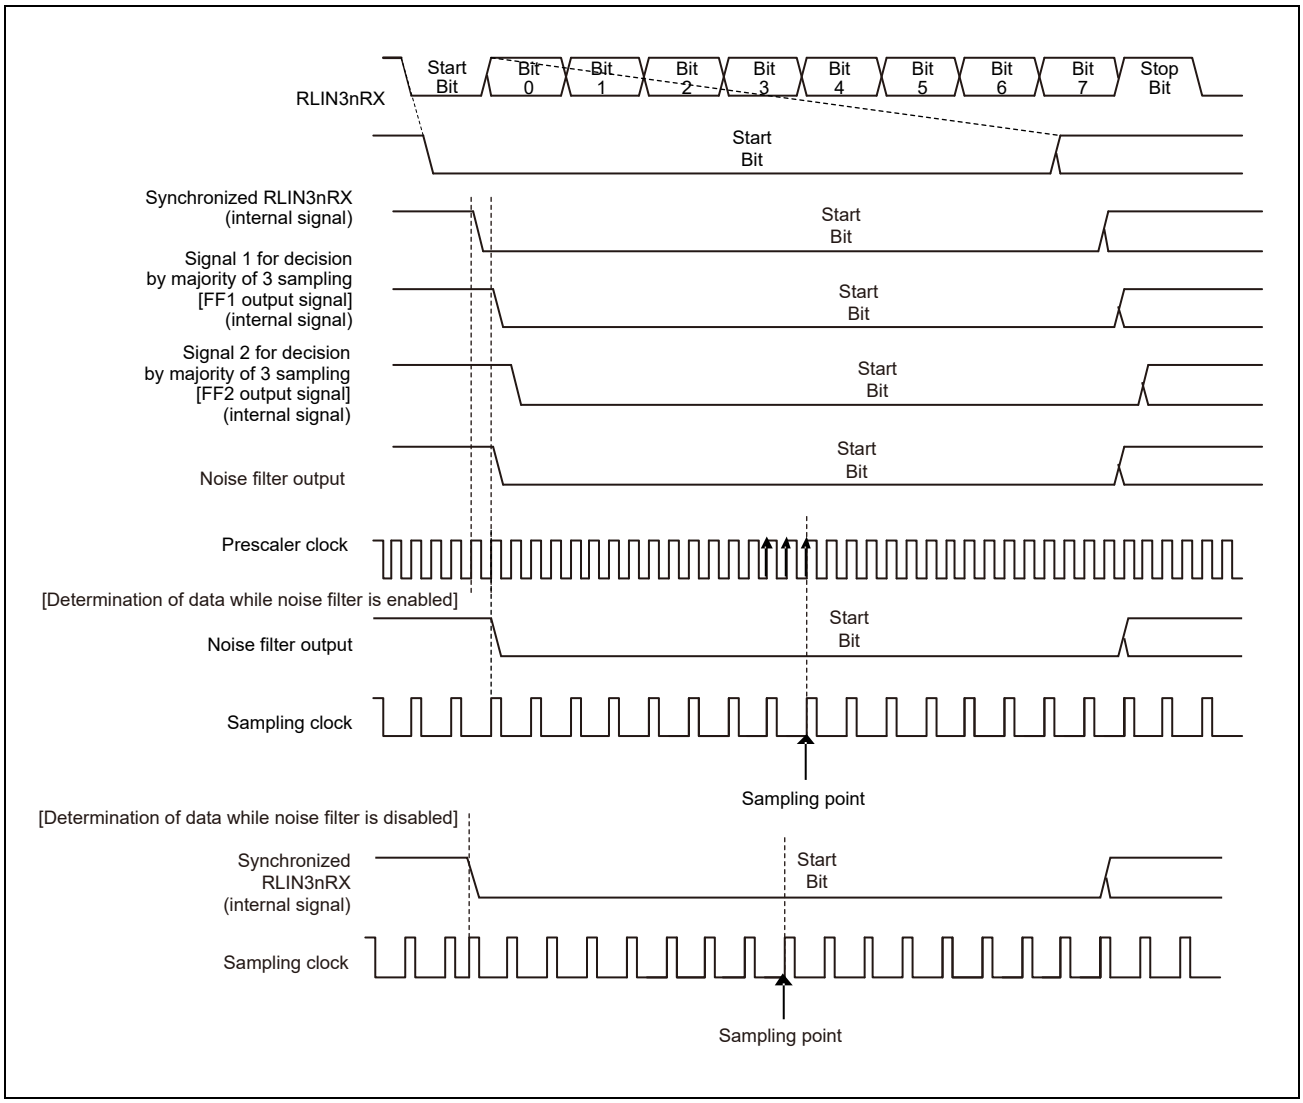

Figure 13.40 Determination of Received Data when Noise Filter is Used

13.12 Usage Notes

13.12.1 Notes on the LIN Master Mode

No response transmission is started if the initiation of a response transmission (writing a 1 into RLN3nLTRC.RTS) and the generation of an error*[1] occur at the same time in frame separate mode (RLN3nLDFC.FSM = 1).

It is likely that unexpected data is transmitted during the response transmission processing after the header for the next frame is received even though RLN3nLTRC.RTS is not set to 1. Once an error occurred, the LIN/UART module (RLIN3) is reinitialized by transiting to the LIN reset mode.

Note 1. Bit error, physical bus error, frame/response timeout error, framing error, or response preparation error.

13.12.2 Notes on the LIN Slave Mode (Fixed Baud Rate)

If the low level width which is specified by the receive brake (low level) detection width configuration bit (RLN3nLBFC.LBLT) is detected during a response transmission (RLN3nLDFC.RCDS = 1 and RLN3nLTRC.RTS = 1), the response transmission is suspended and the RLIN3nTX pin keeps the same state that was established when the low level width was detected.

In fixed baud rate LIN slave mode, RLN3nLEDE.BERE must be set to 1 (enable bit error detection) and RLN3nLSC.IBHS[2:0] to 001_B to 111_B (set the response space to a value other than 0 Tbit).

If the response space is set to 0 Tbit (RLN3nLSC.IBHS[2:0] = 000_B), the LIN/UART module (RLIN3) is reinitialized by setting RLN3nLEDE.BERE = 1 and RLN3nLEDE.TERE = 1 (enable timeout error detection) and transiting to the LIN reset mode after a timeout error occurs.

13.12.3 Notes on the LIN Slave Mode (Auto Baud Rate)

The header may not be received if the conditions (1) and (2) listed below are satisfied in succession, in which case the ID field is erroneously recognized. The next header is received normally, however.

1. A falling edge is detected within the period from the sampling point at which stop bit and response/interbyte space bit error occurred till the end of this bit.
2. The falling edge for the start bit of the ID field is detected within the period from the sampling point for the next sync filed till the end of this bit.

Section 14 CAN Interface (RS-CANFD)

This section contains a generic description of the CAN Interface (RS-CANFD).

The first part of this section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RS-CANFD.

14.1 Features of RH850/C1M-A RS-CANFD

14.1.1 Number of Units and Channels

This microcontroller has the following number of RS-CANFD units.

Table 14.1 Number of Units

Product Name	RH850/C1M-A2	RH850/C1M-A1
Number of Units	1	
Name	RSCFDn (n = 0)	

The individual products have the CAN Interface Channel listed below.

Table 14.2 Unit Configurations and Channels

Unit Name	Channel Name	RH850/C1M-A2	RH850/C1M-A1
RSCFD0	CAN0	√	√
	CAN1	√	√
	CAN2	√	√
	CAN3	√	√

The RS-CANFD has two interface modes (classical CAN mode and CAN FD mode) and uses different registers for each mode. There are two types of register names RSCANnXXX and RSCFDnCFDXXX (XXX: arbitrary) depending on interface modes. When explaining specifications common to two registers, register names are described as RSCFDn(CFD)XXX.

Table 14.3 Indices

Index	Meaning
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index "n" (n = 0); for example, RSCFDn(CFD)GCTR is the global control register of the RSCFD unit.
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index "m" (m = 0 to 3); for example, RSCFDn(CFD)CmSTS is the channel m status register.
j	The individual registers associated with receive rule table are generically indicated by the index "j" (j = 0 to 15); for example, RSCFDn(CFD)GAFLIDj is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index “k” (k = 0 to [channel m × 3 + 2]); for example, RSCFDn(CFD)CFCCk is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index “x” (x = 0 to 7); for example, RSCFDn(CFD)RFSTSx is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by "d" (classical CAN mode: d = 0 to 1, CAN FD mode: d = 0 to 15). For example, the transmit/receive FIFO buffer data field register is described as RSCFDn(CFD)CFDFd_k.
q	The individual receive buffers are generically indicated by the index “q” (q = 0 to [channel m × 16 + 15]); for example, RSCFDn(CFD)RMIDq is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index “p” (q = 0 to [channel m × 16 + 15]; for example, RSCFDn(CFD)TMCp is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by “b” (classical CAN mode: b = 0 to 1, CAN FD mode: b = 0 to 4). For example, the receive buffer data field register is described as RSCFDn(CFD)RMDFb_q.
r	The individual RAM tests for CAN are generically indicated by the index “r” (r = 0 to 63); for example, RSCFDn(CFD)RPGACCr is the RAM test page access register.
y	The registers not covered above are indicated by the letter “y” (y = 0, 1); for example, RSCFDn(CFD)RMNDy is a receive buffer new data register.

14.1.2 Register Base Address

RSCFDn base addresses are listed in the following table.

RSCFDn register addresses are given as offsets from the base addresses in general.

Table 14.4 Register Base Address

Base Address Name	Base Address
<RSCFD0_base>	FFD0 0000_H

14.1.3 Clock Supply

The RSCFDn clock supply is shown in the following table.

Table 14.5 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
RSCFDn	clk_xincan	MOSC (Main OSC)
	clkc	CLKC_LSB (unmodulated low-speed peripheral clock)
	pclk	CLK_HSB (high-speed peripheral clock)

14.1.4 Interrupt Request

RSCFDn interrupt requests are listed in the following table.

Table 14.6 Interrupt Requests

Unit Interrupt Signal	Outline	Interrupt Number
RSCFD0		
INTRCANGERR	CAN global error interrupt	264
INTRCANGRECC	CAN receive FIFO interrupt	263
CAN0		
INTRCAN0ERR	CAN0 error interrupt	266
INTRCAN0REC	CAN0 transmit/receive FIFO receive completion interrupt	265
INTRCAN0TRX	CAN0 transmit interrupt	267
CAN1		
INTRCAN1ERR	CAN1 error interrupt	269
INTRCAN1REC	CAN1 transmit/receive FIFO receive completion interrupt	268
INTRCAN1TRX	CAN1 transmit interrupt	270
CAN2		
INTRCAN2ERR	CAN2 error interrupt	272
INTRCAN2REC	CAN2 transmit/receive FIFO receive completion interrupt	271
INTRCAN2TRX	CAN2 transmit interrupt	273
CAN3		
INTRCAN3ERR	CAN3 error interrupt	275
INTRCAN3REC	CAN3 transmit/receive FIFO receive completion interrupt	274
INTRCAN3TRX	CAN3 transmit interrupt	276

• DMA Request

RSCFDn DMA requests are listed in the following table.

Table 14.7 DMA Request

DMA/DTS Source Signal	Outline	DMA Trigger Number*1		DTS Trigger Number*1	
		1st	2nd	1st	2nd
RSCFD0					
CAN RX FIFO 0	CAN RX FIFO DMA request #0	103	—	103	—
CAN RX FIFO 1	CAN RX FIFO DMA request #1	104	—	104	—
CAN RX FIFO 2	CAN RX FIFO DMA request #2	105	—	105	—
CAN RX FIFO 3	CAN RX FIFO DMA request #3	106	—	106	—
CAN RX FIFO 4	CAN RX FIFO DMA request #4	107	—	107	—
CAN RX FIFO 5	CAN RX FIFO DMA request #5	108	—	108	—
CAN RX FIFO 6	CAN RX FIFO DMA request #6	109	—	109	—
CAN RX FIFO 7	CAN RX FIFO DMA request #7	110	—	110	—
CAN0					
CAN ch.0 FIFO	CAN0 COM FIFO DMA request	99	—	99	—
CAN1					
CAN ch.1 FIFO	CAN1 COM FIFO DMA request	100	—	100	—
CAN2					
CAN ch.2 FIFO	CAN2 COM FIFO DMA request	101	—	101	—
CAN3					
CAN ch.3 FIFO	CAN3 COM FIFO DMA request	102	—	102	—

—: Not assigned

Note 1. 1st: Primary channel, 2nd: Secondary Channel

14.1.5 Reset Source

The reset source of RSCFDn is shown below. The reset source initializes RSCFDn.

Table 14.8 Reset Source

Unit Name	Reset Source
RSCFDn	All reset sources

14.1.6 External Input/Output Signals

External input/output signals of RSCFDn are listed below.

Table 14.9 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
RSCFD0		
CANmRX (m = 0 to 3)	CANm receive data input	CANmRX (m = 0 to 3)
CANmTX (m = 0 to 3)	CANm transmit data output	CANmTX (m = 0 to 3)

14.2 Overview

14.2.1 Functional Overview

Table 14.10 shows the RS-CANFD module specifications. **Figure 14.1** shows the RS-CANFD module block diagram.

Table 14.10 RS-CANFD Module Specifications (1/2)

Item	Specification
Number of channels	4
Protocol	ISO11898-1:2015 compliant Using CAN FD frames is selectable by switching interface modes.
Communication speed	Classical CAN mode: • Maximum 1 Mbps Communication speed (CANm bit time clock) = $\frac{1}{\text{CANm bit time}}$ CANm bit time = CANmTq × Tq count per bit CANmTq = $\frac{\text{(BRP[9:0] bits in the RSCANnCmCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCANnGCFG register) CAN FD mode: • Nominal bit rate: max.1 Mbps, data bit rate: max. 5 Mbps Transmission rate (CANm nominal bit time clock) = $\frac{1}{\text{CANm nominal bit time}}$ Transmission rate (CANm data bit time clock) = $\frac{1}{\text{CANm data bit time}}$ CANm nominal bit time = CANmTq(N) × Tq count per nominal bit CANm data bit time = CANmTq(D) × Tq count per data bit CANmTq(N) = $\frac{\text{(NBRP[9:0] bits in the RSCFDnCFDCmNCFG register + 1)}}{\text{fCAN}}$ CANmTq(D) = $\frac{\text{(DBRP[7:0] bits in the RSCFDnCFDCmDCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCFDnCFDGCFG register) m = 0 to 3 Tq: Time quantum
Buffer	320 buffers in total • Individual buffers: 64 buffers (16 buffers × 4 channels) Transmit buffer: 16 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable) • Shared buffers: 256 buffers for all channels Receive buffer: 0 to 64 buffers Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) • ECC included
Reception function	• Receives data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be received. • Sets interrupt enable/disable for each FIFO. • Mirror function (reception of messages transmitted from the own CAN node) • Timestamp function (to record message reception time as a 16-bit timer value)
Reception filter function	• Selects receive messages according to 256 receive rules. • Sets the number of receive rules (0 to 128) for each channel. • Acceptance filter processing: Sets ID and mask for each receive rule. • DLC filter processing: Enables DLC filter check for each acceptance rule.

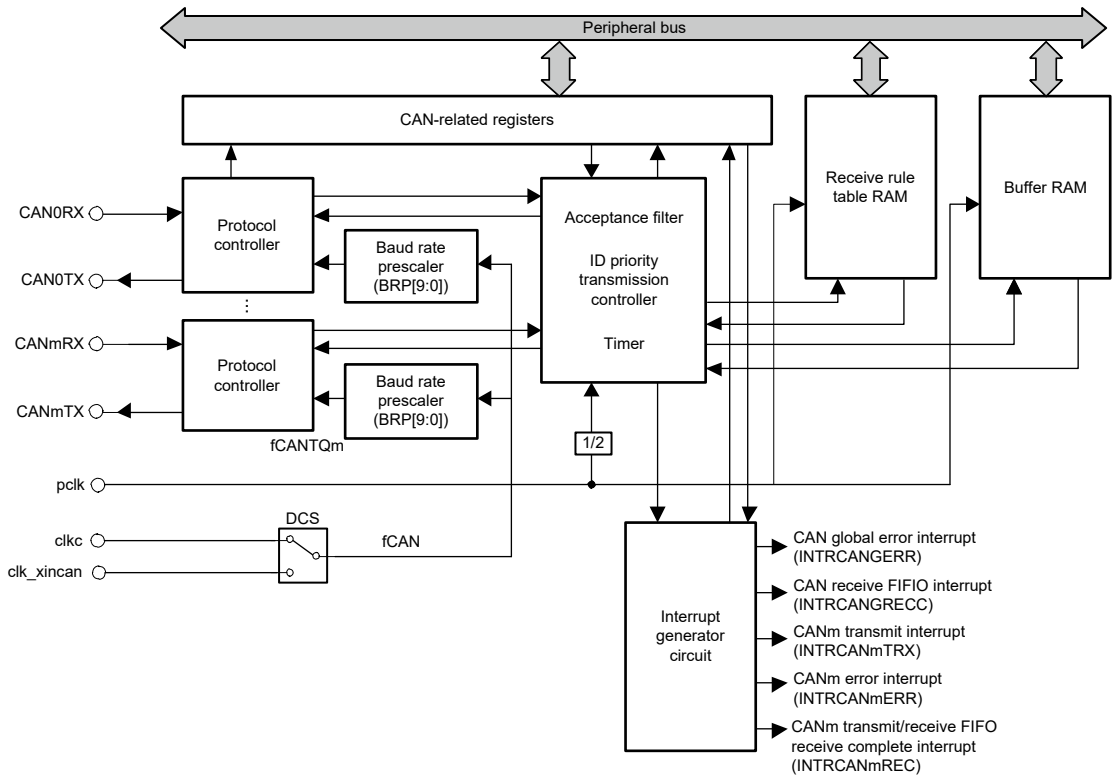
Table 14.10 RS-CANFD Module Specifications (2/2)

Item	Specification
Receive message transfer function	• Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer • Label addition function Stores label information together with a message in a receive buffer and FIFO buffer.
Transmission function	• Transmits data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be transmitted. • Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer. • Selects ID priority transmission or transmit buffer number priority transmission. • Transmit request can be aborted (possible to confirm with a flag) • One-shot transmission function
Interval transmission function	Transmit messages at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers)
Transmit queue function	Transmits all stored messages according to the ID priority.
Transmit history function	Stores the history information of transmission-completed messages Adds timestamp (recording message transmission time as a 16-bit timer value) to the history information.
Gateway function	Transmits a received message automatically.
Bus off recovery mode selection	Selects the method for returning from bus off state • ISO11898-1:2015 compliant • Automatic entry to channel halt mode at bus-off entry • Automatic entry to channel halt mode at bus-off end • Transition to channel halt mode by program request • Transition to the error-active state by program request (forcible return from the bus off state)
Error status monitoring	• Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock). • Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery) • Reads the error counter. • Monitors DLC errors.
Interrupt source	14 sources • Global Interrupts (2 sources) Receive FIFO interrupt Global error interrupt • Channel interrupts (3 sources/channel) CANm transmit interrupt (m = 0 to 3) - CANm transmit complete interrupt - CANm transmit abort interrupt - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode) - CANm transmit history interrupt - CANm transmit queue interrupt CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) CANm error interrupt
CAN stop mode	Reduces power consumption by stopping clock supply to the RS-CANFD module.
CAN clock source	Selects the clkc or the clk_xincan.
Test function	Test function for user evaluation • Listen-only mode • Self-test mode 0 (external loopback) • Self-test mode 1 (internal loopback) • Restricted operation mode • RAM test (read/write test) • Inter-channel communication test [CRC error test enabled]

14.2.2 Interface Modes

The RS-CANFD has two interface modes.

- Classical CAN mode: Handles only classical CAN frames.
- CAN FD mode: Handles classical CAN frames and CAN FD frames.



These two modes use different register maps with the same base address. Register maps change by switching interface modes.

Interface modes are switched by the RCMC bit in the RSCFDn(CFD)GRMCFG register.

14.2.3 CAN FD Protocol Switching

This product supports ISO 11898-1:2015 compatible CAN FD with a new CRC field containing a stuff counter. It can also support the CRC field that conforms to ISO/CD 11898-1 (2014-08-12 version) when the NIE bit of the RSCFDnCFDGCRCCFG register is set to 1.

14.2.4 Block Diagram

Note: m = 0 to 3
BRP[9:0]: Bits in the RSCANnCmCFG register
DCS: Bits in the RSCANnGCFG register
fCANTQm: CANmTq clock
fCAN: CAN clock

Figure 14.1 RS-CANFD Module Block Diagram (Classical CAN Mode)

In CAN FD mode, different clock signals are input to the baud rate prescaler and the protocol controller respectively. See **Section 14.11.1.3, Communication Speed Setting**.

14.3 Registers (Classical CAN Mode)

14.3.1 List of Registers

The following tables list RS-CANFD registers to be used in classical CAN mode.

For details about <RSCFDn_base>, see **Section 14.1.2, Register Base Address.**

Table 14.11 Registers (1/3)

Module	Register	Symbol	Address
Interface mode-related registers			
RSCANn	Global Interface Mode Select Register	RSCANnGRMCFG	<RSCFDn_base> + $04FC_H$
Channel-related registers			
RSCANn	Channel m Configuration Register	RSCANnCmCFG	<RSCFDn_base> + 0000_H + (10_H × m)
RSCANn	Channel m Control Register	RSCANnCmCTR	<RSCFDn_base> + 0004_H + (10_H × m)
RSCANn	Channel m Status Register	RSCANnCmSTS	<RSCFDn_base> + 0008_H + (10_H × m)
RSCANn	Channel m Error Flag Register	RSCANnCmERFL	<RSCFDn_base> + $000C_H$ + (10_H × m)
Global-related registers			
RSCANn	Global Configuration Register	RSCANnGCFG	<RSCFDn_base> + 0084_H
RSCANn	Global Control Register	RSCANnGCTR	<RSCFDn_base> + 0088_H
RSCANn	Global Status Register	RSCANnGSTS	<RSCFDn_base> + $008C_H$
RSCANn	Global Error Flag Register	RSCANnGERFL	<RSCFDn_base> + 0090_H
RSCANn	Global Timestamp Counter Register	RSCANnGTSC	<RSCFDn_base> + 0094_H
RSCANn	Global TX Interrupt Status Register 0	RSCANnGTINTSTS0	<RSCFDn_base> + 0460_H
RSCANn	Global FD Configuration Register	RSCANnGFDCFG	<RSCFDn_base> + 0474_H
Receive rule-related registers			
RSCANn	Receive Rule Entry Control Register	RSCANnGAFLECTR	<RSCFDn_base> + 0098_H
RSCANn	Receive Rule Configuration Register 0	RSCANnGAFLCFG0	<RSCFDn_base> + $009C_H$
RSCANn	Receive Rule ID Register j	RSCANnGAFLIDj	<RSCFDn_base> + 0500_H + (10_H × j)
RSCANn	Receive Rule Mask Register j	RSCANnGAFLMj	<RSCFDn_base> + 0504_H + (10_H × j)
RSCANn	Receive Rule Pointer 0 Register j	RSCANnGAFLP0_j	<RSCFDn_base> + 0508_H + (10_H × j)
RSCANn	Receive Rule Pointer 1 Register j	RSCANnGAFLP1_j	<RSCFDn_base> + $050C_H$ + (10_H × j)
Receive buffer-related registers			
RSCANn	Receive Buffer Number Register	RSCANnRMNB	<RSCFDn_base> + $00A4_H$
RSCANn	Receive Buffer New Data Register y	RSCANnRMNDy	<RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCANn	Receive Buffer ID Register q	RSCANnRMIDq	<RSCFDn_base> + 0600_H + (10_H × q)
RSCANn	Receive Buffer Pointer Register q	RSCANnRMPTRq	<RSCFDn_base> + 0604_H + (10_H × q)
RSCANn	Receive Buffer Data Field 0 Register q	RSCANnRMDF0_q	<RSCFDn_base> + 0608_H + (10_H × q)

14.3.2 Details of Interface Mode-Related Registers

14.3.2.1 RSCANnGRMCFG – Global Interface Mode Select Register

Access: RSCANnGRMCFG register can be read/written in 32-bit units
RSCANnGRMCFGL, RSCANnGRMCFGH registers can be read/written in 16-bit units.
RSCANnGRMCFGLL, RSCANnGRMCFGLH, RSCANnGRMCFGHL, RSCANnGRMCFGHH registers can be read/written in 8-bit units.

Address: RSCANnGRMCFG: <RSCFDn_base> + $04FC_H$
RSCANnGRMCFGL: <RSCFDn_base> + $04FC_H$,
RSCANnGRMCFGH: <RSCFDn_base> + $04FE_H$
RSCANnGRMCFGLL: <RSCFDn_base> + $04FC_H$,
RSCANnGRMCFGLH: <RSCFDn_base> + $04FD_H$,
RSCANnGRMCFGHL: <RSCFDn_base> + $04FE_H$,
RSCANnGRMCFGHH: <RSCFDn_base> + $04FF_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.16 RSCANnGRMCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
0	RCMC	Interface Mode Select 0: Classical CAN mode 1: CAN FD mode

Note: RSCANnGRMCFG and RSCFDnCFDGRMCFG are the same register. Set either of these registers.

Modify the RSCANnGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 0 makes classical CAN mode available. To switch CAN FD mode to classical CAN mode, set the value after reset to all registers and bits allocated to the register map of CAN FD mode and then modify the RSCANnGRMCFG register.

14.3.3 Details of Channel-Related Registers

14.3.3.1 RSCANnCmCFG ─ Channel Configuration Register (m = 0 to 3)

Access: RSCANnCmCFG register can be read/written in 32-bit units
RSCANnCmCFGL, RSCANnCmCFGH registers can be read/written in 16-bit units
RSCANnCmCFGLL, RSCANnCmCFGLH, RSCANnCmCFGHL, RSCANnCmCFGHH registers can be read/written in 8-bit units.

Address: RSCANnCmCFG: <RSCFDn_base> + 0000_H + (10_H × m)
RSCANnCmCFGL: <RSCFDn_base> + 0000_H + (10_H × m),
RSCANnCmCFGH: <RSCFDn_base> + 0002_H + (10_H × m)
RSCANnCmCFGLL: <RSCFDn_base> + 0000_H + (10_H × m),
RSCANnCmCFGLH: <RSCFDn_base> + 0001_H + (10_H × m),
RSCANnCmCFGHL: <RSCFDn_base> + 0002_H + (10_H × m),

15 to10	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
9 to 0	BRP[9:0]	Prescaler Division Ratio Set When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.

Modify the RSCANnCmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before shifting to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see **Section 14.11.1, Initial Settings.**

SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width. Allowed values are 1 Tq to 4 Tq, inclusive. Set a value less than or equal to the value of the TSEG2 bits.

TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).

Allowed values are 2 Tq to 8 Tq, inclusive.

Set a value smaller than the value of the TSEG1 bits.

TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).

Allowed values are 4 Tq to 16 Tq, inclusive.

BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

14.3.3.2 RSCANnCmCTR ─ Channel Control Register (m = 0 to 3)

Access: RSCANnCmCTR register can be read/written in 32-bit units
RSCANnCmCTRL, RSCANnCmCTRH registers can be read/written in 16-bit units
RSCANnCmCTRLL, RSCANnCmCTRLH, RSCANnCmCTRHL, RSCANnCmCTRHH registers can be read/written in 8-bit units.

Address: RSCANnCmCTR: <RSCFDn_base> + 0004_H + (10_H × m)
RSCANnCmCTRL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCANnCmCTRH: <RSCFDn_base> + 0006_H + (10_H × m)
RSCANnCmCTRLL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCANnCmCTRLH: <RSCFDn_base> + 0005_H + (10_H × m),
RSCANnCmCTRHL: <RSCFDn_base> + 0006_H + (10_H × m),
RSCANnCmCTRHH: <RSCFDn_base> + 0007_H + (10_H × m)

Value after reset: $0000\ 0005_H$

1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCANnCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCANnCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCANnGTSTCFG register is 1)
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCANnCmERFL register.

When this bit is clear to 0, if any error is detected while the flags of bits 14-8 in the RSCANnCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module. When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCANnCmCTR register (m = 0 to 3) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01_B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCANnCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCANnCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCANnCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCANnCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCANnCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCANnCmERFLregister is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCANnCmERFLregister is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCANnCmERFLregister is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTSregister to 00_H and also clears the BOSTS flag in the RSCANnCmSTSregister to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCANnCmCTRregister are 00_B (ISO 11898-1:2015 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RS-CANFD module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.

Clearing this bit to 0 makes the channel exit channel stop mode.

This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 14.6.2, Channel Modes.** Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the RS-CANFD module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10_B.

14.3.3.3 RSCANnCmSTS ─ Channel Status Register (m = 0 to 3)

Access: RSCANnCmSTS register can be read only in 32-bit units
RSCANnCmSTSL, RSCANnCmSTSH registers can be read only in 16-bit units
RSCANnCmSTSLL, RSCANnCmSTSLH, RSCANnCmSTSHL, RSCANnCmSTSHH registers can be read only in 8-bit units

Address: RSCANnCmSTS: <RSCFDn_base> + 0008_H + (10_H × m)
RSCANnCmSTSL: <RSCFDn_base> + 0008_H + (10_H × m),
RSCANnCmSTSH: <RSCFDn_base> + $000A_H$ + (10_H × m)
RSCANnCmSTSLL: <RSCFDn_base> + 0008_H + (10_H × m),
RSCANnCmSTSLH: <RSCFDn_base> + 0009_H + (10_H × m),
RSCANnCmSTSHL: <RSCFDn_base> + $000A_H$ + (10_H × m),
RSCANnCmSTSHH: <RSCFDn_base> + $000B_H$ + (10_H × m)

Value after reset: $0000\ 0005_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.19 RSCANnCmSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 8	Reserved	When read, the value after a reset is read.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1:2015).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1:2015).

These bits are cleared to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the RS-CANFD module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode.

This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the RS-CANFD module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel stop mode, and is cleared to 0 when the RS-CANFD module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel halt mode, and is cleared to 0 when the RS-CANFD module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel reset mode, and is cleared to 0 when the RS-CANFD module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the RS-CANFD module transitions from channel reset mode to channel stop mode.

14.3.3.4 RSCANnCmERFL ─ Channel Error Flag Register (m = 0 to 3)

Access: RSCANnCmERFL register can be read/written in 32-bit units
RSCANnCmERFLL, RSCANnCmERFLH registers can be read/written in 16-bit units
RSCANnCmERFLLL, RSCANnCmERFLLH, RSCANnCmERFLHL, RSCANnCmERFLHH registers can be read/written in 8-bit units

Address: RSCANnCmERFL: <RSCFDn_base> + $000C_H$ + (10_H × m)
RSCANnCmERFLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCANnCmERFLH: <RSCFDn_base> + $000E_H$ + (10_H × m)
RSCANnCmERFLLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCANnCmERFLLH: <RSCFDn_base> + $000D_H$ + (10_H × m),
RSCANnCmERFLHL: <RSCFDn_base> + $000E_H$ + (10_H × m),
RSCANnCmERFLHH: <RSCFDn_base> + $000F_H$ + (10_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	CRCREG[14:0]														
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.20 RSCANnCmERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.

Table 14.20 RSCANnCmERFL Register Contents (2/2)

Bit Position	Bit Name	Function
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus is detected. 1: Channel bus is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1:2015) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCANnCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCANnCmERFL is detected, the flag bits are only set by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

CRCREG[14:0] Flags

When the CTME bit in the RSCANnCmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

This bit is always 0 in channe reset mode.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The RS-CANFD module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the RS-CANFD module returns from the bus off state. However, this flag is not set to 1 if the RS-CANFD module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCANnCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCANnCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCANnCmCTR register (m = 0 to 3) set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127). This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCANnCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

14.3.4 Details of Global-Related Registers

14.3.4.1 RSCANnGCFG ─ Global Configuration Register

Access: RSCANnGCFG register can be read/written in 32-bit units
RSCANnGCFGL, RSCANnGCFGH registers can be read/written in 16-bit units
RSCANnGCFGLL, RSCANnGCFGLH, RSCANnGCFGHL, RSCANnGCFGHH registers can be read/written in 8-bit units

Address: RSCANnGCFG: <RSCFDn_base> + 0084_H
RSCANnGCFGL: <RSCFDn_base> + 0084_H, RSCANnGCFGH: <RSCFDn_base> + 0086_H
RSCANnGCFGLL: <RSCFDn_base> + 0084_H, RSCANnGCFGLH: <RSCFDn_base> + 0085_H,
RSCANnGCFGHL: <RSCFDn_base> + 0086_H, RSCANnGCFGHH: <RSCFDn_base> + 0087_H

11 to 8	TSP[3:0]	Timestamp Clock Source Division b11 b10 b9 b8 0 0 0 0: Not divided 0 0 0 1: Divided by 2 0 0 1 0: Divided by 4 0 0 1 1: Divided by 8 0 1 0 0: Divided by 16 0 1 0 1: Divided by 32 0 1 1 0: Divided by 64 0 1 1 1: Divided by 128 1 0 0 0: Divided by 256 1 0 0 1: Divided by 512 1 0 1 0: Divided by 1024 1 0 1 1: Divided by 2048 1 1 0 0: Divided by 4096 1 1 0 1: Divided by 8192 1 1 1 0: Divided by 16384 1 1 1 1: Divided by 32768
7	TMTSCE	Transmission Timestamp Enable 0: Transmission timestamp is disabled. 1: Transmission timestamp is enabled.
6	EEFE	ECC Error Flag Enable 0: The ECC error flag is disabled. 1: The ECC error flag is enabled.
5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
4	DCS	CAN Clock Source Select 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Modify the RSCANnGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 14.8.3.1, Interval Transmission Function**.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

TSSS Bit

This bit is used to select a clock source of the timestamp counter.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

TMTSCE Bit

Setting this bit to 1 makes it possible to store the timestamp of a transmitted message in the transmit history buffer. The timestamp is stored in TMTS[15:0] bits in the RSCANnTHLACCm register.

EEFE Bit

Setting this bit to 1 sets the EEFm bit in the RSCANnGERFL register to 1 when a 2-bit ECC error is detected during the transmission priority determination. At this time, the message in which a 2-bit ECC error was detected is not transmitted.

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCANnGAFLP0_j register to 0000_B before clearing the DCE bit in the RSCANnGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1:2015 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

14.3.4.2 RSCANnGCTR ─ Global Control Register

Access: RSCANnGCTR register can be read/written in 32-bit units.
RSCANnGCTRL, RSCANnGCTRH registers can be read/written in 16-bit units.
RSCANnGCTRLL, RSCANnGCTRLH, RSCANnGCTRHL, RSCANnGCTRHH registers can be read/written in 8-bit units.

Address: RSCANnGCTR: <RSCFDn_base> + 0088_H
RSCANnGCTRL: <RSCFDn_base> + 0088_H, RSCANnGCTRH: <RSCFDn_base> + $008A_H$

Table 14.22 RSCANnGCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCANnGTSC register is cleared to 0000_H.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RS-CANFD module into global stop mode.

Clearing this bit to 0 makes the RS-CANFD module leave from global stop mode.

This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 14.6.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

14.3.4.3 RSCANnGSTS ─ Global Status Register

Access: RSCANnGSTS register can be read only in 32-bit units.
RSCANnGSTSL, RSCANnGSTSH registers can be read only in 16-bit units.
RSCANnGSTSLL, RSCANnGSTSLH, RSCANnGSTSHL, RSCANnGSTSHH registers can be read only in 8-bit units.

Address: RSCANnGSTS: <RSCFDn_base> + $008C_H$
RSCANnGSTSL: <RSCFDn_base> + $008C_H$, RSCANnGSTSH: <RSCFDn_base> + $008E_H$
RSCANnGSTSLL: <RSCFDn_base> + $008C_H$, RSCANnGSTSLH: <RSCFDn_base> + $008D_H$,
RSCANnGSTSHL: <RSCFDn_base> + $008E_H$, RSCANnGSTSHH: <RSCFDn_base> + $008F_H$

Value after reset: 0000 $000D_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.23 RSCANnGSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global stop mode, and is cleared to 0 when the RS-CANFD module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global test mode, and is cleared to 0 when the RS-CANFD module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global reset mode, and is cleared to 0 when the RS-CANFD module has exited global reset mode. This flag remains 1 even when the RS-CANFD module has transitioned from global reset mode to global stop mode.

14.3.4.4 RSCANnGERFL – Global Error Flag Register

Access: RSCANnGERFL register can be read/written in 32-bit units.
RSCANnGERFLL, RSCANnGERFLH registers can be read/written in 16-bit units.
RSCANnGERFLLL, RSCANnGERFLLH, RSCANnGERFLHL, RSCANnGERFLHH registers can be read/written in 8-bit units.

Address: RSCANnGERFL: <RSCFDn_base> + 0090_H
RSCANnGERFLL: <RSCFDn_base> + 0090_H, RSCANnGERFLH: <RSCFDn_base> + 0092_H
RSCANnGERFLLL: <RSCFDn_base> + 0090_H, RSCANnGERFLLH: <RSCFDn_base> + 0091_H,
RSCANnGERFLHL: <RSCFDn_base> + 0092_H, RSCANnGERFLHH: <RSCFDn_base> + 0093_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	EEF3	EEF2	EEF1	EEF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R/W *1	R/W *1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.24 RSCANnGERFL Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
19	EEF3	ECC Error Flag for Channel 3 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
18	EEF2	ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
17	EEF1	ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
16	EEF0	ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
15 to 3	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCANnGERFL register are cleared to 0 in global reset mode.

EEFm Flag

While the EEFE bit in the RSCANnGCFG register is 1, when a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 3), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCANnTHLSTSm register (m = 0 to 3) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCANnRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCANnCFSTSk register (k = 0 to 11) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

14.3.4.5 RSCANnGTSC ─ Global Timestamp Counter Register

Access: RSCANnGTSC register can be read only in 32-bit units.
RSCANnGTSCL, RSCANnGTSCH registers can be read only in 16-bit units.

Address: RSCANnGTSC: <RSCFDn_base> + 0094_H
RSCANnGTSCL: <RSCFDn_base> + 0094_H, RSCANnGTSCH: <RSCFDn_base> + 0096_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.25 RSCANnGTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, while the TMTSCE bit in the RSCANnGCFG register is 1, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter start timing and stop timing depend on the count source.

- When the TSSS bit in the RSCANnGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RS-CANFD module has transitioned to global operating mode.
  This counter stops counting when the RS-CANFD module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

14.3.4.6 RSCANnGTINTSTS0 ─ Global TX Interrupt Status Register 0

Access: RSCANnGTINTSTS0 register can be read only in 32-bit units.
RSCANnGTINTSTS0L, RSCANnGTINTSTS0H registers can be read only in 16-bit units.
RSCANnGTINTSTS0LL, RSCANnGTINTSTS0LH, RSCANnGTINTSTS0HL, RSCANnGTINTSTS0HH registers can be read only in 8-bit units.

Address: RSCANnGTINTSTS0: <RSCFDn_base> + 0460_H
RSCANnGTINTSTS0L: <RSCFDn_base> + 0460_H, RSCANnGTINTSTS0H: <RSCFDn_base> + 0462_H
RSCANnGTINTSTS0LL: <RSCFDn_base> + 0460_H, RSCANnGTINTSTS0LH: <RSCFDn_base> + 0461_H,
RSCANnGTINTSTS0HL: <RSCFDn_base> + 0462_H, RSCANnGTINTSTS0HH: <RSCFDn_base> + 0463_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R*1	R*1	R*1	R*1	R*1	R	R	R	R*1	R*1	R*1	R*1	R*1

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 14.26 RSCANnGTINTSTS0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned.
28	THIF3	Channel 3 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
27	CFTIF3	Channel 3 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
26	TQIF3	Channel 3 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
25	TAIF3	Channel 3 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
24	TSIF3	Channel 3 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
23 to 21	Reserved	When read, the value after reset is returned.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.

Table 14.26 RSCANnGTINTSTS0 Register Contents (2/2)

Bit Position	Bit Name	Function
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	When read, the value after a reset is read.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	When read, the value after a reset is read.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

14.3.4.7 RSCANnGFDCFG ─ Global FD Configuration Register

Access: RSCANnGFDCFG register can be read/written in 32-bit units.
RSCANnGFDCFG L, RSCANnGFDCFG H registers can be read/written in 16-bit units.
RSCANnGFDCFG LL, RSCANnGFDCFG LH, RSCANnGFDCFG HL, RSCANnGFDCFG HH registers can be read/written in 8-bit units.

Address: RSCANnGFDCFG: <RSCFDn_base> + 0474_H
RSCANnGFDCFG L: <RSCFDn_base> + 0474_H, RSCANnGFDCFG H: <RSCFDn_base> + 0476_H
RSCANnGFDCFG LL: <RSCFDn_base> + 0474_H, RSCANnGFDCFG LH: <RSCFDn_base> + 0475_H,
RSCANnGFDCFG HL: <RSCFDn_base> + 0476_H, RSCANnGFDCFG HH: <RSCFDn_base> + 0477_H

Value after reset: $0000\ 0000_H$

Table 14.27 RSCANnGFDCFG Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
9, 8	TSCCFG[1:0]	Time-stamp capture setting bit b 9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Setting prohibited 1 1: Setting prohibited
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	Reserved	When read, the undefined value is returned. When writing this bit, write the value after reset.

TSCCFG bit

Select a point where a time-stamp value is caputured. Modify this bit only in global reset mode.

14.3.5 Details of Receive Rule-Related Registers

14.3.5.1 RSCANnGAFLECTR ─ Receive Rule Entry Control Register

Access: RSCANnGAFLECTR register can be read/written in 32-bit units.
RSCANnGAFLECTRL, RSCANnGAFLECTRH registers can be read/written in 16-bit units.
RSCANnGAFLECTRLL, RSCANnGAFLECTRLH, RSCANnGAFLECTRHL, RSCANnGAFLECTRHH registers can be read/written in 8-bit units.

Address: RSCANnGAFLECTR: <RSCFDn_base> + 0098_H
RSCANnGAFLECTRL: <RSCFDn_base> + 0098_H, RSCANnGAFLECTRH: <RSCFDn_base> + $009A_H$
RSCANnGAFLECTRLL: <RSCFDn_base> + 0098_H, RSCANnGAFLECTRLH: <RSCFDn_base> + 0099_H,
RSCANnGAFLECTRHL: <RSCFDn_base> + $009A_H$, RSCANnGAFLECTRHH: <RSCFDn_base> + $009B_H$

Value after reset: $0000\ 0000_H$

Table 14.28 RSCANnGAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected from a range of page 0 (00000_B) to page 15 (01111_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 01111_B.

14.3.5.2 RSCANnGAFLCFG0 ─ Receive Rule Configuration Register 0

Access: RSCANnGAFLCFG0 register can be read/written in 32-bit units.
RSCANnGAFLCFG0L, RSCANnGAFLCFG0H registers can be read/written in 16-bit units.
RSCANnGAFLCFG0LL, RSCANnGAFLCFG0LH, RSCANnGAFLCFG0HL, RSCANnGAFLCFG0HH registers can be read/written in 8-bit units.

Address: RSCANnGAFLCFG0: <RSCFDn_base> + $009C_H$
RSCANnGAFLCFG0L: <RSCFDn_base> + $009C_H$, RSCANnGAFLCFG0H: <RSCFDn_base> + $009E_H$
RSCANnGAFLCFG0LL: <RSCFDn_base> + $009C_H$, RSCANnGAFLCFG0LH: <RSCFDn_base> + $009D_H$,
RSCANnGAFLCFG0HL: <RSCFDn_base> + $009E_H$, RSCANnGAFLCFG0HH: <RSCFDn_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.29 RSCANnGAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules exclusively used for channel 2.
7 to 0	RNC3[7:0]	Number of Rules for Channel 3 Set the number of receive rules exclusively used for channel 3.

Modify the RSCANnGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC3[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 3 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

14.3.5.3 RSCANnGAFLIDj ─ Receive Rule ID Register (j = 0 to 15)

Access: RSCANnGAFLIDj register can be read/written in 32-bit units.
RSCANnGAFLIDjL, RSCANnGAFLIDjH registers can be read/written in 16-bit units.
RSCANnGAFLIDjLL, RSCANnGAFLIDjLH, RSCANnGAFLIDjHL, RSCANnGAFLIDjHH registers can be read/written in 8-bit units.

Address: RSCANnGAFLIDj: <RSCFDn_base> + 0500_H + (10_H × j)
RSCANnGAFLIDjL: <RSCFDn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjH: <RSCFDn_base> + 0502_H + (10_H × j)
RSCANnGAFLIDjLL: <RSCFDn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjLH: <RSCFDn_base> + 0501_H + (10_H × j),
RSCANnGAFLIDjHL: <RSCFDn_base> + 0502_H + (10_H × j),
RSCANnGAFLIDjHH: <RSCFDn_base> + 0503_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDE	GAFLRTR	GAFLLB	GAFLID[28:16]

Table 14.30 RSCANnGAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCANnGAFLIDj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

14.3.5.4 RSCANnGAFLMj ─ Receive Rule Mask Register (j = 0 to 15)

Access: RSCANnGAFLMj register can be read/written in 32-bit units.
RSCANnGAFLMjL, RSCANnGAFLMjH registers can be read/written in 16-bit units.
RSCANnGAFLMjLL, RSCANnGAFLMjLH, RSCANnGAFLMjHL, RSCANnGAFLMjHH registers can be read/written in 8-bit units.

Address: RSCANnGAFLMj: <RSCFDn_base> + 0504_H + (10_H × j)
RSCANnGAFLMjL: <RSCFDn_base> + 0504_H + (10_H × j),
RSCANnGAFLMjH: <RSCFDn_base> + 0506_H + (10_H × j)
RSCANnGAFLMjLL: <RSCFDn_base> + 0504_H + (10_H × j),
RSCANnGAFLMjLH: <RSCFDn_base> + 0505_H + (10_H × j),
RSCANnGAFLMjHL: <RSCFDn_base> + 0506_H + (10_H × j),
RSCANnGAFLMjHH: <RSCFDn_base> + 0507_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDEM	GAFLRTRM	—	GAFLIDM[28:16]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 14.31 RSCANnGAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared.
29	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCANnGAFLMj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCANnGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

14.3.5.5 RSCANnGAFLP0_j ─ Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCANnGAFLP0_j register can be read/written in 32-bit units.
RSCANnGAFLP0_jL, RSCANnGAFLP0_jH registers can be read/written in 16-bit units.
RSCANnGAFLP0_jLL, RSCANnGAFLP0_jLH, RSCANnGAFLP0_jHL, RSCANnGAFLP0_jHH registers can be read/written in 8-bit units.

Address: RSCANnGAFLP0_j: <RSCFDn_base> + 0508_H + (10_H × j)
RSCANnGAFLP0_jL: <RSCFDn_base> + 0508_H + (10_H × j),
RSCANnGAFLP0_jH: <RSCFDn_base> + $050A_H$ + (10_H × j)
RSCANnGAFLP0_jLL: <RSCFDn_base> + 0508_H + (10_H × j),
RSCANnGAFLP0_jLH: <RSCFDn_base> + 0509_H + (10_H × j),
RSCANnGAFLP0_jHL: <RSCFDn_base> + $050A_H$ + (10_H × j),
RSCANnGAFLP0_jHH: <RSCFDn_base> + $050B_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.32 RSCANnGAFLP0_j Register Contents

Bit Position	Bit Name	Function
31 to 28	GAFLDLC[3:0]	Receive Rule DLC b31 b30 b29 b28 0 0 0 0: DLC check is disabled. 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	GAFLPTR[11:0]	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Modify the RSCANnGAFLP0_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCANnRMNB register.

14.3.5.6 RSCANnGAFLP1_j ─ Receive Rule Pointer 1 Register (j = 0 to 15)

Access: RSCANnGAFLP1_j register can be read/written in 32-bit units.
RSCANnGAFLP1_jL, RSCANnGAFLP1_jH registers can be read/written in 16-bit units.
RSCANnGAFLP1_jLL, RSCANnGAFLP1_jLH, RSCANnGAFLP1_jHL, RSCANnGAFLP1_jHH registers can be read/written in 8-bit units.

Address: RSCANnGAFLP1_j: <RSCFDn_base> + $050C_H$ + (10_H × j)
RSCANnGAFLP1_jL: <RSCFDn_base> + $050C_H$ + (10_H × j),
RSCANnGAFLP1_jH: <RSCFDn_base> + $050E_H$ + (10_H × j)
RSCANnGAFLP1_jLL: <RSCFDn_base> + $050C_H$ + (10_H × j),
RSCANnGAFLP1_jLH: <RSCFDn_base> + $050D_H$ + (10_H × j),
RSCANnGAFLP1_jHL: <RSCFDn_base> + $050E_H$ + (10_H × j),
RSCANnGAFLP1_jHH: <RSCFDn_base> + $050F_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	GAFLFDP[19:16]

Table 14.33 RSCANnGAFLP1_j Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
19 to 8	GAFLFDP[19:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCANnGAFLP1_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP [19:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCANnGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCANnCFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) are selectable.

14.3.6 Details of Receive Buffer-Related Registers

14.3.6.1 RSCANnRMNB ─ Receive Buffer Number Register

Access: RSCANnRMNB register can be read/written in 32-bit units.
RSCANnRMNBL, RSCANnRMNBH registers can be read/written in 16-bit units.
RSCANnRMNBLL, RSCANnRMNBLH, RSCANnRMNBHL, RSCANnRMNBHH registers can be read/written in 8-bit units.

Address: RSCANnRMNB: <RSCFDn_base> + $00A4_H$
RSCANnRMNBL: <RSCFDn_base> + $00A4_H$, RSCANnRMNBH: <RSCFDn_base> + $00A6_H$
RSCANnRMNBLL: <RSCFDn_base> + $00A4_H$, RSCANnRMNBLH: <RSCFDn_base> + $00A5_H$,
RSCANnRMNBHL: <RSCFDn_base> + $00A6_H$, RSCANnRMNBHH: <RSCFDn_base> + $00A7_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 14.34 RSCANnRMNB Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 64.

Modify the RSCANnRMNB register only in global reset mode.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting these bits all to 0 makes receive buffers unavailable.

14.3.6.2 RSCANnRMNDy ─ Receive Buffer New Data Register (y = 0, 1)

Access: RSCANnRMNDy register can be read/written in 32-bit units.
RSCANnRMNDyL, RSCANnRMNDyH registers can be read/written in 16-bit units.
RSCANnRMNDyLL, RSCANnRMNDyLH, RSCANnRMNDyHL, RSCANnRMNDyHH registers can be read/written in 8-bit units.

Address: RSCANnRMNDy: <RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCANnRMNDyL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCANnRMNDyH: <RSCFDn_base> + $00AA_H$ + (04_H × y)
RSCANnRMNDyLL: <RSCFDn_base> + $00A8_H$ + (04_H × y),

Table 14.35 RSCANnRMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCANnRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 63)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message.

These flags are cleared to 0 in global reset mode.

14.3.6.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 63)

Access: RSCANnRMIDq register can be read only in 32-bit units.
RSCANnRMIDqL, RSCANnRMIDqH registers can be read only in 16-bit units.
RSCANnRMIDqLL, RSCANnRMIDqLH, RSCANnRMIDqHL, RSCANnRMIDqHH registers can be read only in 8-bit units.

Address: RSCANnRMIDq: <RSCFDn_base> + 0600_H + (10_H × q)
RSCANnRMIDqL: <RSCFDn_base> + 0600_H + (10_H × q),
RSCANnRMIDqH: <RSCFDn_base> + 0602_H + (10_H × q)
RSCANnRMIDqLL: <RSCFDn_base> + 0600_H + (10_H × q),
RSCANnRMIDqLH: <RSCFDn_base> + 0601_H + (10_H × q),
RSCANnRMIDqHL: <RSCFDn_base> + 0602_H + (10_H × q),
RSCANnRMIDqHH: <RSCFDn_base> + 0603_H + (10_H × q)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.36 RSCANnRMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	When read, the value after reset is returned.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

14.3.6.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 63)

Access: RSCANnRMPTRq register can be read only in 32-bit units.
RSCANnRMPTRqL, RSCANnRMPTRqH registers can be read only in 16-bit units.
RSCANnRMPTRqLL, RSCANnRMPTRqLH, RSCANnRMPTRqHL, RSCANnRMPTRqHH registers can be read only in 8-bit units.

Address: RSCANnRMPTRq: <RSCFDn_base> + 0604_H + (10_H × q)
RSCANnRMPTRqL: <RSCFDn_base> + 0604_H + (10_H × q),
RSCANnRMPTRqH: <RSCFDn_base> + 0606_H + (10_H × q)
RSCANnRMPTRqLL: <RSCFDn_base> + 0604_H + (10_H × q),

31 to 28	RMDLC[3:0]	Receive Buffer DLC Data b31 b30 b29 b28 0 0 0 0: No data byte 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	RMPTR[11:0]	Receive Buffer Label Data Label information of the received message.
15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

14.3.6.5 RSCANnRMDF0_q — Receive Buffer Data Field 0 Register (q = 0 to 63)

Access: RSCANnRMDF0_q register can be read only in 32-bit units.
RSCANnRMDF0_qL, RSCANnRMDF0_qH registers can be read only in 16-bit units.
RSCANnRMDF0_qLL, RSCANnRMDF0_qLH, RSCANnRMDF0_qHL, RSCANnRMDF0_qHH registers can be read only in 8-bit units.

Address: RSCANnRMDF0_q: <RSCFDn_base> + 0608_H + (10_H × q)
RSCANnRMDF0_qL: <RSCFDn_base> + 0608_H + (10_H × q),

Bit Position	Bit Name	Function
31 to 24	RMDB7[7:0]	Receive Buffer Data Byte 7
23 to 16	RMDB6[7:0]	Receive Buffer Data Byte 6
15 to 8	RMDB5[7:0]	Receive Buffer Data Byte 5
7 to 0	RMDB4[7:0]	Receive Buffer Data Byte 4 Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

14.3.7 Details of Receive FIFO Buffer-Related Registers

14.3.7.1 RSCANnRFCCx ─ Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access: RSCANnRFCCx register can be read/written in 32-bit units.
RSCANnRFCCxL, RSCANnRFCCxH registers can be read/written in 16-bit units.
RSCANnRFCCxLL, RSCANnRFCCxLH, RSCANnRFCCxHL, RSCANnRFCCxHH registers can be read/written in 8-bit units.

Address: RSCANnRFCCx: <RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCANnRFCCxL: <RSCFDn_base> + $00B8_H$ + (04_H × x),
RSCANnRFCCxH: <RSCFDn_base> + $00BA_H$ + (04_H × x)
RSCANnRFCCxLL: <RSCFDn_base> + $00B8_H$ + (04_H × x),
RSCANnRFCCxLH: <RSCFDn_base> + $00B9_H$ + (04_H × x),
RSCANnRFCCxHL: <RSCFDn_base> + $00BA_H$ + (04_H × x),
RSCANnRFCCxHH: <RSCFDn_base> + $00BB_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Table 14.40 RSCANnRFCCx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCANnRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCCx register have been done.

This bit is cleared to 0 in global reset mode.

14.3.7.2 RSCANnRFSTSx – Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RSCANnRFSTSx register can be read/written in 32-bit units.
RSCANnRFSTSxL, RSCANnRFSTSxH registers can be read/written in 16-bit units.
RSCANnRFSTSxLL, RSCANnRFSTSxLH, RSCANnRFSTSxHL, RSCANnRFSTSxHH registers can be read/written in 8-bit units.

Address: RSCANnRFSTSx: <RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCANnRFSTSxL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCANnRFSTSxH: <RSCFDn_base> + $00DA_H$ + (04_H × x)
RSCANnRFSTSxLL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCANnRFSTSxLH: <RSCFDn_base> + $00D9_H$ + (04_H × x),
RSCANnRFSTSxHL: <RSCFDn_base> + $00DA_H$ + (04_H × x),
RSCANnRFSTSxHH: <RSCFDn_base> + $00DB_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.41 RSCANnRFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flags

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCANnRFCCx register is set to 0.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCANnRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCANnRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCANnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCANnRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

14.3.7.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RSCANnRFPCTRx register can only be written in 32-bit units.
RSCANnRFPCTRxL, RSCANnRFPCTRxH registers can only be written in 16-bit units.
RSCANnRFPCTRxLL, RSCANnRFPCTRxLH, RSCANnRFPCTRxHL, RSCANnRFPCTRxHH registers can only be written in 8-bit units.

Address: RSCANnRFPCTRx: <RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCANnRFPCTRxL: <RSCFDn_base> + $00F8_H$ + (04_H × x),
RSCANnRFPCTRxH: <RSCFDn_base> + $00FA_H$ + (04_H × x)
RSCANnRFPCTRxLL: <RSCFDn_base> + $00F8_H$ + (04_H × x),
RSCANnRFPCTRxLH: <RSCFDn_base> + $00F9_H$ + (04_H × x),
RSCANnRFPCTRxHL: <RSCFDn_base> + $00FA_H$ + (04_H × x),
RSCANnRFPCTRxHH: <RSCFDn_base> + $00FB_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCANnRFSTSx register is decremented. Read the RSCANnRFIDx, RSCANnRFPTRx, RSCANnRFDF0_x, and RSCANnRFDF1_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCANnRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCANnRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

14.3.7.4 RSCANnRFIDx ─ Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RSCANnRFIDx register can be read only in 32-bit units.
RSCANnRFIDxL, RSCANnRFIDxH registers can be read only in 16-bit units.
RSCANnRFIDxLL, RSCANnRFIDxLH, RSCANnRFIDxHL, RSCANnRFIDxHH registers can be read only in 8-bit units.

Address: RSCANnRFIDx: <RSCFDn_base> + $0E00_H$ + (10_H × x)
RSCANnRFIDxL: <RSCFDn_base> + $0E00_H$ + (10_H × x),
RSCANnRFIDxH: <RSCFDn_base> + $0E02_H$ + (10_H × x)
RSCANnRFIDxLL: <RSCFDn_base> + $0E00_H$ + (10_H × x),
RSCANnRFIDxLH: <RSCFDn_base> + $0E01_H$ + (10_H × x),
RSCANnRFIDxHL: <RSCFDn_base> + $0E02_H$ + (10_H × x),
RSCANnRFIDxHH: <RSCFDn_base> + $0E03_H$ + (10_H × x)

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31	RFIDE	Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	RFRTR	Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	When read, the value after reset is returned.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

14.3.7.5 RSCANnRFPTRx ─ Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RSCANnRFPTRx register can be read only in 32-bit units.
RSCANnRFPTRxL, RSCANnRFPTRxH registers can be read only in 16-bit units.
RSCANnRFPTRxLL, RSCANnRFPTRxLH, RSCANnRFPTRxHL, RSCANnRFPTRxHH registers can be read only in 8-bit units.

Address: RSCANnRFPTRx: <RSCFDn_base> + $0E04_H$ + (10_H × x)
RSCANnRFPTRxL: <RSCFDn_base> + $0E04_H$ + (10_H × x),

15 to 0	RFTS[15:0]	Receive FIFO Buffer Timestamp Data Timestamp value of the received message can be read.

RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

14.3.7.6 RSCANnRFDF0_x – Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7)

Access: RSCANnRFDF0_x register can be read only in 32-bit units.
RSCANnRFDF0_xL, RSCANnRFDF0_xH registers can be read only in 16-bit units.
RSCANnRFDF0_xLL, RSCANnRFDF0_xLH, RSCANnRFDF0_xHL, RSCANnRFDF0_xHH registers can be read only in 8-bit units.

Address: RSCANnRFDF0_x: <RSCFDn_base> + $0E08_H$ + (10_H × x)
RSCANnRFDF0_xL: <RSCFDn_base> + $0E08_H$ + (10_H × x),

15 to 8	RFDB5[7:0]	Receive FIFO Buffer Data Byte 5
7 to 0	RFDB4[7:0]	Receive FIFO Buffer Data Byte 4 Data for a message stored in the receive FIFO buffer can be read.

When the RFDLC[3:0] value in the RSCANnRFPTRx register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

14.3.8 Details of Transmit/Receive FIFO Buffer-Related Registers

14.3.8.1 RSCANnCFCCk ─ Transmit/receive FIFO Buffer Configuration and Control Register (k = 0 to 11)

Access: RSCANnCFCCk register can be read/written in 32-bit units.
RSCANnCFCCkL, RSCANnCFCCkH registers can be read/written in 16-bit units.
RSCANnCFCCkLL, RSCANnCFCCkLH, RSCANnCFCCkHL, RSCANnCFCCkHH registers can be read/written in 8-bit units.

Address: RSCANnCFCCk: <RSCFDn_base> + 0118_H + (04_H × k)
RSCANnCFCCkL: <RSCFDn_base> + 0118_H + (04_H × k),
RSCANnCFCCkH: <RSCFDn_base> + $011A_H$ + (04_H × k)
RSCANnCFCCkLL: <RSCFDn_base> + 0118_H + (04_H × k),
RSCANnCFCCkLH: <RSCFDn_base> + 0119_H + (04_H × k),
RSCANnCFCCkHL: <RSCFDn_base> + $011A_H$ + (04_H × k),
RSCANnCFCCkHH: <RSCFDn_base> + $011B_H$ + (04_H × k)

15 to 13	CFIGCV[2:0]	Transmit/Receive FIFO Receive Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	CFIM	Transmit/Receive FIFO Interrupt Source Select 0: • Receive mode/gateway mode When the number of received messages has met the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. • Transmit mode/gateway mode When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. 1: • Receive mode/gateway mode A FIFO receive interrupt request is generated each time a message has been received. • Transmit mode/gateway mode A FIFO transmit interrupt request is generated each time a message has been transmitted.
11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10 to 8	CFDC[2:0]	Transmit/Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 14.12** and **Table 14.13** , as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCANnGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using another instruction.

14.3.8.2 RSCANnCFSTSk ─ Transmit/receive FIFO Buffer Status Register (k = 0 to 11)

Access: RSCANnCFSTSk register can be read/written in 32-bit units.
RSCANnCFSTSkL, RSCANnCFSTSkH registers can be read/written in 16-bit units.
RSCANnCFSTSkLL, RSCANnCFSTSkLH, RSCANnCFSTSkHL, RSCANnCFSTSkHH registers can be read/written in 8-bit units.

Address: RSCANnCFSTSk: <RSCFDn_base> + 0178_H + (04_H × k)
RSCANnCFSTSkL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCANnCFSTSkH: <RSCFDn_base> + $017A_H$ + (04_H × k)
RSCANnCFSTSkLL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCANnCFSTSkLH: <RSCFDn_base> + 0179_H + (04_H × k),
RSCANnCFSTSkHL: <RSCFDn_base> + $017A_H$ + (04_H × k),
RSCANnCFSTSkHH: <RSCFDn_base> + $017B_H$ + (04_H × k)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	CFMC[7:0]								—	—	—	CFT XIF	CFR XIF	CFMLT	CFFLL	CFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.48 RSCANnCFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCANnCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCANnCFCCk register.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCANnCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort.
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCANnCFPCTRk register after data was written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

14.3.8.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 11)

Access: RSCANnCFPCTRk register can only be written in 32-bit units.
RSCANnCFPCTRkL, RSCANnCFPCTRkH registers can only be written in 16-bit units.
RSCANnCFPCTRkLL, RSCANnCFPCTRkLH, RSCANnCFPCTRkHL, RSCANnCFPCTRkHH registers can only be written in 8-bit units.

Address: RSCANnCFPCTRk: <RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCANnCFPCTRkL: <RSCFDn_base> + $01D8_H$ + (04_H × k),
RSCANnCFPCTRkH: <RSCFDn_base> + $01DA_H$ + (04_H × k)
RSCANnCFPCTRkLL: <RSCFDn_base> + $01D8_H$ + (04_H × k),
RSCANnCFPCTRkLH: <RSCFDn_base> + $01D9_H$ + (04_H × k),
RSCANnCFPCTRkHL: <RSCFDn_base> + $01DA_H$ + (04_H × k),
RSCANnCFPCTRkHH: <RSCFDn_base> + $01DB_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.49 RSCANnCFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCANnCFCCk register is 00_B):
  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCANnCFSTSk register is decremented. Read the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCANnCFCCk register is 01_B):
  Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers before writing FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 and the CFFLL flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCANnCFCCk register is 10_B):
  Setting prohibited

14.3.8.4 RSCANnCFIDk — Transmit/Receive FIFO Buffer Access ID Register (k = 0 to 11)

Access: RSCANnCFIDk register can be read/written in 32-bit units.
RSCANnCFIDkL, RSCANnCFIDkH registers can be read/written in 16-bit units.
RSCANnCFIDkLL, RSCANnCFIDkLH, RSCANnCFIDkHL, RSCANnCFIDkHH registers can be read/written in 8-bit units.

Address: RSCANnCFIDk: <RSCFDn_base> + $0E80_H$ + (10_H × k)
RSCANnCFIDkL: <RSCFDn_base> + $0E80_H$ + (10_H × k),
RSCANnCFIDkH: <RSCFDn_base> + $0E82_H$ + (10_H × k)
RSCANnCFIDkLL: <RSCFDn_base> + $0E80_H$ + (10_H × k),
RSCANnCFIDkLH: <RSCFDn_base> + $0E81_H$ + (10_H × k),
RSCANnCFIDkHL: <RSCFDn_base> + $0E82_H$ + (10_H × k),
RSCANnCFIDkHH: <RSCFDn_base> + $0E83_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Table 14.50 RSCANnCFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

14.3.8.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 11)

Access: RSCANnCFPTRk register can be read/written in 32-bit units.
RSCANnCFPTRkL, RSCANnCFPTRkH registers can be read/written in 16-bit units.
RSCANnCFPTRkLL, RSCANnCFPTRkLH, RSCANnCFPTRkHL, RSCANnCFPTRkHH registers can be read/written in 8-bit units.

Address: RSCANnCFPTRk: <RSCFDn_base> + $0E84_H$ + (10_H × k)
RSCANnCFPTRkL: <RSCFDn_base> + $0E84_H$ + (10_H × k),
RSCANnCFPTRkH: <RSCFDn_base> + $0E86_H$ + (10_H × k)
RSCANnCFPTRkLL: <RSCFDn_base> + $0E84_H$ + (10_H × k),
RSCANnCFPTRkLH: <RSCFDn_base> + $0E85_H$ + (10_H × k),
RSCANnCFPTRkHL: <RSCFDn_base> + $0E86_H$ + (10_H × k),
RSCANnCFPTRkHH: <RSCFDn_base> + $0E87_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.51 RSCANnCFPTRk Register Contents

Bit Position	Bit Name	Function
31 to 28	CFDLC[3:0]	Transmit/Receive FIFO Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 1001_B or more, the actual transmit data defaults to 8 bytes.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

14.3.8.6 RSCANnCFDF0_k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 11)

Access: RSCANnCFDF0_k register can be read/written in 32-bit units.
RSCANnCFDF0_kL, RSCANnCFDF0_kH registers can be read/written in 16-bit units.
RSCANnCFDF0_kLL, RSCANnCFDF0_kLH, RSCANnCFDF0_kHL, RSCANnCFDF0_kHH registers can be read/written in 8-bit units.

Address: RSCANnCFDF0_k: <RSCFDn_base> + $0E88_H$ + (10_H × k)
RSCANnCFDF0_kL: <RSCFDn_base> + $0E88_H$ + (10_H × k),
RSCANnCFDF0_kH: <RSCFDn_base> + $0E8A_H$ + (10_H × k)
RSCANnCFDF0_kLL: <RSCFDn_base> + $0E88_H$ + (10_H × k),
RSCANnCFDF0_kLH: <RSCFDn_base> + $0E89_H$ + (10_H × k),
RSCANnCFDF0_kHL: <RSCFDn_base> + $0E8A_H$ + (10_H × k),
RSCANnCFDF0_kHH: <RSCFDn_base> + $0E8B_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Table 14.53 RSCANnCFDF1_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB7[7:0]	Transmit/Receive FIFO Buffer Data Byte 7
23 to 16	CFDB6[7:0]	Transmit/Receive FIFO Buffer Data Byte 6
15 to 8	CFDB5[7:0]	Transmit/Receive FIFO Buffer Data Byte 5
7 to 0	CFDB4[7:0]	Transmit/Receive FIFO Buffer Data Byte 4 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode).

This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

14.3.9 Details of FIFO Status-Related Registers

14.3.9.1 RSCANnFESTS ─ FIFO Empty Status Register

Access: RSCANnFESTS register can be read only in 32-bit units.
RSCANnFESTSL, RSCANnFESTSH registers can be read only in 16-bit units.
RSCANnFESTSLL, RSCANnFESTSLH, RSCANnFESTSHL, RSCANnFESTSHH registers can be read only in 8-bit units.

Address: RSCANnFESTS: <RSCFDn_base> + 0238_H
RSCANnFESTSL: <RSCFDn_base> + 0238_H, RSCANnFESTSH: <RSCFDn_base> + $023A_H$
RSCANnFESTSLL: <RSCFDn_base> + 0238_H, RSCANnFESTSLH: <RSCFDn_base> + 0239_H,
RSCANnFESTSHL: <RSCFDn_base> + $023A_H$, RSCANnFESTSHH: <RSCFDn_base> + $023B_H$

Value after reset: $03FF\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.54 RSCANnFESTS Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after a reset is read.
19	CF11EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 11)
18	CF10EMP	
17	CF9EMP	
16	CF8EMP	
15	CF7EMP	
14	CF6EMP	
13	CF5EMP	
12	CF4EMP	
11	CF3EMP	
10	CF2EMP	
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCANnFESTS register is set to 03FF FFFF$_H$ in global reset mode.

CFkEMP Flag (k = 0 to 11)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

14.3.9.2 RSCANnFFSTS ─ FIFO Full Status Register

Access: RSCANnFFSTS register can be read only in 32-bit units.
RSCANnFFSTSL, RSCANnFFSTSH registers can be read only in 16-bit units.
RSCANnFFSTSLL, RSCANnFFSTSLH, RSCANnFFSTSHL, RSCANnFFSTSHH registers can be read only in 8-bit units.

Address: RSCANnFFSTS: <RSCFDn_base> + $023C_H$
RSCANnFFSTSL: <RSCFDn_base> + $023C_H$, RSCANnFFSTSH: <RSCFDn_base> + $023E_H$
RSCANnFFSTSLL: <RSCFDn_base> + $023C_H$, RSCANnFFSTSLH: <RSCFDn_base> + $023D_H$,
RSCANnFFSTSHL: <RSCFDn_base> + $023E_H$, RSCANnFFSTSHH: <RSCFDn_base> + $023F_H$

Value after reset: $0000\ 0000_H$

10	CF2FLL	
9	CF1FLL	
8	CF0FLL	
7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCANnFFSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkFLL Flag (k = 0 to 11)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).

When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

14.3.9.3 RSCANnFMSTS – FIFO Message Lost Status Register

Access: RSCANnFMSTS register can be read only in 32-bit units.
RSCANnFMSTSL, RSCANnFMSTSH registers can be read only in 16-bit units.
RSCANnFMSTSLL, RSCANnFMSTSLH, RSCANnFMSTSHL, RSCANnFMSTSHH registers can be read only in 8-bit units.

Address: RSCANnFMSTS: <RSCFDn_base> + 0240_H
RSCANnFMSTSL: <RSCFDn_base> + 0240_H, RSCANnFMSTSH: <RSCFDn_base> + 0242_H
RSCANnFMSTSLL: <RSCFDn_base> + 0240_H, RSCANnFMSTSLH: <RSCFDn_base> + 0241_H,
RSCANnFMSTSHL: <RSCFDn_base> + 0242_H, RSCANnFMSTSHH: <RSCFDn_base> + 0243_H

Value after reset: $0000\ 0000_H$

7	RF7MLT	Receive FIFO Buffer Message Lost Status Flag 0: No receive FIFO buffer x message is lost. 1: A receive FIFO buffer x message is lost. (x = 0 to 7)
6	RF6MLT	
5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCANnFMSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkMLT Flag (k = 0 to 11)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO message is lost).

When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

14.3.9.4 RSCANnRFISTS ─ Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCANnRFISTS register can be read only in 32-bit units.
RSCANnRFISTSL, RSCANnRFISTSH registers can be read only in 16-bit units.
RSCANnRFISTSLL, RSCANnRFISTSLH, RSCANnRFISTSHL, RSCANnRFISTSHH registers can be read only in 8-bit units.

Address: RSCANnRFISTS: <RSCFDn_base> + 0244_H
RSCANnRFISTSL: <RSCFDn_base> + 0244_H, RSCANnRFISTSH: <RSCFDn_base> + 0246_H
RSCANnRFISTSLL: <RSCFDn_base> + 0244_H, RSCANnRFISTSLH: <RSCFDn_base> + 0245_H,
RSCANnRFISTSHL: <RSCFDn_base> + 0246_H, RSCANnRFISTSHH: <RSCFDn_base> + 0247_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.57 RSCANnRFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCANnRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

14.3.9.5 RSCANnCFRISTS ─ Transmit/Receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCANnCFRISTS register can be read only in 32-bit units.
RSCANnCFRISTSL, RSCANnCFRISTSH registers can be read only in 16-bit units.
RSCANnCFRISTSLL, RSCANnCFRISTSLH, RSCANnCFRISTSHL, RSCANnCFRISTSHH registers can be read only in 8-bit units.

Address: RSCANnCFRISTS: <RSCFDn_base> + 0248_H
RSCANnCFRISTSL: <RSCFDn_base> + 0248_H, RSCANnCFRISTSH: <RSCFDn_base> + $024A_H$
RSCANnCFRISTSLL: <RSCFDn_base> + 0248_H, RSCANnCFRISTSLH: <RSCFDn_base> + 0249_H,
RSCANnCFRISTSHL: <RSCFDn_base> + $024A_H$, RSCANnCFRISTSHH: <RSCFDn_base> + $024B_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	CF11 RXIF	CF10 RXIF	CF9 RXIF	CF8 RXIF	CF7 RXIF	CF6 RXIF	CF5 RXIF	CF4 RXIF	CF3 RXIF	CF2 RXIF	CF1 RXIF	CF0 RXIF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.58 RSCANnCFRISTS Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned.
11	CF11RXIF	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 11)
10	CF10RXIF	
9	CF9RXIF	
8	CF8RXIF	
7	CF7RXIF	
6	CF6RXIF	
5	CF5RXIF	
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCANnCFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkRXIF Flag (k = 0 to 11)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

14.3.9.6 RSCANnCFTISTS ─ Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCANnCFTISTS register can be read only in 32-bit units.
RSCANnCFTISTSL, RSCANnCFTISTSH registers can be read only in 16-bit units.
RSCANnCFTISTSLL, RSCANnCFTISTSLH, RSCANnCFTISTSHL, RSCANnCFTISTSHH registers can be read only in 8-bit units.

Address: RSCANnCFTISTS: <RSCFDn_base> + $024C_H$
RSCANnCFTISTSL: <RSCFDn_base> + $024C_H$, RSCANnCFTISTSH: <RSCFDn_base> + $024E_H$
RSCANnCFTISTSLL: <RSCFDn_base> + $024C_H$, RSCANnCFTISTSLH: <RSCFDn_base> + $024D_H$,
RSCANnCFTISTSHL: <RSCFDn_base> + $024E_H$, RSCANnCFTISTSHH: <RSCFDn_base> + $024F_H$

Value after reset: $0000\ 0000_H$

	—	—	—	—	CF11 TXIF	CF10 TXIF	CF9 TXIF	CF8 TXIF	CF7 TXIF	CF6 TXIF	CF5 TXIF	CF4 TXIF	CF3 TXIF	CF2 TXIF	CF1 TXIF	CF0 TXIF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.59 RSCANnCFTISTS Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after a reset is read.
11	CF11TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 11)
10	CF10TXIF	
9	CF9TXIF	
8	CF8TXIF	
7	CF7TXIF	
6	CF6TXIF	
5	CF5TXIF	
4	CF4TXIF	
3	CF3TXIF	
2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCANnCFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkTXIF Flag (k = 0 to 11)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

14.3.10 Details of Transmit Buffer-Related Registers

14.3.10.1 RSCANnTMCp ─ Transmit Buffer Control Register (p = 0 to 63)

Access: RSCANnTMCp registers can be read/written in 8-bit units.

Address: RSCANnTMCp: <RSCFDn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 14.60 RSCANnTMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCANnTMCp register meets any of the following conditions, set it to 00_H.

- The RSCANnTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCANnCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCANnTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCANnTXQCCm (m = 0 to 3) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).

Bits in the RSCANnTMCp register are all cleared to 0 in channel reset mode. Modify the RSCANnTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCANnTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration loss has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCANnTMSTSp register is 00_B.

14.3.10.2 RSCANnTMSTSp ─ Transmit Buffer Status Register (p = 0 to 63)

Access: RSCANnTMSTSp registers can be read/written in 8-bit units.

Address: RSCANnTMSTSp: <RSCFDn_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 14.61 RSCANnTMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCANnTMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCANnTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCANnTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCANnTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCANnTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

14.3.10.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 63)

Access: RSCANnTMIDp register can be read/written in 32-bit units.
RSCANnTMIDpL, RSCANnTMIDpH registers can be read/written in 16-bit units.
RSCANnTMIDpLL, RSCANnTMIDpLH, RSCANnTMIDpHL, RSCANnTMIDpHH registers can be read/written in 8-bit units.

Address: RSCANnTMIDp: <RSCFDn_base> + 1000_H + (10_H × p)
RSCANnTMIDpL: <RSCFDn_base> + 1000_H + (10_H × p),
RSCANnTMIDpH: <RSCFDn_base> + 1002_H + (10_H × p)
RSCANnTMIDpLL: <RSCFDn_base> + 1000_H + (10_H × p),
RSCANnTMIDpLH: <RSCFDn_base> + 1001_H + (10_H × p),
RSCANnTMIDpHL: <RSCFDn_base> + 1002_H + (10_H × p),
RSCANnTMIDpHH: <RSCFDn_base> + 1003_H + (10_H × p)

Table 14.62 RSCANnTMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp (timestamp is included if the TMTSCE bit in the RSCANnGCFG register is 1)) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

14.3.10.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 63)

Access: RSCANnTMPTRp register can be read/written in 32-bit units.
RSCANnTMPTRpL, RSCANnTMPTRpH registers can be read/written in 16-bit units.
RSCANnTMPTRpLL, RSCANnTMPTRpLH, RSCANnTMPTRpHL, RSCANnTMPTRpHH registers can be read/written in 8-bit units.

Address: RSCANnTMPTRp: <RSCFDn_base> + 1004_H + (10_H × p)
RSCANnTMPTRpL: <RSCFDn_base> + 1004_H + (10_H × p),
RSCANnTMPTRpH: <RSCFDn_base> + 1006_H + (10_H × p)
RSCANnTMPTRpLL: <RSCFDn_base> + 1004_H + (10_H × p),
RSCANnTMPTRpLH: <RSCFDn_base> + 1005_H + (10_H × p),
RSCANnTMPTRpHL: <RSCFDn_base> + 1006_H + (10_H × p),
RSCANnTMPTRpHH: <RSCFDn_base> + 1007_H + (10_H × p)

Value after reset: $0000\ 0000_H$

Table 14.63 RSCANnTMPTRp Register Contents

Bit Position	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 24	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCANnTMIDp register is set to 0 (data frame). If the data length is set to 1001_B or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), set the data length of messages to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

14.3.10.5 RSCANnTMDF0_p — Transmit Buffer Data Field 0 Register (p = 0 to 63)

Access: RSCANnTMDF0_p register can be read/written in 32-bit units.
RSCANnTMDF0_pL, RSCANnTMDF0_pH registers can be read/written in 16-bit units.
RSCANnTMDF0_pLL, RSCANnTMDF0_pLH, RSCANnTMDF0_pHL, RSCANnTMDF0_pHH registers can be read/written in 8-bit units.

Address: RSCANnTMDF0_p: <RSCFDn_base> + 1008_H + (10_H × p)
RSCANnTMDF0_pL: <RSCFDn_base> + 1008_H + (10_H × p),
RSCANnTMDF0_pH: <RSCFDn_base> + $100A_H$ + (10_H × p)
RSCANnTMDF0_pLL: <RSCFDn_base> + 1008_H + (10_H × p),
RSCANnTMDF0_pLH: <RSCFDn_base> + 1009_H + (10_H × p),
RSCANnTMDF0_pHL: <RSCFDn_base> + $100A_H$ + (10_H × p),

Table 14.66 RSCANnTMIECy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 63)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCANnTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

Table 14.67 shows the bit assignment.

14.3.11 Details of Transmit Buffer Status-Related Registers

14.3.11.1 RSCANnTMTRSTSy ─ Transmit Buffer Transmit Request Status Register (y = 0, 1)

Access: RSCANnTMTRSTSy register can be read only in 32-bit units.
RSCANnTMTRSTSyL, RSCANnTMTRSTSyH registers can be read only in 16-bit units.
RSCANnTMTRSTSyLL, RSCANnTMTRSTSyLH, RSCANnTMTRSTSyHL, RSCANnTMTRSTSyHH registers can be read only in 8-bit units.

Address: RSCANnTMTRSTSy: <RSCFDn_base> + 0350_H + (04_H × y)
RSCANnTMTRSTSyL: <RSCFDn_base> + 0350_H + (04_H × y),
RSCANnTMTRSTSyH: <RSCFDn_base> + 0352_H + (04_H × y)
RSCANnTMTRSTSyLL: <RSCFDn_base> + 0350_H + (04_H × y),
RSCANnTMTRSTSyLH: <RSCFDn_base> + 0351_H + (04_H × y),
RSCANnTMTRSTSyHL: <RSCFDn_base> + 0352_H + (04_H × y),
RSCANnTMTRSTSyHH: <RSCFDn_base> + 0353_H + (04_H × y)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 63)

These flags indicate the status of the TMTR bit in the RSCANnTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 14.69 shows the bit assignment.

