

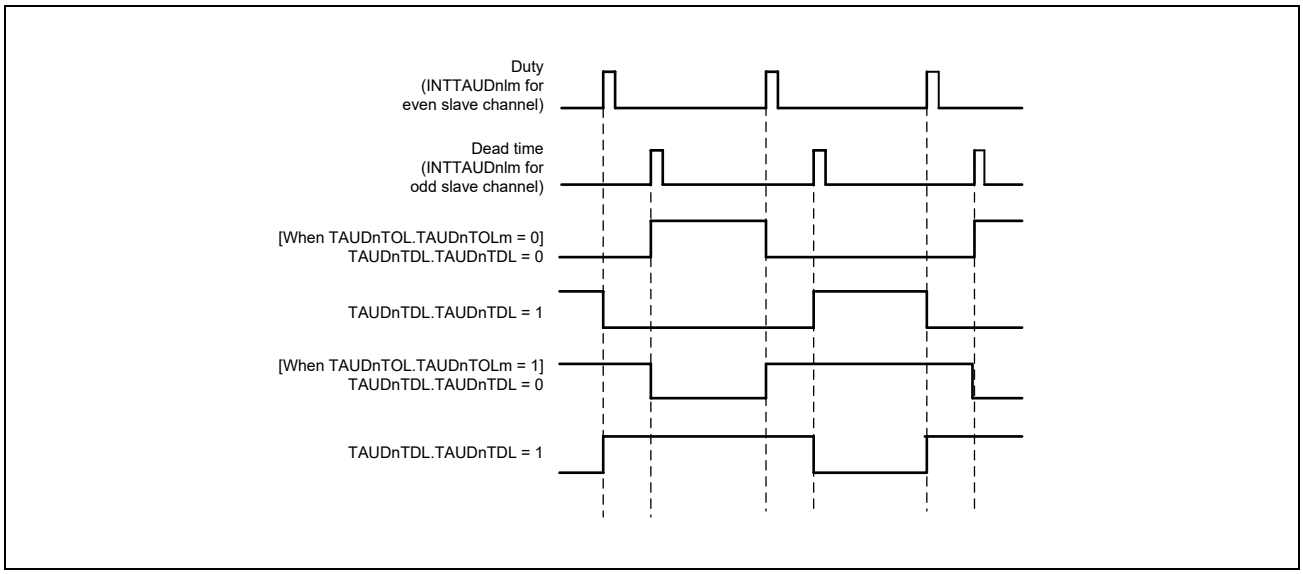

Figure 18.11 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm = 0 for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges.

Prerequisites

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel
  The master channel should be set to interval timer mode.
- One even slave channel
  The even slave channel should be set up/down count mode.
- One odd slave channel (even-numbered channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd-numbered channel and the even-numbered channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm
- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

(5) Synchronous Channel Output Mode 2 with One-Phase PWM Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in **Figure 18.12**.

Set/reset conditions

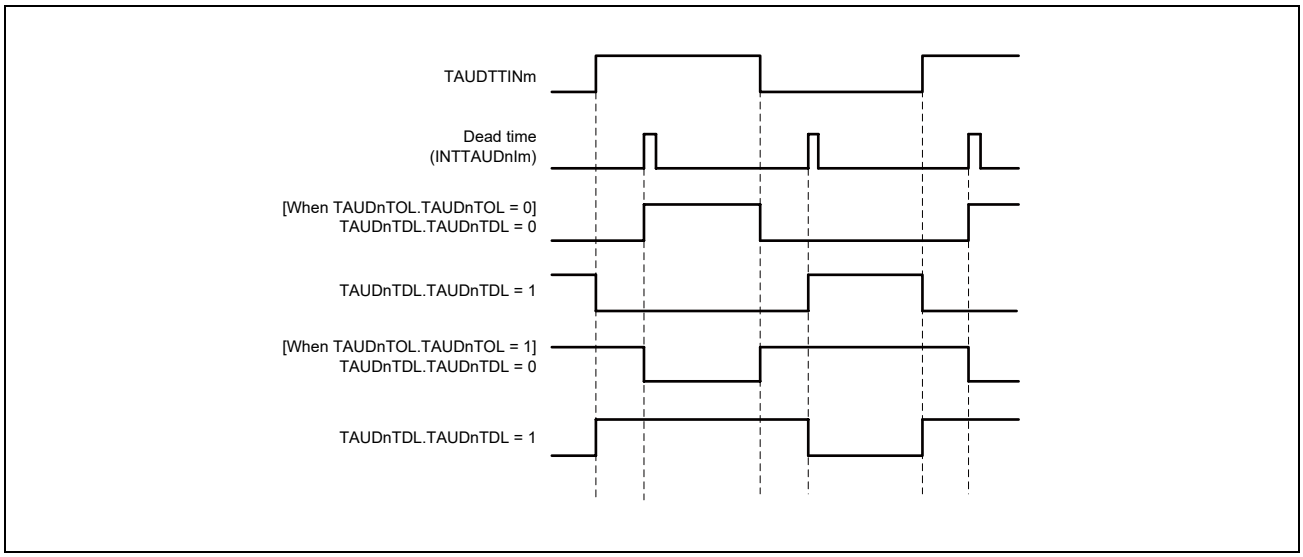

Figure 18.12 Set/Reset Conditions for Synchronous Channel Output Mode 2 with One-Phase PWM Output

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm = 0 for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges.

Prerequisites

One-phase PWM output control requires a set of two channels:

- One even slave channel.
- One odd slave channel (even-numbered channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd-numbered channel and the even-numbered channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm
- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

(6) Synchronous Channel Output Mode 2 with Complementary Modulation Output

Set/reset conditions

In this output mode, TAUDTTOUTm outputs a PWM signal, a high signal, or a low signal depending on the value of real-time output bit (TAUDnTRO.TAUDnTROm), the modulation output bit (TAUDnTME.TAUDnTMEm), and the output level bit (TAUDnTOL.TAUDnTOLm) of a pair of slave channels.

For details, see **Section 18.4.13.3, Complementary Modulation Output Function**.

Prerequisites

A set of at least four channels is required for this mode. The master channel and slave channel 1 generate a period, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time. Slave channels 2 and 3 are a pair. In typical applications, 4 more channels are also used, which operates in the same manner as slave channels 2 and 3 respectively.

TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed during operation, its new value is applied upon detection of INTTAUDnIm at the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on an even slave channel.

(7) Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

The difference from synchronous channel output mode 1 with non-complementary modulation output is the PWM wave shape.

Mode 1 has a rectangular wave while mode 2 has a triangular wave.

18.4.5 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUDnTS.TAUDnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

18.4.5.1 Interval Timer Mode, Judge Mode, Capture Mode, Up/Down Count Mode, and Count Capture Mode

The counter starts operating with the next count clock after TAUDnTS.TAUDnTSm is set to 1. The value of data register is also loaded when the counter starts.

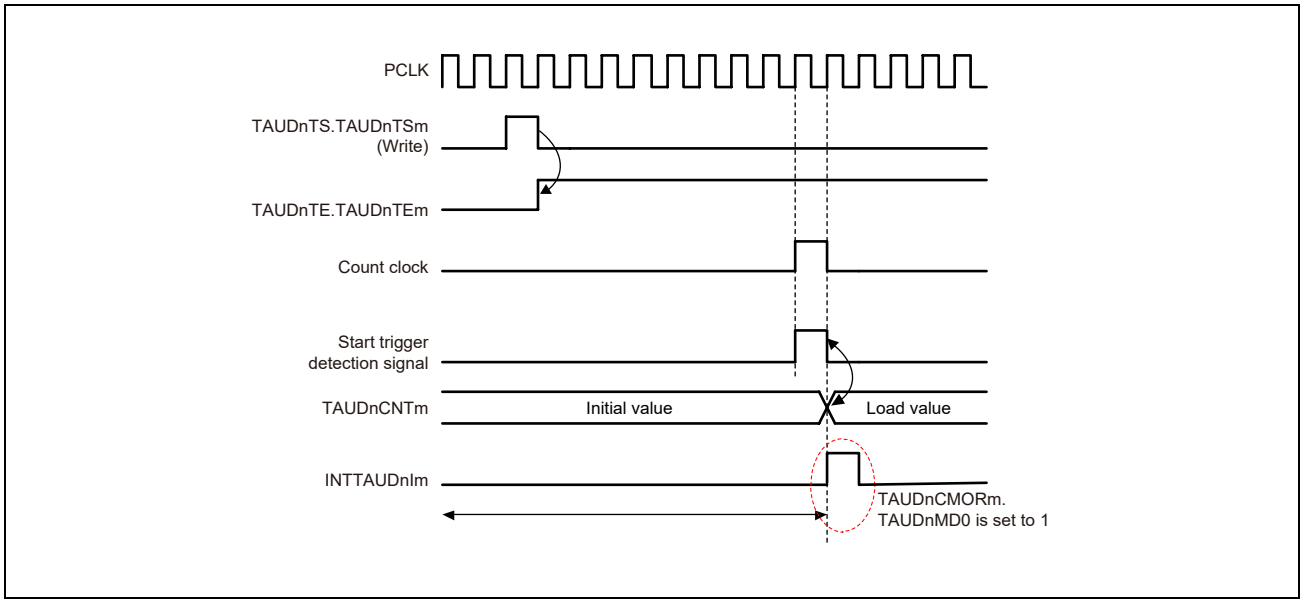

Figure 18.13 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Up/Down Count Mode, and Count Capture Mode

NOTE

Make sure to set TAUDnCMORm.TAUDnMD0 to 0 when using the up/down count mode.

18.4.5.2 Event Count Mode

The value of data register is loaded as soon as TAUDnTS.TAUDnTSm is set to 1. The counter also starts immediately. The value of data register decrements with subsequent count clocks.

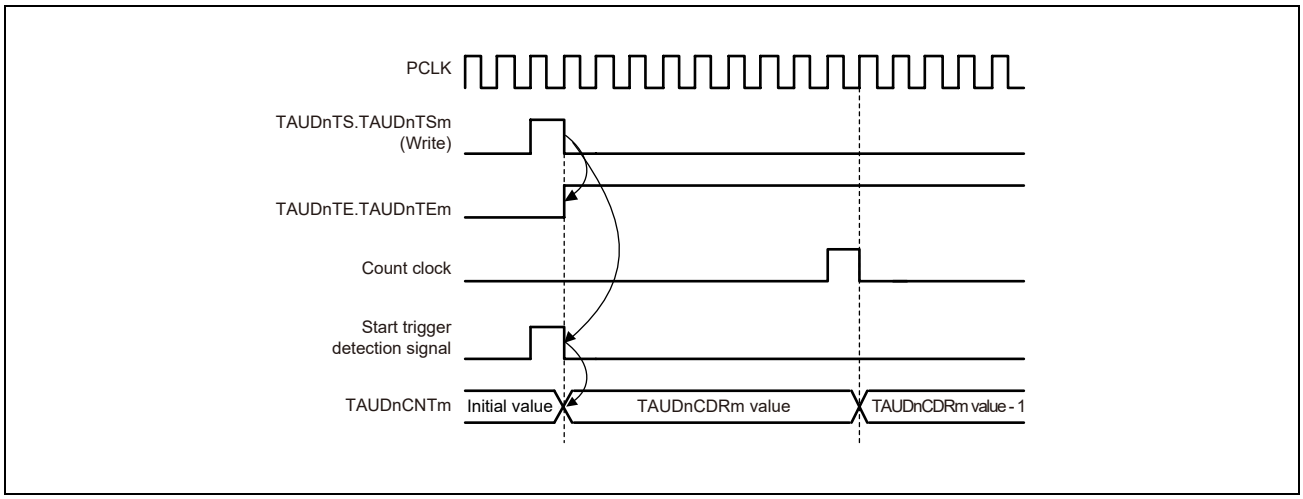

Figure 18.14 Start Timing in Event Count Mode

18.4.5.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of an effective edge of TAUDTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which is irrelevant to start of counter operation, determine the frequency with which all operations take place.

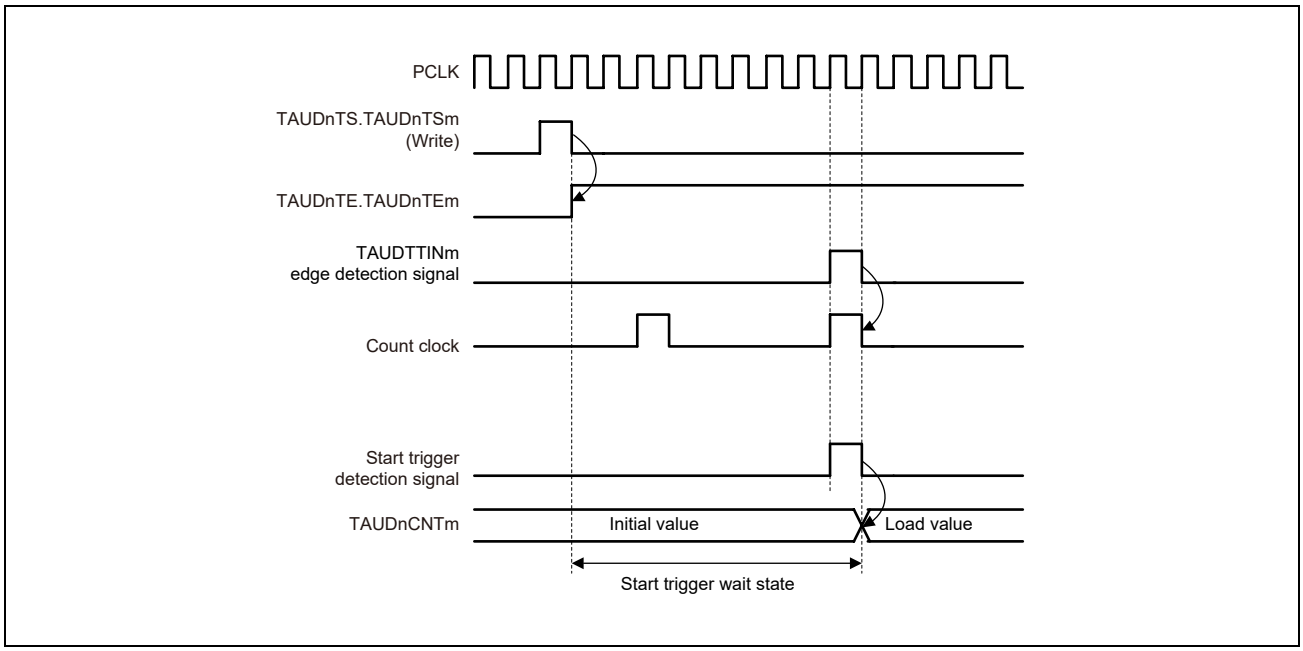

Figure 18.15 Start Timing in Other Operating Modes

18.4.6 TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUDnIm is generated using the TAUDnCMOR.TAUDnMD0 bit. The effect of the bit depends on the selected mode, as shown in **Table 18.44**. The effects of INTTAUDnIm on TAUDTTOUTm depend on the selected channel operation function.

Table 18.44 Effect of TAUDnCMORm.TAUDnMD0 Bit on Generation of INTTAUDnIm when Counter is Triggered

Mode	TAUDnCMORm.TAUDnMD0 Bit	INTTAUDnIm Generated when Counter Starts
Interval timer mode	0	No
Capture Mode Count Capture Mode	1	Yes
Capture & One Count Mode Capture & Gate Count Mode Event Count Mode Up Down Count Mode	0	No
One Count Mode	0/1	No, regardless of setting of TAUDnCMORm.TAUDnMD0 bit.
Pulse One Count Mode	0/1	Yes, regardless of setting of TAUDnCMORm.TAUDnMD0 bit.

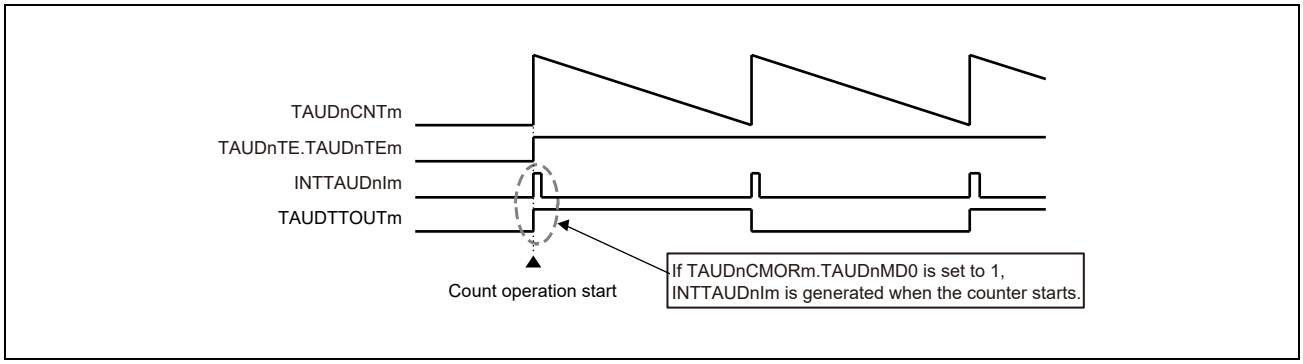

Figure 18.16 INTTAUDnIm Generated when Counter Starts

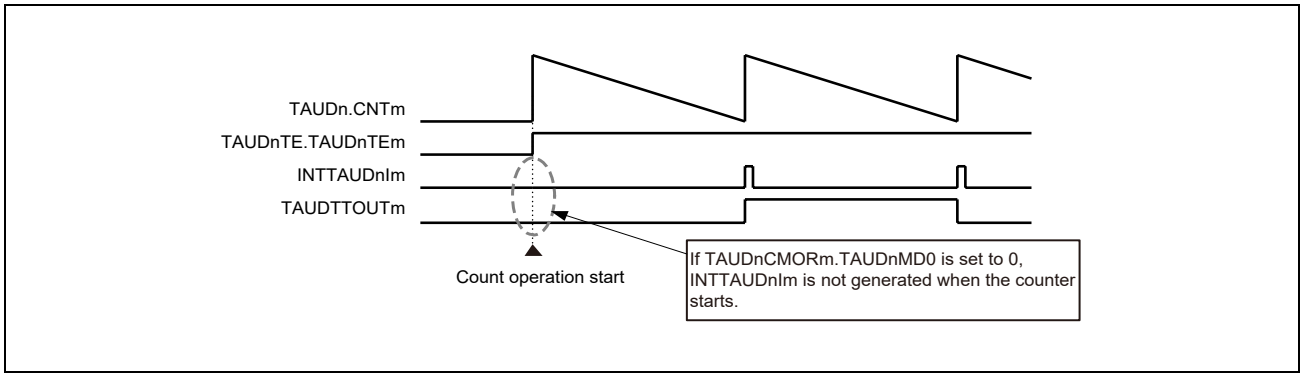

Figure 18.17 INTTAUDnIm not Generated when Counter Starts

18.4.7 Interrupt Generation upon Overflow

Certain independent functions that count up, overflow without generating an interrupt when they reach $FFFF_H$. This section describes how it is possible to generate an interrupt, by combining a channel operating in one of these modes with a channel in a different operation mode which counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches 0000_H at the same time as the first channel overflows (TAUDnCNTm = $FFFF_H$).
- Set TAUDnCDRm of the second channel to $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).

Result:

The down-counter of the second channel reaches 0000_H at exactly the same time as the up-counter of the first channel overflows (TAUDnCNTm = $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

18.4.7.1 Count Capture Mode

Timing diagram

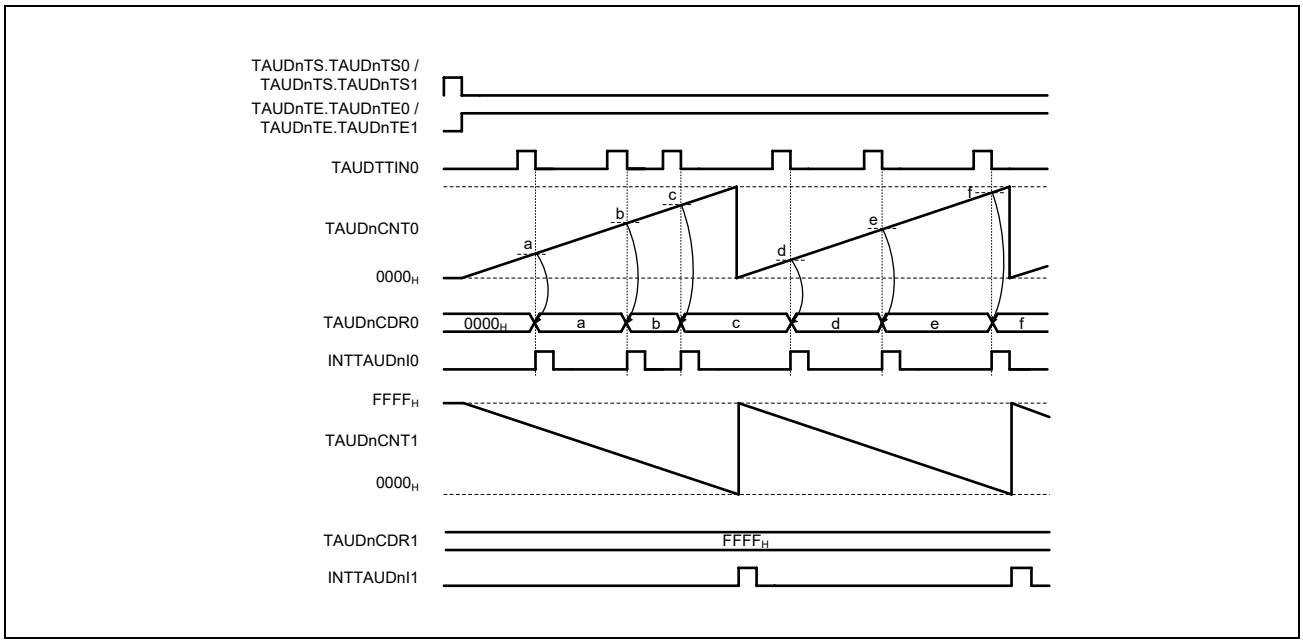

Figure 18.19 Interrupt Generation via Combination of Count Capture Mode and Interval Timer Mode

18.4.8 TAUDTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

Figure 18.20 shows when edge detection takes place.

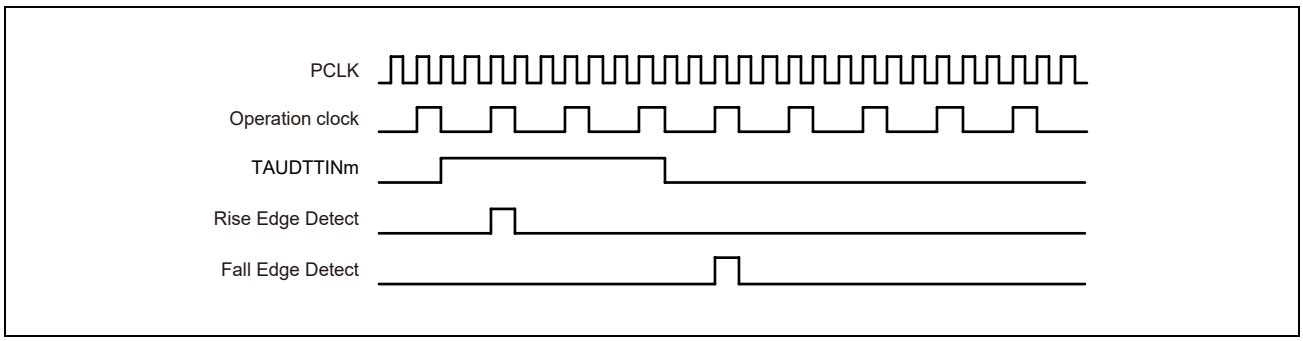

Figure 18.20 Basic Edge Detection Timing

Figure 18.20 shows an operation timing image. Actually, a noise filter or synchronization circuit which is located between the TAUDnlm pin and TAUDn causes a delay time.

18.4.9 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the Timer Array Unit D. For a general overview of independent channel operation, see **Section 18.2, Overview**.

This section describes functions that generate interrupts at regular intervals or with a specified delay.

- **Section 18.4.9.1, Interval Timer Function**
- **Section 18.4.9.2, TAUDTTINm Input Interval Timer Function**
- **Section 18.4.9.3, Clock Divide Function**

- **Section 18.4.9.12, TAUDTTINm Input Signal Width Judgment Function**

18.4.9.1 Interval Timer Function

(1) Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operation mode must be set to Interval Timer Mode, refer to **Table 18.45, Contents of TAUDnCMORm Register for Interval Timer Function**.
- The channel output mode must be set to Independent Channel Output Mode 1, refer to **Section 18.4.4, Channel Output Modes**.

Functional description

The counter is started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is written to TAUDnCNTm and the counter starts to count down from this value.