Bit Position	Bit Name	Function
31 to 16	TMTARSTSp	Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit abort request is present. 1: A transmit abort request is present.
15 to 0	TMTARSTSp	Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit abort request is present. 1: A transmit abort request is present.

TMTARSTSp Flags (p = 0 to 63)

These flags indicate the status of the TMTAR bit in the RSCANnTMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

Table 14.71 shows the bit assignment.

Table 14.72 RSCANnTMTCSTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTCSTSp	Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: Transmission has not been completed. 1: Transmission has been completed.
15 to 0	TMTCSTSp	Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: Transmission has not been completed. 1: Transmission has been completed.

TMTCSTSp Flags (p = 0 to 63)

When the TMTRF[1:0] flag in the RSCANnTMSTSp register is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)), the corresponding TMTCSTSp flag is set to 1.

A TMTCSTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to 00_B or in channel reset mode.

Table 14.73 shows the bit assignment.

14.3.12 Details of Transmit Queue-Related Registers

14.3.12.1 RSCANnTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 3)

Access: RSCANnTXQCCm register can be read/written in 32-bit units.
RSCANnTXQCCmL, RSCANnTXQCCmH registers can be read/written in 16-bit units.
RSCANnTXQCCmLL, RSCANnTXQCCmLH, RSCANnTXQCCmHL, RSCANnTXQCCmHH registers can be read/written in 8-bit units.

Address: RSCANnTXQCCm: <RSCFDn_base> + $03A0_H$ + (04_H × m)
RSCANnTXQCCmL: <RSCFDn_base> + $03A0_H$ + (04_H × m),
RSCANnTXQCCmH: <RSCFDn_base> + $03A2_H$ + (04_H × m)
RSCANnTXQCCmLL: <RSCFDn_base> + $03A0_H$ + (04_H × m),
RSCANnTXQCCmLH: <RSCFDn_base> + $03A1_H$ + (04_H × m),
RSCANnTXQCCmHL: <RSCFDn_base> + $03A2_H$ + (04_H × m),
RSCANnTXQCCmHH: <RSCFDn_base> + $03A3_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Table 14.76 RSCANnTXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 14.9**. Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

14.3.12.2 RSCANnTXQSTSm ─ Transmit Queue Configuration and Control Register (m = 0 to 3)

Access: RSCANnTXQSTSm register can be read/written in 32-bit units.
RSCANnTXQSTSmL, RSCANnTXQSTSmH registers can be read/written in 16-bit units.
RSCANnTXQSTSmLL, RSCANnTXQSTSmLH, RSCANnTXQSTSmHL, RSCANnTXQSTSmHH registers can be read/written in 8-bit units.

Address: RSCANnTXQSTSm: <RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCANnTXQSTSmL: <RSCFDn_base> + $03C0_H$ + (04_H × m),
RSCANnTXQSTSmH: <RSCFDn_base> + $03C2_H$ + (04_H × m)
RSCANnTXQSTSmLL: <RSCFDn_base> + $03C0_H$ + (04_H × m),
RSCANnTXQSTSmLH: <RSCFDn_base> + $03C1_H$ + (04_H × m),
RSCANnTXQSTSmHL: <RSCFDn_base> + $03C2_H$ + (04_H × m),
RSCANnTXQSTSmHH: <RSCFDn_base> + $03C3_H$ + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.77 RSCANnTXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	Reserved	When read, the undefined value is returned. When writing to these bits, write the value after reset.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCANnTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCANnTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCANnTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

14.3.12.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 3)

Access: RSCANnTXQPCTRm register can only be written in 32-bit units.
RSCANnTXQPCTRmL, RSCANnTXQPCTRmH registers can only be written in 16-bit units.
RSCANnTXQPCTRmLL, RSCANnTXQPCTRmLH, RSCANnTXQPCTRmHL, RSCANnTXQPCTRmHH registers can only be written in 8-bit units.

Address: RSCANnTXQPCTRm: <RSCFDn_base> + $03E0_H$ + (04_H × m)
RSCANnTXQPCTRmL: <RSCFDn_base> + $03E0_H$ + (04_H × m),
RSCANnTXQPCTRmH: <RSCFDn_base> + $03E2_H$ + (04_H × m)
RSCANnTXQPCTRmLL: <RSCFDn_base> + $03E0_H$ + (04_H × m),
RSCANnTXQPCTRmLH: <RSCFDn_base> + $03E1_H$ + (04_H × m),
RSCANnTXQPCTRmHL: <RSCFDn_base> + $03E2_H$ + (04_H × m),
RSCANnTXQPCTRmHH: <RSCFDn_base> + $03E3_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 14.78 RSCANnTXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCANnTMIDp, RSCANnTMPTRp, RSCANnTMDF0_p, and RSCANnTMDF1_p registers (p = 15, 31, 47, 63) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCANnTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCANnTXQSTSm register is 0 (he transmit queue is not full).

14.3.13 Details of Transmit History-Related Registers

14.3.13.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0 to 3)

Access: RSCANnTHLCCm register can be read/written in 32-bit units.
RSCANnTHLCCmL, RSCANnTHLCCmH registers can be read/written in 16-bit units.
RSCANnTHLCCmLL, RSCANnTHLCCmLH, RSCANnTHLCCmHL, RSCANnTHLCCmHH registers can be read/written in 8-bit units.

Address: RSCANnTHLCCm: <RSCFDn_base> + 0400_H + (04_H × m)
RSCANnTHLCCmL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCANnTHLCCmH: <RSCFDn_base> + 0402_H + (04_H × m)
RSCANnTHLCCmLL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCANnTHLCCmLH: <RSCFDn_base> + 0401_H + (04_H × m),
RSCANnTHLCCmHL: <RSCFDn_base> + 0402_H + (04_H × m),

Table 14.79 RSCANnTHLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in cahnnel reset mode.

14.3.13.2 RSCANnTHLSTSm ─ Transmit History Status Register (m = 0 to 3)

Access: RSCANnTHLSTSm register can be read/written in 32-bit units.
RSCANnTHLSTSmL, RSCANnTHLSTSmH registers can be read/written in 16-bit units.
RSCANnTHLSTSmLL, RSCANnTHLSTSmLH, RSCANnTHLSTSmHL, RSCANnTHLSTSmHH registers can be read/written in 8-bit units.

Address: RSCANnTHLSTSm: <RSCFDn_base> + 0420_H + (04_H × m)
RSCANnTHLSTSmL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCANnTHLSTSmH: <RSCFDn_base> + 0422_H + (04_H × m)
RSCANnTHLSTSmLL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCANnTHLSTSmLH: <RSCFDn_base> + 0421_H + (04_H × m),
RSCANnTHLSTSmHL: <RSCFDn_base> + 0422_H + (04_H × m),
RSCANnTHLSTSmHH: <RSCFDn_base> + 0423_H + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.80 RSCANnTHLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer. These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCANnTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

14.3.13.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 3)

Access: RSCANnTHLPCTRm register can only be written in 32-bit units.
RSCANnTHLPCTRmL, RSCANnTHLPCTRmH registers can only be written in 16-bit units.
RSCANnTHLPCTRmLL, RSCANnTHLPCTRmLH, RSCANnTHLPCTRmHL, RSCANnTHLPCTRmHH registers can only be written in 8-bit units.

Address: RSCANnTHLPCTRm: <RSCFDn_base> + 0440_H + (04_H × m)
RSCANnTHLPCTRmL: <RSCFDn_base> + 0440_H + (04_H × m),
RSCANnTHLPCTRmH: <RSCFDn_base> + 0442_H + (04_H × m)
RSCANnTHLPCTRmLL: <RSCFDn_base> + 0440_H + (04_H × m),
RSCANnTHLPCTRmLH: <RSCFDn_base> + 0441_H + (04_H × m),
RSCANnTHLPCTRmHL: <RSCFDn_base> + 0442_H + (04_H × m),
RSCANnTHLPCTRmHH: <RSCFDn_base> + 0443_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 14.81 RSCANnTHLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCANnTHLSTSm register is decremented. Write FF_H to the THLPC[7:0] bits after reading from the RSCANnTHLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCANnTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCANnTHLSTSm register is 0.

14.3.13.4 RSCANnTHLACCm — Transmit History Access Register (m = 0 to 3)

Access: RSCANnTHLACCm register can be read only in 32-bit units.
RSCANnTHLACCmL, RSCANnTHLACCmH registers can be read only in 16-bit units.
RSCANnTHLACCmLL, RSCANnTHLACCmLH, RSCANnTHLACCmHL, RSCANnTHLACCmHH registers can be read only in 8-bit units.

Address: RSCANnTHLACCm: <RSCFDn_base> + 1800_H + (04_H × m)
RSCANnTHLACCmL: <RSCFDn_base> + 1800_H + (04_H × m),
RSCANnTHLACCmH: <RSCFDn_base> + 1802_H + (04_H × m)
RSCANnTHLACCmLL: <RSCFDn_base> + 1800_H + (04_H × m),
RSCANnTHLACCmLH: <RSCFDn_base> + 1801_H + (04_H × m),
RSCANnTHLACCmHL: <RSCFDn_base> + 1802_H + (04_H × m),
RSCANnTHLACCmHH: <RSCFDn_base> + 1803_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.82 RSCANnTHLACCm Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTS[15:0]	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	When read, the value after reset is returned.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

When the TMTSCE bit in the RSCANnGCFG register is 1, timestamp values in transmit history data stored in the transmit history buffer are displayed. When the TMTSCE bit is 0, these bits are always read as 0.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

14.3.14 Details of Test-Related Registers

14.3.14.1 RSCANnGTSTCFG ─ Global Test Configuration Register

Access: RSCANnGTSTCFG register can be read/written in 32-bit units.
RSCANnGTSTCFGL, RSCANnGTSTCFGH registers can be read/written in 16-bit units.
RSCANnGTSTCFGLL, RSCANnGTSTCFGLH, RSCANnGTSTCFGHL, RSCANnGTSTCFGHH registers can be read/written in 8-bit units.

Address: RSCANnGTSTCFG: <RSCFDn_base> + 0468_H
RSCANnGTSTCFGL: <RSCFDn_base> + 0468_H, RSCANnGTSTCFGH: <RSCFDn_base> + $046A_H$
RSCANnGTSTCFGLL: <RSCFDn_base> + 0468_H, RSCANnGTSTCFGLH: <RSCFDn_base> + 0469_H,
RSCANnGTSTCFGHL: <RSCFDn_base> + $046A_H$, RSCANnGTSTCFGHH: <RSCFDn_base> + $046B_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	RTMPS[6:0]

Table 14.83 RSCANnGTSTCFG Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within a range of page 0 (00_H) to page 39 (27_H).
15 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	C3ICBCE	CAN3 Inter-channel Communication Test Enable 0: CAN3 inter-channel communication test is disabled. 1: CAN3 inter-channel communication test is enabled.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled. 1: CAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCANnGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to 27_H, inclusive. In addition, do not access more than 128 bytes in the last page (RTMPS[6:0] = 27_H) of the RAM.

C3ICBCE Bit

Setting this bit to 1 enables the channel 3 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

14.3.14.2 RSCANnGTSTCTR ─ Global Test Control Register

Access: RSCANnGTSTCTR register can be read/written in 32-bit units.
RSCANnGTSTCTRL, RSCANnGTSTCTRH registers can be read/written in 16-bit units.
RSCANnGTSTCTRLL, RSCANnGTSTCTRLH, RSCANnGTSTCTRHL, RSCANnGTSTCTRHH registers can be read/written in 8-bit units.

Address: RSCANnGTSTCTR: <RSCFDn_base> + $046C_H$
RSCANnGTSTCTRL: <RSCFDn_base> + $046C_H$, RSCANnGTSTCTRH: <RSCFDn_base> + $046E_H$
RSCANnGTSTCTRLL: <RSCFDn_base> + $046C_H$, RSCANnGTSTCTRLH: <RSCFDn_base> + $046D_H$,
RSCANnGTSTCTRHL: <RSCFDn_base> + $046E_H$, RSCANnGTSTCTRHH: <RSCFDn_base> + $046F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RTME	—	ICBCTME
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 14.84 RSCANnGTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	ICBCTME	Communication Test between Channels Enable 0: Communication test between channels disabled. 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode. This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCANnGCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 3) in the RSCANnGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode. This bit is cleared to 0 in global reset mode.

14.3.14.3 RSCANnGLOCKK ─ Global Lock Key Register

Access: RSCANnGLOCKK register can only be written in 32-bit units.
RSCANnGLOCKKL, RSCANnGLOCKKH registers can only be written in 16-bit units.

Address: RSCANnGLOCKK: <RSCFDn_base> + $047C_H$
RSCANnGLOCKKL: <RSCFDn_base> + $047C_H$, RSCANnGLOCKKH: <RSCFDn_base> + $047E_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCK[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 14.85 RSCANnGLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCANnGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 14.11.4.2, Procedure for Releasing the Protection**.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCANnGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + 0000_H to <RSCFDn_base> + $04FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

14.3.14.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access: RSCANnRPGACCr register can be read/written in 32-bit units.
RSCANnRPGACCrL, RSCANnRPGACCrH registers can be read/written in 16-bit units.
RSCANnRPGACCrLL, RSCANnRPGACCrLH, RSCANnRPGACCrHL, RSCANnRPGACCrHH registers can be read/written in 8-bit units.

Address: RSCANnRPGACCr: <RSCFDn_base> + 1900_H + (04_H × r)
RSCANnRPGACCrL: <RSCFDn_base> + 1900_H + (04_H × r),
RSCANnRPGACCrH: <RSCFDn_base> + 1902_H + (04_H × r)
RSCANnRPGACCrLL: <RSCFDn_base> + 1900_H + (04_H × r),
RSCANnRPGACCrLH: <RSCFDn_base> + 1901_H + (04_H × r),
RSCANnRPGACCrHL: <RSCFDn_base> + 1902_H + (04_H × r),
RSCANnRPGACCrHH: <RSCFDn_base> + 1903_H + (04_H × r)

Value after reset: $0000\ 0000_H$

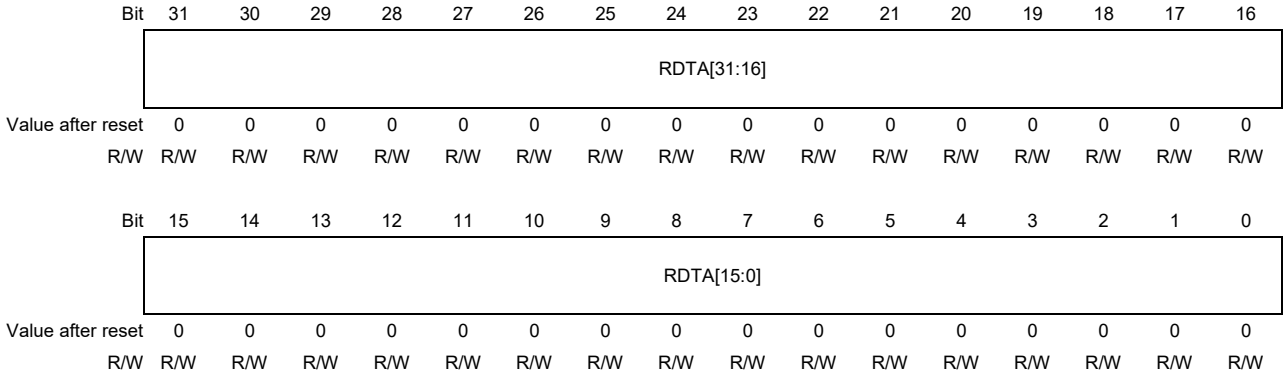

Table 14.86 RSCANnRPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA[31:0]	RAM Data Test Access Data can be read and written in CAN RAM.

Modify the RSCANnRPGACCr register in global test mode with the RTME bit in the RSCANnGTSTCTR register set to 1 (RAM test is enabled).

The RSCANnRPGACCr register is readable and writable when the RTME bit is set to 1.

14.4 Registers (CAN FD Mode)

This section describes all registers to be used when the RS-CANFD is used in CAN FD mode.

14.4.1 List of Registers

The following tables list RS-CANFD registers to be used in CAN FD mode.

For details about <RSCFDn_base>, see **Section 14.1.2, Register Base Address**.

Table 14.87 Registers (1/4)

Module	Register	Symbol	Address
Interface mode-related registers			
RSCFDn	Global interface mode select register	RSCFDnCFDGRMCFG	<RSCFDn_base> + $04FC_H$
Channel-related registers			
RSCFDn	Channel m nominal bit rate configuration register	RSCFDnCFDCmNCFG	<RSCFDn_base> + 0000_H + (10_H × m)
RSCFDn	Channel m control register	RSCFDnCFDCmCTR	<RSCFDn_base> + 0004_H + (10_H × m)
RSCFDn	Channel m status register	RSCFDnCFDCmSTS	<RSCFDn_base> + 0008_H + (10_H × m)
RSCFDn	Channel m error flag register	RSCFDnCFDCmERFL	<RSCFDn_base> + $000C_H$ + (10_H × m)
RSCFDn	Channel m data bit rate configuration register	RSCFDnCFDCmDCFG	<RSCFDn_base> + 0500_H + (20_H × m)
RSCFDn	Channel m CAN FD configuration register	RSCFDnCFDCmFDCFG	<RSCFDn_base> + 0504_H + (20_H × m)
RSCFDn	Channel m CAN FD control register	RSCFDnCFDCmFDCTR	<RSCFDn_base> + 0508_H + (20_H × m)
RSCFDn	Channel m CAN FD status register	RSCFDnCFDCmFDSTS	<RSCFDn_base> + $050C_H$ + (20_H × m)
RSCFDn	Channel m CAN FD CRC register	RSCFDnCFDCmFDCRC	<RSCFDn_base> + 0510_H + (20_H × m)
Global-related registers			
RSCFDn	Global configuration register	RSCFDnCFDGCFG	<RSCFDn_base> + 0084_H
RSCFDn	Global control register	RSCFDnCFDGCTR	<RSCFDn_base> + 0088_H
RSCFDn	Global status register	RSCFDnCFDGSTS	<RSCFDn_base> + $008C_H$
RSCFDn	Global error flag register	RSCFDnCFDGERFL	<RSCFDn_base> + 0090_H
RSCFDn	Global timestamp counter register	RSCFDnCFDGTSC	<RSCFDn_base> + 0094_H
RSCFDn	Global TX Interrupt Status Register 0	RSCFDnCFDGTINTSTS0	<RSCFDn_base> + 0460_H
RSCFDn	Glboal FD configuration register	RSCFDnCFDGFDCFG	<RSCFDn_base> + 0474_H
RSCFDn	Global CRC configuration register	RSCFDnCFDGCRCCFG	<RSCFDn_base> + 0478_H
Receive rule-related registers			
RSCFDn	Receive Rule Entry Control Register	RSCFDnCFDGAFLECTR	<RSCFDn_base> + 0098_H
RSCFDn	Receive Rule Configuration Register 0	RSCFDnCFDGAFLCFG0	<RSCFDn_base> + $009C_H$
RSCFDn	Receive Rule ID Register j	RSCFDnCFDGAFLIDj	<RSCFDn_base> + 1000_H + (10_H × j)
RSCFDn	Receive Rule Mask Register j	RSCFDnCFDGAFLMj	<RSCFDn_base> + 1004_H + (10_H × j)

Table 14.87 Registers (2/4)

Module	Register	Symbol	Address
RSCFDn	Receive Rule Pointer 0 Register j	RSCFDnCFDGAFLP0_j	<RSCFDn_base> + 1008_H + (10_H × j)
RSCFDn	Receive Rule Pointer 1 Register j	RSCFDnCFDGAFLP1_j	<RSCFDn_base> + $100C_H$ + (10_H × j)
Receive buffer-related registers			
RSCFDn	Receive Buffer Number Register	RSCFDnCFDRMNB	<RSCFDn_base> + $00A4_H$
RSCFDn	Receive Buffer New Data Register y	RSCFDnCFDRMNDy	<RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCFDn	Receive Buffer ID Register q	RSCFDnCFDRMIDq	<RSCFDn_base> + 2000_H + (20_H × q)
RSCFDn	Receive Buffer Pointer Register q	RSCFDnCFDRMPTRq	<RSCFDn_base> + 2004_H + (20_H × q)
RSCFDn	Receive buffer CAN FD status register q	RSCFDnCFDRMFDSTSq	<RSCFDn_base> + 2008_H + (20_H × q)
RSCFDn	Receive Buffer Data Field b Register q	RSCFDnCFDRMDFb_q	<RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q)
Receive FIFO buffer-related registers			
RSCFDn	Receive FIFO Buffer Configuration and Control Register x	RSCFDnCFDRFCCx	<RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Status Register x	RSCFDnCFDRFSTSx	<RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Pointer Control Register x	RSCFDnCFDRFPCTRx	<RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Access ID Register x	RSCFDnCFDRFIDx	<RSCFDn_base> + 3000_H + (80_H × x)
RSCFDn	Receive FIFO Buffer Access Pointer Register x	RSCFDnCFDRFPTRx	<RSCFDn_base> + 3004_H + (80_H × x)
RSCFDn	Receive FIFO CAN FD status register x	RSCFDnCFDRFFDSTSx	<RSCFDn_base> + 3008_H + (80_H × x)
RSCFDn	Receive FIFO Buffer Access Data Field d Register x	RSCFDnCFDRFDFd_x	<RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x)
Transmit/Receive FIFO buffer related registers			
RSCFDn	Transmit/receive FIFO Buffer Configuration and Control Register k	RSCFDnCFDCFCCk	<RSCFDn_base> + 0118_H + (04_H × k)
RSCFDn	Transmit/receive FIFO Buffer Status Register k	RSCFDnCFDCFSTSk	<RSCFDn_base> + 0178_H + (04_H × k)
RSCFDn	Transmit/receive FIFO Buffer Pointer Control Register k	RSCFDnCFDCFPCTRk	<RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCFDn	Transmit/receive FIFO Buffer Access ID Register k	RSCFDnCFDCFIDk	<RSCFDn_base> + 3400_H + (80_H × k)
RSCFDn	Transmit/receive FIFO Buffer Access Pointer Register k	RSCFDnCFDCFPTRk	<RSCFDn_base> + 3404_H + (80_H × k)
RSCFDn	Transmit/receive FIFO CAN FD configuration/status register k	RSCFDnCFDCFFDCSTSk	<RSCFDn_base> + 3408_H + (80_H × k)

14.4.2 Details of Interface Mode-Related Registers

14.4.2.1 RSCFDnCFDGRMCFG ─ Global Interface Mode Select Register

Access: RSCFDnCFDGRMCFG register can be read/written in 32-bit units.
RSCFDnCFDGRMCFGL, RSCFDnCFDGRMCFGH registers can be read/written in 16-bit units.
RSCFDnCFDGRMCFGLL, RSCFDnCFDGRMCFGLH, RSCFDnCFDGRMCFGHL, RSCFDnCFDGRMCFGHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGRMCFG: <RSCFDn_base> + $04FC_H$
RSCFDnCFDGRMCFGL: <RSCFDn_base> + $04FC_H$,
RSCFDnCFDGRMCFGH: <RSCFDn_base> + $04FE_H$
RSCFDnCFDGRMCFGLL: <RSCFDn_base> + $04FC_H$,
RSCFDnCFDGRMCFGLH: <RSCFDn_base> + $04FD_H$,
RSCFDnCFDGRMCFGHL: <RSCFDn_base> + $04FE_H$,
RSCFDnCFDGRMCFGHH: <RSCFDn_base> + $04FF_H$

Value after reset: $0000\ 0000_H$

Table 14.92 RSCFDnCFDGRMCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	RCMC	Interface Mode Select 0: Classical CAN mode 1: CAN FD mode

Note: RSCANnGRMCFG and RSCFDnCFDGRMCFG are the same register. Set either of these registers.

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Before setting other RS- CANFD registers, set this register.

RCMC Bit

Setting this bit to 1 makes CAN FD mode available. To switch classical CAN mode to CAN FD mode, set the value after reset to all registers and bits allocated to the register map of classical CAN mode and then modify the RSCFDnCFDGRMCFG register.

14.4.3 Details of Channel-Related Registers

14.4.3.1 RSCFDnCFDCmNCFG ─ Channel Nominal Bit Rate Configuration Register (m = 0 to 3)

Access: RSCFDnCFDCmNCFG register can be read/written in 32-bit units.
RSCFDnCFDCmNCFGL, RSCFDnCFDCmNCFGH registers can be read/written in 16-bit units.
RSCFDnCFDCmNCFGLL, RSCFDnCFDCmNCFGLH, RSCFDnCFDCmNCFGHL, RSCFDnCFDCmNCFGHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCmNCFG: <RSCFDn_base> + 0000_H + (10_H × m)
RSCFDnCFDCmNCFGL: <RSCFDn_base> + 0000_H + (10_H × m),

10	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
9 to 0	NBRP[9:0]	Nominal Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings of bit timing parameters, see **Section 14.11.1, Initial Settings**.

NTSEG2[4:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.

Allowed values are 2 Tq to 32 Tq, inclusive.

Set a value smaller than the value of the NTSEG1[6:0] bits.

NTSEG1[6:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.

A value of 4 to 128 Tq is settable.

NSJW[4:0] Bits

These bits specify the resynchronization jump width of nominal bit rate as a Tq value. A value of 1 to 32 Tq is settable. Specify a value equal to or smaller than the NTSEG2[4:0] value.

NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

Set the NBRP[9:0] and DBRP[7:0] bits to the same value for the ordinary and data bit rates and the two bit rates to different values according to the segment values.

14.4.3.2 RSCFDnCFDCmCTR ─ Channel Control Register (m = 0 to 3)

Access: RSCFDnCFDCmCTR register can be read/written in 32-bit units.
RSCFDnCFDCmCTRL, RSCFDnCFDCmCTRH registers can be read/written in 16-bit units.
RSCFDnCFDCmCTRLL, RSCFDnCFDCmCTRLH, RSCFDnCFDCmCTRHL, RSCFDnCFDCmCTRHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCmCTR: <RSCFDn_base> + 0004_H + (10_H × m)
RSCFDnCFDCmCTRL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCFDnCFDCmCTRH: <RSCFDn_base> + 0006_H + (10_H × m)
RSCFDnCFDCmCTRLL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCFDnCFDCmCTRLH: <RSCFDn_base> + 0005_H + (10_H × m),
RSCFDnCFDCmCTRHL: <RSCFDn_base> + 0006_H + (10_H × m),
RSCFDnCFDCmCTRHH: <RSCFDn_base> + 0007_H + (10_H × m)

Value after reset: $0000\ 0005_H$

1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

ROM Bit

When the ROM bit and the CTME bit in the RSCFDnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RSCFDnCFDCmCTR register is 00_B (standard test mode). Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCFDnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register.

When this bit is clear to 0, if any error is detected while the flags of bits 14-8 in the RSCFDnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 3) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01_B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TDCVFIE Bit

When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

SOCOIE Bit

When the SOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

EOCOIE Bit

When the EOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCFDnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCFDnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCFDnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCFDnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCFDnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCFDnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register to 00_H and also clears the BOSTS flag in the RSCFDnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCFDCmCTR register are 00_B (ISO11898-1:2015 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RS-CANFD module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.

Clearing this bit to 0 makes the channel exit channel stop mode.

This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 14.6.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the RS-CANFD module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10_B.

14.4.3.3 RSCFDnCFDCmSTS ─ Channel Status Register (m = 0 to 3)

Access: RSCFDnCFDCmSTS register can be read/written in 32-bit units.
RSCFDnCFDCmSTSL, RSCFDnCFDCmSTSH registers can be read/written in 16-bit units.
RSCFDnCFDCmSTSLL, RSCFDnCFDCmSTSLH, RSCFDnCFDCmSTSHL, RSCFDnCFDCmSTSHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCmSTS: <RSCFDn_base> + 0008_H + (10_H × m)
RSCFDnCFDCmSTSL: <RSCFDn_base> + 0008_H + (10_H × m),
RSCFDnCFDCmSTSH: <RSCFDn_base> + $000A_H$ + (10_H × m)
RSCFDnCFDCmSTSLL: <RSCFDn_base> + 0008_H + (10_H × m),
RSCFDnCFDCmSTSLH: <RSCFDn_base> + 0009_H + (10_H × m),
RSCFDnCFDCmSTSHL: <RSCFDn_base> + $000A_H$ + (10_H × m),
RSCFDnCFDCmSTSHH: <RSCFDn_base> + $000B_H$ + (10_H × m)

Value after reset: $0000\ 0005_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TEC[7:0]								REC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ESIF	COMSTS	RECSTS	TRMSTS	BOSTS	EPSTS	CSLPSTS	CHLTSTS	CRSTSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1
R/W	R	R	R	R	R	R	R	R/W *1	R	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.95 RSCFDnCFDCmSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 9	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
8	ESIF	Error State Indication Flag 0: No CAN FD message whose ESI bit is recessive has been received. 1: At least one CAN FD message whose ESI bit is recessive has been received.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1:2015).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1:2015).

These bits are cleared to 0 in channel reset mode.

ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.

This flag is 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the RS-CANFD module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the RS-CANFD module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel stop mode, and is cleared to 0 when the RS-CANFD module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel halt mode, and is cleared to 0 when the RS-CANFD module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel reset mode, and is cleared to 0 when the RS-CANFD module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the RS-CANFD module transitions from channel reset mode to channel stop mode.

14.4.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0 to 3)

Access: RSCFDnCFDCmERFL register can be read/written in 32-bit units.
RSCFDnCFDCmERFLL, RSCFDnCFDCmERFLH registers can be read/written in 16-bit units.
RSCFDnCFDCmERFLLL, RSCFDnCFDCmERFLLH, RSCFDnCFDCmERFLHL, RSCFDnCFDCmERFLHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCmERFL: <RSCFDn_base> + $000C_H$ + (10_H × m)
RSCFDnCFDCmERFLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCFDnCFDCmERFLH: <RSCFDn_base> + $000E_H$ + (10_H × m)
RSCFDnCFDCmERFLLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCFDnCFDCmERFLLH: <RSCFDn_base> + $000D_H$ + (10_H × m),
RSCFDnCFDCmERFLHL: <RSCFDn_base> + $000E_H$ + (10_H × m),
RSCFDnCFDCmERFLHH: <RSCFDn_base> + $000F_H$ + (10_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	CRCREG[14:0]														
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	ADERR	B0ERR	B1ERR	CERR	AERR	FERR	SERR	ALF	BLF	OVLF	BORF	BOEF	EPF	EWF	BEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.96 RSCFDnCFDCmERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data (CRC length:15 bits) A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.

Table 14.96 RSCFDnCFDCmERFL Register Contents (2/2)

Bit Position	Bit Name	Function
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus is detected. 1: Channel bus is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1:2015) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If an error is detected with all of bits 14-8 of the RSCFDnCFDCmERFL register set to 0 when the ERRD bit of the RSCFDnCFDCmCTR is set to 0 (display only the first error information that occurred) for bits 14-8 of the RSCFDnCFDCmERFL register, the corresponding bit is set to 1.

CRCREG[14:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CAN FD frame is sent or received, the value of CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register is updated. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The RS-CANFD module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the RS-CANFD module returns from the bus off state. However, this flag is not set to 1 if the RS-CANFD module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 3) set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127). This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

14.4.3.5 RSCFDnCFDCmDCFG ─ Channel Data Bit Rate Configuration Register (m = 0 to 3)

Access: RSCFDnCFDCmDCFG register can be read/written in 32-bit units.
RSCFDnCFDCmDCFGL, RSCFDnCFDCmDCFGH registers can be read/written in 16-bit units.
RSCFDnCFDCmDCFGLL, RSCFDnCFDCmDCFGLH, RSCFDnCFDCmDCFGHL, RSCFDnCFDCmDCFGHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCmDCFG: <RSCFDn_base> + 0500_H + (20_H × m)
RSCFDnCFDCmDCFGL: <RSCFDn_base> + 0500_H + (20_H × m),
RSCFDnCFDCmDCFGH: <RSCFDn_base> + 0502_H + (20_H × m)
RSCFDnCFDCmDCFGLL: <RSCFDn_base> + 0500_H + (20_H × m),
RSCFDnCFDCmDCFGLH: <RSCFDn_base> + 0501_H + (20_H × m),
RSCFDnCFDCmDCFGHL: <RSCFDn_base> + 0502_H + (20_H × m),
RSCFDnCFDCmDCFGHH: <RSCFDn_base> + 0503_H + (20_H × m)

Value after reset: $0000\ 0000_H$

15 to 8	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
7 to 0	DBRP[7:0]	Data Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value. For the description and settings of bit timing parameters, see **Section 14.11.1, Initial Settings**.

DSJW[2:0] Bits

These bits specify the resynchronization jump width of data bit rate as a Tq value. A value of 1 to 8 Tq is settable. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.

Allowed values are 2 Tq to 8 Tq, inclusive.

Set a value smaller than or equal to the value of the DTSEG1[3:0] bits.

DTSEG1[3:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.

A value of 2 to 16 Tq is settable.

DBRP[7:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the data bit rate prescaler ((DBRP[7:0]) + 1) becomes CANmTq(D) clock (fCANTQ(D)m). One clock of the CANmTq(D) clock becomes one Time Quantum (Tq).

Be sure to set the NBRP[9:0] and DBRP[7:0] bits to the same value.

When setting the ordinary and data bit rates to different values, change the RSCFDnCFDCmNCFG.NTSEG1 and NTSEG2 bits and the RSCFDnCFDCmDCFG.DTSEG1 and DTSEG2 bits to the desired bit rates respectively.

If the TDCE bit of the RSCFDnCFDCmFDCFG register is 1 (enabling transmitter delay compensation), set the NBRP[9:0] and DBRP[7:0] bits to the same value equal to or less than 1.

14.4.3.6 RSCFDnCFDCmFDCFG ─ Channel CAN FD Configuration Register (m = 0 to 3)

Access: RSCFDnCFDCmFDCFG register can be read/written in 32-bit units.
RSCFDnCFDCmFDCFGL, RSCFDnCFDCmFDCFGH registers can be read/written in 16-bit units.
RSCFDnCFDCmFDCFGLL, RSCFDnCFDCmFDCFGLH, RSCFDnCFDCmFDCFGHL, RSCFDnCFDCmFDCFGHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCmFDCFG: <RSCFDn_base> + 0504_H + (20_H × m)
RSCFDnCFDCmFDCFGL: <RSCFDn_base> + 0504_H + (20_H × m),
RSCFDnCFDCmFDCFGH: <RSCFDn_base> + 0506_H + (20_H × m)
RSCFDnCFDCmFDCFGLL: <RSCFDn_base> + 0504_H + (20_H × m),
RSCFDnCFDCmFDCFGLH: <RSCFDn_base> + 0505_H + (20_H × m),
RSCFDnCFDCmFDCFGHL: <RSCFDn_base> + 0506_H + (20_H × m),
RSCFDnCFDCmFDCFGHH: <RSCFDn_base> + 0507_H + (20_H × m)

Value after reset: $0000\ 0000_H$

Table 14.98 RSCFDnCFDCmFDCFG Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
29	REFE	Reception data edge filter enable bit 0: Reception data edge filter disabled 1: Reception data edge filter enabled
28	FDOE	FD-only mode enable bit 0: FD-only mode disabled 1: FD-only mode enabled
27	TMME	Transmit Buffer Merge Mode Enable 0: Transmit buffer merge mode is disabled. 1: Transmit buffer merge mode is enabled.
26	GWBRS	Gateway BRS 0: A frame is transmitted with the BRS bit in the received frame set to 0. 1: A frame is transmitted with the BRS bit in the received frame set to 1.
25	GWFDF	Gateway FDF 0: A frame is transmitted regarding the received frame as a classical CAN frame. 1: A frame is transmitted regarding the received frame as a CAN FD frame.
24	GWEN	CAN-CAN FD Gateway Enable 0: CAN-CAN FD gateway is disabled. 1: CAN-CAN FD gateway is enabled.
23	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
22 to 16	TDCO[6:0]	Transmitter Delay Compensation Offset These bits are set to the transmitter delay compensation offset value.
15 to 11	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
10	ESIC	Error State Display Mode Select 0: Always transmits the error state of the channel as the ESI bit in the frame. 1: Transmits the error state of the message buffer as the ESI bit in the frame when the channel is not in the error passive state. Transmits the error state of the channel as the ESI bit in the frame when the channel is in the error passive state.
9	TDCE	Transmitter Delay Compensation Enable 0: Transmitter delay compensation is disabled. 1: Transmitter delay compensation is enabled.
8	TDCOC	Transmitter Delay Compensation Measurement Select 0: Measurement and offset 1: Only offset
7 to 3	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
2 to 0	EOCCFG[2:0]	Error Occurrence Counting Method Select b2 b1 b0 0 0 0: All transmit messages and receive messages 0 0 1: All transmit messages 0 1 0: All receive messages 0 1 1: Setting prohibited 1 0 0: Only data phase of transmitted or received CAN FD message 1 0 1: Only data phase of transmitted CAN FD message 1 1 0: Only data phase of received CAN FD message 1 1 1: Setting prohibited

REFE Bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge. Modify this bit only in channle reset mode.

FDOE Bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CAN FD frame will be sent regardless of the settings to the CFFDF bit in the RSCFDnCFDCFFDCSTSk register or the TMFDF bit in the RSCFDnCFDTMFDCTRp register. When a Classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

TMME Bit

Setting this bit to 1 enables transmit buffer merge mode. Modify this bit only in channel reset mode or channel halt mode.

GWBRS Bit

When the GWEN bit is 1, the BRS bit in a CAN FD frame to be transmitted by the gateway function is set. Write 0 to this bit to clear the GWBRS bit to 0. Modify this bit only in channel reset mode.

GWFDF Bit

When the GWEN bit is 1, the FDF bit in a CAN FD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RSCFDnCFDCFCCk register set to 10_B (gateway mode).

Setting this bit to 1 enables the CAN-CAN FD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWFDF bit and the GWBRS bit. When the DLC value in the received classical CAN frame is 1001_B or more and the GWFDF bit is 1 (CAN FD frame), the DLC value is replaced with 1000_B.

While this bit is 1, do not perform routing the following frames by using the gateway function.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

While this bit is 1, the following frame shoudl be transmitted in the channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frame should be transmitted.
- When GWFDF bit is set to 1, only CAN FD frame should be transmitted.

Modify this bit only in channel reset mode.

Table 14.99 shows the settings and formats of transmit frame and receive frame while the CAN-CAN FD gateway is enabled.

Table 14.99 Operation when the CAN-CAN FD Gateway is Enabled

Receive Frame				Transmit Frame		
Format	BRS Bit	Received DLC Value	GWFDF Bit	Format	BRS Bit	DLC Value to be Transmitted
Classical CAN	None	DLC ≤ 1000_B	0	Classical CAN	None	Not replaced
		DLC > 1000_B				
CAN FD	Arbitrary	DLC ≤ 1000_B				
Classical CAN	None	DLC ≤ 1000_B	1	CAN FD	According to GWBRS bit setting	Not replaced
		DLC > 1000_B				Replaced with 1000_B
CAN FD	Arbitrary	DLC ≤ 1000_B				Not replaced

TDCO[6:0] Bits

These bits are set to the SSP offset value. How to use this value depends on the TDCOC bit in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded to the nearest integer Tq).

When the TDCOC bit is 1, the transmitter delay compensation result equals to the TDCO[6:0] value.

The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

ESIC Bit

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode.

Table 14.100 ESI Value to be Transmitted

ESIC Bit	Channel Status	ESI Value to be Transmitted
0	Error active	0 (error active node)
	Error passive	1 (error passive node)
1	Error active	ESI value set in the transmit/receive FIFO buffer or transmit buffer (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register)
	Error passive	1 (error passive node)

TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

TDCOC Bit

When this bit is 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is 1, the SSP position is defined only by the SSP offset value.

Modify this bit only in channel reset mode or channel halt mode.

EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

14.4.3.7 RSCFDnCFDCmFDCTR ─ Channel CAN FD Control Register (m = 0 to 3)

Access: RSCFDnCFDCmFDCTR register can be read/written in 32-bit units.
RSCFDnCFDCmFDCTRL, RSCFDnCFDCmFDCTRH registers can be read/written in 16-bit units.
RSCFDnCFDCmFDCTRLL, RSCFDnCFDCmFDCTRLH, RSCFDnCFDCmFDCTRHL, RSCFDnCFDCmFDCTRHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCmFDCTR: <RSCFDn_base> + 0508_H + (20_H × m)
RSCFDnCFDCmFDCTRL: <RSCFDn_base> + 0508_H + (20_H × m),
RSCFDnCFDCmFDCTRH: <RSCFDn_base> + $050A_H$ + (20_H × m)
RSCFDnCFDCmFDCTRLL: <RSCFDn_base> + 0508_H + (20_H × m),
RSCFDnCFDCmFDCTRLH: <RSCFDn_base> + 0509_H + (20_H × m),
RSCFDnCFDCmFDCTRHL: <RSCFDn_base> + $050A_H$ + (20_H × m),
RSCFDnCFDCmFDCTRHH: <RSCFDn_base> + $050B_H$ + (20_H × m)

Value after reset: $0000\ 0000_H$

Table 14.101 RSCFDnCFDCmFDCTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
1	SOCCLR	Successful Occurrence Counter Clear Setting the SOCCLR bit to 1 clears the successful occurrence counter. This bit is always read as 0.
0	EOCCLR	Error Occurrence Counter Clear Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0.

SOCCLR Bit

Setting this bit to 1 clears the successful occurrence counter (SOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

14.4.3.8 RSCFDnCFDCmFDSTS – Channel CAN FD Status Register (m = 0 to 3)

Access: RSCFDnCFDCmFDSTS register can be read/written in 32-bit units.
RSCFDnCFDCmFDSTSL, RSCFDnCFDCmFDSTSH registers can be read/written in 16-bit units.
RSCFDnCFDCmFDSTSLL, RSCFDnCFDCmFDSTSLH, RSCFDnCFDCmFDSTSHL, RSCFDnCFDCmFDSTSHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCmFDSTS: <RSCFDn_base> + $050C_H$ + (20_H × m)
RSCFDnCFDCmFDSTSL: <RSCFDn_base> + $050C_H$ + (20_H × m),
RSCFDnCFDCmFDSTSH: <RSCFDn_base> + $050E_H$ + (20_H × m)
RSCFDnCFDCmFDSTSLL: <RSCFDn_base> + $050C_H$ + (20_H × m),
RSCFDnCFDCmFDSTSLH: <RSCFDn_base> + $050D_H$ + (20_H × m),
RSCFDnCFDCmFDSTSHL: <RSCFDn_base> + $050E_H$ + (20_H × m),
RSCFDnCFDCmFDSTSHH: <RSCFDn_base> + $050F_H$ + (20_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R/W *1	R/W *1	R/W *1	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.102 RSCFDnCFDCmFDSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	SOC[7:0]	Successful Occurrence Counter The successful occurrence counter value can be read.
23 to 16	EOC[7:0]	Error Occurrence Counter The error occurrence counter value can be read.
15 to 10	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
9	SOCO	Successful Occurrence Counter Overflow Flag 0: The successful occurrence counter does not overflow. 1: The successful occurrence counter has overflowed.
8	EOCO	Error Occurrence Counter Overflow Flag 0: The error occurrence counter does not overflow. 1: The error occurrence counter has overflowed.
7	TDCVF	Transmitter Delay Compensation Violation Flag 0: No transmitter delay compensation violation is present. 1: A transmitter delay compensation violation is present.
6 to 0	TDCR[6:0]	Transmitter Delay Compensation Result Status The transmitter delay compensation result can be read.

SOC[7:0] Bits

These bits show the successful occurrence counter value. The successful occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches FF_H. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RSCFDnCFDCmCTR register. These bits are 0 in channel reset mode.

EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register. This counter stops counting when it reaches FF_H.

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RSCFDnCFDCmCTR register. These bits are 0 in channel reset mode.

SOCO Flag

This bit indicates that successful occurrence counter overflow has occurred.

This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached FF_H. This flag is 0 in channel reset mode.

EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.

This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register when the EOC[7:0] value has reached FF_H. This flag is 0 in channel reset mode.

TDCVF Flag

This bit indicates violation of transmitter delay compensation.

The transmit data is compared with the reception CAN bus level delayed due to the transceiver's loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CANm bit times - 2 fCAN (CANm bit time is the value of data bit rate).

This flag is 0 in channel reset mode.

TDCR[6:0] Flags

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).

This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

This flag is updated at a falling edge between the FDF bit and res bit when the TDCE bit (transmitter delay compensation enable) in the RSCFDnCFDCmFDCFG register is set to 1 and also the TDCOC bit (transmitter delay compensation measurement select) in the RSCFDnCFDCmFDCFG register is set to 0.

This flag is 0 in channel reset mode.

NOTE

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

14.4.3.9 RSCFDnCFDCmFDCRC ─ Channel CAN FD CRC Register (m = 0 to 3)

Access: RSCFDnCFDCmFDCRC register can be read only in 32-bit units.
RSCFDnCFDCmFDCRCL, RSCFDnCFDCmFDCRCH registers can be read only in 16-bit units.
RSCFDnCFDCmFDCRCLL, RSCFDnCFDCmFDCRCLH, RSCFDnCFDCmFDCRCHL, RSCFDnCFDCmFDCRCHH registers can be read only in 8-bit units.

Address: RSCFDnCFDCmFDCRC: <RSCFDn_base> + 0510_H + (20_H × m)
RSCFDnCFDCmFDCRCL: <RSCFDn_base> + 0510_H + (20_H × m)
RSCFDnCFDCmFDCRCH: <RSCFDn_base> + 0512_H + (20_H × m)
RSCFDnCFDCmFDCRCLL: <RSCFDn_base> + 0510_H + (20_H × m)
RSCFDnCFDCmFDCRCLH: <RSCFDn_base> + 0511_H + (20_H × m)
RSCFDnCFDCmFDCRCHL: <RSCFDn_base> + 0512_H + (20_H × m)
RSCFDnCFDCmFDCRCHH: <RSCFDn_base> + 0513_H + (20_H × m)

Value after reset: $0000\ 0000_H$

	CRCREG[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.103 RSCFDnCFDCmFDCRC Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after a reset is read.
27 to 24	SCNT[3:0]	Stuff count bit Indicate a value of the stuff count in a CAN FD frame. Bits 25-27 indicates the Gray-coded value of the stuff bit count modulo 8 in the transsmitted/received frames. Bit 24 indicates an even parity value of bits 25-27.
23 to 21	Reserved	When read, the value after a reset is read.
20 to 0	CRCREG[20:0]	CRC Calculation Data (CRC Length:17 Bit or 21 Bit) These bits show the CRC value calculated based on the transmit message or receive message. When the CRC length is 17 bits, bits b20 to b17 are read as 0.

SCNT[3:0] flags

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CAN FD frame can be read if a message transmitted/received is a CAN FD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. This flag is updated at the first bit in the CRC field of the CAN FD frame. These bits are cleared to 0 in channel reset mode.

CRCREG[20:0] flags

When the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CAN FD frame (CRC length = 17 or 21 bits), these flags are updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received, the CRCREG[14:0] value in the RSCFDnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0.

14.4.4 Details of Global-Related Registers

14.4.4.1 RSCFDnCFDGCFG ─ Global Configuration Register

Access: RSCFDnCFDGCFG register can be read/written in 32-bit units.
RSCFDnCFDGCFGL, RSCFDnCFDGCFGH registers can be read/written in 16-bit units.
RSCFDnCFDGCFGLL, RSCFDnCFDGCFGLH, RSCFDnCFDGCFGHL, RSCFDnCFDGCFGHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGCFG: <RSCFDn_base> + 0084_H
RSCFDnCFDGCFGL: <RSCFDn_base> + 0084_H, RSCFDnCFDGCFGH: <RSCFDn_base> + 0086_H

Table 14.104 RSCFDnCFDGCFG Register Contents (2/2)

Bit Position	Bit Name	Function
11 to 8	TSP[3:0]	Timestamp Clock Source Division b11 b10 b9 b8 0 0 0 0: Not divided 0 0 0 1: Divided by 2 0 0 1 0: Divided by 4 0 0 1 1: Divided by 8 0 1 0 0: Divided by 16 0 1 0 1: Divided by 32 0 1 1 0: Divided by 64 0 1 1 1: Divided by 128 1 0 0 0: Divided by 256 1 0 0 1: Divided by 512 1 0 1 0: Divided by 1024 1 0 1 1: Divided by 2048 1 1 0 0: Divided by 4096 1 1 0 1: Divided by 8192 1 1 1 0: Divided by 16384 1 1 1 1: Divided by 32768
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	CMPOC	Payload Overflow Mode Select 0: No message is stored. 1: Messages are stored and payloads exceeding the buffer size are discarded.
4	DCS	CAN Clock Source Select 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Modify the RSCFDnCFDGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 14.8.3.1, Interval Transmission Function**.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CAN FD frames.

TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.

When this bit is 0, the received message in which the payload overflows is not stored in the buffer.

When this bit is 1, the received message in which the payload overflows is stored in the buffer. In this case, the value of the DLC field, either that in the received message or from the receive rule table, depending on the value of the DRE bit, is stored in the buffer with the payload truncated to fit the available space.

The buffer's payload storage size is set by the following bits.

- Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to 0000_B before clearing the DCE bit in the RSCFDnCFDGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1:2015 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

14.4.4.2 RSCFDnCFDGCTR – Global Control Register

Access: RSCFDnCFDGCTR register can be read/written in 32-bit units.
RSCFDnCFDGCTRL, RSCFDnCFDGCTRH registers can be read/written in 16-bit units.
RSCFDnCFDGCTRLL, RSCFDnCFDGCTRLH, RSCFDnCFDGCTRHL, RSCFDnCFDGCTRHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGCTR: <RSCFDn_base> + 0088_H
RSCFDnCFDGCTRL: <RSCFDn_base> + 0088_H, RSCFDnCFDGCTRH: <RSCFDn_base> + $008A_H$
RSCFDnCFDGCTRLL: <RSCFDn_base> + 0088_H, RSCFDnCFDGCTRLH: <RSCFDn_base> + 0089_H,
RSCFDnCFDGCTRHL: <RSCFDn_base> + $008A_H$, RSCFDnCFDGCTRHH: <RSCFDn_base> + $008B_H$

Value after reset: $0000\ 0005_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.105 RSCFDnCFDGCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 12	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
11	CMPOFIE	Payload Overflow Interrupt Enable 0: A payload overflow interrupt is disabled. 1: A payload overflow interrupt is enabled.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCFDnCFDGTSC register is cleared to 0000_H.

CMPOFIE Bit

When the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request occurs. Modify this bit only in global reset mode.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RS-CANFD module into global stop mode.

Clearing this bit to 0 makes the RS-CANFD module leave from global stop mode.

This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 14.6.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

14.4.4.3 RSCFDnCFDGSTS – Global Status Register

Access: RSCFDnCFDGSTS register can be read only in 32-bit units.
RSCFDnCFDGSTSL, RSCFDnCFDGSTSH registers can be read only in 16-bit units.
RSCFDnCFDGSTSLL, RSCFDnCFDGSTSLH, RSCFDnCFDGSTSHL, RSCFDnCFDGSTSHH registers can be read only in 8-bit units.

Address: RSCFDnCFDGSTS: <RSCFDn_base> + $008C_H$
RSCFDnCFDGSTSL: <RSCFDn_base> + $008C_H$, RSCFDnCFDGSTSH: <RSCFDn_base> + $008E_H$
RSCFDnCFDGSTSLL: <RSCFDn_base> + $008C_H$, RSCFDnCFDGSTSLH: <RSCFDn_base> + $008D_H$
RSCFDnCFDGSTSHL: <RSCFDn_base> + $008E_H$, RSCFDnCFDGSTSHH: <RSCFDn_base> + $008F_H$

Value after reset: $0000\ 000D_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.106 RSCFDnCFDGSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global stop mode, and is cleared to 0 when the RS-CANFD module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global test mode, and is cleared to 0 when the RS-CANFD module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global reset mode, and is cleared to 0 when the RS-CANFD module has exited global reset mode. This flag remains 1 even when the RS-CANFD module has transitioned from global reset mode to global stop mode.

14.4.4.4 RSCFDnCFDGERFL – Global Error Flag Register

Access: RSCFDnCFDGERFL register can be read/written in 32-bit units.
RSCFDnCFDGERFLL, RSCFDnCFDGERFLH registers can be read/written in 16-bit units.
RSCFDnCFDGERFLLL, RSCFDnCFDGERFLLH, RSCFDnCFDGERFLHL, RSCFDnCFDGERFLHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGERFL: <RSCFDn_base> + 0090_H
RSCFDnCFDGERFLL: <RSCFDn_base> + 0090_H, RSCFDnCFDGERFLH: <RSCFDn_base> + 0092_H
RSCFDnCFDGERFLLL: <RSCFDn_base> + 0090_H, RSCFDnCFDGERFLLH: <RSCFDn_base> + 0091_H
RSCFDnCFDGERFLHL: <RSCFDn_base> + 0092_H, RSCFDnCFDGERFLHH: <RSCFDn_base> + 0093_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	EEF3	EEF2	EEF1	EEF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R/W *1	R/W *1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CMPOF	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R	R	R/W *1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.107 RSCFDnCFDGERFL Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
19	EEF3	ECC Error Flag for Channel 3 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
18	EEF2	ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
17	EEF1	ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
16	EEF0	ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
15 to 4	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset
3	CMPOF	Payload Overflow Flag 0: No payload overflow has occurred. 1: A payload overflow has occurred.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

EEFm Flag

When a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 3), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

CMPOF Flag

When a payload overflow occurs in any of channel m (m = 0 to 3), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register (m = 0 to 3) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCFDnCFDCFSTSk register (k = 0 to 11) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

14.4.4.5 RSCFDnCFDGTSC ─ Global Timestamp Counter Register

Access: RSCFDnCFDGTSC register can be read only in 32-bit units.
RSCFDnCFDGTSCL, RSCFDnCFDGTSCH registers can be read only in 16-bit units.

Address: RSCFDnCFDGTSC: <RSCFDn_base> + 0094_H
RSCFDnCFDGTSCL: <RSCFDn_base> + 0094_H, RSCFDnCFDGTSCH: <RSCFDn_base> + 0096_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.108 RSCFDnCFDGTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCFDnCFDGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RS-CANFD module has transitioned to global operating mode.
  This counter stops counting when the RS-CANFD module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm nominal bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

14.4.4.6 RSCFDnCFDGTINTSTS0 ─ Global TX Interrupt Status Register 0

Access: RSCFDnCFDGTINTSTS0 register can be read only in 32-bit units.
RSCFDnCFDGTINTSTS0L, RSCFDnCFDGTINTSTS0H registers can be read only in 16-bit units.
RSCFDnCFDGTINTSTS0LL, RSCFDnCFDGTINTSTS0LH, RSCFDnCFDGTINTSTS0HL,
RSCFDnCFDGTINTSTS0HH registers can be read only in 8-bit units.

Address: RSCFDnCFDGTINTSTS0: <RSCFDn_base> + 0460_H
RSCFDnCFDGTINTSTS0L: <RSCFDn_base> + 0460_H, RSCFDnCFDGTINTSTS0H: <RSCFDn_base> + 0462_H
RSCFDnCFDGTINTSTS0LL: <RSCFDn_base> + 0460_H, RSCFDnCFDGTINTSTS0LH: <RSCFDn_base> + 0461_H,
RSCFDnCFDGTINTSTS0HL: <RSCFDn_base> + 0462_H, RSCFDnCFDGTINTSTS0HH: <RSCFDn_base> + 0463_H

Value after reset: $0000\ 0000_H$

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 14.109 RSCFDnCFDGTINTSTS0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after a reset is read.
28	THIF3	Channel 3 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
27	CFTIF3	Channel 3 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
26	TQIF3	Channel 3 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
25	TAIF3	Channel 3 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
24	TSIF3	Channel 3 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

Table 14.109 RSCFDnCFDGTINTSTS0 Register Contents (2/2)

Bit Position	Bit Name	Function
23 to 21	Reserved	When read, the value after a reset is read.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	When read, the value after a reset is read.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	When read, the value after a reset is read.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

14.4.4.7 RSCFDnCFDGFDCFG ─ Global FD Configuration Register

Access: RSCFDnCFDGFDCFG register can be read/written in 32-bit units.
RSCFDnCFDGFDCFG L, RSCFDnCFDGFDCFG H registers can be read/written in 16-bit units.
RSCFDnCFDGFDCFG LL, RSCFDnCFDGFDCFG LH, RSCFDnCFDGFDCFG HL, RSCFDnCFDGFDCFG HH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGFDCFG: <RSCFDn_base> + 0474_H
RSCFDnCFDGFDCFG L: <RSCFDn_base> + 0474_H, RSCFDnCFDGFDCFG H: <RSCFDn_base> + 0476_H
RSCFDnCFDGFDCFG LL: <RSCFDn_base> + 0474_H, RSCFDnCFDGFDCFG LH: <RSCFDn_base> + 0475_H,
RSCFDnCFDGFDCFG HL: <RSCFDn_base> + 0476_H, RSCFDnCFDGFDCFG HH: <RSCFDn_base> + 0477_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 14.110 RSCFDnCFDGFDCFG Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
9, 8	TSCCFG[1:0]	Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Captured at a sample point of the res bit.*1 1 1: Setting prohibited
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	RPED	Protocol exception event detection disabled bit 0: Protocol exception event detection enabled 1: Protocol exception event detection disabled

Note 1. When a Classical CAN frame is transmitted/received, a time-stamp value will be captured at the sample point in the SOF bit.

TSCCFG Bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

RPED Bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame will be output. Modify this bit only in global reset mode.

14.4.4.8 RSCFDnCFDGCRCCFG ─ Global CRC Configuration Register

Access: RSCFDnCFDGCRCCFG register can be read/written in 32-bit units.
RSCFDnCFDGCRCCFG L, RSCFDnCFDGCRCCFG H registers can be read/written in 16-bit units.
RSCFDnCFDGCRCCFG LL, RSCFDnCFDGCRCCFG LH, RSCFDnCFDGCRCCFG HL, RSCFDnCFDGCRCCFG HH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGCRCCFG: <RSCFDn_base> + 0478_H
RSCFDnCFDGCRCCFG L: <RSCFDn_base> + 0478_H, RSCFDnCFDGCRCCFG H: <RSCFDn_base> + $047A_H$
RSCFDnCFDGCRCCFG LL: <RSCFDn_base> + 0478_H, RSCFDnCFDGCRCCFG LH: <RSCFDn_base> + 0479_H,
RSCFDnCFDGCRCCFG HL: <RSCFDn_base> + $047A_H$, RSCFDnCFDGCRCCFG HH: <RSCFDn_base> + $047B_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 14.111 RSCFDnCFDGCRCCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	NIE	ISO11898-1:2015 protocol switching bit 0: Supports CAN FD that conforms to the ISO11898-1:2015 protocol. 1: Supports CAN FD that conforms to the ISO/CD 11898-1 (2014-08-12 version) protocol (non-compliant to ISO11898-1:2015).

NIE Bit

A 1 in this bit causes the product to support CAN FD that conforms to the ISO/CD 11898-1 (2014-08-12 version). In this case, the product is non-compliant to the ISO11898-1:2015 protocol. Modify this bit only in global reset mode. This bit is set to 0 when the RCMC bit of the RSCFDn(CFD)GRMCFG register is set to 0 (classical CAN mode).

14.4.5 Details of Receive Rule-Related Registers

14.4.5.1 RSCFDnCFDGAFLECTR ─ Receive Rule Entry Control Register

Access: RSCFDnCFDGAFLECTR register can be read/written in 32-bit units.
RSCFDnCFDGAFLECTRL, RSCFDnCFDGAFLECTRH registers can be read/written in 16-bit units.
RSCFDnCFDGAFLECTRLL, RSCFDnCFDGAFLECTRLH, RSCFDnCFDGAFLECTRHL, RSCFDnCFDGAFLECTRHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGAFLECTR: <RSCFDn_base> + 0098_H
RSCFDnCFDGAFLECTRL: <RSCFDn_base> + 0098_H, RSCFDnCFDGAFLECTRH: <RSCFDn_base> + $009A_H$
RSCFDnCFDGAFLECTRLL: <RSCFDn_base> + 0098_H, RSCFDnCFDGAFLECTRLH: <RSCFDn_base> + 0099_H
RSCFDnCFDGAFLECTRHL: <RSCFDn_base> + $009A_H$, RSCFDnCFDGAFLECTRHH: <RSCFDn_base> + $009B_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	AFLDAE	—	—	—	AFLPN[4:0]

R/W	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 14.112 RSCFDnCFDGAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected from a range of page 0 (00000_B) to page 15 (01111_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 01111_B.

14.4.5.2 RSCFDnCFDGAFLCFG0 – Receive Rule Configuration Register 0

Access: RSCFDnCFDGAFLCFG0 register can be read/written in 32-bit units.
RSCFDnCFDGAFLCFG0L, RSCFDnCFDGAFLCFG0H registers can be read/written in 16-bit units.
RSCFDnCFDGAFLCFG0LL, RSCFDnCFDGAFLCFG0LH, RSCFDnCFDGAFLCFG0HL, RSCFDnCFDGAFLCFG0HH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGAFLCFG0: <RSCFDn_base> + $009C_H$
RSCFDnCFDGAFLCFG0L: <RSCFDn_base> + $009C_H$, RSCFDnCFDGAFLCFG0H: <RSCFDn_base> + $009E_H$
RSCFDnCFDGAFLCFG0LL: <RSCFDn_base> + $009C_H$, RSCFDnCFDGAFLCFG0LH: <RSCFDn_base> + $009D_H$,
RSCFDnCFDGAFLCFG0HL: <RSCFDn_base> + $009E_H$, RSCFDnCFDGAFLCFG0HH: <RSCFDn_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RNC0[7:0]								RNC1[7:0]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 14.113 RSCFDnCFDGAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules exclusively used for channel 2.
7 to 0	RNC3[7:0]	Number of Rules for Channel 3 Set the number of receive rules exclusively used for channel 3.

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC3[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 3 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

14.4.5.3 RSCFDnCFDGAFLIDj ─ Receive Rule ID Register (j = 0 to 15)

Access: RSCFDnCFDGAFLIDj register can be read/written in 32-bit units.
RSCFDnCFDGAFLIDjL, RSCFDnCFDGAFLIDjH registers can be read/written in 16-bit units.
RSCFDnCFDGAFLIDjLL, RSCFDnCFDGAFLIDjLH, RSCFDnCFDGAFLIDjHL, RSCFDnCFDGAFLIDjHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGAFLIDj: <RSCFDn_base> + 1000_H + (10_H × j)
RSCFDnCFDGAFLIDjL: <RSCFDn_base> + 1000_H + (10_H × j)
RSCFDnCFDGAFLIDjH: <RSCFDn_base> + 1002_H + (10_H × j)
RSCFDnCFDGAFLIDjLL: <RSCFDn_base> + 1000_H + (10_H × j)
RSCFDnCFDGAFLIDjLH: <RSCFDn_base> + 1001_H + (10_H × j)
RSCFDnCFDGAFLIDjHL: <RSCFDn_base> + 1002_H + (10_H × j)
RSCFDnCFDGAFLIDjHH: <RSCFDn_base> + 1003_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.114 RSCFDnCFDGAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

14.4.5.4 RSCFDnCFDGAFLMj ─ Receive Rule Mask Register (j = 0 to 15)

Access: RSCFDnCFDGAFLMj register can be read/written in 32-bit units.
RSCFDnCFDGAFLMjL, RSCFDnCFDGAFLMjH registers can be read/written in 16-bit units.
RSCFDnCFDGAFLMjLL, RSCFDnCFDGAFLMjLH, RSCFDnCFDGAFLMjHL, RSCFDnCFDGAFLMjHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGAFLMj: <RSCFDn_base> + 1004_H + (10_H × j)
RSCFDnCFDGAFLMjL: <RSCFDn_base> + 1004_H + (10_H × j)
RSCFDnCFDGAFLMjH: <RSCFDn_base> + 1006_H + (10_H × j)
RSCFDnCFDGAFLMjLL: <RSCFDn_base> + 1004_H + (10_H × j)
RSCFDnCFDGAFLMjLH: <RSCFDn_base> + 1005_H + (10_H × j)
RSCFDnCFDGAFLMjHL: <RSCFDn_base> + 1006_H + (10_H × j)
RSCFDnCFDGAFLMjHH: <RSCFDn_base> + 1007_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Table 14.115 RSCFDnCFDGAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared.
29	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCFDnCFDGAFLMj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnCFDGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

14.4.5.5 RSCFDnCFDGAFLP0_j ─ Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCFDnCFDGAFLP0_j register can be read/written in 32-bit units.
RSCFDnCFDGAFLP0_jL, RSCFDnCFDGAFLP0_jH registers can be read/written in 16-bit units.
RSCFDnCFDGAFLP0_jLL, RSCFDnCFDGAFLP0_jLH, RSCFDnCFDGAFLP0_jHL, RSCFDnCFDGAFLP0_jHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGAFLP0_j: <RSCFDn_base> + 1008_H + (10_H × j)
RSCFDnCFDGAFLP0_jL: <RSCFDn_base> + 1008_H + (10_H × j),
RSCFDnCFDGAFLP0_jH: <RSCFDn_base> + $100A_H$ + (10_H × j)
RSCFDnCFDGAFLP0_jLL: <RSCFDn_base> + 1008_H + (10_H × j),
RSCFDnCFDGAFLP0_jLH: <RSCFDn_base> + 1009_H + (10_H × j),
RSCFDnCFDGAFLP0_jHL: <RSCFDn_base> + $100A_H$ + (10_H × j),
RSCFDnCFDGAFLP0_jHH: <RSCFDn_base> + $100B_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Table 14.116 RSCFDnCFDGAFLP0_j Register Contents

Bit Position	Bit Name	Function
31 to 28	GAFLDLC[3:0]	Receive Rule DLC

b31	b30	b29	b28	Classical CAN Frame	CAN FD Frame
0	0	0	0	No DLC check	
0	0	0	1	1 data byte	
0	0	1	0	2 data bytes	
0	0	1	1	3 data bytes	
0	1	0	0	4 data bytes	
0	1	0	1	5 data bytes	
0	1	1	0	6 data bytes	
0	1	1	1	7 data bytes	
1	0	0	0	8 data bytes	
1	0	0	1	8 data bytes	12 data bytes
1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

27 to 16	GAFLPTR[11:0]	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.

Modify the RSCFDnCFDGAFLP0_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCFDnCFDRMNB register.

14.4.5.6 RSCFDnCFDGAFLP1_j ─ Receive Rule Pointer 1 Register (j = 0 to 15)

Access: RSCFDnCFDGAFLP1_j register can be read/written in 32-bit units.
RSCFDnCFDGAFLP1_jL, RSCFDnCFDGAFLP1_jH registers can be read/written in 16-bit units.
RSCFDnCFDGAFLP1_jLL, RSCFDnCFDGAFLP1_jLH, RSCFDnCFDGAFLP1_jHL, RSCFDnCFDGAFLP1_jHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGAFLP1_j: <RSCFDn_base> + $100C_H$ + (10_H × j)
RSCFDnCFDGAFLP1_jL: <RSCFDn_base> + $100C_H$ + (10_H × j),
RSCFDnCFDGAFLP1_jH: <RSCFDn_base> + $100E_H$ + (10_H × j)
RSCFDnCFDGAFLP1_jLL: <RSCFDn_base> + $100C_H$ + (10_H × j),
RSCFDnCFDGAFLP1_jLH: <RSCFDn_base> + $100D_H$ + (10_H × j),
RSCFDnCFDGAFLP1_jHL: <RSCFDn_base> + $100E_H$ + (10_H × j),
RSCFDnCFDGAFLP1_jHH: <RSCFDn_base> + $100F_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.117 RSCFDnCFDGAFLP1_j Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
19 to 8	GAFLFDP[19:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCFDnCFDGAFLP1_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP [19:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) are selectable.

14.4.6 Details of Receive Buffer-Related Registers

14.4.6.1 RSCFDnCFDRMNB ─ Receive Buffer Number Register

Access: RSCFDnCFDRMNB register can be read/written in 32-bit units.
RSCFDnCFDRMNBL, RSCFDnCFDRMNBH registers can be read/written in 16-bit units.
RSCFDnCFDRMNBLL, RSCFDnCFDRMNBLH, RSCFDnCFDRMNBHL, RSCFDnCFDRMNBHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDRMNB: <RSCFDn_base> + $00A4_H$
RSCFDnCFDRMNBL: <RSCFDn_base> + $00A4_H$, RSCFDnCFDRMNBH: <RSCFDn_base> + $00A6_H$
RSCFDnCFDRMNBLL: <RSCFDn_base> + $00A4_H$, RSCFDnCFDRMNBLH: <RSCFDn_base> + $00A5_H$
RSCFDnCFDRMNBHL: <RSCFDn_base> + $00A6_H$, RSCFDnCFDRMNBHH: <RSCFDn_base> + $00A7_H$

Value after reset: $0000\ 0000_H$

Table 14.118 RSCFDnCFDRMNB Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
9, 8	RMPLS[1:0]	Receive Buffer Payload Storage Size Select b9 b8 0 0: 8 bytes 0 1: 12 bytes 1 0: 16 bytes 1 1: 20 bytes
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 64.

Modify the RSCFDnCFDRMNB register only in global reset mode.

RMPLS[1:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting these bits all to 0 makes receive buffers unavailable.

14.4.6.2 RSCFDnCFDRMNDy ─ Receive Buffer New Data Register (y = 0, 1)

Access: RSCFDnCFDRMNDy register can be read/written in 32-bit units.
RSCFDnCFDRMNDyL, RSCFDnCFDRMNDyH registers can be read/written in 16-bit units.
RSCFDnCFDRMNDyLL, RSCFDnCFDRMNDyLH, RSCFDnCFDRMNDyHL, RSCFDnCFDRMNDyHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDRMNDy: <RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCFDnCFDRMNDyL: <RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCFDnCFDRMNDyH: <RSCFDn_base> + $00AA_H$ + (04_H × y)
RSCFDnCFDRMNDyLL: <RSCFDn_base> + $00A8_H$ + (04_H × y)

Table 14.119 RSCFDnCFDRMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 63)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[1:0] value in the RSCFDnCFDRMNB register is 00_B (8 bytes), the message storing time is 12 pclk clock cycles. When the RMPLS[1:0] value is 11_B (20 bytes), the message storing time is 18 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size).

These flags are cleared to 0 in global reset mode.

14.4.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 63)

Access: RSCFDnCFDRMIDq register can be read only in 32-bit units.
RSCFDnCFDRMIDqL, RSCFDnCFDRMIDqH registers can be read only in 16-bit units.
RSCFDnCFDRMIDqLL, RSCFDnCFDRMIDqLH, RSCFDnCFDRMIDqHL, RSCFDnCFDRMIDqHH registers can be read only in 8-bit units.

Address: RSCFDnCFDRMIDq: <RSCFDn_base> + 2000_H + (20_H × q)
RSCFDnCFDRMIDqL: <RSCFDn_base> + 2000_H + (20_H × q)
RSCFDnCFDRMIDqH: <RSCFDn_base> + 2002_H + (20_H × q)
RSCFDnCFDRMIDqLL: <RSCFDn_base> + 2000_H + (20_H × q)
RSCFDnCFDRMIDqLH: <RSCFDn_base> + 2001_H + (20_H × q)
RSCFDnCFDRMIDqHL: <RSCFDn_base> + 2002_H + (20_H × q)
RSCFDnCFDRMIDqHH: <RSCFDn_base> + 2003_H + (20_H × q)

Value after reset: $0000\ 0000_H$

Table 14.120 RSCFDnCFDRMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR/RRS • When the received message is a classical CAN frame 0: Data frame 1: Remote frame • When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	Reserved	When read, the value after a reset is read.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

14.4.6.4 RSCFDnCFDRMPTRq ─ Receive Buffer Pointer Register (q = 0 to 63)

Access: RSCFDnCFDRMPTRq register can be read only in 32-bit units.
RSCFDnCFDRMPTRqL, RSCFDnCFDRMPTRqH registers can be read only in 16-bit units.
RSCFDnCFDRMPTRqLL, RSCFDnCFDRMPTRqLH, RSCFDnCFDRMPTRqHL, RSCFDnCFDRMPTRqHH registers can be read only in 8-bit units.

Address: RSCFDnCFDRMPTRq: <RSCFDn_base> + 2004_H + (20_H × q)
RSCFDnCFDRMPTRqL: <RSCFDn_base> + 2004_H + (20_H × q)
RSCFDnCFDRMPTRqH: <RSCFDn_base> + 2006_H + (20_H × q)
RSCFDnCFDRMPTRqLL: <RSCFDn_base> + 2004_H + (20_H × q)

0	1	1	1	7 data bytes	
1	0	0	0	8 data bytes	
1	0	0	1	8 data bytes	12 data bytes
1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

27 to 16	RMPTR[11:0]	Receive Buffer Label Data Label information of the received message.
15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

14.4.6.5 RSCFDnCFDRMFDSTSq ─ Receive Buffer CAN FD Status Register (q = 0 to 63)

Access: RSCFDnCFDRMFDSTSq register can be read only in 32-bit units.
RSCFDnCFDRMFDSTSqL, RSCFDnCFDRMFDSTSqH registers can be read only in 16-bit units.
RSCFDnCFDRMFDSTSqLL, RSCFDnCFDRMFDSTSqLH, RSCFDnCFDRMFDSTSqHL,
RSCFDnCFDRMFDSTSqHH registers can be read only in 8-bit units.

Address: RSCFDnCFDRMFDSTSq: <RSCFDn_base> + 2008_H + (20_H × q)
RSCFDnCFDRMFDSTSqL: <RSCFDn_base> + 2008_H + (20_H × q)

Table 14.122 RSCFDnCFDRMFDSTSq Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after a reset is read.
2	RMFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	RMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RMESI	ESI 0: Error active node 1: Error passive node

RMFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive buffer.

RMBRS Bit

When the RMFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

RMESI Bit

When the RMFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

14.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 63)

Access: RSCFDnCFDRMDFb_q register can be read only in 32-bit units.
RSCFDnCFDRMDFb_qL, RSCFDnCFDRMDFb_qH registers can be read only in 16-bit units.
RSCFDnCFDRMDFb_qLL, RSCFDnCFDRMDFb_qLH, RSCFDnCFDRMDFb_qHL, RSCFDnCFDRMDFb_qHH registers can be read only in 8-bit units.

Address: RSCFDnCFDRMDFb_q: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q)
RSCFDnCFDRMDFb_qL: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q)
RSCFDnCFDRMDFb_qH: <RSCFDn_base> + $200E_H$ + (04_H × b) + (20_H × q)
RSCFDnCFDRMDFb_qLL: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q)
RSCFDnCFDRMDFb_qLH: <RSCFDn_base> + $200D_H$ + (04_H × b) + (20_H × q)
RSCFDnCFDRMDFb_qHL: <RSCFDn_base> + $200E_H$ + (04_H × b) + (20_H × q)
RSCFDnCFDRMDFb_qHH: <RSCFDn_base> + $200F_H$ + (04_H × b) + (20_H × q)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RMDB4 × b + 3 [7:0]								RMDB4 × b + 2 [7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RMDB4 × b + 1 [7:0]								RMDB4 × b + 0 [7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.123 RSCFDnCFDRMDFb_q Register Contents

Bit Position	Bit Name	Function
31 to 24	RMDB4 × b + 3 [7:0]	Receive Buffer Data Byte 4 × b + 3
23 to 16	RMDB4 × b + 2 [7:0]	Receive Buffer Data Byte 4 × b + 2
15 to 8	RMDB4 × b + 1 [7:0]	Receive Buffer Data Byte 4 × b + 1
7 to 0	RMDB4 × b + 0 [7:0]	Receive Buffer Data Byte 4 × b + 0 Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCFDnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the receive buffer by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. Do not read or write the RSCFDnCFDRMDFb_q register corresponding to an area larger than the specified size.

14.4.7 Details of Receive FIFO Buffer-Related Registers

14.4.7.1 RSCFDnCFDRFCCx ─ Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access: RSCFDnCFDRFCCx register can be read/written in 32-bit units.
RSCFDnCFDRFCCxL, RSCFDnCFDRFCCxH registers can be read/written in 16-bit units.
RSCFDnCFDRFCCxLL, RSCFDnCFDRFCCxLH, RSCFDnCFDRFCCxHL, RSCFDnCFDRFCCxHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDRFCCx: <RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCFDnCFDRFCCxL: <RSCFDn_base> + $00B8_H$ + (04_H × x)

Table 14.124 RSCFDnCFDRFCCx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
6 to 4	RFPLS[2:0]	Receive FIFO Buffer Payload Storage Size Select b6 b5 b4 0 0 0: 8 bytes 0 0 1: 12 bytes 0 1 0: 16 bytes 0 1 1: 20 bytes 1 0 0: 24 bytes 1 0 1: 32 bytes 1 1 0: 48 bytes 1 1 1: 64 bytes
3, 2	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCFDnCFDRFCCx register have been done.

This bit is cleared to 0 in global reset mode.

14.4.7.2 RSCFDnCFDRFSTSx ─ Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RSCFDnCFDRFSTSx register can be read/written in 32-bit units.
RSCFDnCFDRFSTSxL, RSCFDnCFDRFSTSxH registers can be read/written in 16-bit units.
RSCFDnCFDRFSTSxLL, RSCFDnCFDRFSTSxLH, RSCFDnCFDRFSTSxHL, RSCFDnCFDRFSTSxHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDRFSTSx: <RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCFDnCFDRFSTSxL: <RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCFDnCFDRFSTSxH: <RSCFDn_base> + $00DA_H$ + (04_H × x)
RSCFDnCFDRFSTSxLL: <RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCFDnCFDRFSTSxLH: <RSCFDn_base> + $00D9_H$ + (04_H × x)
RSCFDnCFDRFSTSxHL: <RSCFDn_base> + $00DA_H$ + (04_H × x)
RSCFDnCFDRFSTSxHH: <RSCFDn_base> + $00DB_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.125 RSCFDnCFDRFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flags

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCFDnCFDRFCCx register is set to 0.

This flag is 00_H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

14.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RSCFDnCFDRFPCTRx register can only be written in 32-bit units.
RSCFDnCFDRFPCTRxL, RSCFDnCFDRFPCTRxH registers can only be written in 16-bit units.
RSCFDnCFDRFPCTRxLL, RSCFDnCFDRFPCTRxLH, RSCFDnCFDRFPCTRxHL, RSCFDnCFDRFPCTRxHH registers can only be written in 8-bit units.

Address: RSCFDnCFDRFPCTRx: <RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCFDnCFDRFPCTRxL: <RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCFDnCFDRFPCTRxH: <RSCFDn_base> + $00FA_H$ + (04_H × x)
RSCFDnCFDRFPCTRxLL: <RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCFDnCFDRFPCTRxLH: <RSCFDn_base> + $00F9_H$ + (04_H × x)
RSCFDnCFDRFPCTRxHL: <RSCFDn_base> + $00FA_H$ + (04_H × x)
RSCFDnCFDRFPCTRxHH: <RSCFDn_base> + $00FB_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 14.126 RSCFDnCFDRFPCTRx Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

When the RFDMAEx value in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCFDnCFDRFSTSx register is decremented. Read the RSCFDnCFDRFIDx, RSCFDnCFDRFPTRx, RSCFDnCFDRFDSTSx, and RSCFDnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCFDnCFDRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCFDnCFDRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

14.4.7.4 RSCFDnCFDRFIDx ─ Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RSCFDnCFDRFIDx register can be read only in 32-bit units.
RSCFDnCFDRFIDxL, RSCFDnCFDRFIDxH registers can be read only in 16-bit units.
RSCFDnCFDRFIDxLL, RSCFDnCFDRFIDxLH, RSCFDnCFDRFIDxHL, RSCFDnCFDRFIDxHH registers can be read only in 8-bit units.

Address: RSCFDnCFDRFIDx: <RSCFDn_base> + 3000_H + (80_H × x)
RSCFDnCFDRFIDxL: <RSCFDn_base> + 3000_H + (80_H × x)
RSCFDnCFDRFIDxH: <RSCFDn_base> + 3002_H + (80_H × x)
RSCFDnCFDRFIDxLL: <RSCFDn_base> + 3000_H + (80_H × x)

Table 14.127 RSCFDnCFDRFIDx Register Contents

Bit Position	Bit Name	Function
31	RFIDE	Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	RFRTR	Receive FIFO Buffer RTR/RRS • When the received message is a classical CAN frame 0: Data frame 1: Remote frame • When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	Reserved	When read, the value after a reset is read.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

14.4.7.5 RSCFDnCFDRFPTRx ─ Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RSCFDnCFDRFPTRx register can be read only in 32-bit units.
RSCFDnCFDRFPTRxL, RSCFDnCFDRFPTRxH registers can be read only in 16-bit units.
RSCFDnCFDRFPTRxLL, RSCFDnCFDRFPTRxLH, RSCFDnCFDRFPTRxHL, RSCFDnCFDRFPTRxHH registers can be read only in 8-bit units.

Address: RSCFDnCFDRFPTRx: <RSCFDn_base> + 3004_H + (80_H × x)

Table 14.129 RSCFDnCFDRFFDSTSx Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after a reset is read.
2	RFFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	RFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RFESI	ESI 0: Error active node 1: Error passive node

RFFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive FIFO buffer.