When the counter reaches 0000_H, INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and subsequently continues to operate.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm stop but retain their values. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in an inverted TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details refer to **Section 18.4.6, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

(2) Equations

INTTAUDnIm cycle = count clock cycle × (TAUDnCDRm + 1)

TAUDTTOUTm square wave cycle = count clock cycle × (TAUDnCDRm + 1) × 2

(3) Block Diagram and General Timing Diagram

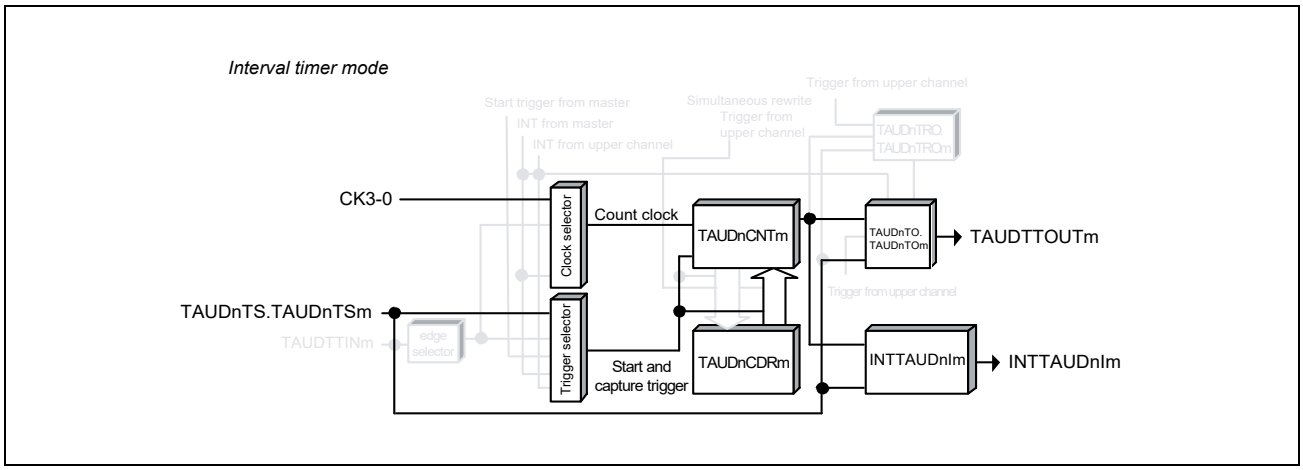

Figure 18.21 Block Diagram of Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 1)

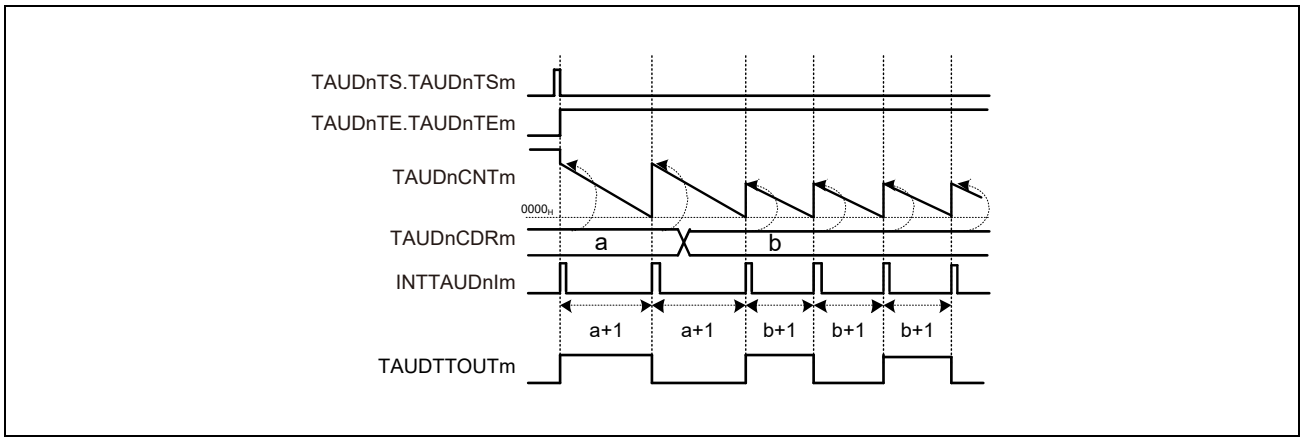

Figure 18.22 General Timing Diagram of Interval Timer Function

(4) Register Settings

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	Unused. Set to 00.

(c) Channel output mode

Table 18.47 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Section 18.4.4, Channel Output Modes**.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the interval timer function. Therefore, these registers should be set to 0.

Table 18.48 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Operating Procedure for Interval Timer Function

Table 18.49 Operating Procedure for Interval Timer Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.45, Contents of TAUDnCMORm Register for Interval Timer Function**, and **Table 18.46, Contents of TAUDnCMURm Register for Interval Timer Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 18.47, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. When TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated and TAUDTTOUTm toggles.
During Operation	The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000_H: • The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. • INTTAUDnIm is generated and TAUDTTOUTm toggles.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(6) Specific Timing Diagrams

(a) TAUDnCDRm = 0000_H, count clock = PCLK/2

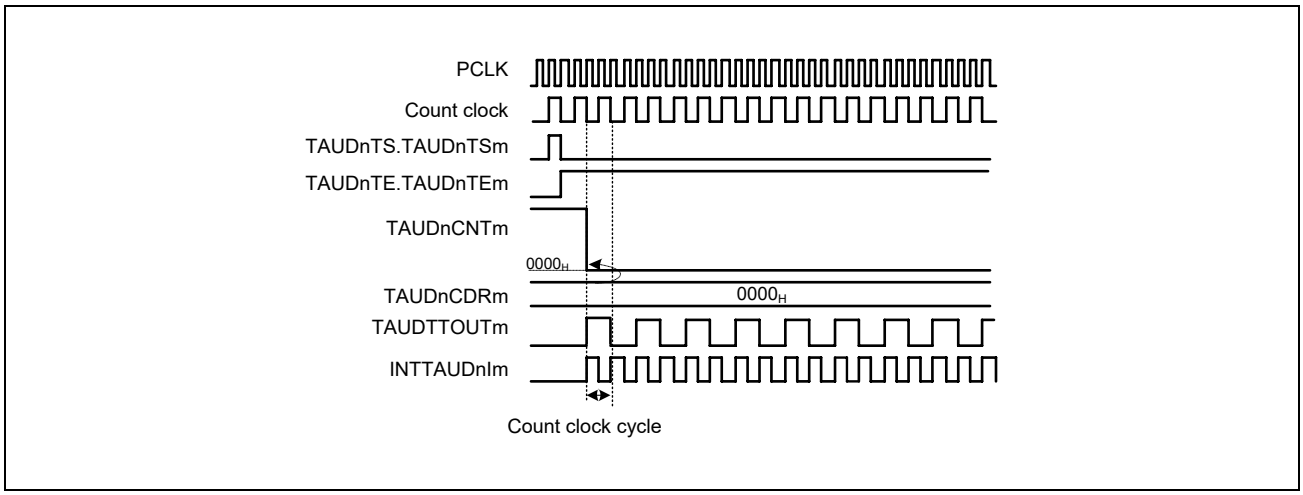

Figure 18.23 TAUDnCDRm = 0000_H, Count Clock = PCLK/2

- If TAUDnCDRm = 0000_H and the count clock = PCLK/2, the TAUDnCDRm value is loaded into TAUDnCNTm every count clock, meaning that TAUDnCNTm is always 0000_H.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

(b) TAUDnCDRm = 0000_H, count clock = PCLK

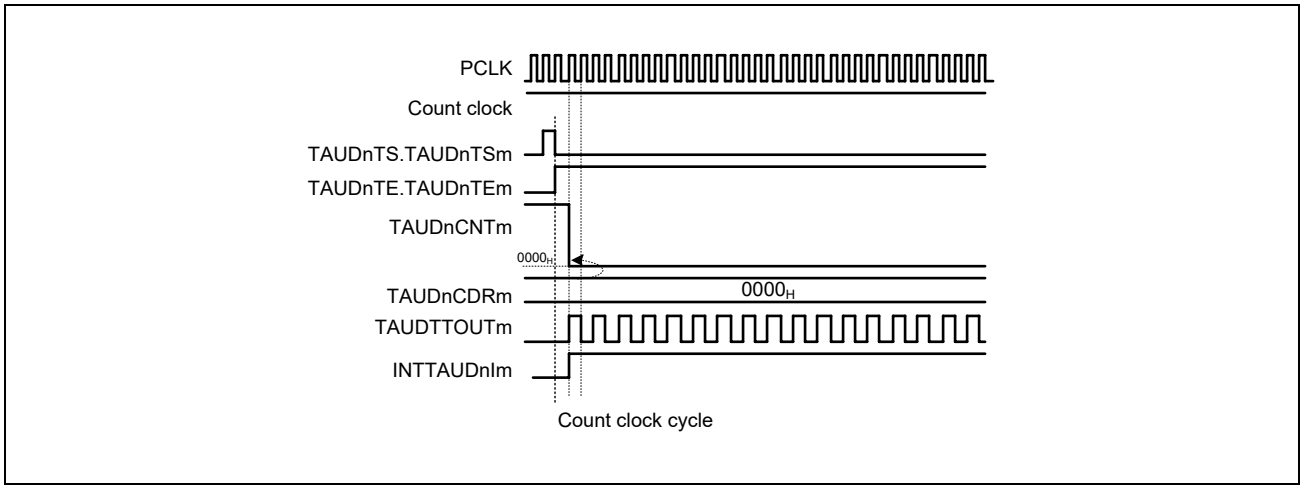

Figure 18.24 TAUDnCDRm = 0000_H, Count Clock = PCLK

- If TAUDnCDRm = 0000_H and the count clock = PCLK, the TAUDnCDRm value is loaded into TAUDnCNTm every PCLK clock, meaning that TAUDnCNTm is always 0000_H.
- INTTAUDnIm is generated continuously, resulting in TAUDTTOUTm toggling every PCLK clock.

(c) Operation stop and restart

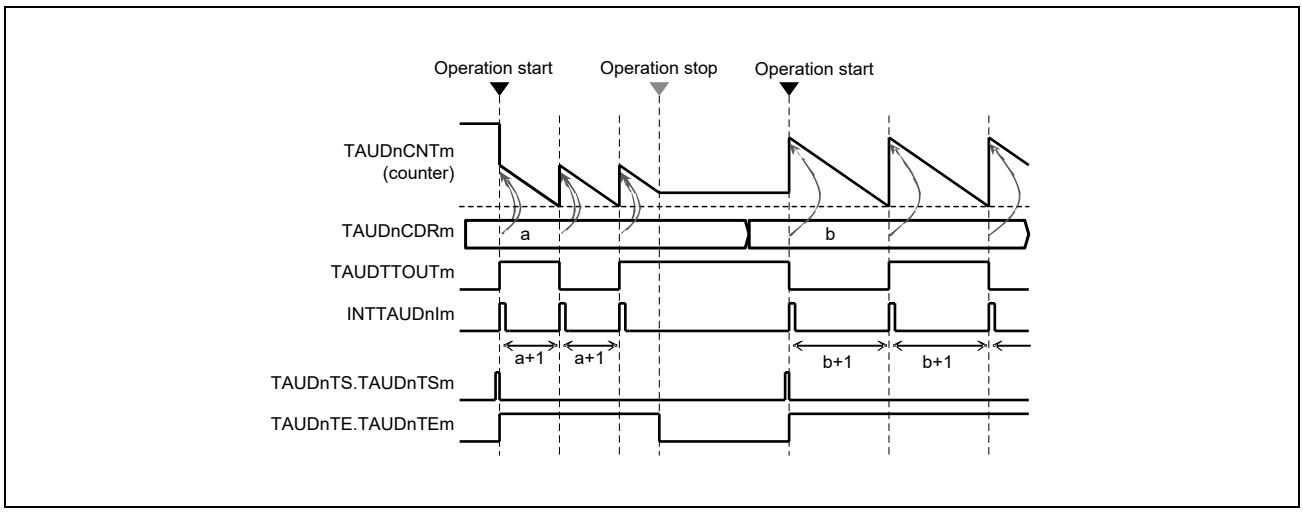

Figure 18.25 Operation Stop and Restart (TAUDnCMORm.TAUDnMD0 = 1)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm and TAUDTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

(d) Forced restart (TAUDnCMORm.TAUDnMD0 = 1)

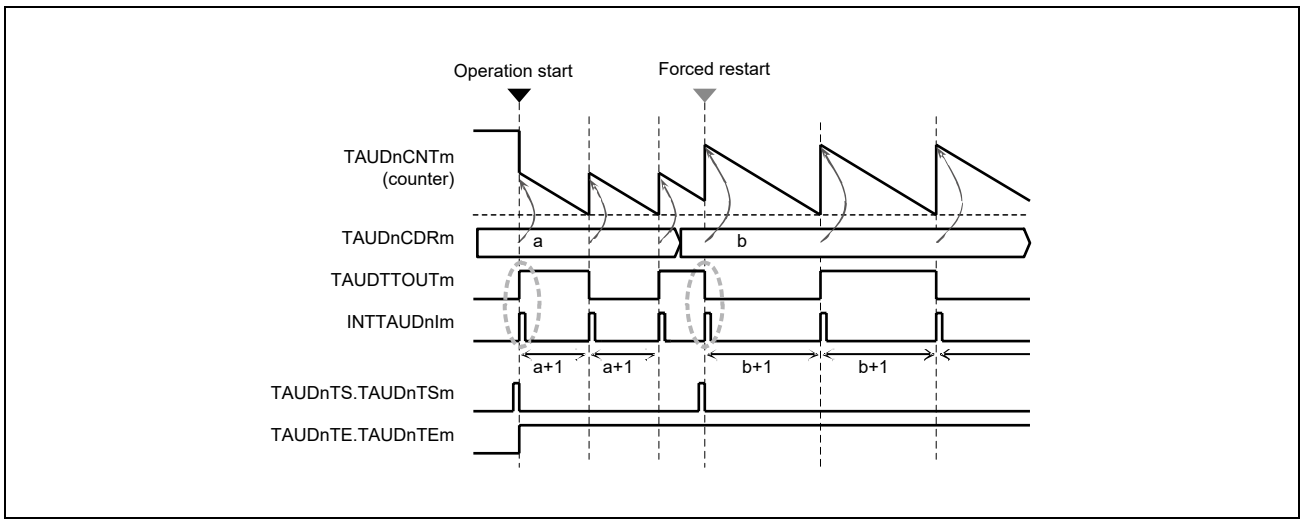

Figure 18.26 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 1)

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 1, the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUDnCDRm value is reflected to TAUDnCNTm and counting starts. Execute a forced restart to reflect the changed TAUDnCDRm value immediately.
- When a forced restart is made, an interrupt (INTTAUDnlm) is generated and TAUDTTOUTm is inverted.

(e) Forced restart (TAUDnCMORm.TAUDnMD0 = 0)

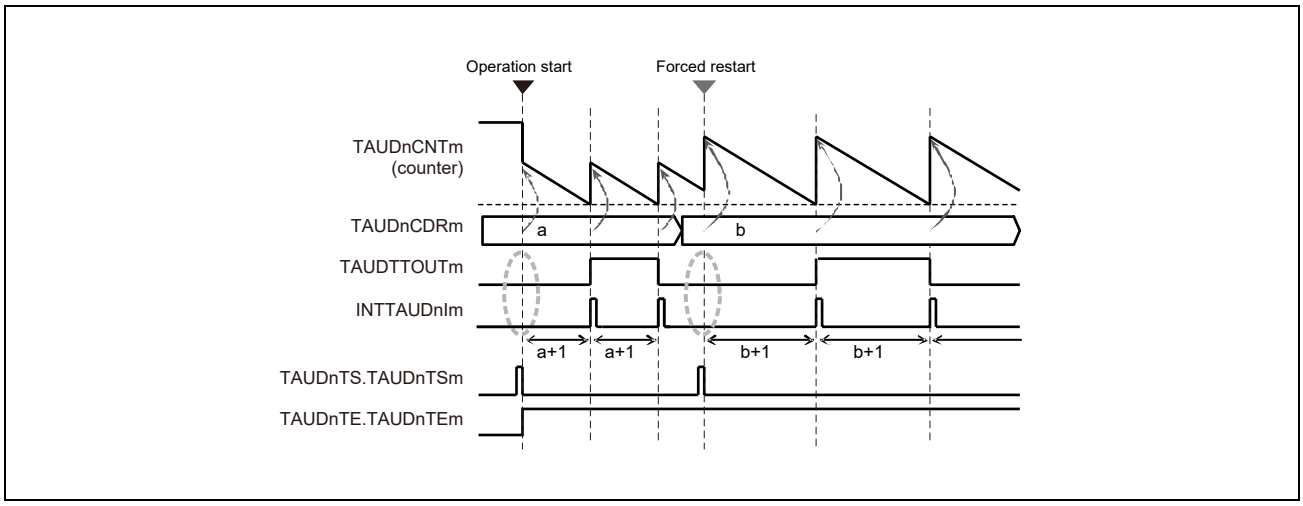

Figure 18.27 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 0)

- When a forced restart is made, an interrupt (INTTAUDnlm) is not generated and TAUDTTOUTm is not inverted.

18.4.9.2 TAUDTTINm Input Interval Timer Function

(1) Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals or when an effective TAUDTTINm input edge is detected. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operating mode should be set to interval timer mode. See **Table 18.50, Contents of TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function**.
- The channel output mode should be set to independent channel output mode 1. See **Section18.4.4, Channel Output Modes**.

Functional description

This function operates in an identical manner to the interval timer function (see **Section 18.4.9.1,** Interval Timer Function) except that this function is restarted by an effective TAUDTTINm input edge. The type of edge used as a trigger is specified using the TAUDnCMURm.TAUDnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edge can be selected.

(2) Equations

INTTAUDnIm cycle = count clock cycle × (TAUDnCDRm + 1)

TAUDTTOUTm square wave cycle = count clock cycle × (TAUDnCDRm + 1) × 2

(3) Block Diagram and General Timing Diagram

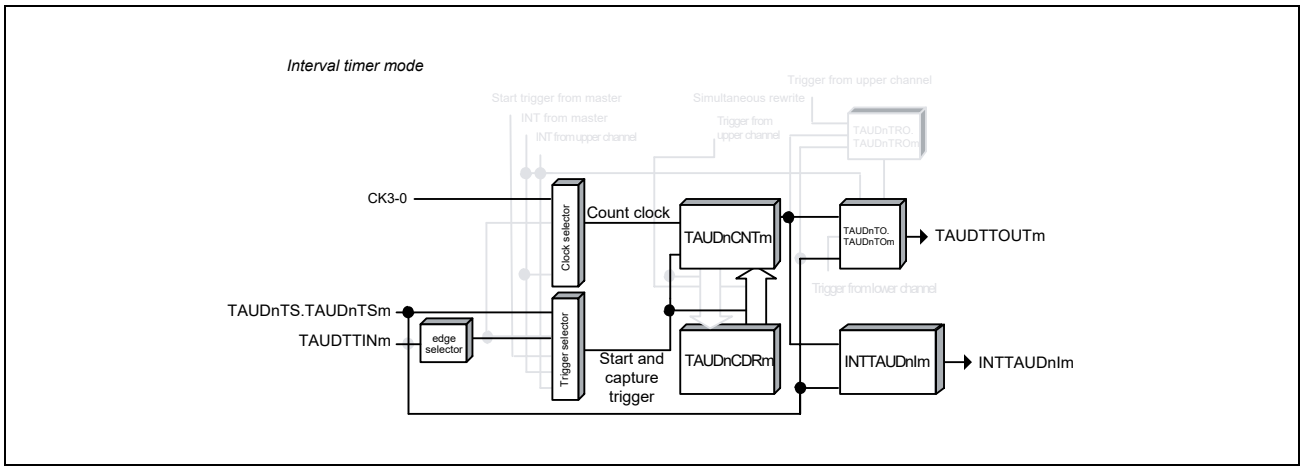

Figure 18.28 Block Diagram of TAUDTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 1)
- Rising edge detection (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

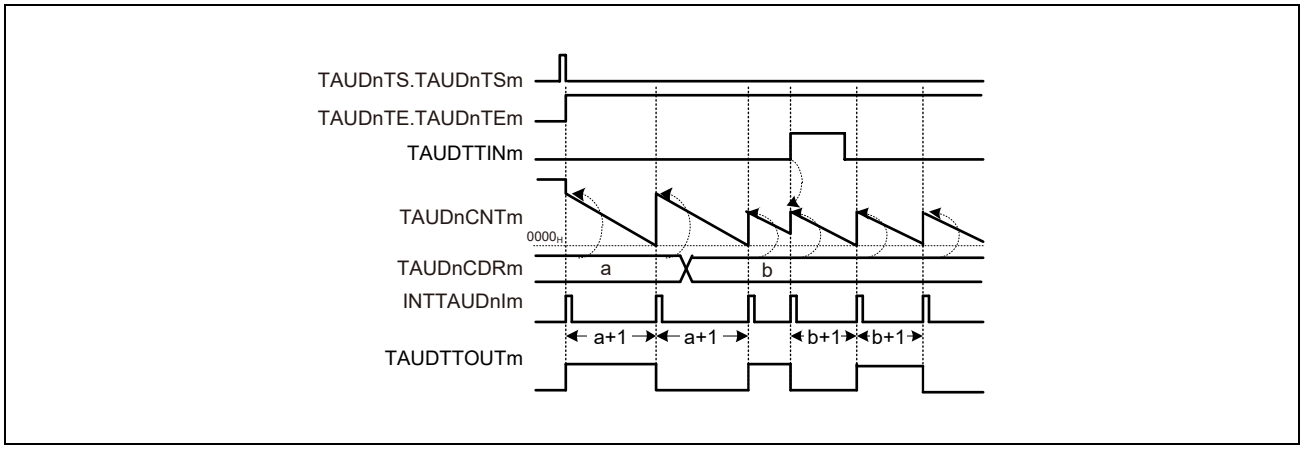

Figure 18.29 General Timing Diagram of TAUDTTINm Input Interval Timer Function

(c) Channel output mode

Table 18.52 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Setting prohibited

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts.

For details, see **Section 18.4.4, Channel Output Modes**.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm Input Interval Timer Function. Therefore, these registers should be set to 0.

Table 18.53 Simultaneous Rewrite Settings for TAUDTTINm Input Interval Timer Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Operating Procedure for TAUDTTINm Input Interval Timer Function

Table 18.54 Operating Procedure for TAUDTTINm Input Interval Timer Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.50 Contents of TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function**, and **Table 18.51 Contents of TAUDnCMURm Register for TAUDTTINm Input Interval Timer Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 18.52, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. When TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated and TAUDTTOUTm toggles.
During Operation	The values of the TAUDnCMURm.TAUDnTIS[1:0] and the TAUDnCDRm register are changeable at any time. The TAUDnCNTm register can be read at all times. Detection of TAUDTTINm edge	TAUDnCNTm counts down. When the counter reaches 0000_H: • The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. • INTTAUDnIm is generated and TAUDTTOUTm toggles. When an effective TAUDTTINm input edge is detected during count operation, the TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(6) Specific Timing Diagrams

The timing diagrams in **Section 18.4.9.1, Interval Timer Function** apply, and in addition the counter can also be restarted by an effective TAUDTTINm input edge.

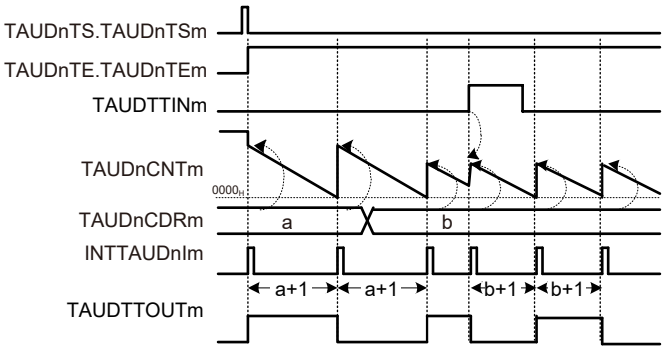

Figure 18.30 Counter Triggered by Rising TAUDTTINm Input Edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B), TAUDnCMORm.TAUDnMD0 = 1

- If an effective TAUDTTINm input edge is detected, an interrupt is generated which causes TAUDTTOUTm to toggle. In this example, the effective edge is a rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B).

18.4.9.3 Clock Divide Function

(1) Overview

Summary

This function is used as a frequency divider. The frequency of the input signal TAUDTTINm is divided by a factor related to TAUDnCDRm, and the resulting signal is output to TAUDTTOUTm.