RFBRS Bit

When the RFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

RFESI Bit

When the RFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

14.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x =0 to 7)

Access: RSCFDnCFDRFDFd_x register can be read only in 32-bit units.
RSCFDnCFDRFDFd_xL, RSCFDnCFDRFDFd_xH registers can be read only in 16-bit units.
RSCFDnCFDRFDFd_xLL, RSCFDnCFDRFDFd_xLH, RSCFDnCFDRFDFd_xHL, RSCFDnCFDRFDFd_xHH registers can be read only in 8-bit units.

Address: RSCFDnCFDRFDFd_x: <RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x)
RSCFDnCFDRFDFd_xL: <RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x)

Table 14.130 RSCFDnCFDRFDFd_x Register Contents

Bit Position	Bit Name	Function
31 to 24	RFDB4 × d + 3 [7:0]	Receive FIFO Buffer Data Byte 4 × d + 3
		Receive FIFO Buffer Data Byte 4 × d + 2
23 to 16	RFDB4 × d + 2 [7:0]	Receive FIFO Buffer Data Byte 4 × d + 1
		Receive FIFO Buffer Data Byte 4 × d + 0
15 to 8	RFDB4 × d + 1 [7:0]	Data for a message stored in the receive FIFO buffer can be read.
7 to 0	RFDB4 × d + 0 [7:0]	

When the RFDLC[3:0] value in the RSCFDnCFDRFPTRx register is smaller than the payload storage size of the receive FIFO buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the receive FIFO buffer by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register. Do not read or write the RSCFDnCFDRFDFd_x register corresponding to an area larger than the specified size.

14.4.8 Transmit/Receive FIFO Buffer Related Registers

14.4.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 11)

Access: RSCFDnCFDCFCCk register can be read/written in 32-bit units.
RSCFDnCFDCFCCkL, RSCFDnCFDCFCCkH registers can be read/written in 16-bit units.
RSCFDnCFDCFCCkLL, RSCFDnCFDCFCCkLH, RSCFDnCFDCFCCkHL, RSCFDnCFDCFCCkHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCFCCk: <RSCFDn_base> + 0118_H + (04_H × k)
RSCFDnCFDCFCCkL: <RSCFDn_base> + 0118_H + (04_H × k)
RSCFDnCFDCFCCkH: <RSCFDn_base> + $011A_H$ + (04_H × k)
RSCFDnCFDCFCCkLL: <RSCFDn_base> + 0118_H + (04_H × k)
RSCFDnCFDCFCCkLH: <RSCFDn_base> + 0119_H + (04_H × k)
RSCFDnCFDCFCCkHL: <RSCFDn_base> + $011A_H$ + (04_H × k)
RSCFDnCFDCFCCkHH: <RSCFDn_base> + $011B_H$ + (04_H × k)

3	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 14.88** and **Table 14.89**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel does not handle the CAN FD frames.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCFDnCFDCFCCk register have been set, set this bit to 1 by using another instruction.

14.4.8.2 RSCFDnCFDCFSTSk ─ Transmit/receive FIFO Buffer Status Register (k = 0 to 11)

Access: RSCFDnCFDCFSTSk register can be read/written in 32-bit units.
RSCFDnCFDCFSTSkL, RSCFDnCFDCFSTSkH registers can be read/written in 16-bit units.
RSCFDnCFDCFSTSkLL, RSCFDnCFDCFSTSkLH, RSCFDnCFDCFSTSkHL, RSCFDnCFDCFSTSkHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCFSTSk: <RSCFDn_base> + 0178_H + (04_H × k)
RSCFDnCFDCFSTSkL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCFDnCFDCFSTSkH: <RSCFDn_base> + $017A_H$ + (04_H × k)
RSCFDnCFDCFSTSkLL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCFDnCFDCFSTSkLH: <RSCFDn_base> + 0179_H + (04_H × k),
RSCFDnCFDCFSTSkHL: <RSCFDn_base> + $017A_H$ + (04_H × k),
RSCFDnCFDCFSTSkHH: <RSCFDn_base> + $017B_H$ + (04_H × k)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFMC[7:0]								—	—	—	CFTXIF	CFRXIF	CFMLT	CFFLL	CFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.132 RSCFDnCFDCFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCFDnCFDCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCFDnCFDCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCFDnCFDCFCCk register.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCFDnCFDCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCFDnCFDCFPCTRk register after data was written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

14.4.8.3 RSCFDnCFDCFPCTRk ─ Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 11)

Access: RSCFDnCFDCFPCTRk register can only be written in 32-bit units.
RSCFDnCFDCFPCTRkL, RSCFDnCFDCFPCTRkH registers can only be written in 16-bit units.
RSCFDnCFDCFPCTRkLL, RSCFDnCFDCFPCTRkLH, RSCFDnCFDCFPCTRkHL, RSCFDnCFDCFPCTRkHH registers can only be written in 8-bit units.

Address: RSCFDnCFDCFPCTRk: <RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCFDnCFDCFPCTRkL: <RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCFDnCFDCFPCTRkH: <RSCFDn_base> + $01DA_H$ + (04_H × k)
RSCFDnCFDCFPCTRkLL: <RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCFDnCFDCFPCTRkLH: <RSCFDn_base> + $01D9_H$ + (04_H × k)
RSCFDnCFDCFPCTRkHL: <RSCFDn_base> + $01DA_H$ + (04_H × k)
RSCFDnCFDCFPCTRkHH: <RSCFDn_base> + $01DB_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 14.133 RSCFDnCFDCFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

When the corresponding transmit/receive FIFO buffer is the first transmit/receive FIFO buffer (k = 3 × m) allocated to channel m and when the CFDMAEm bit in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 00_B):
  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCFDnCFDCFSTSk register is decremented. Read the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B):
  Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers before writing FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 and the CFFLL flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 10_B): Setting prohibited

14.4.8.4 RSCFDnCFDCFIDk – Transmit/Receive FIFO Buffer Access ID Register (k = 0 to 11)

Access: RSCFDnCFDCFIDk register can be read/written in 32-bit units.
RSCFDnCFDCFIDkL, RSCFDnCFDCFIDkH registers can be read/written in 16-bit units.
RSCFDnCFDCFIDkLL, RSCFDnCFDCFIDkLH, RSCFDnCFDCFIDkHL, RSCFDnCFDCFIDkHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCFIDk: <RSCFDn_base> + 3400_H + (80_H × k)
RSCFDnCFDCFIDkL: <RSCFDn_base> + 3400_H + (80_H × k)

Table 14.134 RSCFDnCFDCFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR/RRS • When the CFM[1:0] value is 01_B (transmit mode) - When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame - When the transmit message is a CAN FD frame Write 0 to this bit. • When the CFM[1:0] value is 00_B (receive mode) - When the received message is a classical CAN frame 0: Data frame 1: Remote frame - When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This RSCFDnCFDCFIDk register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

If the the received message is a classical CAN frame, this bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. If the received message is a CAN FD frame, this bit indicates the RRS bit value of the received message.

When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer. When the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 1 (CAN FD frame), set this bit to 0.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

14.4.8.5 RSCFDnCFDCFPTRk – Transmit/Receive FIFO Buffer Access Pointer Register (k = 0 to 11)

Access: RSCFDnCFDCFPTRk register can be read/written in 32-bit units.
RSCFDnCFDCFPTRkL, RSCFDnCFDCFPTRkH registers can be read/written in 16-bit units.
RSCFDnCFDCFPTRkLL, RSCFDnCFDCFPTRkLH, RSCFDnCFDCFPTRkHL, RSCFDnCFDCFPTRkHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCFPTRk: <RSCFDn_base> + 3404_H + (80_H × k)
RSCFDnCFDCFPTRkL: <RSCFDn_base> + 3404_H + (80_H × k)
RSCFDnCFDCFPTRkH: <RSCFDn_base> + 3406_H + (80_H × k)
RSCFDnCFDCFPTRkLL: <RSCFDn_base> + 3404_H + (80_H × k)
RSCFDnCFDCFPTRkLH: <RSCFDn_base> + 3405_H + (80_H × k)
RSCFDnCFDCFPTRkHL: <RSCFDn_base> + 3406_H + (80_H × k)

		1	1	1	0		48 data bytes
		1	1	1	1		64 data bytes

Table 14.135 RSCFDnCFDCFPTRk Register Contents (2/2)

Bit Position	Bit Name	Function
27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFDLC[3:0] bits are set to 1001_B or more while the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the CFFDF bit is 1 (CAN FD frame), the settable value range varies depending on the settings of the TMME bit in the RSCFDnCFDCmFDCFG register and the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

- When TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000_B to 1111_B is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by CC_H.
- When TMME bit = 1 (transmit buffer merge mode enabled):
  Set the data length within the payload storage size specified by the CFPLS[2:0] bits.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

14.4.8.6 RSCFDnCFDCFFDCSTSk ─ Transmit/Receive FIFO CAN FD Configuration/Status Register (k = 0 to 11)

Access: RSCFDnCFDCFFDCSTSk register can be read/written in 32-bit units.
RSCFDnCFDCFFDCSTSkL, RSCFDnCFDCFFDCSTSkH registers can be read/written in 16-bit units.
RSCFDnCFDCFFDCSTSkLL, RSCFDnCFDCFFDCSTSkLH, RSCFDnCFDCFFDCSTSkHL,
RSCFDnCFDCFFDCSTSkHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCFFDCSTSk: <RSCFDn_base> + 3408_H + (80_H × k)
RSCFDnCFDCFFDCSTSkL: <RSCFDn_base> + 3408_H + (80_H × k)
RSCFDnCFDCFFDCSTSkH: <RSCFDn_base> + $340A_H$ + (80_H × k)
RSCFDnCFDCFFDCSTSkLL: <RSCFDn_base> + 3408_H + (80_H × k)
RSCFDnCFDCFFDCSTSkLH: <RSCFDn_base> + 3409_H + (80_H × k)
RSCFDnCFDCFFDCSTSkHL: <RSCFDn_base> + $340A_H$ + (80_H × k)
RSCFDnCFDCFFDCSTSkHH: <RSCFDn_base> + $340B_H$ + (80_H × k)

Value after reset: $0000\ 0000_H$

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 14.136 RSCFDnCFDCFFDCSTSk Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
2	CFFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	CFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	CFESI	ESI 0: Error active node 1: Error passive node

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). Do not read or write this register when the CFM[1:0] value is 10_B (gateway mode).

CFFDF Bit

When the CFM[1:0] value is 00_B, this bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] value is 01_B, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.

CFBRS Bit

When the CFM[1:0] value is 00_B, if the CFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is 01_B, if the CFFDF bit is 1, this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is 0, write 0 to this bit.

CFESI Bit

When the CFM[1:0] value is 00_B, if the CFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is 01_B, if the CFFDF bit is 1, this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is 0, write 0 to this bit.

14.4.8.7 RSCFDnCFDCFDFd_k — Transmit/Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 11)

Access: RSCFDnCFDCFDFd_k register can be read/written in 32-bit units.
RSCFDnCFDCFDFd_kL, RSCFDnCFDCFDFd_kH registers can be read/written in 16-bit units.
RSCFDnCFDCFDFd_kLL, RSCFDnCFDCFDFd_kLH, RSCFDnCFDCFDFd_kHL, RSCFDnCFDCFDFd_kHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCFDFd_k: <RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k)
RSCFDnCFDCFDFd_kL: <RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k)
RSCFDnCFDCFDFd_kH: <RSCFDn_base> + $340E_H$ + (04_H × d) + (80_H × k)
RSCFDnCFDCFDFd_kLL: <RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k)
RSCFDnCFDCFDFd_kLH: <RSCFDn_base> + $340D_H$ + (04_H × d) + (80_H × k)
RSCFDnCFDCFDFd_kHL: <RSCFDn_base> + $340E_H$ + (04_H × d) + (80_H × k)
RSCFDnCFDCFDFd_kHH: <RSCFDn_base> + $340F_H$ + (04_H × d) + (80_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.137 RSCFDnCFDCFDFd_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB4 × d + 3 [7:0]	Transmit/Receive FIFO Buffer Data Byte 4 × d + 3 Transmit/Receive FIFO Buffer Data Byte 4 × d + 2 Transmit/Receive FIFO Buffer Data Byte 4 × d + 1 Transmit/Receive FIFO Buffer Data Byte 4 × d + 0 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.
23 to 16	CFDB4 × d + 2 [7:0]	
15 to 8	CFDB4 × d + 1 [7:0]	
7 to 0	CFDB4 × d + 0 [7:0]	

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode).

This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCFDnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register. Do not read or write the RSCFDnCFDCFDFd_k register corresponding to an area larger than the specified size.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

14.4.9 Details of FIFO Status-Related Registers

14.4.9.1 RSCFDnCFDFESTS – FIFO Empty Status Register

Access: RSCFDnCFDFESTS register can be read only in 32-bit units.
RSCFDnCFDFESTSL, RSCFDnCFDFESTSH registers can be read only in 16-bit units.
RSCFDnCFDFESTSLL, RSCFDnCFDFESTSLH, RSCFDnCFDFESTSHL, RSCFDnCFDFESTSHH registers can be read only in 8-bit units.

Address: RSCFDnCFDFESTS: <RSCFDn_base> + 0238_H
RSCFDnCFDFESTSL: <RSCFDn_base> + 0238_H, RSCFDnCFDFESTSH: <RSCFDn_base> + $023A_H$
RSCFDnCFDFESTSLL: <RSCFDn_base> + 0238_H, RSCFDnCFDFESTSLH: <RSCFDn_base> + 0239_H
RSCFDnCFDFESTSHL: <RSCFDn_base> + $023A_H$, RSCFDnCFDFESTSHH: <RSCFDn_base> + $023B_H$

Value after reset: $03FF\ FFFF_H$

Table 14.138 RSCFDnCFDFESTS Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after a reset is read.
19	CF11EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 11)
18	CF10EMP	
17	CF9EMP	
16	CF8EMP	
15	CF7EMP	
14	CF6EMP	
13	CF5EMP	
12	CF4EMP	
11	CF3EMP	
10	CF2EMP	
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCFDnCFDFESTS register is set to 03FF $FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 11)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

14.4.9.2 RSCFDnCFDFFSTS – FIFO Full Status Register

Access: RSCFDnCFDFFSTS register can be read only in 32-bit units.
RSCFDnCFDFFSTSL, RSCFDnCFDFFSTSH registers can be read only in 16-bit units.
RSCFDnCFDFFSTSLL, RSCFDnCFDFFSTSLH, RSCFDnCFDFFSTSHL, RSCFDnCFDFFSTSHH registers can be read only in 8-bit units.

Address: RSCFDnCFDFFSTS: <RSCFDn_base> + $023C_H$
RSCFDnCFDFFSTSL: <RSCFDn_base> + $023C_H$, RSCFDnCFDFFSTSH: <RSCFDn_base> + $023E_H$

Table 14.139 RSCFDnCFDFFSTS Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after a reset is read.
19	CF11FLL	Transmit/Receive FIFO Buffer Full Status Flag 0: Transmit/receive buffer k is not full. 1: Transmit/receive buffer k is full. (k = 0 to 11)
18	CF10FLL	
17	CF9FLL	
16	CF8FLL	
15	CF7FLL	
14	CF6FLL	
13	CF5FLL	
12	CF4FLL	
11	CF3FLL	
10	CF2FLL	
9	CF1FLL	
8	CF0FLL	
7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCFDnCFDFFSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkFLL Flag (k = 0 to 11)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).

When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

14.4.9.3 RSCFDnCFDFMSTS ─ FIFO Message Lost Status Register

Access: RSCFDnCFDFMSTS register can be read only in 32-bit units.
RSCFDnCFDFMSTSL, RSCFDnCFDFMSTSH registers can be read only in 16-bit units.
RSCFDnCFDFMSTSLL, RSCFDnCFDFMSTSLH, RSCFDnCFDFMSTSHL, RSCFDnCFDFMSTSHH registers can be read only in 8-bit units.

Address: RSCFDnCFDFMSTS: <RSCFDn_base> + 0240_H
RSCFDnCFDFMSTSL: <RSCFDn_base> + 0240_H, RSCFDnCFDFMSTSH: <RSCFDn_base> + 0242_H
RSCFDnCFDFMSTSLL: <RSCFDn_base> + 0240_H, RSCFDnCFDFMSTSLH: <RSCFDn_base> + 0241_H
RSCFDnCFDFMSTSHL: <RSCFDn_base> + 0242_H, RSCFDnCFDFMSTSHH: <RSCFDn_base> + 0243_H

Value after reset: $0000\ 0000_H$

5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCFDnCFDFMSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkMLT Flag (k = 0 to 11)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO message is lost).

When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

14.4.9.4 RSCFDnCFDRFISTS ─ Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCFDnCFDRFISTS register can be read only in 32-bit units.
RSCFDnCFDRFISTSL, RSCFDnCFDRFISTSH registers can be read only in 16-bit units.
RSCFDnCFDRFISTSLL, RSCFDnCFDRFISTSLH, RSCFDnCFDRFISTSHL, RSCFDnCFDRFISTSHH registers can be read only in 8-bit units.

Address: RSCFDnCFDRFISTS: <RSCFDn_base> + 0244_H
RSCFDnCFDRFISTSL: <RSCFDn_base> + 0244_H, RSCFDnCFDRFISTSH: <RSCFDn_base> + 0246_H
RSCFDnCFDRFISTSLL: <RSCFDn_base> + 0244_H, RSCFDnCFDRFISTSLH: <RSCFDn_base> + 0245_H
RSCFDnCFDRFISTSHL: <RSCFDn_base> + 0246_H, RSCFDnCFDRFISTSHH: <RSCFDn_base> + 0247_H

Table 14.141 RSCFDnCFDRFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCFDnCFDRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

14.4.9.5 RSCFDnCFDCFRISTS – Transmit/Receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCFDnCFDCFRISTS register can be read only in 32-bit units.
RSCFDnCFDCFRISTSL, RSCFDnCFDCFRISTSH registers can be read only in 16-bit units.
RSCFDnCFDCFRISTSLL, RSCFDnCFDCFRISTSLH, RSCFDnCFDCFRISTSHL, RSCFDnCFDCFRISTSHH registers can be read only in 8-bit units.

Address: RSCFDnCFDCFRISTS: <RSCFDn_base> + 0248_H
RSCFDnCFDCFRISTSL: <RSCFDn_base> + 0248_H, RSCFDnCFDCFRISTSH: <RSCFDn_base> + $024A_H$
RSCFDnCFDCFRISTSLL: <RSCFDn_base> + 0248_H, RSCFDnCFDCFRISTSLH: <RSCFDn_base> + 0249_H
RSCFDnCFDCFRISTSHL: <RSCFDn_base> + $024A_H$, RSCFDnCFDCFRISTSHH: <RSCFDn_base> + $024B_H$

Value after reset: $0000\ 0000_H$

5	CF5RXIF	
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCFDnCFDCFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkRXIF Flag (k = 0 to 11)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

14.4.9.6 RSCFDnCFDCFTISTS – Transmit/Receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCFDnCFDCFTISTS register can be read only in 32-bit units.
RSCFDnCFDCFTISTSL, RSCFDnCFDCFTISTSH registers can be read only in 16-bit units.
RSCFDnCFDCFTISTSLL, RSCFDnCFDCFTISTSLH, RSCFDnCFDCFTISTSHL, RSCFDnCFDCFTISTSHH registers can be read only in 8-bit units.

Address: RSCFDnCFDCFTISTS: <RSCFDn_base> + $024C_H$
RSCFDnCFDCFTISTSL: <RSCFDn_base> + $024C_H$, RSCFDnCFDCFTISTSH: <RSCFDn_base> + $024E_H$
RSCFDnCFDCFTISTSLL: <RSCFDn_base> + $024C_H$, RSCFDnCFDCFTISTSLH: <RSCFDn_base> + $024D_H$
RSCFDnCFDCFTISTSHL: <RSCFDn_base> + $024E_H$, RSCFDnCFDCFTISTSHH: <RSCFDn_base> + $024F_H$

Value after reset: $0000\ 0000_H$

5	CF5TXIF	
4	CF4TXIF	
3	CF3TXIF	
2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCFDnCFDCFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkTXIF Flag (k = 0 to 11)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

14.4.10 Details of FIFO DMA-Related Registers

14.4.10.1 RSCFDnCFDCDTCT – DMA Enable Register

Access: RSCFDnCFDCDTCT register can be read/written in 32-bit units.
RSCFDnCFDCDTCTL, RSCFDnCFDCDTCTH registers can be read/written in 16-bit units.
RSCFDnCFDCDTCTLL, RSCFDnCFDCDTCTLH, RSCFDnCFDCDTCTHL, RSCFDnCFDCDTCTHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDCDTCT: <RSCFDn_base> + 0490_H
RSCFDnCFDCDTCTL: <RSCFDn_base> + 0490_H
RSCFDnCFDCDTCTH: <RSCFDn_base> + 0492_H
RSCFDnCFDCDTCTLL: <RSCFDn_base> + 0490_H

4	RFDMAE4	
3	RFDMAE3	
2	RFDMAE2	
1	RFDMAE1	
0	RFDMAE0	

Modify the RSCFDnCFDCDTCT register in global operating mode or global test mode.

CFDMAEm Bit

This bit is used to enable DMA transfer for transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m). DMA transfer is enabled only for transmit/receive FIFO buffers for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register is set to 00_B (receive mode). Set this bit to 0 when the CFM[1:0] value is 01_B (transmit mode) or 10_B (gateway mode).

RFDMAEx Bit

This bit is used to enable DMA transfer for receive FIFO buffer x.

14.4.10.2 RSCFDnCFDCDTSTS ─ DMA Status Register

Access: RSCFDnCFDCDTSTS register can be read only in 32-bit units.
RSCFDnCFDCDTSTSL, RSCFDnCFDCDTSTSH registers can be read only in 16-bit units.
RSCFDnCFDCDTSTSLL, RSCFDnCFDCDTSTSLH, RSCFDnCFDCDTSTSHL, RSCFDnCFDCDTSTSHH registers can be read only in 8-bit units.

Address: RSCFDnCFDCDTSTS: <RSCFDn_base> + 0494_H
RSCFDnCFDCDTSTSL: <RSCFDn_base> + 0494_H
RSCFDnCFDCDTSTSH: <RSCFDn_base> + 0496_H
RSCFDnCFDCDTSTSLL: <RSCFDn_base> + 0494_H
RSCFDnCFDCDTSTSLH: <RSCFDn_base> + 0495_H
RSCFDnCFDCDTSTSHL: <RSCFDn_base> + 0496_H
RSCFDnCFDCDTSTSHH: <RSCFDn_base> + 0497_H

Value after reset: $0000\ 0000_H$

Table 14.145 RSCFDnCFDCDTSTS Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after a reset is read.
11	CFDMASTS3	Transmit/Receive FIFO Buffer 9 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 9 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 9 is in progress.
10	CFDMASTS2	Transmit/Receive FIFO Buffer 6 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 6 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 6 is in progress.
9	CFDMASTS1	Transmit/Receive FIFO Buffer 3 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 3 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 3 is in progress.
8	CFDMASTS0	Transmit/Receive FIFO Buffer 0 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 0 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 0 is in progress.
7	RFDMASTS7	Receive FIFO Buffer x DMA Status 0: DMA transfer of receive FIFO buffer x is not in progress. 1: DMA transfer of receive FIFO buffer x is in progress. (x = 0 to 7)
6	RFDMASTS6	
5	RFDMASTS5	
4	RFDMASTS4	
3	RFDMASTS3	
2	RFDMASTS2	
1	RFDMASTS1	
0	RFDMASTS0	

CFDMASTSm Bit

When DMA transfer is enabled (CFDMAEm bit in the RSCFDnCFDCDTCT register is 1) for the transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m) while the transmit/receive FIFO buffer contains one of more messages, the CFDMASTSm bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the transmit/receive FIFO buffer have been transferred or DMA transfer is disabled (CFDMAEm bit is 0), the CFDMASTSm bit is cleared to 0 indicating that DMA transfer has been completed. If the CFDMAEm bit is set to 0 during DMA transfer, the CFDMASTSm bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

RFDMASTSx Bit

When DMA transfer is enabled (corresponding RFDMAEx bit in the RSCFDnCFDCDTCT register is 1) for the receive FIFO buffer x and the receive FIFO buffer contains one of more messages, the RFDMASTSx bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the receive FIFO buffer x have been transferred or DMA transfer is disabled (RFDMAEx bit = 0), the RFDMASTSx bit is cleared to 0 indicating that DMA transfer has been completed. If the RFDMAEx bit is set to 0 during DMA transfer, the RFDMASTSx bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

14.4.11 Details of Transmit Buffer-Related Registers

14.4.11.1 RSCFDnCFDTMCp ─ Transmit Buffer Control Register (p = 0 to 63)

Access: RSCFDnCFDTMCp registers can be read/written in 8-bit units.

Address: RSCFDnCFDTMCp: <RSCFDn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 14.146 RSCFDnCFDTMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after a reset is read. When writing, write the value after a reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCFDnCFDTMCp register meets any of the following conditions, set it to 00_H.

- The RSCFDnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFDCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm (m = 0 to 3) register (p = (m × 16 + 15) to (m × 16 + 15 - the value of TXQDC[3:0] bits)).
- RSCFDnCFDTMCp register (p = (m × 16) + 1, (m × 16) + 2), (m × 16) + 4, (m × 16) + 5) corresponding to the transmit buffer allocated as a payload storage area when the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode).

Bits in the RSCFDnCFDTMCp register are all cleared to 0 in channel reset mode. Modify the RSCFDnCFDTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCFDnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration loss has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnCFDTMSTSp register is 00_B.

14.4.11.2 RSCFDnCFDTMSTSp ─ Transmit Buffer Status Register (p = 0 to 63)

Access: RSCFDnCFDTMSTSp registers can be read/written in 8-bit units.

Address: RSCFDnCFDTMSTSp: <RSCFDn_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 14.147 RSCFDnCFDTMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCFDnCFDTMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

14.4.11.3 RSCFDnCFDTMIDp ─ Transmit Buffer ID Register (p = 0 to 63)

Access: RSCFDnCFDTMIDp register can be read/written in 32-bit units.
RSCFDnCFDTMIDpL, RSCFDnCFDTMIDpH registers can be read/written in 16-bit units.
RSCFDnCFDTMIDpLL, RSCFDnCFDTMIDpLH, RSCFDnCFDTMIDpHL, RSCFDnCFDTMIDpHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDTMIDp: <RSCFDn_base> + 4000_H + (20_H × p)
RSCFDnCFDTMIDpL: <RSCFDn_base> + 4000_H + (20_H × p)
RSCFDnCFDTMIDpH: <RSCFDn_base> + 4002_H + (20_H × p)
RSCFDnCFDTMIDpLL: <RSCFDn_base> + 4000_H + (20_H × p)
RSCFDnCFDTMIDpLH: <RSCFDn_base> + 4001_H + (20_H × p)
RSCFDnCFDTMIDpHL: <RSCFDn_base> + 4002_H + (20_H × p)
RSCFDnCFDTMIDpHH: <RSCFDn_base> + 4003_H + (20_H × p)

Value after reset: $0000\ 0000_H$

Table 14.148 RSCFDnCFDTMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR/RRS • When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame • When the transmit message is a CAN FD frame Write 0 to this bit.
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

Set this bit to 0 when the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 1 (CAN FD frame).

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

14.4.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 63)

Access: RSCFDnCFDTMPTRp register can be read/written in 32-bit units.
RSCFDnCFDTMPTRpL, RSCFDnCFDTMPTRpH registers can be read/written in 16-bit units.
RSCFDnCFDTMPTRpLL, RSCFDnCFDTMPTRpLH, RSCFDnCFDTMPTRpHL, RSCFDnCFDTMPTRpHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDTMPTRp: <RSCFDn_base> + 4004_H + (20_H × p)
RSCFDnCFDTMPTRpL: <RSCFDn_base> + 4004_H + (20_H × p)
RSCFDnCFDTMPTRpH: <RSCFDn_base> + 4006_H + (20_H × p)
RSCFDnCFDTMPTRpLL: <RSCFDn_base> + 4004_H + (20_H × p)
RSCFDnCFDTMPTRpLH: <RSCFDn_base> + 4005_H + (20_H × p)
RSCFDnCFDTMPTRpHL: <RSCFDn_base> + 4006_H + (20_H × p)
RSCFDnCFDTMPTRpHH: <RSCFDn_base> + 4007_H + (20_H × p)

Value after reset: $0000\ 0000_H$

		1 0 0 0	8 data bytes		
		1 0 0 1	8 data bytes	12 data bytes	
		1 0 1 0		16 data bytes	
		1 0 1 1		20 data bytes	
		1 1 0 0		24 data bytes	
		1 1 0 1		32 data bytes	
		1 1 1 0		48 data bytes	
		1 1 1 1		64 data bytes	

Table 14.149 RSCFDnCFDTMPTRp Register Contents (2/2)

Bit Position	Bit Name	Function
27 to 24	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCFDnCFDTMIDp register is set to 0 (data frame).

When the TMDLC[3:0] bits are set to 1001_B or more while the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the MFDF bit is 1 (CAN FD frame), the settable value range varies depending on the setting of the TMME bit in the RSCFDnCFDCmFDCFG register.

- When the TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000_B to 1111_B is settable. If a value larger than 1100_B is set, payloads exceeding 20 bytes are padded by CC_H.
- When the TMME bit = 1 (transmit buffer merge mode enabled):
  When the corresponding transmit buffer number p = (m × 16) + 0 or (m × 16) + 3, a value of 0000_B to 1111_B is settable. In other cases, set a value of 0000_B to 1011_B (20 data bytes).

When the TMRTR bit is 1 (remote frame), set the data length of a message to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

14.4.11.5 RSCFDnCFDTMFDCTRp ─ Transmit Buffer CAN FD Configuration Register (p = 0 to 63)

Access: RSCFDnCFDTMFDCTRp register can be read/written in 32-bit units.
RSCFDnCFDTMFDCTRpL, RSCFDnCFDTMFDCTRpH registers can be read/written in 16-bit units.
RSCFDnCFDTMFDCTRpLL, RSCFDnCFDTMFDCTRpLH, RSCFDnCFDTMFDCTRpHL,
RSCFDnCFDTMFDCTRpHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDTMFDCTRp: <RSCFDn_base> + 4008_H + (20_H × p)
RSCFDnCFDTMFDCTRpL: <RSCFDn_base> + 4008_H + (20_H × p)
RSCFDnCFDTMFDCTRpH: <RSCFDn_base> + $400A_H$ + (20_H × p)
RSCFDnCFDTMFDCTRpLL: <RSCFDn_base> + 4008_H + (20_H × p)
RSCFDnCFDTMFDCTRpLH: <RSCFDn_base> + 4009_H + (20_H × p)
RSCFDnCFDTMFDCTRpHL: <RSCFDn_base> + $400A_H$ + (20_H × p)
RSCFDnCFDTMFDCTRpHH: <RSCFDn_base> + $400B_H$ + (20_H × p)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	—	—	—	TMFDF	TMBRS	TMESI
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 14.150 RSCFDnCFDTMFDCTRp Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	TMFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	TMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	TMESI	ESI 0: Error active node 1: Error passive node

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer p (p = m × 16 + 15) of the corresponding channel.

TMFDF Bit

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.

TMBRS Bit

When this bit is set to 1 while the TMFDF bit is 1, the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is 0, write 0 to this bit.

TMESI Bit

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is 1. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is 0, write 0 to this bit.

14.4.11.6 RSCFDnCFDTMDFb_p ─ Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 63)

Access: RSCFDnCFDTMDFb_p register can be read/written in 32-bit units.
RSCFDnCFDTMDFb_pL, RSCFDnCFDTMDFb_pH registers can be read/written in 16-bit units.
RSCFDnCFDTMDFb_pLL, RSCFDnCFDTMDFb_pLH, RSCFDnCFDTMDFb_pHL, RSCFDnCFDTMDFb_pHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDTMDFb_p: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p)
RSCFDnCFDTMDFb_pL: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p)
RSCFDnCFDTMDFb_pH: <RSCFDn_base> + $400E_H$ + (04_H × b) + (20_H × p)
RSCFDnCFDTMDFb_pLL: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p)
RSCFDnCFDTMDFb_pLH: <RSCFDn_base> + $400D_H$ + (04_H × b) + (20_H × p)
RSCFDnCFDTMDFb_pHL: <RSCFDn_base> + $400E_H$ + (04_H × b) + (20_H × p)
RSCFDnCFDTMDFb_pHH: <RSCFDn_base> + $400F_H$ + (04_H × b) + (20_H × p)

Value after reset: $0000\ 0000_H$

Table 14.152 RSCFDnCFDTMIECy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 63)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue. When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode enable), set the bit corresponding to the transmit buffer allocated as a payload storage area to 0.

Table 14.153 shows the bit assignment.

Table 14.153 TMIEp Bit Assignment

Bit	Channel	Transmit Buffer Number

14.4.12 Details of Transmit Buffer Status-Related Registers

14.4.12.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0, 1)

Access: RSCFDnCFDTMTRSTSy register can be read only in 32-bit units.
RSCFDnCFDTMTRSTSyL, RSCFDnCFDTMTRSTSyH registers can be read only in 16-bit units.
RSCFDnCFDTMTRSTSyLL, RSCFDnCFDTMTRSTSyLH, RSCFDnCFDTMTRSTSyHL, RSCFDnCFDTMTRSTSyHH registers can be read only in 8-bit units.

Address: RSCFDnCFDTMTRSTSy: <RSCFDn_base> + 0350_H + (04_H × y)
RSCFDnCFDTMTRSTSyL: <RSCFDn_base> + 0350_H + (04_H × y)
RSCFDnCFDTMTRSTSyH: <RSCFDn_base> + 0352_H + (04_H × y)
RSCFDnCFDTMTRSTSyLL: <RSCFDn_base> + 0350_H + (04_H × y)
RSCFDnCFDTMTRSTSyLH: <RSCFDn_base> + 0351_H + (04_H × y)
RSCFDnCFDTMTRSTSyHL: <RSCFDn_base> + 0352_H + (04_H × y)
RSCFDnCFDTMTRSTSyHH: <RSCFDn_base> + 0353_H + (04_H × y)

Value after reset: $0000\ 0000_H$

Table 14.154 RSCFDnCFDTMTRSTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 63)

These flags indicate the status of the TMTR bit in the RSCFDnCFDTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 14.155 shows the bit assignment.

14.4.13 Details of Transmit Queue-Related Registers

14.4.13.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 3)

Access: RSCFDnCFDTXQCCm register can be read/written in 32-bit units.
RSCFDnCFDTXQCCmL, RSCFDnCFDTXQCCmH registers can be read/written in 16-bit units.
RSCFDnCFDTXQCCmLL, RSCFDnCFDTXQCCmLH, RSCFDnCFDTXQCCmHL, RSCFDnCFDTXQCCmHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDTXQCCm: <RSCFDn_base> + $03A0_H$ + (04_H × m)
RSCFDnCFDTXQCCmL: <RSCFDn_base> + $03A0_H$ + (04_H × m)
RSCFDnCFDTXQCCmH: <RSCFDn_base> + $03A2_H$ + (04_H × m)
RSCFDnCFDTXQCCmLL: <RSCFDn_base> + $03A0_H$ + (04_H × m)
RSCFDnCFDTXQCCmLH: <RSCFDn_base> + $03A1_H$ + (04_H × m)
RSCFDnCFDTXQCCmHL: <RSCFDn_base> + $03A2_H$ + (04_H × m)
RSCFDnCFDTXQCCmHH: <RSCFDn_base> + $03A3_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Table 14.162 RSCFDnCFDTXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited. For transmit buffer merge mode, set g to 2 to 9.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 14.9**.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode), transmit buffers (m × 16 + 5) to (m × 16 + 0) are merged and cannot be allocated to the transmit queue. Therefore, do not set TXQDC[3:0] bits to 10 to 15.

Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

14.4.13.2 RSCFDnCFDTXQSTSm – Transmit Queue Status Register (m = 0 to 3)

Access: RSCFDnCFDTXQSTSm register can be read/written in 32-bit units.
RSCFDnCFDTXQSTSmL, RSCFDnCFDTXQSTSmH registers can be read/written in 16-bit units.
RSCFDnCFDTXQSTSmLL, RSCFDnCFDTXQSTSmLH, RSCFDnCFDTXQSTSmHL, RSCFDnCFDTXQSTSmHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDTXQSTSm: <RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCFDnCFDTXQSTSmL: <RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCFDnCFDTXQSTSmH: <RSCFDn_base> + $03C2_H$ + (04_H × m)
RSCFDnCFDTXQSTSmLL: <RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCFDnCFDTXQSTSmLH: <RSCFDn_base> + $03C1_H$ + (04_H × m)
RSCFDnCFDTXQSTSmHL: <RSCFDn_base> + $03C2_H$ + (04_H × m)
RSCFDnCFDTXQSTSmHH: <RSCFDn_base> + $03C3_H$ + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.163 RSCFDnCFDTXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	Reserved	When read, the undefined value is returned. When writing to these bits, write the value after reset.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCFDnCFDTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCFDnCFDTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

14.4.13.3 RSCFDnCFDTXQPCTRm ─ Transmit Queue Pointer Control Register (m = 0 to 3)

Access: RSCFDnCFDTXQPCTRm register can only be written in 32-bit units.
RSCFDnCFDTXQPCTRmL, RSCFDnCFDTXQPCTRmH registers can only be written in 16-bit units.
RSCFDnCFDTXQPCTRmLL, RSCFDnCFDTXQPCTRmLH, RSCFDnCFDTXQPCTRmHL,
RSCFDnCFDTXQPCTRmHH registers can only be written in 8-bit units.

Address: RSCFDnCFDTXQPCTRm: <RSCFDn_base> + $03E0_H$ + (04_H × m)
RSCFDnCFDTXQPCTRmL: <RSCFDn_base> + $03E0_H$ + (04_H × m)
RSCFDnCFDTXQPCTRmH: <RSCFDn_base> + $03E2_H$ + (04_H × m)
RSCFDnCFDTXQPCTRmLL: <RSCFDn_base> + $03E0_H$ + (04_H × m)
RSCFDnCFDTXQPCTRmLH: <RSCFDn_base> + $03E1_H$ + (04_H × m)
RSCFDnCFDTXQPCTRmHL: <RSCFDn_base> + $03E2_H$ + (04_H × m)
RSCFDnCFDTXQPCTRmHH: <RSCFDn_base> + $03E3_H$ + (04_H × m)

Table 14.164 RSCFDnCFDTXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDnCFDTMDFb_p registers (p = 15, 31, 47, 63) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCFDnCFDTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCFDnCFDTXQSTSm register is 0 (he transmit queue is not full).

14.4.14 Details of Transmit History-Related Registers

14.4.14.1 RSCFDnCFDTHLCCm ─ Transmit History Configuration and Control Register (m = 0 to 3)

Access: RSCFDnCFDTHLCCm register can be read/written in 32-bit units.
RSCFDnCFDTHLCCmL, RSCFDnCFDTHLCCmH registers can be read/written in 16-bit units.
RSCFDnCFDTHLCCmLL, RSCFDnCFDTHLCCmLH, RSCFDnCFDTHLCCmHL, RSCFDnCFDTHLCCmHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDTHLCCm: <RSCFDn_base> + 0400_H + (04_H × m)
RSCFDnCFDTHLCCmL: <RSCFDn_base> + 0400_H + (04_H × m)
RSCFDnCFDTHLCCmH: <RSCFDn_base> + 0402_H + (04_H × m)
RSCFDnCFDTHLCCmLL: <RSCFDn_base> + 0400_H + (04_H × m)
RSCFDnCFDTHLCCmLH: <RSCFDn_base> + 0401_H + (04_H × m)
RSCFDnCFDTHLCCmHL: <RSCFDn_base> + 0402_H + (04_H × m)
RSCFDnCFDTHLCCmHH: <RSCFDn_base> + 0403_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Table 14.165 RSCFDnCFDTHLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated.

Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

14.4.14.2 RSCFDnCFDTHLSTSm ─ Transmit History Status Register (m = 0 to 3)

Access: RSCFDnCFDTHLSTSm register can be read/written in 32-bit units.
RSCFDnCFDTHLSTSmL, RSCFDnCFDTHLSTSmH registers can be read/written in 16-bit units.
RSCFDnCFDTHLSTSmLL, RSCFDnCFDTHLSTSmLH, RSCFDnCFDTHLSTSmHL, RSCFDnCFDTHLSTSmHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDTHLSTSm: <RSCFDn_base> + 0420_H + (04_H × m)
RSCFDnCFDTHLSTSmL: <RSCFDn_base> + 0420_H + (04_H × m)
RSCFDnCFDTHLSTSmH: <RSCFDn_base> + 0422_H + (04_H × m)
RSCFDnCFDTHLSTSmLL: <RSCFDn_base> + 0420_H + (04_H × m)
RSCFDnCFDTHLSTSmLH: <RSCFDn_base> + 0421_H + (04_H × m)
RSCFDnCFDTHLSTSmHL: <RSCFDn_base> + 0422_H + (04_H × m)
RSCFDnCFDTHLSTSmHH: <RSCFDn_base> + 0423_H + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THLEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W *1	R/W *1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 14.166 RSCFDnCFDTHLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer. These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnCFDTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

14.4.14.3 RSCFDnCFDTHLPCTRm ─ Transmit History Pointer Control Register (m = 0 to 3)

Access: RSCFDnCFDTHLPCTRm register can only be written in 32-bit units.
RSCFDnCFDTHLPCTRmL, RSCFDnCFDTHLPCTRmH registers can only be written in 16-bit units.
RSCFDnCFDTHLPCTRmLL, RSCFDnCFDTHLPCTRmLH, RSCFDnCFDTHLPCTRmHL,
RSCFDnCFDTHLPCTRmHH registers can only be written in 8-bit units.

Address: RSCFDnCFDTHLPCTRm: <RSCFDn_base> + 0440_H + (04_H × m)
RSCFDnCFDTHLPCTRmL: <RSCFDn_base> + 0440_H + (04_H × m)
RSCFDnCFDTHLPCTRmH: <RSCFDn_base> + 0442_H + (04_H × m)
RSCFDnCFDTHLPCTRmLL: <RSCFDn_base> + 0440_H + (04_H × m)
RSCFDnCFDTHLPCTRmLH: <RSCFDn_base> + 0441_H + (04_H × m)
RSCFDnCFDTHLPCTRmHL: <RSCFDn_base> + 0442_H + (04_H × m)
RSCFDnCFDTHLPCTRmHH: <RSCFDn_base> + 0443_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 14.167 RSCFDnCFDTHLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCFDnCFDTHLSTSm register is decremented. Write FF_H to the THLPC[7:0] bits after reading from the RSCFDnCFDTHLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCFDnCFDTHLSTSm register is 0.

14.4.14.4 RSCFDnCFDTHLACCm – Transmit History Access Register (m = 0 to 3)

Access: RSCFDnCFDTHLACCm register can be read only in 32-bit units.
RSCFDnCFDTHLACCmL, RSCFDnCFDTHLACCmH registers can be read only in 16-bit units.
RSCFDnCFDTHLACCmLL, RSCFDnCFDTHLACCmLH, RSCFDnCFDTHLACCmHL, RSCFDnCFDTHLACCmHH registers can be read only in 8-bit units.

Address: RSCFDnCFDTHLACCm: <RSCFDn_base> + 6000_H + (04_H × m)
RSCFDnCFDTHLACCmL: <RSCFDn_base> + 6000_H + (04_H × m)
RSCFDnCFDTHLACCmH: <RSCFDn_base> + 6002_H + (04_H × m)
RSCFDnCFDTHLACCmLL: <RSCFDn_base> + 6000_H + (04_H × m),
RSCFDnCFDTHLACCmLH: <RSCFDn_base> + 6001_H + (04_H × m)
RSCFDnCFDTHLACCmHL: <RSCFDn_base> + 6002_H + (04_H × m)
RSCFDnCFDTHLACCmHH: <RSCFDn_base> + 6003_H + (04_H × m)

Table 14.168 RSCFDnCFDTHLACCm Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTS[15:0]	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	When read, the value after reset is returned.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

Timestamp values in transmit history data stored in the transmit history buffer are displayed.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

14.4.15 Details of Test-Related Registers

14.4.15.1 RSCFDnCFDGTSTCFG ─ Global Test Configuration Register

Access: RSCFDnCFDGTSTCFG register can be read/written in 32-bit units.
RSCFDnCFDGTSTCFGL, RSCFDnCFDGTSTCFGH registers can be read/written in 16-bit units.
RSCFDnCFDGTSTCFGLL, RSCFDnCFDGTSTCFGLH, RSCFDnCFDGTSTCFGHL, RSCFDnCFDGTSTCFGHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGTSTCFG: <RSCFDn_base> + 0468_H
RSCFDnCFDGTSTCFGL: <RSCFDn_base> + 0468_H, RSCFDnCFDGTSTCFGH: <RSCFDn_base> + $046A_H$
RSCFDnCFDGTSTCFGLL: <RSCFDn_base> + 0468_H, RSCFDnCFDGTSTCFGLH: <RSCFDn_base> + 0469_H,
RSCFDnCFDGTSTCFGHL: <RSCFDn_base> + $046A_H$, RSCFDnCFDGTSTCFGHH: <RSCFDn_base> + $046B_H$

Value after reset: $0000\ 0000_H$

Table 14.169 RSCFDnCFDGTSTCFG Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within a range of page 0 (00_H) to page 55 (37_H).
15 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	C3ICBCE	CAN3 Inter-channel Communication Test Enable 0: CAN3 inter-channel communication test is disabled. 1: CAN3 inter-channel communication test is enabled.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled. 1: CAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCFDnCFDGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to 37_H, inclusive. In CAN FD mode, do not access more than 128 bytes in the last page (RTMPS[6:0] = 37_H) during RAM test.

C3ICBCE Bit

Setting this bit to 1 enables the channel 3 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

14.4.15.2 RSCFDnCFDGTSTCTR ─ Global Test Control Register

Access: RSCFDnCFDGTSTCTR register can be read/written in 32-bit units.
RSCFDnCFDGTSTCTRL, RSCFDnCFDGTSTCTRH registers can be read/written in 16-bit units.
RSCFDnCFDGTSTCTRLL, RSCFDnCFDGTSTCTRLH, RSCFDnCFDGTSTCTRHL, RSCFDnCFDGTSTCTRHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDGTSTCTR: <RSCFDn_base> + $046C_H$
RSCFDnCFDGTSTCTRL: <RSCFDn_base> + $046C_H$, RSCFDnCFDGTSTCTRH: <RSCFDn_base> + $046E_H$
RSCFDnCFDGTSTCTRLL: <RSCFDn_base> + $046C_H$, RSCFDnCFDGTSTCTRLH: <RSCFDn_base> + $046D_H$,
RSCFDnCFDGTSTCTRHL: <RSCFDn_base> + $046E_H$, RSCFDnCFDGTSTCTRHH: <RSCFDn_base> + $046F_H$

Value after reset: 0000 0000 H

Table 14.170 RSCFDnCFDGTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	ICBCTME	Communication Test between Channels Enable 0: Communication test between channels disabled 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode. This bit is cleread to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCFDnCFDGCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 3) in the RSCFDnCFDGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode. This bit is cleared to 0 in global reset mode.

14.4.15.3 RSCFDnCFDGLOCKK ─ Global Lock Key Register

Access: RSCFDnCFDGLOCKK register can only be written in 32-bit units.
RSCFDnCFDGLOCKKL, RSCFDnCFDGLOCKKH registers can only be written in 16-bit units.

Address: RSCFDnCFDGLOCKK: <RSCFDn_base> + $047C_H$
RSCFDnCFDGLOCKKL: <RSCFDn_base> + $047C_H$, RSCFDnCFDGLOCKKH: <RSCFDn_base> + $047E_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 14.171 RSCFDnCFDGLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCFDnCFDGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 14.11.4.2, Procedure for Releasing the Protection**.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCFDnCFDGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + 0000_H to <RSCFDn_base> + $0FFF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

14.4.15.4 RSCFDnCFDRPGACCr ─ RAM Test Page Access Register (r = 0 to 63)

Access: RSCFDnCFDRPGACCr register can be read/written in 32-bit units.
RSCFDnCFDRPGACCrL, RSCFDnCFDRPGACCrH registers can be read/written in 16-bit units.
RSCFDnCFDRPGACCrLL, RSCFDnCFDRPGACCrLH, RSCFDnCFDRPGACCrHL, RSCFDnCFDRPGACCrHH registers can be read/written in 8-bit units.

Address: RSCFDnCFDRPGACCr: <RSCFDn_base> + 6400_H + (04_H × r)
RSCFDnCFDRPGACCrL: <RSCFDn_base> + 6400_H + (04_H × r)
RSCFDnCFDRPGACCrH: <RSCFDn_base> + 6402_H + (04_H × r)
RSCFDnCFDRPGACCrLL: <RSCFDn_base> + 6400_H + (04_H × r)
RSCFDnCFDRPGACCrLH: <RSCFDn_base> + 6401_H + (04_H × r)
RSCFDnCFDRPGACCrHL: <RSCFDn_base> + 6402_H + (04_H × r)
RSCFDnCFDRPGACCrHH: <RSCFDn_base> + 6403_H + (04_H × r)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.172 RSCFDnCFDRPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA[31:0]	RAM Data Test Access Data can be read and written in CAN RAM.

Modify the RSCFDnCFDRPGACCr register in global test mode with the RTME bit in the RSCFDnCFDGTSTCTR register set to 1 (RAM test is enabled).

The RSCFDnCFDRPGACCr register is readable and writable when the RTME bit is set to 1.

14.5 Interrupt Sources and DMA Trigger

14.5.1 Interrupt Sources

The RS-CANFD module has 14 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources):
  Receive FIFO interrupt
  Global error interrupt
- Channel interrupts (3 sources/channel):
  CANm transmit interrupt (m = 0 to 3)
  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)
CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

Table 14.173 lists the CAN interrupt sources. **Figure 14.2** shows the CAN global interrupt block diagram. **Figure 14.3** shows the CAN channel interrupt block diagram.

Table 14.173 List of CAN Interrupt Sources

	Interrupt Source		Corresponding Interrupt Request Flag	Corresponding Interrupt Enable Bit
Global interrupts	Receive FIFO	Receive FIFO 0	RFIF in the RSCFDn(CFD)RFSTS0 register	RFIE in the RSCFDn(CFD)RFCC0 register
		Receive FIFO 1	RFIF in the RSCFDn(CFD)RFSTS1 register	RFIE in the RSCFDn(CFD)RFCC1 register
		Receive FIFO 2	RFIF in the RSCFDn(CFD)RFSTS2 register	RFIE in the RSCFDn(CFD)RFCC2 register
		Receive FIFO 3	RFIF in the RSCFDn(CFD)RFSTS3 register	RFIE in the RSCFDn(CFD)RFCC3 register
		Receive FIFO 4	RFIF in the RSCFDn(CFD)RFSTS4 register	RFIE in the RSCFDn(CFD)RFCC4 register
		Receive FIFO 5	RFIF in the RSCFDn(CFD)RFSTS5 register	RFIE in the RSCFDn(CFD)RFCC5 register
		Receive FIFO 6	RFIF in the RSCFDn(CFD)RFSTS6 register	RFIE in the RSCFDn(CFD)RFCC6 register
		Receive FIFO 7	RFIF in the RSCFDn(CFD)RFSTS7 register	RFIE in the RSCFDn(CFD)RFCC7 register
	Global error		DEF in the RSCFDn(CFD)GERFL register MES in the RSCFDn(CFD)GERFL register THLES in the RSCFDn(CFD)GERFL register CMPOF in the RSCFDnCFDGERFL register	DEIE in the RSCFDn(CFD)GCTR register MEIE in the RSCFDn(CFD)GCTR register THLEIE in the RSCFDn(CFD)GCTR register CMPOFIE in the RSCFDnCFDGCTR register
Channel interrupts (m = 0 to 3)	CANm transmit	CANm transmit complete	TMTRF[1:0] in the RSCFDn(CFD)TMSTSp register	TMIEp in the RSCFDn(CFD)TMIECy register
		CANm transmit abort	TMTRF[1:0] in the RSCFDn(CFD)TMSTSp register	TAIE in the RSCFDn(CFD)CmCTR register
		CANm transmit/ receive FIFO transmit complete	CFTXIF in the RSCFDn(CFD)CFSTSk register	CFTXIE in the RSCFDn(CFD)CFCCk register
		CANm transmit queue	TXQIF in the RSCFDn(CFD)TXQSTSm register	TXQIE in the RSCFDn(CFD)TXQCCm register
		CANm transmit history	THLIF in the RSCFDn(CFD)THLSTSm register	THLIE in the RSCFDn(CFD)THLCCm register
	CANm transmit/receive FIFO receive complete		CFRXIF in the RSCFDn(CFD)CFSTSk register	CFRXIE in the RSCFDn(CFD)CFCCk register
	CANm error		BEF in the RSCFDn(CFD)CmERFL register ALF in the RSCFDn(CFD)CmERFL register BLF in the RSCFDn(CFD)CmERFL register OVLF in the RSCFDn(CFD)CmERFL register BORF in the RSCFDn(CFD)CmERFL register BOEF in the RSCFDn(CFD)CmERFL register EPF in the RSCFDn(CFD)CmERFL register EWF in the RSCFDn(CFD)CmERFL register SOCO in the RSCFDnCFDCmFDSTS register EOCO in the RSCFDnCFDCmFDSTS register TDCVF in the RSCFDnCFDCmFDSTS register	BEIE in the RSCFDn(CFD)CmCTR register ALIE in the RSCFDn(CFD)CmCTR register BLIE in the RSCFDn(CFD)CmCTR register OLIE in the RSCFDn(CFD)CmCTR register BORIE in the RSCFDn(CFD)CmCTR register BOEIE in the RSCFDn(CFD)CmCTR register EPIE in the RSCFDn(CFD)CmCTR register EWIE in the RSCFDn(CFD)CmCTR register SOCOIE in the RSCFDnCFDCmCTR register EOCOIE in the RSCFDnCFDCmCTR register TDCVFIE in the RSCFDnCFDCmCTR register

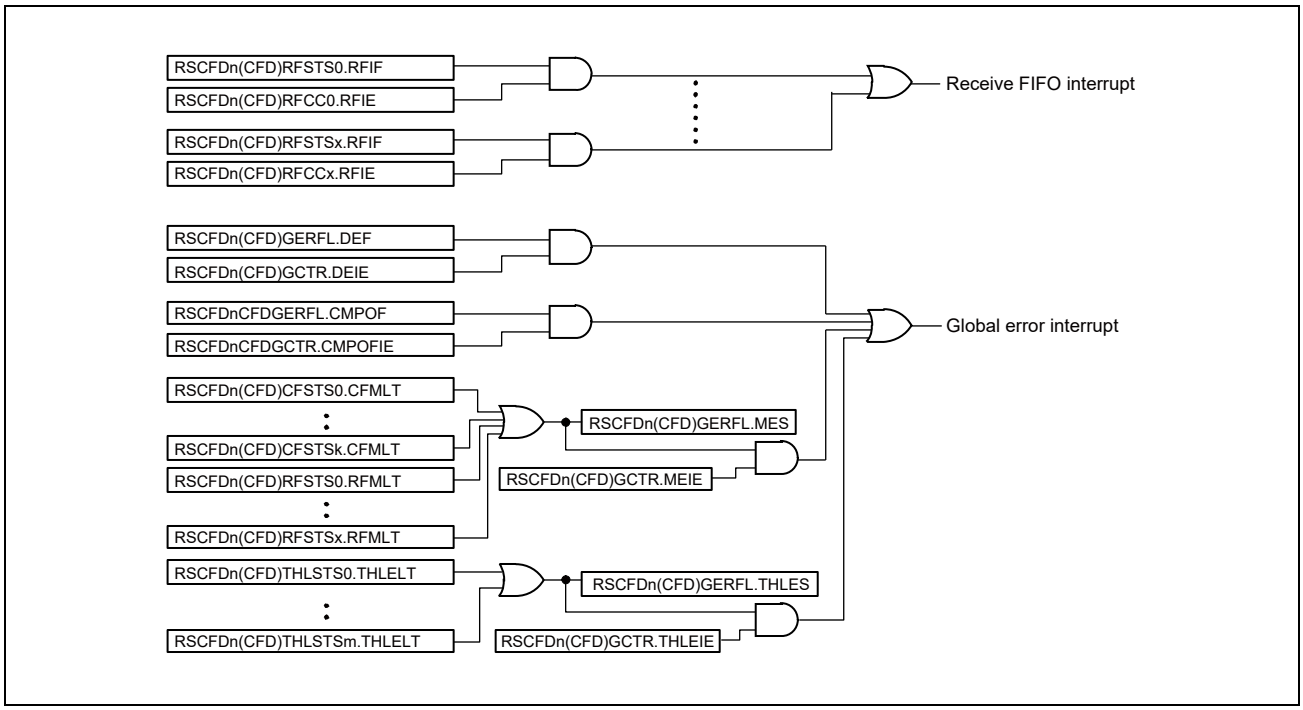

Figure 14.2 CAN Global Interrupt Block Diagram

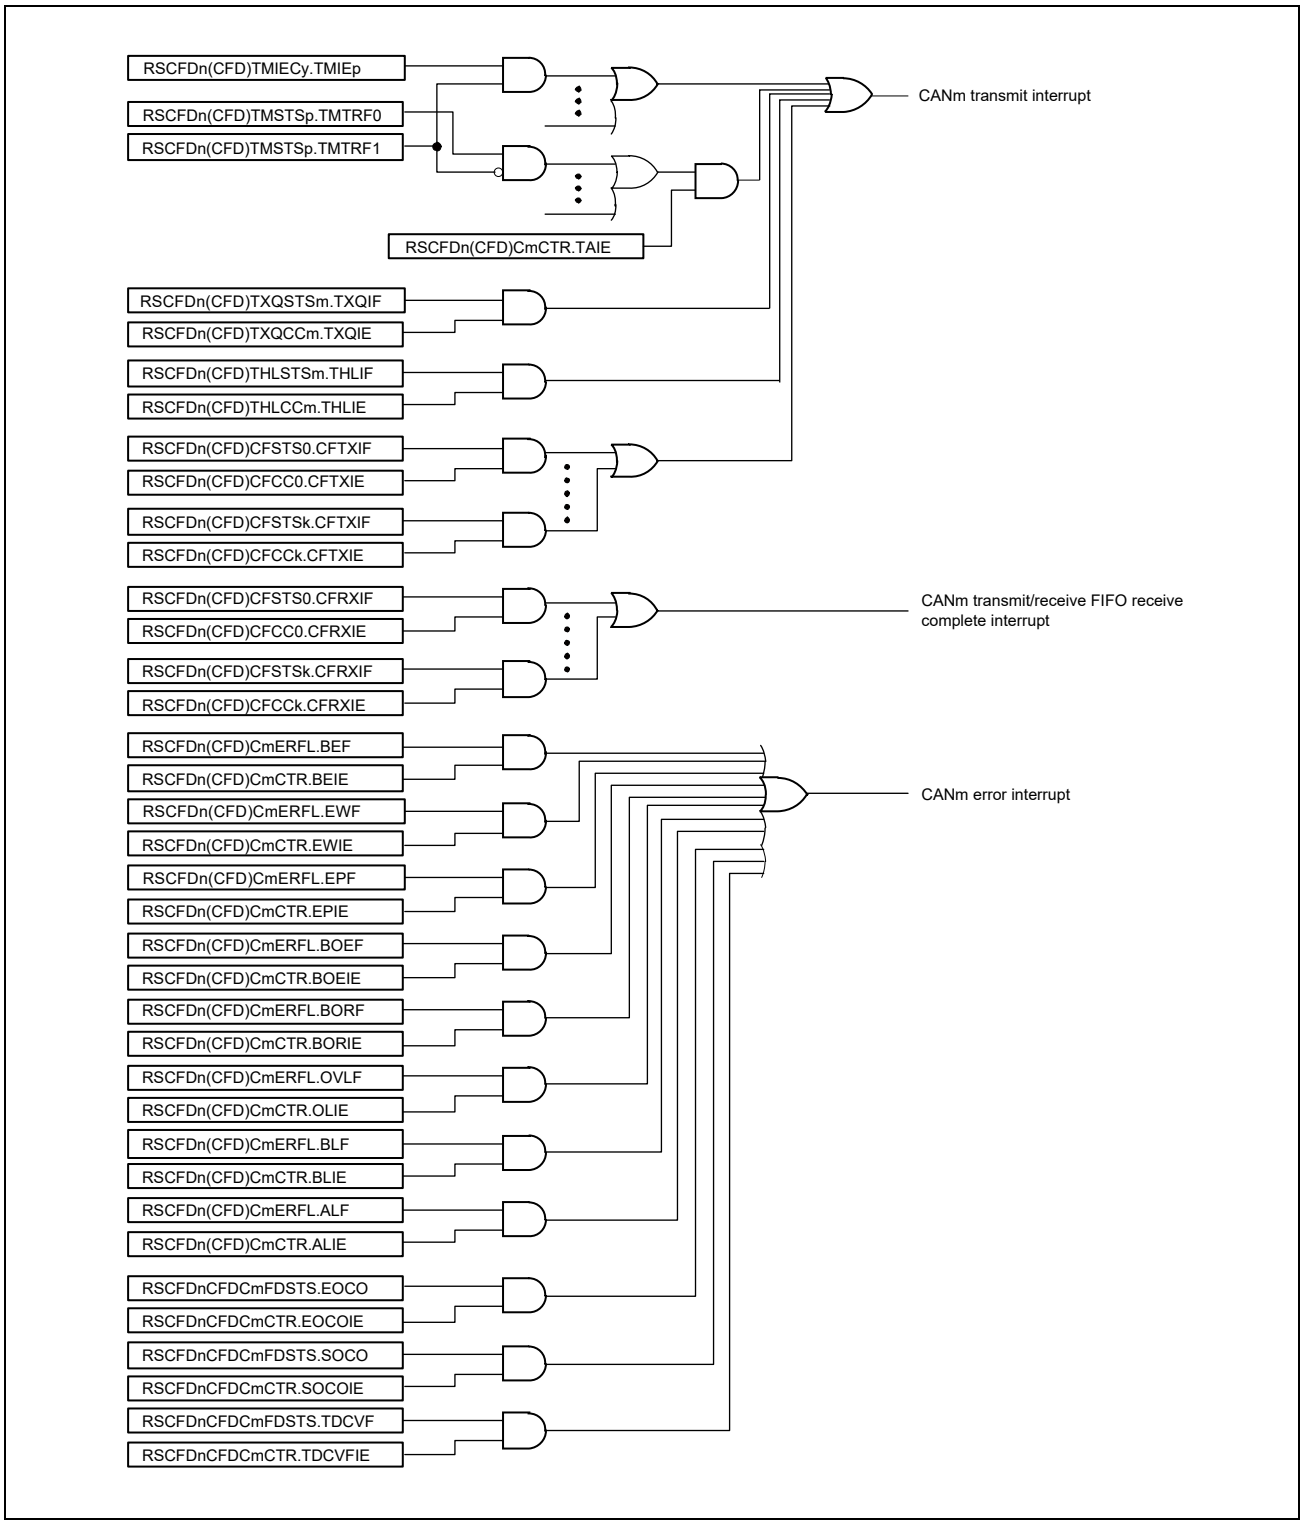

Figure 14.3 CAN Channel Interrupt Block Diagram

14.5.2 DMA Trigger (Only in CAN FD Mode)

In CAN FD mode, receive FIFO buffers can be related to DMA channels. The following 12 FIFO buffers can be related.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k (k = 3 × m, m = 0 to 3) allocated to channel m

When the DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) is set to 1 and an unread message is remaining in the related FIFO, a DMA transfer request trigger is generated.

14.6 CAN Modes

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in **Section 14.6.1, Global Modes**, and details of channel modes are described in **Section 14.6.2, Channel Modes**.

- Global stop mode:
  Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode:
  Performs initial settings for the entire module.
- Global test mode:
  Performs test settings and performs the RAM test.
- Global operating mode:
  Makes the entire module operable.
- Channel stop mode:
  Stops the channel clock.
- Channel reset mode:
  Performs initial settings for the channels.
- Channel halt mode:
  Stops CAN communication and allows channel testing.
- Channel communication mode:
  Performs CAN communication.

14.6.1 Global Modes

Figure 14.4 shows the transitions of global modes.

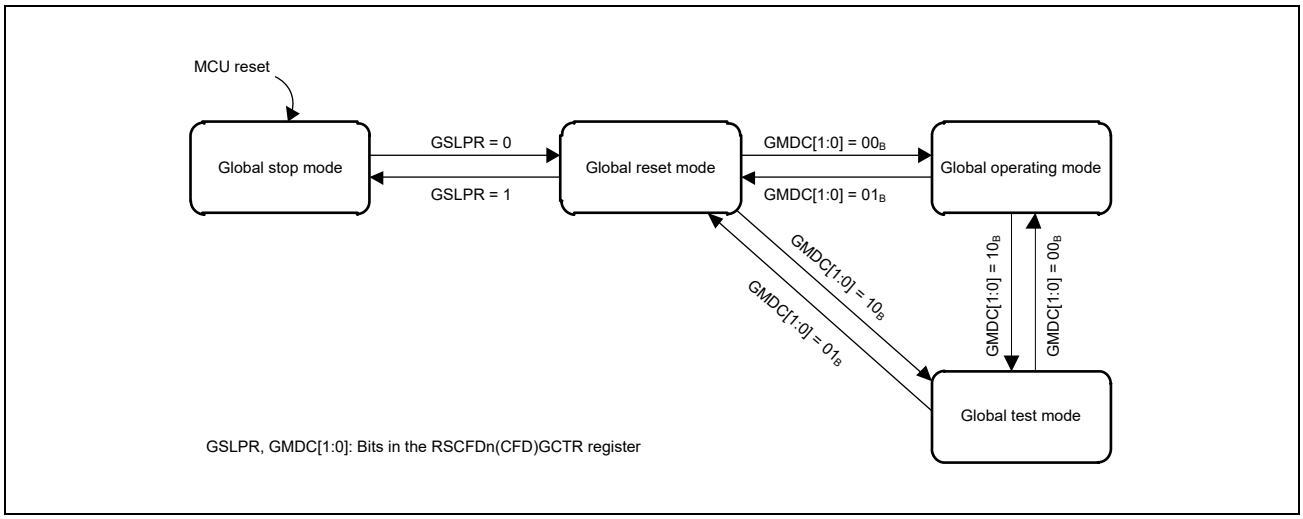

Figure 14.4 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. **Table 14.174** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 14.174 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

	Channel Mode after Setting			
Channel Mode before Setting	GMDC[1:0] = 00_B GSLPR = 0 (Global Operation)	GMDC[1:0] = 10_B GSLPR = 0 (Global Test)	GMDC[1:0] = 01_B GSLPR = 0 (Global Reset)	GMDC[1:0] = 01_B GSLPR = 1 (Global Stop)
Channel communication	Channel communication	Channel halt	Channel reset	Transition prohibited
Channel halt	Channel halt	Channel halt	Channel reset	Transition prohibited
Channel reset	Channel reset	Channel reset	Channel reset	Channel stop
Channel stop	Channel stop	Channel stop	Channel stop	Channel stop

Note: GMDC[1:0], GSLPR: Bits in the RSCFDn(CFD)GCTR register

Table 14.175 shows the global mode transition time.

Table 14.175 Global Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Global stop	Global reset	Three pclk cycles
Global reset	Global stop	Three pclk cycles
Global reset	Global test	Ten pclk cycles
Global reset	Global operating	Ten pclk cycles
Global test	Global reset	Two CAN bit times*1 *2
Global test	Global operating	Three pclk cycles
Global operating	Global reset	Two CAN bit times*1 *2
Global operating	Global test	Two CAN frames*1

Note 1. CAN frame time and CAN bit time of the lowest communication speed of the channels in use

Note 2. In CAN FD mode, this time value is the CAN bit time of the nominal bit rate.

14.6.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the RS-CANFD module transitions to global stop mode. Setting the GSLPR bit in the RSCFDn(CFD)GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each of the RSCFDn(CFD)CmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the RS-CANFD module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

14.6.1.2 Global Reset Mode

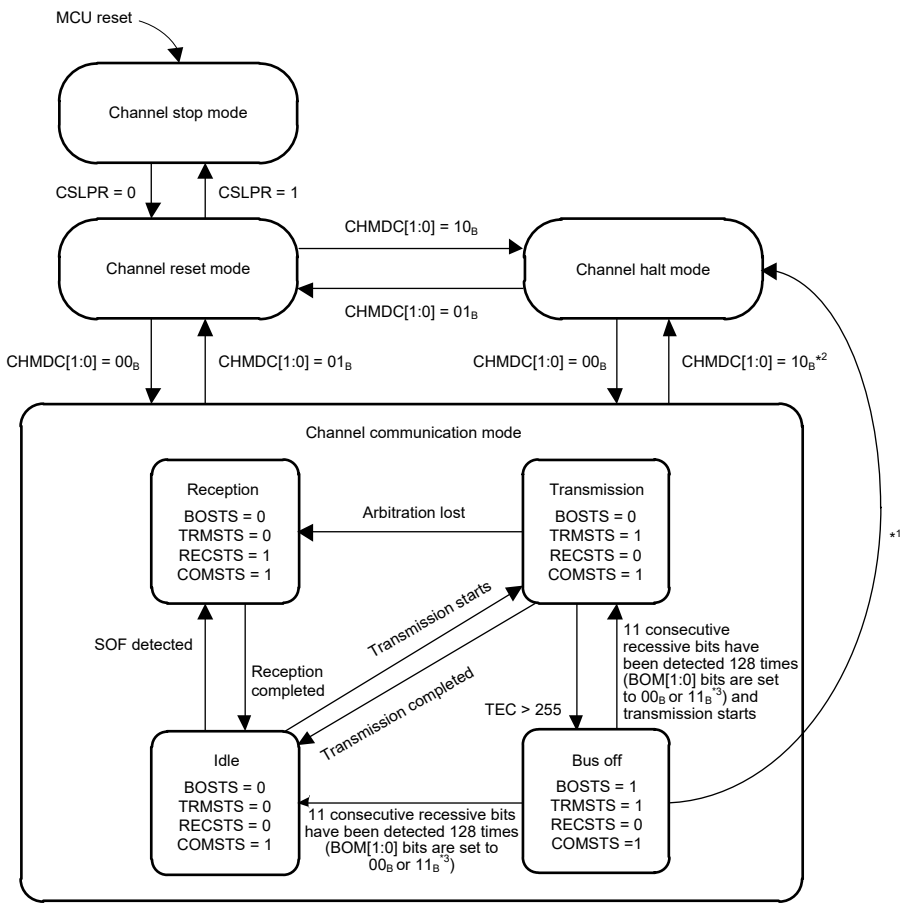
In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. For registers to be initialized, see **Table 14.178, Registers Initialized in Global Reset Mode or Channel Reset Mode** and **Table 14.179, Registers Initialized Only in Global Reset Mode**.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 01_B sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR registers (m = 0 to 3) to 01_B (channel reset mode). If all channels are forced to transition to channel reset mode, the RS-CANFD module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01_B).

14.6.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the RS-CANFD module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 10_B sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR register to 10_B (channel halt mode). If all channels are forced to transition to channel halt mode, the RS-CANFD module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.



14.6.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.

When the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register are set to 00_B, the RS-CANFD module transitions to global operating mode.

14.6.2 Channel Modes

Figure 14.5 shows a channel mode state transition chart. **Table 14.176** shows the channel mode transition time.

Note: CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCFDn(CFD)CmCTR register (m = 0 to 3)
BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCFDn(CFD)CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = 01_B: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = 10_B: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = 11_B: Transition to channel halt mode when the CHMDC[1:0] bits are set to 10_B

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Note 3. When 11 consecutive recessive bits have been detected 128 times before the CHMDC[1:0] bits are set to 10_B

Figure 14.5 Channel Mode State Transition Chart

Table 14.176 Channel Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel stop	Channel reset	Three pclk cycles
Channel reset	Channel stop	Three pclk cycles
Channel reset	Channel halt	Three CANm bit times*1
Channel reset	Channel communication	Four CANm bit times*1
Channel halt	Channel reset	Two CANm bit times*1
Channel halt	Channel communication	Four CANm bit times*1
Channel communication	Channel reset	Two CANm bit times*1
Channel communication	Channel halt	Two CANm frames

Note 1. In CAN FD mode, this time value is the CANm bit time of the nominal bit rate.

14.6.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. Channel-related registers can be read, but writing data to them is prohibited (except for the CSLPR bit). Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RSCFDn(CFD)CmCTR register (m = 0 to 3) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

14.6.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. For registers to be initialized, see **Table 14.178, Registers Initialized in Global Reset Mode or Channel Reset Mode**.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 01_B (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 14.177** shows the operation when the CHMDC[1:0] bits are set to 01_B (channel reset mode) during CAN communication.

14.6.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

Table 14.177 shows operation when the CHMDC[1:0] bits are set to 10_B (channel halt mode) during CAN communication.

Table 14.177 Operation a Channel Transitions to Channel Reset Mode/Channel Halt Mode

Mode	During Reception	During Transmission	Bus Off State
Channel reset (CHMDC[1:0] = 01_B)	Transitions to channel reset mode before reception is completed.*1	Transitions to channel reset mode before transmission is completed.*1	Transitions to channel reset mode before bus off recovery.
Channel halt*3 (CHMDC[1:0] = 10_B)	Transitions to channel halt mode after reception is completed.*2	Transitions to channel halt mode after transmission is completed.	[When BOM[1:0] = 00_B] Transitions to channel halt mode (CHMDC[1:0] = 10_B) only after bus off recovery. [When BOM[1:0] = 01_B] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = 10_B] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = 11_B] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10_B before bus off recovery.

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10_B and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01_B.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCFDn(CFD)CmERFL register that becomes 1 when dominant lock is detected.

Note 3. In classical CAN mode, when the transition from channel reset mode to channel halt mode is to be made, set the RSCANnCmCFG register in channel reset mode and then shift to channel halt mode. In CAN FD mode, set the RSCFDnCFDCmNCFG register and the RSCFDnCFDCmDCFG register, and then make a transition.

14.6.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 00_B, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCFDn(CFD)CmSTS register (m = 0 to 3) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

14.6.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCFDn(CFD)CmCTR register.

- When BOM[1:0] = 00_B:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCFDn(CFD)CmSTS register are initialized to 00_H, the BORF flag in the RSCFDn(CFD)CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 10_B (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = 01_B:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10_B and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.
- When BOM[1:0] = 10_B:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10_B. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.
- When BOM[1:0] = 11_B:
  When the CHMDC[1:0] bits are set to 10_B in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a RS-CANFD module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to 10_B.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01_B or 10_B is made only when the CHMDC[1:0] bits are 00_B (channel communication mode).

Furthermore, setting the RTBO bit in the RSCFDn(CFD)CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the RS-CANFD module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to 00_H. Write 1 to the RTBO bit only when the BOM[1:0] value is 00_B. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

14.6.3 Initializing Registers by Transition to CAN Mode

Table 14.178 lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, **Table 14.179** lists bits and flags to be initialized only by a transition to global reset mode.

Table 14.178 Registers Initialized in Global Reset Mode or Channel Reset Mode

Register	Bit / Flag
RSCFDn(CFD)CmCTR register	(ROM), CRCT, CTMS[1:0], CTME, CHMDC[1:0]
RSCFDn(CFD)CmSTS register	CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, (ESIF), REC[7:0], TEC[7:0]
RSCFDn(CFD)CmERFL register	CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF
RSCFDnCFDCmFDCTR register	EOCCLR, SOCCLR
RSCFDnCFDCmFDSTS register	SOC[7:0], EOC[7:0], SOCO, EOCO, TDCVF, TDCR[6:0]
RSCFDnCFDCmFDCRC register	CRCREG[20:0], SCNT[3:0]
RSCFDn(CFD)CFCCk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE
RSCFDn(CFD)CFSTSk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF
RSCFDn(CFD)CFTISTS register	CFkTXIF
RSCFDn(CFD)TMCp register	TMOM, TMTAR, TMTR
RSCFDn(CFD)TMSTSp register	TMTARM, TMTRM, TMTRF[1:0], TMTSTS
RSCFDn(CFD)TMTRSTSy register	TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTARSTSy register	TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTCSTSy register	TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTASTSy register	TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TXQCCm register	TXQE
RSCFDn(CFD)TXQSTSm register	TXQIF, TXQFLL, TXQEMP
RSCFDn(CFD)THLCCm register	THLE
RSCFDn(CFD)THLSTSm register	THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP
RSCFDn(CFD)GTINTSTS0 register	TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 0 to 3)

Note: Bits and flags in parentheses exist only in registers in CAN FD mode.

Table 14.179 Registers Initialized Only in Global Reset Mode

Register	Bit / Flag
RSCFDn(CFD)GSTS register	GHLTSTS
RSCFDn(CFD)GERFL register	EEF0, EEF1, EEF2, EEF3, (CMPOF), THLES, MES, DEF
RSCFDn(CFD)GTSC register	TS[15:0]
RSCFDn(CFD)RMNDy register	RMNSq
RSCFDn(CFD)RFCCx register	RFE
RSCFDn(CFD)RFSTSx register	RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP
RSCFDn(CFD)CFCCk register	When transmit/receive FIFO buffer is in receive mode: CFE
RSCFDn(CFD)CFSTSk register	When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT
RSCFDn(CFD)FESTS register	CFkEMP, RFxEMP
RSCFDn(CFD)FFSTS register	CFkFLL, RFxFLL
RSCFDn(CFD)FMSTS register	CFkMLT, RFxMLT
RSCFDn(CFD)RFISTS register	RFxIF
RSCFDn(CFD)CFRISTS register	CFkRXIF
RSCFDnCFDCDTCT register	CFDMAEm, RFDMAEx
RSCFDnCFDCDTSTS register	CFDMASTSm, RFDMASTSx
RSCFDn(CFD)GTSTCFG register	RTMPS[6:0], C0ICBCE, C1ICBCE, C2ICBCE, C3ICBCE
RSCFDn(CFD)GTSTCTR register	RTME, ICBCTME

Note: Bits and flags in parentheses exist only in registers in CAN FD mode.

14.7 Reception Function

There are two reception types.

- Reception by receive buffers:
  0 to 64 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

14.7.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module. (Up to 256 receive rules can be registered in this module that has 4 channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 14.6** illustrates how receive rules are registered.

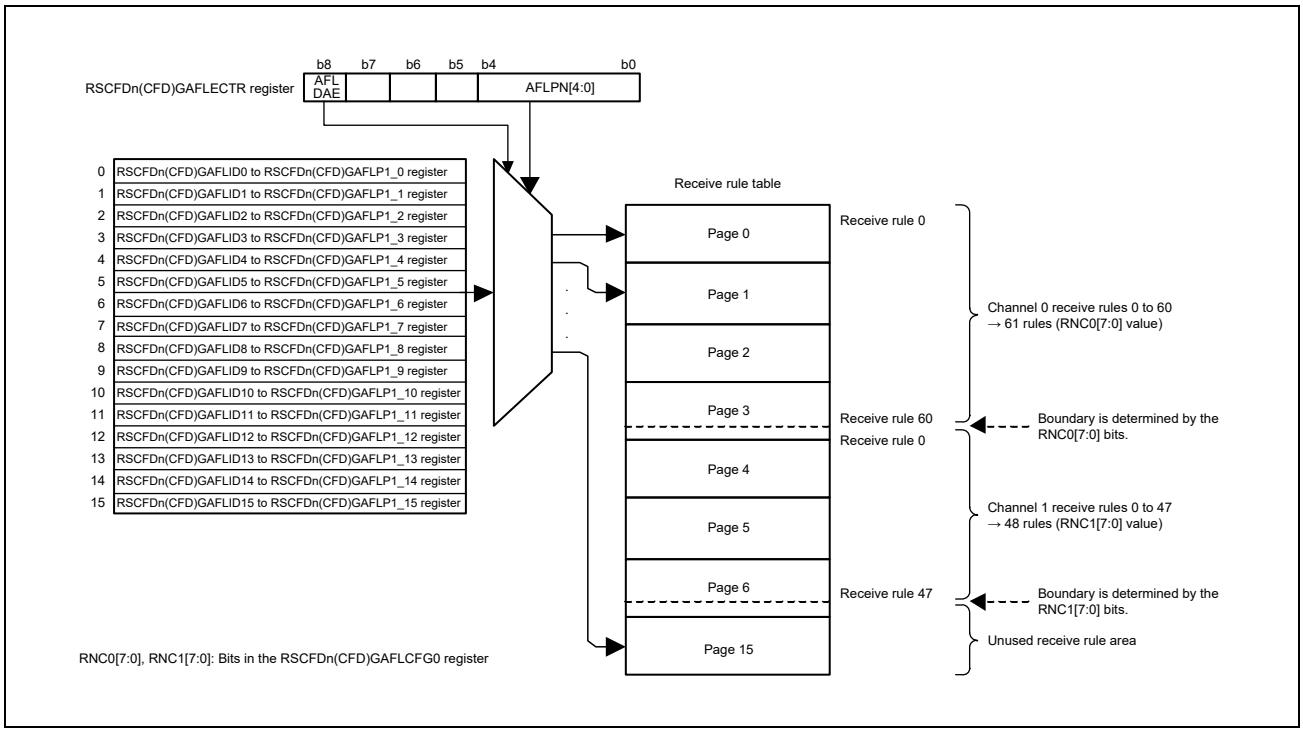


Figure 14.6 Entry of Receive Rules (for Setting Channel 0 and 1)

CAUTION

Receive rules for each channel must be set in contiguous blocks. Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, and RSCFDn(CFD)GAFLP1_j registers (j = 0 to 15). The RSCFDn(CFD)GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCFDn(CFD)GAFLMj register is used to set mask, the RSCFDn(CFD)GAFLP0_j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCFDn(CFD)GAFLP1_j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

14.7.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCFDn(CFD)GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

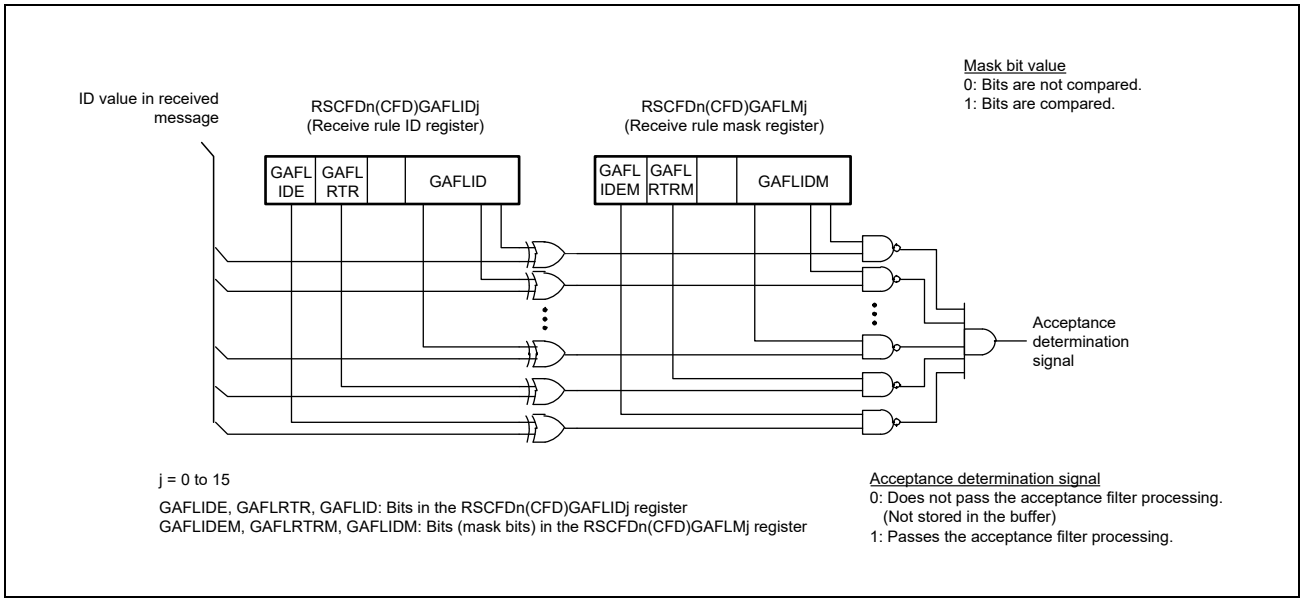

Figure 14.7 Acceptance Filter Function

14.7.1.2 DLC Filter Processing

When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of 00_H is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCFDn(CFD)GERFL register is set to 1 (a DLC error is present).

14.7.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCFDn(CFD)GAFLP0_j register (j = 0 to 15) and by the RSCFDn(CFD)GAFLP1_j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

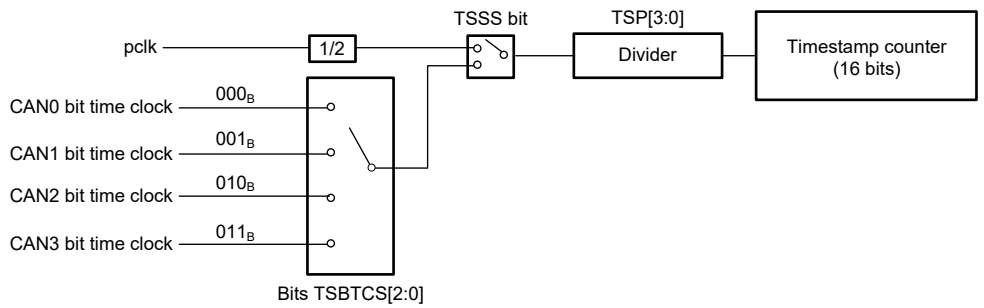
In CAN FD mode, if the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 (payload overflow) and the processing is handled according to the CMPOC bit in the RSCFDnCFDGCFG register. When the CMPOC bit is 0, a received message with a payload exceeding the available space for payload storage is not stored in the buffer. When the CMPOC bit is 1, the received message with the payload truncated to fit the available space and the value of the DLC field, either that in the received message or from the reception rule table, depending on the value of the DRE bit in the RSCFDnCFDGCFG register, are stored in the buffer.

14.7.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCFDn(CFD)GAFLP0_j register.

14.7.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCFDn(CFD)GCFG register to 1 (mirror function is enabled).



When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

14.7.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message reception time and transmission time. The timestamp counter value is fetched at the timing set with the TSCCFG[1:0] bits in the RSCFDn(CFD)GFDCFG register and is then stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RSCFDn(CFD)GCFG register. In classical CAN mode, either pclk/2 or the CANm bit time clock (m = 0 to 3). In CAN FD mode, the clock source is selectable from pclk/2 or nominal CANm bit time clock. However, do not select the nominal CANm bit time clock of channels that handle CAN FD frames. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCFDn(CFD)GCFG register.

When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to 0000_H by setting the TSRST bit in the RSCFDn(CFD)GCTR register to 1.

TSBTCS[2:0], TSSS, TSP[3:0]: Bits in the RSCFDn(CFD)GCFG register

Note: When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Figure 14.8 Timestamp Function Block Diagram

14.8 Transmission Functions

There are three types of transmission. In classical CAN mode, transmittable payload length is 8 bytes in every transmission type. In CAN FD mode, transmittable payload length varies with transmission types.

- Transmission using transmit buffers:
  Each channel has 16 buffers. Transmittable payload length in CAN FD mode is 20 bytes. However, when transmit buffer merge mode is used, four buffers out of 16 buffers are allocated as a payload-only storage area and two buffers are able to transmit payloads with a length of more than 20 bytes.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Transmittable payload length in CAN FD mode is 64 bytes. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmittable payload length in CAN FD mode is 20 bytes. Transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

Figure 14.9 shows the allocation of transmit queues and transmit/receive FIFO buffer link.

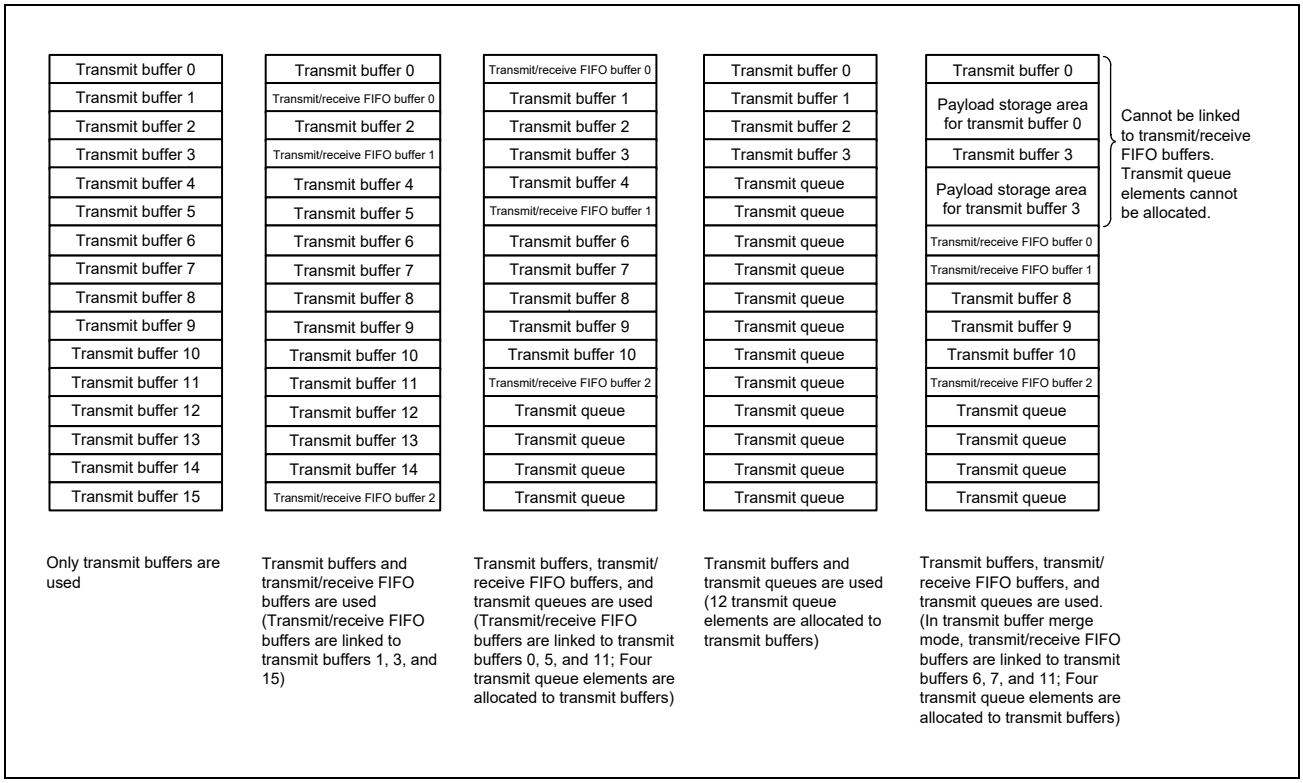


Figure 14.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

14.8.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

The priority is determined by using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCFDn(CFD)GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit. When a 2-bit ECC error is detected in the priority determination processing, no message is transmitted (only when the EEFE bit in the RSCANnGCFG register is 1 in classical CAN mode).

14.8.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCFDn(CFD)TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register (p = 0 to 63). When transmit completes successfully, the TMTRF[1:0] flag is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)).

14.8.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCFDn(CFD)TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCFDn(CFD)TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSp register is set to 01_B (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

14.8.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCFDn(CFD)TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10_B or 11_B. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to 01_B (transmit abort has been completed).

14.8.2.3 Transmit Buffer Merge Mode (Only in CAN FD Mode)

Transmit buffers can transmit messages with a payload length of 20 bytes, but can transmit messages with a payload length of up to 64 bytes by merging three transmit buffers in transmit buffer merge mode.

Setting the TMME bit to 1 in the RSCFDnCFDCmFDCFG register enables transmit buffer merge mode. In this mode, six buffers per channel become a merge area and two sets of transmit buffers (16 × m) + 0 to (16 × m) + 2 and transmit buffers (16 × m) + 3 to (16 × m) + 5 are merged. A transmission request is made by the first transmit buffer, and subsequent two buffers are used as a payload storage area. Do not set the transmission request bit (TMTR bit in the RSCFDnCFDTMCp register) and the transmission abort request bit (TMTAR bit in the RSCFDnCFDTMCp register) to 1 for transmit buffers except for the first buffer.

While transmit buffer merge mode is enabled, do not link the transmit/receive FIFO buffer to six merged buffers or allocate it to the transmit queue.

14.8.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 11). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register. When the CFE bit in the RSCFDn(CFD)CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, arbitration-lost or the transition to channel halt mode in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

14.8.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCFDn(CFD)CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RSCFDn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to 00_H.

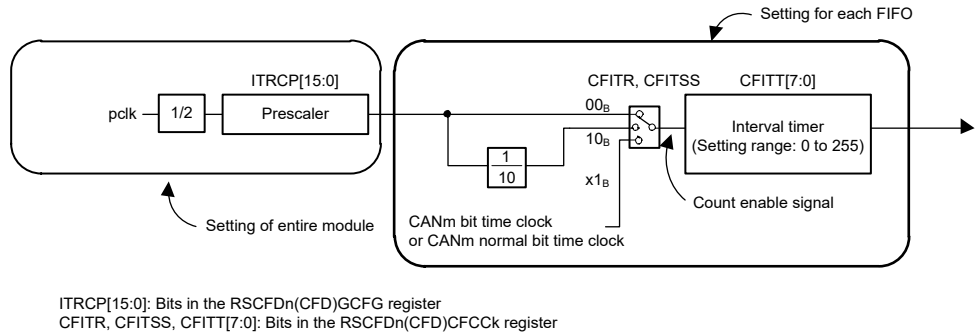
Select an interval timer count source using the CFITR and CFITSS bits in the RSCFDn(CFD)CFCCk register. When the CFITR and CFITSS bits are set to 00_B, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to 10_B, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits in the RSCFDn(CFD)GCFG register × 10). When the CFITR and CFITSS bits are set to $x1_B$, the CANm bit time clock becomes a count source in classical CAN mode and the nominal CANm bit time clock becomes a count source in CAN FD mode.

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00_B:

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times N$$

- When CFITR and CFITSS = 10_B:



$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = $x1_B$:

$$\text{Classical CAN mode} : \frac{1}{\text{CANm bit time clock frequency}} \times N$$

$$\text{CAN FD mode} : \frac{1}{\text{Nominal CANm bit time clock frequency}} \times N$$

Figure 14.10 shows the interval timer block diagram.

ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register
CFITR, CFITSS, CFITT[7:0]: Bits in the RSCFDn(CFD)CFCCk register

Note: m = 0 to 3, k = 0 to 11

Figure 14.10 Interval Timer Block Diagram

Figure 14.11 shows the interval timer timing diagram.

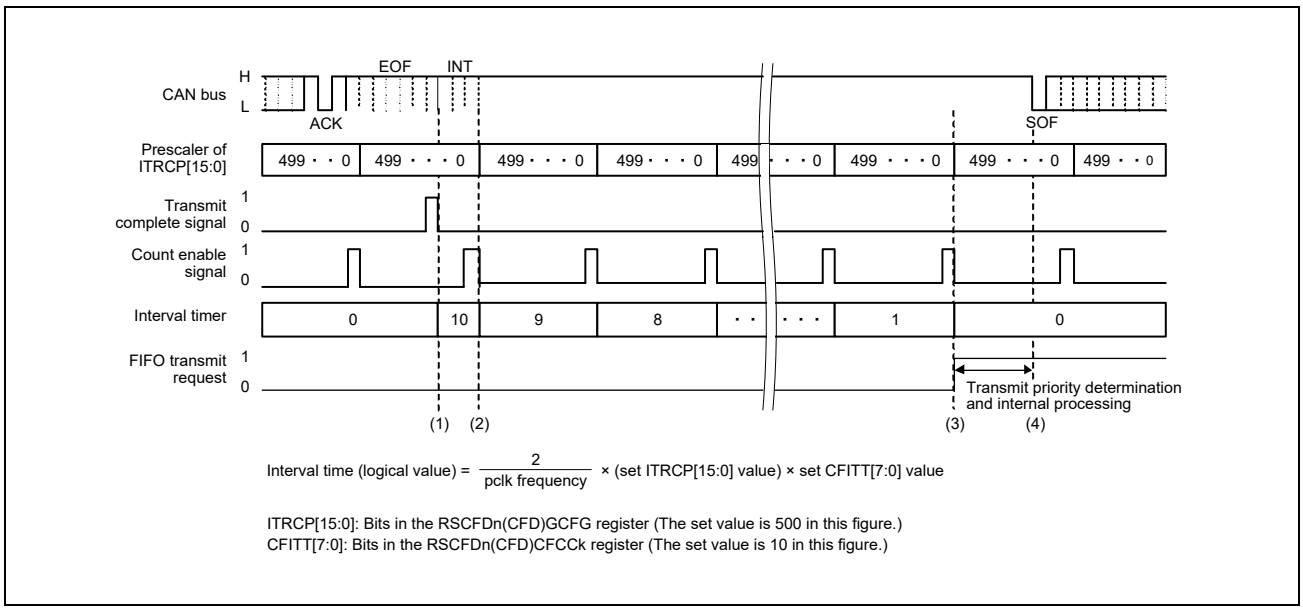


Figure 14.11 Interval Timer Timing Chart

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 1376 cycles of the pclk may be generated.

14.8.4 Transmission Using Transmit Queues

Three to sixteen buffers (up to 10 buffers in transmit buffer merge mode) are allocated to a transmit queue for each channel, and transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RSCFDn(CFD)TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCFDn(CFD)TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, arbitration-lost, or the transition to channel halt mode when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

14.8.5 Transmit Data Padding (Only in CAN FD Mode)

When the payload length indicated by the set DLC value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by CC_H.

This processing is performed in the following cases when the transmit buffer merge mode is disabled (TMME bit in the RSCFDnCFDCmFDCFG register is 0).

- Transmit/receive FIFO set to transmission or gateway mode:
  When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register
- Transmit buffer (including transmit queue):
  When the payload length of the transmit DLC exceeds 20 bytes

When the transmit buffer merge mode is enabled, no transmit data is padded in any transmission using a transmit buffer, transmit/receive FIFO buffer, or transmit queue. At this time, do not set a payload length more than the payload storage size of the buffer for transmitting as the DLC value in the transmit message.

14.8.6 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCFDn(CFD)THLCCm register. The THLEN bit in the RSCFDn(CFD)CFIDk register (k = 0 to 11) determines whether transmit history data is stored for each message. In classical CAN mode, the TMTSCE bit in the RSCANnGCFG register can be used to set whether to include a timestamp value in the transmit history data. In CAN FD mode, a timestamp value is always included.

The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.

Storage of the transmit history data after the successful completion of transmission may take up to 152 cycles of pclk in classical CAN mode or 420 cycles of pclk in CAN FD mode.

- Buffer type
  001_B: Transmit buffer
  010_B: Transmit/receive FIFO buffer
  100_B: Transmit queue
- Buffer number
  Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See **Table 14.180**.
- Label data
  Label information of the transmit message
- Timestamp
  Timestamp value of the transmit message
  (When the TMTSCE bit is 1 in classical CAN mode)

Table 14.180 Transmit History Data Buffer Numbers

Buffer type / Buffer No.	001_B	010_B	100_B
0000_B	Transmit buffer 16 × m + 0	Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 11)	Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission
0001_B	Transmit buffer 16 × m + 1		
0010_B	Transmit buffer 16 × m + 2		
0011_B	Transmit buffer 16 × m + 3		
0100_B	Transmit buffer 16 × m + 4		
0101_B	Transmit buffer 16 × m + 5		
0110_B	Transmit buffer 16 × m + 6		
0111_B	Transmit buffer 16 × m + 7		
1000_B	Transmit buffer 16 × m + 8		
1001_B	Transmit buffer 16 × m + 9		
1010_B	Transmit buffer 16 × m + 10		
1011_B	Transmit buffer 16 × m + 11		
1100_B	Transmit buffer 16 × m + 12		
1101_B	Transmit buffer 16 × m + 13		
1110_B	Transmit buffer 16 × m + 14		
1111_B	Transmit buffer 16 × m + 15		

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see **Section 14.7.1.6, Timestamp**.

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

14.9 Gateway Function

When a transmit/receive FIFO buffer is set to gateway mode, receive messages can be transmitted from an arbitrary channel without CPU intervention.

When the CFM[1:0] bits in the RSCFDn(CFD)CFCCk register are set to 10_B (gateway mode) for the transmit/receive FIFO buffer selected by the RSCFDn(CFD)GAFLP1_j register of a channel being used for transmission, messages that pass through filter processing according to the receive rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.

Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes the target of transmit priority determination.

Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the RSCFDn(CFD)CFCCk register to 0 and the CFEMP flag becomes 1 according to the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted and will not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when the message in it is being transmitted or will be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

14.9.1 CAN-CAN FD Gateway (Only in CAN FD Mode)

When the gateway function is used in CAN FD mode, a frame to be transmitted can be replaced with a classical CAN frame or a CAN FD frame.

Setting the GWEN bit in the RSCFDnCFDCmFDCFG register to 1 enables the CAN-CAN FD gateway. The FDF and BRS bits in the transmit frame can be selected by the GWFDF and GWBRS bits in the RSCFDnCFDCmFDCFG register. When the DLC value of the received CAN frame is 1001_B or more and the GWFDF bit is 1 (CAN FD frame), the DLC value is replaced with 1000_B.

When the CAN-CAN FD gateway is enabled, do not perform routing for the following frames.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

When the CAN-CAN FD gateway is enabled, the following frame shoudl be transmitted in the channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frame should be transmitted.
- When GWFDF bit is set to 1, only CAN FD frame should be transmitted.

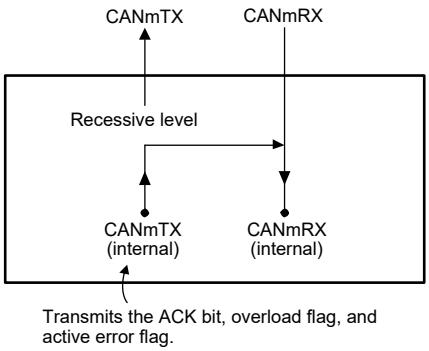
14.10 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
  - Restricted operation mode (only in CAN FD mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test [CRC error test enabled]

14.10.1 Standard Test Mode

CRC tests are enabled in standard test mode. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register when the message is a classical CAN frame (CRC length = 15 bits) or in the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register when the message is a CAN FD frame (CRC length = 17 or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see **Section 14.10.6.1, CRC Error Test**.



14.10.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

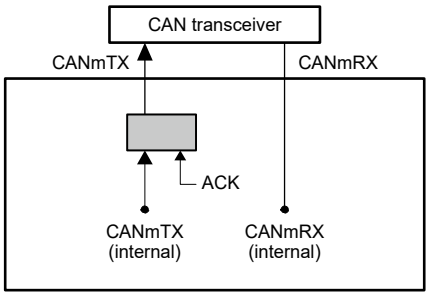
Figure 14.12 shows the connection when listen-only mode is selected.

Note: m = 0 to 3

Figure 14.12 Connection when Listen-Only Mode is Selected

14.10.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).



If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

14.10.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

Figure 14.13 shows the connection when self-test mode 0 is selected.

Note: m = 0 to 3

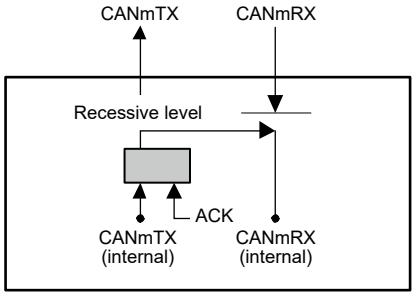


Figure 14.13 Connection when Self-Test Mode 0 is Selected

14.10.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin (m = 0 to 3) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

Figure 14.14 shows the connection when self-test mode 1 is selected.

Note: m = 0 to 3

Figure 14.14 Connection when Self-Test Mode 1 is Selected

14.10.4 Restricted Operation Mode (Only in CAN FD Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the bus idle state comes for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error.

A desired transmission request can be made for transmission without restrictions.

14.10.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCFDn(CFD)GTSTCFG register. Data in the set page can be read from and written to the RSCFDn(CFD)RPGACCr register (r = 0 to 63). The available total RAM size is 10112 bytes (2780_H) in classical CAN mode or 14208 bytes (3780_H) in CAN FD mode. Do not access more than 128 bytes in the last page (classical CAN mode: RTMPS[6:0] = 27_H, CAN FD mode: RTMPS[6:0] = 37_H) during RAM test.

14.10.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.

Figure 14.15 shows the connection for inter-channel communication test.

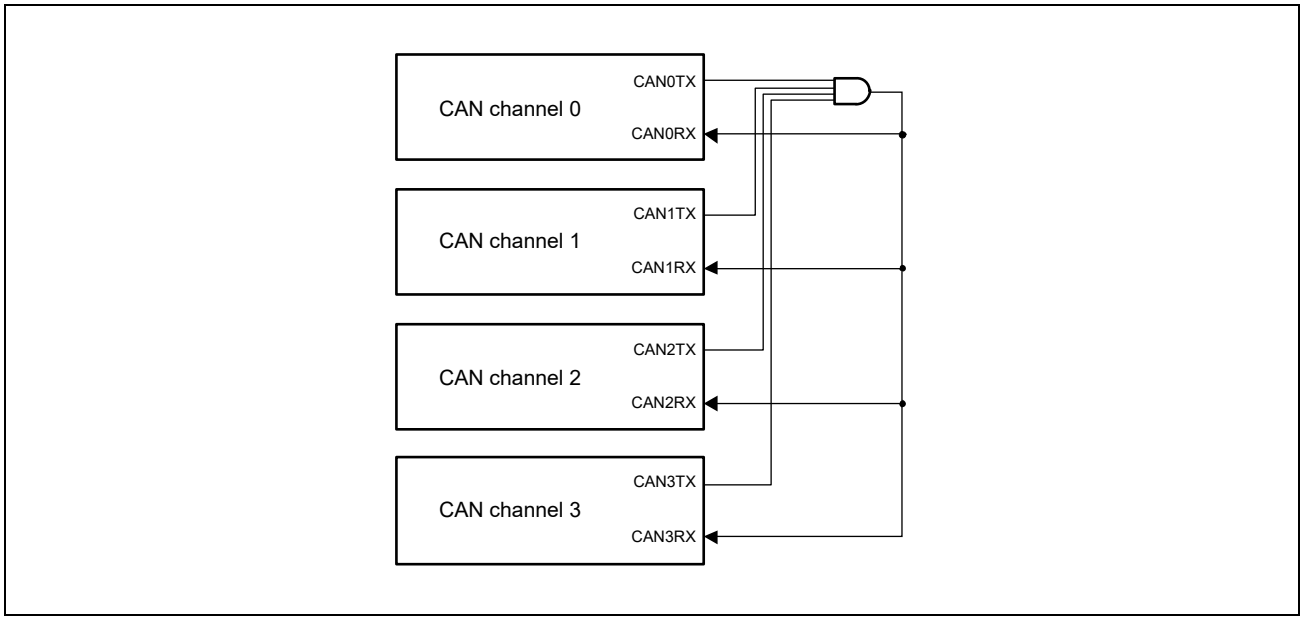

Figure 14.15 Connection for Inter-Channel Communication Test

14.10.6.1 CRC Error Test

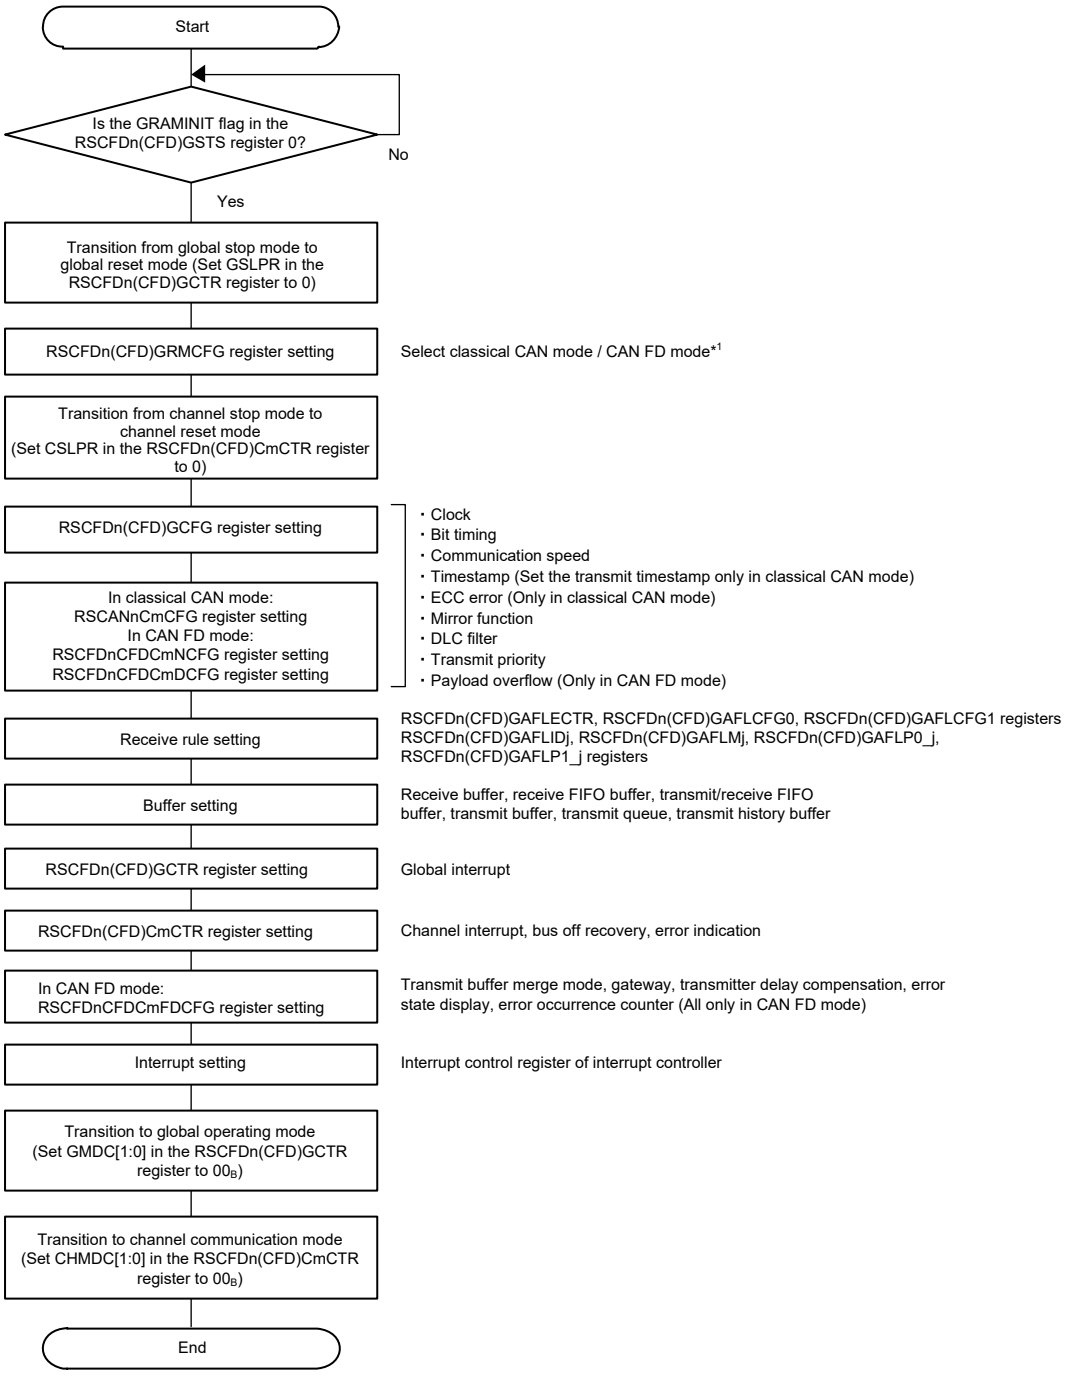
A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

Preconditions

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

Procedure

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RSCFDn(CFD)C0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RSCFDn(CFD)TMCp register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register or the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RSCFDm(CFD)C0ERFL is 1 (CRC error detected).



The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID's upper 5-bit value is 10000_B or ID's upper 6-bit value is 011111_B is received.

The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

14.11 RS-CANFD Setting Procedure

14.11.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 7586 cycles of the pclk. The GRAMINIT flag in the RSCFDn(CFD)GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 14.16** shows the CAN setting procedure after the MCU is reset.

Note 1. RSCANnGRMCFG and RSCFDnCFDGRMCFG are the same register. Set either of these registers.

Note: m = 0 to 3, j = 0 to 15

Figure 14.16 CAN Setting Procedure after the MCU is Reset

14.11.1.1 Clock Setting

Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk_xincan or clkc using the DCS bit in the RSCFDn(CFD)GCFG register.

14.11.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding registers for each channel. In classical CAN mode, set these two segments in the RSCANnCmCFG register. Two bit rates (nominal bit rate and data bit rate) are provided for CAN FD mode. Set the nominal bit rate in the RSCFDnCFDCmNCFG register and set the data bit rate in the RSCFDnCFDCmDCFG register. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RSCFDn(CFD)GCFG register. Set a division ratio by the BRP[9:0] bits in the RSCANnCmCFG register in classical CAN mode (CANmTq clock), and by the NBRP[9:0] bits in the RSCFDnCFDCmNCFG register and the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register in CAN FD mode (CANmTq(N) clock and CANmTq(D) clock). ISO11898-1:2015 grants different frequency division ratios for the ordinary bit rate and the data bit rate. If different values are set for these rates, however, it becomes likely that CAN nodes become out-of-synchronization when the active bit rate switches from the ordinary bit rate to the data bit rate. Thus, the NBRP[9:0] value and the DBRP[7:0] value should be equal and the two bit rate values be different according to the respective segment values.

Figure 14.17 shows the bit timing chart. **Table 14.181** shows an example of bit timing setting.

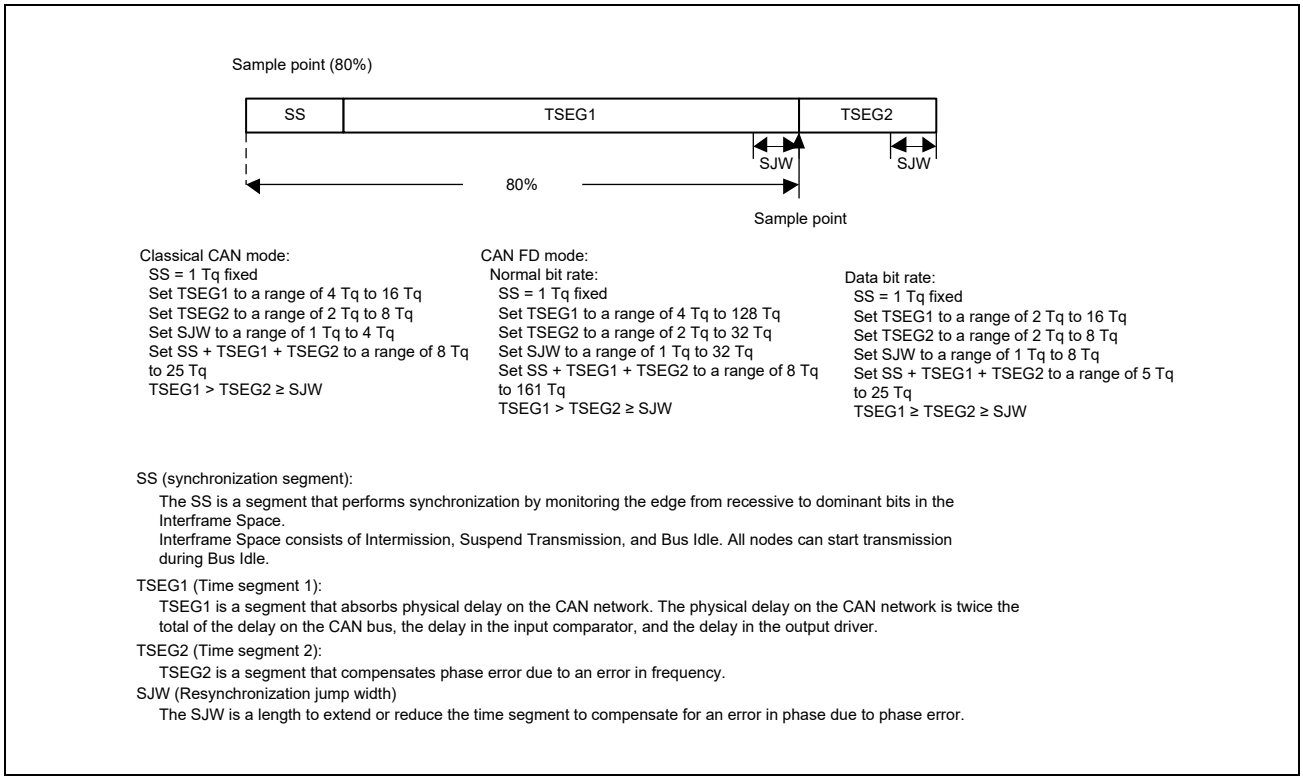


Figure 14.17 Bit Timing Chart

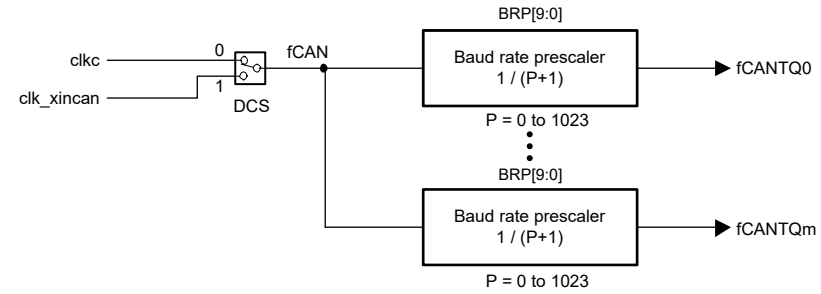
Table 14.181 Example of Bit Timing Setting

	Set Value (Tq)				Sample Point (%)
1 Bit	SS	TSEG1	TSEG2	SJW	**Note:** See **Figure 14.17**.
5Tq*1	1	2	2	1	60.00
8Tq	1	4	3	1	62.50
	1	5	2	1	75.00
10Tq	1	6	3	1	70.00
	1	7	2	1	80.00
16Tq	1	10	5	1	68.75
	1	11	4	1	75.00
20Tq	1	12	7	1	65.00
	1	13	6	1	70.00
50Tq*1	1	39	10	4	80.00



Note 1. Only in CAN FD mode

14.11.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. For CAN FD mode, set two types of transmission rate (arbitration phase and data phase) for each channel.

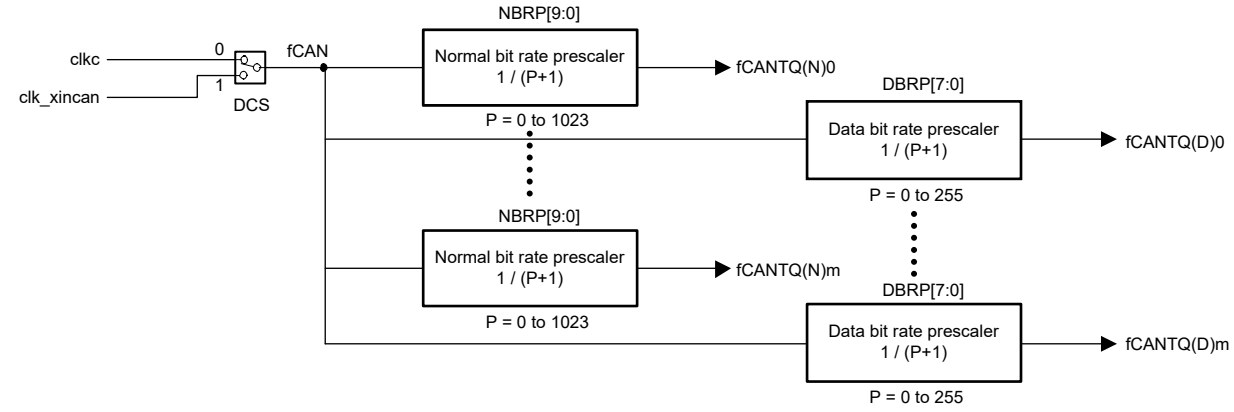


Figure 14.18 shows the CAN clock control block diagram, and **Table 14.182**, **Table 14.183** shows an example of the communication speed setting.

Classical CAN mode:

$$\text{Communication speed} = \frac{\text{fCAN}}{\text{Baud rate prescaler division value} \times (\text{Tq count of 1 bit time})}$$

CAN FD mode:

$$\text{Normal bit rate} = \frac{\text{fCAN}}{\text{Normal bit rate prescaler division value x (Tq count of 1 normal bit time)}}$$

$$\text{Data bit rate} = \frac{\text{fCAN}}{\text{Data bit rate prescaler division value x (Tq count of 1 data bit time)}}$$

Note: m = 0 to 3
DCS: Bit in the RSCFDn(CFD)GCFG register
BRP[9:0]: Bits in the RSCANnCmCFG register
NBRP[9:0]: Bits in the RSCFDnCFDCmNCFG register
DBRP[7:0]: Bits in the RSCFDnCFDCmDCFG register
fCAN: CAN clock
fCANTQm: CANmTq clock
fCANTQ(N)m: CANmTq(N) clock
fCANTQ(D)m: CANmTq(D) clock

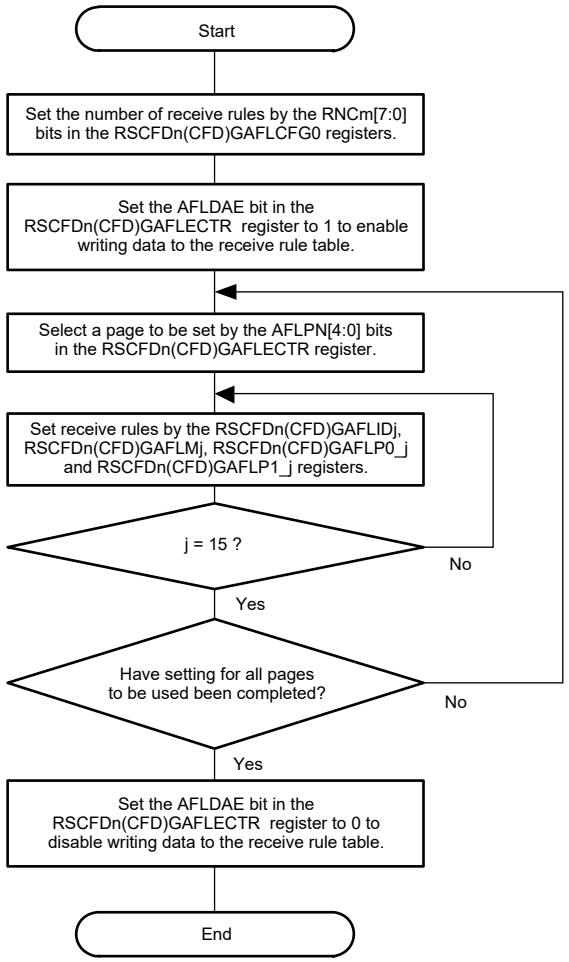
Figure 14.18 CAN Clock Control Block Diagram

Table 14.182 Example of Communication Speed Setting (Classical CAN mode)

fCAN / Communication Speed	40 MHz	20 MHz
1 Mbps	8 Tq (5) 20 Tq (2)	10 Tq (2) 20 Tq (1)
500 Kbps	8 Tq (10) 20 Tq (4)	10 Tq (4) 20T Tq (2)
250 Kbps	8 Tq (20) 20 Tq (8)	10 Tq (8) 20 Tq (4)
125 Kbps	8 Tq (40) 20 Tq (16)	10 Tq (16) 20 Tq (8)

Table 14.183 Example of Transmission Rate Setting (Nominal Bit Rate and Data Bit Rate in CAN FD Mode)

fCAN / Communication Rate	40 MHz	20 MHz
Nominal bit rate 1 Mbps Data bit rate 5 Mbps	Nominal bit rate 40 Tq (1) Data bit rate 8 Tq (1)	-
Nominal bit rate 500 Kbps Data bit rate 2 Mbps	Nominal bit rate 80 Tq (1) Data bit rate 20 Tq (1)	Nominal bit rate 40 Tq (1) Data bit rate 10 Tq (1)



Note: Values in ( ) are baud rate prescaler division values.

14.11.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 23 (for 6-channel unit) by the AFLPN[4:0] bits in the RSCFDn(CFD)GAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.

Figure 14.19 shows the receive rule setting procedure.

Note: m = 0 to 3, j = 0 to 15

Figure 14.19 Receive Rule Setting Procedure

14.11.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. Also set the payload storage size for CAN FD mode. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

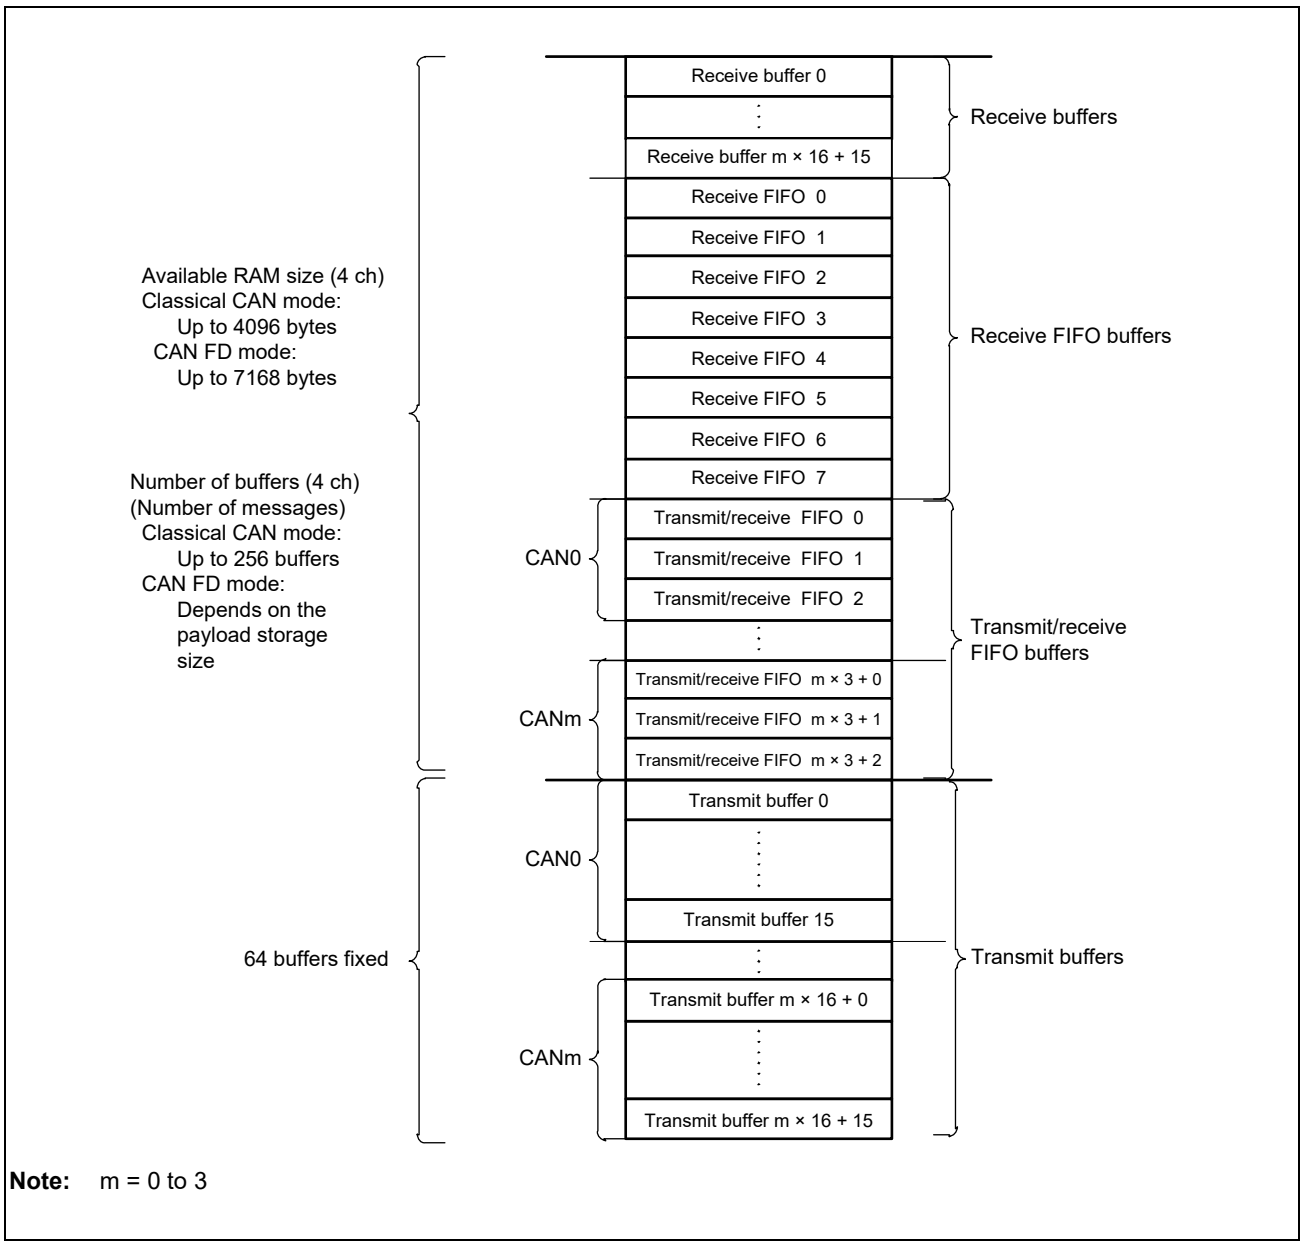
In classical CAN mode, up to 4096 bytes of the RAM can be used in receive buffers and FIFO buffers. Up to 256 buffers are available, and 16 bytes are used per buffer. Configure the buffers so that the following conditions are met.

Number of receive buffers
+ total number of depth of receive FIFO buffers x
+ total number of depth of transmit/receive FIFO buffers k ≤ 256 buffers

In CAN FD mode, up to 7168 bytes of the RAM can be used in receive buffers and FIFO buffers. Configure the buffers so that the following conditions are met.

Number of receive buffers × (12 + payload storage size)
+ total of (number of depth × (12 + payload storage size)) of receive FIFO buffers x
+ total of (number of depth × (12 + payload storage size)) of transmit/receive FIFO buffers k ≤ 7168 bytes

Figure 14.20 shows the buffer configuration. **Figure 14.21** shows the buffer setting procedure.



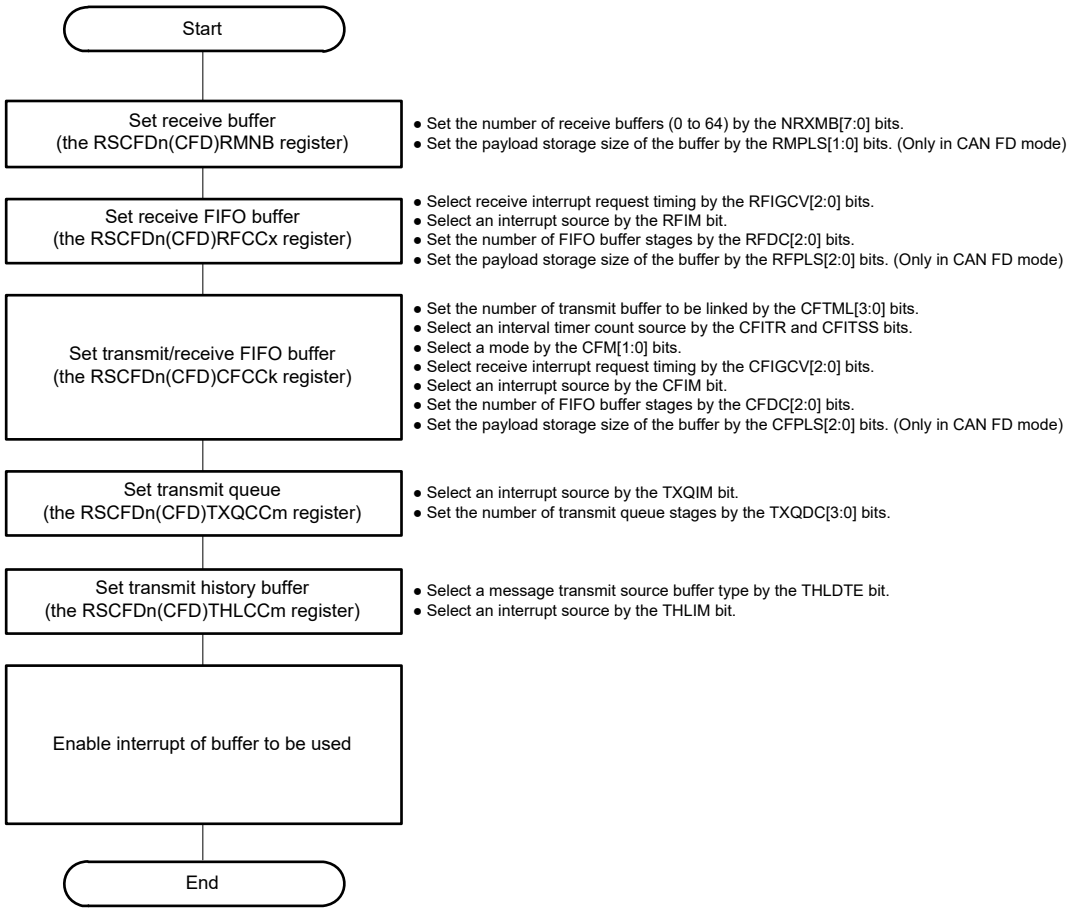


Figure 14.20 Buffer Configuration

CAUTION

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.

Note: k = 0 to 11, x = 0 to 7

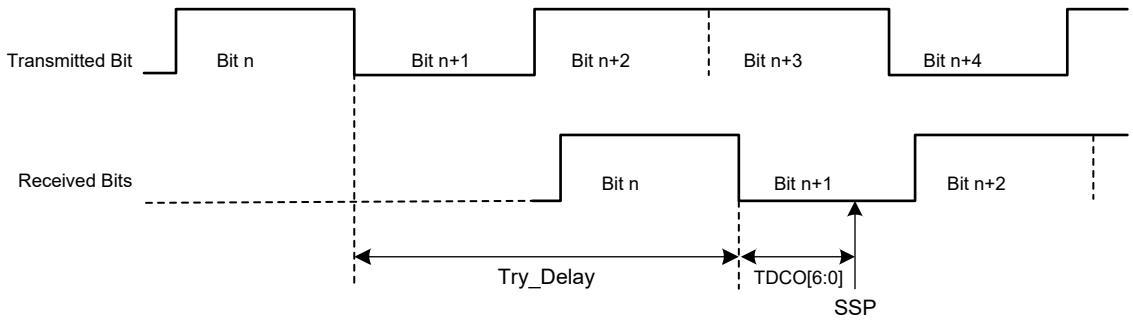

Figure 14.21 Buffer Setting Procedure

14.11.1.6 Transmitter Delay Compensation (Only in CAN FD Mode)

A high baud rate is used in CAN FD mode. Transmitter delay compensation is provided as a function to accept propagation delay in this case.

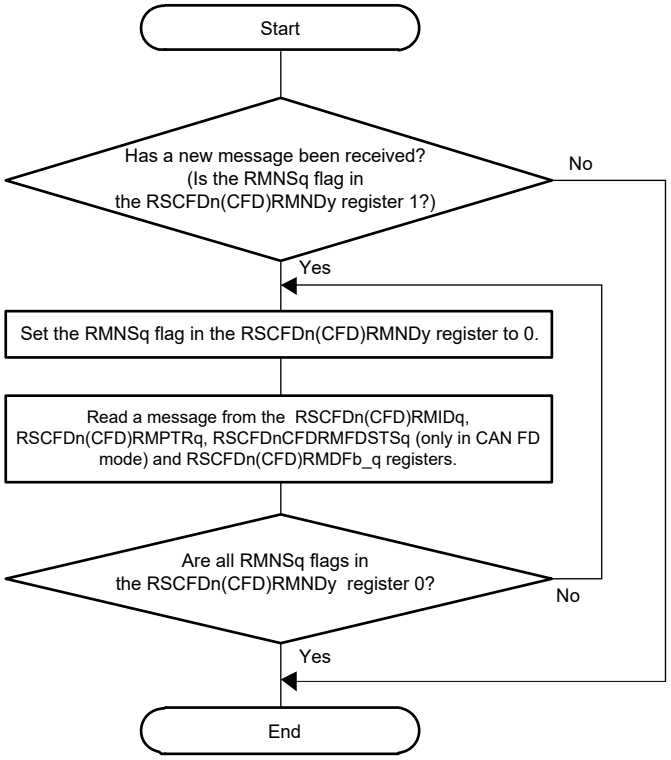
To use this function, set the TDCE bit in the RSCFDnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the SSP timing equals the total value of the delay measured by the RS-CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of Tq.) Usually, the TDCO[6:0] value must be equal to SS + TSEG1, the sample point timing

Note: Bit n: Desired bit of the data phase
TDCO[6:0]: Bits of the RSCFDnCFDCmFDCFG register

Figure 14.22 SSP Timing

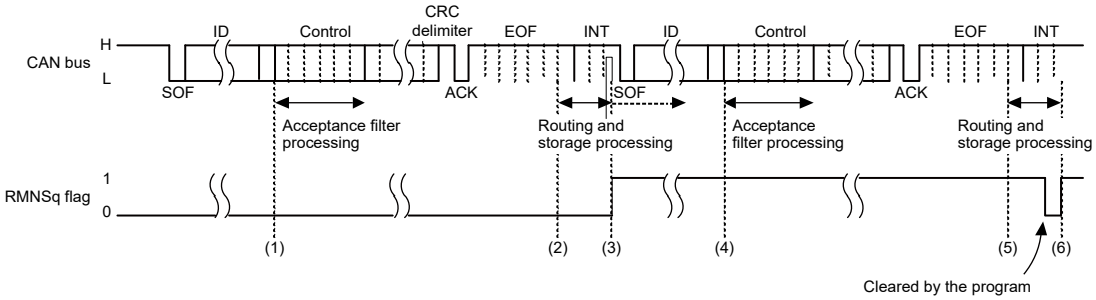
When the TDCOC bit is 1, the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RSCFDnCFDCmDCFG register is larger than 0, the TDCO[6:0] value is also rounded off to the nearest integer of Tq.)



The RS-CANFD module compensates a delay up to (3 CANm bit time - 2 fCAN). (CANm bit time is data bit rate value.)

If the TDCE bit of the RSCFDnCFDCmFDCFG register is 1 (enabling transmitter delay compensation), set the NBRP[9:0] and DBRP[7:0] bits to the same value equal to or less than 1.

14.11.2 Reception Procedure



14.11.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCFDn(CFD)RMNDy register (y = 0, 1, q = 0 to 63) is set to 1 (receive buffer q contains a new message). Messages can be read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq (only in CAN FD mode), and RSCFDn(CFD)RMDFb_q (b = 0 or 1 in classical CAN mode, b = 0 to 4 in CAN FD mode). **Figure 14.23** shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q.

Note: y = 0, 1, q = 0 to 63, b = 0 to 1 (classical CAN mode), 0 to 4 (CAN FD mode)

Figure 14.23 Receive Buffer Reading Procedure

Note: y = 0, 1, q = 0 to 63
RMNSq: Flag in the RSCFDn(CFD)RMNDy register

Figure 14.24 Receive Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

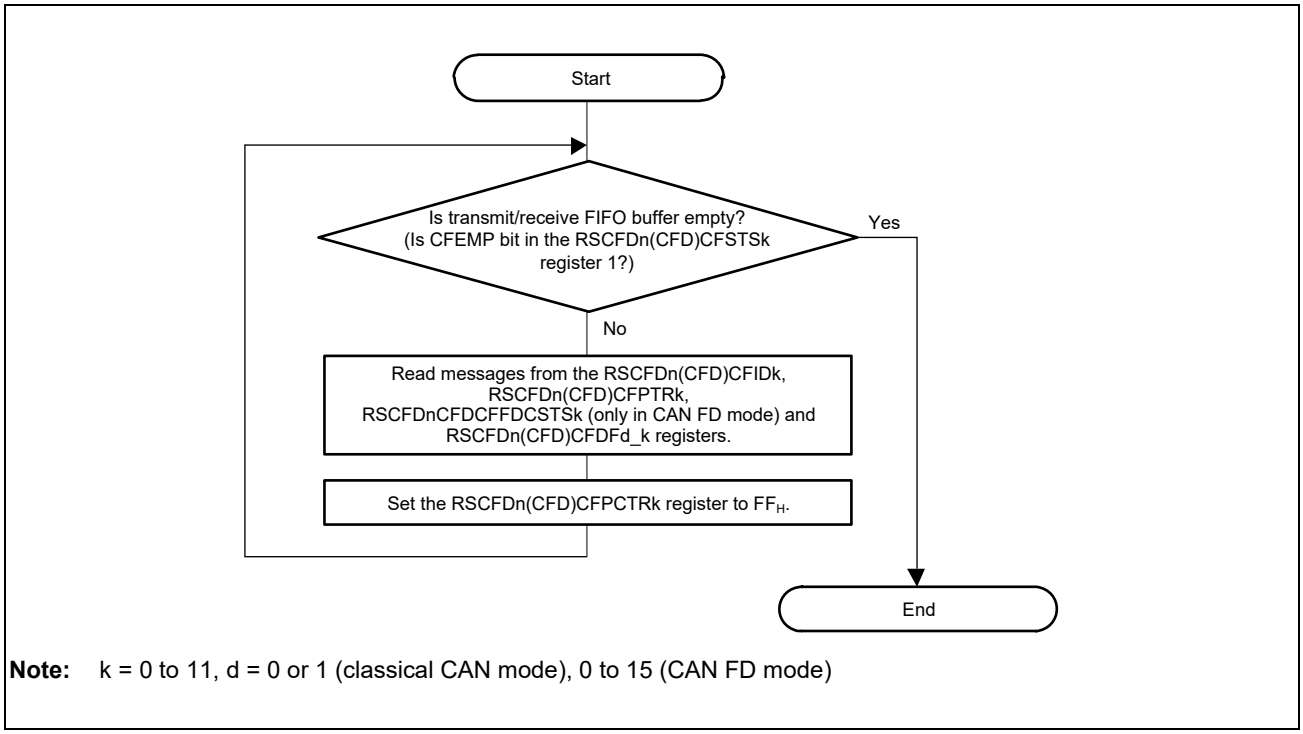
(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCFDn(CFD)RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.



14.11.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register (k = 0 to 11)) is incremented. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCFDn(CFD)RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCFDn(CFD)CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx (only in CAN FD mode), and RSCFDn(CFD)RFDFd_x (d = 0 or 1 in classical CAN mode, d = 0 to 15 in CAN FD mode) registers for receive FIFO buffers, or from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk (only in CAN FD mode), and RSCFDn(CFD)CFDFd_k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

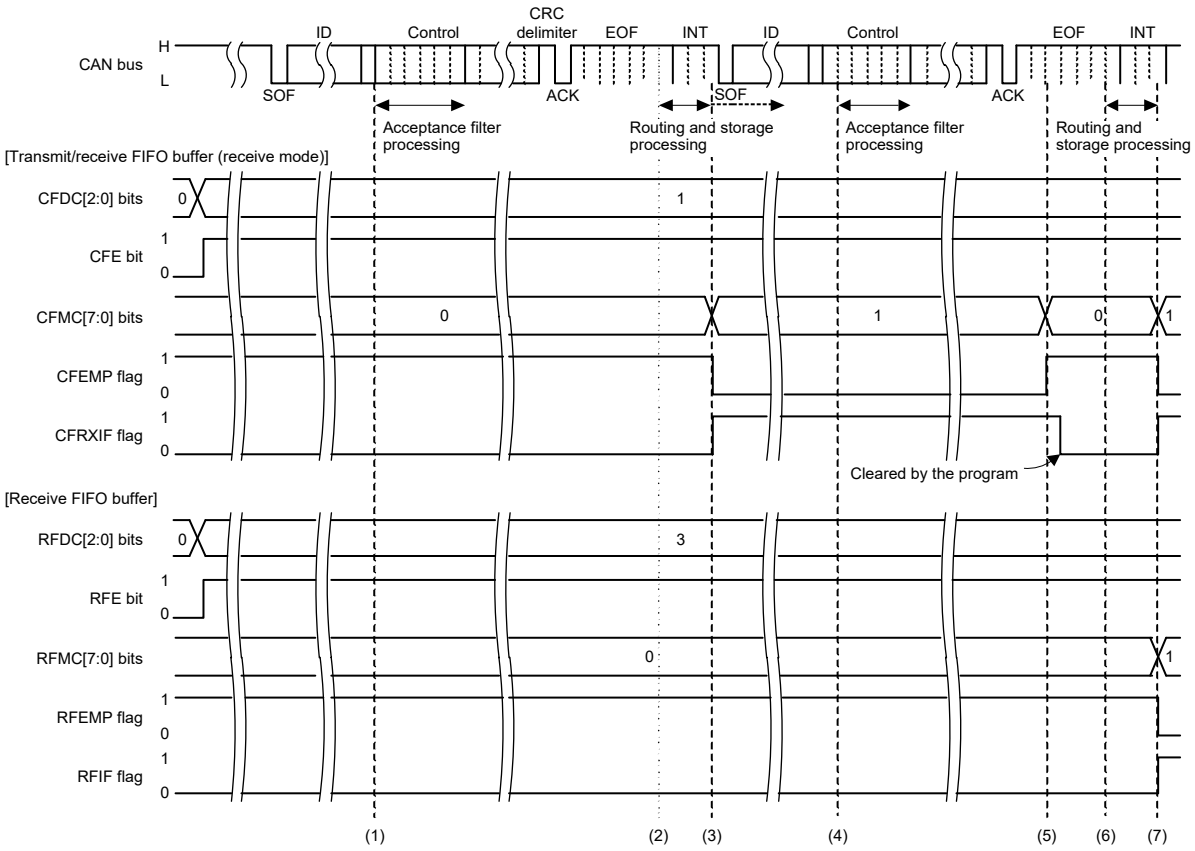
When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register or the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCFDn(CFD)RFSTSx register or the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCFDn(CFD)RFSTSx register or CFRXIF flag in the RSCFDn(CFD)CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.

Note: k = 0 to 11, d = 0 or 1 (classical CAN mode), 0 to 15 (CAN FD mode)

Figure 14.25 Transmit/Receive FIFO Buffer Reading Procedure



When reading a message in CAN FD mode, do not read the RSCFDnCFDRFDFd_x or RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 14.184 Payload Storage Area of Receive FIFO Buffer

Set RFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF1_x
001_B	12 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF2_x
010_B	16 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF3_x
011_B	20 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF4_x
100_B	24 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF5_x
101_B	32 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF7_x
110_B	48 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF11_x
111_B	64 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF15_x

Table 14.185 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001_B	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010_B	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011_B	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100_B	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101_B	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110_B	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111_B	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k

Note: k = 0 to 11, x = 0 to 7
CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFRXIF: Flags in the RSCFDn(CFD)CFSTSk register
RFDC[2:0], RFE: Bits in the RSCFDn(CFD)RFCCx register
RFMC[7:0], RFEMP, RFIF: Flags in the RSCFDn(CFD)RFSTSx register

Figure 14.26 FIFO Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCFDn(CFD)CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCk register is 001_B or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCFDn(CFD)CFSTSk register is incremented and becomes 01_H. When the CFIM bit in the RSCFDn(CFD)CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCFDn(CFD)CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, and RSCFDn(CFD)CFDFd_k registers and write FF_H to the RSCFDn(CFD)CFPCTRk register. This causes the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register to be decremented. When CFMC[7:0] becomes 00_H, the CFEMP flag in the RSCFDn(CFD)CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001_B or more. The CFMC[7:0] bit value is incremented by 1 to be 01_H. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCFDn(CFD)RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register are set to 001_B or more. The RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register are set to 01_H by being incremented by 1. When the RFIM bit in the RSCFDn(CFD)RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCFDn(CFD)RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

14.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer

In CAN FD mode, the following FIFO buffers can be read by DMA transfer.

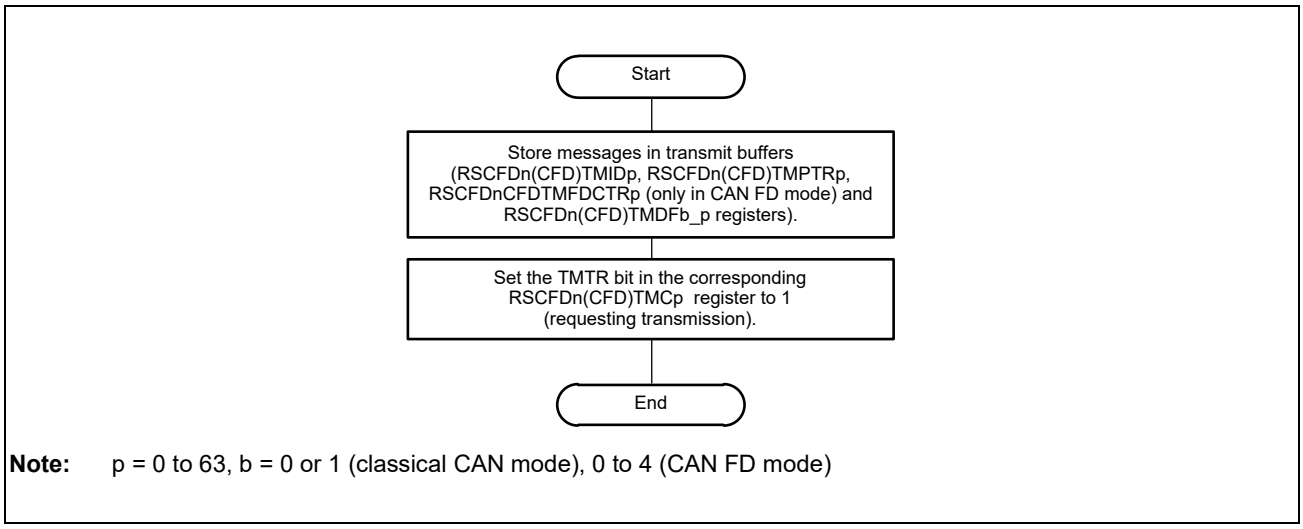
- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k allocated to channel m (k = 3 × m, m = 0 to 3)

The DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) can be set at any time. However, before setting the DMA enable bit to 1 (to enable DMA transfer requests), set the receive interrupt enable bit (RFIE bit in the RSCFDnCFDRFCCx register or CFRXIE bit in the RSCFDnCFDCFCCk register) of related FIFO buffers to 0 (to disable interrupts). When DMA transfer requests are enabled, do not write a value to the FIFO control register (RSCFDnCFDRFCCx register or RSCFDnCFDCFCCk register).

When an unread message is remaining in a DMA transfer-enabled FIFO buffer, a DMA transfer request trigger is generated. Specify the FIFO access register*[1] address for the transfer source address, and adjust the transfer size so that data can be read to the end of the payload storage area with a single trigger. The end of the payload storage area depends on the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

After the end of the payload stored in the FIFO buffer has been read, the RFMC[7:0] value in the RSCFDnCFDRFSTSx register or the CFMC[7:0] value in the RSCFDnCFDCFSTSk register is automatically decremented. After that, if an unread message is remaining in the FIFO buffer, a trigger is generated again.

When the RFDMAEx or CFDMAEm bit is set to 0 (to disable DMA transfer requests) during DMA transfer, wait until the DMA transfer status (RFDMASTSx or CFDMASTSm bit in the RSCFDnCFDCDTSTS register) is cleared to 0 (DMA transfer disabled), and then start the next processing (enabling DMA transfer again etc.). When disabling DMA transfer, examine how to process a message remaining in the FIFO buffer and a newly arriving message. When the FIFO buffer is enabled, it continues to receive messages.



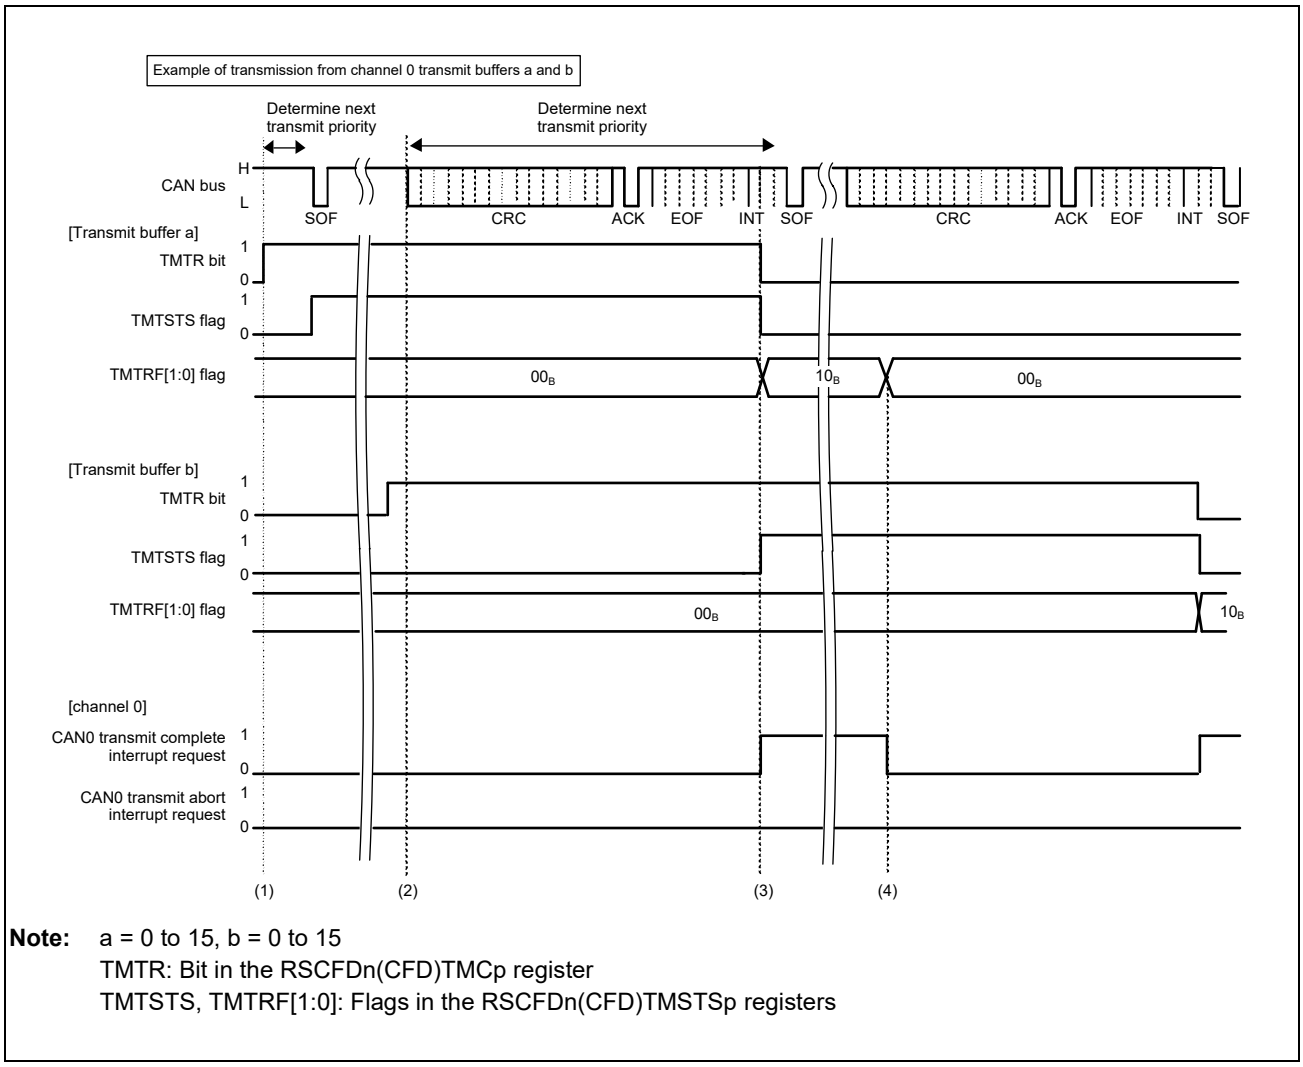
Note 1. • For receive FIFO buffers
RCFDCnCFDRFIDx, RCFDCnCFDRFPTRx, RCFDCnCFDRFFDSTSx, RCFDCnCFDRFDFd_x
• For transmit/receive FIFO buffers
RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, RCFDCnCFDCFDFd_k

14.11.3 Transmission Procedure

14.11.3.1 Procedure for Transmission from Transmit Buffers

Figure 14.27 shows the procedure for transmission from transmit buffers.

Figure 14.28 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 14.29** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.



Note: p = 0 to 63, b = 0 or 1 (classical CAN mode), 0 to 4 (CAN FD mode)

Figure 14.27 Procedure for Transmission from Transmit Buffers

In CAN FD mode and transmit buffer merge mode, messages with a payload size of more than 20 bytes can be transmitted from transmit buffers (16 × m) + 0 and transmit buffers (16 × m) + 3. At this time, transmit buffers (16 × m) + 1 to (16 × m) + 2 and transmit buffers (16 × m) + 4 to (16 × m) + 5 are allocated as a payload storage area. Registers RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, and RSCFDnCFDTMFDCTRp corresponding to these buffers can be used as data field registers that can store 4-byte data bytes (payload) like the RSCFDnCFDTMDFb_p register. **Table 14.186** shows message storage registers when transmitting a message with a payload size of more than 20 bytes from transmit buffer 0.

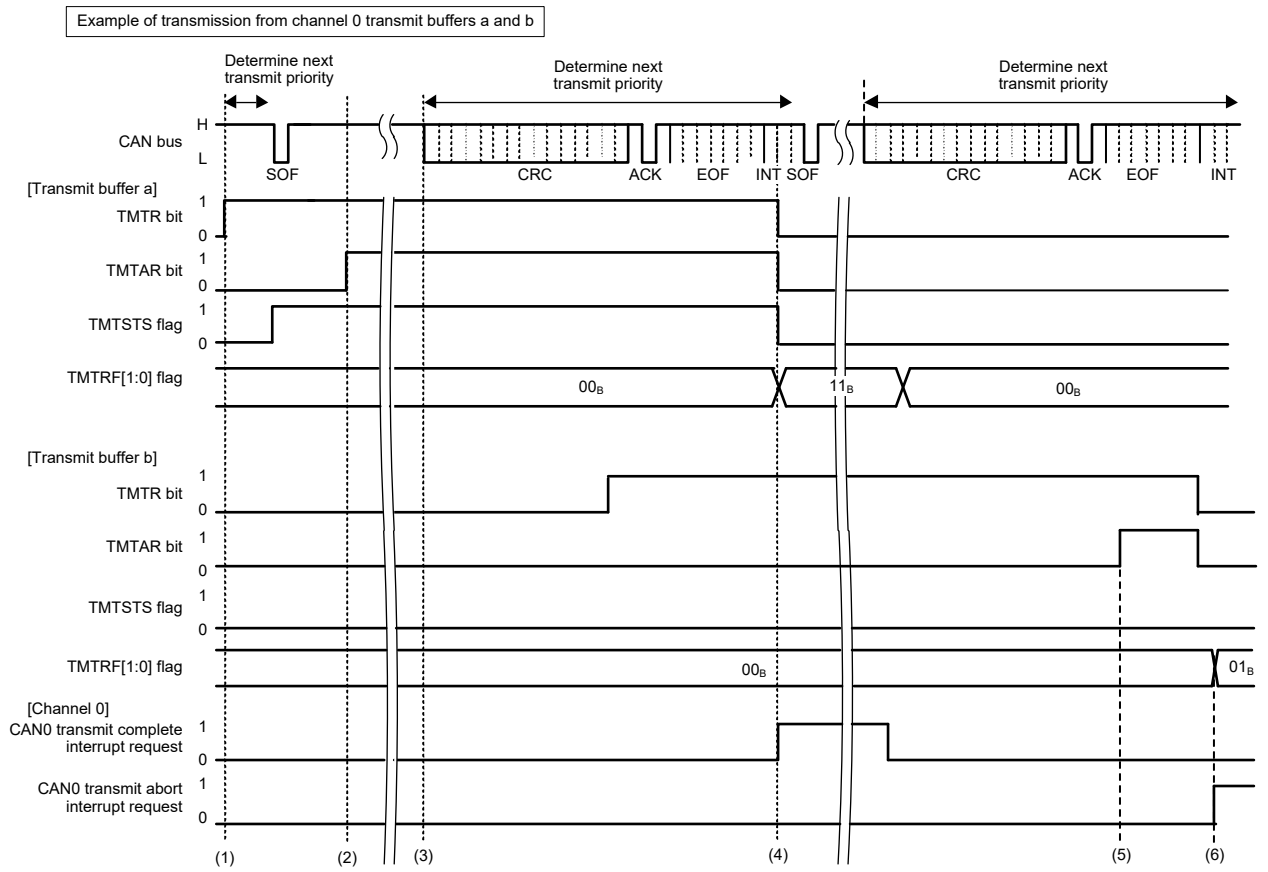
Table 14.186 Message Storage Registers in Transmit Buffer Merge Mode (Example of Transmit Buffer 0)

Transmit Buffer	Offset from Base Address	Symbol	Register Function in Transmit Buffer Merge Mode
Transmit buffer 0	4000_H	RSCFDnCFDTMID0	Transmit buffer 0 ID data, transmit history data store enable bit, RTR bit,and IDE bit
	4004_H	RSCFDnCFDTMPTR0	Transmit buffer 0 label data and DLC data
	4008_H	RSCFDnCFDTMFDCTR0	Transmit buffer 0 ESI bit, BRS bit, and FDF bit
	$400C_H$ to $401C_H$	RSCFDnCFDTMDF0_0 to RSCFDnCFDTMDF4_0	Transmit buffer 0 data bytes 0, 1, 2, and 3 to transmit buffer 0 data bytes 16, 17, 18, and 19
Transmit buffer 1	4020_H	RSCFDnCFDTMID1	Transmit buffer 0 data bytes 20, 21, 22, and 23
	4024_H	RSCFDnCFDTMPTR1	Transmit buffer 0 data bytes 24, 25, 26, and 27
	4028_H	RSCFDnCFDTMFDCTR1	Transmit buffer 0 data bytes 28, 29, 30, and 31
	$402C_H$ to $403C_H$	RSCFDnCFDTMDF0_1 to RSCFDnCFDTMDF4_1	Transmit buffer 0 data bytes 32, 33, 34, and 35 to transmit buffer 0 data bytes 48, 49, 50, and 51
Transmit buffer 2	4040_H	RSCFDnCFDTMID2	Transmit buffer 0 data bytes 52, 53, 54, and 55
	4044_H	RSCFDnCFDTMPTR2	Transmit buffer 0 data bytes 56, 57, 58, and 59
	4048_H	RSCFDnCFDTMFDCTR2	Transmit buffer 0 data bytes 60, 61, 62, and 63
	$404C_H$ to $405C_H$	RSCFDnCFDTMDF0_2 to RSCFDnCFDTMDF4_2	Not used

Note: a = 0 to 15, b = 0 to 15
TMTR: Bit in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp registers

Figure 14.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.