Prerequisites

- TAUDTTINm should have a fixed frequency.
- The operating mode should be set to interval timer mode (see **Table 18.55, Contents of TAUDnCMORm Register for Clock Divide Function**).
- The channel output mode should be set to independent channel output mode 1 (see **Section 18.4.4, Channel Output Modes**).

Functional description

The counter is started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value, using TAUDTTINm as a count clock.

When the counter value reaches 0000_H, INTTAUDnIm occurs and TAUDTTOUTm signal is toggled. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The value of TAUDnCDRm can be rewritten at any time. The changed value of TAUDnCDRm is applied when the counter starts to count down next time.

The counter can be stopped by setting TAUDnTT.TAUDnTTm = 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm and TAUDTTOUTm stop but retain their values. The function can be restarted by setting TAUDnTS.TAUDnTSm = 1. The counter can also be forcibly restarted without making a stop by setting TAUDnTS.TAUDnTSm = 1 during operation (forced restart).

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in an inverted TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details, see **Section 18.4.6, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

NOTE

TAUDTTINm input signals are sampled at the frequency of the operation clock set by TAUDnCMORm.TAUDnCKS[1:0] bits. Therefore, the TAUDTTOUTm output clock cycle has an error of ± 1 operation clock cycle.

(2) Equations

- When rising edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/[(TAUDnCDRm + 1) × 2]
- When falling edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/[(TAUDnCDRm + 1) × 2]
- When falling and rising edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/(TAUDnCDRm + 1)

(3) Block Diagram and General Timing Diagram

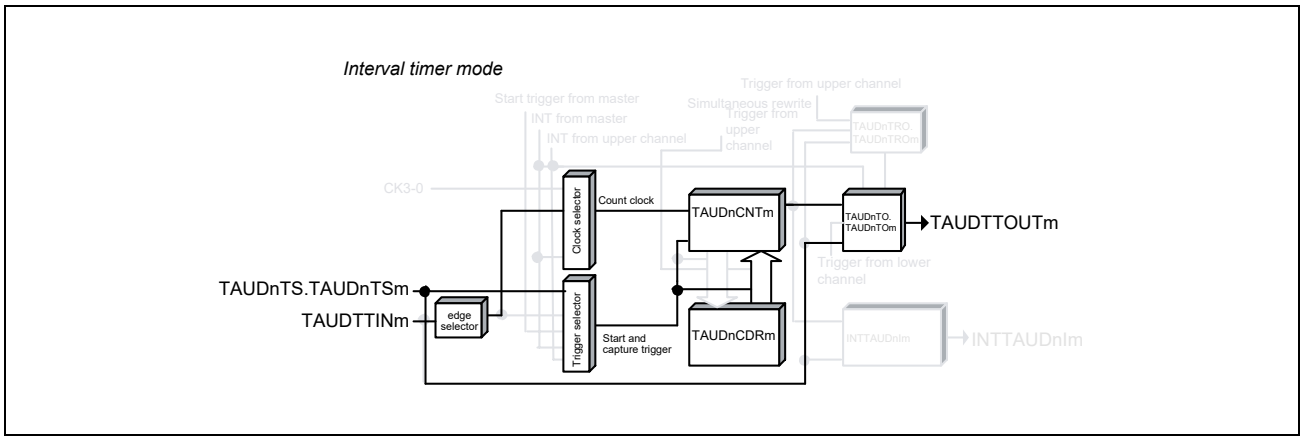

Figure 18.31 Block Diagram of Clock Divide Function

The following settings apply to the general timing diagram.

- INTTAUDnIm generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

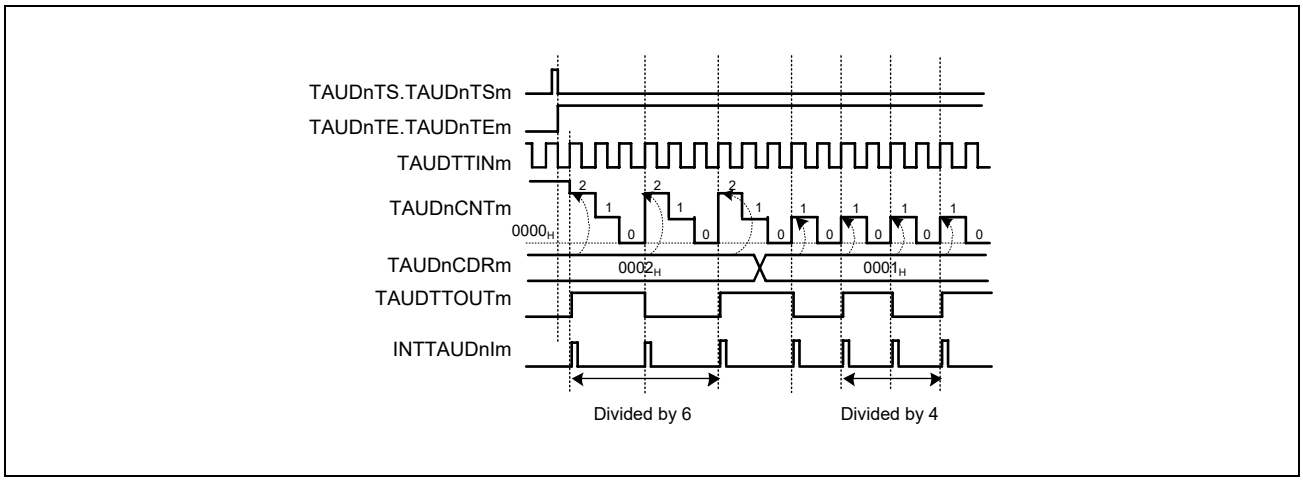

Figure 18.32 General Timing Diagram of Clock Divide Function

7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges

(c) Channel output mode

Table 18.57 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with this function. Therefore, these registers should be set to 0.

Table 18.58 Simultaneous Rewrite Settings for Clock Divide Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Operating Procedure for Clock Divide Function

Table 18.59 Operating Procedure for Clock Divide Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.55, Contents of TAUDnCMORm Register for Clock Divide Function**, and **Table 18.56, Contents of TAUDnCMURm Register for Clock Divide Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 18.57, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm loads TAUDnCDRm value. If TAUDnCMORm.TAUDnMD0 is set to 1, INTTAUDnIm occurs and TAUDTTOUTm is toggled.
During Operation	The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When the counter reaches 0000_H: • TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. • INTTAUDnIm is generated. • TAUDTTOUTm is toggled. Afterwards, this procedure is repeated.
Stop Operations	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm and TAUDTTOUTm retain their current values.

Restart

(6) Specific Timing Diagrams

(a) TAUDnCDRm = 0000_H

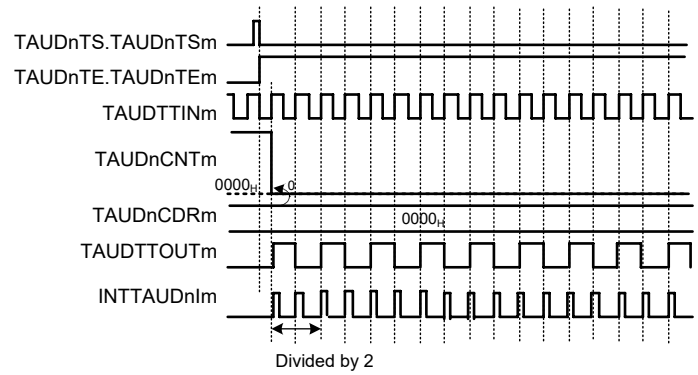

Figure 18.33 TAUDnCDRm = 0000_H, TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01_B

- If TAUDnCDRm is 0000_H, TAUDnCNTm is always 0000_H.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

Figure 18.33 shows an operation timing example. Actually, there is a delay from TINm detection until TOUTm output because of the delay time of a noise filter or synchronization circuit placed between the TAUDnlm pin and TAUDn.

(b) Restart

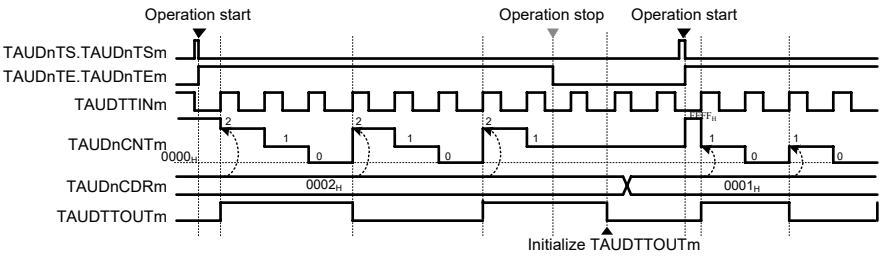

Figure 18.34 Restart (TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

To reset the value of TAUDTTOUTm:

- Set TAUDnTOE.TAUDnTOEm = 0 when the counter is stopped (TAUDnTE.TAUDnTEm = 0).
- Then, write either 0 or 1 to TAUDTO.TAUDnTOm to set the new start value of TAUDTTOUTm.

(c) Forced restart

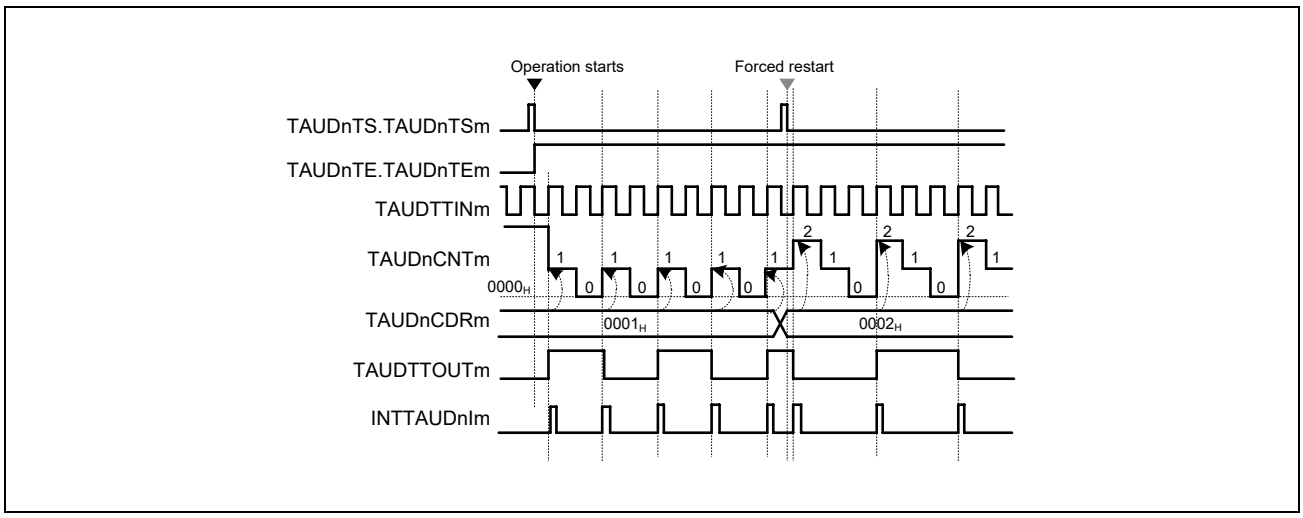

Figure 18.35 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm = 1 during operation.
- The value of TAUDnCDRm is written to TAUDnCNTm and the count operation restarts.
- TAUDTTOUTm restarts at the same level as before the forced restart.

18.4.9.4 External Event Count Function

(1) Overview

Summary

This function is used as an event timer, which generates an interrupt (INTTAUDnIm) when a specific number of TAUDTTINm input pulses has occurred.

Prerequisites

- The operating mode should be set to the event count mode (see **Table 18.60, Contents of TAUDnCMORm Register for External Event Count Function**).
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When the counter starts, the current value of TAUDnCDRm is loaded into TAUDnCNTm.

When an effective TAUDTTINm input edge is detected, the value of TAUDnCNTm decrements by 1. TAUDnCNTm retains this value until an effective TAUDTTINm input edge is detected or the counter is restarted.

When the effective edge is detected for the (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. The counter can also be restarted without stopping it first (forced restart) by setting TAUDnTS.TAUDnTSm to 1 during operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

An edge type used as a trigger is specified by TAUDnCMURm.TAUDnTIS[1:0] bits.

- When TAUDnCMURm.TAUDnTIS[1:0] = 00_B, falling edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = 01_B, rising edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = 10_B, both edges are counted.

(2) Equations

Number of effective edges detected before INTTAUDnIm generation = TAUDnCDRm + 1

(3) Block Diagram and General Timing Diagram

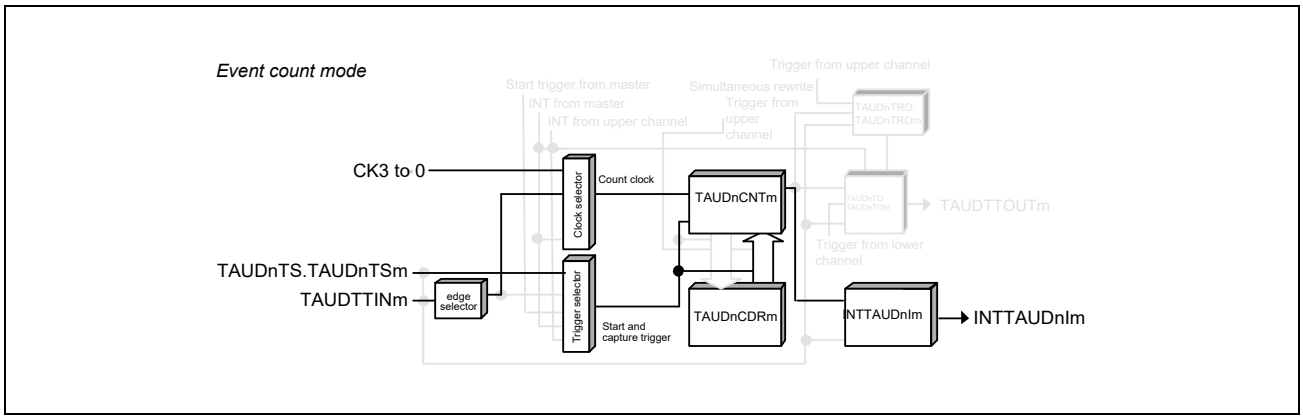

Figure 18.36 Block Diagram of External Event Count Function

The following settings apply to the general timing diagram.

- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

(c) Channel output mode

The channel output mode is not used by this function.

(d) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with this function. Therefore, these registers should be set to 0.

Table 18.62 Simultaneous Rewrite Settings for External Event Count Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Operating Procedure for External Event Count Function

Table 18.63 Operating Procedure for External Event Count Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.60, Contents of TAUDnCMORm Register for External Event Count Function**, and **Table 18.61, Contents of TAUDnCMURm Register for External Event Count Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm loads TAUDnCDRm value and waits for TAUDTTINm input edge detection.
During Operation	Detection of TAUDTTINm edge The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When the counter reaches 0000_H. When effective edges are detected (TAUDnCDRm + 1) times: • TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. • INTTAUDnIm is generated. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart

(6) Specific Timing Diagrams

(a) TAUDnCDRm = 0000_H

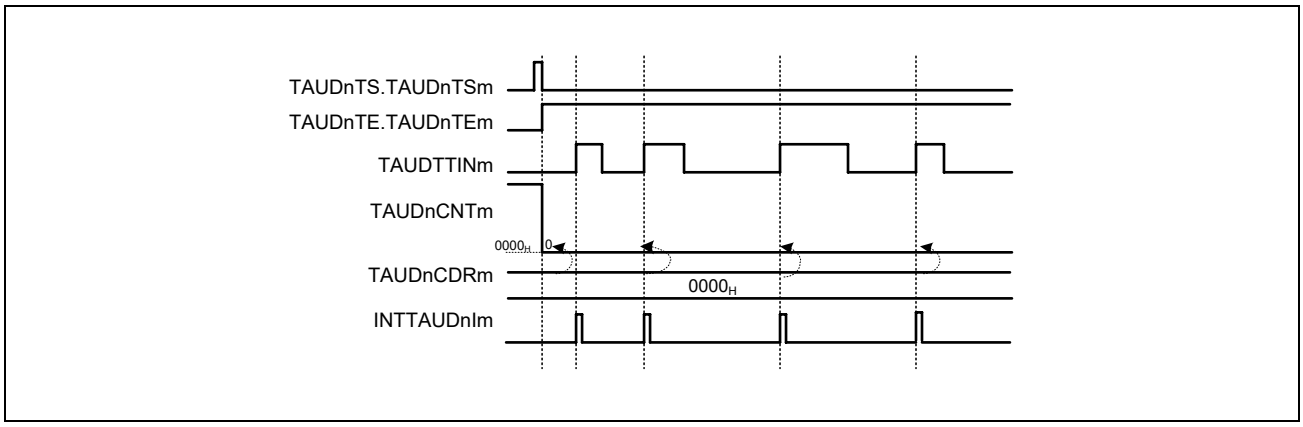

Figure 18.38 TAUDnCDRm = 0000_H, TAUDnCMURm.TAUDnTIS[1:0] = 01_B

- If TAUDnCDRm = 0000_H, 0000_H is loaded into TAUDnCNTm each time an effective TAUDTTINm input edge is detected.
  In other words, INTTAUDnlm occurs each time an effective TAUDTTINm input edge is detected.

(b) Operation stop and restart

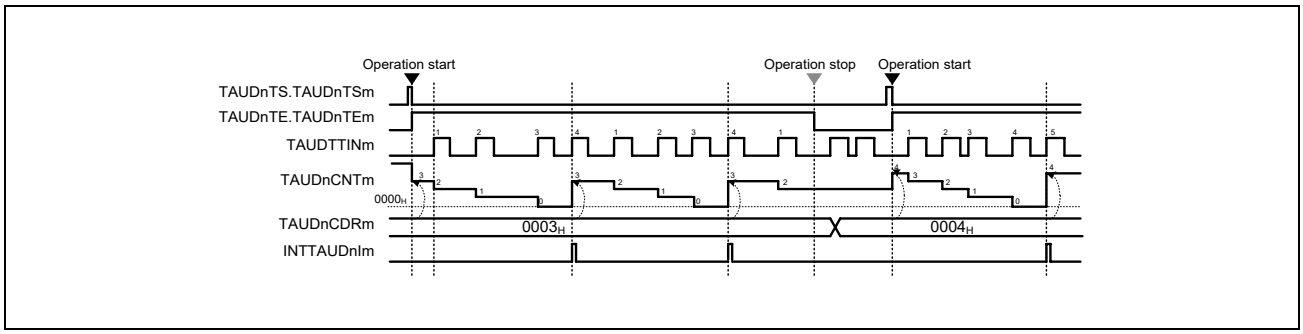

Figure 18.39 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value. TAUDTTINm continues and TAUDnCNTm ignores the effective edge.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm loads the TAUDnCDRm value and restarts count operation.

(c) Forced restart

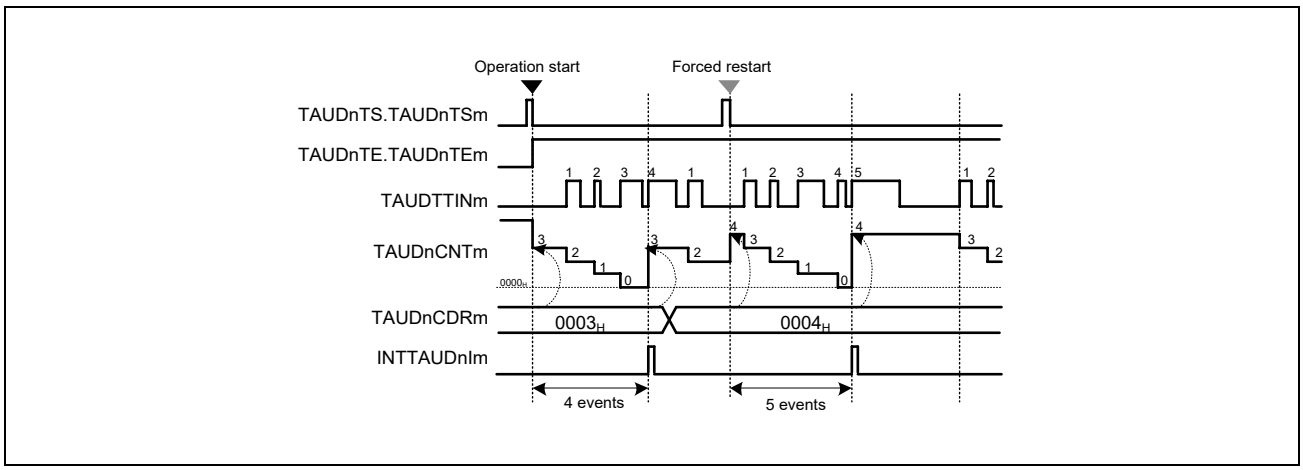

Figure 18.40 Forced Restart Operation (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

Once a forced restart is made, the changed value of TAUDnCDRm is applied to TAUDnCNTm.

- The counter can be restarted without making a stop by setting TAUDnTS.TAUDnTSm to 1 during operation.
- The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter awaits the next effective TAUDTTINm input edge.

18.4.9.5 Delay Count Function

(1) Overview

Summary

This function generates interrupts (INTTAUDnIm), which have a defined delay to the TAUDTTINm input signal. TAUDTTINm input signal pulses that occur within the delay period are ignored.

Prerequisites

- The operating mode should be set to one-count mode. See **Table 18.64, Contents of TAUDnCMORm Register for Delay Count Function**.
- TAUDTTOUTm is not used with this function.
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when an effective TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches 0000_H, an interrupt is generated. The counter returns to $FFFF_H$ and awaits the next effective TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits:

- If TAUDnCMURm.TAUDnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

(2) Equations

Delay between TAUDTTINm and INTTAUDnIm = count clock cycle × (TAUDnCDRm + 1)

(3) Block Diagram and General Timing Diagram

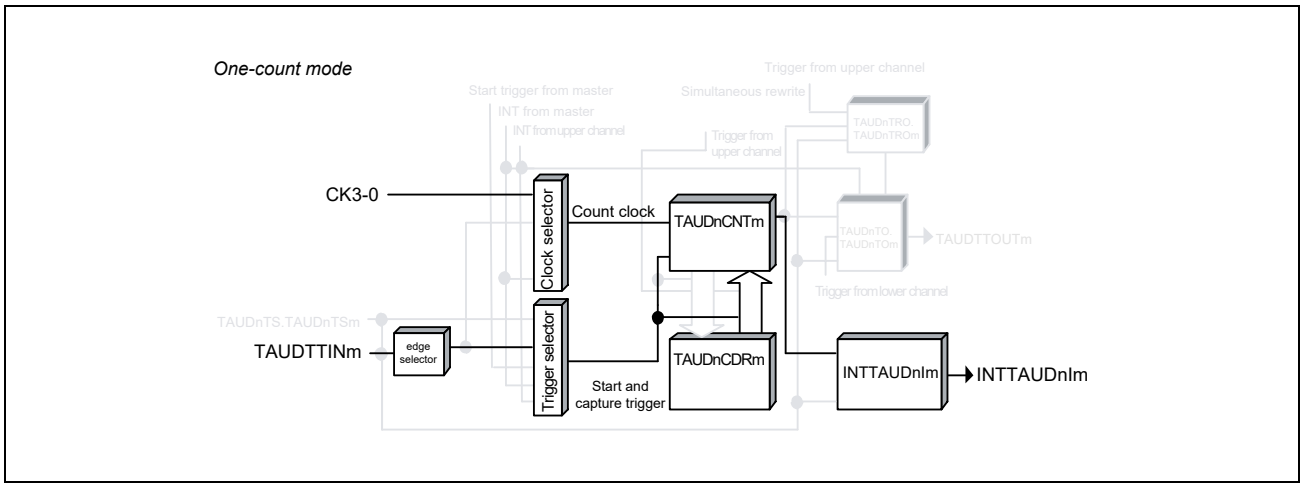

Figure 18.41 Block Diagram of Delay Count Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

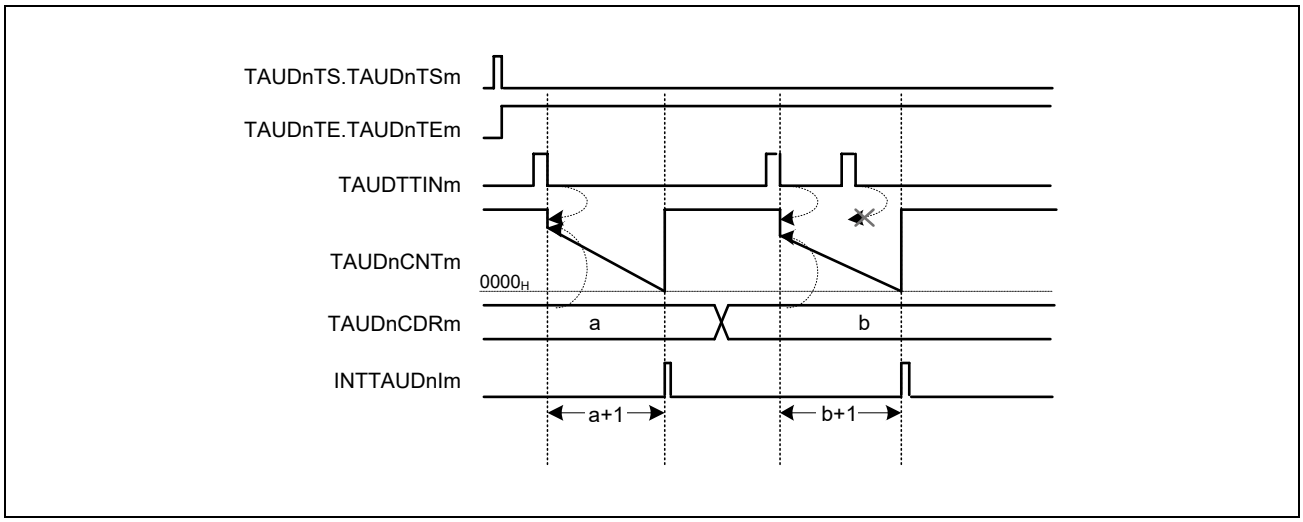

Figure 18.42 General Timing Diagram of Delay Count Function

(c) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(d) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with this function. Therefore, these registers should be set to 0.

Table 18.66 Simultaneous Rewrite Settings for Delay Count Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Operating Procedure for Delay Count Function

Table 18.67 Operating Procedure for Delay Count Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.64, Contents of TAUDnCMORm Register for Delay Count Function**, and **Table 18.65, Contents of TAUDnCMURm Register for Delay Count Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a start edge is detected, the TAUDnCDRm value is loaded in TAUDnCNTm.
During Operation	The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000_H. INTTAUDnIm is generated. TAUDnCNTm stops counting, returns $FFFF_H$, and waits for a trigger. If a trigger occurs while TAUDnCNTm is counting, the trigger is ignored. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its value.

Restart

18.4.9.6 One-Pulse Output Function

(1) Overview

Summary

This function generates an interrupt (INTTAUDnIm) when an effective TAUDTTINm input edge is detected and at a defined interval afterward. TAUDTTINm input signal pulses that occur within the defined interval are ignored. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operating mode should be set to pulse one-count mode (see **Table 18.68, Contents of TAUDnCMORm Register for One-Pulse Output Function**).
- The channel output mode should be set to independent channel output mode 1 (see **Section 18.4.4, Channel Output Modes**).
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when an effective TAUDTTINm input edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. An interrupt is generated and TAUDTTOUTm toggles.

When the counter reaches 0001_H, an interrupt is generated and TAUDTTOUTm is set to the inactive level. The counter stops at 0000_H and awaits the next effective TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits:

- If TAUDnCMURm.TAUDnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

(2) Equations

Interval between TAUDTTINm and INTTAUDnIm
= TAUDTTOUTm (timer output) width = count clock cycle × TAUDnCDRm

(3) Block Diagram and General Timing Diagram

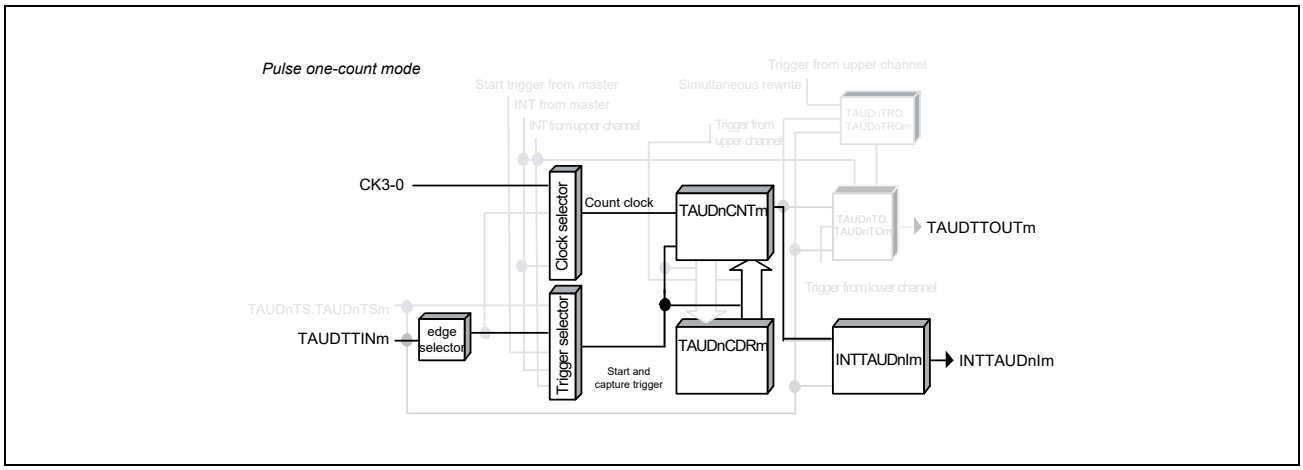

Figure 18.43 Block Diagram of One-Pulse Output Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

(c) Channel output mode

Table 18.70 Control Bit Settings in Independent Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode controlled by software.
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Table 18.43, Channel Output Modes**.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the One-Pulse Output Function. Therefore, these registers should be set to 0.

Table 18.71 Simultaneous Rewrite Settings for One-Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Operating Procedure for One-Pulse Output Function

Table 18.72 Operating Procedure for One-Pulse Output Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.68, Contents of TAUDnCMORm Register for One-Pulse Output Function**, and **Table 18.69, Contents of TAUDnCMURm Register for One-Pulse Output Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 18.70, Control Bit Settings in Independent Channel Output Mode 2**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a start edge is detected, TAUDnCNTm loads the TAUDnCDRm value.
During Operation	The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at all times.	INTTAUDnIm is generated when TAUDnCNTm starts and TAUDTTOUTm is set to its active level. TAUDnCNTm counts down. When the counter reaches 0001_H: • INTTAUDnIm is generated. • TAUDTTOUTm is set to its inactive level. TAUDnCNTm stops counting and waits for a trigger. If a trigger occurs while TAUDnCNTm is counting, the trigger is ignored.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

18.4.9.7 TAUDTTINm Input Pulse Interval Measurement Function

(1) Overview

Summary

This function captures the count value and uses this value and the overflow bit TAUDnCSRm.TAUDnOVF to measure the interval of the TAUDTTINm input signal.

Prerequisites

- The operating mode should be set to capture mode. See **Table 18.74, Contents of TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function**.
- TAUDTTOUTm is not used with this function.

Functional description

The counter is started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter TAUDnCNTm starts to count up from 0000_H. When an effective TAUDTTINm edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter resets to 0000_H and subsequently continues to operate.

If the counter reaches $FFFF_H$ before an effective TAUDTTINm edge is detected, it overflow. The counter is reset to 0000_H and subsequently continues to operate. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

Table 18.73 Effects of Overflow

TAUDnCMORm. TAUDnCOS[1:0]	When Overflow Occurs		When an Effective TAUDTTINm Input is Detected	
	TAUDnCDRm	TAUDnCSRm. TAUDnOVF	TAUDnCDRm, TAUDnCNTm	TAUDnCSRm. TAUDnOVF
00	Unchanged	0	TAUDnCNTm loaded into TAUDnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUDnCNTm set to 0, TAUDnCDRm unchanged	Unchanged
11		1		

When TAUDnCMORm.TAUDnCOS[0] = 1, the overflow bit (TAUDnCSRm.TAUDnOVF) can be cleared only by setting TAUDnCSCm.TAUDnCLOV = 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the interval of the TAUDTTINm signal. However, if an overflow occurs multiple times before an effective TAUDTTINm input is detected, the overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

The function can be stopped by setting TAUDnTT.TAUDnTTm = 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm stops but retains its value. While the function is stopped, effective TAUDTTINm input edge detection and TAUDnCNTm capture are not performed.

The counter is reset to 0000_H and subsequently continues to operate.

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 18.4.6, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

NOTE

When TAUDnCMORm.TAUDnCOS[1:0] = 10_B or 11_B, the value of TAUDnCNTm is not loaded into TAUDnCDRm when the first effective TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

(2) Equations

TAUDTTINm input pulse interval
= count clock cycle × [(TAUDnCSRm.TAUDnOVF × ($FFFF_H$ + 1)) + TAUDnCDRm capture value + 1]

(3) Block Diagram and General Timing Diagram

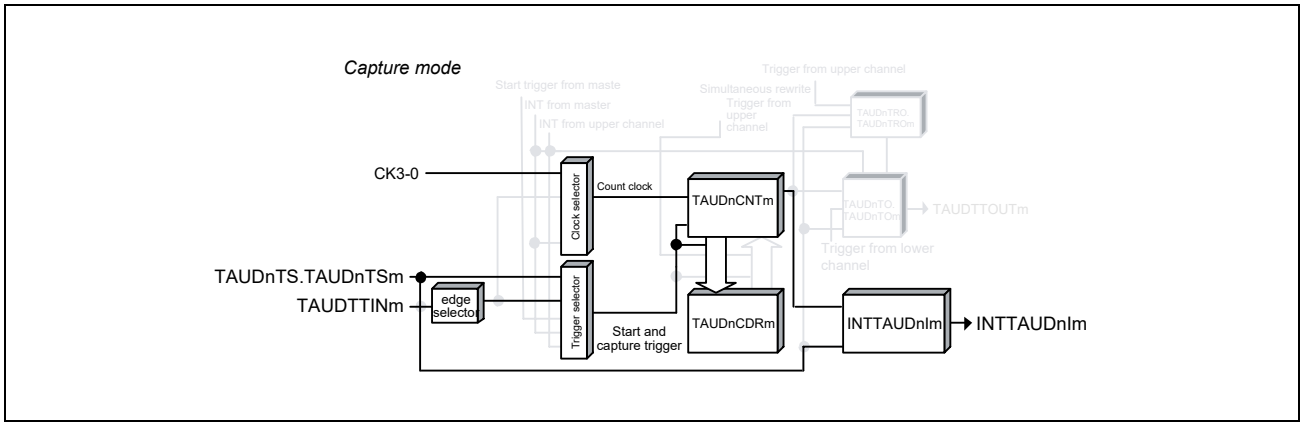

Figure 18.45 Block Diagram of TAUDTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUDnIm not generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 0)
- Falling edge detection (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)
- When an effective TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1 (TAUDnCMORm.TAUDnCOS[1:0] = 00_B)

7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges

(c) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input pulse interval measurement function. Therefore, these registers should be set to 0.

Table 18.76 Simultaneous Rewrite Settings for TAUDTTINm Input Pulse Interval Measurement Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

Table 18.77 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.74 Contents of TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function**, and **Table 18.75 Contents of TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Measurement Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000_H. INTTAUDnIm is generated when TAUDnCMORm.TAUDnMD0 is set to 1.
During Operation	Detection of TAUDTTINm edge The TAUDnCMURm.TAUDnTIS[1:0] bits can be changed at any time. The TAUDnCDRm and TAUDnCSRm registers can be read at any time. TAUDnCSCm.TAUDnCLOV can be written to 1. (TAUDnCSRm.TAUDnOVF bit is cleared to 0.)	TAUDnCNTm starts to count up from 0000_H. When an effective TAUDTTINm edge is detected: • TAUDnCNTm transfers (captures) its value to TAUDnCDRm, and returns to 0000_H. • INTTAUDnIm is then generated. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values.

Restart

(6) Specific Timing Diagrams: Overflow Operation

(a) TAUDnCMORm.TAUDnCOS[1:0] = 00_B

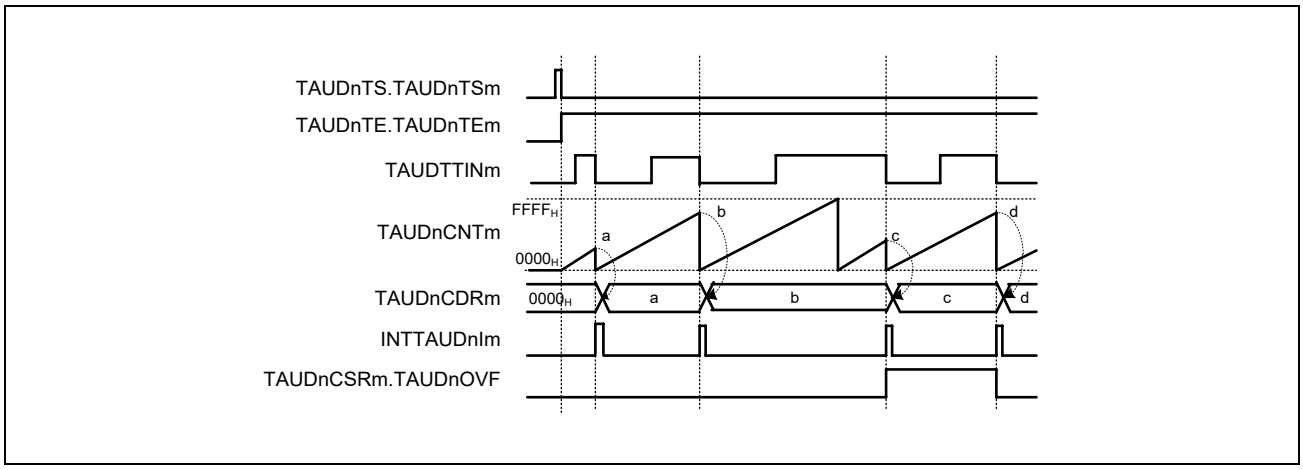

Figure 18.47 TAUDnCMORm.TAUDnCOS[1:0] = 00_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains = 0.
- Upon detection of the next effective TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to1.
- Upon detection of the next effective TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0.

(b) TAUDnCMORm.TAUDnCOS[1:0] = 01_B

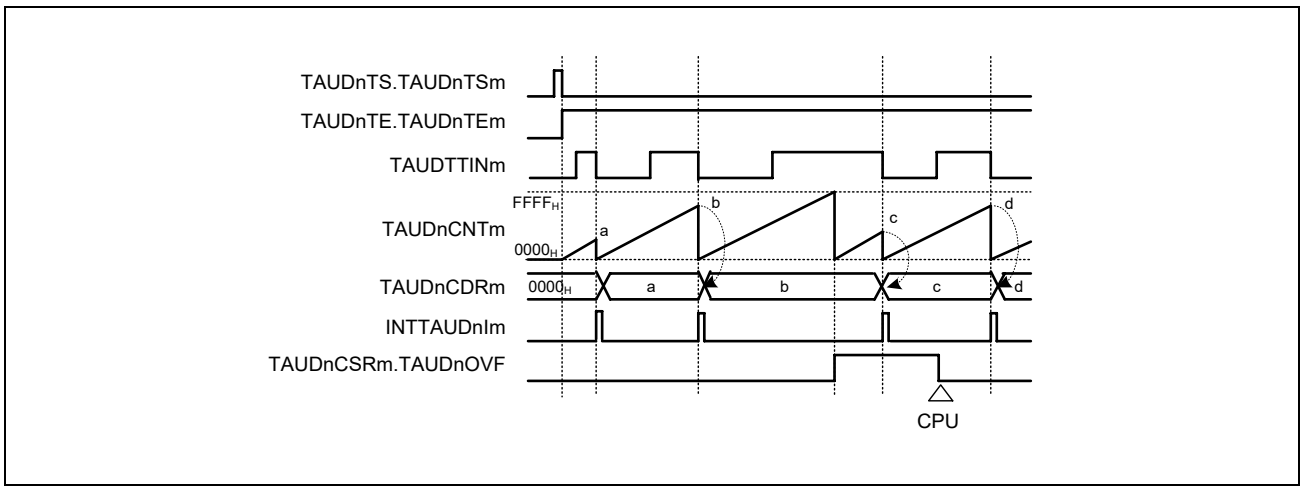

Figure 18.48 TAUDnCMORm.TAUDnCOS[1:0] = 01_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to1.
- Upon detection of the next effective TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).

(c) TAUDnCMORm.TAUDnCOS[1:0] = 10_B

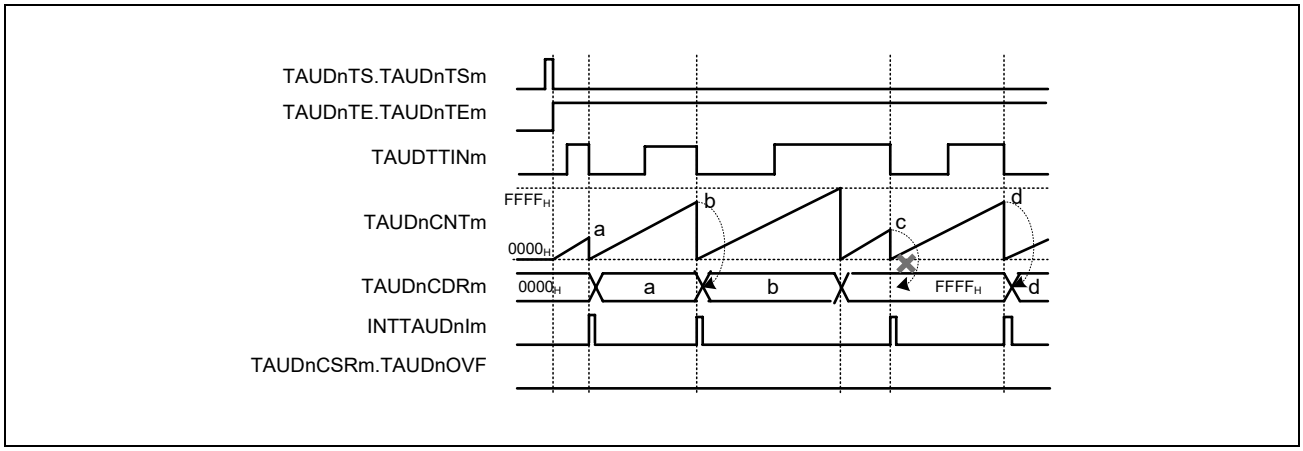

Figure 18.49 TAUDnCMORm.TAUDnCOS[1:0] = 10_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF remains = 0.
- Upon detection of the next effective TAUDTTINm input edge, TAUDnCNTm is reset to 0, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next effective TAUDTTINm input edge after the overflow is ignored.

(d) TAUDnCMORm.TAUDnCOS[1:0] = 11_B

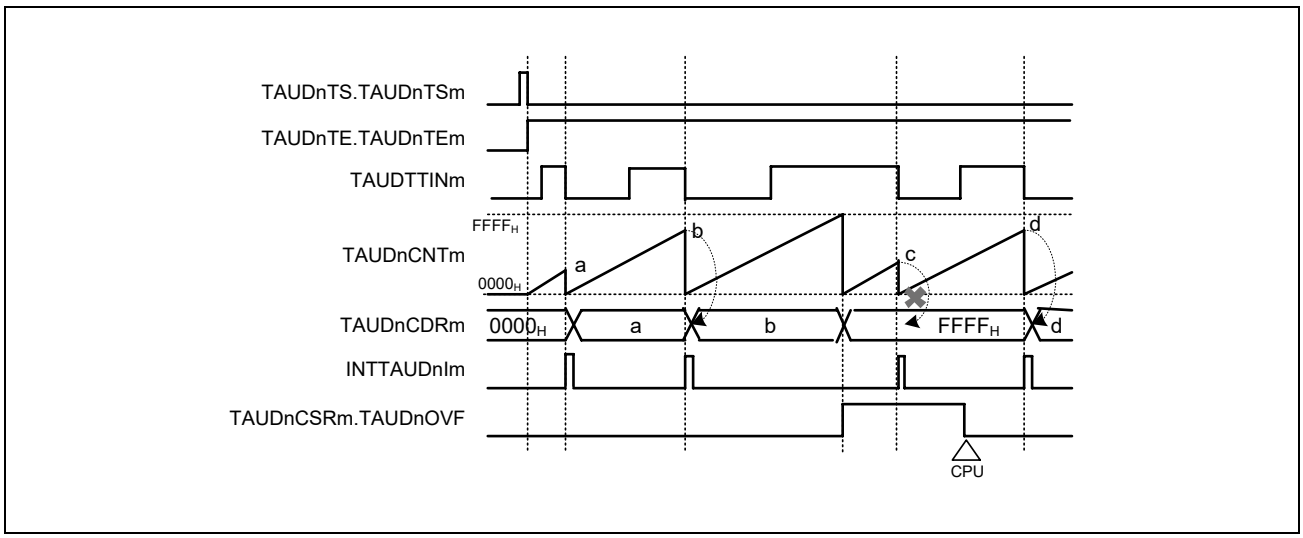

Figure 18.50 TAUDnCMORm.TAUDnCOS[1:0] = 11_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next effective TAUDTTINm input edge, TAUDnCNTm is reset to 0, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next effective TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

18.4.9.8 TAUDTTINm Input Signal Width Measurement Function

(1) Overview

Summary

This function measures the width of a TAUDTTINm signal, by starting the count at one edge of TAUDTTINm and capturing the count value at the other edge.

Prerequisites

- The operating mode should be set to capture and one-count mode. See **Table 18.79, Contents of TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function**
- TAUDTTOUTm is not used with this function.
- TAUDnCMORm.TAUDnMD0 should be set to 0.

Functional description

The counter is started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When an effective TAUDTTINm start edge is detected, the counter TAUDnCNTm starts to count up from 0000_H. When an effective TAUDTTINm stop edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter retains its value (TAUDnCDRm +1) and awaits the next effective TAUDTTINm input start edge.

If the counter reaches $FFFF_H$ before an effective TAUDTTINm stop edge is detected, it overflows. The counter is reset to 0000_H and subsequently continues to operate. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

Table 18.78 Effects or Overflow

	When Overflow Occurs		When an Effective TAUDTTINm Input Stop Edge is Detected	
TAUDnCMORm. TAUDnCOS[1:0]	TAUDnCDRm	TAUDnCSRm. TAUDnOVF	TAUDnCDRm, TAUDnCNTm	TAUDnCSRm. TAUDnOVF
00	Unchanged	0	TAUDnCNTm loaded into TAUDnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUDnCNTm stops counting TAUDnCDRm unchanged	Unchanged
11		1		

When TAUDnCMORm.TAUDnCOS[0] = 1, overflow bit TAUDnCSRm.TAUDnOVF can be cleared only by setting TAUDnCSCm.TAUDnCLOV to 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the width of the TAUDTTINm signal. However, if an overflow occurs multiple times before an effective TAUDTTINm input is detected, overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

This function cannot be forcibly restarted.