(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to 10_B (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa bit in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to 00_B. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00_B.

If an arbitration-lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (in classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1).

Note: a = 0 to 15, b = 0 to 15
TMTR, TMTAR: Bits in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp register

Figure 14.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

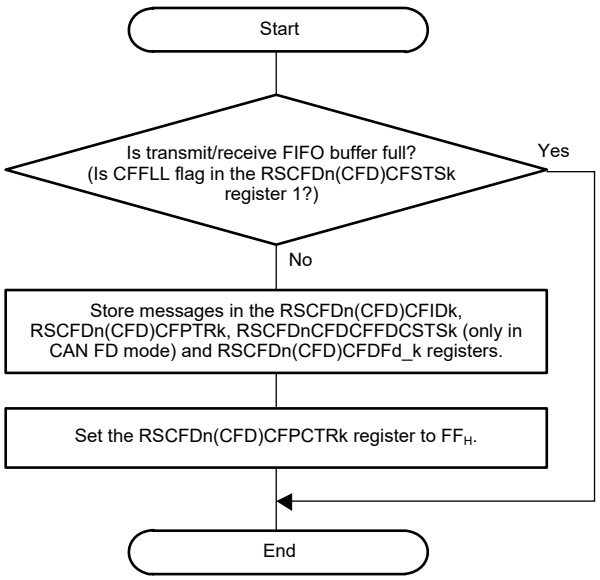
(2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts at the first bit of the CRC field for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to 11_B (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa value in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01_B. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01_B. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCFDn(CFD)CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B.



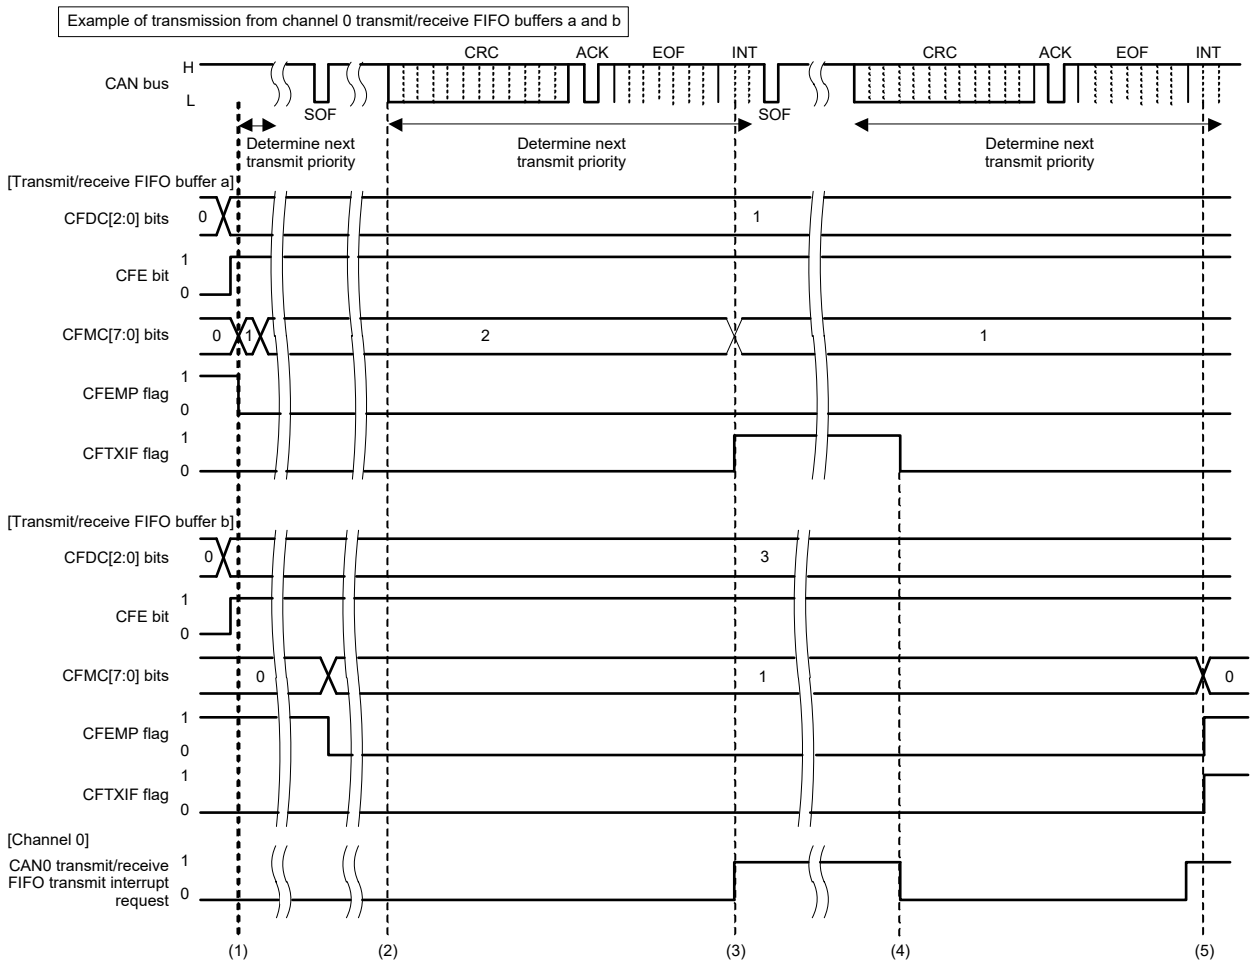
If an arbitration loss has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (in classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1).

14.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure 14.30 shows the procedure for transmission from transmit/receive FIFO buffers.

Figure 14.31 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 14.32** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.



Note: k = 0 to 11, d = 0 or 1 (classical CAN mode), 0 to 15 (CAN FD mode)

Figure 14.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

When storing a message, do not write a value to the RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

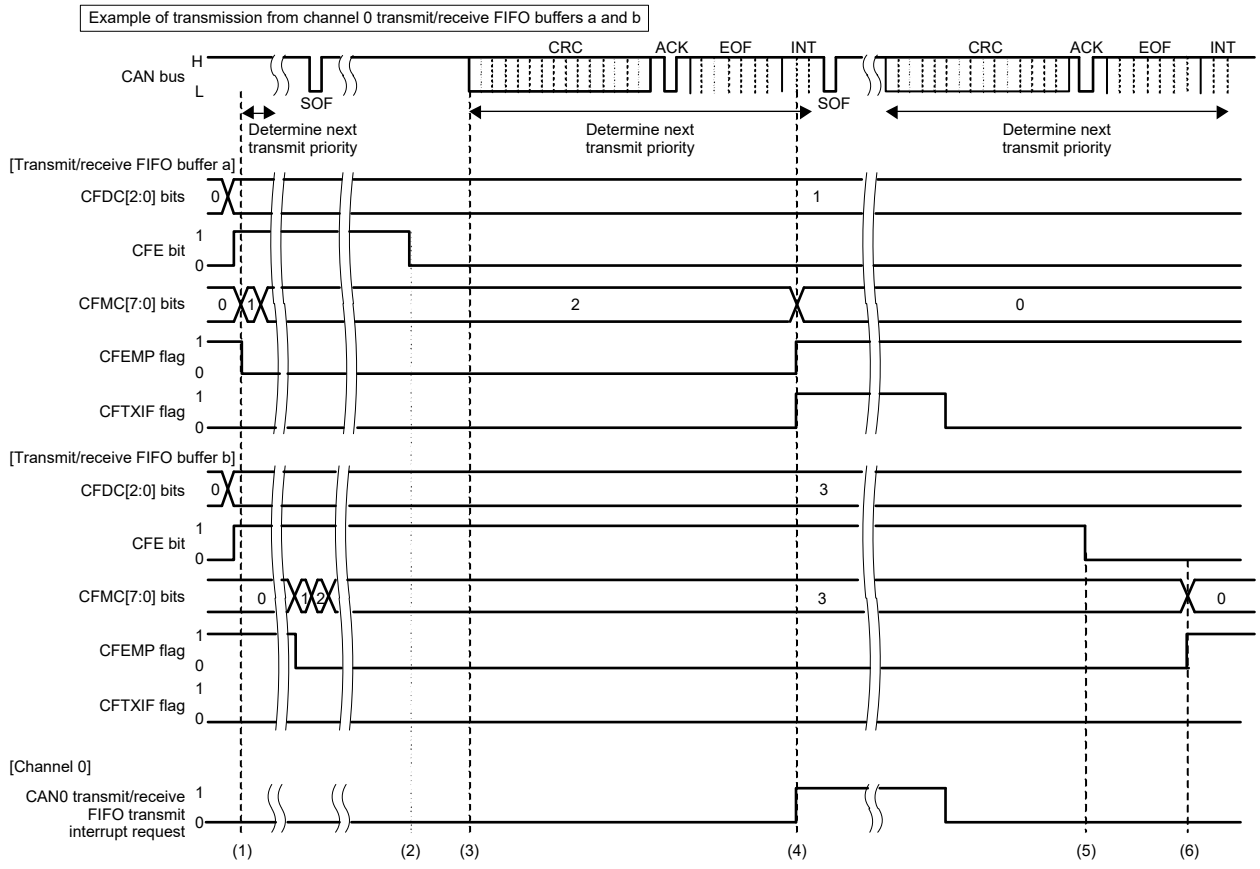
Table 14.187 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001_B	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010_B	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011_B	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100_B	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101_B	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110_B	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111_B	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k

Note: a = 0 to 2, b = 0 to 2
CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 14.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.



(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is decremented. Setting the CFIM bit in the RSCFDn(CFD)CFCCa register to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSb register is decremented. The CFMC[7:0] bits are cleared to 00_H and therefore the CFEMP flag in the RSCFDn(CFD)CFSTSb register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCFDn(CFD)CFSTSa and RSCFDn(CFD)CFSTSb register is set to 1 (the transmit/receive FIFO buffer is full).

Note: a = 0 to 2, b = 0 to 2
CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0] , CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 14.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

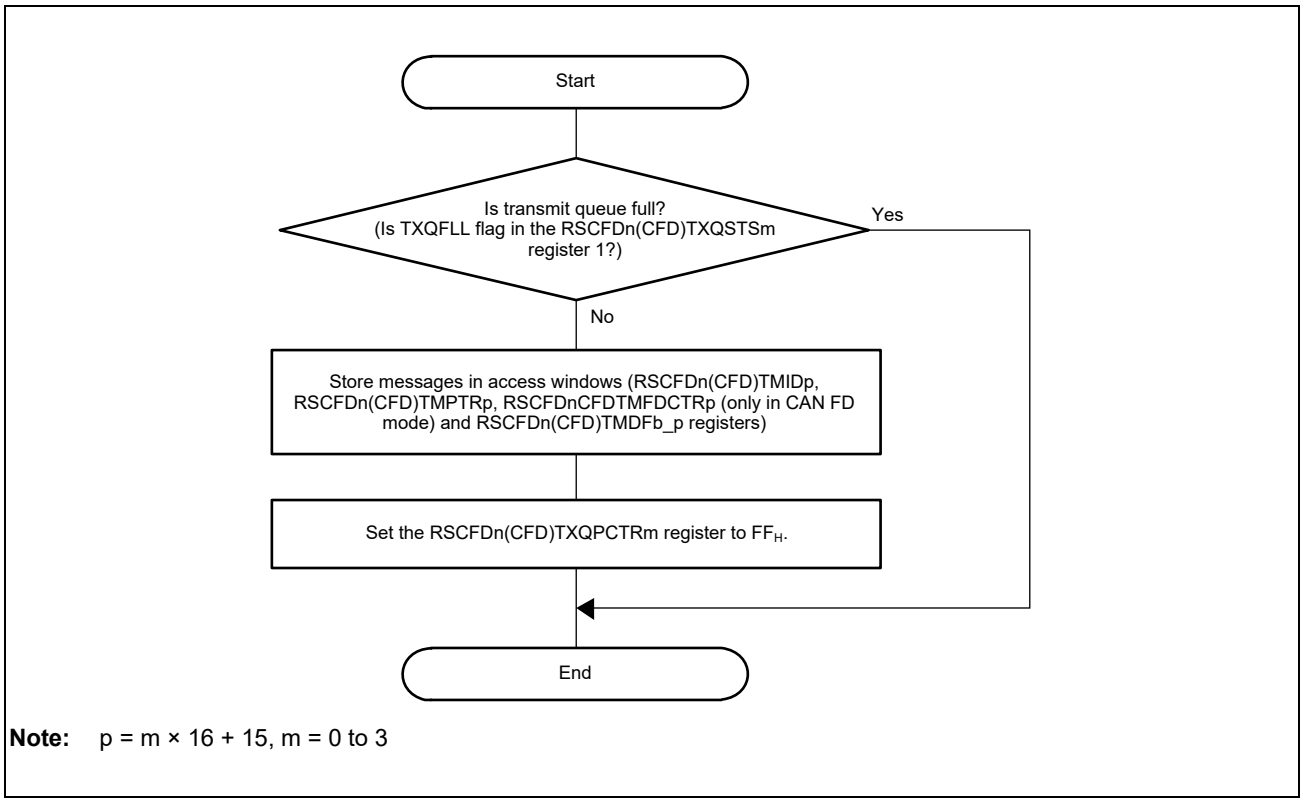
(4) When transmit completes successfully, the CFMC[7:0] value is cleared to 00_H. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffer b cannot be disabled immediately even if the CFE bit in the RSCFDn(CFD)CFCCb register is cleared to 0 (no transmit/receive FIFO buffer b is used) during transmit priority determination. (The CFEMP flag in the RSCFDn(CFD)CFSTSb register is not set to 1 (the transmit/receive FIFO buffer b contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffer b are disabled and the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSb register are cleared to 00_H and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer b is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer b is immediately disabled. (The CFMC[7:0] bits are cleared to 00_H and the CFEMP flag is set to 1.)

14.11.3.3 Procedure for Transmission from the Transmit Queue

Figure 14.33 shows the procedure for transmission from the transmit queue.



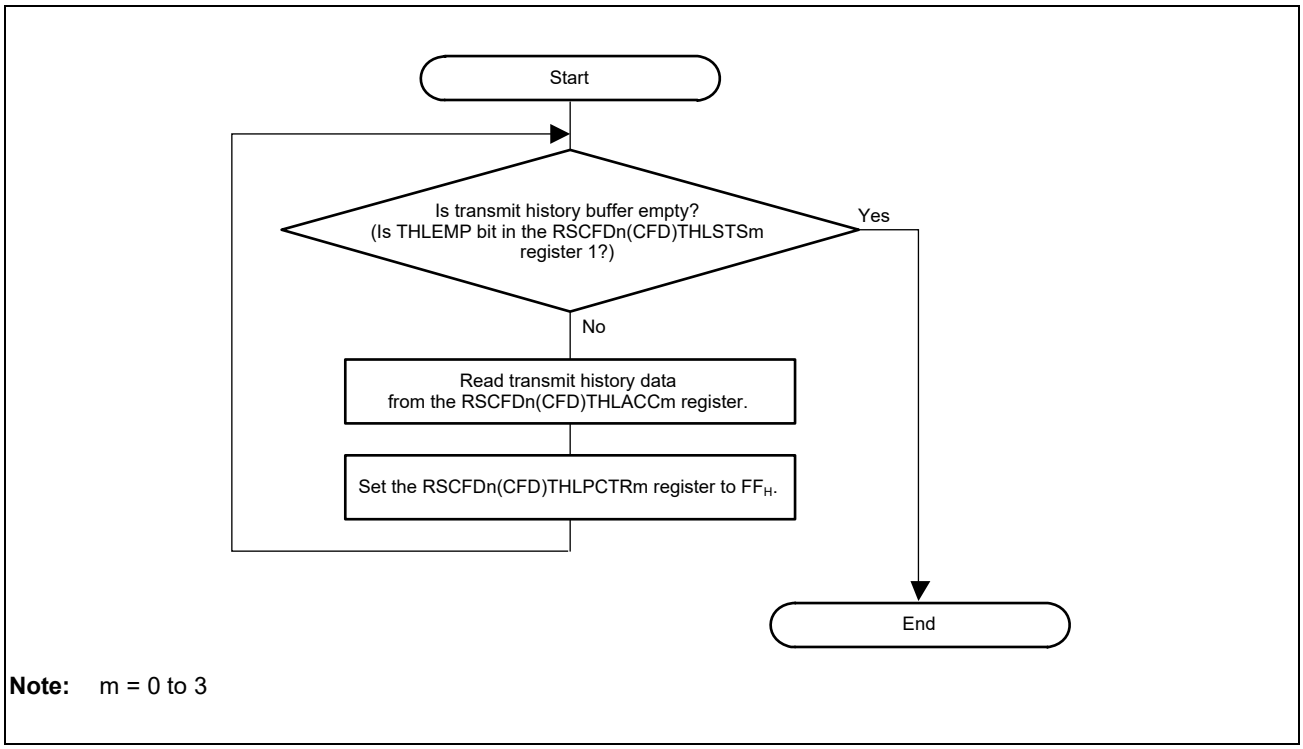


Figure 14.33 Procedure for Transmission from the Transmit Queue

14.11.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. The next data can be accessed by writing FF_H to the corresponding RSCFDn(CFD)THLPCTRm register (m = 0 to 3) after reading a set of data. **Figure 14.34** shows the transmit history buffer reading procedure.

Note: m = 0 to 3

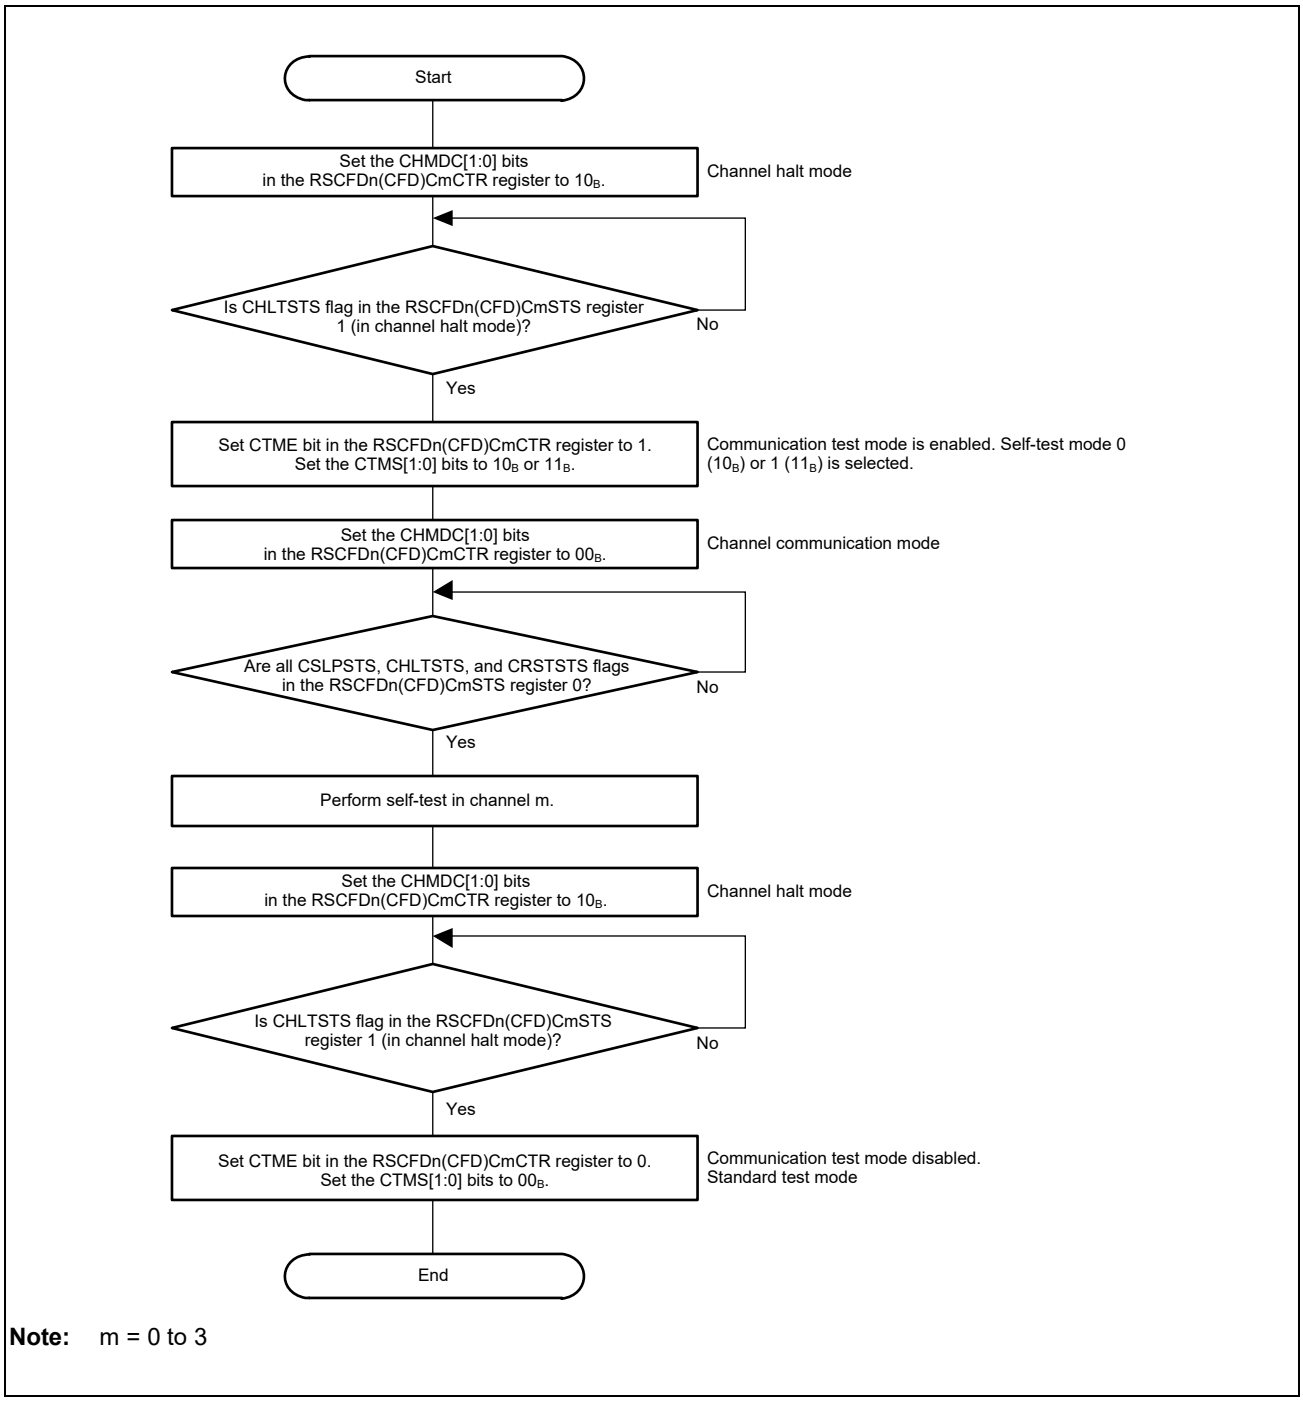

Figure 14.34 Transmit History Buffer Reading Procedure

14.11.4 Test Settings

14.11.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

Figure 14.35 shows the self-test mode setting procedure.

Note: m = 0 to 3

Figure 14.35 Self-Test Mode Setting Procedure

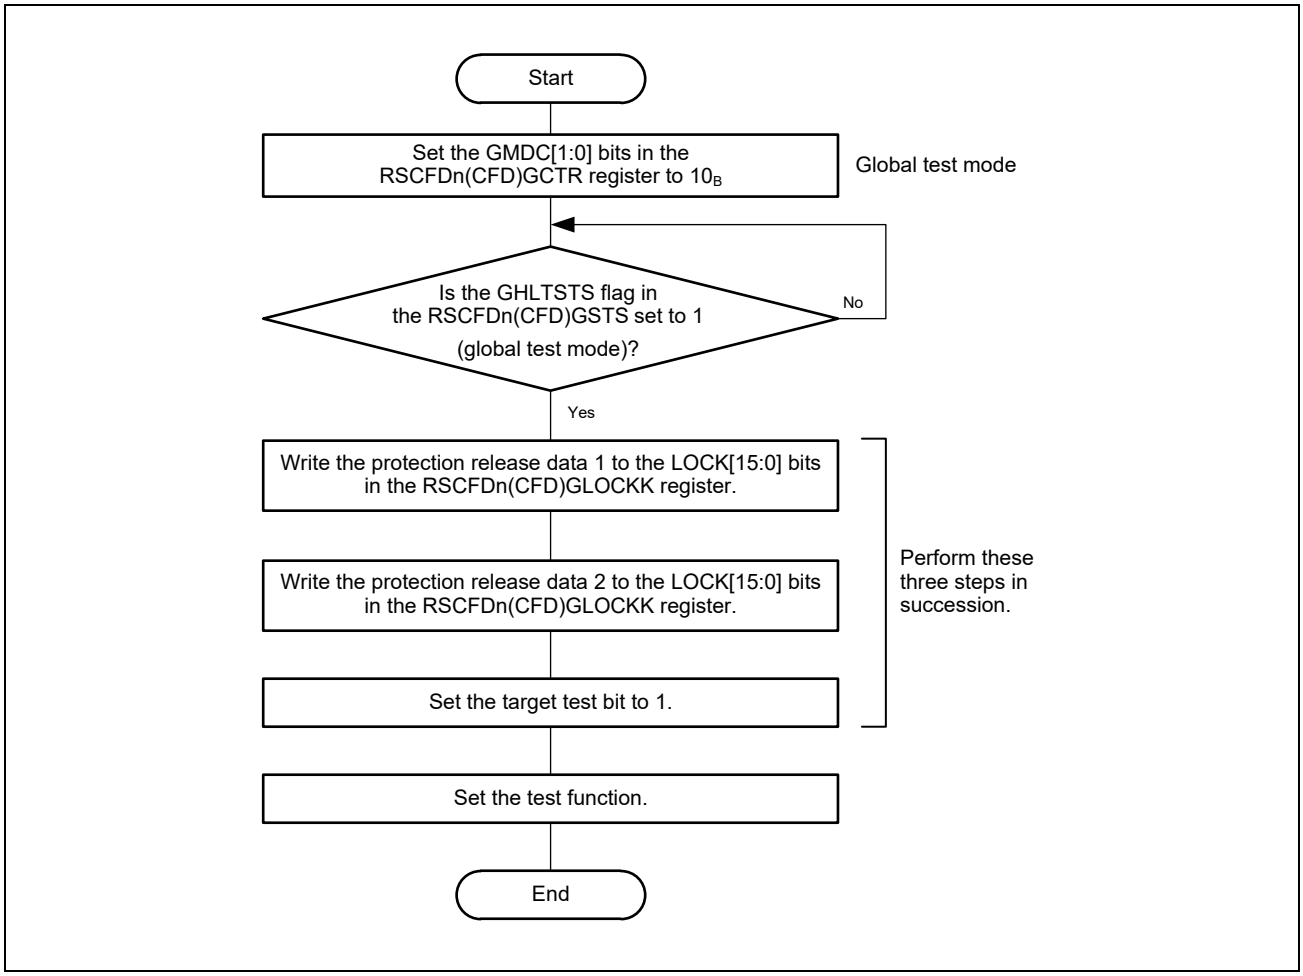
14.11.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 14.188** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCFDn(CFD)GLOCKK register, then set the target test bit to 1.

Table 14.188 Protection Release Data for Test Function

Test Function	Protection Release Data 1	Protection Release Data 2	Target Bit
RAM test	7575_H	$8A8A_H$	RTME bit in the RRSCFDn(CFD)GTSTCTR register

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. **Figure 14.36** shows the procedure for releasing the protection.



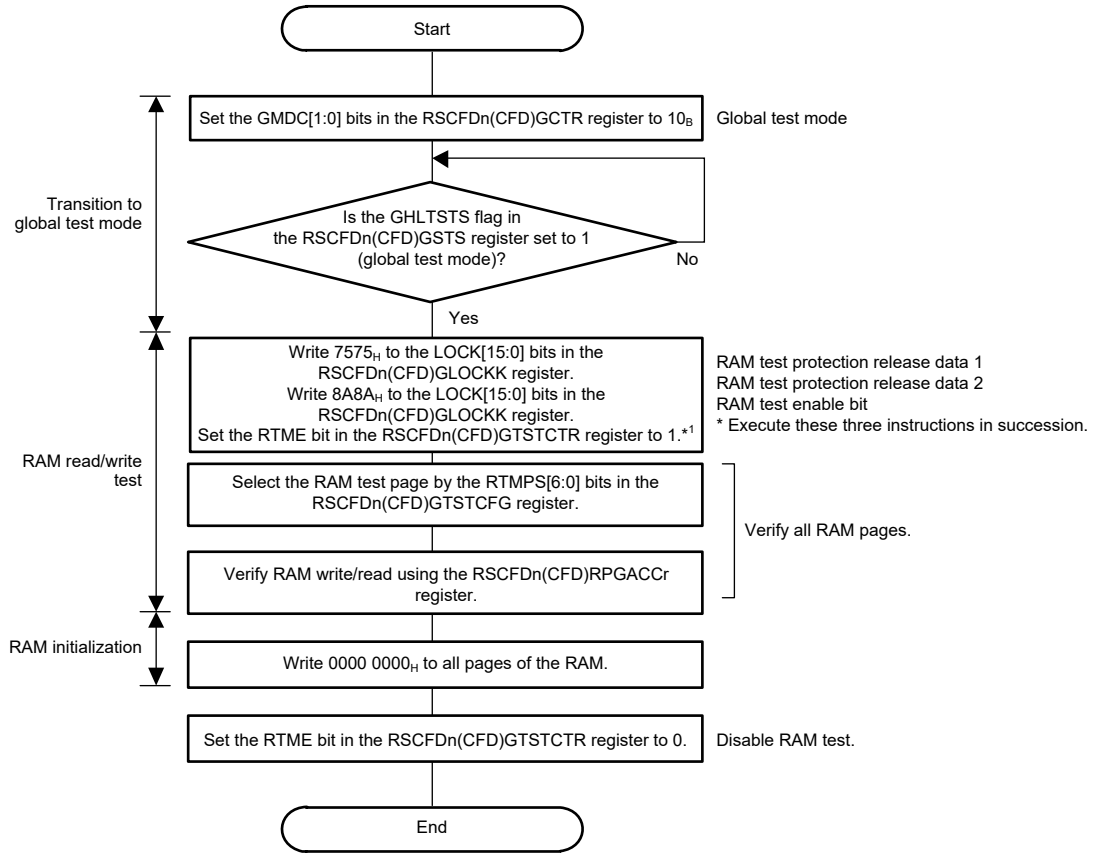


Figure 14.36 Protection Release Procedure

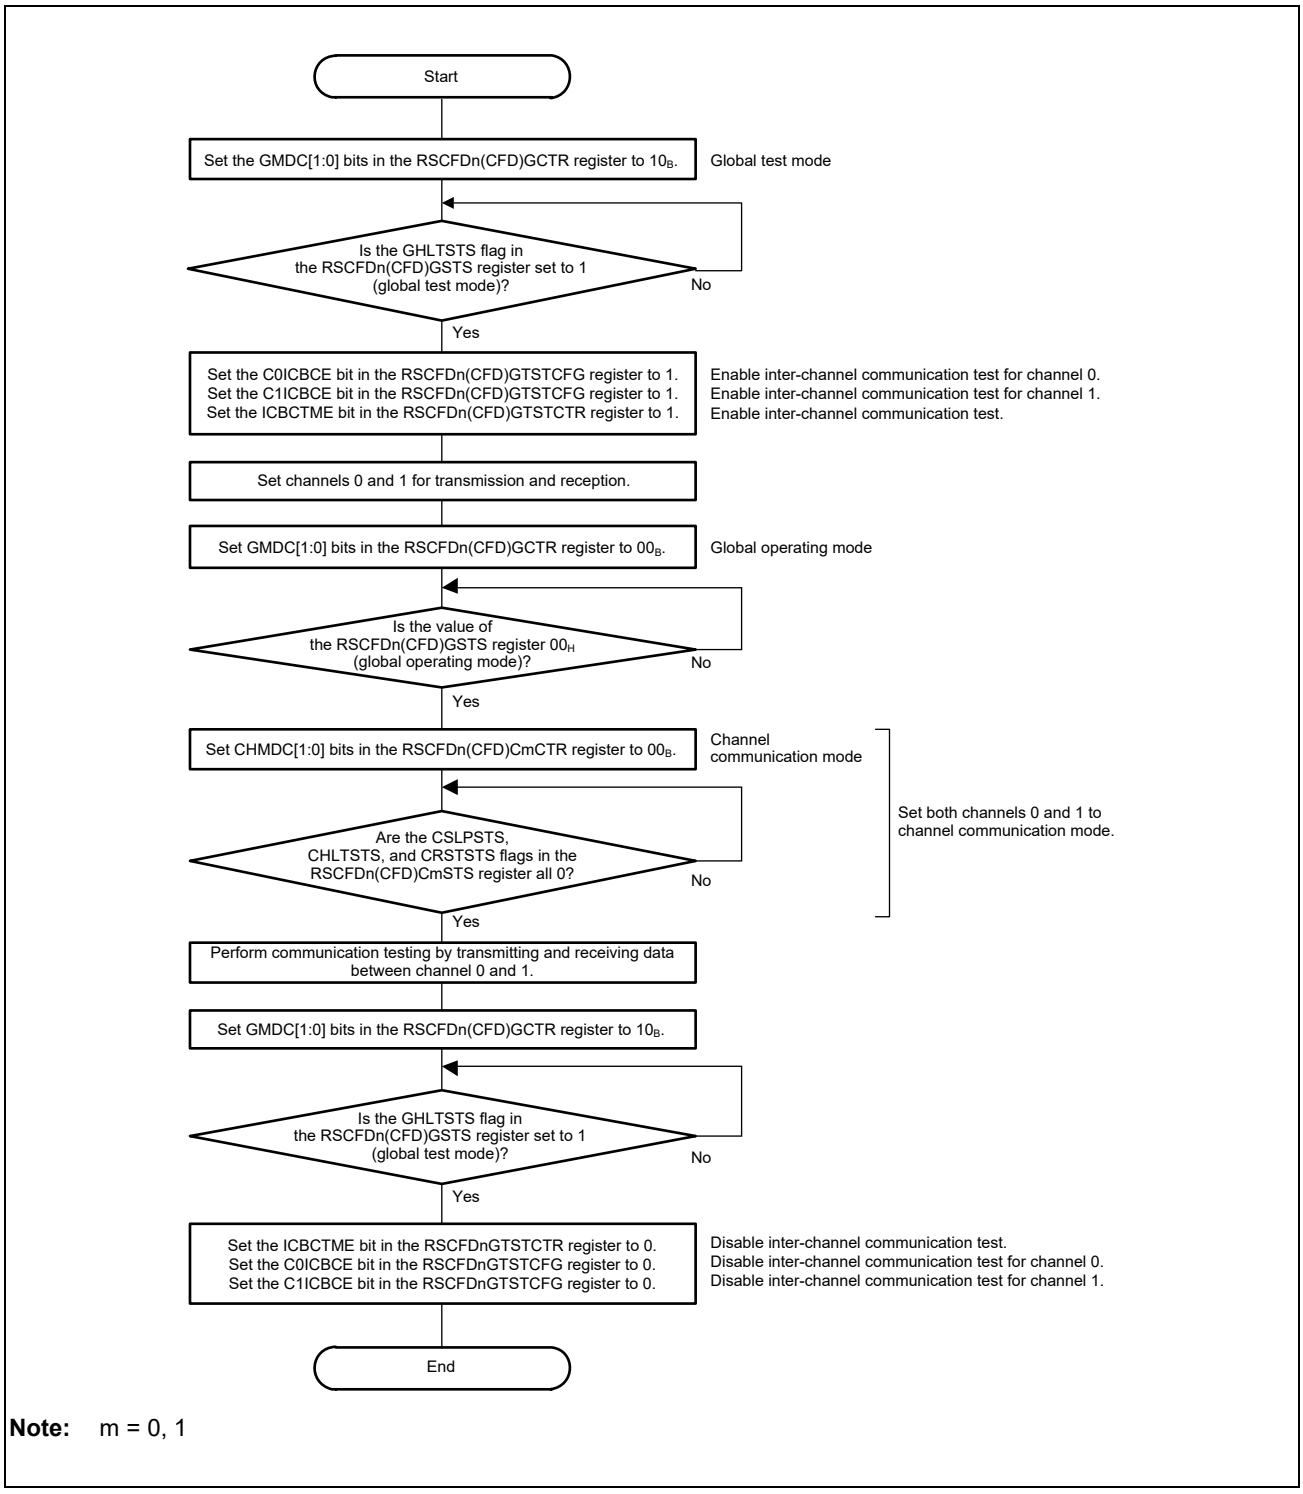
14.11.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write 0000 0000_H to all pages of the CAN RAM.

Figure 14.37 shows the RAM test setting procedure.

Note 1. Perform the following operations before the transition to the RAM test.
- Canceling the transmit request
- Disabling the FIFO buffers and transmit queues
- Clearing the flags for the receive buffers



Note: r = 0 to 63

Figure 14.37 RAM Test Setting Procedure

14.11.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

Figure 14.38 shows the inter-channel communication test setting procedure.

Note: m = 0, 1

Figure 14.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

14.12 Notes on the RS-CANFD Module

- When changing interface mode without resetting the RS-CANFD, write the value after reset to all registers and bits that are not allocated to the register map after change and then modify the RSCFDn(CFD)GRMCFG register.
- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCFDn(CFD)GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCFDn(CFD)CmSTS register (m = 0 to 3) for transitions.
- When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCFDn(CFD)TMCp) of the corresponding transmit buffer to 00_H. The status register (RSCFDn(CFD)TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCFDn(CFD)TMTRSTS0, RSCFDn(CFD)TMTRSTS1, RSCFDn(CFD)TMTARSTS0, RSCFDn(CFD)TMTARSTS1, RSCFDn(CFD)TMTCSTS0, RSCFDn(CFD)TMTCSTS1, RSCFDn(CFD)TMTASTS0 and RSCFDn(CFD)TMTASTS1), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RSCFDn(CFD)TMIEC0 and RSCFDn(CFD)TMIEC1) to 0 (transmit buffer interrupt is disabled).
- When using transmit buffer merge mode (in CAN FD mode), write 00_H to the control register (RSCFDn(CFD)TMCp) of the transmit buffer corresponding to the transmit buffer allocated as a payload storage area. Set the enable bit of corresponding interrupt enable registers (RSCFDn(CFD)TMIEC0 and RSCFDn(CFD)TMIEC1) to 0 (to disable interrupts).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not bet allocated to transmit queues. Do not allocate a transmit buffer allocated as a payload storage area in transmit buffer merge mode (in CAN FD mode) to the transmit queue either.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.

- In the case of registers that access the RAM, the value after reset shown in **Section 14.3, Registers (Classical CAN Mode)** and **Section 14.4, Registers (CAN FD Mode)** indicate the values cleared by initialization of the CAN RAM. Values before clear are undefined. The following registers apply.
  - Receive rule (RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, RSCFDn(CFD)GAFLP1_j registers)
  - Receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, RSCFDn(CFD)RMDFb_q registers)
  - Receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, RSCFDn(CFD)RFDFd_x registers)
  - Transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, RSCFDn(CFD)CFDFd_k registers)
  - Transmit buffers (RSCFDn(CFD)TMIDp, RSCFDn(CFD)TMPTRp, RSCFDnCFDTMFDCTRp, RSCFDn(CFD)TMDFb_p registers)
  - Transmit history access register (RSCFDn(CFD)THLACCm registers)
  - RAM test page access register (RSCFDn(CFD)RPGACCr registers)
- The values of unused receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q registers), receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers) and transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

Section 15 Single Edge Nibble Transmission (RSENT)

This section describes the Single Edge Nibble Transmission (RSENT) module.

The first subsection describes the RH850/C1M-A-specific features such as the number of units and register base address. The subsequent subsections describe the functions and registers of the RSENT.

15.1 Features of the RH850/C1M-A RSENT

15.1.1 Number of Units

This product contains the number of RSENT units listed below.

Table 15.1 Number of Units

Product Name	RH850/C1M-A
Number of units	4
Name	RSENTn (n = 0 to 3)

Index n

This section identifies each RSENT units by “n” (n = 0 to 3). For example, the RSENT timestamp register is described as RSENTnTSPC.

15.1.2 Register Base Addresses

RSENT register base addresses are represented by an offset from the base address.

The following table shows the base address of each RSENT module.

Table 15.2 Register Base Addresses

Base Address Name	Base Address
<RSENT0_base>	FFDB 0000_H
<RSENT1_base>	FF7B 0080_H
<RSENT2_base>	FFDB 0100_H
<RSENT3_base>	FF7B 0180_H

15.1.3 Clock Supply

The following clock input is supplied for the RSENT module.

Table 15.3 RSENT Clock Source

Unit Name	Name of Unit Clock	Name of Supplied Clock
RSENTn	clkc	Non-modulated low-speed clock CLKC_LSB

15.1.4 Interrupt Requests

The RSENT module can generate the following interrupt requests.

Table 15.4 RSENT Interrupt Requests

Unit Interrupt Signal	Outline	Interrupt No.	DMA Trigger No.*1		DTS Trigger No.*1	
			1st	2nd	1st	2nd
RSENT0						
INT_SENT_TX	RSENT status interrupt	322	—	—	—	—
INT_SENT_RX	RSENT receive interrupt	321	—	45	—	45
RSENT1						
INT_SENT_TX	RSENT status interrupt	324	—	—	—	—
INT_SENT_RX	RSENT receive interrupt	323	—	46	—	46
RSENT2						
INT_SENT_TX	RSENT status interrupt	326	—	—	—	—
INT_SENT_RX	RSENT receive interrupt	325	—	47	—	47
RSENT3						
INT_SENT_TX	RSENT status interrupt	328	—	—	—	—
INT_SENT_RX	RSENT receive interrupt	327	—	48	—	48

—: Not assigned.

Note 1. 1st: Primary Channel, 2nd: Secondary Channel

15.1.5 Reset Factor

The reset factors of the RSENT module are listed below. The RSENT module is initialized by the following reset factor.

Table 15.5 Reset Factor

Unit Name	Reset Factor
RSENTn	All reset factors

15.1.6 External Input/Output Signals

The following table shows the RSENT external input/output signals.

Table 15.6 External Input/Output Signals

Unit Signal Name	Outline	Port Pin Name
RSENT0		
sent_rx	RSENT data input	RSENT0RX
sent_spc	RSENT SPC control output	RSENT0SPCO
RSENT1		
sent_rx	RSENT data input	RSENT1RX
sent_spc	RSENT SPC control output	RSENT1SPCO
RSENT2		
sent_rx	RSENT data input	RSENT2RX
sent_spc	RSENT SPC control output	RSENT2SPCO
RSENT3		
sent_rx	RSENT data input	RSENT3RX
sent_spc	RSENT SPC control output	RSENT3SPCO

15.2 Outline

15.2.1 Function Outline

The RSENT interface supports the following standard specification (SAE J2716 version JAN2010) functions:

- Triple speed expansion Tick Time: Clock cycle (1 µs to 90 µs)
- Variable data transmission rate
  - 24.7 kbps to 64.9 kbps: 3 clock rate 6 nibble data
  - 74.1 kbps to 194.7 kbps: 1 clock rate 6 nibble data
- Unidirectional communication: Between the sensor and MCU
- Bidirectional communication: Between the sensor and MCU (supported in SPC mode)
- Single edge data transmission: Coded by the temporal distance of two serially-detected falling edges on a data line
- Transmission frame with up to 6 data nibbles + status and communication nibbles
- Data transmission protected with CRC is available.
  - CRC data can be read with the RSENTnSRXD.SCRC bits.
- Calibration phrase in each data frame (RSENTnCPL.CPLV bits)
- Compatible with 3 systems, i.e., SENT standard (1-wire system), SPC extension (1-wire system), and SPC extension (2-wire system).
- Multiple sensors can connect to the RSENT channel that has the standard expansion function. Received data from sensors is detected by software or DMA.
- Timestamp function: Master can only be set for RSENT0.
  For others, slave can only be set (RSENTnTSPC.TMS bit)

15.2.2 Block Diagram

The following figure shows a block diagram of the RSENT module.

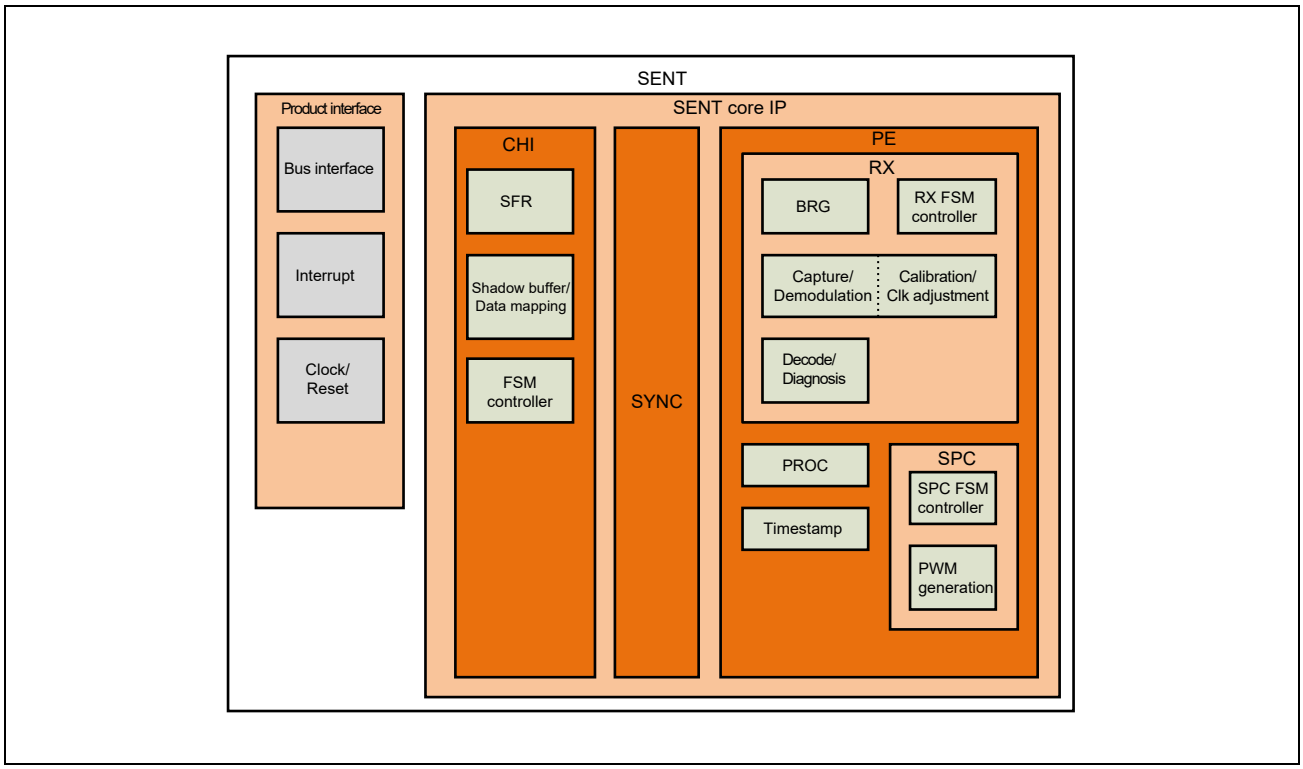


Figure 15.1 Block Diagram of RSENT

15.3 Registers

15.3.1 List of Registers

RSENTn is controlled and operated by the following registers.

For <RSENTn_base>, see **Section 15.1.2, Register Base Addresses.**

Table 15.7 Overview of RSENTn Registers

Module Name	Register Name	Abbreviation	Address
RSENTn	RSENT timestamp register	RSENTnTSPC	<RSENTn_base> + 0000_H
RSENTn	RSENT timestamp counter register	RSENTnTSC	<RSENTn_base> + 0004_H
RSENTn	RSENT communication configuration register	RSENTnCC	<RSENTn_base> + 0010_H
RSENTn	RSENT baud rate prescaler register	RSENTnBRP	<RSENTn_base> + 0014_H
RSENTn	RSENT interrupt/DMA enable register	RSENTnIDE	<RSENTn_base> + 0018_H
RSENTn	RSENT mode control register	RSENTnMDC	<RSENTn_base> + $001C_H$
RSENTn	RSENT SPC transmission register	RSENTnSPCT	<RSENTn_base> + 0020_H
RSENTn	RSENT mode status register	RSENTnMST	<RSENTn_base> + 0024_H
RSENTn	RSENT communication status register	RSENTnCS	<RSENTn_base> + 0028_H
RSENTn	RSENT communication status clear register	RSENTnCSC	<RSENTn_base> + $002C_H$
RSENTn	RSENT slow channel receive timestamp register	RSENTnSRTS	<RSENTn_base> + 0030_H
RSENTn	RSENT slow channel receive data register	RSENTnSRXD	<RSENTn_base> + 0034_H
RSENTn	RSENT calibration pulse length register	RSENTnCPL	<RSENTn_base> + 0038_H
RSENTn	RSENT message length register	RSENTnML	<RSENTn_base> + $003C_H$
RSENTn	RSENT fast channel receive timestamp register	RSENTnFRTS	<RSENTn_base> + 0040_H
RSENTn	RSENT fast channel receive data register	RSENTnFRXD	<RSENTn_base> + 0044_H

15.3.2 RSENTnTSPC — RSENT Timestamp Register

Access: This register can be read/written in 32-bit units.

Address: <RSENTn_base> + 0000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TMS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	TTM[6:0]							—	TTPV[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 15.8 RSENTnTSPC Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
16	TMS	Timestamp Mode Selection 0: Master mode 1: Slave mode
15	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
14 to 8	TTM[6:0]	Timestamp Tick Multiplier 0000000_B: 1 0000001_B: 2 0000010_B: 3 : 1111111_B: 128
7	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
6 to 0	TTPV[6:0]	Timestamp Tick Prescaler Value 0000000_B: 1 0000001_B: 2 0000010_B: 3 : 1111111_B: 128

RSENTnTSPC.TMS (Timestamp Mode Selection)

When this bit is set to 0, the timestamp counter operates in master mode.

Writing 0000 0000_H to RSENTnTSC by the module set as the master leads to clearing of the timestamps in that module and in the channels set as slaves.

The CPU can only write to this bit if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

A RSENT module running in the slave mode needs to have the same timestamp counter prescaler value as the RSENT module running as its master.

NOTE

In this product series, RSENT0 is only the channel which can be set as a master.

Before synchronizing the timestamp counter, be sure to set RSENT0 and other channels as slave mode and slave mode, respectively.

Synchronization of the timestamp counter when the above setting is not made is not guaranteed.

RSENTnTSPC.TTM (Timestamp Tick Multiplier)

These bits define the multiplication value of the 1-µs time tick used for the timestamp counter. For timestamp clock configuration, see **Section 15.4.2.1, Timestamp**.

The CPU can only write to these bits if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnTSPC.TTPV (Timestamp Tick Prescaler Value)

These bits define the prescaler value to generate a 1-µs clock tick.

For timestamp clock configuration, see **Section 15.4.2.1, Timestamp.**

The CPU can only write to these bits if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

The CPU should configure this value in such a way that, based on the supplied communication clock, a 1-µs clock tick is generated.

15.3.3 RSENTnTSC — RSENT Timestamp Counter Register

Access: This register can be read/written in 32-bit units.

Address: <RSENTn_base> + 0004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TS[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.9 RSENTnTSC Register Contents

Bit Position	Bit Name	Function
31 to 0	TS[31:0]	Timestamp counter value

RSENTnTSC.TS (Timestamp)

These bits indicate the current timestamp counter value.

The CPU can set this bit to a value other than $0000\ 0000_H$ only when the RSENT module is in CONFIGURATION mode (RSENTnMST.OMS = 001_B).

When the timestamp counter is configured to operate in slave mode (RSENTnTSPC.TMS = 1), writing to this register has no effect when the RSENT module is in OPERATION IDLE or OPERATION ACTIVE mode (the RSENTnMST.OMS bits are either 011_B or 101_B).

The timestamp counter is incremented on every timestamp counter tick (as configured in the RSENTnTSPC.TTPV and RSENTnTSPC.TTM bits) when the RSENT module is in OPERATION IDLE or OPERATION ACTIVE mode (the RSENTnMST.OMS bits are either 011_B or 101_B).

When the timestamp counter is configured to operate in master mode (RSENTnTSPC.TMS = 0), the CPU writes $0000\ 0000_H$ to these bits and RSENTnTSC.TS is set to $0000\ 0000_H$.

When the slave mode setting is made for the timestamp counter (RSENTnTSPC.TMS = 1), writing $0000\ 0000_H$ to the RSENT0TSC.TS bit leads to the RSENTnTSC.TS bits being set to $0000\ 0000_H$.

For timestamp mode selection, see **Section 15.4.2.1, Timestamp**.

15.3.4 RSENTnCC — RSENT Communication Configuration Register

Access: This register can be read/written in 32-bit units.

Address: <RSENTn_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.10 RSENTnCC Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
12	SOPC	SPC Output Polarity Control 0: SPC pulse active high 1: SPC pulse active low
11	FCM	Frame Check Method0: 0: Check against next calibration pulse 1: Check against previous calibration pulse
10	SCCD	Slow Channel CRC Check 0: Slow channel CRC check enabled 1: Slow channel CRC check disabled
9	FCCD	Fast Channel CRC Check 0: Fast channel CRC check enabled 1: Fast channel CRC check disabled
8	DCF	Data Nibble CRC Format Select 0: CRC format defined in SAE J2716 JAN2010 is selected 1: CRC format prior to SAE J2716 FEB2008 is selected
7, 6	SMF[1:0]	Serial Message Format 00_B: No serial message extraction 01_B: Short serial message format 10_B: Enhanced serial message format 11_B: Setting prohibited
5	PPTC	Pause Pulse Type Configuration 0: Pause pulse for variable message length 1: Pause pulse for fixed message length
4	PPC	Pause Pulse Configuration 0: Without pause pulse 1: With pause pulse

Table 15.10 RSENTnCC Register Contents (2/2)

Bit Position	Bit Name	Function
3 to 1	NDN[2:0]	Number of Data Nibbles 000_B: 1 data nibble 001_B: 2 data nibbles 010_B: 3 data nibbles 011_B: 4 data nibbles 100_B: 5 data nibbles 101_B: 6 data nibbles Other than above: Setting prohibited
0	SPCE	SPC Mode Enable 0: SPC mode disabled 1: SPC mode enabled

RSENTnCC.SOPC (SPC Output Polarity Control)

When this bit is set to 0, the SPC pulse is sent as an active high signal. The default output value is low level.

When this bit is set to 1, the SPC pulse is sent as an active low signal. The default output value is high level.

For SPC operation, see **Section 15.4.4, SPC Function**.

The CPU can write to this bit only when the RSENT module is in CONFIGURATION mode (RSENTnMST.OMS = 001_B).

NOTE

- In this product series, be sure to set this bit to select active low for use with a single-wire SPC system.
- Any change to this bit from the default value becomes effective on the output value when entering the OPERATION_ACTIVE mode (MST.OMS is 101_B). When entering RESET mode (MST.OMS is 000_B), the output level is set to the default value (low level).

RSENTnCC.FCM (Frame Check Method)

When this bit is set to 0, the current calibration pulse is compared to the next received calibration pulse.

The buffer update mechanism is operating according to the preferred option as described in SAE J2716 2010.

When this bit is set to 1, the current calibration pulse is compared to the previously received calibration pulse.

The buffer update mechanism is operating according to the second option as described in SAE J2716 2010 which should be only used if extra latency to process the second calibration pulse cannot be tolerated.

For buffer update timings, see also **Section 15.4.3.5, Fast Channel Message Reception.**

The CPU can only write to this bit if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnCC.SCCD (Slow Channel CRC Check Disable)

When this bit is set to 1, the CRC check for the slow channel is disabled. In this case, messages are stored in the slow channel message reception buffer with the received CRC.

When this bit is set to 1, the RSENTnCS.SCS bit is not set.

The CPU can only write to this bit if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnCC.FCCD (Fast Channel CRC Check Disable)

When this bit is set to 1, the CRC check for the fast channel is disabled. In this case, messages are stored in the fast channel message receive buffer with the received CRC.

When this bit is set to 1, the RSENTnCS.FCS bit is not set.

The CPU can only write to this bit if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTn.DCF (Data Nibble CRC Format Select)

This bit selects the data nibble CRC format from the format defined in SAE J2716 JAN2010 or an earlier format.

When this bit is set to 0, the CRC format defined in SAE J2716 JAN2010 is set. When this bit is set to 1, the CRC format defined prior to SAE J2716 FEB2008 is set.

For details of the CRC for data nibbles, see Sections *5.4.2.1* and *5.4.2.2* of *SAE J2716 JAN2010.*

The CPU can write to this bit only when the RSENT module is in CONFIGURATION mode (RSENTnMST.OMS = 001_B).

RSENTnCC.SMF (Serial Message Format)

These bits define the serial message format expected to be received for automatic extraction.

When these bits are set to 00_B, no serial message is extracted and the status and communication nibble are provided in the RSENTnSRXD register.

The CPU can only write to these bits if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

The CPU shall set these bits to 00_B when RSENTnCC.SPCE is set to 1 and more than one sensor is connected to the RSENT module.

RSENTnCC.PPTC (Pause Pulse Type Configuration)

This bit defines the pause pulse type.

The CPU can only write to this bit if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

The CPU must not set this bit to 1 when the RSENTnCC.PPC bit is set to 0.

RSENTnCC.PPC (Pause Pulse Configuration)

This bit defines the presence or absence of the pause pulse.

The CPU can only write to this bit if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnCC.NDN (Number of Data Nibbles)

These bits define the number of data nibbles included in an RSENT message.

The CPU can only write to these bits if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnCC.SPCE (SPC Mode Enable)

This bit enables SPC mode.

For details about SPC mode operation, see **Section 15.4.4, SPC Function**.

The CPU can only write to this bit if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

15.3.5 RSENTnBRP — RSENT Baud Rate Prescaler Register

Access: This register can be read/written in 32-bit units.

Address: <RSENTn_base> + 0014_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	TTF[3:0]				—	TTI[6:0]

Table 15.11 RSENTnBPR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
27 to 24	TTF[3:0]	Time Tick Decimal Fraction 0000_B: 0.0 µs 0001_B: 0.1 µs 0010_B: 0.2 µs : 1000_B: 0.8 µs 1001_B: 0.9 µs Other than above: Setting prohibited
23	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
22 to 16	TTI[6:0]	Time Tick Integer 0000000_B: 1 µs 0000001_B: 2 µs 0000010_B: 3 µs : 1011000_B: 89 µs 1011001_B: 90 µs Other than above: Setting prohibited
15	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
14 to 8	SCDV[6:0]	Sample Clock Division Value 0000000_B: 1 0000001_B: 2 0000010_B: 3 : 1111110_B: 127 1111111_B: 128
7 to 5	Reserved	When read, these bits are read as 0. When writing, write the value after reset.

Table 15.11 RSENTnBPR Register Contents (2/2)

Bit Position	Bit Name	Function
4 to 0	SCMV[4:0]	Sample Clock Multiplication Value 00000_B: 1 00001_B: 2 00010_B: 3 : 11110_B: 31 11111_B: 32

RSENTnBRP.TTF (Time Tick Decimal Fraction)

These bits define the decimal part of the tick length in 0.1-µs granularity.

For tick length configuration, see **Section 15.4.2.2(2), RX and SPC Tick Settings**.

The CPU can only write to these bits if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnBRP.TTI (Time Tick Integer)

These bits define the integer part of the tick length.

For tick length configuration, see **Section 15.4.2.2(2), RX and SPC Tick Settings**.

The CPU can only write to these bits if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnBRP.SCDV (Sample Clock Division Value)

These bits define the division value for the sample clock generation logic.

For RSENTnBRP configuration, see **Section 15.4.2.2(1), RX BRP Setting**.

The CPU can only write to these bits if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnBRP.SCMV (Sample Clock Multiplication Value)

These bits define the multiplication value for the sample clock generation logic.

For RSENTnBRP configuration, see **Section 15.4.2.2(1), RX BRP Setting**.

The CPU can only write to these bits if the RSENT module is in CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

15.3.6 RSENTnIDE — RSENT Interrupt/DMA Enable Register

Access: This register can be read/written in 32-bit units.

Address: <RSENTn_base> + 0018_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 15.12 RSENTnIDE Register Contents (2/2)

Bit Position	Bit Name	Function
0	FRIE	Fast Channel Receive Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled

RSENTnIDE.SEIE (Slow Channel Encoding Error Interrupt Enable)

This bit enables the generation of the slow channel encoding error interrupt.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.SMIE (Slow Channel Message Lost Interrupt Enable)

This bit enables the generation of the slow channel message lost interrupt.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.SCIE (Slow Channel CRC Error Interrupt Enable)

This bit enables the generation of the slow channel CRC error interrupt.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.NRIE (No Response Error Interrupt Enable)

This bit enables the generation of the no response error interrupt.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

The CPU should not set this bit when SPC mode is disabled (RSENTnCC.SPCE set to 0).

RSENTnIDE.CVIE (Calibration Pulse Length Variation Error Interrupt Enable)

This bit enables the generation of the calibration pulse length variation error interrupt.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.CLIE (Calibration Pulse Length Error Interrupt Enable)

This bit enables the generation of the calibration pulse length error interrupt.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.FNIE (Fast Channel Nibble Count Error Interrupt Enable)

This bit enables the generation of the fast channel nibble count error interrupt.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.FEIE (Fast Channel Nibble Encoding Error Interrupt Enable)

This bit enables the generation of the fast channel nibble encoding error interrupt.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.FMIE (Fast Channel Message Lost Interrupt Enable)

This bit enables the generation of the fast channel message lost interrupt.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.FCIE (Fast Channel CRC Error Interrupt Enable)

This bit enables the generation of the fast channel CRC error interrupt.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.FRIE (Fast Channel Receive Interrupt Enable)

This bit enables the generation of the fast channel receive interrupt.

The fast channel receive interrupt can be also used to notify a DMA request.

The CPU cannot write to this bit if the RSENT module is in RESET mode (the RSENTnMST.OMS bits are 000_B).

15.3.7 RSENTnMDC — RSENT Mode Control Register

Access: This register can be read/written in 32-bit units.

Address: <RSENTn_base> + $001C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	OMC[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 15.13 RSENTnMDC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
2 to 0	OMC[2:0]	Operation Mode Control 000_B: RESET 001_B: CONFIGURATION 011_B: OPERATION IDLE 101_B: OPERATION ACTIVE Other than above: Setting prohibited

RSENTnMDC.OMC (Operation Mode Control)

These bits are used to control the operation mode of the RSENT module.

- 000_B: RESET
  In RESET mode, the mode can only be changed to CONFIGURATION mode.
- 001_B: CONFIGURATION
  In CONFIGURATION mode, the mode can only be changed to RESET mode or OPERATION ACTIVE mode.
- 011_B: OPERATION IDLE
  In OPERATION IDLE mode, the mode can be changed to OPERATION ACTIVE mode, CONFIGURATION mode, or RESET mode.
- 101_B: OPERATION ACTIVE
  In OPERATION ACTIVE mode, the mode can be changed to OPERATION IDLE mode, CONFIGURATION mode, or RESET mode. However, it is recommended to process to the OPERATION IDLE mode first.
  For the recommended methods to select the operation mode, see **Section 15.4.3.1, Changing Operation Modes**.
- Other than above: Setting prohibited
  The CPU should not write any other value than listed above into this register.
  The CPU must follow the mode selection procedure shown in **Section 15.4.3.1, Changing Operation Modes**.

15.3.8 RSENTnSPCT — RSENT SPC Transmission Register

Access: This register can be read/written in 32-bit units.

Address: <RSENTn_base> + 0020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	TLL[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.14 RSENTnSPCT Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
6 to 0	TLL[6:0]	Length of the Trigger Low Phase in Ticks 0000000_B: 1 tick 0000001_B: 2 ticks 0000010_B: 3 ticks : 1111110_B: 127 ticks 1111111_B: 128 ticks

RSENTnSPCT.TLL (Trigger Low Length)

These bits define the length of the SPC trigger pulse.

When the CPU writes to these bits, an SPC trigger pulse with the configured length is sent immediately independently of the current status of the RSENT module.

For details about SPC communication, see **Section 15.4.4, SPC Function**.

The CPU can only write to these bits if the RSENT module is in OPERATION ACTIVE mode (the RSENTnMST.OMS bits are 101_B) and SPC communication is enabled (RSENTnCC.SPCE is 1).

It is important to note that two consecutive write access might not cause a no response error as the previous request might not have started yet.

After writing to this register, the CPU should wait for at least one SPC trigger tick before writing again to this register.

15.3.9 RSENTnMST — RSENT Mode Status Register

Access: This register is read-only in 32-bit units.

Address: <RSENTn_base> + 0024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	OMS[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 15.15 RSENTnMST Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
2 to 0	OMS[2:0]	Operation Mode Control 000_B: RESET 001_B: CONFIGURATION 011_B: OPERATION IDLE 101_B: OPERATION ACTIVE Other than above: Reserved

RSENTnMST.OMS (Operation Mode Status)

These bits indicate the current operation mode.

These bits are read only.

These bits are updated after a mode change request is made in the RSENTnMDC.OMC register.

- 000_B: RESET mode
  When in RESET mode, all registers are set to their reset values and write access to all registers except the RSENTnMDC register is disabled.
  When in RESET mode, RSENT communication is disabled.
- 001_B: CONFIGURATION mode
  When in CONFIGURATION mode, write access to the timestamp registers (RSENTnTSPC and RSENTnTSC register), configuration registers (RSENTnCC and RSENTnBRP register), RSENTnIDE register, and mode control register (RSENTnMDC.OMC) is enabled.
  When in CONFIGURATION mode, RSENT communication is disabled.
  When entering CONFIGURATION mode, all status registers and receive buffer registers are set to their reset values.
- 011_B: OPERATION IDLE mode
  In OPERATION IDLE mode, no reception or SPC trigger transmission is possible.
  When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.
- 101_B: OPERATION ACTIVE mode
  In OPERATION ACTIVE mode, reception and SPC trigger transmission are possible.
- Other than above: Reserved

15.3.10 RSENTnCS — RSENT Communication Status Register

Access: This register is read-only in 32-bit units.

Address: <RSENTn_base> + 0028_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

2	FMS	Fast Channel Message Lost Interrupt Detection 0: Not detected 1: Detected

Table 15.16 RSENTnCS Register Contents (2/2)

Bit Position	Bit Name	Function
1	FCS	Fast Channel CRC Error Interrupt Detection 0: Not detected 1: Detected
0	FRS	Fast Channel Receive Interrupt Detection 0: Not detected 1: Detected

RSENTnCS.SES (Slow Channel Encoding Error Status)

This bit represents the slow channel encoding error status.

This bit is read only.

In the short serial message format (RSENTnCC.SMF = 01_B), this bit is set when the sequence on serial start bit (status & communication nibble bit #3) is different from "1000 0000 0000 0000_B" (a single 1 and 15 0s).

In the enhanced serial message format (RSENTnCC.SMF = 10_B), this bit is set unless bit 13 or bit 18 is received as 0 after a serial message start frame (sequence of status & communication nibble bit 3 is 0111 1110_B) is received.

When this bit is set in the short serial message format the received communication and status nibble is used to assemble a serial message.

When this bit is set in the enhanced serial message format the RSENT module checks the presence of a new start sequence at the same time and uses the received communication and status nibble to assemble a serial message.

This bit is cleared by writing 1 to RSENTnCSC.SEC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.SMS (Slow Channel Message Lost Status)

This bit represents the slow channel message lost status.

This bit is read only.

This bit is set when there is an attempt to update the slow channel message reception buffer, but the previous message has not been read yet.

This bit is cleared when writing 1 to RSENTnCSC.SEC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.SCS (Slow Channel CRC Error Status)

This bit represents the slow channel CRC error status.

This bit is read only.

This bit is set when a CRC error is detected on the slow channel and the slow channel CRC detection is enabled (RSENTnCC.SCCD is set to 0).

This bit is cleared when writing 1 to RSENTnCSC.SCC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.NRS (No Response Error Status)

This bit represents the no response error status.

This bit is read only.

This bit is set when

- the CPU writes to the RSENTnSPCT.TLL bits and
- SPC mode enabled (RSENTnCC.SPCE set to 1) and
- no complete response was received from the sensor for the previous SPC trigger.

This bit is cleared when writing 1 to RSENTnCSC.NRC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.CVS (Calibration Pulse Length Variation Error Status)

This bit represents the calibration pulse length variation error status.

This bit is read only.

When RSENTnCC.PPTC is 0, then this bit is set when two successive calibration pulses differ by more than 1.5625%.

When RSENTnCC.PPTC is 1, this bit is never set. In this mode (pause pulse with fixed message length), the CPU needs to check the variation of the ratio of calibration pulse to message length by reading the RSENTnCPL and RSENTnML registers.

This bit is cleared when writing 1 to RSENTnCSC.CVC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.CLS (Calibration Pulse Length Error Status)

This bit represents the calibration pulse length error status.

This bit is read only.

This bit is set when the measured calibration pulse length is less than 42 clock ticks or more than 70 clock ticks (deviation of 25% from specification length (56 clock ticks)).

This bit is cleared when writing 1 to RSENTnCSC.CLC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.FNS (Fast Channel Nibble Count Error Status)

This bit represents the fast channel nibble count error status.

This bit is read only.

This bit is set when there is an unexpected number of falling edges between two calibration pulses.

This bit is cleared when writing 1 to RSENTnCSC.FNC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.FES (Fast Channel Nibble Encoding Error Status)

This bit represents the fast channel nibble encoding error status.

This bit is read only.

This bit is set when on the fast channel a measured nibble period is less than 12 clock ticks or more than 27 clock ticks.

This bit is cleared when writing 1 to RSENTnCSC.FEC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.FMS (Fast Channel Message Lost Status)

This bit represents the fast channel message lost status.

This bit is read only.

This bit is set when the fast channel message receive buffer is updated, but the previous messages have not been read yet.

This bit is cleared when writing 1 to RSENTnCSC.FMC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.FCS (Fast Channel CRC Error Status)

This bit represents the fast channel CRC error status.

This bit is read only.

This bit is set when a CRC error is detected on the fast channel and the fast channel CRC detection is enabled (RSENTnCC.FCCD is set to 0).

This bit is cleared when writing 1 to RSENTnCSC.FCC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.FRS (Fast Channel Receive Status)

This bit represents the fast channel receive status.

This bit is read only.

This bit is set when the fast channel message receive buffer was updated.

This bit is cleared when the CPU reads the RSENTnFRXD.FND bit.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

15.3.11 RSENTnCSC — RSENT Communication Status Clear Register

Access: This register can be read/written in 32-bit units.

Address: <RSENTn_base> + $002C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

4	FNC	Fast Channel Nibble Count Error Interrupt Clear 0: No effect 1: Clear
3	FEC	Fast Channel Nibble Encoding Error Interrupt Clear 0: No effect 1: Clear

Table 15.17 RSENTnCSC Register Contents (2/2)

Bit Position	Bit Name	Function
2	FMC	Fast Channel Message Lost Interrupt Clear 0: No effect 1: Clear
1	FCC	Fast Channel CRC Error Interrupt Clear 0: No effect 1: Clear
0	Reserved	When read, these bits are read as 0. When writing, write the value after reset.

RSENTnCSC.SEC (Slow Channel Encoding Error Clear)

Writing 1 clears RSENTnCS.SES to 0.

Writing 0 has no effect.

This bit is always read as 0.

RSENTnCSC.SMC (Slow Channel Message Lost Clear)

Writing 1 clears RSENTnCS.SMS to 0.

Writing 0 has no effect.

This bit is always read as 0.

RSENTnCSC.SCC (Slow Channel CRC Error Clear)

Writing 1 clears RSENTnCS.SCS to 0.

Writing 0 has no effect.

This bit is always read as 0.

RSENTnCSC.NRC (No Response Error Clear)

Writing 1 clears RSENTnCS.NRS to 0.

Writing 0 has no effect.

This bit is always read as 0.

RSENTnCSC.CVC (Calibration Pulse Length Variation Error Clear)

Writing 1 clears RSENTnCS.CVS to 0.

Writing 0 has no effect.

This bit is always read as 0.

RSENTnCSC.CLC (Calibration Pulse Length Error Clear)

Writing 1 clears RSENTnCS.CLS to 0.

Writing 0 has no effect.

This bit is always read as 0.

RSENTnCSC.FNC (Fast Channel Nibble Count Error Clear)

Writing 1 clears RSENTnCS.FNS to 0.

Writing 0 has no effect.

This bit is always read as 0.

RSENTnCSC.FEC (Fast Channel Nibble Encoding Error Clear)

Writing 1 clears RSENTnCS.FES to 0.

Writing 0 has no effect.

This bit is always read as 0.

RSENTnCSC.FMC (Fast Channel Message Lost Clear)

Writing 1 clears RSENTnCS.FMS to 0.

Writing 0 has no effect.

This bit is always read as 0.

RSENTnCSC.FCC (Fast Channel CRC Error Clear)

Writing 1 clears RSENTnCS.FCS to 0.

Writing 0 has no effect.

This bit is always read as 0.

15.3.12 RSENTnSRTS — RSENT Slow Channel Receive Timestamp Register

Access: This register is read-only in 32-bit units.

Address: <RSENTn_base> + 0030_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STS[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 15.18 RSENTnSRTS Register Contents

Bit Position	Bit Name	Function
31 to 0	STS	Slow Channel Receive Timestamp

RSENTnSRTS.STS (Slow Channel Timestamp)

These bits are read only.

These bits are updated when the slow channel message reception buffer is updated with the timestamp counter value of the last frame provided to the slow channel message.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

15.3.13 RSENTnSRXD — RSENT Slow Channel Receive Data Register

Access: This register is read-only in 32-bit units.

Address: <RSENTn_base> + 0034_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SND	—	SCRC[5:0]						—	—	—	SMGC	IDD[19:16]

Table 15.19 RSENTnSRXD Register Contents

Bit Position	Bit Name	Function
31	SND	Slow Channel New Data 0: Slow channel frame data is not updated since last read. 1: Slow channel frame data is updated since last read.
30	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
29 to 24	SCRC[5:0]	Slow Channel CRC Data
23 to 21	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
20	SMGC	Slow Channel Configuration Bit Data
19 to 0	IDD[19:0]	Slow Channel Data / ID Information

RSENTnSRXD.SND (Slow Channel New Data)

This bit indicates that the slow channel message reception buffer is holding data that has not been read.

This bit is read only.

This bit is set when the slow channel message reception buffer is updated.

This bit is cleared automatically whenever it is read.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnSRXD.SCRC (Slow Channel CRC)

These bits indicate the slow channel CRC data.

These bits are read only.

These bits are updated when the slow channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnSRXD.SMGC (Slow Channel Configuration Bit)

This bit represents the slow channel configuration bit data.

This bit is read only.

This bit is updated when the slow channel message reception buffer is updated.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnSRXD.IDD (ID/Data)

These bits are representing the slow channel data and ID information.

The alignment within this register depends on the message format. For details, see **Section 15.4.3.7,** Slow Channel Message Reception.

These bits are read only.

These bits are updated when the slow channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

15.3.14 RSENTnCPL — RSENT Calibration Pulse Length Register

Access: This register is read-only in 32-bit units.

Address: <RSENTn_base> + 0038_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPLV [16]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CPLV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 15.20 RSENTnCPL Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
16 to 0	CPLV[16:0]	Calibration Pulse Length Value of Received Message

RSENTnCPL.CPLV (Calibration Pulse Length Value)

When suspension of pulses is enabled in fixed message length mode, these bits and the RSENTnML.MLV bits can be used by software to calculate the ratios of the respective message lengths in consecutive frames and of the calibration pulses and compare the variations to produce diagnostic messages.

These bits are read only.

Updating of the fast channel message reception buffer is storage of the value counted over the calibration pulse length (one tick time × the number of ticks between calibration pulses) based on the sample clock (fSAMPLE = 16 MHz).

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

15.3.15 RSENTnML — RSENT Message Length Register

Access: This register is read-only in 32-bit units.

Address: <RSENTn_base> + $003C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	MLV[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MLV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 15.21 RSENTnML Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, these bits are read as 0. When writing, write the value after reset.
20 to 0	MLV[20:0]	Message length of received message

RSENTnML.MLV (Message Length Value)

When suspension of pulses is enabled in fixed message length mode, these bits and the RSENTnCPL.CPLV bits can be used by software to calculate the ratios of the respective message lengths in consecutive frames and of the calibration pulses and compare the variations to produce diagnostic messages.

These bits are read only.

These bits are updated with the measured message length in sample clock ticks when the fast channel message receive buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

15.3.16 RSENTnFRTS — RSENT Fast Channel Receive Timestamp Register

Access: This register is read-only in 32-bit units.

Address: <RSENTn_base> + 0040_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 15.23 RSENTnFRXD Register Contents

Bit Position	Bit Name	Function
31	SNDM	Slow Channel New Data Mirror 0: Slow channel frame data is not updated since last read. 1: Slow channel frame data is updated since last read.
30	FND	Fast Channel New Data 0: Fast channel frame data is not updated since last read. 1: Fast channel frame data is updated since last read.
29, 28	FCCN[1:0]	Fast Channel Status and Communication Nibble[1:0]
27 to 24	FCRC[3:0]	Fast Channel CRC Data
23 to 0	ND[23:0]	Fast Channel Nibble Data

RSENTnFRXD.SNDM (Slow Channel New Data Mirror)

This bit indicates that the slow channel message reception buffer is holding data that has not been read.

This bit is read only.

This bit is set when the slow channel message reception buffer is updated.

This bit is cleared automatically whenever the slow channel new data bit (RSENTnSRXD.SND) is read.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnFRXD.FND (Fast Channel New Data)

This bit indicates that the fast channel message receive buffer is holding data that has not been read. This bit is read only.

This bit is set when the fast channel message receive buffer is updated.

This bit is cleared automatically whenever it is read.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnFRXD.FCCN (Fast Channel Status and Communication Nibble)

These bits are representing the fast channel status and communication nibble bits [1:0].

These bits are read only.

These bits are updated when the fast channel message receive buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnFRXD.FCRC (Fast Channel CRC)

These bits are representing the fast channel CRC data.

These bits are read only.

These bits are updated when the fast channel message receive buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnFRXD.ND (Fast Channel Nibble Data)

These bits are representing the fast channel nibble data.

The alignment of the nibble data depends on nibble data count (RSENTnCC.NDN). For details, see **Section 15.4.3.5, Fast Channel Message Reception**.

These bits are read only.

These bits are updated when the fast channel message receive buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

15.4 Functions

15.4.1 Modes of Operation

RSENTn operates in any of the following modes.

- RESET mode
- CONFIGURATION mode
- OPERATION IDLE mode
- OPERATION ACTIVE mode

CPU should follow the mode change flow as shown **Section 15.4.3.1, Changing Operation Modes**.

The current operation mode status can be seen in the RSENTnMST.OMS bits.