NOTE

When TAUDnCMORm.COS[1:0] = 10_B or 11_B, the value of TAUDnCNTm is not loaded to TAUDnCDRm when the first effective TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

(2) Equations

TAUDTTINm input signal width
= count clock cycle × [(TAUDnCSRm.TAUDnOVF × ($FFFF_H$ + 1)) + TAUDnCDRm capture value + 1]

(3) Block Diagram and General Timing Diagram

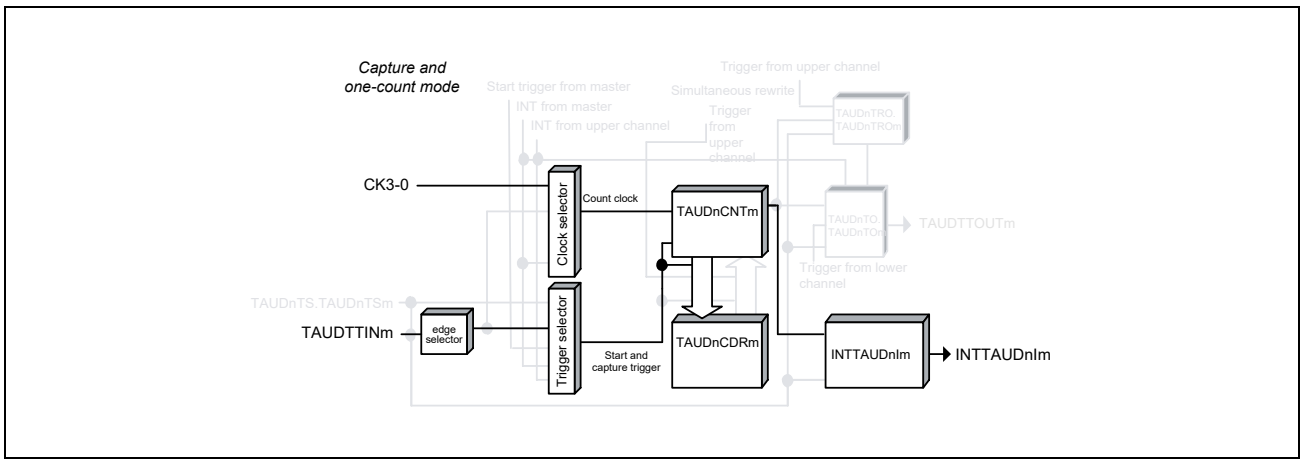

Figure 18.51 Block Diagram of TAUDTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)
- When an effective TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1. (TAUDnCMORm.TAUDnCOS[1:0] = 00_B)

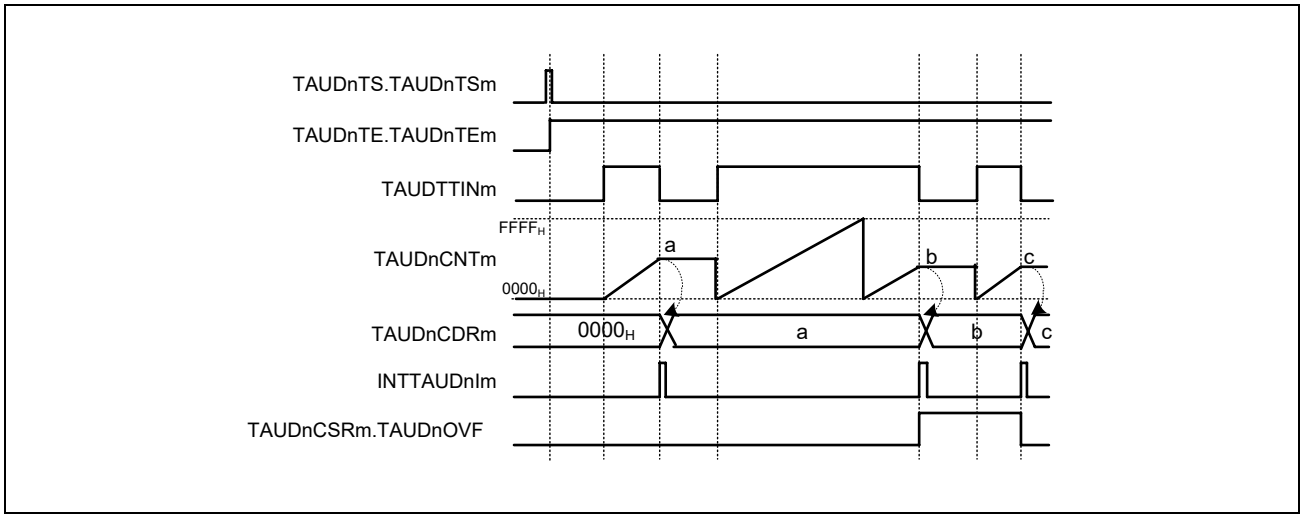

Figure 18.52 General Timing Diagram of TAUDTTINm Input Signal Width Measurement Function

Table 18.79 Contents of TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Operation clock = CK0 01: Operation clock = CK1 10: Operation clock = CK2 11: Operation clock = CK3
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Independent channel operation. Set to 0.
10 to 8	TAUDnSTS[2:0]	010: Effective edge of the TAUDTTINm input signal is used as an external start trigger and the reverse edge as a stop trigger.
7, 6	TAUDnCOS[1:0]	See **Table 18.78, Effects or Overflow.**
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0110: Capture and one-count mode
0	TAUDnMD0	0: Disables the start trigger during operation.

(b) TAUDnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.80 Contents of TAUDnCMURm Register for TAUDTTINm Input Signal Width Measurement Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	10: Detection of rising and falling edges (low width measurement) 11: Detection of rising and falling edges (high width measurement)

(c) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input signal width measurement function. Therefore, these registers should be set to 0.

Table 18.81 Simultaneous Rewrite Settings for TAUDTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

Table 18.82 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.79, Contents of TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function**, and **Table 18.80, Contents of TAUDnCMURm Register for TAUDTTINm Input Signal Width Measurement Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a TAUDTTINm start edge is detected, TAUDnCNTm starts to count up.
During Operation	Detection of TAUDTTINm edge TAUDnCDRm, TAUDnCNTm, and TAUDnCSRm registers can be read at any time. The TAUDnCSCm.TAUDnCLOV bit can be set to 1.	TAUDnCNTm starts to count up from 0000_H. When an effective TAUDTTINm edge is detected: • TAUDnCNTm transfers (captures) its value to TAUDnCDRm, and retains its value. INTTAUDnIm is then generated. Counting stops at the “value that transferred to TAUDnCDRm + 1” and TUAnCNTm waits for detection of the TAUDTTINm start edge. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values.

Restart → Start Operation

(6) Specific Timing Diagrams: Overflow Operation

(a) TAUDnCMORm.TAUDnCOS[1:0] = 00_B

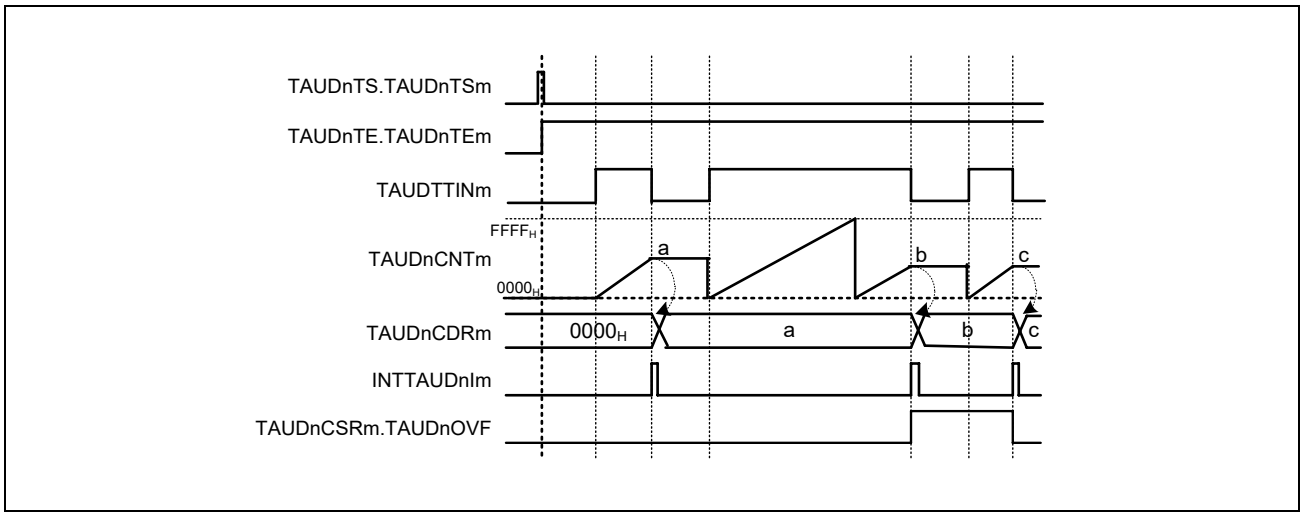

Figure 18.53 TAUDnCMORm.TAUDnCOS[1:0] = 00_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains = 0.
- Upon detection of the next effective TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next effective TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0.

(b) TAUDnCMORm.TAUDnCOS[1:0] = 01_B

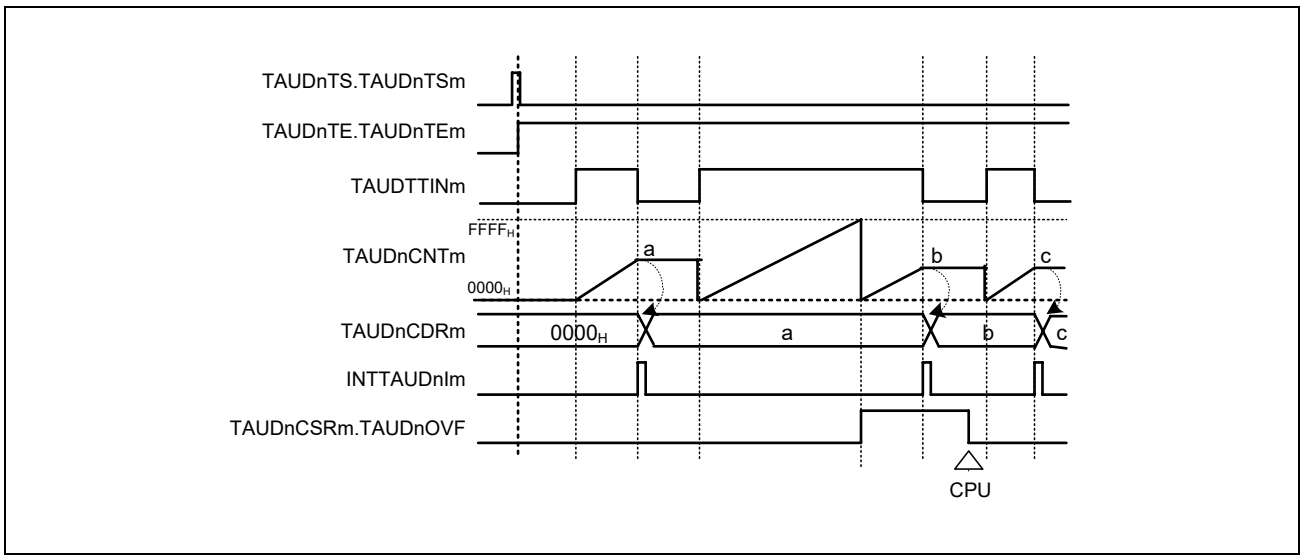

Figure 18.54 TAUDnCMORm.TAUDnCOS[1:0] = 01_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next effective TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).

(c) TAUDnCMORm.TAUDnCOS[1:0] = 10_B

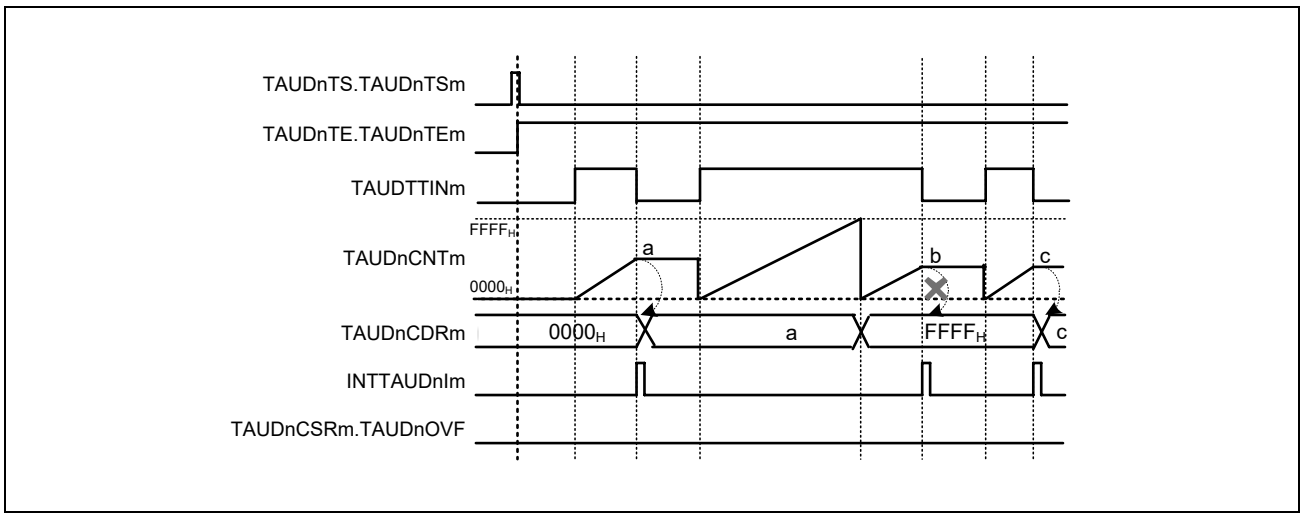

Figure 18.55 TAUDnCMORm.TAUDnCOS[1:0] = 10_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, TAUDnCDRm is set to FFFF$_H$ and TAUDnCSRm.TAUDnOVF remains = 0.
- Upon detection of the next effective TAUDTTINm input edge, the counter of TAUDnCNTm is stopped, and TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next effective TAUDTTINm input edge after the overflow is ignored.

(d) TAUDnCMORm.TAUDnCOS[1:0] = 11_B

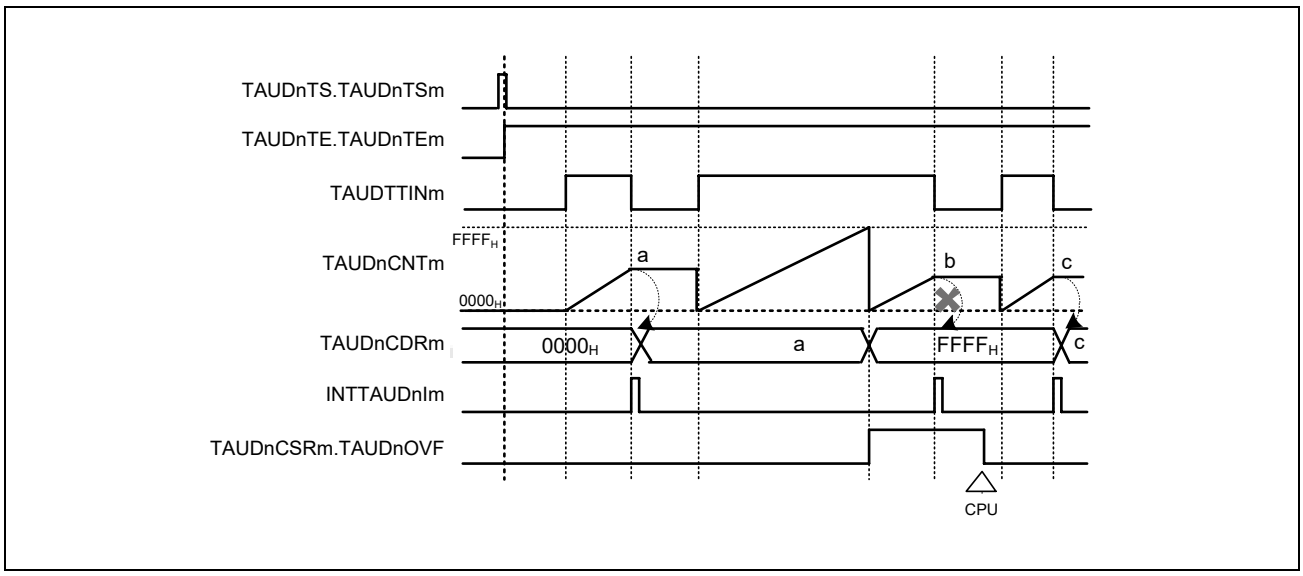

Figure 18.56 TAUDnCMORm.TAUDnCOS[1:0] = 11_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next effective TAUDTTINm input edge, the counter of TAUDnCNTm is stopped, and TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next effective TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

18.4.9.9 TAUDTTINm Input Position Detection Function

(1) Overview

Summary

This function measures the input signal duration by capturing the count value at the effective edge of TAUDTTINm.

Prerequisites

- The operating mode should be set to count capture mode (see **Table 18.83, Contents of TAUDnCMORm Register for TAUDTTINm Input Position Detection Function**).
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter starts counting from 0000_H. When an effective TAUDTTINm input edge is detected, the current value of TAUDnCNTm is loaded into TAUDnCDRm and an interrupt (INTTAUDnlm) is generated. The count operation continues.

When the counter reaches $FFFF_H$, the counter restarts to count from 0000_H.

NOTE

The input TAUDTTINm is sampled at the frequency of the operation clock, specified by the TAUDnCMORm.TAUDnCKS[1:0] bits. As a result, the output cycle of TAUDTTOUTm has an error of ± 1 operation clock cycle.

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt does not occur at the beginning of operation or after restart. For details, see **Section 18.4.6, TAUDTTOUTm Output and INTTAUDnlm Generation when Counter Starts or Restarts.**

(2) Equations

Functional duration at a TAUDTTINm input pulse = count clock cycle × (TAUDnCDRm capture value + 1)

(3) Block Diagram and General Timing Diagram

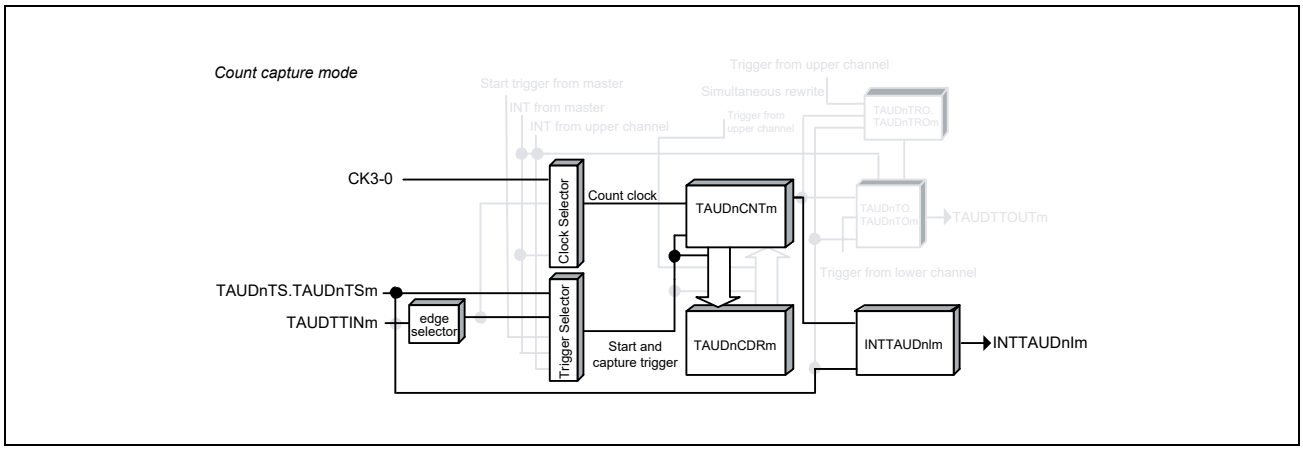

Figure 18.57 Block Diagram of TAUDTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUDnIm not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

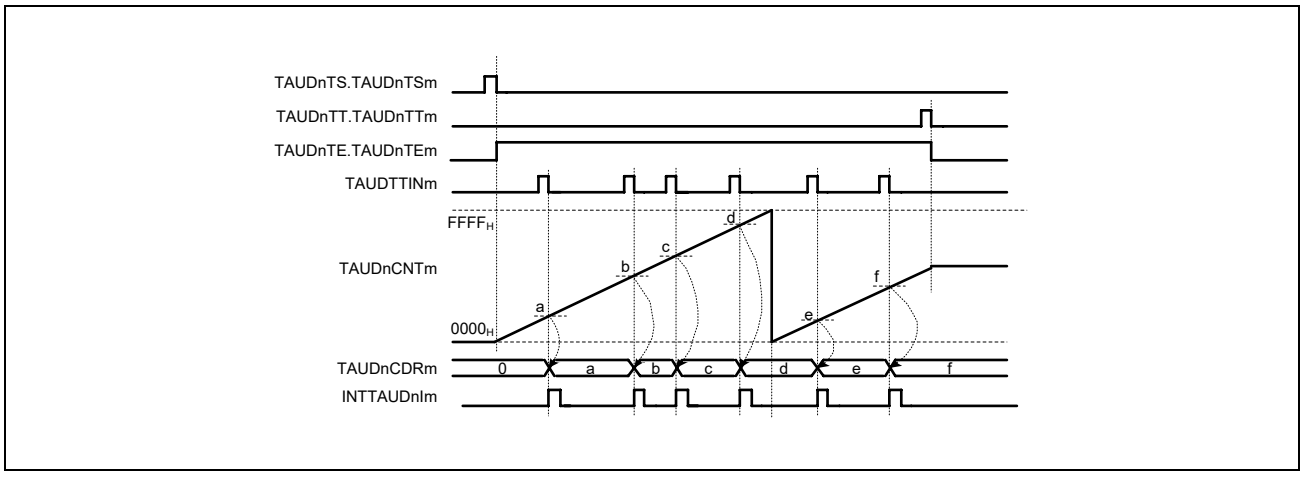

Figure 18.58 General Timing Diagram of TAUDTTINm Input Position Detection Function

(c) Channel output mode

The channel output mode is not used by this function.

(d) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with this function. Therefore, these registers should be set to 0.

Table 18.85 Simultaneous Rewrite Settings for TAUDTTINm Input Position Detection Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Operating Procedure for TAUDTTINm Input Position Detection Function

Table 18.86 Operating Procedure for TAUDTTINm Input Position Detection Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.83, Contents of TAUDnCMORm Register for TAUDTTINm Input Position Detection Function** and **Table 18.84, Contents of TAUDnCMURm Register for TAUDTTINm Input Position Detection Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm occurs.
During Operation	The TAUDnCMURm.TAUDnTIS[1:0] bits can be changed at any time. The TAUDnCDRm and TAUDnCSRm registers can be read at any time.	TAUDnCNTm starts to count up from 0000_H. When an effective TAUDTTINm edge is detected: • TAUDnCNTm transfers (captures) its own value to TAUDnCDRm. • INTTAUDnIm occurs. • The counter is not cleared to 0000_H and TAUDnCNTm continues counting. Afterwards, this procedure is repeated. If TAUDnCNTm reaches $FFFF_H$, the counter restarts from 0000_H.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm retains their current values.

Restart

(6) Specific Timing Diagrams

(a) Operation stop and restart

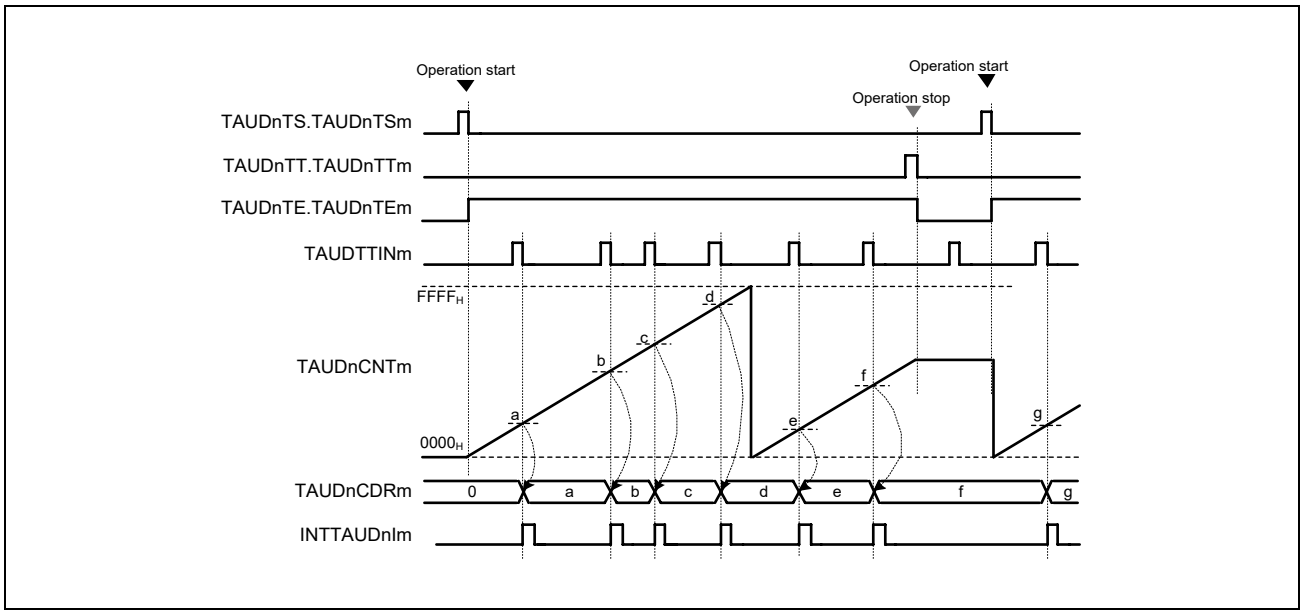

Figure 18.59 Operation Stop and Restart (TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

- The counter can stop operating by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value.
- If the counter stops operating, effective TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm restarts to count from 0000_H.

18.4.9.10 TAUDTTINm Input Period Count Detection Function

(1) Overview

Summary

This function measures the cumulative width of a TAUDTTINm input signal.

Prerequisites

- The operating mode should be set to capture and gate count mode (see **Table 18.87, Contents of TAUDnCMORm Register for TAUDTTINm Input Period Count Detection Function**).
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter awaits an effective TAUDTTINm input edge.

When an effective TAUDTTINm input start edge is detected, the counter starts to count from 0000_H.

When an effective TAUDTTINm input stop edge is detected, the current TAUDnCNTm value is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The counter stops and retains its value (TAUDnCDRm + 1) until the next effective TAUDTTINm input start edge is detected.

When the next effective TAUDTTINm input start edge is detected, the counter restarts to count from the value retained when stopped.

If the counter reaches $FFFF_H$, the counter restarts to count from 0000_H.

NOTE

TAUDTTINm input signal is sampled at the frequency of an operation clock set by the TAUDnCMORm.TAUDnCKS[1:0] bits.

As this function is to measure the TAUDTTINm input signal width, setting TAUDnTS.TAUDnTSm to 1 is disabled while TAUDnTE.TAUDnTEm = 1.

Conditions

The effective start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits:

- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, the TAUDTTINm input low period is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11_B, the TAUDTTINm input high period is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

(2) Equations

Cumulative TAUDTTINm input width = count clock cycle × (TAUDnCDRm capture value + 1)

(3) Block Diagram and General Timing Diagram

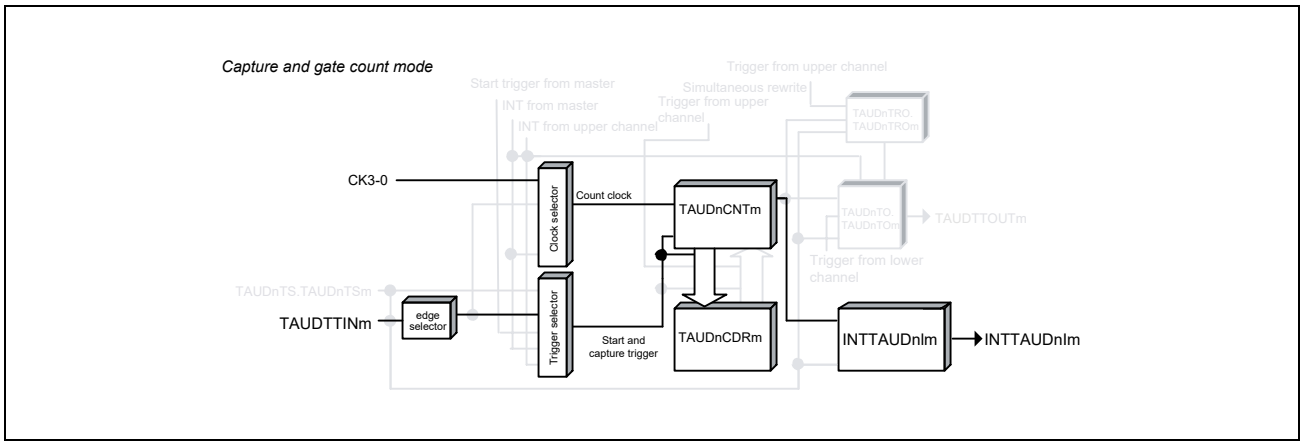

Figure 18.60 Block Diagram of TAUDTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

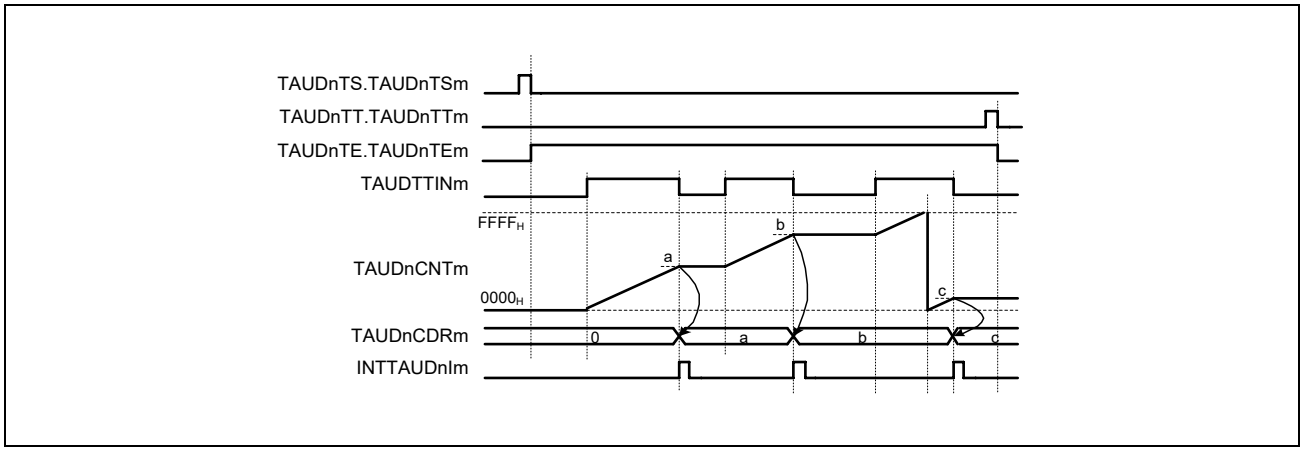

Figure 18.61 General Timing Diagram of TAUDTTINm Input Period Count Detection Function

(4) Register Settings

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	10: Detection of rising and falling edges (low width measurement) 11: Detection of rising and falling edges (high width measurement)

(c) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(d) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with this function. Therefore, these registers should be set to 0.

Table 18.89 Simultaneous Rewrite Settings for TAUDTTINm Input Period Count Detection Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Operating Procedure for TAUDTTINm Input Period Count Detection Function

Table 18.90 Operating Procedure for TAUDTTINm Input Period Count Detection Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.87, Contents of TAUDnCMORm Register for TAUDTTINm Input Period Count Detection Function**, and **Table 18.88, Contents of TAUDnCMURm Register for TAUDTTINm Input Period Count Detection Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a start edge is detected, TAUDnCNTm is cleared to 0000_H and starts counting up.
During Operation	Detection of TAUDTTINm edge The TAUDnCDRm, TAUDnCNTm, and TAUDnCSRm registers can be read at any time. The TAUDnCSCm.TAUDnCLOV bit can be set to 1.	When a TAUDTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUDnCNTm starts counting up from the stop value. When TAUDnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUDnCDRm and INTTAUDnIm is generated. Counting stops at the “value transferred to TAUDnCDRm + 1” and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When TAUDnCNTm reaches $FFFF_H$, the counter restarts count operation from 0000_H. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm retains its current values.

Restart

(6) Specific Timing Diagrams

(a) Operation stop and restart

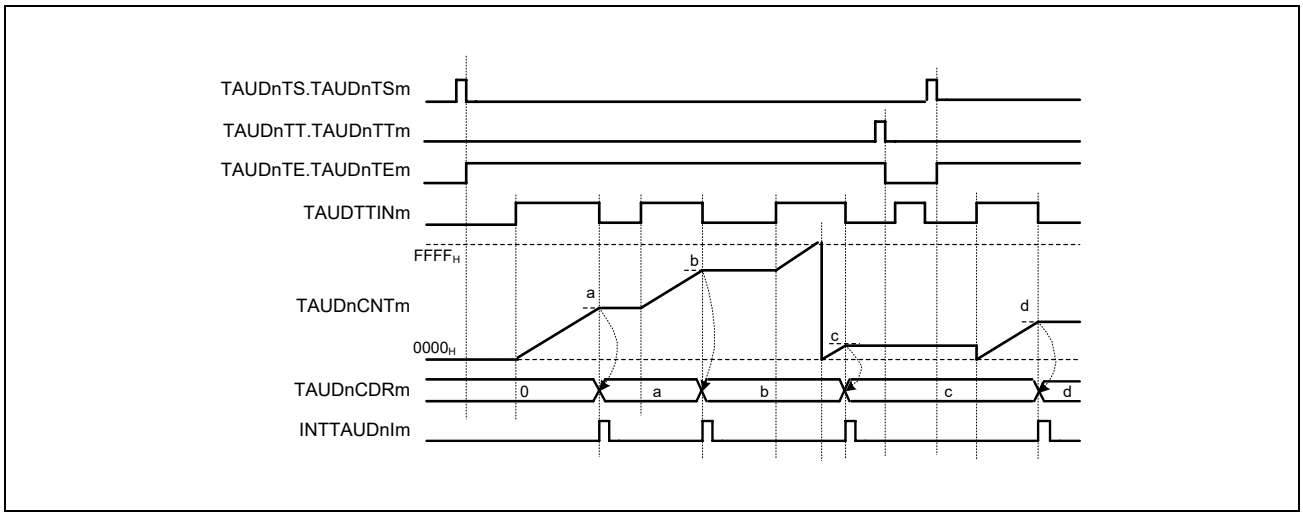

Figure 18.62 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value.
- If the counter is stopped, effective TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm restarts to count from 0000_H.

18.4.9.11 TAUDTTINm Input Pulse Interval Judgment Function

(1) Overview

Summary

This function outputs the result of a comparison between the count value (TAUDnCNTm) and the value in the channel data register (TAUDnCDRm) when a TAUDTTINm input pulse occurs. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true.

Prerequisites

- The operating mode should be set to judge mode. See **Table 18.91, Contents of TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Judgment Function**.
- TAUDTTOUTm is not used with this function.

Functional description

The counter is started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When an effective TAUDTTINm edge is detected or TAUDnTS.TAUDnTSm is set to 1, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. TAUDnCNTm reloads the value of TAUDnCDRm and subsequently continues to operate, regardless of the result of the comparison.

If the counter reaches 0000_H before an effective TAUDTTINm edge is detected, TAUDnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:

- If TAUDnCMORm.TAUDnMD0 = 0, INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm.
- If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm.

(2) Block Diagram and General Timing Diagram

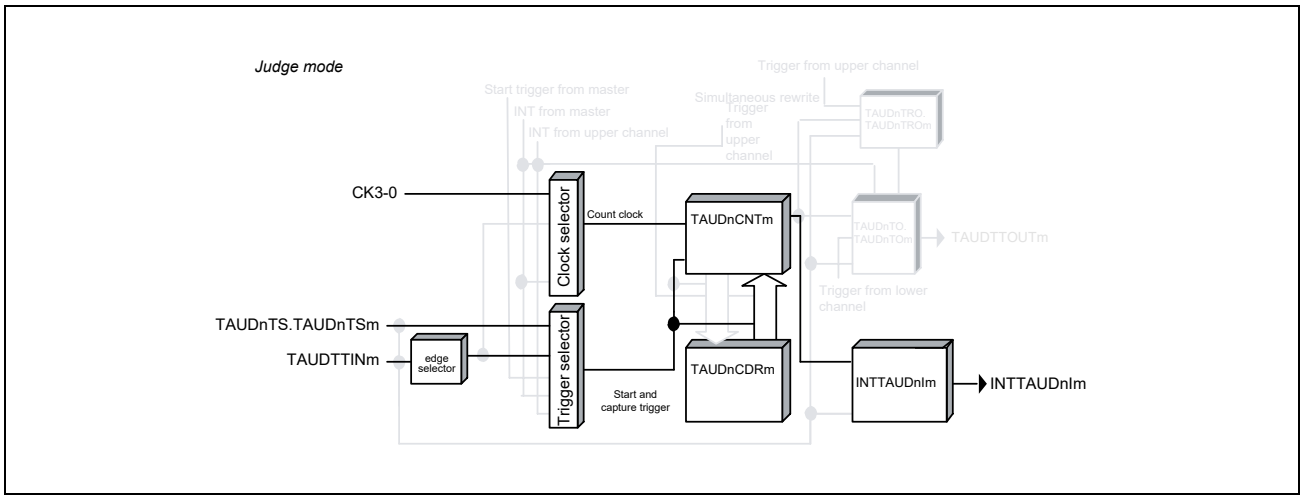

Figure 18.63 Block Diagram of TAUDTTINm Input Pulse Interval Judgment Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(4) Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

Table 18.94 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.91 Contents of TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Judgment Function**, and **Table 18.92 Contents of TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Judgment Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCDRm value is loaded into TAUDnCNTm.
During Operation	Detection of TAUDTTINm edge The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at any time.	When TAUDnCMORm.TAUDnMD0 = 0: If TAUDnCNTm ≤ TAUDnCDRm when a TAUDTTINm input edge is detected, INTTAUDnIm is generated. When TAUDnCMORm.TAUDnMD0 = 1: If TAUDnCNTm > TAUDnCDRm when a TAUDTTINm input edge is detected, INTTAUDnIm is generated. If a TAUDTTINm input edge is detected, then TAUDnCNTm starts to count down from the value of TAUDnCDRm. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart

18.4.9.12 TAUDTTINm Input Signal Width Judgment Function

(1) Overview

Summary

This function compares the count value (TAUDnCNTm) for the high or low level width of a TAUDTTINm input signal and the TAUDnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUDnIm.

Prerequisites

- The operating mode should be set to judge and one-count mode (see **Table 18.95, Contents of TAUDnCMORm Register for TAUDTTINm Input Signal Width Judgment Function**).
- TAUDTTOUTm is not used with this function.

Functional description

The counter is started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When an effective TAUDTTINm input start edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When an effective TAUDTTINm stop edge is detected, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. The counter TAUDnCNTm retains its value until the next effective TAUDTTINm start edge is detected, regardless of the result of the comparison.

If the counter reaches 0000_H before an effective TAUDTTINm stop edge is detected, TAUDnCNTm overflows and is set to $FFFF_H$. The counter then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

- The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:
  - If TAUDnCMORm.TAUDnMD0 = 0, INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm.
  - If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm.
- The TAUDnCMURm.TAUDnTIS[1:0] bits specify a type of width measurement:
  - For high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B), TAUDTTINm rising edge is used as a start edge and TAUDTTINm falling edge as a stop edge.
  - For low width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 10_B), TAUDTTINm falling edge is used as a start edge and TAUDTTINm rising edge as a stop edge.
- This function cannot make a forced restart.

(2) Block Diagram and General Timing Diagram

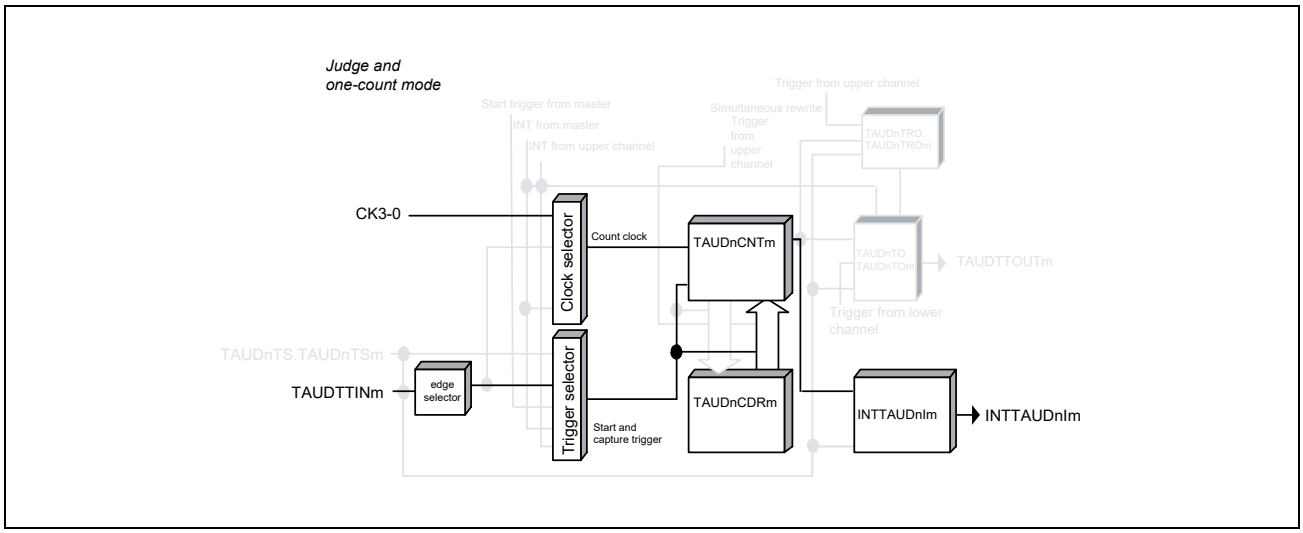

Figure 18.65 Block Diagram of TAUDTTINm Input Signal Width Judgment Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm (TAUDnCMORm.TAUDnMD0 = 0)
- Effective TAUDTTINm start edge = rising edge, effective TAUDTTINm stop edge = falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	10: Detection of rising and falling edges (low width measurement) 11: Detection of rising and falling edges (high width measurement)

(c) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(d) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with this function. Therefore, these registers should be set to 0.

Table 18.97 Simultaneous Rewrite Settings for TAUDTTINm Input Signal Width Judgment Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(4) Operating Procedure for TAUDTTINm Input Signal Width Judgment Function

Table 18.98 Operating Procedure for TAUDTTINm Input Signal Width Judgment Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 18.95, Contents of TAUDnCMORm Register for TAUDTTINm Input Signal Width Judgment Function**, and **Table 18.96, Contents of TAUDnCMURm Register for TAUDTTINm Input Signal Width Judgment Function.** Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge.
During Operation	Detection of TAUDTTINm edge The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at any time.	Upon detection of a TAUDTTINm start edge, TAUDnCNTm starts count down from the value of TAUDnCDRm. When TAUDnCMORm.TAUDnMD0 = 0: If TAUDnCNTm ≤ TAUDnCDRm when a TAUDTTINm input stop edge is detected, INTTAUDnIm is generated. When TAUDnCMORm.TAUDnMD0 = 1: If TAUDnCNTm > TAUDnCDRm when a TAUDTTINm input stop edge is detected, INTTAUDnIm is generated. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart

18.4.10 Independent Channel Real-Time Functions

- This section describes functions that output the value of the TAUDnTRO.TROm bit in real time:
- **Section 18.4.10.1, Real-Time Output Function Type 1**
- **Section 18.4.10.2, Real-Time Output Function Type 2**

18.4.10.1 Real-Time Output Function Type 1

(1) Overview

Summary

This function outputs a value of the TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated at certain specified intervals.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm = 1), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger (TAUDnTRC.TAUDnTRCm = 0).

Prerequisites

- Channels should use the TAUDTTOUTm control of other channels.
- The operating mode for the upper channel should be set to interval timer mode (see **Table 18.99, Contents of TAUDnCMORm Register for Real-Time Output Function Type 1**.
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output (see **18.4.4, Channel Output Modes**).
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREm = 1).

Functional description

The counter of the upper channel is started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current value of the data register of the upper channel (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.

When the counter of the upper channel reaches 0000_H, INTTAUDnIm is generated and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1). TAUDnCNTm then reloads the TAUDnCDRm value to continue operation subsequently.

The TAUDTTOUTm signal changes only when an interrupt is generated, and when its value is different to current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.

Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm = 0) or if the channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.
- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1) and TAUDnTRC.TAUDnTRCm = 0, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not output. For details, see **Section 18.4.6, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

(2) Equations

INTTAUDnIm generation cycle = count clock cycle × (TAUDnCDRm value + 1)

Table 18.100 Contents of TAUDnCMURm Register for Real-Time Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for upper channels

Table 18.101 Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	1: Channel m generates a unique real-time output trigger.
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for upper channels

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the real-time output function type 1. Therefore, these registers should be set to 0.

Table 18.102 Simultaneous Rewrite Settings for Real-Time Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Register Settings for Lower Channels

(a) TAUDnCMORm for lower channels

The TAUDnCMORm register for lower channels is available for any setting.

(b) TAUDnCMURm for lower channels

The TAUDnCMURm register for lower channels is available for any setting.

(c) Channel output mode for lower channels

Table 18.103 Control Bit Settings for the Lower Channels in Independent Channel Output Mode 1 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for lower channels

Simultaneous rewrite registers for lower channels can be set arbitrarily.

(6) Operating Procedure for Real-Time Output Function Type 1

Table 18.104 Operating Procedure for Real-Time Output Function Type 1

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for upper channels as described in **Table 18.99, Contents of TAUDnCMORm Register for Real-Time Output Function Type 1**, and **Table 18.100, Contents of TAUDnCMURm Register for Real-Time Output Function Type 1**. Set TAUDnCMORm and TAUDnCMURm registers for lower channels as described in **Section (5), Register Settings for Lower Channels**. Set the value of TAUDnCDRm register (only channels with TAUDnTRC.TAUDnTRCm = 1) Set channel output mode by setting the control bits as described in **Table 18.101, Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output**. Set channel output mode by setting the control bits as described in **Table 18.103, Control Bit Settings for the Lower Channels in Independent Channel Output Mode 1 with Real-Time Output**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm = 1 on the channel with TAUDnTRC.TAUDnTRCm set to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	[Channel with TAUDnTRC.TAUDnTRCm set to 1] TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCDRm value is loaded into TAUDnCNTm.TAUDnCMORm. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm occurs.
During Operation	TAUDnCDRm and TAUDnTRO.TAUDnTROm can be changed at any time. The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down. When the counter reaches 0000_H: • The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. • INTTAUDnIm is generated. • TAUDTTOUTm outputs the current value of the real-time output bit TAUDnTRO.TAUDnTROm. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. Both TAUDnCNTm and TAUDTTOUTm retain their current values.

Restart

(7) Specific Timing Diagrams

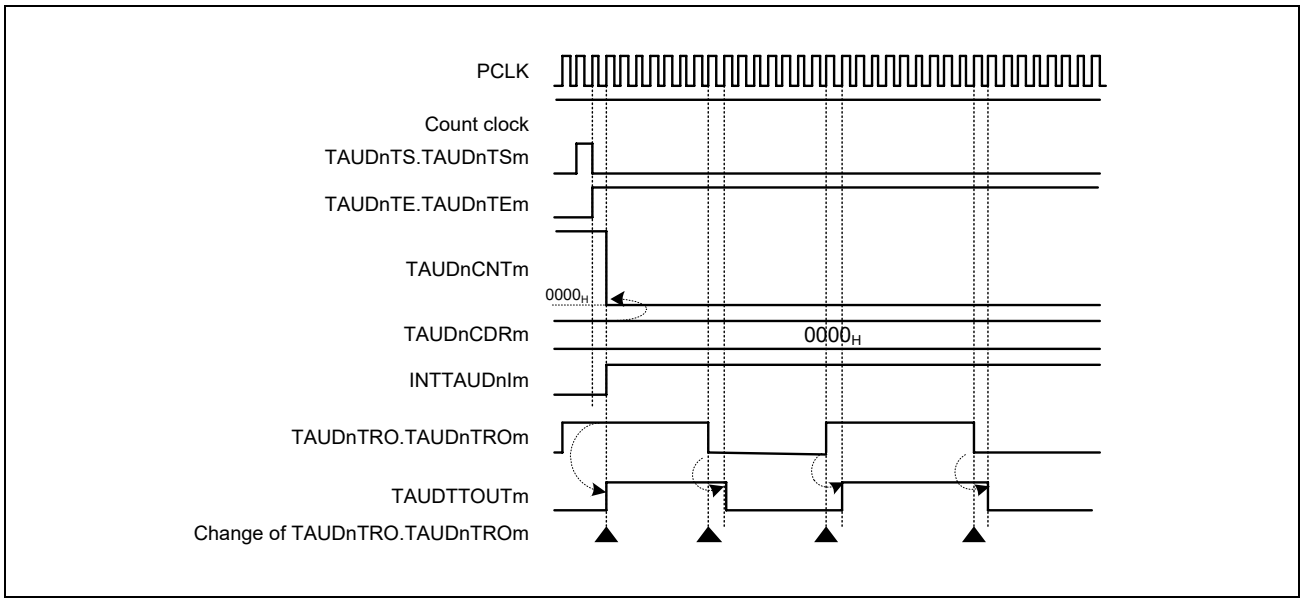

Figure 18.69 TAUDnCDRm = 0000_H, TAUDnCMORm.TAUDnMD0 = 1

- The value of TAUDTTOUTm changes according to the setting of TAUDnTRO.TAUDnTROm with a delay of one PCLK cycle.

18.4.10.2 Real-Time Output Function Type 2

(1) Overview

Summary

This function outputs the value of TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated when an effective TAUDTTINm input edge is detected or the function starts.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm = 1), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger (TAUDnTRC.TAUDnTRCm = 0).

Prerequisites

- Channels should use the TAUDTTOUTm control of the other channels.
- The operating mode for the upper channel should be set to interval timer mode (**see Table 18.105, Contents of TAUDnCMORm Register for Real-Time Output Function Type 2**).
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output (see **Section 18.4.4, Channel Output Modes**).
- Real-time output should be enabled for the upper channel (TAUDnTRE.TREm = 1).

Functional description

The counter for upper channels is started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1.This sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The counter starts to count up.

When an effective TAUDTTINm input edge is generated on one of upper channels, an interrupt occurs and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1).

The TAUDTTOUTm signal changes only when an interrupt is generated, and when TAUDTTOUTm value is different to the current value of TAUDnTRO.TAUDnTROm during the occurrence of the interrupt.

Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TRCm to 1 for the corresponding channel. The TAUDnTRC.TRCm bit should be 0 for all other channels.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm = 0) or if the channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.
- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1) and TAUDnTRC.TAUDnTRCm = 0, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not output. For details, see **Section 18.4.6, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

(2) Block Diagram and General Timing Diagram

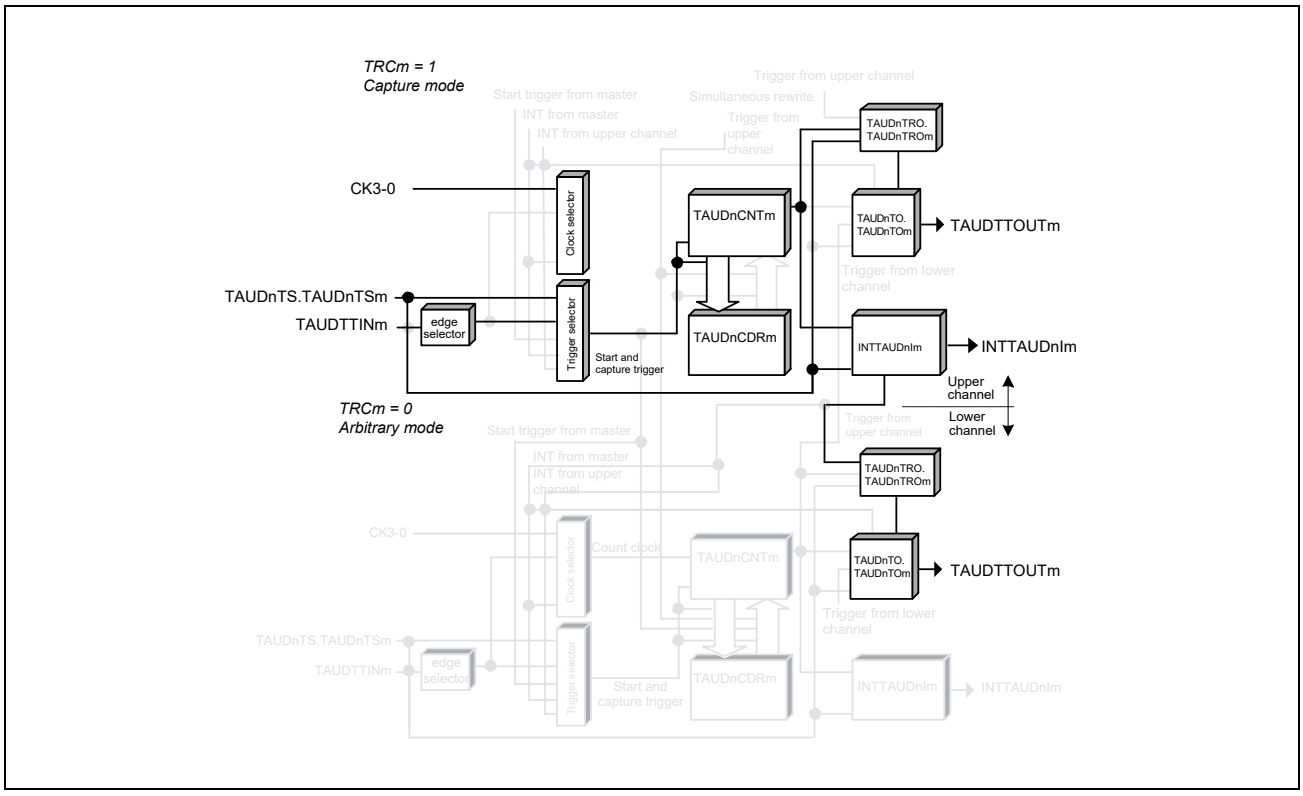

Figure 18.70 Block Diagram of Real-Time Output Function Type 2

The following settings apply to the general timing diagram.

- INTTAUDnIm not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)

1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges

(c) Channel output mode for upper channels

Table 18.107 Control Bit Settings in Independent Channel Output Mode 2 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	1: Channel m generates a unique real-time output trigger.
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for upper channels

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the real-time output function type 2. Therefore, these registers should be set to 0.

Table 18.108 Simultaneous Rewrite Settings for Real-Time Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(4) Register Settings for Lower Channels

(a) TAUDnCMORm for lower channels

The TAUDnCMORm register for lower channels is available for any setting.

(b) TAUDnCMURm for lower channels

The TAUDnCMURm register for lower channels is available for any setting.

(c) Channel output mode for lower channels

Table 18.109 Control Bit Settings for Lower Channels in Independent Channel Output Mode 2 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode.
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation.
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output 1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for lower channels

Simultaneous rewrite registers for lower channels can be set arbitrarily.

(5) Operating Procedure for Real-Time Output Function Type 2

Table 18.110 Operating Procedure for Real-Time Output Function Type 2

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for upper channels as described in **Table 18.105, Contents of TAUDnCMORm Register for Real-Time Output Function Type 2**, and **Table 18.106, Contents of TAUDnCMURm Register for Real-Time Output Function Type 2**. Set TAUDnCMORm and TAUDnCMURm registers for the lower channel as described in **Section (4), Register Settings for Lower Channels**. The TAUDnCDRm register functions as a capture register. (channels with TAUDnTRC.TAUDnTRCm = 1) Set channel output mode by setting the control bits as described in **Table 18.107, Control Bit Settings in Independent Channel Output Mode 2 with Real-Time Output**. Set channel output mode by setting the control bits as described in **Table 18.109, Control Bit Settings for Lower Channels in Independent Channel Output Mode 2 with Real-Time Output.**	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm = 1 on the channel with TAUDnTRC.TAUDnTRCm set to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	[Channel with TAUDnTRC.TAUDnTRCm set to 1] TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000_H. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm occurs.
During Operation	TAUDnTRO.TAUDnTROm can be changed at any time.	TAUDnCNTm starts to count up from 0000_H. When an effective TAUDTTINm input edge is detected: • The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. • INTTAUDnIm is generated. • TAUDTTOUTm outputs the current value of the real-time output bit TAUDnTRO.TAUDnTROm. TAUDTTOUTm outputs the current value of real-time output bit TAUDnTRO.TAUDnTROm. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm, TAUDnCSRm.TAUDnOVF, and TAUDTTOUTm retain their current values.

Restart

(6) Specific Timing Diagrams

(a) Operation start and stop

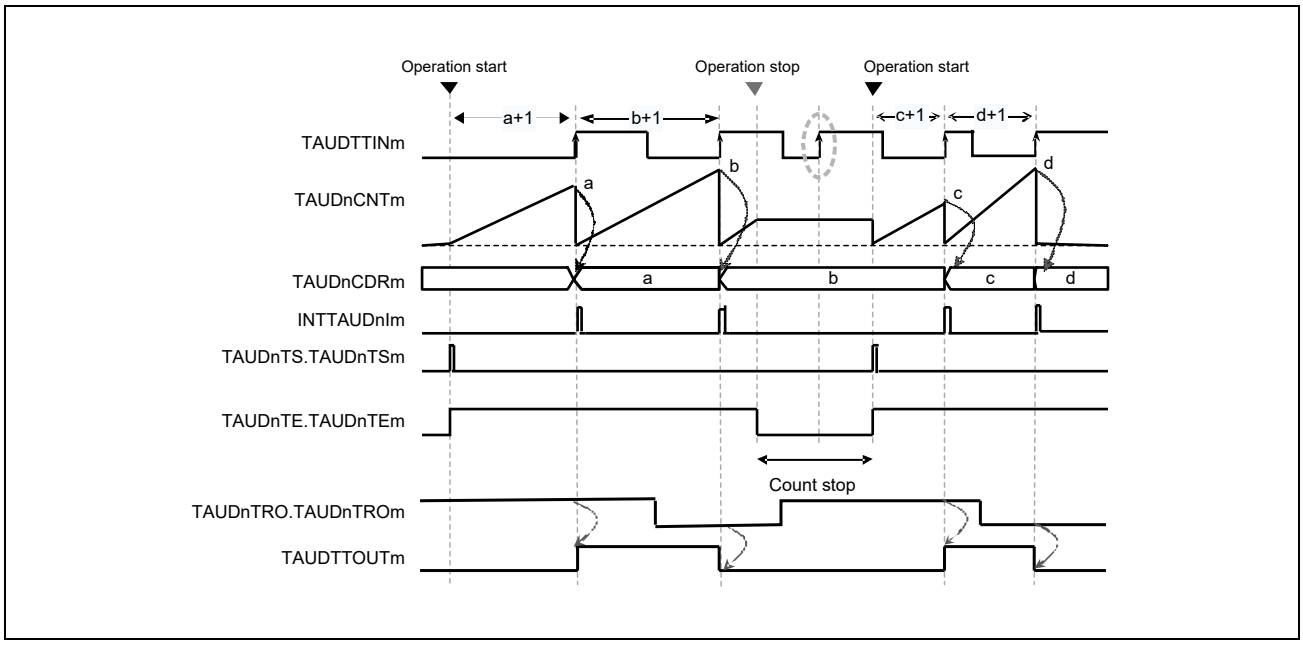

Figure 18.72 Operation Start and Stop (TAUDnCMORm.TAUDnMD0 = 0)

- When TAUDnTS.TAUDnTSm is set to 1, the counter starts counting up.
- When an effective input edge is detected, the current value of the counter is written to the data register (TAUDnCDRm) and an interrupt is generated.
- TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) and the counter resets and starts to count up again.
- The TAUDTTOUTm signal only changes when an interrupt is generated, and then only when its value is different to current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.
- If the counter is stopped (TAUDnTE.TAUDnTEm = 0), effective input edges are ignored and no interrupt is generated.

18.4.11 Independent Channel Simultaneous Rewrite Functions

This section describes functions that carry out simultaneous rewrite:

- **Section 18.4.11.1, Simultaneous Rewrite Trigger Generation Function Type 1**

18.4.11.1 Simultaneous Rewrite Trigger Generation Function Type 1

(1) Overview

Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals.

The upper channel is a channel which generates a simultaneous rewrite trigger (TAUDnRDC.TAUDnRDCm = 1), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger (TAUDnRDC.TAUDnRDCm = 0).

Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite (TAUDnRDE.RDEm = 1).
- The operating mode for the upper channel should be set to interval timer mode (see **Table 18.111, Contents of TAUDnCMORm Register for Simultaneous Rewrite Trigger Generation Function Type 1**).
- For the operating mode that can be set for lower channels, see **Table 18.42, Channel Operation Functions and Methods They Use**.
- TAUDTTOUTm is not used for any channel in this function.

Functional description

The counter operation is enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) for upper and lower channels to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of the data register buffer for upper channels (TAUDnCDRm buf) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value. The counter for lower channels start to count according to the selected operating mode.

Once the counter reaches 0000_H, an interrupt occurs on the channel. The current value of the corresponding TAUDnCDRm buffer is loaded into TAUDnCNTm to continue operation subsequently.

If the channel where an interrupt occurs is specified as a trigger channel for simultaneous rewrite (TAUDnRDC.RDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUDnRSF.RSFm = 1).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnRDC.TAUDnRDCm = 1 for the corresponding channel. The TAUDnRDC.TAUDnRDCm bit should be 0 for all other channels in which simultaneous rewrite should take place.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 18.4.6, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

(2) Equations

Simultaneous rewrite trigger generation cycle = count clock cycle × (TAUDnCDRm + 1)

To control simultaneous rewrite, the following condition should be satisfied:

[PWM]

TAUDnCDRm
= [(value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1) × number of interrupts] – 1

[Triangle PWM]

TAUDnCDRm
= [(value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1) × 2 × number of interrupts] – 1

That is, the ratio of TAUDnCDRm + 1 and TAUDnCDRm_master + 1 of master channel subject to simultaneous rewrite should be an integer. This integer corresponds to the number of interrupts.

For triangle PWM, remember that the cycle doubles.

(3) Block Diagram and General Timing Diagram

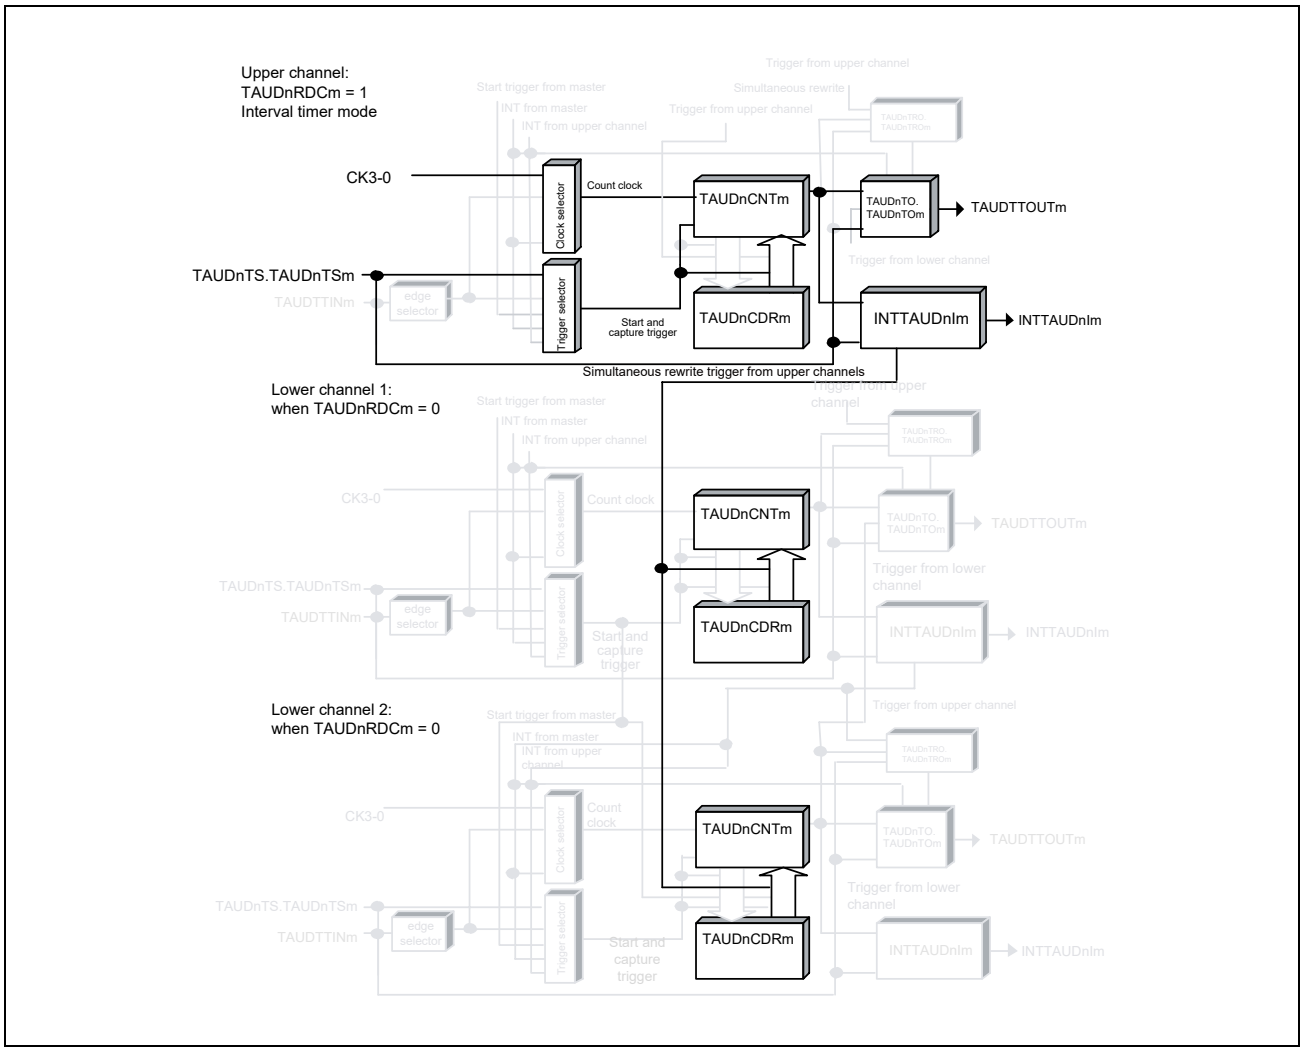

Figure 18.73 Block Diagram of Simultaneous Rewrite Trigger Generation Function Type 1

The following settings apply to the general timing diagram.

- INTTAUDnIm generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

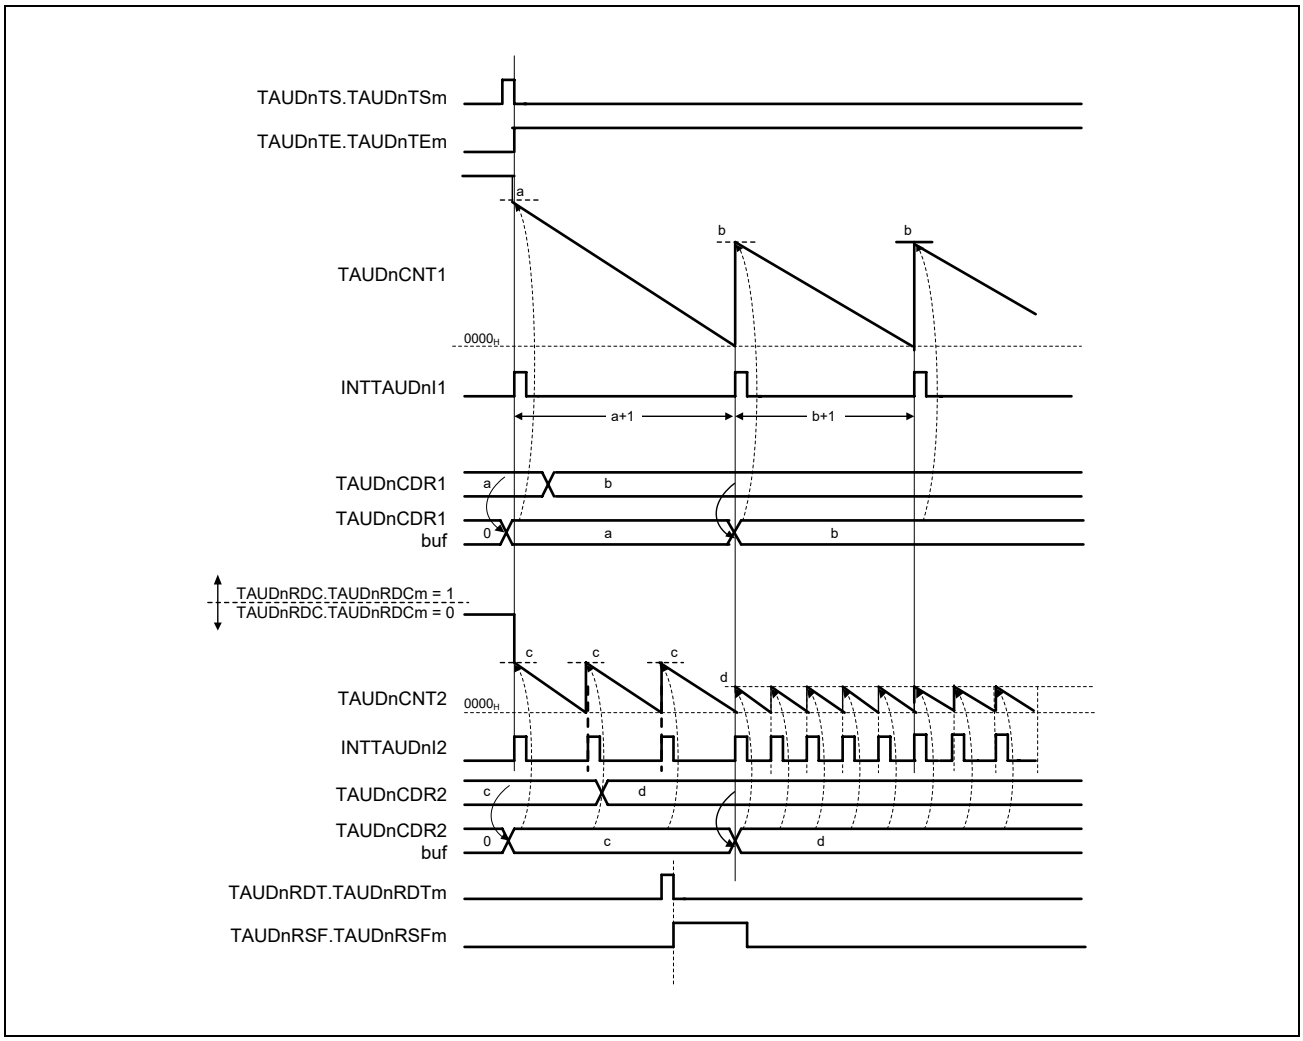

Figure 18.74 General Timing Diagram of Simultaneous Rewrite Trigger Generation Function Type 1

(4) Register Settings for Upper Channels

(a) TAUDnCMORm for upper channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 18.111 Contents of TAUDnCMORm Register for Simultaneous Rewrite Trigger Generation Function Type 1

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Operation clock = CK0 01: Operation clock = CK1 10: Operation clock = CK2 11: Operation clock = CK3
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Independent channel operation. Set to 0.
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm not generated at the beginning of operation. 1: INTTAUDnIm generated at the beginning of operation.

(b) TAUDnCMURm for upper channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.112 Contents of TAUDnCMURm Register for Simultaneous Rewrite Trigger Generation Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for upper channels

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(d) Simultaneous rewrite for upper channels

Table 18.113 Simultaneous Rewrite Settings for Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	1: Monitors INTTAUDnIm signal which triggers a simultaneous rewrite on the channel.

(5) Register Settings for Lower Channels

(a) TAUDnCMORm for lower channels

TAUDnCMORm register for lower channels must follow the TAUDnCMORm register settings in the operating mode which can be set (see **Table 18.42, Channel Operation Functions and Methods They Use**).

(b) TAUDnCMURm for lower channels

TAUDnCMURm register for lower channels must follow the TAUDnCMURm register settings in the operating mode which can be set (see **Table 18.42, Channel Operation Functions and Methods They Use**).

(c) Channel output mode for lower channels

Output can be made according to the operating mode setting (master/slave) for lower channels. As for the available function for simultaneous rewrite trigger generation function type 1, see **Table 18.42, Channel Operation Functions and Methods They Use**.

(d) Simultaneous rewrite for lower channels

Table 18.114 Simultaneous Rewrite Settings for Lower Channels in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(6) Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Table 18.115 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for the upper channel as described in **Table 18.111, Contents of TAUDnCMORm Register for Simultaneous Rewrite Trigger Generation Function Type 1**, and **Table 18.112, Contents of TAUDnCMURm Register for Simultaneous Rewrite Trigger Generation Function Type 1**. Set TAUDnCMORm and TAUDnCMURm registers for lower channels as described in **Section (5), Register Settings for Lower Channels**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCDRm value is loaded into TAUDnCNTm. If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm occurs.
During Operation	TAUDnRDT.TAUDnRDTm and TAUDnCDR.CDRm is changeable. TAUDnRSF.TAUDnRSFm can be always read.	TAUDnCNTm counts down. When the counter reaches 0000_H: • The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. • INTTAUDnIm is generated. If INTAUDnIm occurs on the channel where TAUDnRDC.TAUDnRDCm is set to 1, simultaneous rewrite is controlled. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart

18.4.12 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the timer array unit D. For a general overview of synchronous channel operation, see **Section 18.2, Overview**.

This section describes functions that generate PWM signals at regular intervals.

- **Section 18.4.12.1, PWM Output Function**
- **Section 18.4.12.2, One-Shot Pulse Output Function**
- **Section 18.4.12.3, Trigger Start PWM Output Function**

- **Section 18.4.12.10, Interrupt Request Signals Culling Function**
- **Section 18.4.12.11, One-Phase PWM Output Function**

18.4.12.1 PWM Output Function

(1) Overview

Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty cycle of the TAUDTTOUTm to be set. The pulse cycle is set in the master channel. The duty cycle is set in the slave channel.

Prerequisites

- It requires two channels.
- The operating mode for the master channel should be set to interval timer mode (see **Table 18.116, Contents of TAUDnCMORm Register for Master Channels of PWM Output Function**).
- The operating mode for the slave channels should be set to one count mode (see **Table 18.119, Contents of TAUDnCMORm Register for Slave Channels of PWM Output Function**).
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channels should be set to Synchronous Channel Output Mode 1 (see **Section 18.4.4, Channel Output Modes**).

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDmCNT, and the counter starts counting down from the TAUDnCDRm value. If an INTTAUDnlm occurs on the master channel and TAUDTTOUTm (slave) is set/reset, PWM output is made.

- Master channel:
  When the master channel counter reaches 0000_H and the pulse cycle time has passed, INTTAUDnIm occurs. The counter loads TAUDnCDRm value into TAUDnCNTm and counts down.
- Slave channels:
  When INTTAUDnIm occurs on the master channel, the counter operation of the slave channel is triggered. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave) and the counter starts counting down from the TAUDnCDRm value. TAUDTTOUTm signal is set to the active level.
  When the counter reaches to 0000_H (duty time has elapsed), INTTAUDnIm occurs and a TAUDTTOUTm signal is set to an inactive level. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnlm (start of the next pulse cycle) of the master channel.

The counter can stop operating by setting the TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. See **Section 18.4.3, Simultaneous Rewrite**.