Figure 15.2 shows the possible transitions between the channel modes:

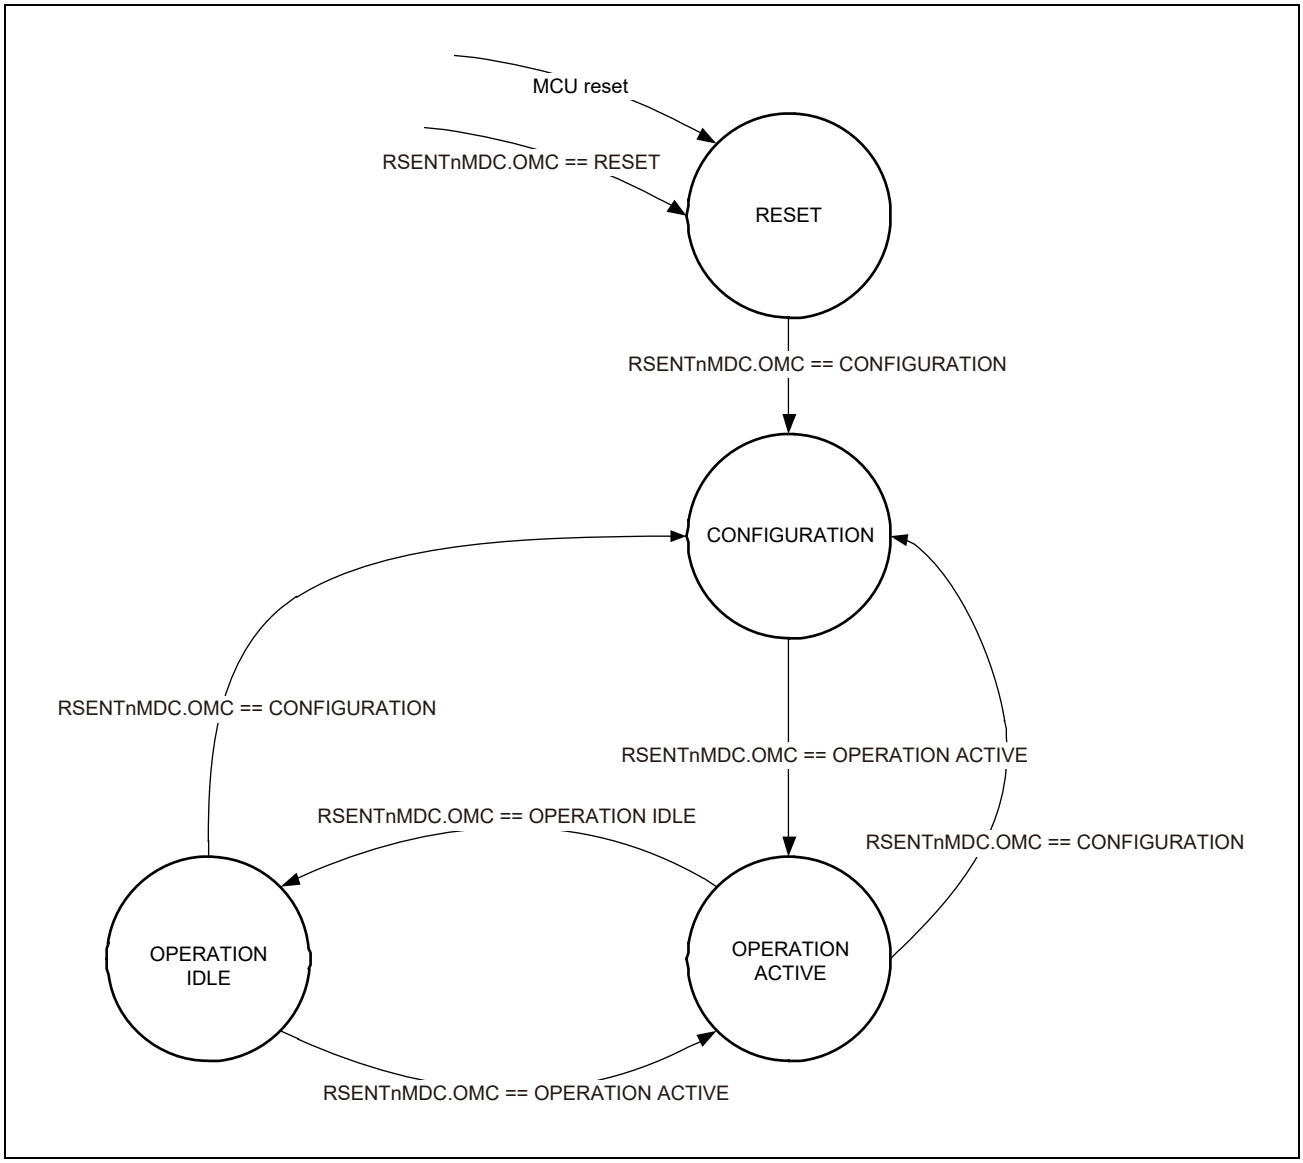

Figure 15.2 Transition between Operation Modes

15.4.1.1 RESET Mode

This mode is the initial mode that the RSENT module automatically enters after release from the reset state. This initializes the registers in the RSENT module.

The RESET mode is also entered after the RSENTnMDC.OMC bits have been set to 000_B. In this state, all, configuration, control (except RSENTnMDC.OMC bits), and status registers are set to the state after release from the reset state. Any on-going transmission or reception process is stopped immediately and the interface pins of the RSENT module are set to the value after their reset.

Read access to all registers is possible in RESET mode. Write access is limited to the RSENTnMDC register.

15.4.1.2 CONFIGURATION Mode

CONFIGURATION mode is entered after the RSENTnMDC.OMC bits are set to 001_B.

The interface pins of the RSENT module are set to their default values.

Regarding the output polarity setting of RSENTnSPCO pin and the timing that becomes effective, please refer to the explanation of "RSENTnCC.SOPC (SPC Output Polarity Control)" in **Section 15.3.4, RSENTnCC — RSENT Communication Configuration Register**.

In CONFIGURATION mode, all status registers (RSENTnCS) and the receive buffer registers

(RSENTnSRTS, RSENTnSRXD, RSENTnCPL, RSENTnML, RSENTnFRTS, and RSENTnFRXD) are set to the value after their reset.

Read access to all registers is possible in this state.

Write access is limited to both timestamp registers (RSENTnTSPC and RSENTnTSC) and configuration registers (RSENTnCC, RSENTnBRP, RSENTnIDE, RSENTnMDC, and RSENTnCSC).

15.4.1.3 OPERATION IDLE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to 011_B. In OPERATION IDLE mode, no reception and transmission are done.

When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.

Read access to all registers is possible in OPERATION IDLE mode.

Write access is limited to RSENTnTSC, RSENTnIDE, RSENTnMDC, and RSENTnCSC.

15.4.1.4 OPERATION ACTIVE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to 101_B. In OPERATION ACTIVE mode, transmission and reception can take place.

Frame reception and status flagging starts after a valid calibration pulse (including the falling edge at the beginning) was detected.

Read access to all registers is possible in this state.

Write access is limited to RSENTnTSC, RSENTnIDE, RSENTnMDC, RSENTnSPCT, and RSENTnCSC.

15.4.1.5 Register Behavior in Operation Modes

Table 15.24 shows the register behavior when the RSENT module transitions to the indicated operation modes. The table also gives an overview about the access restriction in each operation mode.

Table 15.24 Register Behavior in Operation Modes

Register Name	Symbol	Reset	RESET mode		CONFIGURATION mode		OPERATION IDLE mode		OPERATION ACTIVE mode	
		Change	Change	R/W	Change	R/W	Change	R/W	Change	R/W
Timestamp prescaler configuration register	RSENTnTSPC	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R	Unchanged	R
Timestamp counter register	RSENTnTSC	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R/W *1	Unchanged	R/W *1
Communication configuration register	RSENTnCC	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R	Unchanged	R
Baud rate prescaler register	RSENTnBRP	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R	Unchanged	R
Interrupt/DMA enable register	RSENTnIDE	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R/W	Unchanged	R/W
Mode control register	RSENTnMDC	0000 0000$_H$	0000 0000$_H$	R/W	Unchanged	R/W	Unchanged	R/W	Unchanged	R/W
SPC transmission register	RSENTnSPCT	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R	Unchanged	R	Unchanged	R/W
Mode status register	RSENTnMST	0000 0000$_H$	0000 0000$_H$	R	0000 0001$_H$	R	0000 0003$_H$	R	0000 0005$_H$	R
Communication status register	RSENTnCS	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Communication status clear register	RSENTnCSC	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R/W	Unchanged	R/W
Slow channel receive timestamp register	RSENTnSRTS	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Slow channel receive data register	RSENTnSRXD	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Calibration pulse length register	RSENTnCPL	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Message length register	RSENTnML	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Fast channel receive timestamp register	RSENTnFRTS	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Fast channel receive data register	RSENTnFRXD	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R

Note 1. Means write restriction exists.

15.4.2 Clock Configuration

15.4.2.1 Timestamp

(1) Timestamp Clock Configuration

The RSENT module includes a timestamp counter.

The user should set the RSENTnTSPC.TTPV bits according to the communications frequency (that of clkc) such that the output of the prescaler, TPV, is a 1-µs clock tick.

The resolution of the timestamps can be decreased by setting the RSENTnTSPC.TTM bits according to the set tick length. The input frequency, which has already been divided by the prescaler, is further divided by the value of the RSENTnTSPC.TTM bits (a multiplier for the period).

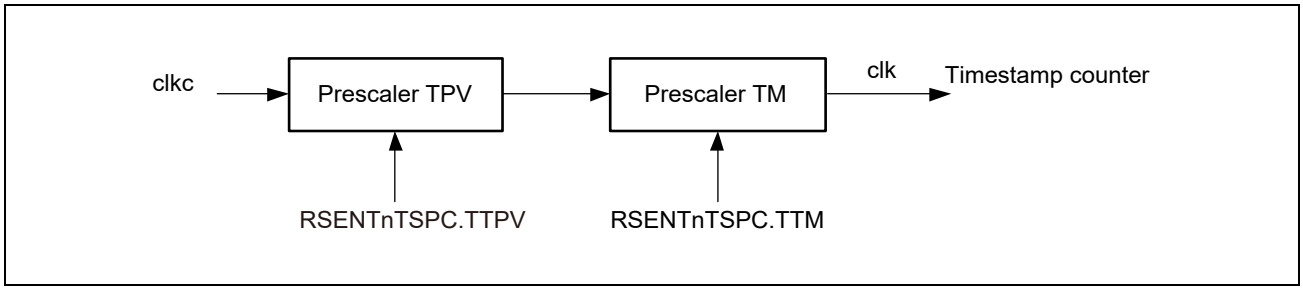

Figure 15.3 Timestamp Counter Clock Generation

(2) Timestamp Counter Operation

The timestamp counter value can be initialized to any value by writing to the RSENTnTSC.TS bits only when the RSENT module is in CONFIGURATION mode.

When timestamp counters are configured to operate in master mode (RSENTnTSPC.TMS = 0), the CPU can reset the timestamp counter by writing 0000 0000_H to the RSENTnTSC.TS bits when the RSENT module is in OPERATION_IDLE or OPERATION_ACTIVE mode.

When timestamp counters are configured to operate in slave mode (RSENTnTSPC.TMS = 1), the RSENTtimestamp counter is cleared when the CPU writes 0000 0000_H to the RSENTnTSC.TS bits of the channel set in the master when the RSENT module is in OPERATION_IDLE or OPERATION ACTIVE mode. Make the same settings for the timestamp counter prescalers of channels operating in master mode and slave mode. When timestamp counter synchronization occurs, the internal timestamp counter prescalers are also synchronized.

The current timestamp counter value can be read from the RSENTnTSC.TS bits.

When the RSENT module is in OPERATION ACTIVE mode, each received message is stored with its related timestamp. Timestamp values are taken for fast channel and slow channel data.

The timestamp value is captured when the calibration pulse is detected.

The timestamp value for the fast channel is stored in the RSENTnFRTS.FTS bits.

The timestamp value for the slow channel is stored in the RSENTnSRTS.STS bits. The timestamp value for the slow channel is identical to the timestamp value of the last fast channel message contributing to the slow channel message reception buffer.

In case timestamp counter synchronization is required, the following flow should be used.

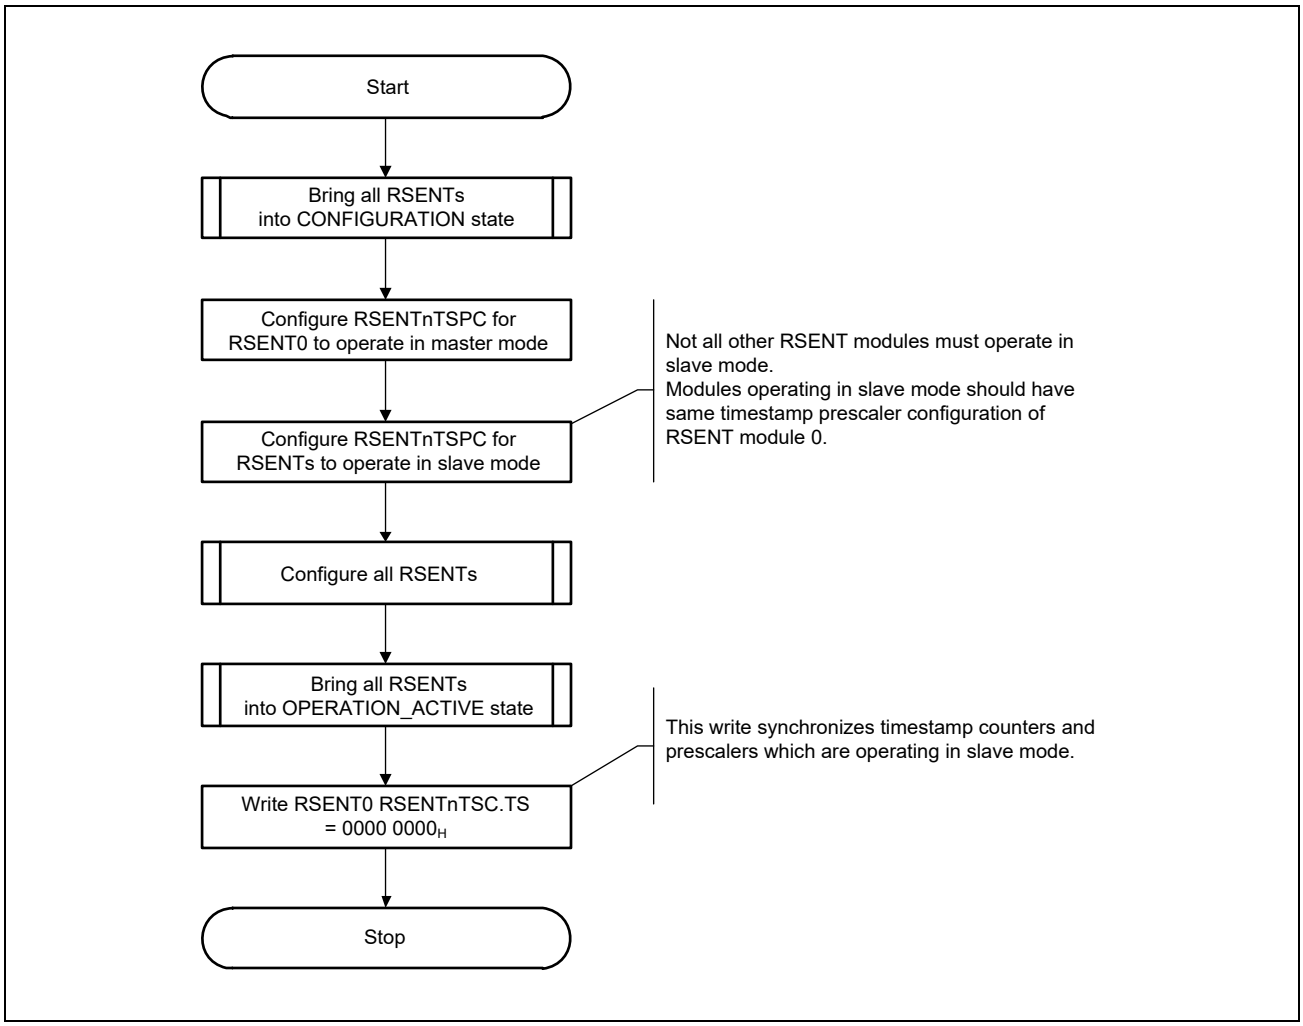

Figure 15.4 Timestamp Counter Synchronization

Synchronization of the timestamp can be done if the state of the master module has changed to OPERARION_ACTIVE or OPERARION_IDLE.

15.4.2.2 Communication Clock Configuration

(1) RX BRP Setting

Configure the communication baud rate by setting the RSENTnBRP.SCMV bit and the RSENTnBRP.SCDV bit according to the following formula.

Select the values of RSENTnBRP.SCMV and RSENTnBRP.SCDV so that frequency-dividing $f_{COMMUNICATION}$ (the clock clkc) sets f_{SAMPLE} to 16MHz.

$$f_{SAMPLE} = 16\,MHz = f_{COMMUNICATION} \times \frac{Sample\ clock\ multiplication\ value\ (BRP.SCMV + 1)}{Sample\ clock\ division\ value\ (BRP.SCDV + 1)}$$

Here, Sample clock multiplication value = 1 (BRP.SCMV = 00000B)

Sample clock division value = 5 (BRP.SCDV = 0000100B)

$f_{COMMUNICATION}$ = 80 MHz

f_{SAMPLE} = 80 × 1/5 = 16 MHz

(2) RX and SPC Tick Settings

The tick length to be used by the receive and SPC functions can be configured by setting the RSENTnBRP.TTI and RSENTnBRP.TTF bits. Tick lengths of 1.0 µs to 90.0 µs can be configured in 0.1 µs resolution.

RSENTnBRP.TTI holds the integer part of the tick length and the RSENTnBRP.TTF bits hold the fractional part of the tick length. The tick length is then calculated by:

$$T_{TICK} = T_{BRP.TTI} + T_{BRP.TTF}$$

Here, VRP.TTI = 0000000B, BRP.TTF = 0011B

T_{Tick} = 1 + 0.3 = 1.3 µs

15.4.3 RSENT Operation

When starting communication with RSENTn installed in a product of this series, be sure to configure the pints that are associated with the RSENTn interface in question before following the configuration steps explained in this section.

Make PORT settings for each of SENT reception system, SPC 1-wire system, and SPC 2-wire system as summarized below.

Table 15.25 PORT Settings when RSENT is used

		Port Setting Registers				
		PMC	PIPC	PM	PIBC	PBDC
SENT reception	RSENTnRX	1	0	1	0	0
SPC single-wire system	RSENTnRX/RSENTnSPCO	1	1	1	0	0
SPC two-wire system	RSENTnRX	1	0	1	0	0
	RSENTnSPCO	1	0	0	0	0

For details of the pin settings, see **Section 2, Pins**.

15.4.3.1 Changing Operation Modes

Once initialization has been completed in CONFIGURATION mode, operation can be enabled by entering OPERATION ACTIVE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION ACTIVE and waiting for the RSENTnMST.OMS to transition to OPERATION ACTIVE.

Once in OPERATION ACTIVE mode the RSENT module begins to receive messages or SPC communication can be started depending on the configuration.

Figure 15.5 shows the communication enabled flow assuming that the RSENT module is in RESET mode:

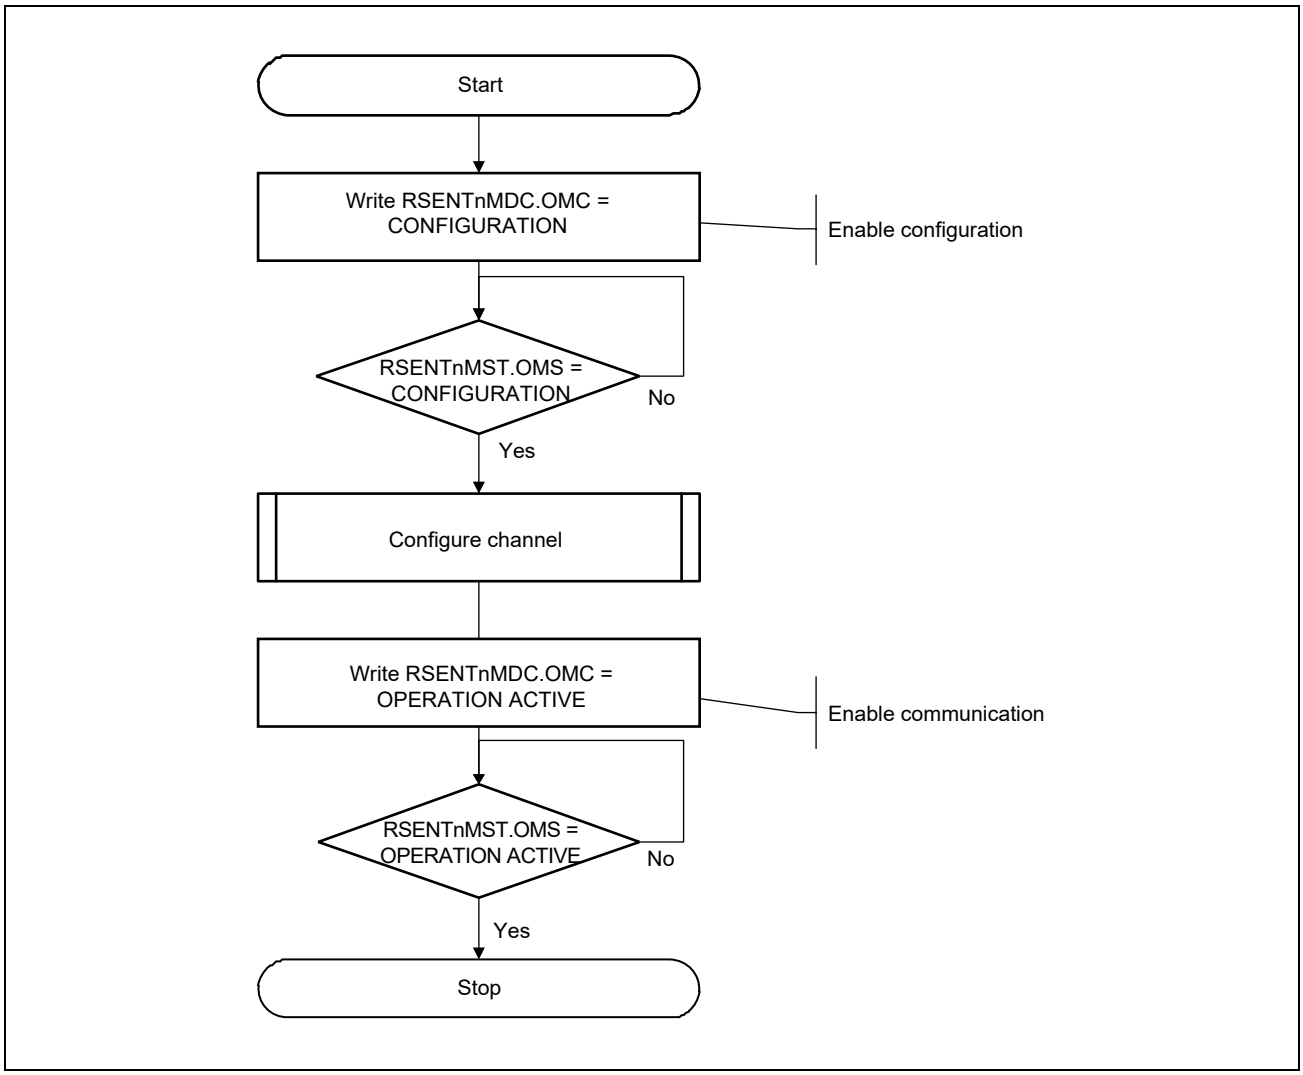

Figure 15.5 Communication Enable Flow

To leave OPERATION ACTIVE mode, communication should be disabled first by transition to OPERATION IDLE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION IDLE and waiting for the RSENTnMST.OMS bits to transition to OPERATION IDLE.

However, when the SPC mode is enabled (CC.SPCE = 1) and the SPC trigger transmission has not been requested after the previous SPC communication has been completed (e.g. successful reception for the previous SPC trigger transmission), the RSENT module can directly enter the CONFIGURATION mode.

The transition between OPERATION ACTIVE and OPERATION IDLE depends on the setting of the RSENTnCC.SPCE bit.

(1) RSENTnCC.SPCE = 0

In case a reception is currently ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the receive buffer was updated or error was flagged (see **Section 15.4.3.5, Fast Channel Message Reception**).

In case no reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place immediately.

(2) RSENTnCC.SPCE = 1

In case a reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

In case a no response error is flagged, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place at the same time as the error flagging.

The mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the sequence of making a SPC trigger and receiving the response has been completed. This means when a response was already received, the transition takes place immediately. When the response is still pending, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

CONFIGURATION mode can be entered by writing CONFIGURATION into the RSENTnMST.OMS bits and waiting for RSENTnMST.OMS to switch to the CONFIGURATION state.

Once CONFIGURATION mode is entered, the remaining status and message information stored in the RSENT module is lost since status and message information is cleared in CONFIGURATION mode.

Figure 15.6 shows the communication disable flow assuming that the RSENT module is in OPERATION ACTIVE mode.

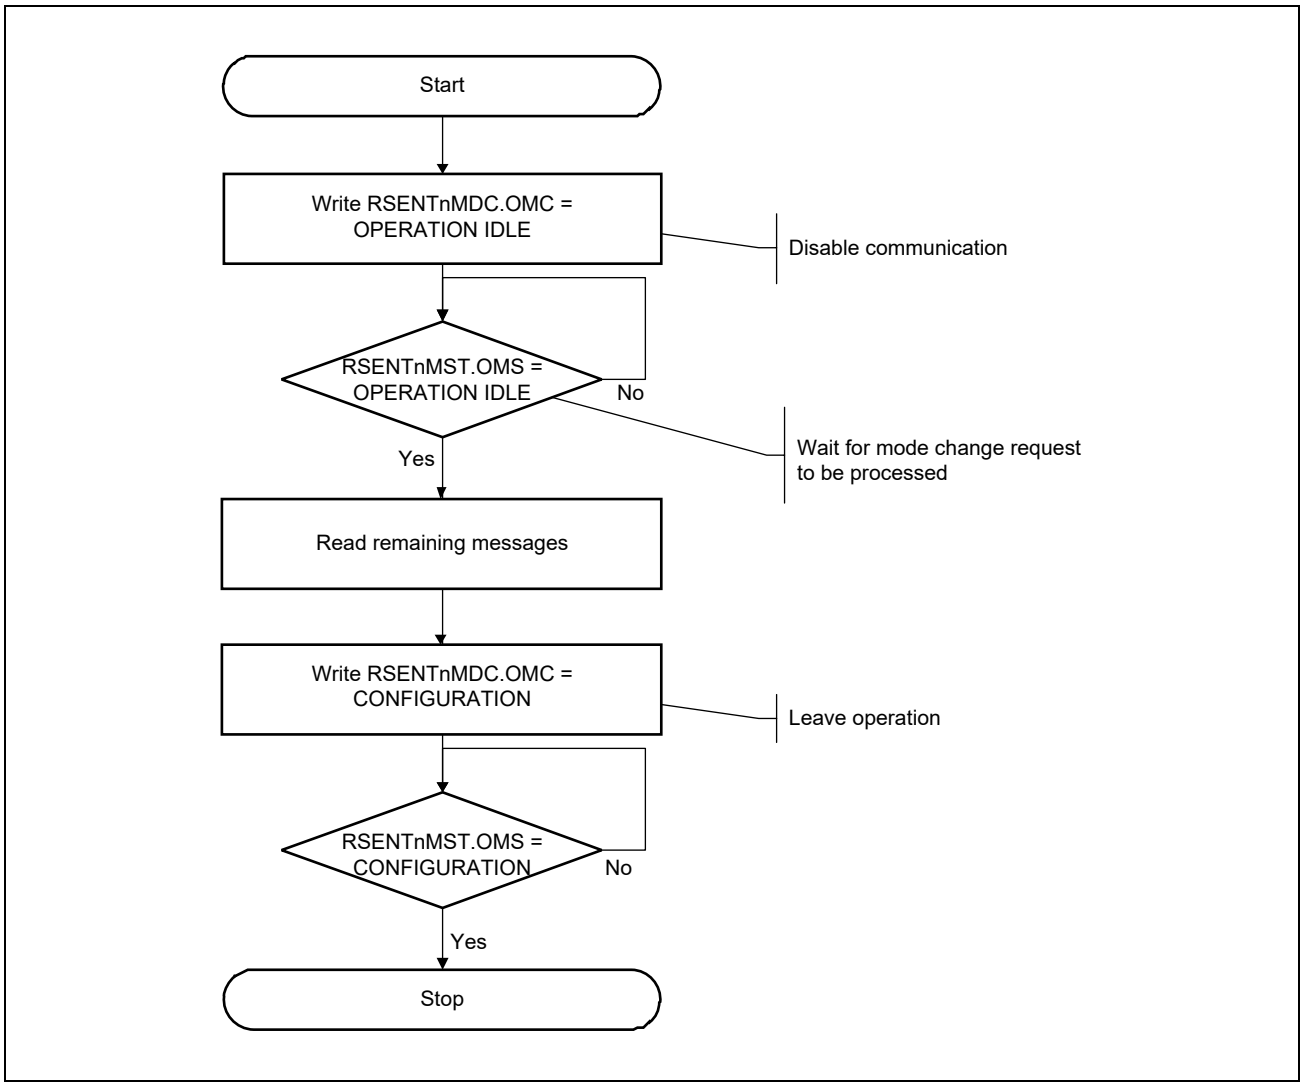

Figure 15.6 Communication Stop Flow

15.4.3.2 Message Reception

RSENT message reception is composed of the calibration pulse reception followed by the data nibble pulse reception.

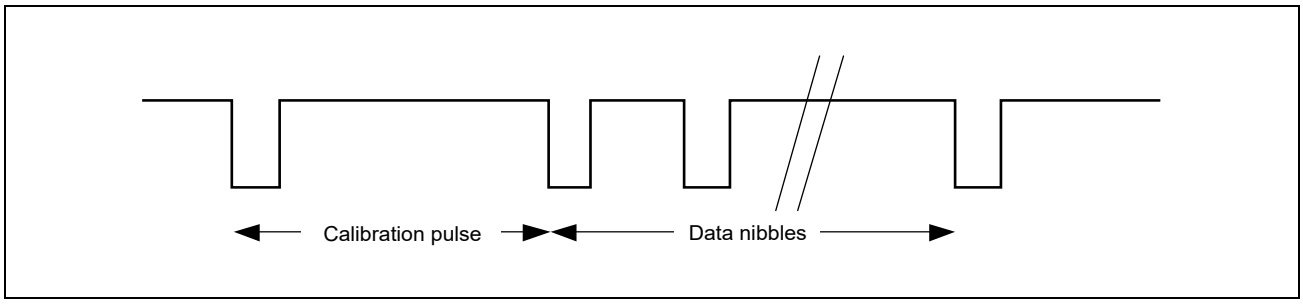

Figure 15.7 RSENT Received Message Structure

15.4.3.3 Calibration Pulse Reception

Within the calibration pulse reception phase the internally generated clock tick is adjusted to the transmit clock speed.

In addition, the calibration pulse is used to end the previous message and perform message diagnostics. The RSENT module supports automatic calibration pulse length diagnostics in variable message length modes (RSENTnCC.PPTC = 0). In case the calibration pulse ratio check fails, the calibration pulse length variation error flag (RSENTnCS.CVS) is set to 1.

15.4.3.4 Data Nibble Reception

The receive function of the RSENT module is a straightforward capture and compare function. The RSENT module receives sensor information encoded by the temporal distance of two consecutive falling edges on the data line. The temporal distance (in # of clock ticks) is captured and compared against a set of values to determine the actual nibble value. The data encoding is illustrated in **Table 15.26** below.

Table 15.26 Data Nibble Encoding

Nibble Period (# Clock Ticks)	Nibble Value (Binary)
12	0000_B
13	0001_B
14	0010_B
15	0011_B
16	0100_B
17	0101_B
18	0110_B
19	0111_B
20	1000_B
21	1001_B
22	1010_B
23	1011_B
24	1100_B
25	1101_B
26	1110_B
27	1111_B

The received data nibbles are composed into an RSENT message which is then stored in the fast channel message receive buffer.

Any other received nibble period during the reception of data nibbles will cause a fast channel nibble encoding error.

15.4.3.5 Fast Channel Message Reception

Messages received on the fast message channel are stored in a receive buffer.

A fast channel message receive buffer is composed of the calibration pulse length register (RSENTnCPL), the message length register (RSENTnML), the fast channel receive timestamp register (RSENTnFRTS), and the fast channel receive data register (RSENTnFRXD).

These registers are arranged on successive addresses for a transfer of the register content into memory using DMA.

The RSENT module is equipped with a double receive buffer structure that allows the storage of two complete RSENT messages including the related timestamp and message length information. Message decoding and assembling are done in a separate register stage.

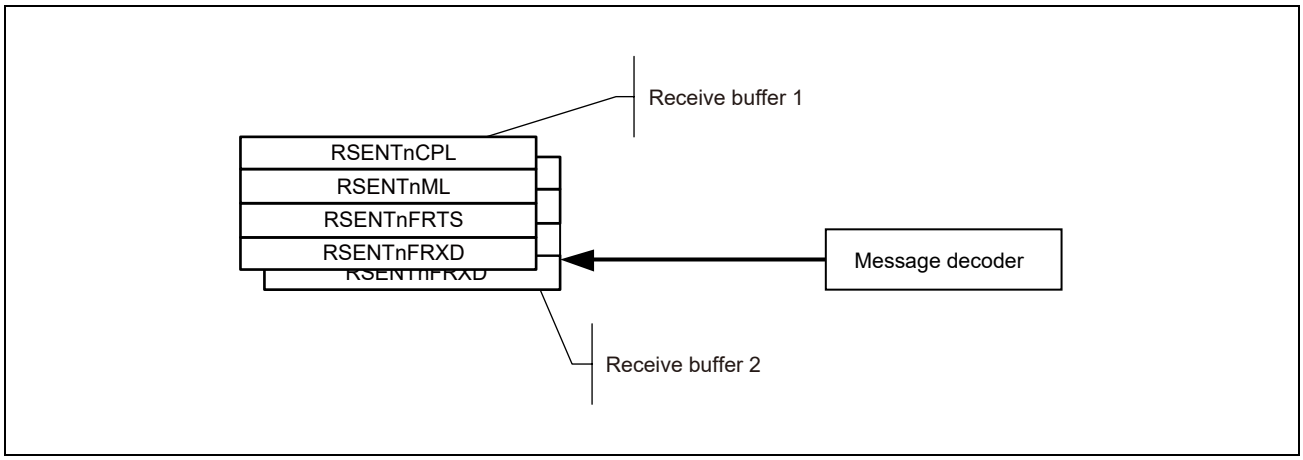

Figure 15.8 Fast Channel Message Receive Buffer

The first received message is placed into the message buffer that can be accessed by the CPU. This buffer (except the RSENTnFRXD.SNDM bit) is not updated any more until the RSENTnFRXD.FND bit was read.

When a new message is placed into a receive buffer, the RSENTnFRXD.FND bit is set. At the same time, the RSENTnCS.FRS bit is set and, if enabled, a receive interrupt request is generated.

When receive buffer 1 is holding an unprocessed message (the RSENTnFRXD.FND bit is 1), any further incoming message is placed in receive buffer 2. Receive buffer 2 is updated with any further incoming messages. In case an unprocessed message in receive buffer 2 is overwritten, the RSENTnCS.FMS bit is set to 1.

When the CPU reads the RSENTnFRXD.FND bit and there is valid data in the buffer 2, the data previously located in receive buffer 2 becomes available in the receive buffer becomes available in the receive buffer and is accessible by the CPU. If enabled, a new interrupt request for fast channel data is generated and RSENTnCS.FRS is set.

When the RSENTnFRXD.FND/ RSENTnCS.FRS bit is not set, the data in the receive buffer is not defined and the CPU should not access the receive buffer.

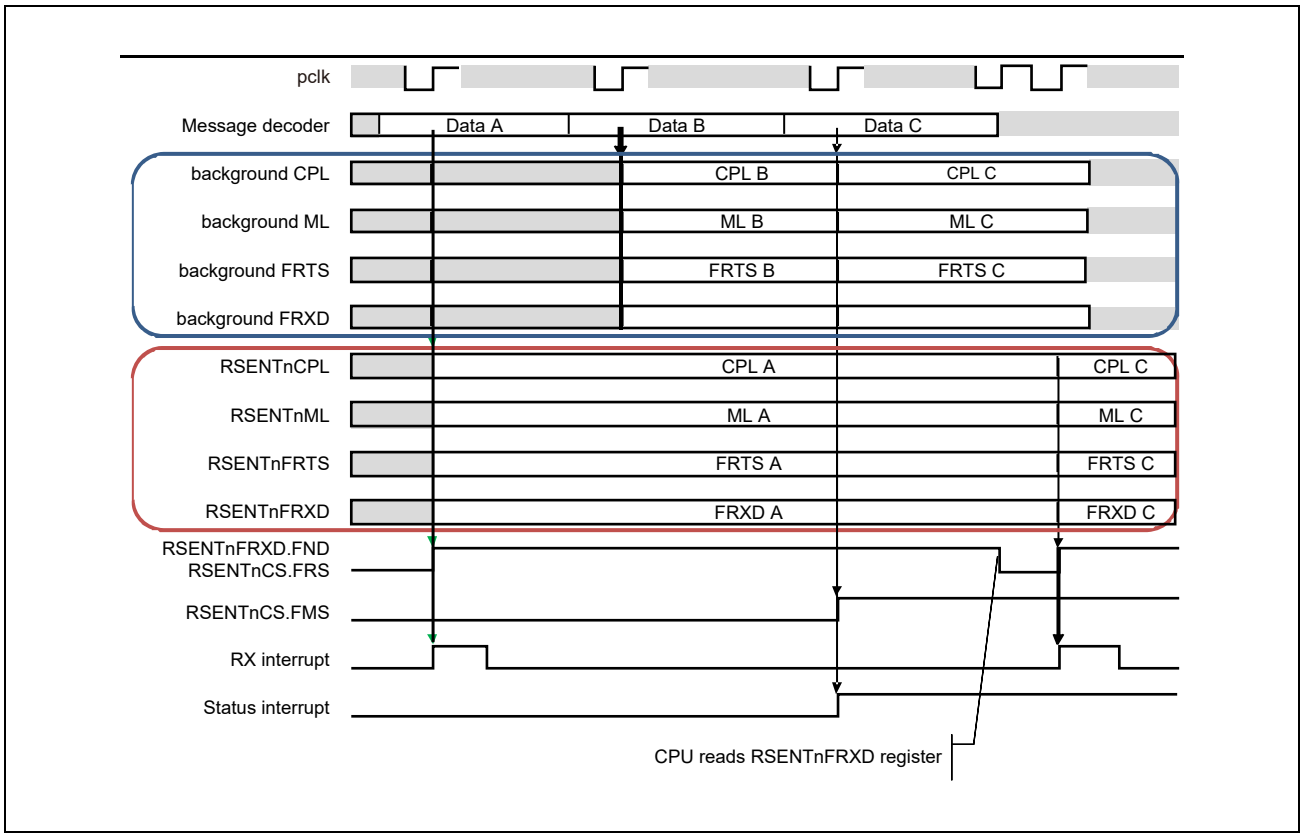

Figure 15.9 Fast Channel Message Receive Buffer Update Timing

The update timing of the receive buffer depends on the applied configuration as depicted in **Figure 15.10** to **Figure 15.13**.

The RSENTnFRTS register is updated with the current timestamp counter register value when the calibration pulse is detected.

The data alignment in the RSENTnFRXD register depends on the nibble data count (RSENTnCC.NDN).

Table 15.27 Data Nibble Alignment in RSENTnFRXD Register

RSENTnCC.NDN	23:20	19:16	15:12	11:8	7:4	3:0
000_B	Undefined	Undefined	Undefined	Undefined	Undefined	Nibble 1
001_B	Undefined	Undefined	Undefined	Undefined	Nibble 1	Nibble 2
010_B	Undefined	Undefined	Undefined	Nibble 1	Nibble 2	Nibble 3
011_B	Undefined	Undefined	Nibble 1	Nibble 2	Nibble 3	Nibble 4
100_B	Undefined	Nibble 1	Nibble 2	Nibble 3	Nibble 4	Nibble 5
101_B	Nibble 1	Nibble 2	Nibble 3	Nibble 4	Nibble 5	Nibble 6

(1) SAE operation with variable message length and preferred check method (RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 0, RSENTnCC.FCM = 0)

In this operation mode, the RSENT module automatically performs the check for successive calibration pulse variation according to the preferred option in the J2716 2010 specification. In this mode, message diagnostics is done after the calibration pulse was received following a message.

If this check is passed, the message receive buffer is updated.

If this check is not passed, the message receive buffer is not updated and RSENTnCS.CVS is set to 1.

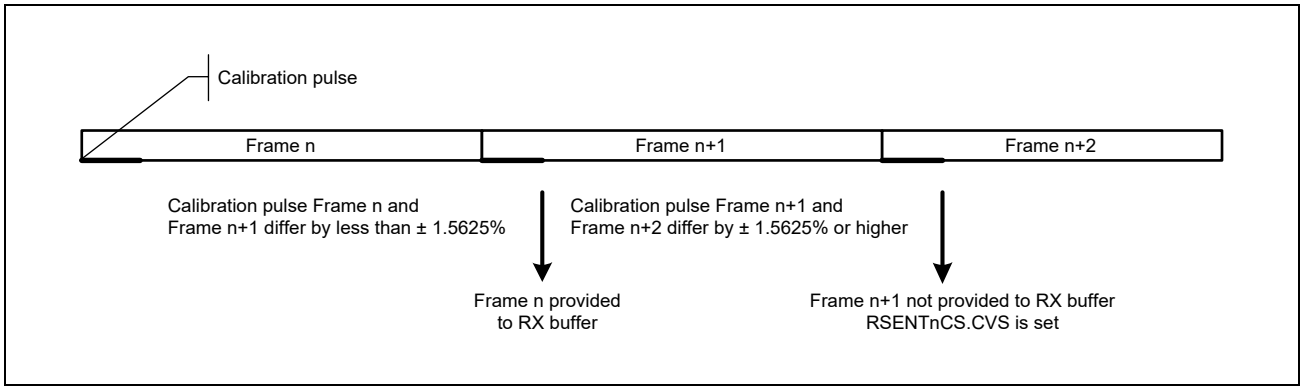

Figure 15.10 Buffer Update in Variable Message Length Mode and Preferred Check Method

(2) SAE operation with variable message length and optional check method (RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 0, RSENTnCC.FCM = 1)

In this operation mode, the RSENT module automatically performs the check for successive calibration pulse variation according to the optional frame check method stipulated in the J2716 2010 specification. In this mode, message diagnostics is done after the calibration pulse was received following a message. In this mode, the calibration pulse in the current frame is compared with the calibration pulse in the preceding valid frame.

If this check is passed, the message receive buffer is updated.

If this check is not passed, the message receive buffer is not updated and RSENTnCS.CVS is set to 1.

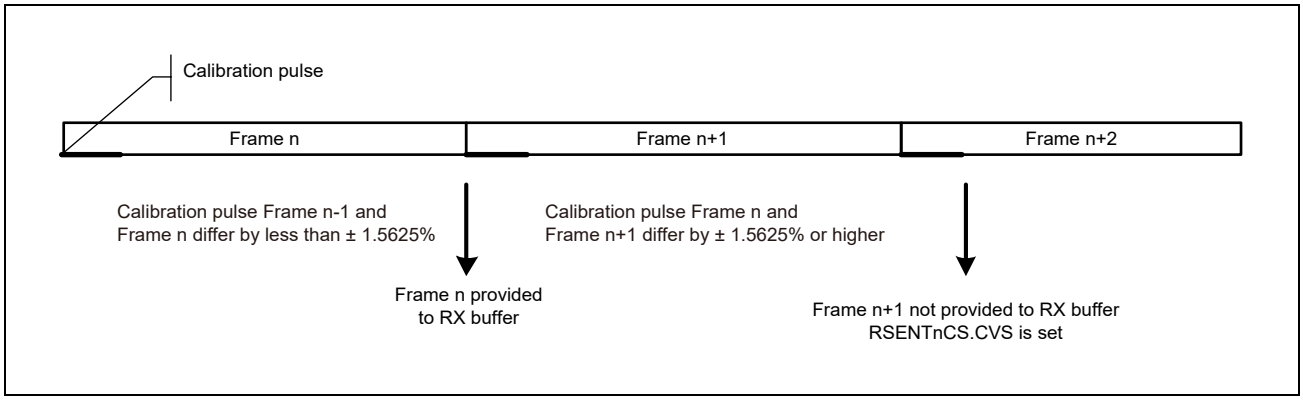

Figure 15.11 Buffer Update in Variable Message Length Mode and Optional Check Method

(3) SAE operation with fixed message length (RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 1, RSENTnCC.PPC = 1)

In this mode, the RSENT module does not perform the check for calibration pulse and message length ratio according to the priority stipulated in the J2716 2010 specification. In this mode, the RSENT module provides the RSENTnCPL register with the calibration pulse length and the RSENTnML register with the message length information. The numbers that are provided are based on the sample.

The message buffer is updated at the beginning of the following calibration pulse irrespective of the values in the RSENTnCPL and RSENTnML registers. The CPU may accept or discard the message by calculating their ratio.

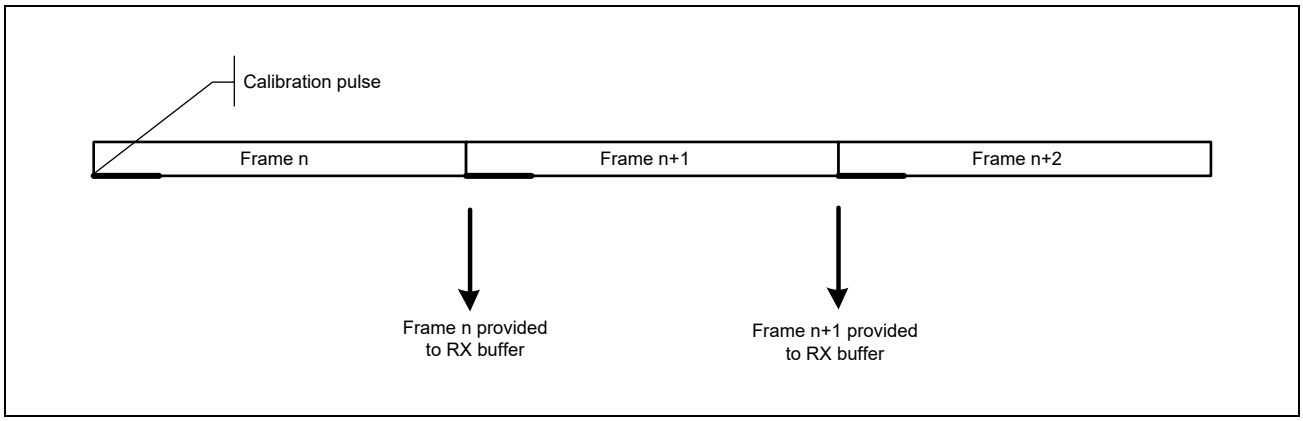

Figure 15.12 Buffer Update in Fixed Message Length Mode

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.

(4) SPC operation (RSENTnCC.SPCE = 1)

In this operation mode, sensor data transmission is done following a SPC master trigger pulse. In SAE SENT communication, the calibration pulse or pause pulse interrupts the perceiving message. In SPC communication, the sensor sends only the data that follows a SPC trigger request. The end pulse sent by the sensor interrupts the message. The message buffer is updated when the end pulse is started.

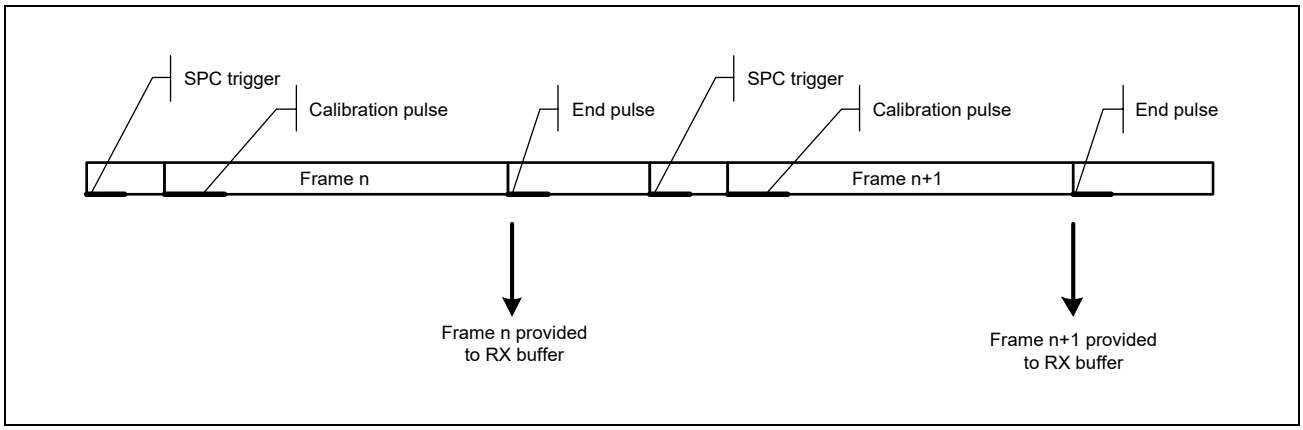

Figure 15.13 Buffer Update in SPC Mode

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.

The RSENT module provides the RSENTnCPL register with the calibration pulse length and the RSENTnML register with the message length information. The numbers that are provided are based on the sample. The CPU may accept or discard the message by calculating their ratio.

In variable message length mode, the RSENT module cannot check the receive timing of the next calibration pulse because it depends on the timing of the next SPC trigger.

15.4.3.6 Fast Channel Reception Flow

Figure 15.14 shows the recommended reception flow for the fast channel message receive buffer. Using a polling or event driven method, the CPU can check for the presence or absence of new fast channel data by reading out only the setting of the RSENTnCS.FRS bit.

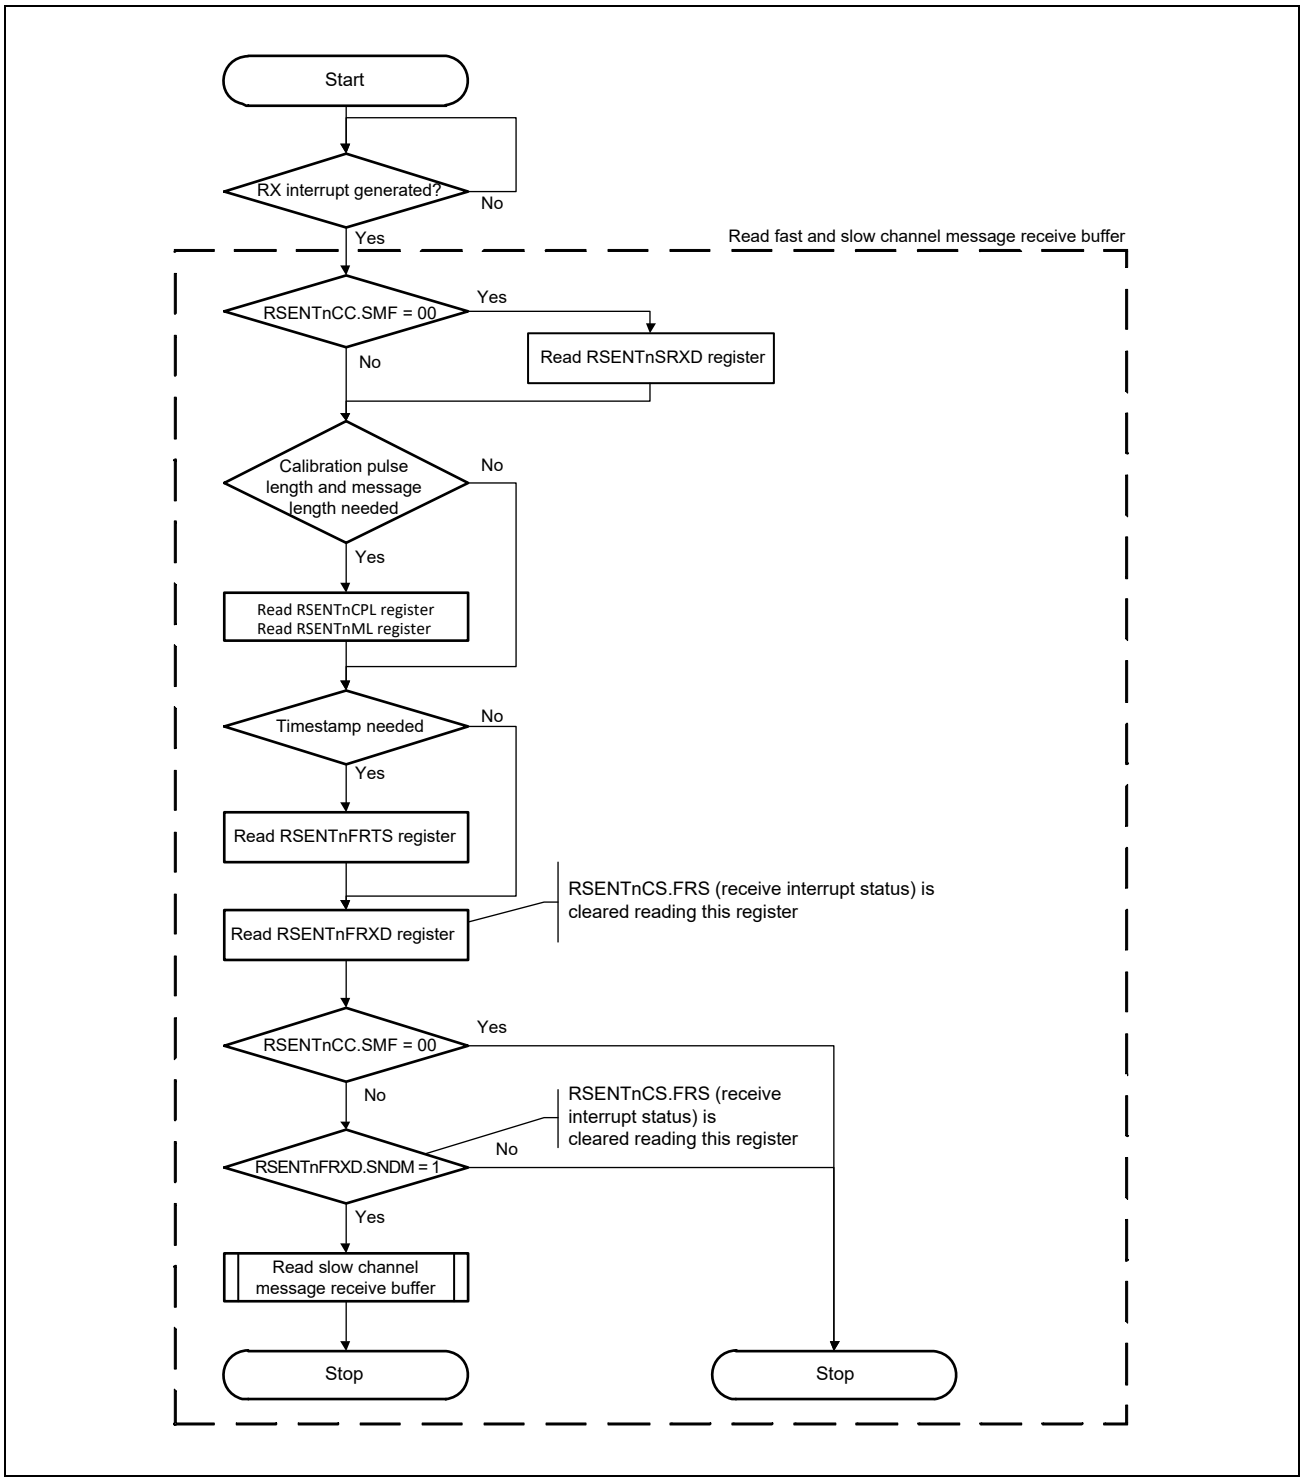

Figure 15.14 Fast Channel Reception Flow

In either case, the CPU needs to observe the receive buffer register read sequence shown in the flow. The RSENTnFRXD register need be the last register to be accessed.

The processing of the slow channel message receive buffer is described in **Section 15.4.3.8, Slow Channel Reception Flow**.

In SAE communication with pause pulse and fixed message length, the flow must be extended up to the message length by checking the ratio of the calibration pulse. This variation check must be performed by the CPU. If the variable check fails, the CPU must discard the received message.

15.4.3.7 Slow Channel Message Reception

The RSENT module supports the function to extract the slow message out of the fast channel messages using the status and communication nibble bits 3 and 2. To enable slow channel extraction, the CPU must set the RSENTnCC.SMF bits to the expected serial message format.

If serial message extraction is not selected (RSENTnCC.SMF = 00_B), the RSENTnSRXD register becomes part of the fast channel message receive buffer structure (including buffer 2) and the RSENTnSRTS register is ignored. The status and communication nibble is placed in the RSENTnSRXD.IDD bits. Furthermore neither slow channel new data nor slow channel message lost flags is generated.

For a slow channel serial message to be received, all the fast channel serial messages contributing to the slow channel serial message must be received successfully and the received slow channel serial message must comply with the selected serial message format.

A message lost on the fast channel will exert no influence on the reception on the slow channel. A slow channel message receive buffer is made up of a slow channel receive timestamp register (RSENTnSRTS) and a slow channel receive data register (RSENTnSRXD).

Unlike the fast channel message receive buffer, the slow channel message receive buffer does not have the double receive buffer structure but the single receive buffer structure. Message decoding and assembling is done in separate register stages.

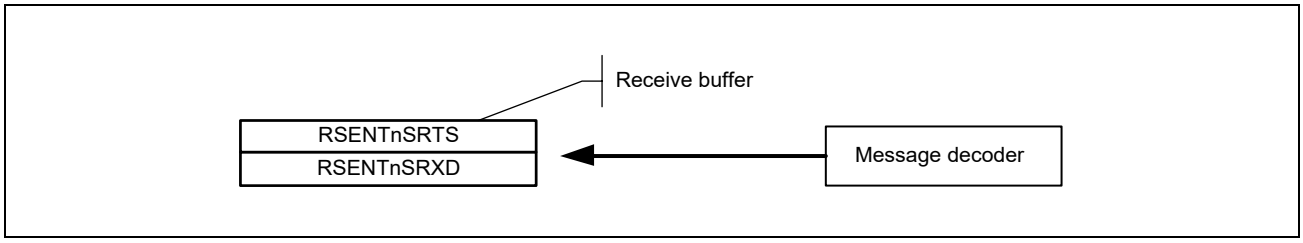

Figure 15.15 Slow Channel Message Reception Buffer

The slow channel message reception buffer is updated at the same time as the fast channel message receive buffer that holds the last status and communication nibble required for the slow channel message. The RSENTnSRXD.SND bit is set to 1 at the same time.

No Further updates to the buffer are carried out until the RSENTnSRXD.SND bit are read.

If the receive buffer is holding an unprocessed message (RSENTnSRXD.SND is 1), any further incoming message is lost (the slow channel message receive buffer is not updated). RSENTnCS.SMS is also set to 1.

When the CPU reads the RSENTnSRXD register, RSENTnSRXD.SND is automatically cleared.

The RSENTnSRTS register is updated with the current timestamp counter register value of the last frame contributing to the slow channel message.

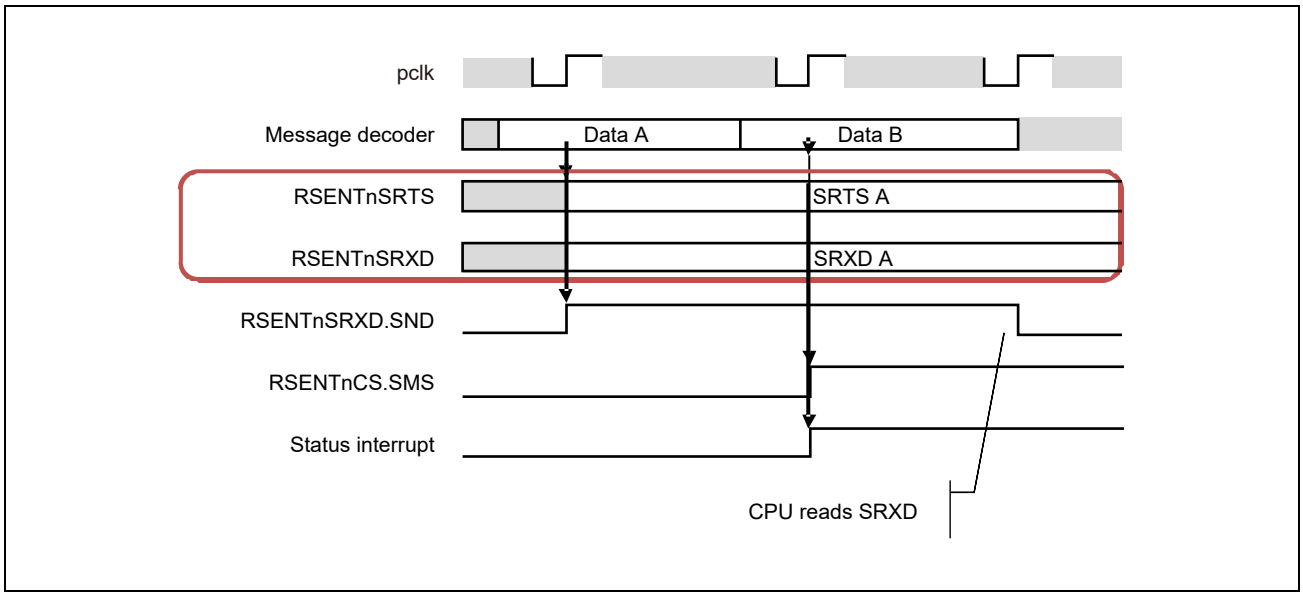

Figure 15.16 Slow Channel Message Receive Buffer Update Timing

The arrangement of the data in the SRDX register depends on the slow channel message format (RSENTnCC.SMF) and the received configuration bit.

Table 15.28 RSENTnSRXD Register Data Arrangement

RSENTn CC.SMF	RSENTnSRX D. SMGC	RSENTnSRXD. IDD[19:16]	RSENTnSRXD. IDD[15:12]	RSENTnSRXD. IDD[11:8]	RSENTnSRXD. IDD[7:4]	RSENTnSRXD. IDD[3:0]
00_B	Undefined	Undefined	Undefined	Undefined	Undefined	C & S nibble
01_B	Undefined	Undefined	Undefined	Message ID[3:0]	DATA[7:4]	DATA[3:0]
10_B	0	Message ID[7:4]	Message ID[3:0]	DATA[11:8]	DATA[7:4]	DATA[3:0]
10_B	1	Message ID[3:0]	DATA[15:12]	DATA[11:8]	DATA[7:4]	DATA[3:0]

15.4.3.8 Slow Channel Reception Flow

In **Figure 15.17**, the recommended reception flow for the slow channel message receive buffer is shown. When the slow channel receive data is required, this process should be executed as part of the fast channel reception flow.

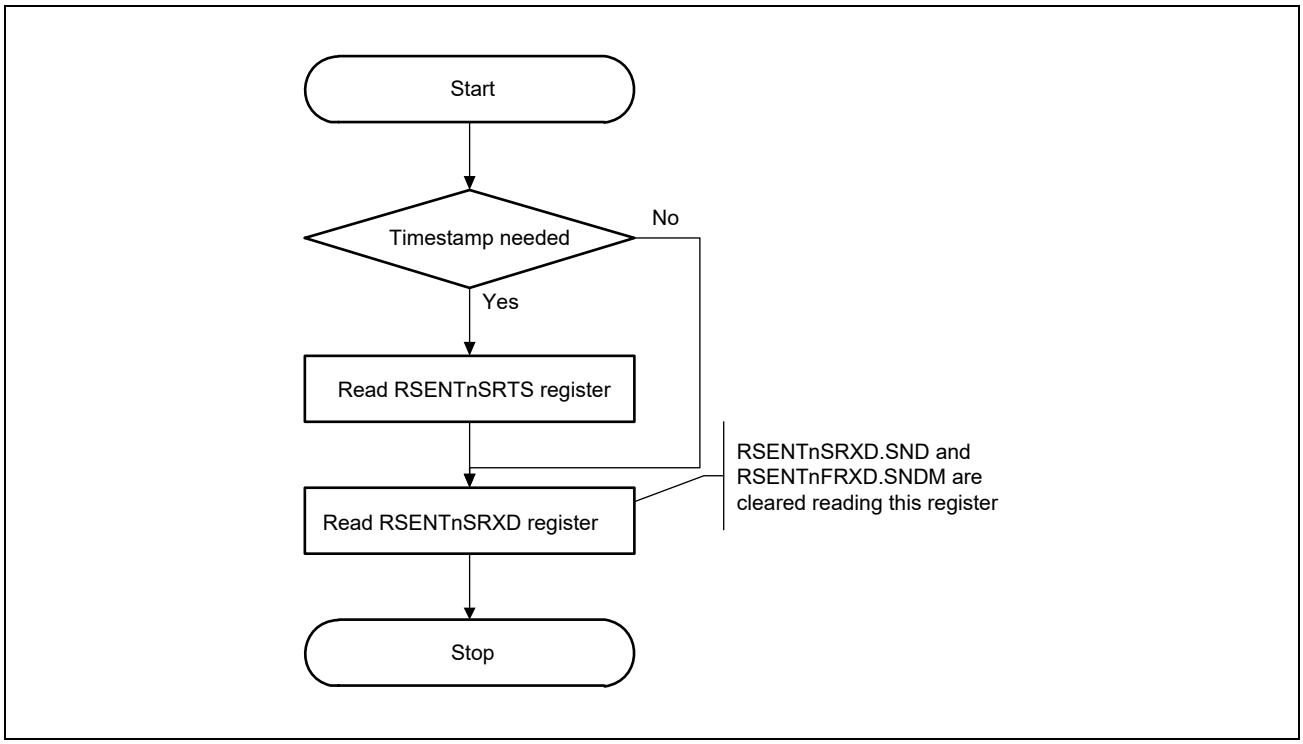

Figure 15.17 Slow Channel Reception Flow

In any case, the CPU should keep the order in reading the slow channel message receive buffer registers as shown in the flow. The RSENTnSRXD.SND bit should be accessed as last.

15.4.3.9 DMA Flow

In case of DMA usage, the start address for the DMA usage and the number of transfers define which part of the receive buffer will be transferred. The RSENTnFRXD register should be the last register to be accessed using a 32 bit access method.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU. In case the variation check fails, the CPU must discard the received message.

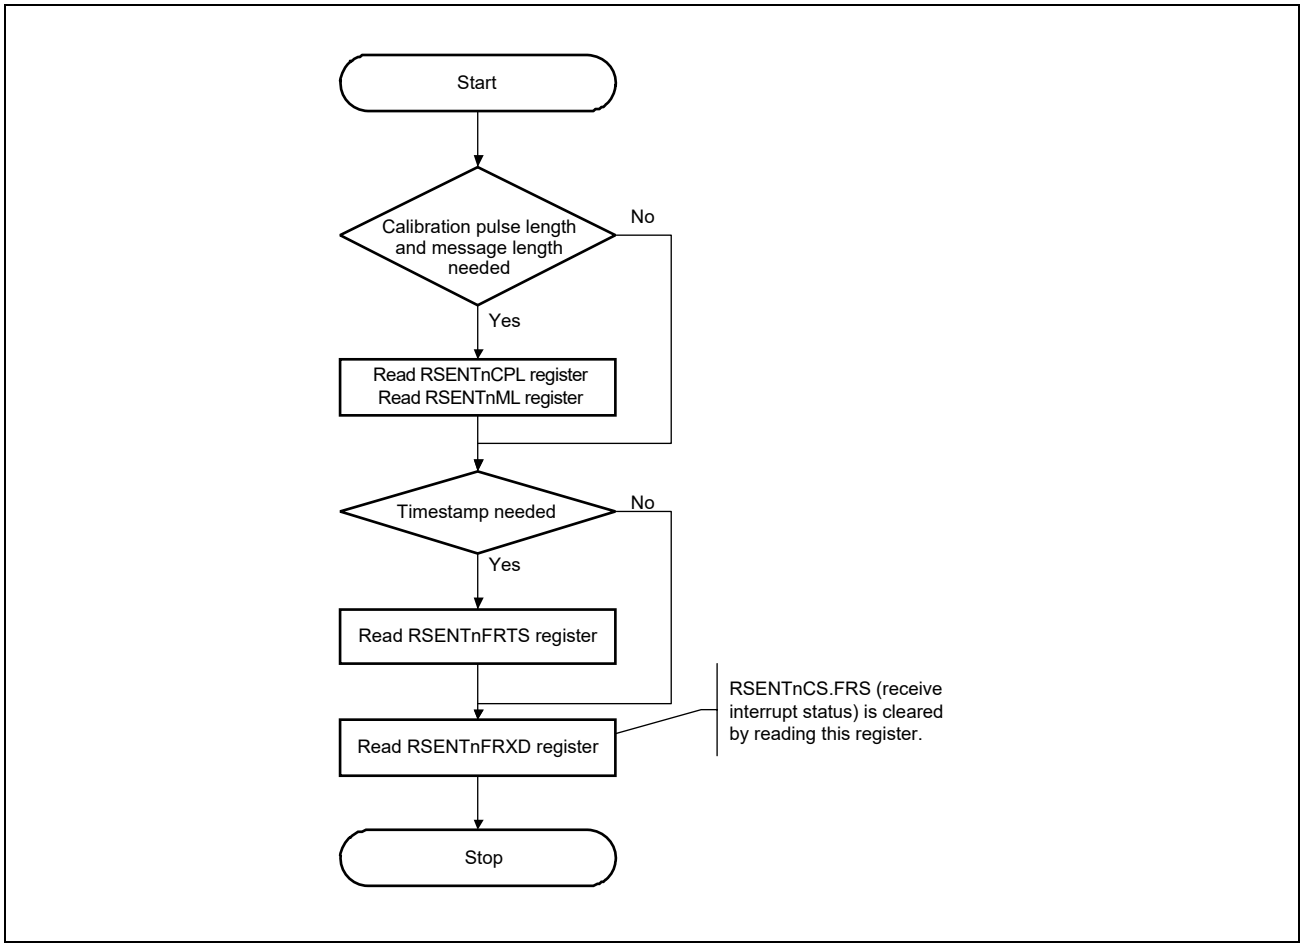

Figure 15.18 DMA Reception Flow

In the software processing, when the transferred data set, the CPU should check the status of the transferred RSENTnFRXD.SNDM bit. If this bit is set to 1, then the user needs to read the slow channel message receive buffer if needed.

15.4.3.10 Error Flagging

The message lost error flag (RSENTnCS.SMS or RSENTnCS.FMS) is set when a new message's diagnostics pass before the previous message is read.

The no response error flag (RSENTnCS.NRS) is set when the CPU has written to RSENTnSPTC.TLL before or during response reception.

The timing at which the fast channel reception error flags (RSENTnCS.CVS, RSENTnCS.CLS,RSENTnCS.FNS, RSENTnCS.FES, and RSENTnCS.FCS) and the slow channel reception error flags (RSENTnCS.SCS, and RSENTnCS.SES) are updated varies with the setting of bits in the communications configuration register (RSENTnCC.SPCE, RSENTnCC.FCM, RSENTnCC.PPC, and RSENTnCC.PPTC).

Table 15.29 and **Table 15.30** list the timings with which the error flags corresponding to each setting are updated.

When a fast channel nibble encoding error or calibration pulse length error is detected, message reception is aborted immediately. No further error flagging for the given message is done. Message decoding starts again after the detection of a valid calibration pulse.

When OPERATION IDLE mode is entered in response to the setting of RSENTnMDC.OMC, error flags of errors for the calibration or the fast channel reception which have been detected in a message being received are not set. A received message is also discarded.

If a fast channel nibble encoding error or calibration pulse length error is detected, entry to OPERATION IDLE mode is immediate.

If a fast channel nibble count error, fast channel CRC error, or calibration pulse length variation error is detected, entry to OPERATION IDLE mode proceeds at the end of the next status and communications nibble.

The fast channel nibble count error flag (RSENTnCS.FNS) is only set when a valid calibration pulse is detected and the subsequent data nibble has a valid length (≥ 12 ticks and ≤ 27 ticks) or no data nibble has been received between two valid calibration pulses.

The fast channel nibble encoding error flag (RSENTnCS.FES) is only set when an encoding error has occurred in a status and communications nibble, CRC nibble, or data nibble.

When the SPC function is enabled (i.e. RSENTnCC.SPCE = 1), the calibration pulse length error flag (RSENTnCS.CLS) is set when the width of a pulse at the expected calibration pulse position is not a valid pulse width for a calibration pulse.

When the SPC function is disabled (i.e. RSENTnCC.SPCE = 0), the calibration pulse length error flag (RSENTnCS.CLS) is set when the width of a pulse at a next expected calibration pulse position after the reception of a valid calibration pulse is not a valid pulse width for a calibration pulse.

An additional error flag being set while seeking a valid calibration pulse does not affect the reception of subsequent frames.

NOTE

When the sensor stops communications, the reception buffer and the state will not be updated after reception of the last message. Confirm the timeout by software.

15.4.4 SPC Function

RSENTn in this product series supports the SPC extension to the SAE J2716 specification.

The RSENTnCC.SPCE bit is used to enable or disable the SPC extension.

When this module is to be used with SPC enabled, the RSENTnSPCO pin must be externally pulled up.

The polarity of RSENTnSPCO can be set by RSENTnCC.SOPC.

When using the SPC extension in the single-wire SENT system, however, be sure to set RSENTnCC.SOPC to 1 (configuring the SPC pulse as active low).

The use of the RSENTnSPCO output allows an RSENTn module to pull down the SPCO signal line via an external transistor.

The signal line is held at the low level for the tick time specified by the RSENTnSPCT.TLL bits.

The tick time is implemented by the RSENTnBRP.TTI and RSENTnBRP.TTF bits whose values form the time equivalent to the transmission tick time. For details, see **Section 15.4.2.2(2), RX and SPC Tick Settings**.

Figure 15.19 shows a sample circuit diagram for the external transistor.

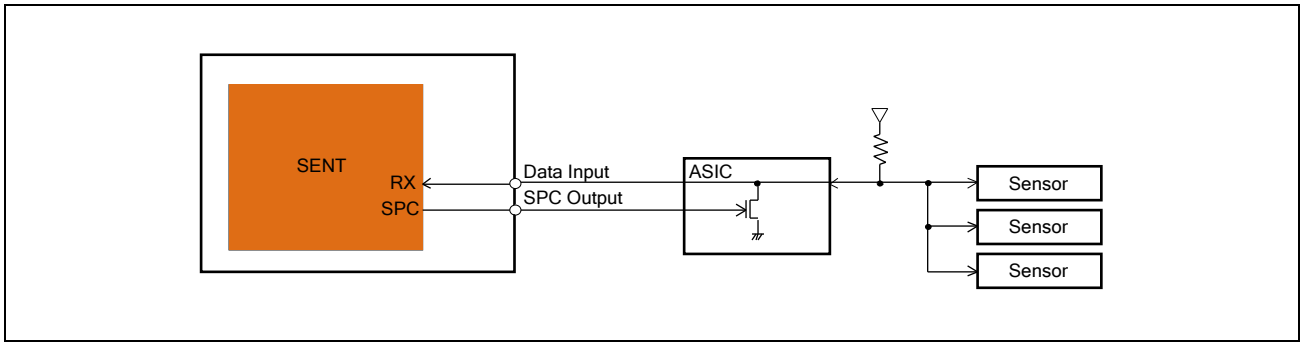

Figure 15.19 Sample Circuit Diagram for the External Transistor

In the SPC extended single-wire system, the RSENTnSPCO pin can be used to trigger data transmission from the sensor. Furthermore, the data can be sent to the sensor by changing the trigger pulse length.

In the SPC extended 2-wire system, the RSENTnSPCO pin can be used to request the dedicated sensor to transmit data.

Once SPC initialization is complete, transmission can be triggered by writing the trigger pulse width to the RSENTnSPCT.TLL register. When the transmission is triggered, a trigger pulse of the specified length is transmitted. Subsequently, a new trigger pulse can be transmitted after the reception of a frame is anticipated and a frame is received.

Writing to the RSENTnSPCT.TLL bits requests the transmission of an SPC trigger.

After writing to RSENTnSPCT.TLL, read the value of RSENTnCS.NRS to confirm whether the response to the previous SPC trigger request was completed.

If RSENTnCS.NRS is set to 1, no SPC trigger is transmitted and any reception that may be in progress at this time is aborted.

If this is the case, it is necessary to clear RSENTnCS.NRS by writing 1'b1 to RSENTnCSC.NRC and to write to RSENTnSPCT.TLL again to request the transmission of an SPC trigger.

For an error case in which RSENTnCS.NRS is not set to 1, it is necessary to count the number of receive timeouts with SW (Soft Ware). If a reception occurs before the timeout counter times out, it is necessary to process the received slow and fast channel data according to the fast channel receive flow (**Figure 15.14**) and slow channel receive flow (**Figure 15.17**). When the timeout counter times out, it indicates that the specified sensor did not transmit a valid response.

In such a case, it is necessary to check the RSENTnCS register to identify the reason for the absence of a successful reception. After confirming that RSENTnCS.NRS is not set, set up a new request. The purpose of the timeout function is to define a timeout window for receiving responses under SW.

Figure 15.20, Transmission Flow shows the flow of transmission using a timeout function implemented by software.

The timeout function is optional and can be omitted if not required.

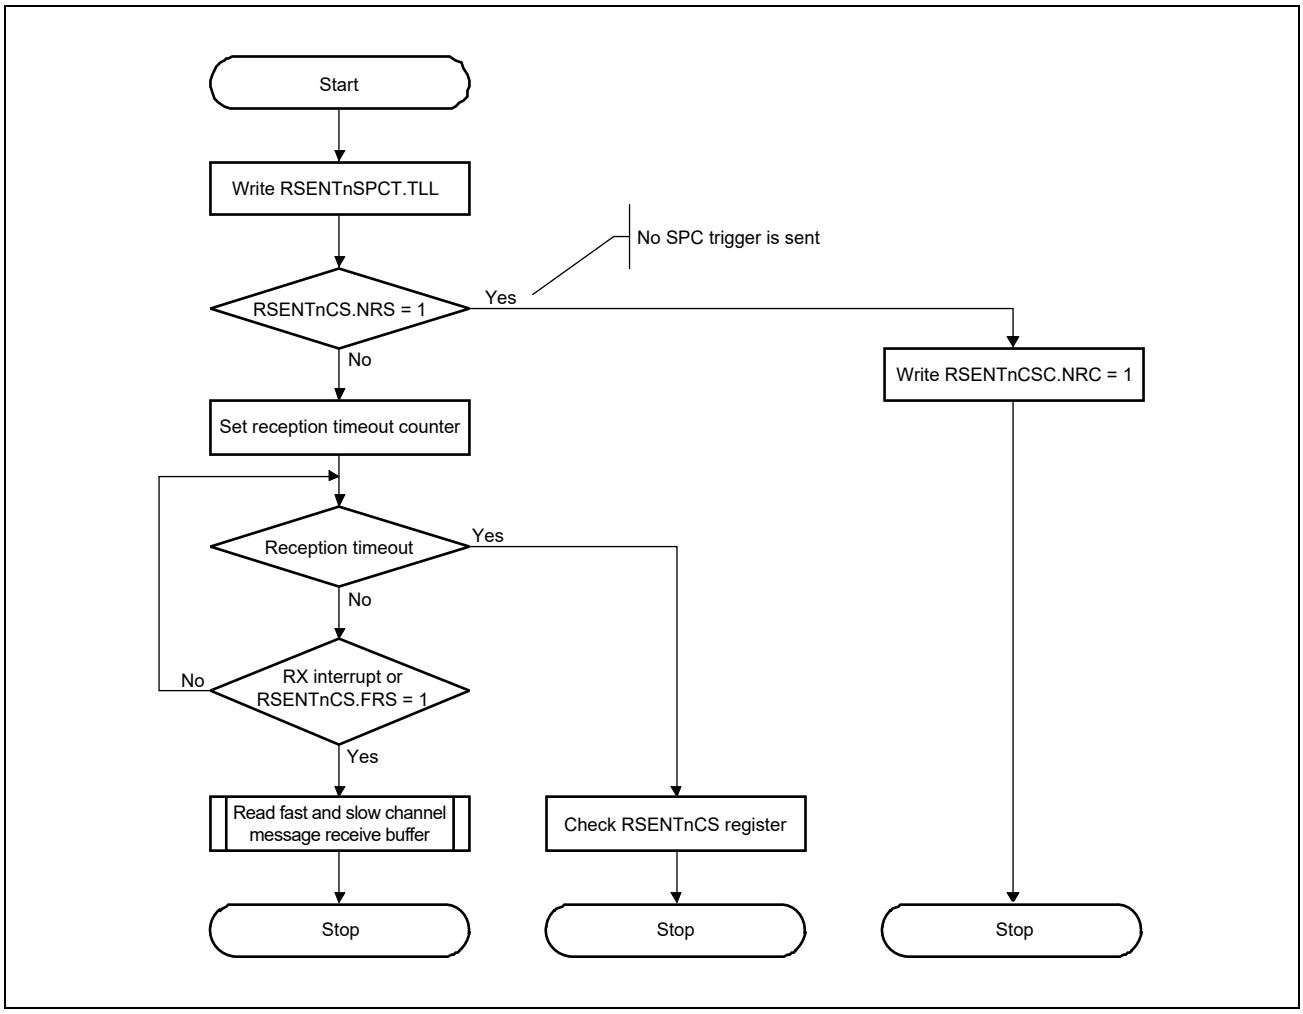

Figure 15.20 Transmission Flow

15.4.5 Interrupts and Checks

The RSENT module provides two interrupt lines. A successful fast channel receive interrupt notifies the CPU that the fast channel message receive buffer was updated and is holding a set of valid received data. Also, the reception status bit is set (RSENTnCS.FRS).

A status interrupt notifies the CPU that at least one of the error flags or message lost flags in the RSENTnCS register is set.

Whether the status flags in the RSENTnCS register are to contribute to the generation of interrupt events can be set individually.

The CRC check can be disabled for the slow channel and fast channel individually. If the check is disabled, the CRC of the received message is not checked and the related error flag is never set.

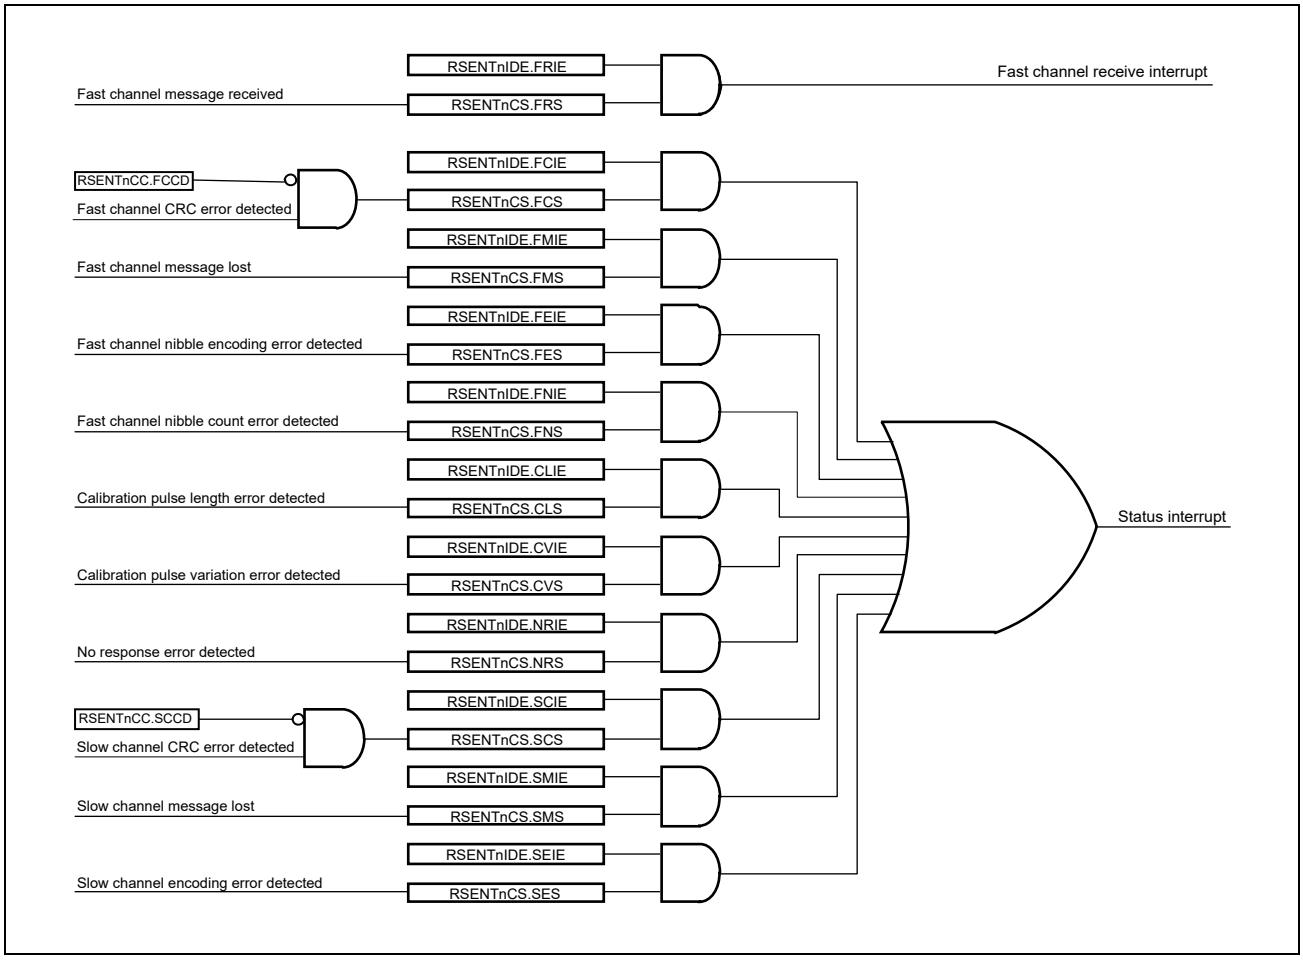

Figure 15.21 Interrupt Structure

Table 15.31 gives an outline of the relationship between set status flags and the buffer update.

Table 15.31 Status Flag Influence on the Receive Buffer Behaviors

RSENTnCS	Fast Channel Message Receive Buffer	Slow Channel Message Receive Buffer
FRS	Updated	Updated if all status and communication nibbles of slow channel messages are received and RSENTnCS.SES = 0 and RSENTnCS.SCS = 0.
FCS	Not updated	Receive processing is suspended. New start condition is searched for.
FMS	Message lost	Not impacted
FES	Not updated	Receive process aborted. Search for new start condition
FNS	Not updated	Receive process aborted. Search for new start condition
CLS	Not updated	Receive process aborted. Search for new start condition
CVS	Not updated	Receive process aborted. Search for new start condition
NRS	Not updated	Receive process aborted. Search for new start condition
SCS	Not impacted	Not updated
SMS	Not impacted	Message lost
SES	Not impacted	Receive process aborted. Search for new start condition

Section 16 Window Watchdog Timer A (WDTA)

This section contains a generic description of the window watchdog timer (WDTA).

The first part of this section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of WDTA.

16.1 Features of RH850/C1M-A WDTA

16.1.1 Number of Units

This microcontroller has the following number of WDTA units.

Table 16.1 Number of Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of Units	2	1
Name	WDTAn (n = 0, 1)	WDTAn (n = 0)

Table 16.2 Index

Index	Meaning
n	Throughout this section, the individual WDTA units are identified by the index “n” (n = 0, 1) (n = 0, 1 for RH850/C1M-A2; n = 0 for RH850/C1M-A1); for example, WDTAnWDTE is the WDTAn enable register.

16.1.2 Register Base Address

WDTA base addresses are listed in the following table.

WDTA register addresses are given as offsets from the base addresses in general.

Table 16.3 Register Base Address

Base Address Name	Base Address
<WDTA0_base>	FFED 0000$_H$
<WDTA1_base>	FF8D 1000$_H$

16.1.3 Clock Supply

The WDTA clock supply is shown in the following table.

Table 16.4 WDTAn Clock Supply

WDTAn	Clock Name for the Unit	Supply Clock Name
WDTA0	WDTATCKI	WDTCLKI
	PCLK	CLKC_LSB (non-modulated low-speed peripheral clock)
WDTA1	WDTATCKI	WDTCLKI
	PCLK	CLKC_LSB (non-modulated low-speed peripheral clock)

16.1.4 Interrupts

WDTA can generate the following interrupt requests.

Table 16.5 Interrupt Requests

WDTAn Signals	Function	Interrupt Number
WDTA0		
WDTA0TIT	75% interrupt	54
WDTA1		
WDTA1TIT	75% interrupt	55*1

Note 1. This is not supported by C1M-A1.

16.1.5 Reset Sources

WDTA is initialized by reset sources listed in the following table.

Table 16.6 Reset Sources

Unit Name	Reset Source
WDTA0	All reset sources
WDTA1	All reset sources

16.1.6 WDTA Start-Up Options

The start-up options determine the start-up configuration of WDTA0 after reset release. The start-up options are described in **Table 16.7, WDTA0 Start-Up Options**. They are not supported in WDTA1.

Table 16.7 WDTA0 Start-Up Options

Start-Up Option	Function	Flash Option Assignment
OPWDOVF[2:0]	Setting for overflow interval time	OPBT0[27:25]
OPWDWS[1:0]	Setting for window open period	OPBT0[29:28]
OPWDINT	Setting for 75% interrupt request	OPBT0[30]
OPWDRUN	Setting for start mode	OPBT0[31]

16.2 Overview

16.2.1 Functional Overview

The WDTA has the following functions:

- Selection of the operating mode after release from reset using the option byte Starting/stopping of the counter after the WDTA is reset, enabling or disabling of 75% interrupt requests, the window-open period, and overflow time can be selected.
- WDTA trigger function
  Writing an activation code to the WDTA trigger register starts WDTA and restarts the counter.
- 75% interrupt request signals
  An interrupt request signal can be generated when the WDTA counter reaches 75% of the overflow interval time (this function can be enabled or disabled by the setting of WDTAnMD.WDTAnWIE).
- Window function
  The period during which writing to the WDTA trigger register is valid (window-open period) can be set. Writing to the WDTA trigger register at a time outside the window-open period causes an error.
- WDTA error detection
  When an error is detected, the WDTAnTRES signal indicates the error to the ECM. For details about the error sources, refer to **Section 16.5.2, Error Detection**.

16.2.2 Block Diagram

Figure 16.1 shows the main components of the WDTA.

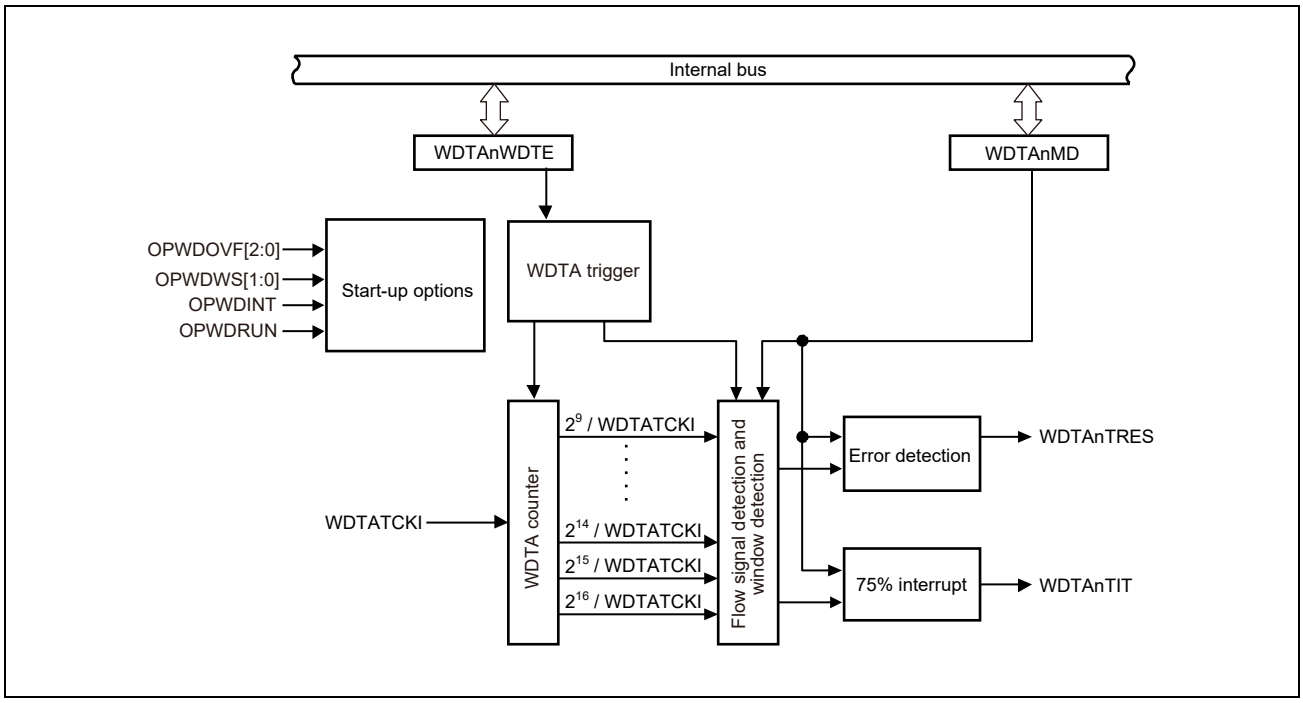

Figure 16.1 Block Diagram of the WDTA

16.3 Register

16.3.1 List of Registers

WDTA registers are listed in the following table.

For details about <WDTAn_base>, see **Section 16.1.2, Register Base Address**.

Table 16.8 WDTA Registers Overview

Module Name	Register Name	Symbol	Address
WDTAn	WDTAn enable register	WDTAnWDTE	<WDTAn_base> + 0_H
WDTAn	WDTAn mode register	WDTAnMD	<WDTAn_base> + C_H

16.3.2 WDTAnWDTE — WDTA Enable Register

This register is the WDTA start control and trigger register.

Writing AC_H to this register generates a WDTA trigger and starts or restarts the WDTA counter.

Refer to **Section 16.5.1.6, WDTA Trigger**, for details.

The writable value of this register is only AC_H.

Access: This register can be read/written in 8-bit units.

Address: <WDTAn_base> + 0000_H

Value after reset: (1) WDTA0

The value after reset of WDTA0 depends on the settings of OPWDRUN.

The initial state of OPWDRUN in the product as shipped is OPWDRUN = 0_B.

Accordingly, the initial register value for WDTA0 at the time of shipment is $2C_H$.

(2) WDTA1*1

The initial register value for WDTA1 is $2C_H$.

For details on the OPWDRUN settings, see **Section 16.5, Function**. Any reset source triggers initialization.

Note 1. Not supported for C1M-A1.

Bit	7	6	5	4	3	2	1	0
	WDTAnRUN[7:0]							
Value after reset	0	0	1	0	1	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.9 WDTAnWDTE Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnRUN[7:0]	Writing a fixed activation code (AC_H) generates a WDTA trigger to control WDTAn count start and restart. Writing a value other than AC_H generates an error. After WDTAn starts, it cannot be stopped.

The value of bit WDTAnRUN[7] after reset depends on other start-up options as listed below.

Table 16.10 WDTAnRUN[7] Values after Reset

Start-Up Options	
OPWDRUN	WDTAnRUN[7] Value after Reset
1	1
0	0

16.3.3 WDTAnMD — WDTA Mode Register

This register specifies the overflow interval time, the 75% interrupt enable/disable, and the window-open period.

It can be updated only once after reset release and before the first trigger. The updated value will be effective after the next WDTA trigger.

Updating this register after the first WDTA trigger has been generated leads to error detection, but an error does not occur if the same value has been written to it.

Access: This register can be read/written in 8-bit units.

Address: <WDTAn_base> + $000C_H$

Value after reset: (1) WDTA0

The value after reset of WDTA0 depends on the settings of OPWDOVF2 to OPWDOVF0, OPWDINT, and OPWDWS1 to OPWDWS0. Since the settings of the option bytes are for the initial state of WDTA0 in the product as shipped to be the same as that of WDTA1, OPWDOVF2 to OPWDOVF0, OPWDINT, and OPWDWS1 and OPWDWS0 are all set to 1_B. Accordingly, the initial register value for WDTA0 at the time.

(2) WDTA1*1

The initial register value for WDTA1 is $7F_H$.

This register is initialized by a reset of any type.

Note 1. Not supported for C1M-A1.

Bit	7	6	5	4	3	2	1	0
	—	WDTAnOVF[2:0]			WDTAnWIE	—	WDTAnWS[1:0]	
Value after reset	0	1	1	1	1	1	1	1
R/W	R	R/W	R/W	R/W	R/W	R	R/W	R/W

Table 16.11 WDTAnMD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When written, write the value after reset.
6 to 4	WDTAnOVF [2:0]	Select the overflow interval time:

WDTAnOVF2	WDTAnOVF1	WDTAnOVF0	Overflow Interval Time
0	0	0	2^9 / WDTATCKI
0	0	1	2^{10} / WDTATCKI
0	1	0	2^{11} / WDTATCKI
0	1	1	2^{12} / WDTATCKI
1	0	0	2^{13} / WDTATCKI
1	0	1	2^{14} / WDTATCKI
1	1	0	2^{15} / WDTATCKI
1	1	1	2^{16} / WDTATCKI

3	WDTAnWIE	Enables/disables the 75% interrupt request WDTAnTIT. 0: WDTAnTIT disabled 1: WDTAnTIT enabled
2	Reserved	When written, write the value after reset.
1, 0	WDTAnWS [1:0]	Select the window-open period:

WDTAnWS1	WDTAnWS0	Window-Open Period
0	0	25%
0	1	50%
1	0	75%
1	1	100%

16.4 Interrupt Sources

The WDTA detects the state of the WDTA counter value or illegal accesses to the WDTA-related registers, and generates an interrupt request. A WDTA interrupt request is described below.

(1) WDTAnTIT (WDTA timer count 75% interrupt request)
An interrupt request signal is generated at 75% of the counter overflow time of the WDTA timer. An interrupt request signal can be enabled or disabled by using the WDTA mode register (WDTAnMD).

16.5 Function

16.5.1 WDTA after Reset Release

16.5.1.1 Start modes

The WDTA provides two modes for the counter start after release from the reset state:

- Software trigger start mode (for WDTA0 and WDTA1)
  The counter value remains 0000_H after reset release. The counter is started with the first WDTA trigger.
- Default start mode (only for WDTA0)
  The counter starts automatically after release from the reset state. However, default start mode is disabled in serial programming mode even if OPWDRUN is set to 1_B for the star-up options.

WDTA1 is fixed to software trigger start mode, and cannot be set by the option byte.

16.5.1.2 Start mode selection (only for WDTA0)

The start mode can be selected by the start-up options. The start mode selection is listed in **Table 16.12**.

Table 16.12 Start Mode Selection

Start-Up Options		
OPWDRUN	Reset Type	Start Mode
0	Ignored	Software trigger
1		Default

16.5.1.3 WDTA settings after reset release

The WDTA settings are as follows between reset release and the first trigger:

Function	Setting after WDTA0 is Reset	Setting after WDTA1 is Reset
Start mode	Specified by start-up options	Software trigger mode
Overflow interval time	Specified by start-up options	2^{16}/WDTATCKI
75% interrupt mode	Specified by start-up options	75% interrupt enabled
Window-open period	Specified by start-up options	100%

Change WDTA settings

The setting of the WDTA mode register (WDTAnMD) is effective when the first WDTA trigger is generated (writing an activation code to WDTAnWDTE). Change the setting of the WDTAnMD register before a WDTA trigger is generated.

Setting of the WDTA by using WDTAnMD is possible only once. If the value set for WDTAnMD is changed after a WDTA trigger is generated, an error occurs. However, an error does not occur if the same value has been set.

16.5.1.4 Default start mode timing (only for WDTA0)

The default start mode timing and the changes to the WDTA settings are illustrated in **Figure 16.2**.

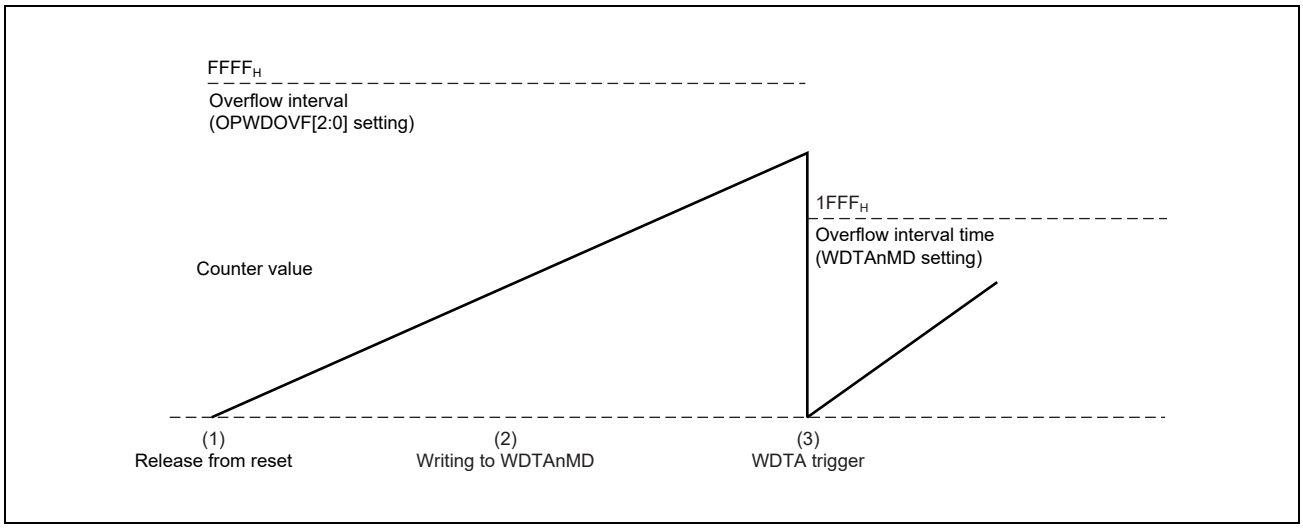

Figure 16.2 Timing Diagram of WDTA Start in Default Start Mode

The timing diagram in **Figure 16.2** shows the following behaviors:

(1) In default start mode, the WDTA counter starts after release from the reset state. The overflow interval time after release from the reset state is set by start-up options.

Example: Overflow interval time after release from the reset state
$= 2^{16}$/WDTATCKI (OPWDOVF[2:0] = 111_B)

(2) WDTAnMD is set before a WDTA trigger is generated. Note, however, that the setting is not applied immediately.

(3) Write to the WDTA trigger register before the WDTA counter overflows.
The WDTAnMD setting is applied due to the WDTA trigger.

Example: Overflow interval time after a WDTA trigger is generated
$= 2^{13}$/WDTATCKI

16.5.1.5 Software trigger start mode timing (common to WDTA0 and WDTA1)

The software trigger start mode timing and the changes to the WDTA settings are illustrated in **Figure 16.3**.

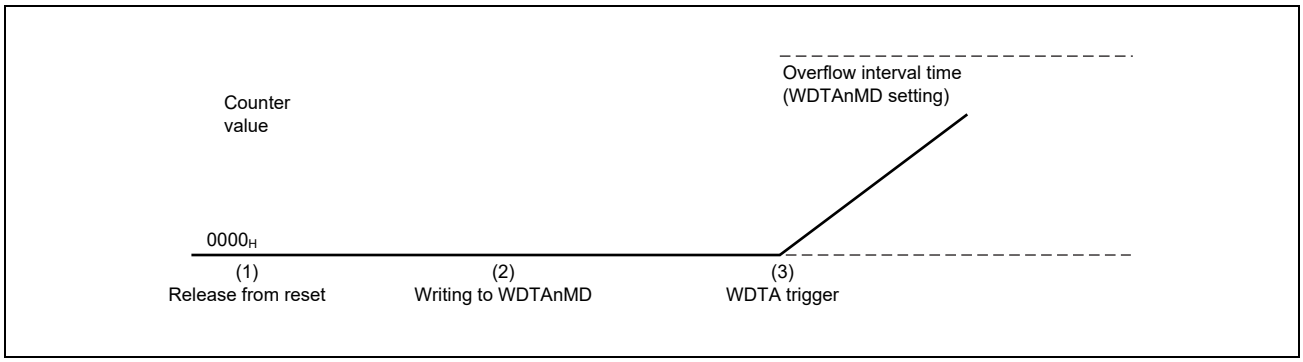

Figure 16.3 Timing Diagram of WDTA Start in Software Trigger Start Mode

The timing diagram in **Figure 16.3** shows the following behaviors:

(1) After release from the reset state, the counter remains 0000_H until the first WDTA trigger.
The overflow interval time is set by using the start-up options, but it does not have any effect.

(2) WDTAnMD is set before the first WDTA trigger. However, the settings are not applied immediately.

(3) The WDTA counter starts at the first WDTA trigger.
The overflow interval time and other settings specified in WDTAnMD are applied.

16.5.1.6 WDTA Trigger

Writing a special value called an activation code to the WDTA enable register (WDTAnWDTE) leads to generation of a WDTA trigger.

The WDTA trigger has the following functions:

- Starting the WDTA counter in software trigger start mode
- Restarting the WDTA counter
- WDTA mode setting by the WDTAnMD register
  (only for the first WDTA trigger after release from the reset state)

The WDTA can be triggered by writing a fixed activation code to the trigger register.

Table 16.13 Trigger Register and Activation Code

Type of Activation Code	Trigger Register	Activation Code
Fixed	WDTAnWDTE	AC_H

16.5.2 Error Detection

The WDTA detects an overflow of the WDTA counter and illegal operations as an error. The conditions for error detection are:

- WDTA counter overflow.
- Wrong activation code is written to the WDTA trigger register.

- Writing to the trigger register at the time outside the window-open period.
- When an attempt is made to change the setting value of the WDTA mode register WDTAnMD after the first WDTA trigger has been generated.
- When updating the setting value of the WDTA mode register WDTAnMD twice before the first WDTA trigger is generated.

16.5.3 WDTA Error Mode

When an error is detected, the WDTAnTRES signal indicates the error to the ECM.

Figure 16.4 shows generation of a reset when the counter overflows and default start mode is selected.

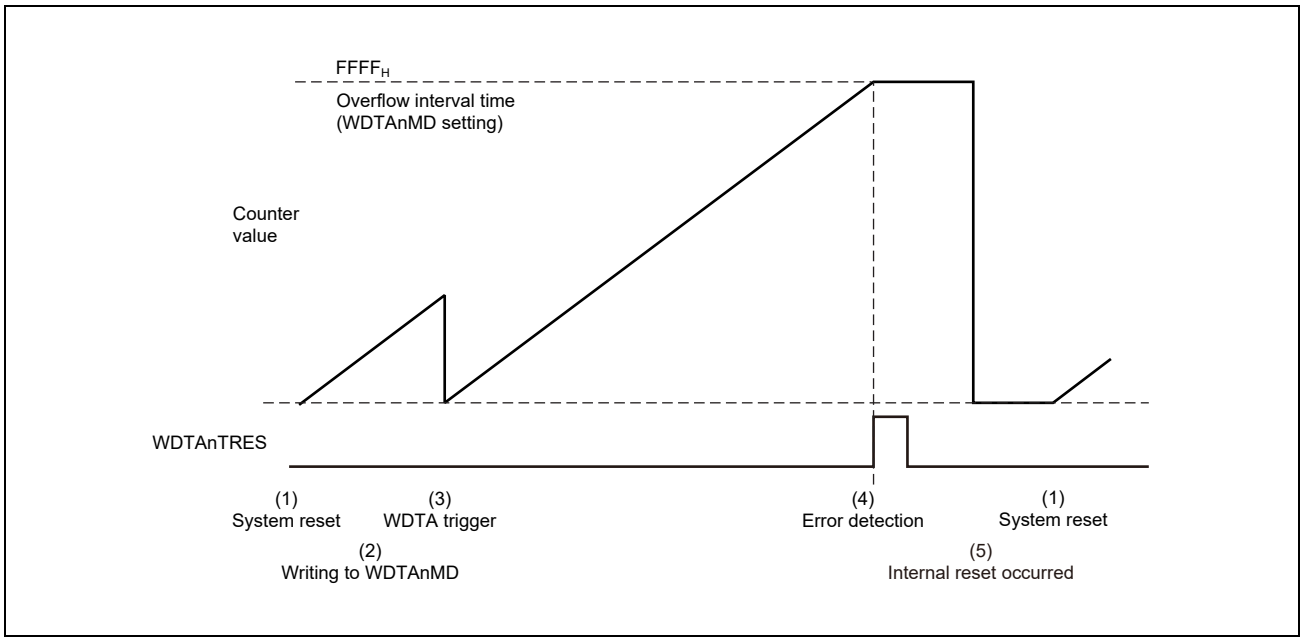

Figure 16.4 Timing Diagram of WDTA Internal Reset Generation

The timing diagram in **Figure 16.4** shows the following behaviors:

(1) In default start mode, the WDTA counter starts after release from the reset state. The overflow interval time after release from the reset state is set by using start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated.
In this case, 2^{16}/WDTATCKI is set for the overflow interval time.

(3) The WDTAnMD setting is applied due to the WDTA trigger.

(4) If the counter overflows, an error is detected and the WDTAnTRES signal indicates the error to the ECM. The counter value remains unchanged until an internal reset occurs.

(5) If an internal reset occurs due to the ECM and other sources, the counter is cleared and stopped until release from the reset state.

16.5.4 75% Interrupt Request Signals

When the WDTA counter reaches 75% of the time set for the overflow interval, an interrupt request WDTAnTIT is generated.

By use of WDTAnMD.WDTAnWIE this function can be enabled or disabled afterwards.

Figure 16.5 shows the 75% interrupt request generation under following conditions:

- Default start mode is selected.
- 75% interrupt request is enabled after the first WDTA trigger is generated.
- WDTA overflow interval time: 2^{16}/WDTATCKI.

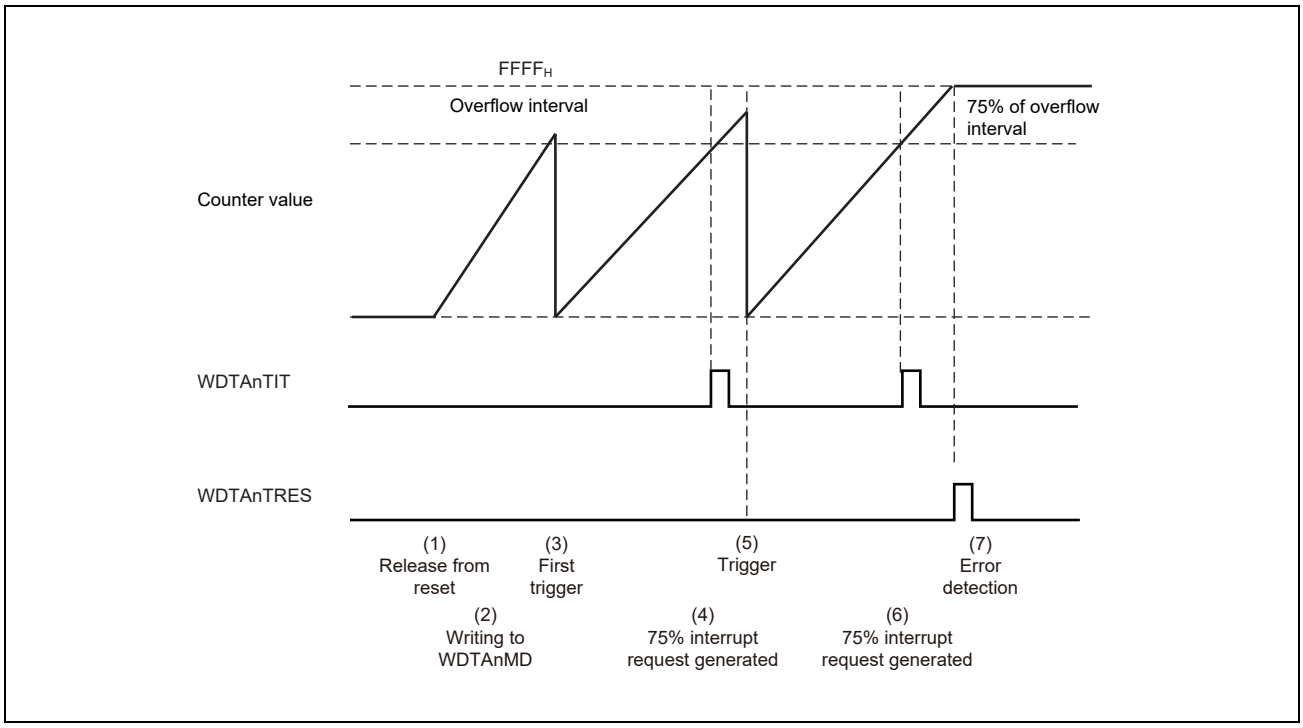

Figure 16.5 Timing Diagram of WDTA 75% Interrupt Request Signals

(1) In default start mode, the WDTA counter starts after release from the reset state. The overflow interval time period after release from the reset state is set by using the start-up options.

(2) WDTAnMD is set before the WDTA trigger is generated. In this figure, 2^{16}/WDTATCKI is set as the overflow interval time period.

(3) The WDTAnMD setting is applied at the WDTA trigger.

(4) When the WDTA counter reaches 75% of the set overflow interval time, an interrupt request WDTAnTIT is generated.

(5) The counter restarts at the WDTA trigger.

(6) Then the WDTA counter reaches 75% of the set overflow interval time, an interrupt request WDTAnTIT is generated.

(7) When the counter overflows, an error is detected and the WDTAnTRES signal indicates the error to the ECM. The counter value remains unchanged until an internal reset occurs.

16.5.5 Window Function

The period when a WDTA trigger is valid (window-open period) can be set.

If the window-open period is set to the value less than 100%, an error occurs by the WDTA trigger generated at the time outside the window-open period. The window-open period after release from the reset state is 100%. The period is set to the value set in the WDTAnMD.WDTAnWS[1:0] after the first WDTA trigger is generated.

Figure 16.6 shows window function operations under the following conditions.

- Default start mode is selected.
- The 25% window open period is valid (WDTAnWS[1:0] = 00_B) after the first WDTA trigger.
- WDTA overflow interval time period: 2^{16}/WDTATCKI

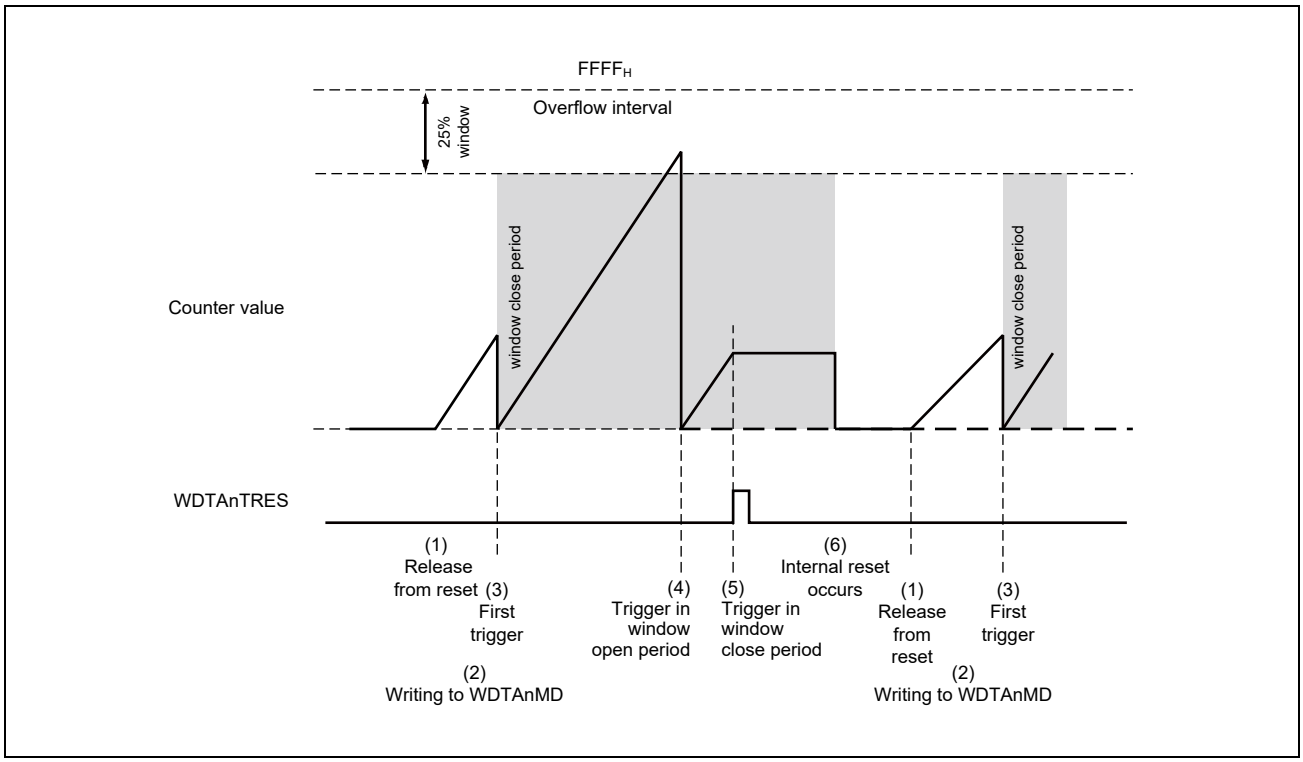

Figure 16.6 Timing Diagram of WDTA Window Function

(1) In default start mode, the WDTA counter starts after release from the reset state. The overflow interval time period after release from the reset state is set by using the start-up options.

(2) WDTAnMD is set before the WDTA trigger is generated. In this figure, 2^{16}/WDTATCKI is set as the overflow interval time period.

(3) The WDTAnMD setting is applied at the WDTA trigger.

(4) The WDTA counter restarts at the WDTA trigger during the window open period.

(5) An error is detected at the WDTA trigger during the window close period, and then the WDTAnTRES signal indicates the error to the ECM. The counter value remains unchanged until an internal reset occurs.

(6) If an internal reset occurs due to the ECM and other sources, the counter is cleared and stopped until release from the reset state.

Section 17 OS Timer (OSTM)

This section contains a generic description of the OS timer (OSTM).

The first part of this section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the OSTM.

17.1 Features of RH850/C1M-A OSTM

17.1.1 Number of Units

This microcontroller has the following number of OSTM units.

Table 17.1 Number of Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of Units	4	3
Name	OSTMn (n = 0 to 3)	OSTMn (n = 0 to 2)

Table 17.2 Index

Index	Meaning
n	Throughout this section, the individual OSTM units are identified by the index “n” (n = 0 to 3) (n = 0 to 3 for RH850/C1M-A2; n = 0 to 2 for RH850/C1M-A1); for example, OSTMnCNT is the OSTM counter register.

17.1.2 Register Base Address

OSTM base addresses are listed in the following table.

OSTM register addresses are given as offsets from the base addresses in general.

Table 17.3 Register Base Address

Base Address Name	Base Address
<OSTM0_base>	FFEC 0000$_H$
<OSTM1_base>	FF8C 1000$_H$
<OSTM2_base>	FFEC 2000$_H$
<OSTM3_base>	FF8C 3000$_H$

Note: RH850/C1M-A1 does not have OSTM3.

17.1.3 Clock Supply

The OSTM clock supply is shown in the following table.

Table 17.4 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
OSTMn	PCLK	CLKC_LSB (unmodulated low-speed peripheral clock)

Note: RH850/C1M-A1 does not have OSTM3.

17.1.4 Interrupt Requests

OSTM interrupt requests are listed in the following table.

Table 17.5 Interrupt Requests

Unit Interrupt Signal	Outline	Interrupt Number
OSTM0TINT	OSTM0 interrupt	25
OSTM1TINT	OSTM1 interrupt	26
OSTM2TINT	OSTM2 interrupt	27
OSTM3TINT	OSTM3 interrupt	28

Note: RH850/C1M-A1 does not have OSTM3.

17.1.5 Reset Sources

OSTM reset sources are listed in the following table. The OSTM is initialized by these reset sources.

Table 17.6 Reset Source

Unit Name	Reset Source
OSTMn	All reset sources

17.2 Overview

The OSTM is a 32-bit timer/counter.

It can be used in interval timer mode or in free-run compare mode. The settings for operating mode specify the direction of counting (up or down) to control the generation of interrupt requests.

A counter-start signal (OSTMnTSST) is input to the OSTM, allowing synchronization of these timers with other peripheral functions.

17.2.1 Functional Overview

The OSTM has the following features.

- Two operating modes
  - Interval timer mode
  - Free-run compare mode
- Simultaneous start trigger function between the units
- OSTMnTINT interrupt

17.2.2 Block Diagram

The following block diagram shows the main components of the OSTM.

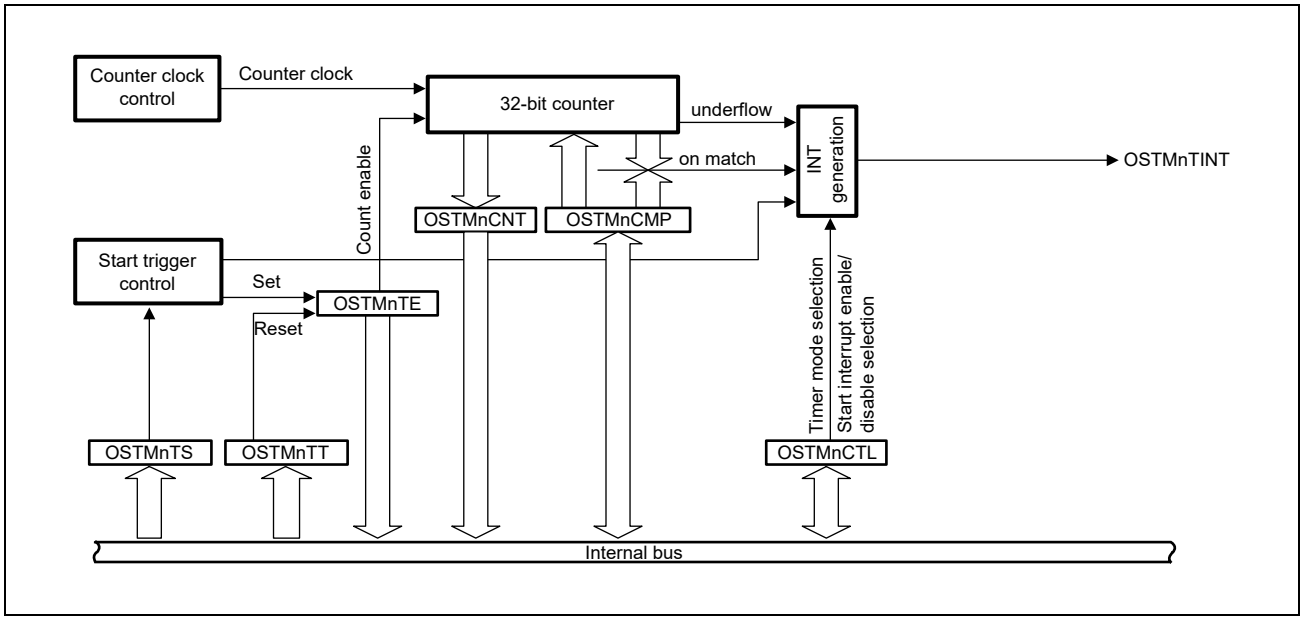

Figure 17.1 Block Diagram of the OSTM

17.2.3 Counter Clock

The OSTM uses PCLK as the counter clock.

17.2.4 Interrupt Request (OSTMnTINT)

By default, an OSTMnTINT interrupt request is generated on counter underflow (interval timer mode) or when the counter matches the compare value (free-run compare mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

Since OSTMnTINT triggers toggling of the OSTMnTTOUT output in timer-output toggling mode (OSTMnTOE.OSTMnTOE is 1), the setting of the OSTMnCTL.OSTMnMD0 bit also affects the output (OSTMnTTOUT).

This is illustrated in the following figure.

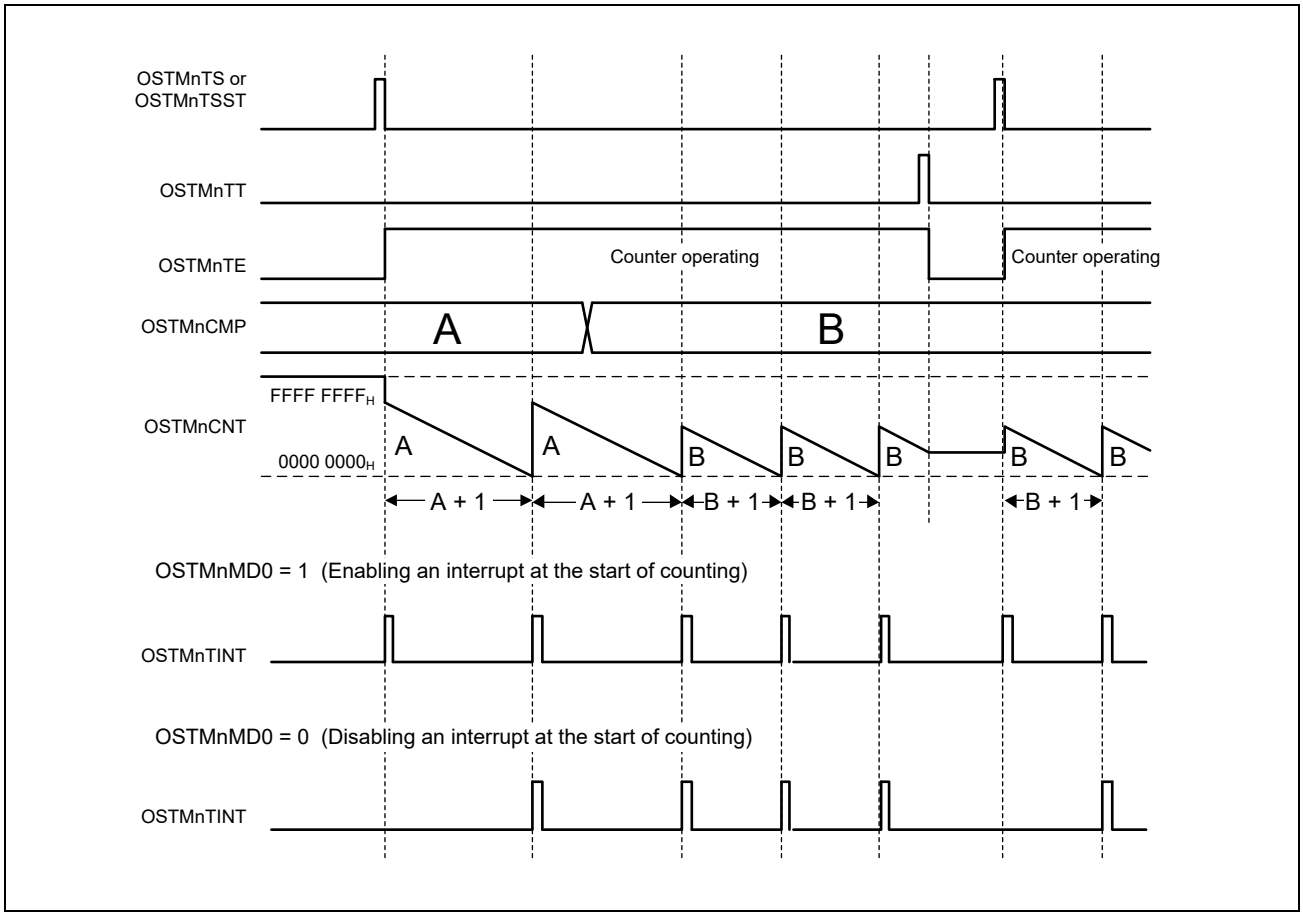

Figure 17.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

17.3 Registers

17.3.1 List of Registers

OSTM registers are listed in the following table.

For details about <OSTMn_base>, see **Section 17.1.2, Register Base Address**.

Table 17.7 Registers

Module	Register	Symbol	Address
OSTMn	OSTMn compare register	OSTMnCMP	<OSTMn_base> + 00_H
OSTMn	OSTMn counter register	OSTMnCNT	<OSTMn_base> + 04_H
OSTMn	OSTMn output register	OSTMnTO	<OSTMn_base> + 08_H
OSTMn	OSTMn output enable register	OSTMnTOE	<OSTMn_base> + $0C_H$
OSTMn	OSTMn count enable status register	OSTMnTE	<OSTMn_base> + 10_H
OSTMn	OSTMn count start trigger register	OSTMnTS	<OSTMn_base> + 14_H
OSTMn	OSTMn count stop trigger register	OSTMnTT	<OSTMn_base> + 18_H
OSTMn	OSTMn control register	OSTMnCTL	<OSTMn_base> + 20_H

17.3.2 OSTMnCMP — OSTMn Compare Register

This register stores the start value of the counter or the value with which the counter is compared, depending on the operation mode.

Access: This register can be read/written in 32-bit units.

Address: <OSTMn_base> + 00_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCMP[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.8 OSTMnCMP Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCMP [31:0]	• In interval timer mode: start value of the counter • In free-run compare mode: compare value

17.3.3 OSTMnCNT — OSTMn Counter Register

This register indicates the counter value of the timer.

Access: This register can be read in 32-bit units.

Address: <OSTMn_base> + 04_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCNT[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.9 OSTMnCNT Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCNT [31:0]	Timer counter value

Table 17.10 shows the correspondence between OSTMn's operating mode, counting direction, and initial value. The initial value is the value read from the counter after a change to the operating mode.

Table 17.10 Correspondence Between Operating Mode, Counting Direction and Initial Value

Timer Operating Mode	OSTMnCTL.OSTMnMD1	Counting Direction	Initial Value
Interval timer mode	0*1	Down	FFFF $FFFF_H$
Free-run compare mode	1	Up	0000 0000_H

Note 1. Value after reset.

17.3.4 OSTMnTO — OSTMn Output Register

This register is used to specify and read the level of an OSTMnTTOUT output signal. The setting of this register is only valid in OSTMn (n = 0).

Access: This register can be read/written in 8-bit units. Writing can only proceed when the software control mode is selected (OSTMnTOE.OSTMnTOE = 0).

Address: <OSTMn_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTO
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 17.11 OSTMnTO Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	OSTMnTO	This bit is used to specify and read the level of the OSTMnTTOUT output signal. 0: Low level 1: High level

17.3.5 OSTMnTOE — OSTMn Output Enable Register

This register specifies OSTMnTTOUT output mode. The setting of this register is only valid in OSTMn (n = 0).

Access: This register can be read/written in 8-bit units.

Address: <OSTMn_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTOE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 17.12 OSTMnTOE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	OSTMnTOE	This bit specifies the OSTMnTTOUT output mode. 0: Software control mode: The level corresponding to the setting of OSTMnTO.OSTMnTO is output to OSTMnTTOUT. 1: Timer-output toggling mode: OSTMnTTOUT output is toggled whenever an OSTMnTINT interrupt request is generated.

17.3.6 OSTMnTE — OSTMn Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

Access: This register can be read in 8-bit units.

Address: <OSTMn_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 17.13 OSTMnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read.
0	OSTMnTE	Indicates whether the counter is enabled or disabled: 0: Counter disabled 1: Counter enabled This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1, or to OSTMnTSST being 1. Setting OSTMnTT.OSTMnTT to 1 resets this bit to 0.

NOTE

If the counter is disabled, the counter value OSTMnCNT retains its value. If the counter is restarted, it

- restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or,
- restarts counting up from the counter value 0000 0000_H if it is in free-run compare mode.

17.3.7 OSTMnTS — OSTMn Count Start Trigger Register

This register starts the counter.

Access: This register can be written in 8-bit units. It is always read as 00_H.

Address: <OSTMn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 17.14 OSTMnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OSTMnTS	Starts the counter: 0: This setting disables the counter. 1: Starts the counter and sets OSTMnTE.OSTMnTE = 1. • In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1. • In free-run compare mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1.

17.3.8 OSTMnTT — OSTMn Count Stop Trigger Register

This register stops the counter.

Access: This register can be written in 8-bit units. It is always read as 00_H.

Address: <OSTMn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 17.15 OSTMnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OSTMnTT	Stops the counter: 0: This setting disables the counter. 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit.

17.3.9 OSTMnCTL — OSTMn Control Register

This register specifies the operating mode for the counter and controls the generation of OSTMnTINT interrupt requests when counting starts.

Although this register is readable and writable, writing to it is only possible when OSTMnTE.OSTMnTE = 0; that is, the register becomes read-only when OSTMnTE.OSTMnTE = 1.

Access: This register can be read/written in 8-bit units.

Address: <OSTMn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OSTMnMD1	OSTMnMD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 17.16 OSTMnCTL Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, value after reset is read. When writing, write the value after reset.
1	OSTMnMD1	Specifies the operating mode for the counter: 0: Interval timer mode 1: Free-run compare mode
0	OSTMnMD0	Controls the generation of OSTMnTINT interrupt requests at the start of counting: 0: Interrupts when counting starts are disabled. 1: Interrupts when counting starts are enabled.

17.4 Functions

17.4.1 Starting and Stopping the Timer

The OSTM is started and stopped as follows:

Starting the timer

The timer is started in either of the following ways:

- Setting the OSTMnTS.OSTMnTS bit to 1
- Setting the OSTMnTSST signal to the high level (when the Simultaneous start trigger function is in use)

The OSTMnTE.OSTMnTE status bit is set to 1.

The counter starts to count up or down in accord with the settings for operating mode. For details, refer to **Section 17.4.2, Interval Timer Mode** and **Section 17.4.3, Free-Run Compare Mode**.

If the OSTMnTS.OSTMnTS bit is to be used to start the timer, the OSTMnTSST input must correspond to logical zero.

Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops the timer.

This also clears the OSTMnTE.OSTMnTE status flag.

When the counter is stopped, values in the OSTMnTO and OSTMnCNT registers and the level of the OSTMnTTOUT output are retained until further counting operations start.

Simultaneous start trigger function

The OSTMnTSST signal output from the PIC1B module can be used to start multiple timers at the same time. Refer to **Section 24, Peripheral Interconnection (PIC)**.

17.4.2 Interval Timer Mode

In interval timer mode, the OSTM can be used as a reference timer generating interrupt requests at fixed intervals.

17.4.2.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMnTINT interrupt request is generated when the counter underflows (reaches 0000 0000_H).

To select interval timer mode, set OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next 0000 0000_H is reached. Then the counter continues with the new value.

OSTMnTINT period

The periods of OSTMnTINT is:

- OSTMnTINT generation period = counter clock period × (OSTMnCMP + 1)

The following figure shows the basic operation of the OSTM in interval timer mode when interrupts at the start of counting are enabled.

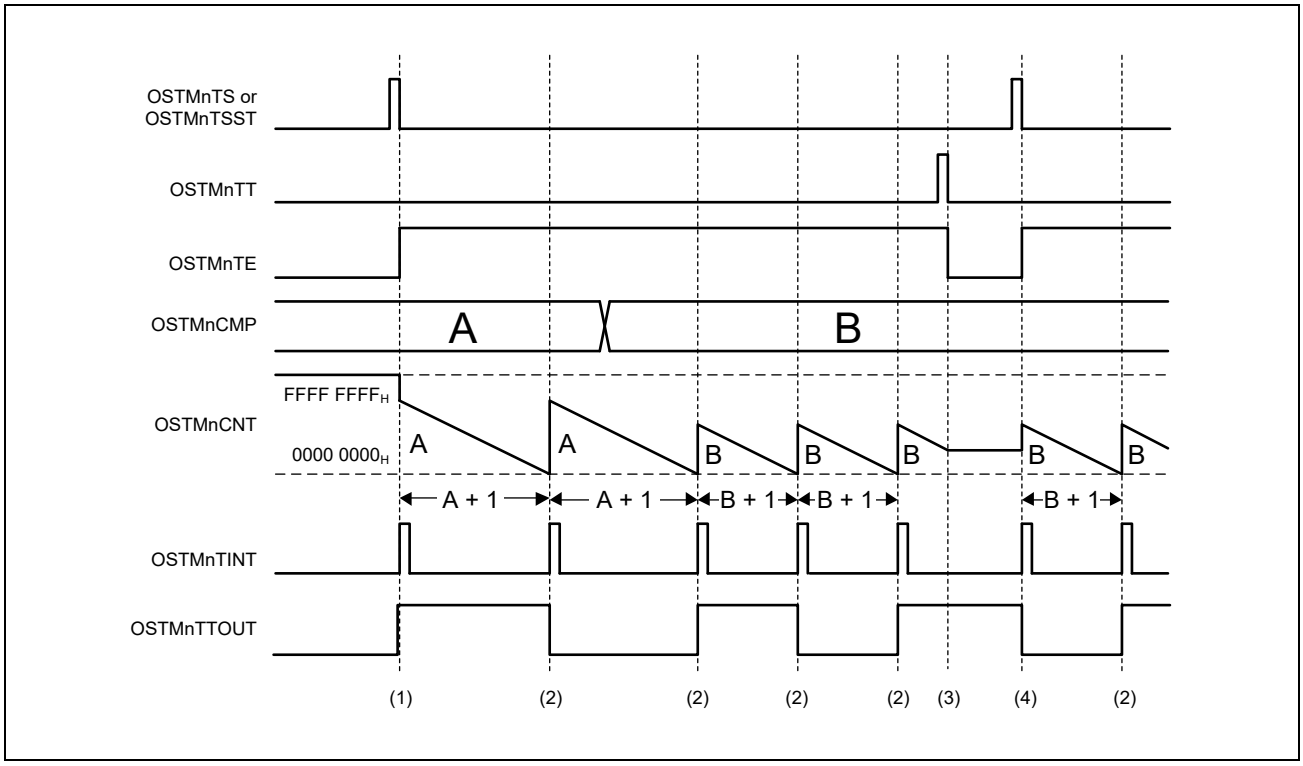

Figure 17.3 Timing Diagram of OSTM in Interval Timer Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1 or OSTMnTSST = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting-down from the value of OSTMnCMP.
If OSTMnCTL.OSTMnMD0 is 1, OSTMnTINT interrupt requests are generated at the start of counting. The OSTMnCNT register indicates the current value of the counter.

(2) When the counter reaches 0000 0000_H, an OSTMnTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.

(4) When counting is restarted (OSTMnTS.OSTMnTS = 1, or OSTMnTSST = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

Forced restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 or by a transition of the OSTMnTSST signal from the high level to the low level during counting.

The counter loads the start value from the OSTMnCMP register and continues to counting down.

The following figure shows the forced restart of the OSTM in interval timer mode, with interrupts at the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

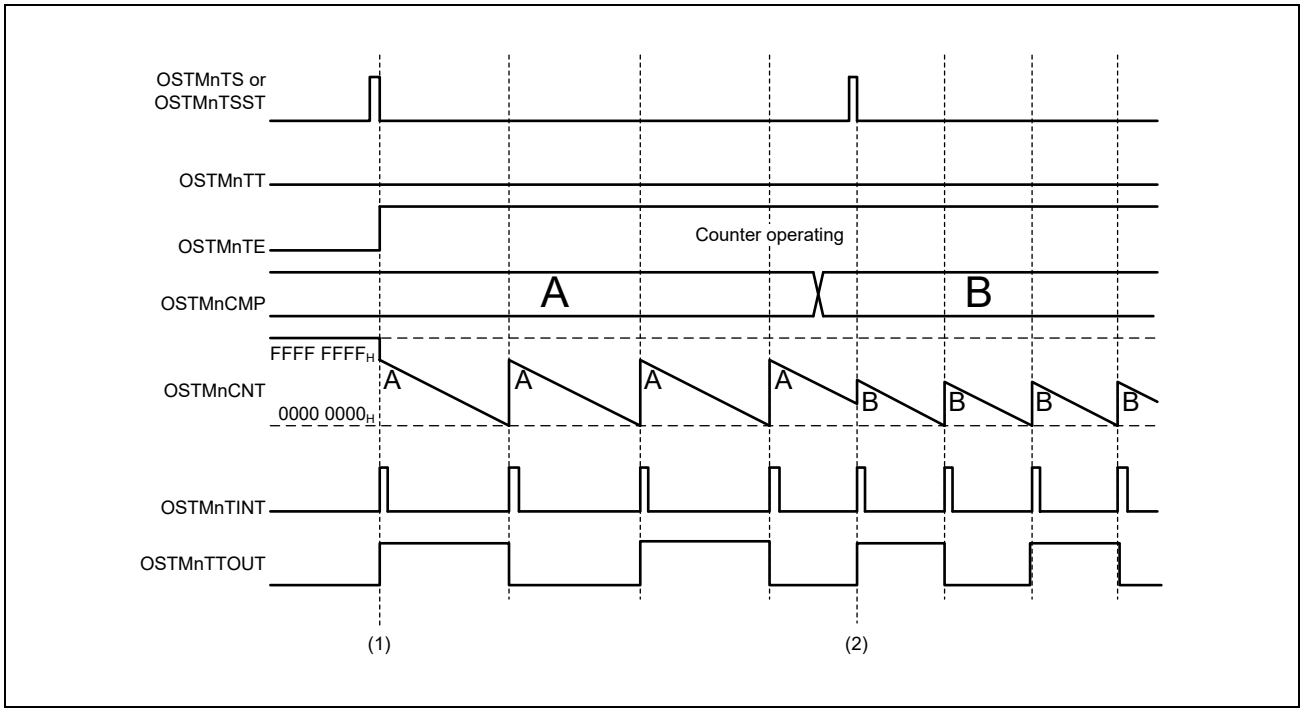

Figure 17.4 Timing Diagram of Forced Restart in Interval Timer Mode

Operations shown in the above timing diagram are as follows.

(1) The counter is started and stopped as described under **Figure 17.3, Timing Diagram of OSTM in Interval Timer Mode**.

(2) Setting OSTMnTS.OSTMnTS = 1 or OSTMnTSST = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP. When OSTMnCTL.OSTMnMD0 = 1, an OSTMnTINT interrupt request is generated when counting starts.

17.4.2.2 Operation when OSTMnCMP = 0000 0000$_H$

When OSTMnCMP = 0000 0000$_H$ the OSTM behaves as follows.

- When the counter is enabled, the OSTMnTINT interrupt request is always set to 1.
- When the OSTMnTTOUT signal is in timer-output toggling mode, the output is toggled on every cycle of PCLK.

The following figure shows operations of the OSTM when OSTMnCMP = 0000 0000$_H$, and interrupts at the start of counting are enabled.

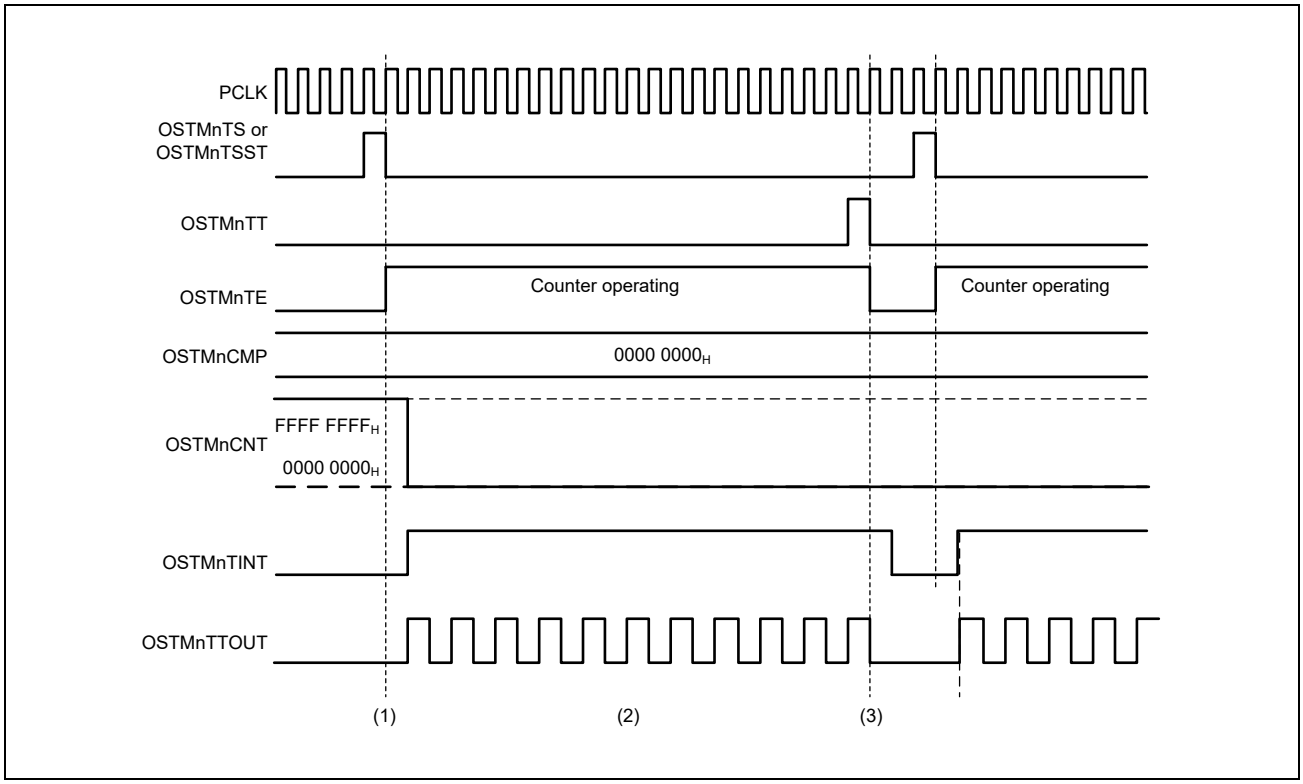

Figure 17.5 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Interval Timer Mode

The timing diagram above shows the following operations:

(1) The counter is reloaded with the value in OSTMnCMP, so the value 0000 0000_H is retained in OSTMnCMP.

(2) The OSTMnTINT interrupt request is continuously asserted.

(3) After the counter stops, the OSTMnTINT interrupt request signal is deasserted.

When interrupts at the start of counting are disabled, interrupts are not generated at the start timing of the counter.

17.4.2.3 Setting Procedure for Interval Timer Mode

The setting procedure in interval timer mode after reset release is described below:

Setting procedure

(1) Set the start value of the counter in the OSTMnCMP register.

(2) Select interval timer mode by clearing the OSTMnCTL.OSTMnMD1 bit.

(3) Select enabling or disabling of interrupts when counting starts (OSTMnCTL.OSTMnMD0).

17.4.3 Free-Run Compare Mode

17.4.3.1 Basic Operation in Free-Run Compare Mode

In free-run compare mode, the counter counts up from 0000 0000_H to FFFF $FFFF_H$. When the value of the OSTMnCMP register matches the current counter value, an OSTMnTINT interrupt request is output.

When free-run compare mode is used, set OSTMnCTL.OSTMnMD1 to 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of the OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

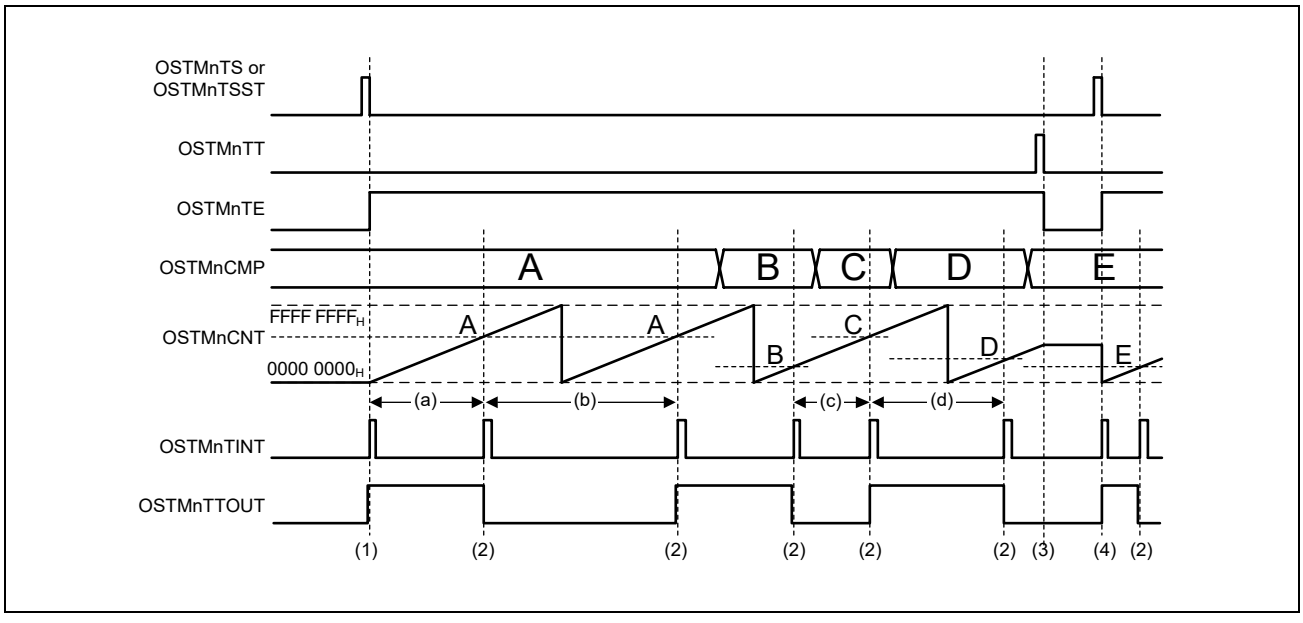

Figure 17.6 Timing Diagram of OSTM in Free-Run Compare Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1, or when OSTMnTSST = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from 0000 0000_H to FFFF $FFFF_H$. The OSTMnCNT register indicates the current value of the counter. When OSTMnCTL.OSTMnMD0 = 1, an interrupt request OSTMnTINT is generated when the counter starts.

(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMnTINT interrupt request is generated.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.

(4) Counting by the counter restarts from 0000 0000_H when OSTMnTS.OSTMnTS = 1, or when OSTMnTSST = 1.

OSTMnTINT period

The OSTMnTINT generation period is different at the start of counting and depends on the old and new compare value if OSTMnCMP is rewritten during operation.

Table 17.17 OSTMnTINT Generation Timing

Old Value for Comparison	New Value for Comparison	Counter Value at Time of Rewriting	Period of OSTMnTINT Generation	Label in Timing Diagram
Counter starts			(A + 1) × counter clock period	(a)
A	A	No rewriting	(FFFF $FFFF_H$ + 1) × counter clock period	(b)
B	C > B	B < counter value < C	(C – B) × counter clock period	(c)
C	D < C	Counter value > D,C	(FFFF $FFFF_H$ – C + D + 1) × counter clock period	(d)

Forced restart

Forced restarting does not proceed during counting even if the OSTMnTS.OSTMnTS bit is set, or if OSTMnTSST = 1. The counter ignores the attempted setting and continues counting.

17.4.3.2 Operation when OSTMnCMP = 0000 0000$_H$

The following figure shows the operation of the OSTM when OSTMnCMP = 0000 0000$_H$, interrupts at the start of counting are enabled (OSTMnCTL.OSTMnMD0 = 1).

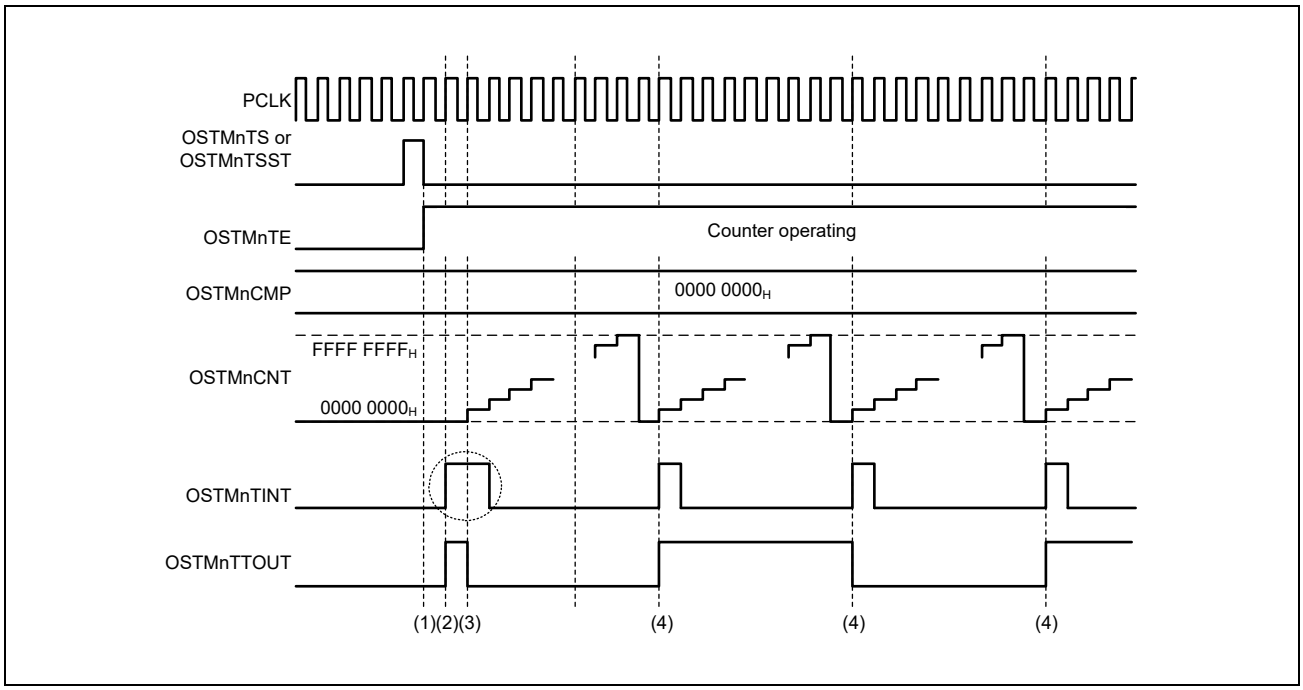

Figure 17.7 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Free-Run Compare Mode

The timing diagram above shows the following operations.

(1) Once the counter starts, it counts up from 0000 0000$_H$ to FFFF FFFF$_H$.

(2) An OSTMnTINT interrupt request is generated when counting starts.

(3) If the current counter value matches OSTMnCMP, an interrupt request OSTMnTINT is generated. If OSTMnCMP = 0000 0000$_H$ in the above case, OSTMnTINT is generated over two clock cycles.

(4) Every (FFFF FFFF$_H$ + 1) clock cycle the OSTMnTINT interrupt request is asserted.
When interrupts at the start of counting are disabled, interrupts are not generated at the start timing of the counter.

When interrupts at the start of counting are disabled, interrupts are not generated at the start timing of the counter.

17.4.3.3 Setting Procedure for Free-Run Compare Mode

The setting procedure in free-run compare mode after reset release is described below:

Setting Procedure

(1) Set the compare value in the OSTMnCMP register.

(2) Select free-run compare mode by setting the OSTMnCTL.OSTMnMD1 bit.

(3) Enable or disable interrupts when counting is started by the OSTMnCTL.OSTMnMD0 bit.

Section 18 Timer Array Unit D (TAUD)

18.1 Overview of RH850/C1M-A TAUD

18.1.1 Units

This LSI has the following number of TAUD units.

Table 18.1 Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of units	4	2
Name	TAUDn (n = 0 to 3)	TAUDn (n = 0, 1)

Table 18.2 Indices

Index	Meaning
n	Throughout this section, the individual TAUD units are identified by the index “n” (n = 0 to 3) (n = 0 to 3 for RH850/C1M-A2; n = 0, 1 for RH850/C1M-A1); for example, TAUD0CNT0 is the TAUDn control register 0.
m	The TAUD has up to 16 channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 15).

The number of channels included in the individual TAUD units is listed in the following table.

Table 18.3 Channels

Unit Name	Number of Channels
TAUDn	16

18.1.2 Register Base Addresses

TAUD base addresses are listed in the following table.

TAUD register addresses are given as offsets from the base addresses in general.

Table 18.4 Register Base Addresses

Base Address Name	Base Address
<TAUD0_base>	FFE2 0000_H
<TAUD1_base>	FF82 1000_H
<TAUD2_base>*1	FFE2 2000_H
<TAUD3_base>*1	FFE2 3000_H

Note 1. RH850/C1M-A1 does not have TAUD2 and TAUD3.

18.1.3 Clock Supply

TAUD clock is listed in following table.

Table 18.5 TAUDn Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
TAUDn	PCLK	CLKC_HSB (Non-modulated high-speed peripheral clock)

18.1.4 Interrupts Requests

TAUD interrupt requests are listed in the following table.

Table 18.6 Interrupt Requests (1/2)

Interrupt Name	Outline	Interrupt Number	DMAC Trigger Number*1		DTS Trigger Number*1	
			1st	2nd	1st	2nd
TAUD0						
INTTAUD0I0	Channel 0 interrupt	98	19	—	19	—

—: No number is assigned.

Note 1. 1st: Primary channel, 2nd: Secondary channel

Note 2. RH850/C1M-A1 does not have TAUD2 and TAUD3.

18.1.5 Reset Sources

TAUD reset sources are listed in the following table. TAUD is initialized by these reset sources.

Table 18.7 Reset Sources

Unit Name	Reset Source
TAUDn	Reset by any reset source

18.1.6 External Input/Output Signals

External input/output signals of TAUD are listed in the following table.

Table 18.8 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal Name
TAUD0		
TAUDTTINm	Channel m input	TAUD0Im
TAUDTTOUTm	Channel m output	TAUD0Om
TAUD1		
TAUDTTINm	Channel m input	TAUD1Im
TAUDTTOUTm	Channel m output	TAUD1Om
TAUD2*1		
TAUDTTINm	Channel m input	TAUD2Im
TAUDTTOUTm	Channel m output	TAUD2Om
TAUD3*1		
TAUDTTINm	Channel m input	TAUD3Im
TAUDTTOUTm	Channel m output	TAUD3Om

Note 1. RH850/C1M-A1 does not have TAUD2 and TAUD3.

CAUTION

When channel input pins are to be used, noise filters must be set for the corresponding port pin functions.

18.2 Overview

18.2.1 Functional Overview

The TAUD has the following functions:

- 16 channels
- 16-bit counter and 16-bit data register per channel
- Independent channel operation
- Synchronous channel operation (master and slave operation)
- Generation of different types of output signal
- Real-time output
- Counter can be triggered by external signal
- Interrupt generation

The Timer Array Unit D is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16 bit counter TAUDnCNTm and a 16-bit data register TAUDnCDRm to hold the start or compare value of the counter.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate in different operation modes, either independently or in combination with other channels (synchronously), i.e. multiple channels depend on each other with one master and one or more slave channels.

When a channel is operated independently, its operation mode and functions are not affected by those of other channels. When a channel is operated synchronously it is either a master or a slave. A master channel can have multiple slaves, and the state of one channel affects that of the other channels. For example, this means that one channel can control when another starts to count, is reset, etc.

CAUTION

The timing chart described in this section shows an operating timing image. A delay time is added to a timer input. For details, see **Section 18.4.8, TAUDTTINm Edge Detection**.

18.2.2 Terms

In this section, the following terms are used:

Independent / synchronous channel operation

Independent or synchronous channel operation describes the dependency of channels on each other:

- If a channel operates independent of all other channels, this is called independent channel operation.
- If a channel operates depending on other channels, this is called synchronous channel operation.

Channel group

In synchronous channel operation, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

Operation mode

An operation mode can be selected for every channel m. The operation mode defines the basic operation and features of a channel.

In synchronous channel operation, every channel in the channel group can operate in a different operation mode.

Examples are “Capture Mode”, “Event Count Mode”, and “Interval Timer Mode”.

Channel output mode

The channel output mode defines the operation of TAUDTTOUTm

- of a single channel (independent output operation) or
- of all channels in a channel group (synchronous output operation).

Examples are “Independent Channel Output Mode 1” and “Synchronous Channel Output Mode 2 with Dead Time Output”.

Channel operation function

The channel operation function defines the complete function and all features

- of a single channel (independent channel operation) or
- of all channels in a channel group (synchronous channel operation).

Upper/lower channel

Depending on the channel number m, a channel with a smaller number or with a larger number is referred to as “upper” or “lower” channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

Example:

For channel 5, channel 3 is an upper channel and channel 9 is a lower channel.

18.2.3 Functional List of Timer Operations

This timer provides the following functions by operating individual channels independently or a combination of channels.

Table 18.9 Functional List of TAUD Operations

Operation function	Example

18.2.4 TAUD I/O and Interrupt Request Signals

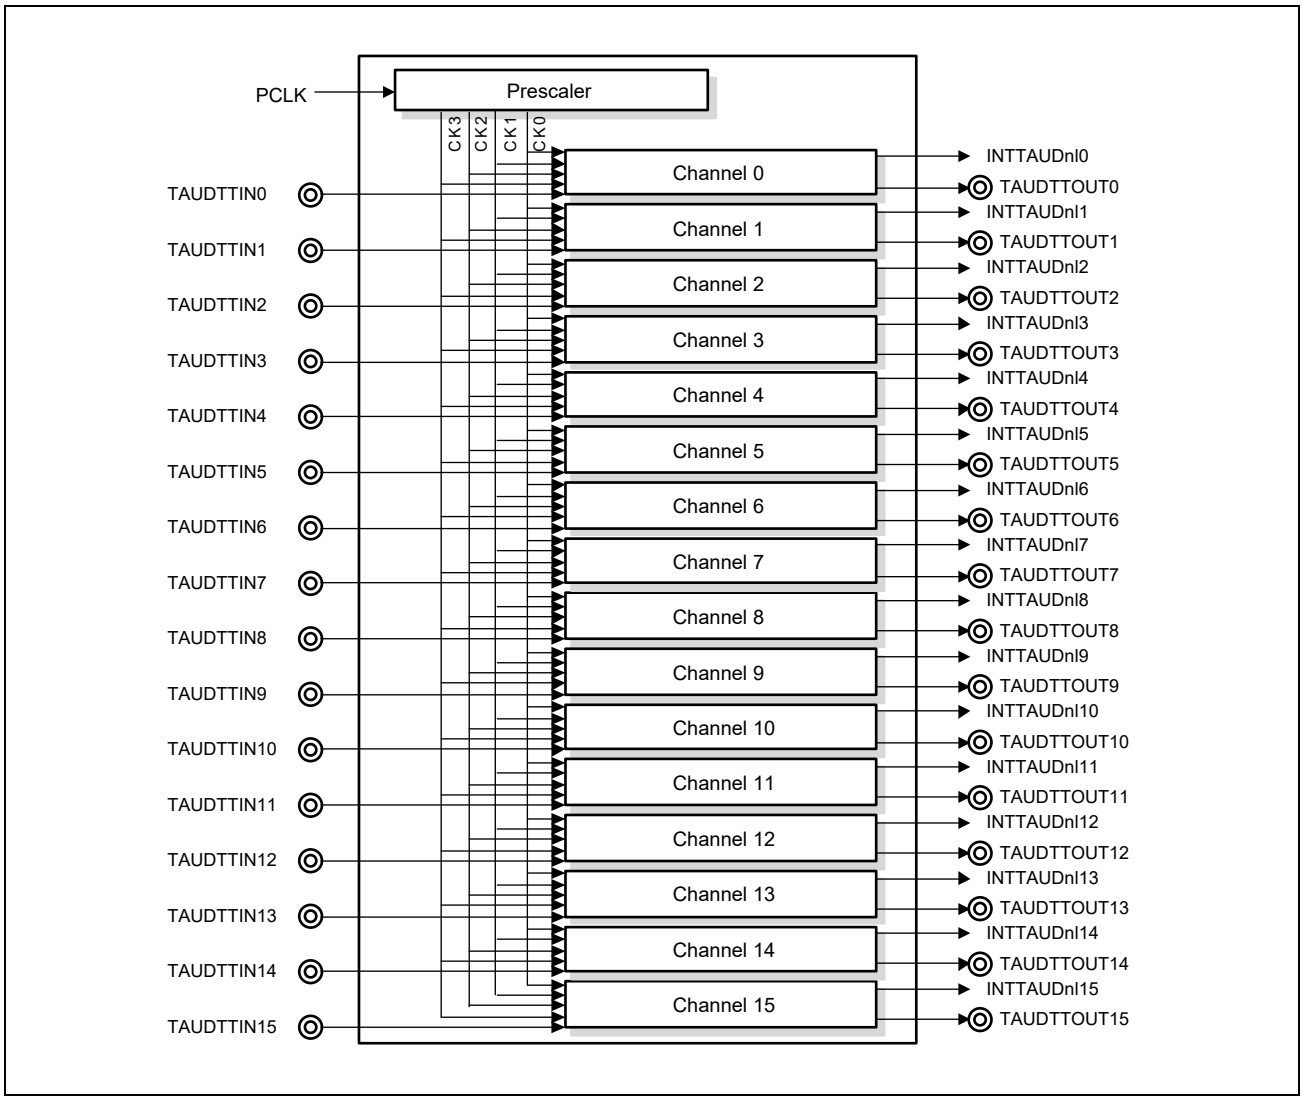

Figure 18.1 TAUD I/O and Interrupt Request Signals

18.2.5 Block Diagram

Figure 18.2 shows the main components of the TAUD:

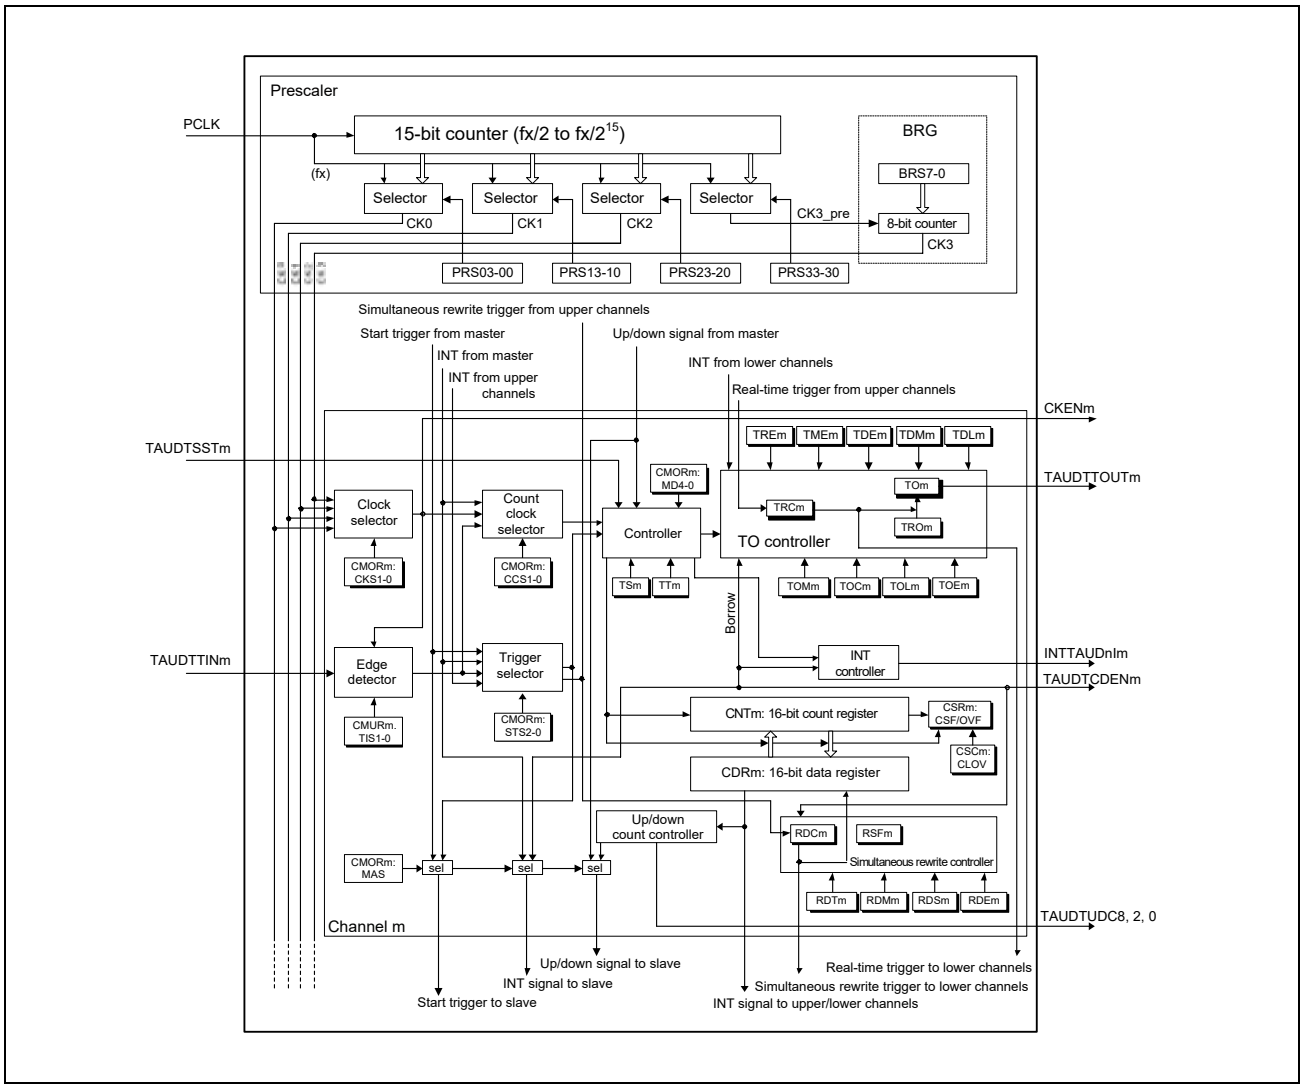

Figure 18.2 Block Diagram of the TAUD

The prefix “TAUDn” has been omitted from the register names for the sake of clarity in the above figure.

- TAUDTSSTm: Simultaneous start trigger (input from PIC1B)

18.2.6 Description of Blocks

The following describes the functional blocks:

Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived from PCLK by a configurable prescaler division factor of 2^0 to 2^{15}. The fourth count clock CK3 can be adjusted more precisely by an additional division factor that is not a power of 2.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- INTTAUDnIm from master channel
- TAUDTTINm input signal effective edge

Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUDnCMORm.TAUDnMD[4:0])
- Counter start enable (TAUDnTS.TAUDnTSm) and counter stop (TAUDnTT.TAUDnTTm) When counter start is enabled, status flag TAUDnTE.TAUDnTEm is set.
- Count direction (up/down) (can be controlled by master channel)

Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled

(TAUDnTE.TAUDnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- Synchronous channel start trigger input TAUDTSSTm

  For details on how to make a simultaneous start between the units, see **Section 24.2.3.1, Simultaneous Start Trigger Function**.
- TAUDTTINm input effective edge
- INTTAUDnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUDTTOUTm generation unit.

Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used in synchronous operation modes. The data registers (TAUDnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

TAUDnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

18.3 Registers

18.3.1 List of Registers

TAUD registers are listed in the following table.

See **Section 18.1.2** for <TAUDn_base>.

Table 18.10 TAUDn Registers Overview

Module Name	Register Name	Symbol	Address
TAUDn prescaler registers			
TAUDn	TAUD prescaler clock select register	TAUDnTPS	<TAUDn_base> + 240_H
TAUDn	TAUDn prescaler baud rate setting register	TAUDnBRS	<TAUDn_base> + 244_H
TAUDn control registers			
TAUDn	TAUDn channel data register m	TAUDnCDRm	<TAUDn_base> + m × 4_H
TAUDn	TAUDn channel counter register m	TAUDnCNTm	<TAUDn_base> + 80_H + m × 4_H
TAUDn	TAUDn channel mode OS register m	TAUDnCMORm	<TAUDn_base> + 200_H + m × 4_H
TAUDn	TAUDn channel mode user register m	TAUDnCMURm	<TAUDn_base> + $C0_H$ + m × 4_H
TAUDn	TAUDn channel status register m	TAUDnCSRm	<TAUDn_base> + 140_H + m × 4_H
TAUDn	TAUDn channel status clear register m	TAUDnCSCm	<TAUDn_base> + 180_H + m × 4_H
TAUDn	TAUDn channel start trigger register	TAUDnTS	<TAUDn_base> + $1C4_H$
TAUDn	TAUDn channel enable status register	TAUDnTE	<TAUDn_base> + $1C0_H$
TAUDn	TAUDn channel stop trigger register	TAUDnTT	<TAUDn_base> + $1C8_H$
TAUDn output registers			
TAUDn	TAUDn channel output enable register	TAUDnTOE	<TAUDn_base> + $5C_H$
TAUDn	TAUDn channel output register	TAUDnTO	<TAUDn_base> + 58_H
TAUDn	TAUDn channel output mode register	TAUDnTOM	<TAUDn_base> + 248_H
TAUDn	TAUDn channel output configuration register	TAUDnTOC	<TAUDn_base> + $24C_H$
TAUDn	TAUDn channel output active level register	TAUDnTOL	<TAUDn_base> + 40_H
TAUDn	TAUDn channel dead time output enable register	TAUDnTDE	<TAUDn_base> + 250_H
TAUDn	TAUDn channel dead time output mode register	TAUDnTDM	<TAUDn_base> + 254_H
TAUDn	TAUDn channel dead time output level register	TAUDnTDL	<TAUDn_base> + 54_H
TAUDn	TAUDn channel real-time output register	TAUDnTRO	<TAUDn_base> + $4C_H$
TAUDn	TAUDn channel real-time output enable register	TAUDnTRE	<TAUDn_base> + 258_H
TAUDn	TAUDn channel real-time output control register	TAUDnTRC	<TAUDn_base> + $25C_H$
TAUDn	TAUDn channel modulation output enable register	TAUDnTME	<TAUDn_base> + 50_H
TAUDn reload registers			
TAUDn	TAUDn channel reload data enable register	TAUDnRDE	<TAUDn_base> + 260_H
TAUDn	TAUDn channel reload data mode register	TAUDnRDM	<TAUDn_base> + 264_H
TAUDn	TAUDn channel reload data control CH select register	TAUDnRDS	<TAUDn_base> + 268_H
TAUDn	TAUDn channel reload data control register	TAUDnRDC	<TAUDn_base> + $26C_H$
TAUDn	TAUDn channel reload data trigger register	TAUDnRDT	<TAUDn_base> + 44_H
TAUDn	TAUDn channel reload status register	TAUDnRSF	<TAUDn_base> + 48_H

18.3.2 TAUDnTPS — TAUDn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescaler. CK3 is generated by dividing CK3_PRE by the factor specified in TAUDnBRS.

Access: Readable/writable in 16-bit units.

Address: <TAUDn_base> + 240_H

Value after reset: $FFFF_H$ This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnPRS3[3:0]				TAUDnPRS2[3:0]				TAUDnPRS1[3:0]				TAUDnPRS0[3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.11 TAUDnTPS Register Contents (1/3)

Bit Position	Bit Name	Function
15 to 12	TAUDnPRS3[3:0]	These bits specify CK3_PRE clock. CK3_PRE clock is an input clock to BRG unit which supplies the CK3 operation clock to all channels.

TAUDnPRS3[3:0]	CK3_PRE Clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK3 are stopped (TAUDnTE.TAUDnTEm = 0).

Table 18.11 TAUDnTPS Register Contents (2/3)

Bit Position	Bit Name	Function
11 to 8	TAUDnPRS2[3:0]	These bits specify the CK2 clock.

TAUDnPRS2[3:0]	CK2 Clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK2 are stopped (TAUDnTE.TAUDnTEm = 0).

7 to 4	TAUDnPRS1[3:0]	These bits specify the CK1 clock.

TAUDnPRS1[3:0]	CK1 Clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK1 are stopped (TAUDnTE.TAUDnTEm = 0).

Table 18.11 TAUDnTPS Register Contents (3/3)

Bit Position	Bit Name	Function
3 to 0	TAUDnPRS0[3:0]	These bits specify the CK0 clock.

TAUDnPRS0[3:0]	CK0 Clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK0 are stopped (TAUDnTE.TAUDnTEm = 0).

NOTE

The TAUDn clock input PCLK is specified in the first part of this section, **Section 18.1.3, Clock Supply**.

18.3.3 TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUDnTPS.TAUDnPRS3[3:0].

Access: Readable/writable in 8-bit units.

Address: <TAUDn_base> + 244_H

Value after reset: 00_H This register is initialized by any reset source.

Bit	7	6	5	4	3	2	1	0
	TAUDnBRS[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.12 TAUDnBRS Register Contents

Bit Position	Bit Name	Function
7 to 0	TAUDnBRS[7:0]	These bits specify a CK3_PRE clock division factor for generating CK3.

TAUDnBRS[7:0]	CK3 Clock
$0000\ 0000_B$	CK3_PRE/1
$0000\ 0001_B$	CK3_PRE/2
$0000\ 0010_B$	CK3_PRE/3
$0000\ 0011_B$	CK3_PRE/4
:	:
$1111\ 1110_B$	CK3_PRE/255
$1111\ 1111_B$	CK3_PRE/256

18.3.4 TAUDnCDRm — TAUDn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUDnCMORm.TAUDnMD[4:1].

Access: Readable/writable in 16-bit units.
Readable in capture mode. Any write operation is ignored.
Readable/writable in compare mode.

Address: <TAUDn_base> + 0_H + m × 4_H

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.13 TAUDnCDRm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnCDR[15:0]	Data register for capture/compare values

18.3.5 TAUDnCNTm — TAUDn Channel Counter Register

This is a channel m counter register.

Access: Readable in 16-bit units.

Address: <TAUDn_base> + 80_H + m × 4_H

Value after reset: $FFFF_H$ The value after reset depends on an operating mode. See **Table 18.15, TAUDnCNTm Read Values after Re-Enabling Counter**. This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCNT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.14 TAUDnCNTm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnCNT[15:0]	16-bit counter value

A read value depends on a counter value, a changed operating mode, TAUDnTS.TAUDnTSm or TAUDnTT.TAUDnTTm bit value.

The initial read value of the counter depends on an operating mode and how the counter is stopped.

- Stop by a reset
- Stop by a counter stop trigger (TAUDnTT.TAUDnTTm = 1)

Table 18.15 lists the initial counter read values after the counter is stopped (TAUDnTE.TAUDnTEm = 0) and re-enabled (TAUDnTS.TAUDnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUDnTS.TAUDnTSm = 1) with the counter waiting for a start trigger.

Table 18.15 TAUDnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUDnCNTm Value		
		After Reset	After Stop Trigger	After One Count
Interval timer mode	Count down	$FFFF_H$	Stop value	—
Judge mode	Count down	$FFFF_H$	Stop value	—
Capture mode	Count up	0000_H	Stop value	—
Event count mode	Count down	$FFFF_H$	Stop value	—
One-count mode	Count down	$FFFF_H$	Stop value	Stop value
Capture and one-count mode	Count up	0000_H	Stop value	Capture value + 1 (TAUDnCDRm)
Judge and one-count mode	Count down	$FFFF_H$	Stop value	TAUDnCNTm value – 1
Up/down count mode	Count down/up	$FFFF_H$	Stop value	—
Pulse one count mode	Count down	$FFFF_H$	Stop value	0000_H
Count capture mode	Count up	0000_H	Stop value	—
Capture and gate count mode	Count up	0000_H	Stop value	Stop value

NOTE

If the operating mode is changed while the counter is stopped, the initial counter value after a counter restart becomes undefined. The operating mode is changed by the TAUDnCMORm.TAUDnMD[4:1] register.

18.3.6 TAUDnCMORm — TAUDn Channel Mode OS Register

This register controls channel m operation.

Access: Readable/writable in 16-bit units. Writable when the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 200_H + m × 4_H

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS [1:0]		TAUDnCCS [1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS [1:0]		—	TAUDnMD[4:0]

Table 18.16 TAUDnCMORm Register Contents (1/3)

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select an operation clock. An operation clock is used for the TAUDTTINm input edge detection circuit. TAUDnCMORm.TAUDnCCS[1:0] bit setting enables use as a counter clock.

TAUDn CKS1	TAUDn CKS0	Selection of Operation Clock
0	0	CK0
0	1	CK1
1	0	CK2
1	1	CK3

Bit Position	Bit Name	Function
13, 12	TAUDnCCS[1:0]	These bits select a count clock for TAUDnCNTm counter.

TAUDn CCS1	TAUDn CCS0	Selection of Operation Clock
0	0	Operation clock specified by TAUDnCMORm.TAUDnCKS[1:0]
0	1	Effective edge of TAUDTTINm input signal
1	0	Setting prohibited
1	1	INTTAUDnIm signal of master channel

Bit Position	Bit Name	Function
11	TAUDnMAS	This bit specifies whether the channel is a master channel or slave channel during synchronous channel operation. 0: Slave 1: Master This bit setting is valid only for even-numbered channels (CHm_even). Odd-numbered channels (CHm_odd) are fixed to 0.

18.3.7 TAUDnCMURm — TAUDn Channel Mode User Register

This register specifies a type of effective edge detection used for TAUDTTINm input.

Access: Readable/writable in 8-bit units.

Address: <TAUDn_base> + $C0_H$ + m × 4_H

Value after reset: 00_H This register is initialized by any reset source.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.17 TAUDnCMURm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	These bits specify an effective edge of TAUDTTINm input signal.

TAUDn TIS1	TAUDn TIS0	Functional Description
0	0	Falling edge
0	1	Rising edge
1	0	Detection of rising and falling edges (selects low width measurement) • Start trigger: Falling edge • Stop trigger (capture): Rising edge
1	1	Detection of rising and falling edges (selects high width measurement) • Start trigger: Rising edge • Stop trigger (capture): Falling edge

Edge detection of TAUDTTINm input signal is based on the operation clock selected by TAUDnCMORm.TAUDnCKS[1:0].

18.3.8 TAUDnCSRm — TAUDn Channel Status Register

This register indicates the count direction and overflow status of channel m counter.

Access: Readable in 8-bit units.

Address: <TAUDn_base> + 140_H + m × 4_H

Value after reset: 00_H This register is initialized by any reset source.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnCSF	TAUDnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 18.18 TAUDnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read.
1	TAUDnCSF	Indicates a count direction. 0: Count-up 1: Count-down The read value of this bit is valid only in the following mode: • Up/down count mode
0	TAUDnOVF	Indicates counter overflow status. 0: No overflow occurs. 1: Overflow occurs. This bit is used only in the following modes: • Capture mode • Capture and one-count mode The function of this bit depends on the setting of control bit TAUDnCMORm.TAUDnCOS[1:0].

18.3.9 TAUDnCSCm — TAUDn Channel Status Clear Register

This is a trigger register for clearing the overflow flag TAUDnCSRm.TAUDnOVF of channel m.

Access: Writable in 8-bit units. This value is always read as 00_H.

Address: <TAUDn_base> + 180_H + m × 4_H

Value after reset: 00_H This register is initialized by any reset source.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUDnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 18.19 TAUDnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUDnCLOV	0: No function 1: Clears overflow flag TAUDnCSRm.TAUDnOVF.

18.3.10 TAUDnTS — TAUDn Channel Start Trigger Register

This register enables the counter operation of each channel.

Access: Writable in 16-bit units. This value is always read as 0000_H.

Address: <TAUDn_base> + $1C4_H$

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTS15	TAUDnTS14	TAUDnTS13	TAUDnTS12	TAUDnTS11	TAUDnTS10	TAUDnTS09	TAUDnTS08	TAUDnTS07	TAUDnTS06	TAUDnTS05	TAUDnTS04	TAUDnTS03	TAUDnTS02	TAUDnTS01	TAUDnTS00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 18.20 TAUDnTS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTSm	These bits enable the counter operation of channel m. 0: No function 1: Enables the counter operation and sets TAUDnTE.TAUDnTEm to 1. The counter operation is only enabled when TAUDnTE.TAUDnTEm is set to 1. Whether counting is started or not depends on a selected operating mode.

18.3.11 TAUDnTE — TAUDn Channel Enable Status Register

This register enables/disables a counter operation.

Access: Readable in 16-bit units.

Address: <TAUDn_base> + $1C0_H$

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTE15	TAUDnTE14	TAUDnTE13	TAUDnTE12	TAUDnTE11	TAUDnTE10	TAUDnTE09	TAUDnTE08	TAUDnTE07	TAUDnTE06	TAUDnTE05	TAUDnTE04	TAUDnTE03	TAUDnTE02	TAUDnTE01	TAUDnTE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.21 TAUDnTE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTEm	These bits enable or disable the counter operation of channel m. 0: Disables counter operation. 1: Enables counter operation. This bit is set to 1 when trigger input of TAUDTSSTm (synchronous channel start trigger signal) is detected or when TAUDnTS.TAUDnTSm is set to 1. This bit is set to 0 when TAUDnTT.TAUDnTTm is set to 1.

NOTE

For details on how to make a simultaneous start between the units, see **Section 24.2.3.1, Simultaneous Start Trigger Function.**

18.3.12 TAUDnTT — TAUDn Channel Stop Trigger Register

This register stops the counter operation of each channel.

Access: Writable in 16-bit units. This value is always read as 0000_H.

Address: <TAUDn_base> + $1C8_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTT15	TAUDnTT14	TAUDnTT13	TAUDnTT12	TAUDnTT11	TAUDnTT10	TAUDnTT09	TAUDnTT08	TAUDnTT07	TAUDnTT06	TAUDnTT05	TAUDnTT04	TAUDnTT03	TAUDnTT02	TAUDnTT01	TAUDnTT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 18.22 TAUDnTT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTTm	These bits are used to stop the counter operation of channel m. 0: No function 1: Stops the counter operation and resets TAUDnTE.TAUDnTEm. TAUDnCNTm, TAUDnTO.TAUDnTOm, and TAUDTTOUTm retain the values provided before the counter is stopped.

18.3.13 TAUDnRDE — TAUDn Channel Reload Data Enable Register

This register enables/disables simultaneous rewrite of TAUDnCDRm/TAUDnTOLm data register.

Access: Readable/writable in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 260_H

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 18.23 TAUDnRDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDEm	These bits enable or disable simultaneous rewrite of the data register of channel m. 0: Disables simultaneous rewrite 1: Enables simultaneous rewrite

18.3.14 TAUDnRDS — TAUDn Channel Reload Data Control Channel Select Register

This register selects a channel that controls simultaneous rewrite.

Access: Readable/writable in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 268_H

Value after reset: 0000_H This register is initialized by any reset source.

Table 18.24 TAUDnRDS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDSm	These bits select a channel that controls a simultaneous rewrite trigger. 0: Master channel 1: Another upper channel

18.3.15 TAUDnRDM — TAUDn Channel Reload Data Mode Register

This register selects the timing for generating a simultaneous rewrite control signal.

Access: Readable/writable in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 264_H

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 18.25 TAUDnRDM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDMm	These bits select the timing for generating a simultaneous rewrite trigger signal. 0: When the master channel counter starts to count 1: At the peak of cycle of triangular wave These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and TAUDnRDS.TAUDnRDSm = 0.

18.3.16 TAUDnRDC — TAUDn Channel Reload Data Control Register

This register specifies a channel which generates an INTTAUDnlm signal to trigger simultaneous rewrite.

Access: Readable/writable in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + $26C_H$

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RDC15	TAUDn RDC14	TAUDn RDC13	TAUDn RDC12	TAUDn RDC11	TAUDn RDC10	TAUDn RDC09	TAUDn RDC08	TAUDn RDC07	TAUDn RDC06	TAUDn RDC05	TAUDn RDC04	TAUDn RDC03	TAUDn RDC02	TAUDn RDC01	TAUDn RDC00

Table 18.26 TAUDnRDC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDCm	These bits specify whether the channel generates a simultaneous rewrite trigger signal or not. 0: Not operate as a simultaneous rewrite trigger channel. 1: Operates as a simultaneous rewrite trigger channel. These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and TAUDnRDS.TAUDnRDSm = 1.

18.3.17 TAUDnRDT — TAUDn Channel Reload Data Trigger Register

This register triggers a simultaneous rewrite enabling state.

Access: Writable in 16-bit units. This value is always read as 0000_H.

Address: <TAUDn_base> + 44_H

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RDT15	TAUDn RDT14	TAUDn RDT13	TAUDn RDT12	TAUDn RDT11	TAUDn RDT10	TAUDn RDT09	TAUDn RDT08	TAUDn RDT07	TAUDn RDT06	TAUDn RDT05	TAUDn RDT04	TAUDn RDT03	TAUDn RDT02	TAUDn RDT01	TAUDn RDT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 18.27 TAUDnRDT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDTm	These bits are used to trigger a simultaneous rewrite enabling state. 0: No function 1: Triggers a simultaneous rewrite enabling state. The simultaneous rewrite pending flag (TAUDnRSFm) is set to 1. The system waits for a simultaneous rewrite trigger.

18.3.18 TAUDnRSF — TAUDn Channel Reload Status Register

This flag register indicates simultaneous rewrite status.

Access: Readable in 16-bit units.

Address: <TAUDn_base> + 48_H

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.28 TAUDnRSF Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRSFm	These bits indicate simultaneous rewrite status. 0: Indicates that a simultaneous rewrite trigger has started simultaneous rewrite. 1: Indicates that simultaneous rewrite is in the enabling state (TAUDnRDTm = 1) and that the system waits for a simultaneous rewrite trigger.

18.3.19 TAUDnTOE — TAUDn Channel Output Enable Register

This register enables/disables the independent channel output mode controlled by software.

Access: Readable/writable in 16-bit units.

Address: <TAUDn_base> + $5C_H$

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTOE15	TAUDnTOE14	TAUDnTOE13	TAUDnTOE12	TAUDnTOE11	TAUDnTOE10	TAUDnTOE09	TAUDnTOE08	TAUDnTOE07	TAUDnTOE06	TAUDnTOE05	TAUDnTOE04	TAUDnTOE03	TAUDnTOE02	TAUDnTOE01	TAUDnTOE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.29 TAUDnTOE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOEm	These bits enable or disable the independent channel output function. 0: Disables the independent timer output function. 1: Enables the independent timer output function.

18.3.20 TAUDnTO — TAUDn Channel Output Register

This register specifies and reads a TAUDTTOUTm level.

Access: Readable/writable in 16-bit units.

Address: <TAUDn_base> + 58_H

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 18.30 TAUDnTO Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOm	These bits specify and read a TAUDTTOUTm level. 0: Low level 1: High level Only TAUDnTOm bits for which Independent Channel Output function is disabled (TAUDnTOEm = 0) can be written.

18.3.21 TAUDnTOM — TAUDn Channel Output Mode Register

This register specifies the output mode of each channel.

Access: Readable/writable in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 248_H

Value after reset: 0000_H This register is initialized by any reset source.

Table 18.31 TAUDnTOM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOMm	These bits specify an output mode. 0: Independent channel operation 1: Synchronous channel operation As described in **Section 18.4.4, Channel Output Modes**, the output mode depends on the setting of each channel output control bit.

18.3.22 TAUDnTOC — TAUDn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUDnTOMm.

Access: Readable/writable in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + $24C_H$

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 18.32 TAUDnTOC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOCm	These bits specify an output mode. 0: Operating mode 1 1: Operating mode 2 As listed below, the output mode depends on the setting of TAUDnTOM.TAUDnTOMm.

TOMm	TOCm	Functional Description
0	0	Toggle mode: Toggle operation is conducted when INTTAUDnIm occurs.
0	1	Set/reset mode: Set when INTTAUDnIm occurs at the beginning of count operation, and reset when INTTAUDnIm is caused by detection of a match between TAUDnCNTm and TAUDnCDRm.
1	0	Synchronous channel operating mode 1: Set when INT occurs on master channels, and reset when INT occurs on slave channels.
1	1	Synchronous channel operating mode 2: Set when INTTAUDnIm occurs in count-down status, and reset when INTTAUDnIm occurs in count-up status.

18.3.23 TAUDnTOL — TAUDn Channel Output Active Level Register

This register specifies the output logic of channel output bit (TAUDnTO.TAUDnTOm).

Access: Readable/writable in 16-bit units.

Address: <TAUDn_base> + 040_H

Value after reset: 0000_H This register is initialized by any reset source.

Table 18.33 TAUDnTOL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOLm	Specifies the output logic of channel m output bit (TAUDnTO.TAUDnTOm). 0: Positive logic (active high) 1: Negative logic (active low) These bits apply in all channel output modes except independent channel output mode controlled by software and independent channel output mode 1.

18.3.24 TAUDnTDE — TAUDn Channel Dead Time Output Enable Register

This register enables/disables the dead time operation of every channel.

Access: Readable/writable in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 250_H

Value after reset: 0000_H This register is initialized by any reset source.

Table 18.34 TAUDnTDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTDEm	These bits enable or disable the dead time control operation of channel m. 0: Disables dead time operation 1: Enables dead time operation. The same setting should be made for both even and odd slave channels in pairs. These bit settings are applied when: • TAUDnTOE.TAUDnTOEm, TAUDnTOM.TAUDnTOMm, TAUDnTOC.TAUDnTOCm = 1

18.3.25 TAUDnTDM — TAUDn Channel Dead Time Output Mode Register

This register specifies the timing to add dead time during dead time output.

Access: Readable/writable in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 254_H

Value after reset: 0000_H This register is initialized by any reset source.

Table 18.37 TAUDnTRE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTREm	These bits enable or disable real-time output of channel m. 0: Disables real-time output 1: Enables real-time output. These bit settings are applied only when TAUDnTOE.TAUDnTOEm = 1.These bit settings are applied only when TAUTnTOE.TAUDnTOEm = 1. When TAUDnTRE.TREm = 0, TAUDTTOUTm is not affected by real-time output. When TAUDnTRE.TREm = 1, TAUDTTOUTm outputs the value of real-time output bit TAUDnTRO.TAUDnTROm in response to a timer operation.

18.3.28 TAUDnTRC — TAUDn Channel Real-time Output Control Register

This register controls the real-time output trigger of each channel.

Access: Readable/writable in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + $25C_H$

Value after reset: 0000_H This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 18.40 TAUDnTME Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTMEm	These bits enable or disable modulation output for timer output and real-time output of channel m. 0: Disables modulation 1: Enables modulation These bit settings are applied only when TAUDnTOE.TAUDnTOEm and TAUDnTRE.TAUDnTREm = 1.

18.4 Function

18.4.1 General Operating Procedure

The following lists the general operation procedure for the TAUDn:

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUDTTOUTm is also initialized and outputs a low level.

(1) Set the TAUDnTPS and TAUDnBRS registers to specify the clock frequency of CK0 to CK3.

(2) Configure the desired TAUDn function:

- Set the operation mode
- Set the channel output mode
- Set any other control bits

(3) Enable the counter by setting the TAUDnTS.TAUDnTSm bit to 1.
The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.

(4) Stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUDnTT.TAUDnTTm bit to 1. The counter can be forcibly restarted by setting the TAUDnTS.TAUDnTSm bit to 1.

(5) Stop the function by setting the TAUDnTT.TAUDnTTm bit to 1.

NOTE

A detailed description of the required control bits and the operation of the individual functions is given below:

- **Section 18.4.9, Independent Channel Operation Functions**
- **Section 18.4.12, Synchronous Channel Operation Functions**

18.4.2 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consist of master and slave channels). Several rules apply to the settings of channels. These rules are detailed in **Section 18.4.2.1, Rules of Synchronous Channel Operation.**

Two special features for synchronous channel operation are detailed in the following sections:

- **Section 18.4.2.2, Simultaneous Start and Stop of Synchronous Channel Counters**
- **Section 18.4.3, Simultaneous Rewrite**

18.4.2.1 Rules of Synchronous Channel Operation

Number of masters and slaves

- Only even-numbered channels (CH0, CH2, CH4, …) can be set as master channels. Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and several slave channels can be set for one master channel.

  Example: If CH2 is a master channel, CH3 and the lower channels (CH4, CH5, …) can be set as slave channels.
- If multiple master channels are used, slave channels cannot cross the master channels. Example: If CH0 and CH4 are master channels, CH1 to CH3 can be set as slave channels for CH0, but CH5 to CH15 cannot.

Operation clock

- The same operation clock must be set for the slave channel and the master channel. This is achieved using the TAUDnCMORm.TAUDnCKS[1:0] bits of the slave and master channel.

The basic concepts of master/slave usage and operation clocks are illustrated in **Figure 18.3**.

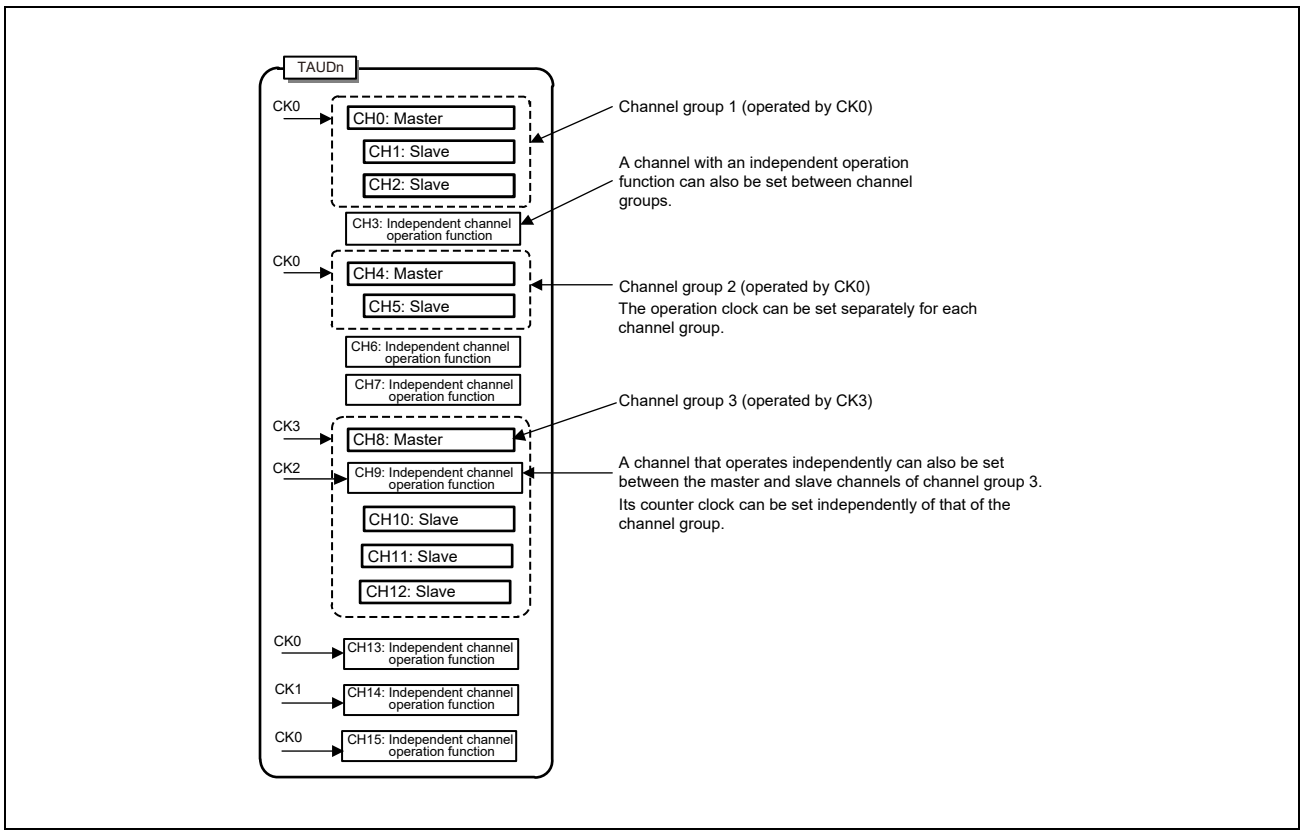

Figure 18.3 Grouping of Channels and Assignment of Count Clocks

Control trigger signal for master/salve channels

- Master channels can output control trigger signals to slave channels.
- Slave channels can use control trigger signals from master channels but cannot output control trigger signals for their own to lower channels.
- Master channels cannot use control trigger signals from upper master channels.

18.4.2.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit and between the units.

(1) Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUDnTS.TAUDnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUDnTT.TAUDnTTm bits of the channels should be set at the same time.

Setting to the TAUDnTS.TAUDnTSm bits to 1 also sets the corresponding TAUDnTE.TAUDnTEm bits to 1, enabling counting. The count start timing depends on operating mode.

(2) Simultaneous Start for Multiple Units

Counters in different units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

For details on how to make a simultaneous start between the units, see **Section 24.2.3.1, Simultaneous Start Trigger Function**.

18.4.3 Simultaneous Rewrite

18.4.3.1 Overview of Operations

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUDnCDRm and TAUDnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUDnIm being issued on the upper channel specified by TAUDnRDC.TAUDnRDCm

There are four methods for simultaneous rewrite. These are listed in **Table 18.41**, along with how to specify them and when they cause simultaneous rewrite to be triggered.

Table 18.41 Simultaneous Rewrite Methods and when They are Triggered

Method	Simultaneous Rewrite Triggered when	TAUDnRDE. TAUDnRDEm	TAUDnRDS. TAUDnRDSm	TAUDnRDM. TAUDnRDMm
—	No simultaneous rewrite	0	0	0
A	The master channel (re)starts counting	1	0	0
B	Counting is started in the master channel. The master channel starts counting down at the peak of triangular cycle of the corresponding slave channel.	1	0	1
C1	INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm	1	1	0/1
C2	INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm that in turn is triggered by an external signal	1	1	0/1

Table 18.42 lists which of these four methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in **Section 18.4.9, Independent Channel Operation Functions** and **Section 18.4.12, Synchronous Channel Operation Functions**.

Table 18.42 Channel Operation Functions and Methods They Use

Function	A	B	C1	C2

Non-Complementary Modulation Output Function Type 2		√	√	
Complementary Modulation Output Function		√	√	

Note: √: Available, (Blank): Unavailable

18.4.3.2 How to Control Simultaneous Rewrite

Figure 18.4 shows the general procedure for simultaneous rewrite. The three main blocks (initial settings, start and counter count operation, and simultaneous rewrite) are explained afterwards.

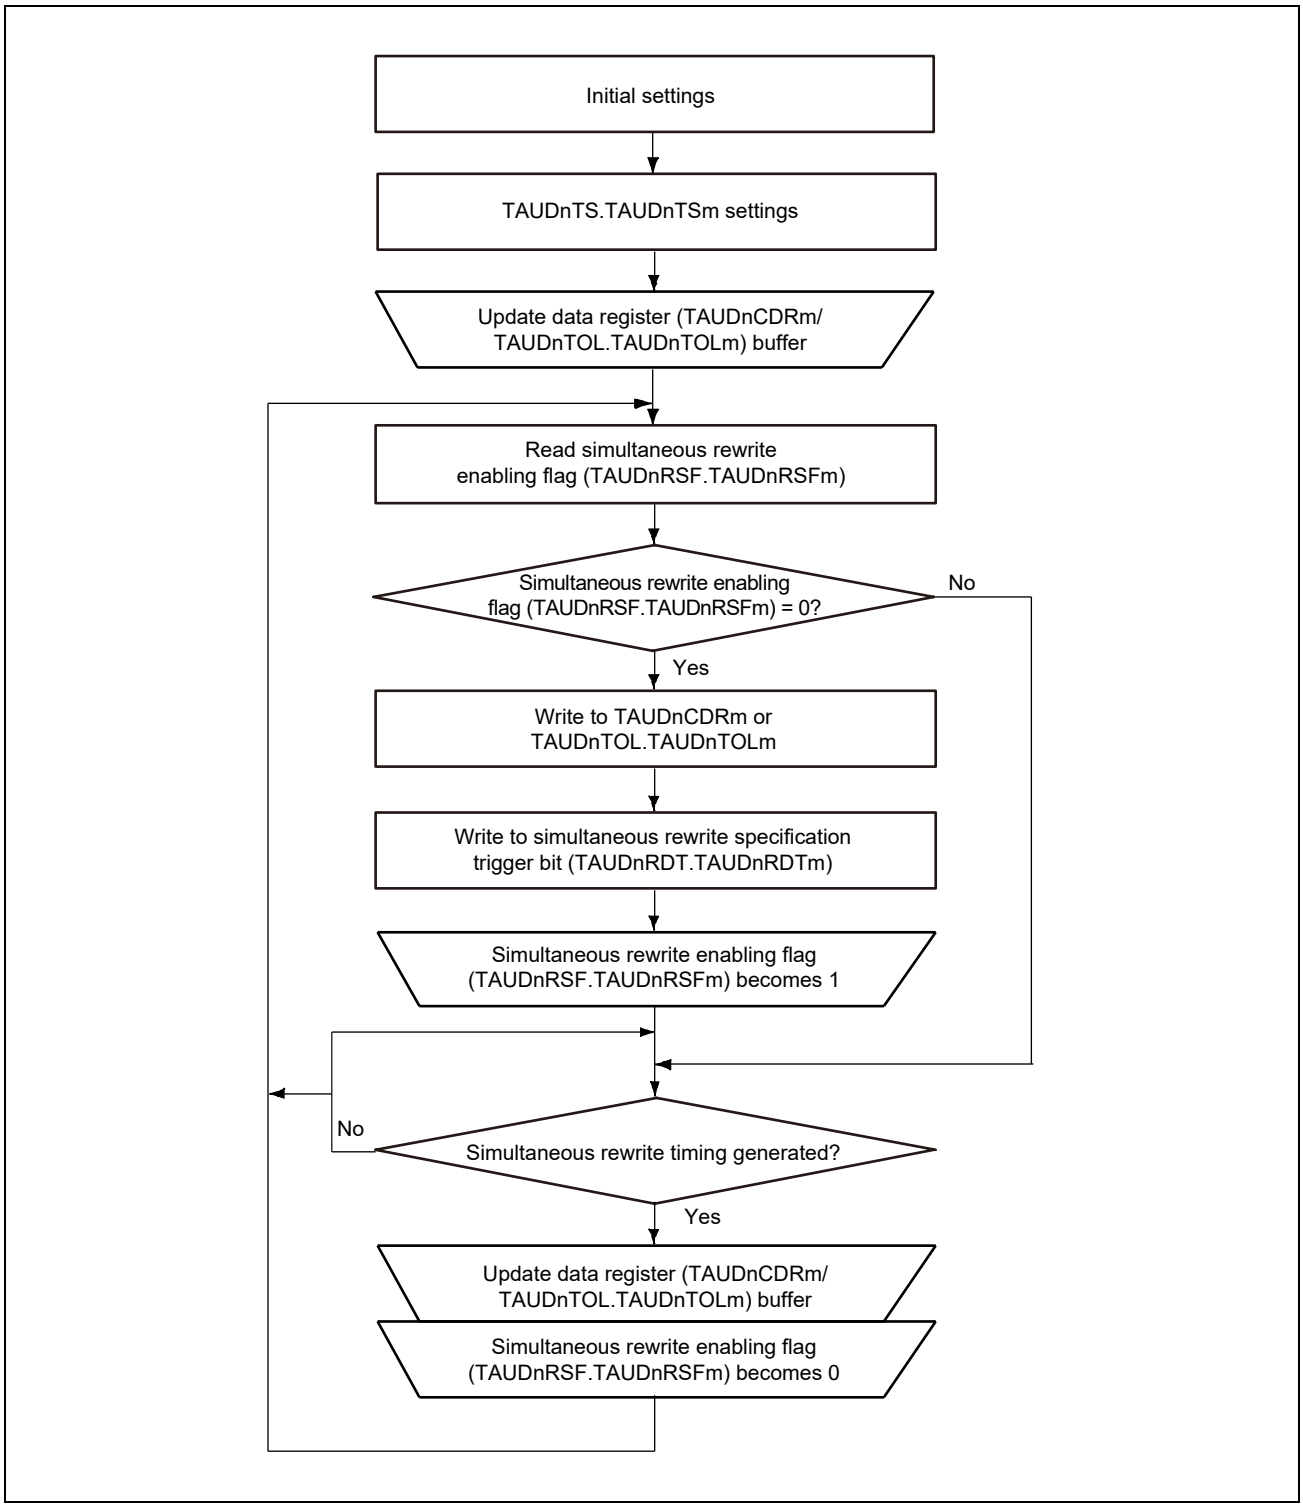

Figure 18.4 General Procedure for Simultaneous Rewrite

(1) Initial Settings

- To enable simultaneous rewrite in channel m, set TAUDnRDE.TAUDnRDEm = 1
- To select the type of simultaneous rewrite, set TAUDnRDM.TAUDnRDMm and TAUDnRDS.TAUDnRDSm according to the values listed in **Table 18.41, Simultaneous Rewrite Methods and when They are Triggered**.
- To select which upper channel is monitored for simultaneous rewrite triggers, use TAUDnRDC.TAUDnRDCm (prerequisite: TAUDnRDS.TAUDnRDSm is set in upper channel.)

(2) Start Counter and Count Operation

- To start all the TAUDnCNTm counters of the channel group, set the corresponding TAUDnTS.TAUDnTSm bits to1. The values of TAUDnTOL.TAUDnTOLm and the data registers (TAUDnCDRm) are loaded into the corresponding TAUDnTOL.TAUDnTOLm buffer (TAUDnTOL.TAUDnTOLm buf) and data buffer registers (TAUDnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1 sets the reload flag (TAUDnRSF.TAUDnRSFm) to 1, enabling simultaneous rewrite. TAUDnRSF.TAUDnRSFm remains set to 1 until simultaneous rewrite is completed.
- When the specified trigger for simultaneous rewrite is detected, the TAUDnRSF.TAUDnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUDnRSF.TAUDnRSFm = 1). If it is, simultaneous rewrite is carried out. Otherwise the simultaneous rewrite is not carried out and waits for the next trigger detection.

(3) Simultaneous Rewrite

- When simultaneous rewrite is enabled (TAUDnRSF.TAUDnRSFm = 1) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and are applied the next time the counter starts or restarts.
- The TAUDnRSF.TAUDnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

18.4.3.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUDnRDE.TAUDnRDEm, TAUDnRDS.TAUDnRDSm, TAUDnRDM.TAUDnRDMm, and TAUDnRDC.TAUDnRDCm cannot be changed while the counter is in operation (TAUDnTE.TAUDnTEm = 1).
- TAUDnTOL.TAUDnTOLm can only be rewritten during operation with PWM output function or triangle PWM output function. For all other output functions, TAUDnTOL.TAUDnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUDTTOUTm outputs an invalid wave.
- When an upper channel is used as a channel issuing the simultaneous rewrite trigger (TAUDnRDS.TAUDnRDSm = 1), the TAUDnRDC.TAUDnRDCm bit controls all the lower channels. This means that if the TAUDnRDC.TAUDnRDCm bits of CH2 and CH7 are set to 1 and the TAUDnRDC.TAUDnRDCm bits of other channels are set to 0, CH2 and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger (TAUDnRDE.TAUDnRDEm and TAUDnRDS.TAUDnRDSm = 1) but no upper channel is set (TAUDnRDC.TAUDnRDC[15:0] = 0), simultaneous rewrite cannot take place.

18.4.3.4 Types of Simultaneous Rewrite

In the following section, the four simultaneous rewrite methods are explained using timing diagrams.

(1) Simultaneous Rewrite when the Master Channel (Re)starts Counting (Method A)

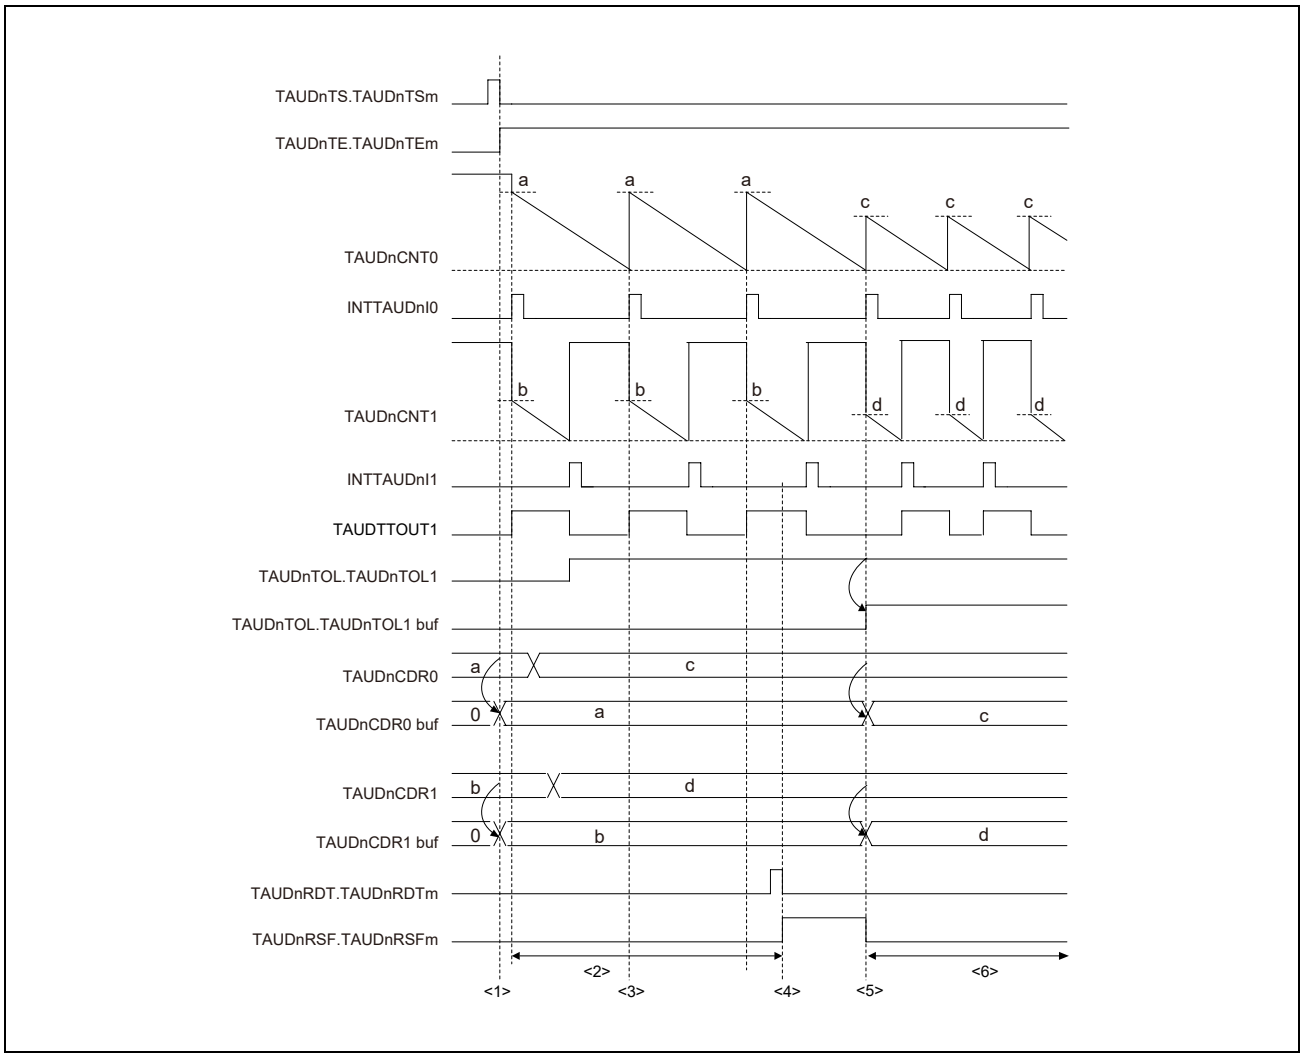

Figure 18.5 Simultaneous Rewrite when the Master Channel (Re) Starts Counting

Setting

- CH0 is the master channel, which counts down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

Description:

(1) When TAUDnTS.TAUDnTSm = 1 is set, the value of TAUDnCDRm is copied to the TAUDnCDRm buffer.

(2) The TAUDnCDRm and TAUDnTOL.TAUDnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm = 0)

(4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.

(5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer and the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

(2) Simultaneous Rewrite at the Peak of a Triangular Cycle of Slave Channel (Method B)

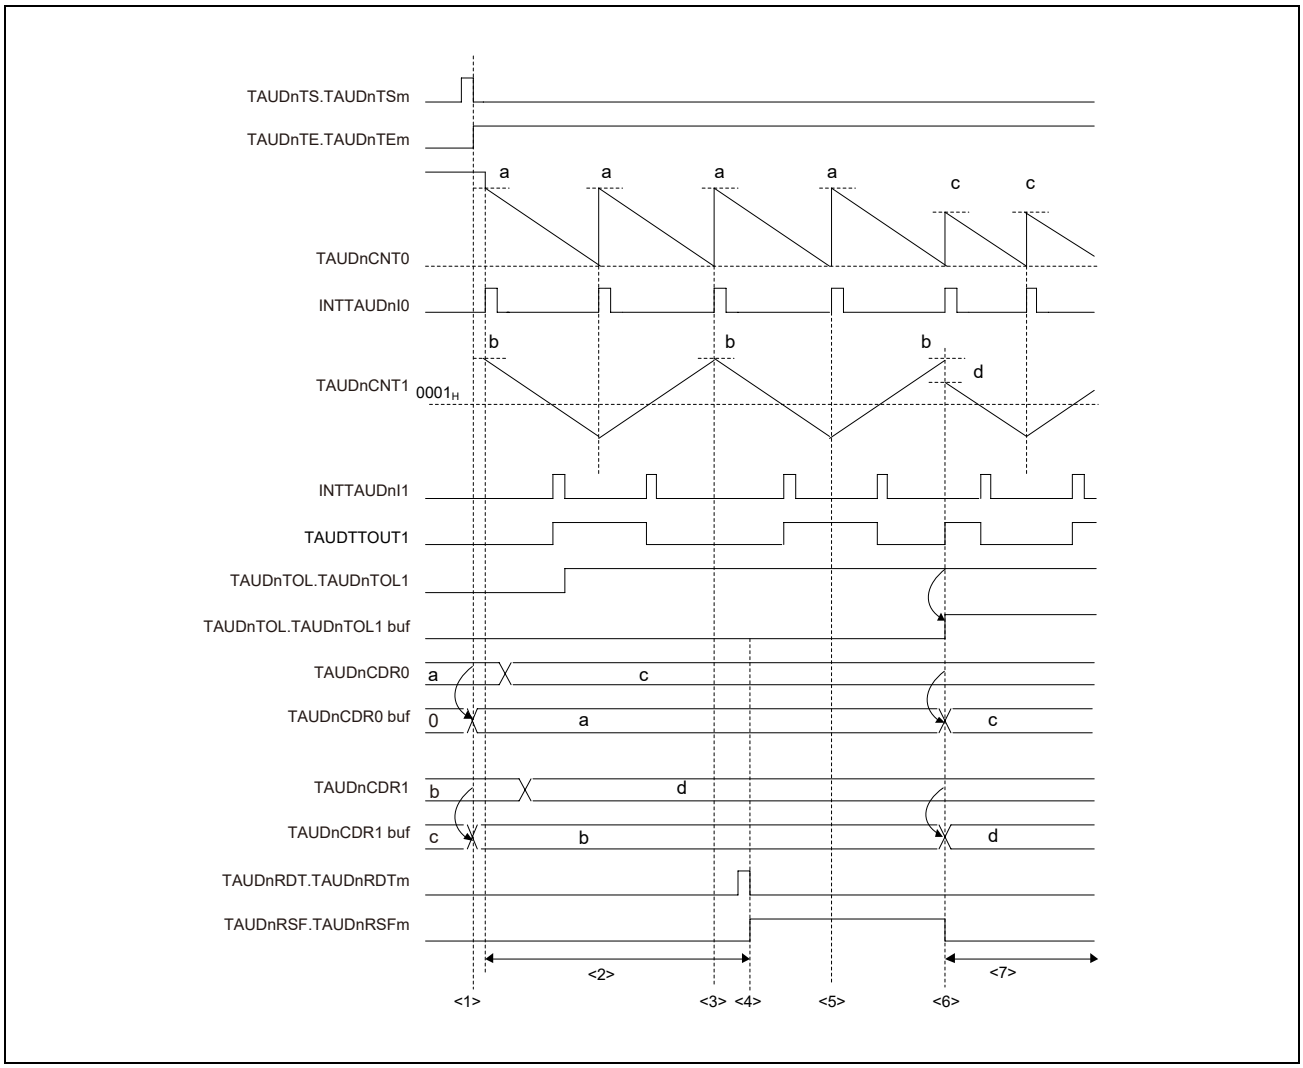

Figure 18.6 Simultaneous Rewrite at the Peak of a Triangular Cycle of Slave Channel

Setting

- CH0 is the master channel which performs counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

Description:

(1) When TAUDnTS.TAUDnTSm = 1 is set, the value of TAUDnCDRm is copied to the TAUDnCDRm buffer.

(2) The TAUDnCDRm and TAUDnTOL registers can be written at any time.

(3) Simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm = 0).

(4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.

(6) Simultaneous rewrite takes place at the top of the triangular cycle. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer, the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.

(7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

(3) Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm (Method C1)

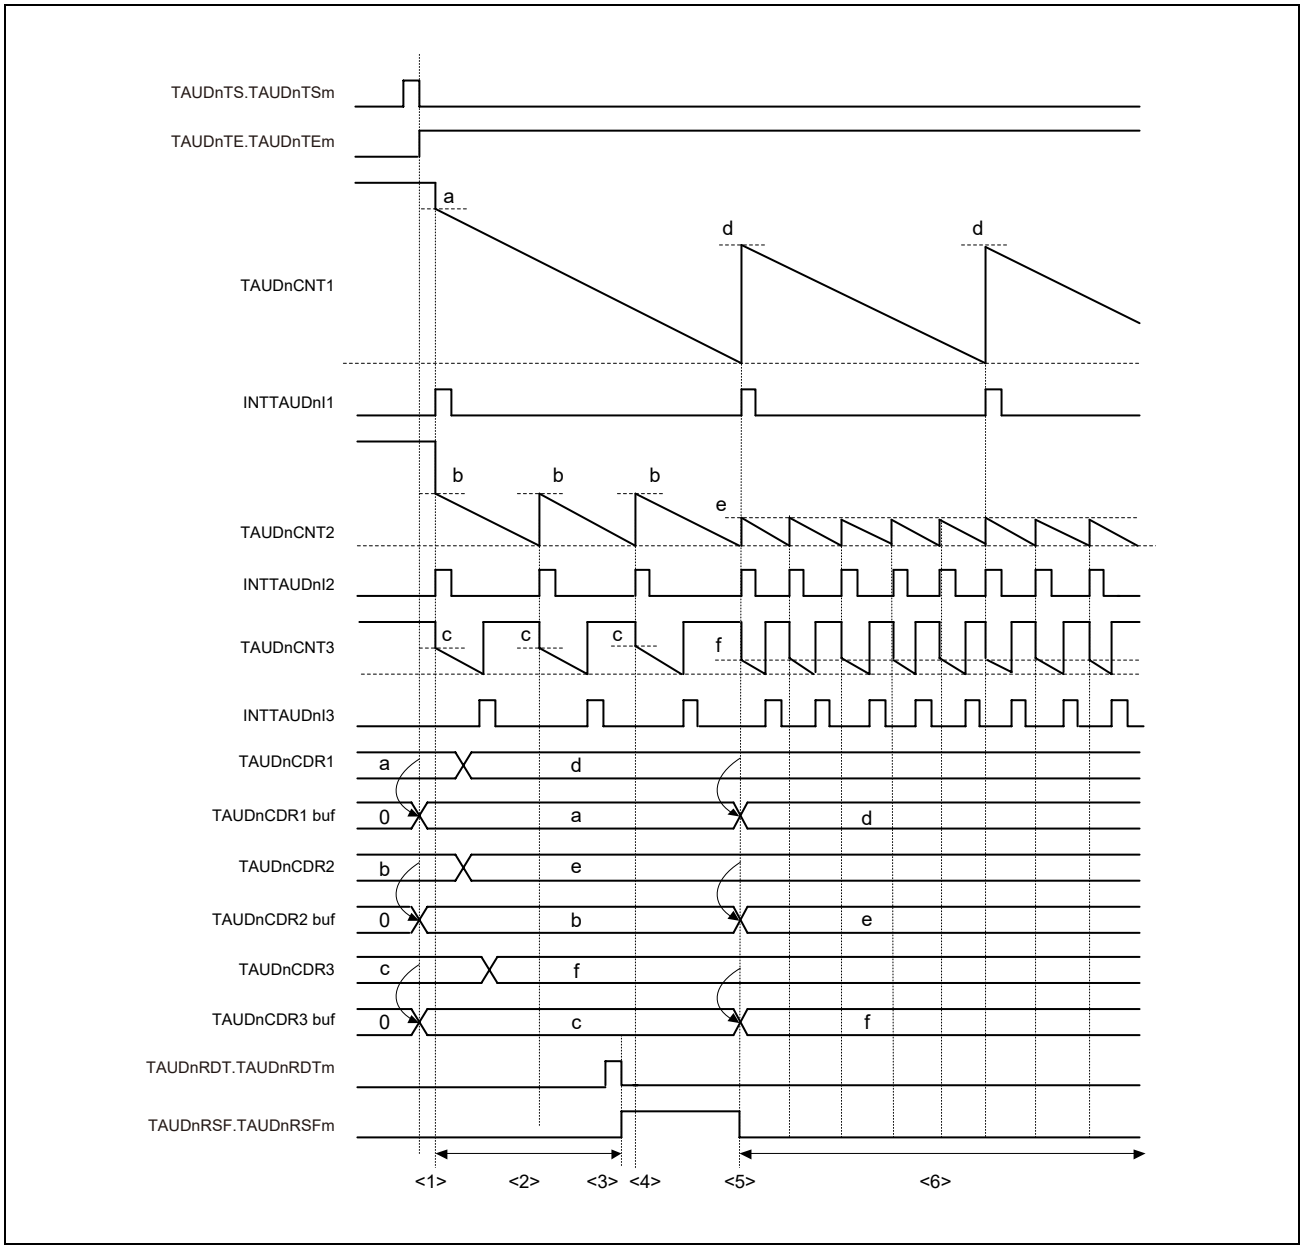

Figure 18.7 Simultaneous Rewrite When INTTAUDnIm Is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm

Setting

- CH1 is an upper channel which performs counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C1 is applied. The TAUDnRDC register specifies a channel which generates simultaneous rewrite triggers.

Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, the TAUDnCDRm value is copied to the TAUDnCDRm buffer.

(2) The TAUDnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1, the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches 0000_H. The TAUDnCDRm values are loaded into the corresponding TAUDnCDRm buffers.

(6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be changed again.

(4) Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal (Method C2)

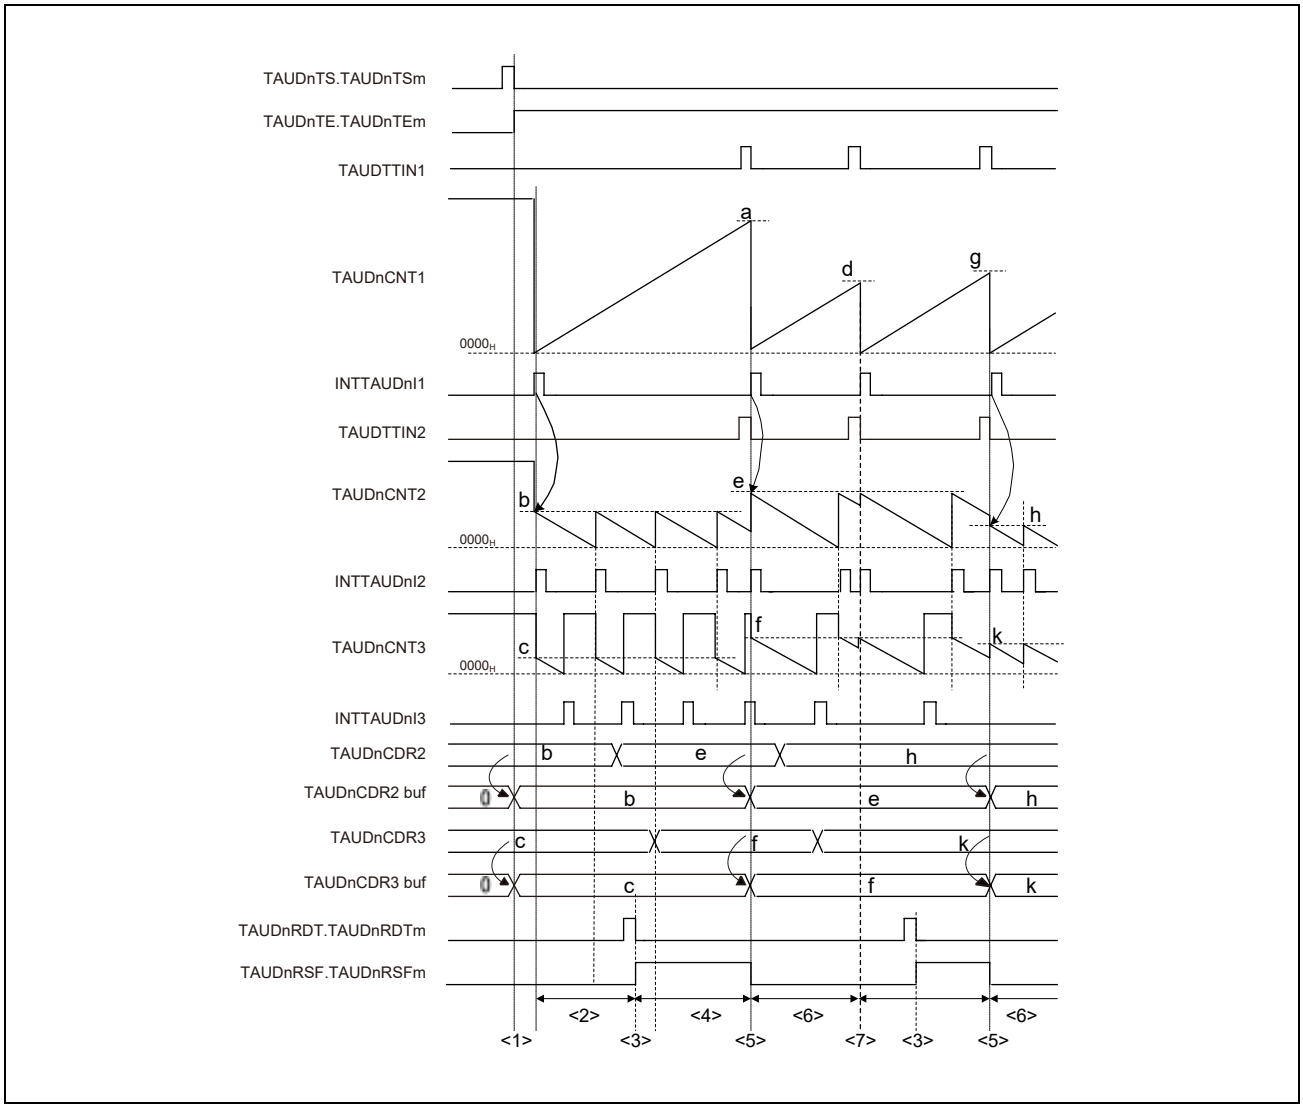

Figure 18.8 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal

Setting

CH1 is an upper channel which performs counting up, CH2 is a master channel, and CH3 is the slave channel. The synchronous channel operation method C2 is applied. The TAUDnRDC register specifies which upper channel is monitored for an INTTAUDnIm trigger.

Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, the TAUDnCDRm value is copied to the TAUDnCDRm buffer. However, as TAUDnCDR1 operates in capture mode, the TAUDnCDR1 value is not copied to the TAUDnCDR1 buffer.

(2) The TAUDnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1, the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is caused by external signal TIN1. The TAUDnCDRm values are written to the corresponding TAUDnCDRm buffers.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be changed again.

(7) An external signal occurs at TIN2 but simultaneous rewrite does not take place because it is disabled (TAUDnRSF.TAUDnRSFm = 0).

18.4.4 Channel Output Modes

The output of the TAUDTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUDnTOE.TAUDnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUDnTO.TAUDnTOm) is sent out of the output pin (TAUDTTOUTm).
- By TAUD signals (TAUDnTOE.TAUDnTOEm = 1)
  When controlled by TAUD signals, the output level of TAUDTTOUTm is set or reset or toggled by internal signals. The value of TAUDnTO.TAUDnTOm is updated accordingly to reflect the value of TAUDTTOUTm
  - Independently (TAUDnTOM.TAUDnTOMm = 0)
    In case of independent operation, the output of the TAUDTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUDnTOM.TAUDnTOMm = 0).
  - Synchronously (TAUDnTOM.TAUDnTOMm = 1)
    In case of synchronous operation, the output of the TAUDTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUDnTOM.TAUDnTOMm = 1).

The TAUDnTO.TAUDnTOm bit can always be read to determine the current value of TAUDTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 18.43, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 18.4.4.2, Channel Output Modes Controlled Independently by TAUDn Signals**
- **Section 18.4.4.3, Channel Output Modes Controlled Synchronously by TAUDn Signals**

Batch operation of TAUDnTOm bit

Whether a set value is reflected to the TAUDnTOm bit or not is controlled by the TAUDnTOE.TAUDnTOEm bit.

The TAUDnTOm setting is written only to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit = 0 when a write to the TAUDnTO register is attempted. No TAUDnTOm setting is reflected to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit = 1.

NOTE

TAUDnTO.TAUDnTOm bit is placed so that its bit number corresponds to a channel number.

Output logic

Positive or negative logic of the output is specified by control bit TAUDnTOL.TAUDnTOLm.

The value of TAUDnTOL.TAUDnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. Otherwise, changes to TAUDnTOL.TAUDnTOLm result in an invalid TAUDTTOUTm signal output.

See **Section 18.4.3, Simultaneous Rewrite.**

The various channel output modes and the channel output control bits are listed in **Table 18.43**.

Table 18.43 Channel Output Modes

Channel Output Mode	TAUDn TOE. TAUDn TOEm	TAUDn TOM. TAUDn TOMm	TAUDn TOC. TAUDn TOCm	TAUDn TDE. TAUDn TDEm	TAUDn TRE. TAUDn TREm	TAUDn TME. TAUDn TMEm	TAUDn TDM. TAUDn TDMm
By software							
Independent channel output mode controlled by software	0	X	X	X	X	X	X
By TAUD signals, independently							
Independent channel output mode 1	1	0	0	0	0	0	0
with real-time output	1	0	0	0	1	0	0
Independent channel output mode 2	1	0	1	0	0	0	0
By TAUD signals, synchronously							
Synchronous channel output mode 1	1	1	0	0	0	0	0
with non-complementary modulation output	1	1	0	0	1	X	0
Synchronous channel output mode 2	1	1	1	0	0	0	0
with dead time output	1	1	1	1	0	0	0
with one-phase PWM output	1	1	1	1	0	0	1
with complementary modulation output	1	1	1	1	1	1	0
with non-complementary modulation output	1	1	1	0	1	1	0

Note: All combinations not listed in this table are forbidden.
Bits marked with an X can be set to any value.

NOTES

1. The following bits cannot be changed during count operation (TAUDnTE.TAUDnTE = 1):
   - TAUDnTOE.TAUDnTOEm
   - TAUDnTOM.TAUDnTOMm
   - TAUDnTOC.TAUDnTOCm
   - TAUDnTDE.TAUDnTDEm
   - TAUDnTRE.TAUDnTREm
   - TAUDnTDM.TAUDnTDMm
2. The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm = 1) except in channel output modes with modulation output:
   - TAUDnTME.TAUDnTMEm
   - TAUDnTDL.TAUDnTDLm

18.4.4.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUDTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUDnTOE.TAUDnTOEm = 0).

(1) Set TAUDnTO.TAUDnTOm to specify the initial level of the TAUDTTOUTm output.

(2) Set channel output mode according to **Table 18.43, Channel Output Modes**, and the output logic using the TAUDnTOL.TAUDnTOLm bit.

(3) Start the counter (TAUDnTS.TAUDnTSm = 1).

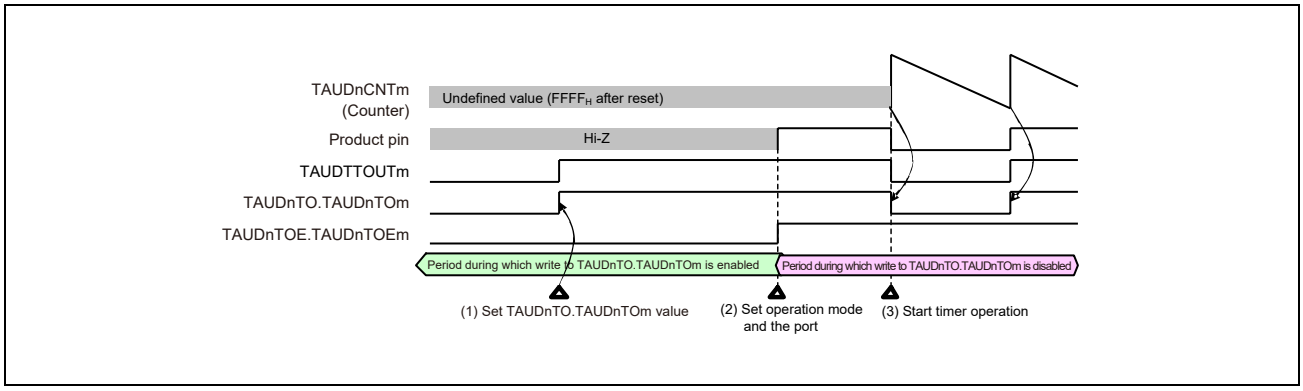

Figure 18.9 General Procedure for Specifying a TAUDTTOUTm Channel Output Mode

18.4.4.2 Channel Output Modes Controlled Independently by TAUDn Signals

This section lists the channel output modes that are controlled independently by TAUDn signals. The control bits used to specify a mode are listed in **Table 18.43, Channel Output Modes**.

(1) Independent Channel Output Mode 1

Set/reset conditions

In this output mode, TAUDTTOUTm toggles when INTTAUDnIm is detected. The value of TAUDnTOL.TAUDnTOLm is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 18.43, Channel Output Modes**.

(2) Independent Channel Output Mode 1 with Real-Time Output

In this output mode, the value of TAUDnTRO.TAUDnTROm bit of the trigger channel is output to TAUDTTOUTm. The trigger channel is specified by setting the corresponding TAUDnTRC.TAUDnTRCm bit to 1. It controls all lower channels for which TAUDnTRC.TAUDnTRCm = 0.

Set/reset conditions

The value of TAUDnTRO.TAUDnTROm bit is sent to TAUDTTOUTm only when an INTTAUDnIm interrupt occurs on the trigger channel. The interrupt is generated either:

- at certain specified intervals or
- on detection of an effective TAUDTTINm input edge/counter start

The type of trigger is set using the TAUDnCMORm.TAUDnMD[4:1] bits.

Prerequisites

Both master and slave channels can be set as a trigger generation channel. A channel for which TAUDnTRC.TRCm is set to 1 serves as a trigger generation channel even if TAUDnTRE.TAUDnTREm is set to 0. If there is no channel for which TAUDnTRC.TAUDnTRCm is set to 1 or if TAUDnTRC.TAUDnTRC0 = 0, real-time output cannot take place.

This can be seen in **Figure 18.10**.

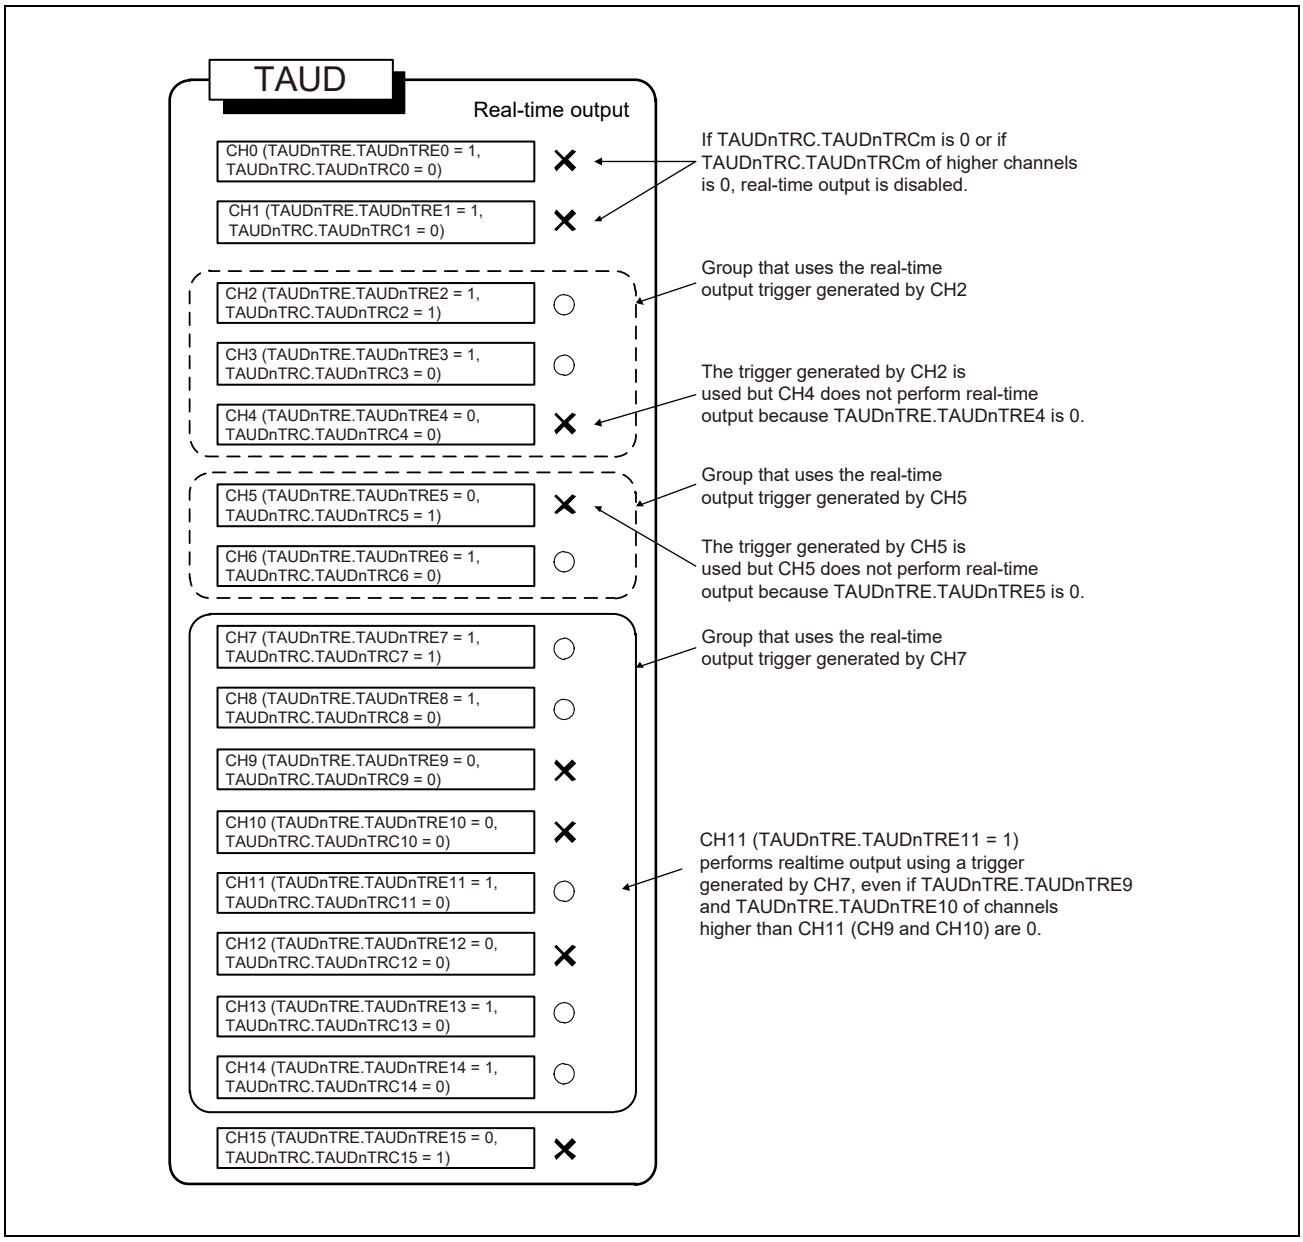

Figure 18.10 Real-Time Output

(3) Independent Channel Output Mode 2

Set/reset conditions

In this output mode, TAUDTTOUTm is set when INTTAUDnIm occurs at the time of count start, and reset when INTTAUDnIm occurs due to a match between TAUDnCNTm and TAUDnCDRm.

Prerequisites

There are no prerequisites other than those shown in **Table 18.43, Channel Output Modes.**

18.4.4.3 Channel Output Modes Controlled Synchronously by TAUDn Signals

This section lists the channel output modes that are controlled synchronously by TAUDn signals. The control bits used to specify a mode are listed in **Table 18.43, Channel Output Modes**.

(1) Synchronous Channel Output Mode 1

Set/reset conditions

In this output mode, INTTAUDnIm of master channel serves as a set signal and INTTAUDnIm of the slave channel as a reset signal. If INTTAUDnIm of master channel and INTTAUDnIm of the slave channel are generated at the same time, INTTAUDnIm of the slave channel (reset signal) has priority over INTTAUDnIm (set signal) of master channel, i.e., the master channel is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 18.43, Channel Output Modes**.

(2) Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

Set/reset conditions

In this output mode, TAUDTTOUTm outputs the result of an AND operation between the PWM output and the real-time output bit (TAUDnTRO.TAUDnTROm) of a channel.

The phase period to which the dead time is added is specified using the TAUDnTDL.TDLm bit; for positive phase set TAUDnTDL.TAUDnTDLm = 0 and for negative phase set TAUDnTDL.TAUDnTDLm = 1.

Prerequisites

A set of at least three channels is required to generate the PWM output. The master channel and slave channel 1 generate a period, and slave channel 2 generates the duty cycle. In typical applications, five more slave channels are also used that operate in the same manner as slave channel 2.

Only the PWM output and the real-time output bit of the same channel can be combined.

TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed, its new value is applied upon detection of INTTAUDnIm on the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on the master channel.

(3) Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to up/down count mode. The result is a triangle PWM wave at TAUDTTOUTm. For details, see **Section 18.4.12.7, Triangle PWM Output Function**.

Set/reset conditions

TAUDnCNTm of the slave channel counts down and up alternatively. When it passes 0001_Hit generates an interrupt, causing TAUDTTOUTm to toggle.

Prerequisites

A set of two channels is required to generate the triangle PWM output. TAUDTTOUTm should be set to 0 before the function starts.

(4) Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in **Figure 18.11**.

Set/reset conditions