(2) Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUDnCDRm (slave) / (TAUDnCDRm (master) + 1) × 100

- Duty cycle = 0%
  TAUDnCDRm (slave) = 0000_H
- Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

(3) Block Diagram and General Timing Diagram

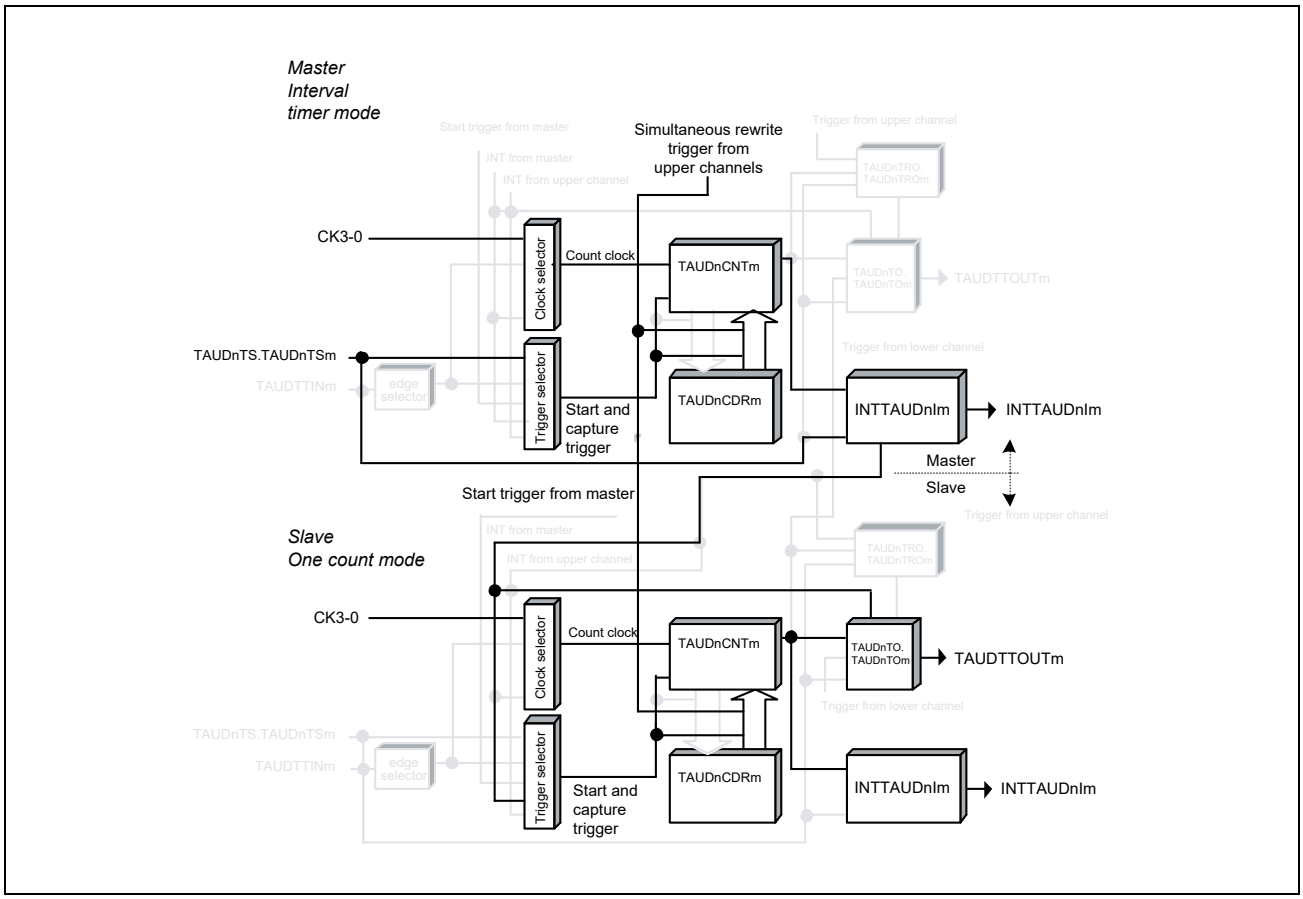

Figure 18.75 Block Diagram of PWM Output Function

The following settings apply to the general timing diagram.

- Slave channels: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

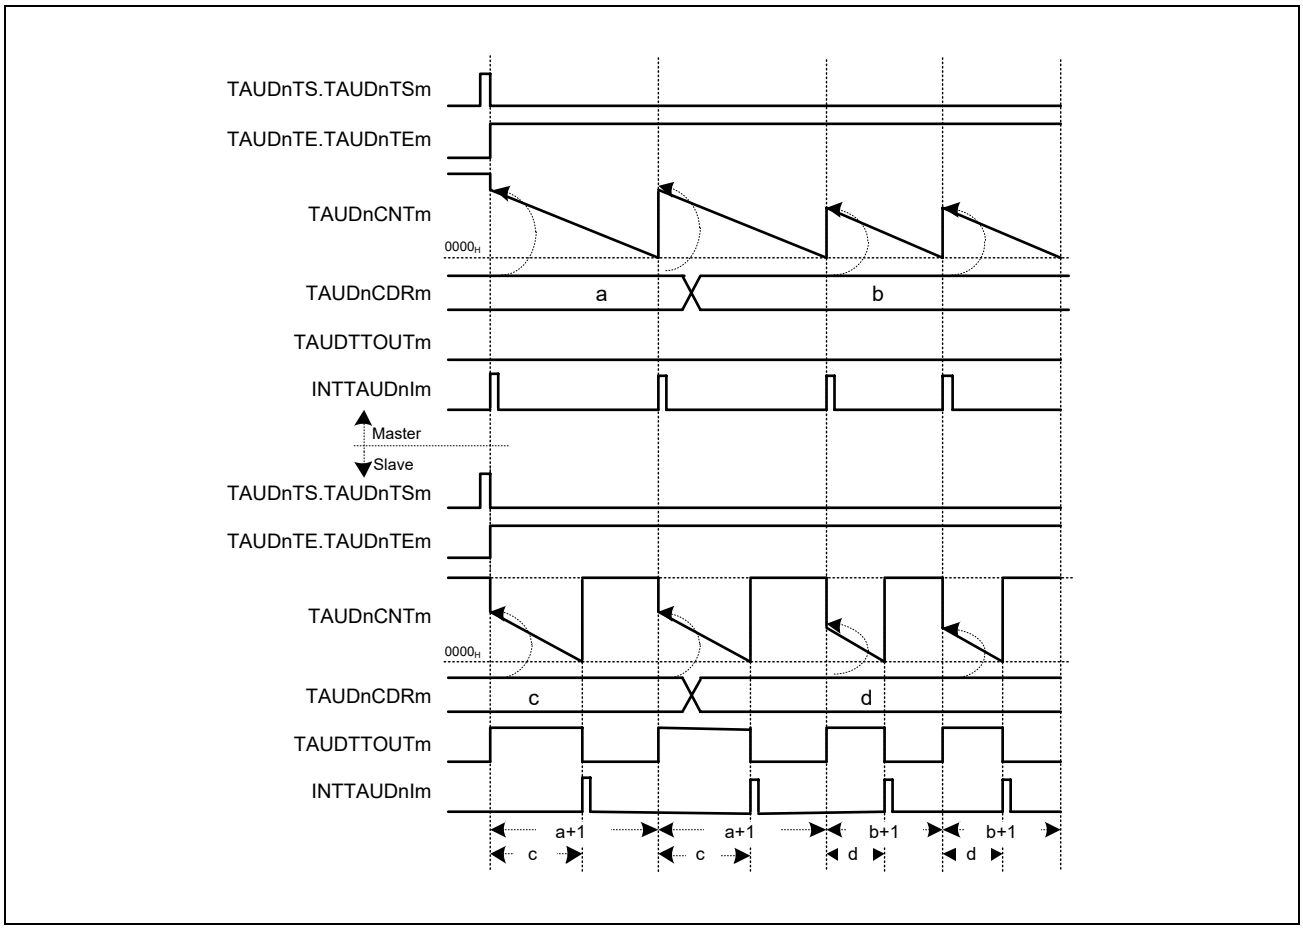

Figure 18.76 General Timing Diagram of PWM Output Function

NOTE

- The interval between the slave channel starting to count and an interrupt being generated is the value of corresponding TAUDnCDRm, whereas for the master channel the interval is the value of the corresponding TAUDnCDRm + 1.
- TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

(4) Register Settings for Master Channels

(a) TAUDnCMORm for master channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.116 Contents of TAUDnCMORm Register for Master Channels of PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	1: Channel is master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	1: INTTAUDnIm generated at the beginning of operation.

(b) TAUDnCMURm for master channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.117 Contents of TAUDnCMURm Register for Master Channels of PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for master channels

The channel output mode is not used with this function.

(d) Simultaneous rewrite for master channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.118 Simultaneous Rewrite Settings for Master Channels of the PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires an upper channel higher than the master channel that operates with the **Section 18.4.11.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Conduct operation settings under the following conditions:

- Simultaneous rewrite trigger output function type 1 setting channel: TAUDnRDCm = 1, TAUDnRDSm = 1
  TAUDnCDRm settings for this channel are as follows:
  = ((TAUDnCDRm setting for the master channel targeted for simultaneous rewrite + 1) × interrupt count) – 1
- Master channels: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channels: TAUDnRDCm = 0, TAUDnRDSm = 1

If TAUDnCDRm (slave) setting > TAUDnCDRm (master) setting + 1, the duty value (which exceeds 100%) is aggregated to be 100% output.

(5) Register Settings for Slave Channels

(a) TAUDnCMORm for slave channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.119 Contents of TAUDnCMORm Register for Slave Channels of PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is valid.

(b) TAUDnCMURm for slave channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.120 Contents of TAUDnCMURm Register for Slave Channels of PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for slave channels

Table 18.121 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for slave channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.122 Simultaneous Rewrite Settings for Slave Channels of PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(6) Operating Procedure for PWM Output Function

Table 18.123 Operating Procedure for PWM Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (5), Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set.
During operation	TAUDnCDRm can be changed at any time. TAUDnTOL.TAUDnTOLm can be changed. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000_H: • INTTAUDnIm (master) occurs. • TAUDnCDRm value is loaded into TAUDnCNTm (master) to continue count operation. • TAUDnCDRm value is loaded into TAUDnCNTm (slave) to perform counting down. • TAUDTTOUTm (slave) is set to the active level. If TAUDnCNTm (slave) reaches 0000_H: • INTTAUDnIm (slave) occurs. • TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(7) Specific Timing Diagrams

(a) Duty cycle = 0%

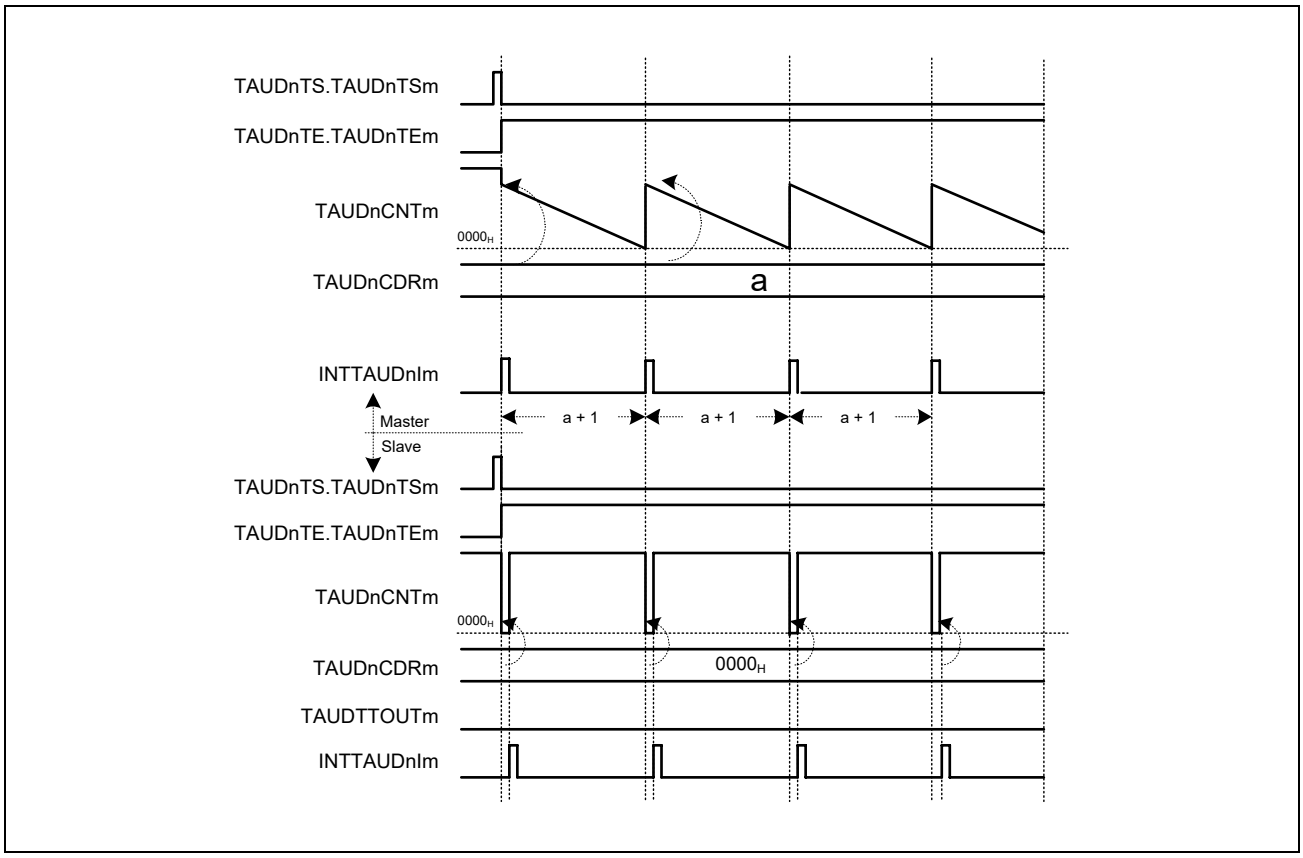

Figure 18.77 TAUDnCDRm (Slave) = 0000_H, Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- Every time the master channel generates an interrupt (INTTAUDnIm), 0000_H is loaded in to TAUDnCNTm (slave). Therefore, TAUDnCNTm (slave) cannot start to count and TAUDTTOUTm remains inactive.
- TAUDnCDRm value is loaded into TAUDnCNTm (slave) to generate an interrupt.

(b) Duty cycle = 100%

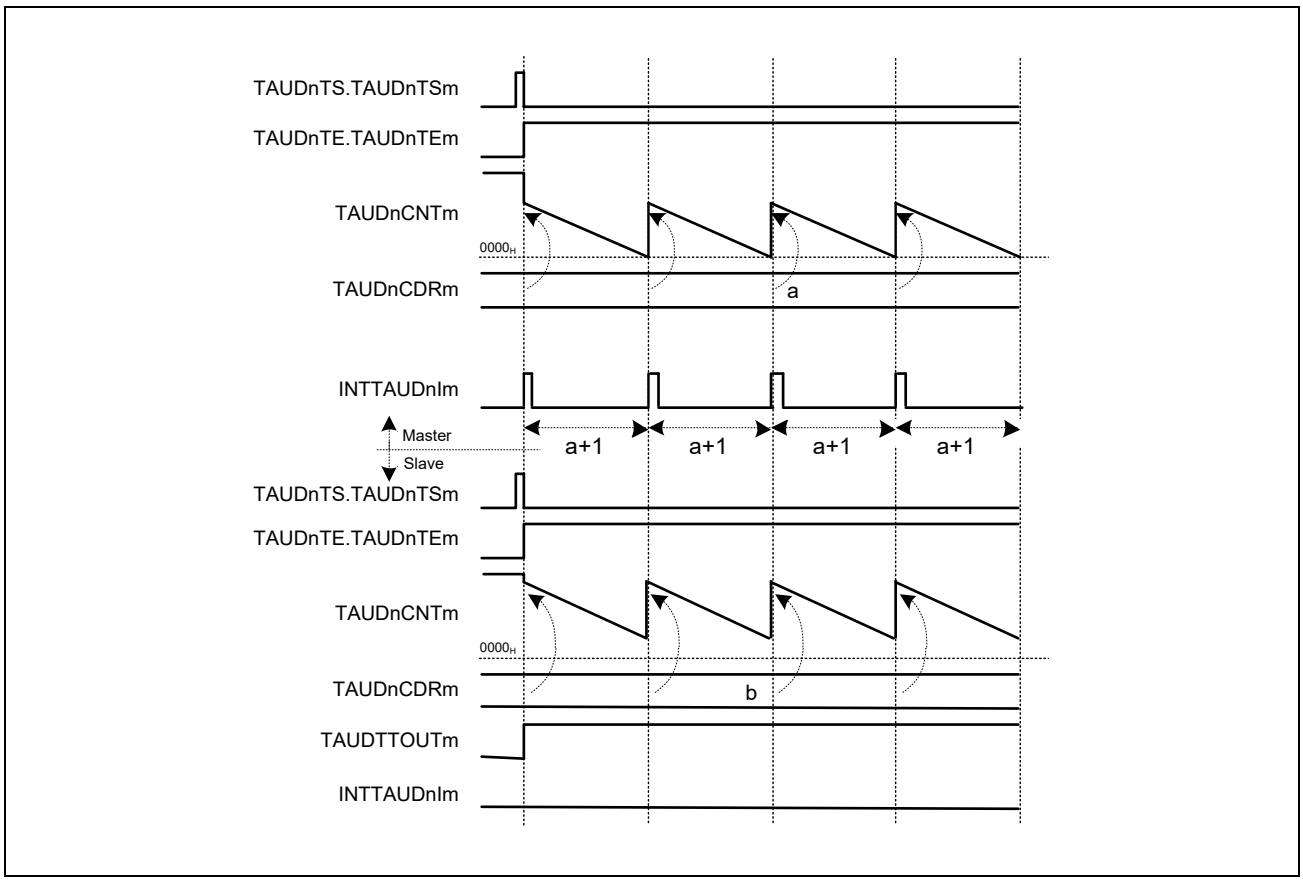

Figure 18.78 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1,
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- If TAUDnCDRm (slave) value is greater than TAUDnCDRm (master) value, the slave channel counter does not reach 0000_H and consequently, no interrupt occurs. TAUDTTOUTm remains active.

(c) Operation stop and restart

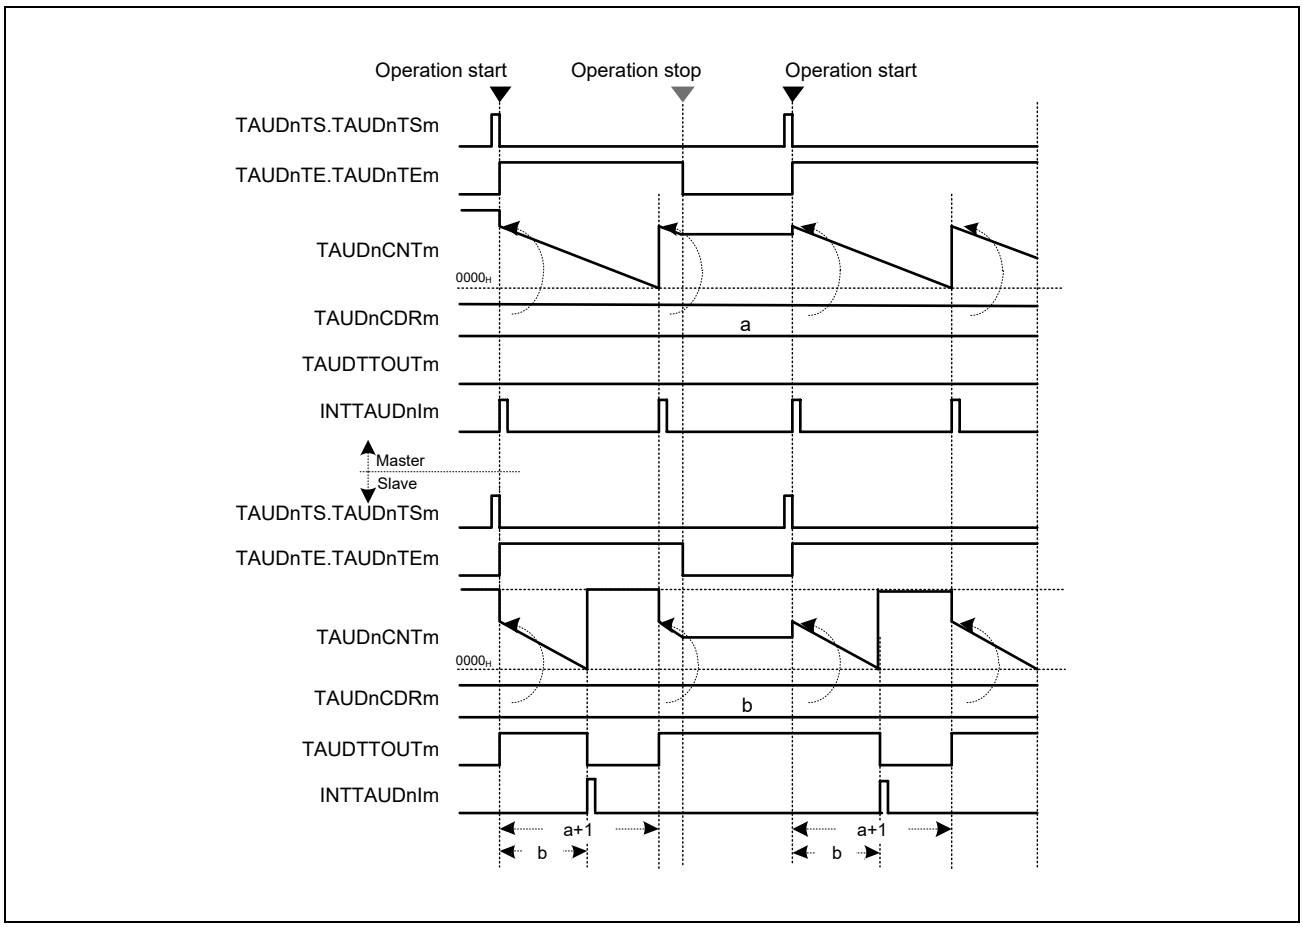

Figure 18.79 Operation Stop and Restart
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm and TAUDTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm of master and slave channels to 1. TAUDnCNTm of master and slave channels reload the current values of TAUDnCDRm and start to count down from these values.

18.4.12.2 One-Shot Pulse Output Function

(1) Overview

Summary

This function outputs a signal pulse with a specific pulse width and delay time (both defined relative to an external input signal pulse or software trigger) by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

Prerequisites

- It requires two channels.
- The operating mode for the master channel should be set to one-count mode (see **Table 18.124, Contents of TAUDnCMORm Register for Master Channels of One-Shot Pulse Output Function**).
- The operating mode for slave channels should be set to pulse one-count mode (see **Table 18.127, Contents of TAUDnCMORm Register for Slave Channels of One-Shot Pulse Output Function**).
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channel should be set to synchronous channel output mode 2 (see **Section 18.4.4, Channel Output Modes**).
- TAUDTTINm (master) has to be detected while TAUDnCNTm (master) and TAUDnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUDTTINm (slave).
- If only a software trigger is to be used, do not select the alternative pin function TAUDTTINm.

Functional description

The counters are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm, enabling count operation.

- Master channel:
  When the next effective TAUDTTINm input edge or a software trigger (TAUDnTS.TAUDnTSm = 1 (m: master channel number) when TAUDnTE.TAUDnTEm = 1) is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm. The counter starts to count down from this value. If TAUDnCMORm.TAUDnMD0 = 0, a trigger (TAUDTTINm) which is detected within the delay time is ignored.
  When the counter of master channel reaches 0000_H, INTTAUDnIm is generated. The counter is reset to $FFFF_H$ and waits for the next effective TAUDTTINm input edge or a software trigger (TAUDnTS.TAUDnTSm = 1 (m: master channel number) when TAUDnTE.TAUDnTEm = 1).
- Slave channels:
  INTTAUDnIm generated on master channel triggers the counter operation of slave channel. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave). The counter starts counting down from this value. An interrupt occurs and the TAUDTTOUTm signal is set. When the counter reaches 0001_H, INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter stops at 0000_H and waits for the next INTTAUDnIm of master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Setting TAUDnTS.TAUDnTSm to 1 while counting allows the counter to restart counting of master channel without making a stop (forced restart).

Conditions

- If TAUDnCMORn.TAUDnMD0 of master channel is set to 0, TAUDTTINm input edges detected during counting are ignored.
- Simultaneous rewrite can be used with this function. See **Section 18.4.3, Simultaneous Rewrite**.

(2) Equations

Delay from trigger input to pulse output = (TAUDnCDRm (master) + 1) × count clock cycle

Pulse width = (TAUDnCDRm (slave)) × count clock cycle

(3) Block Diagram and General Timing Diagram

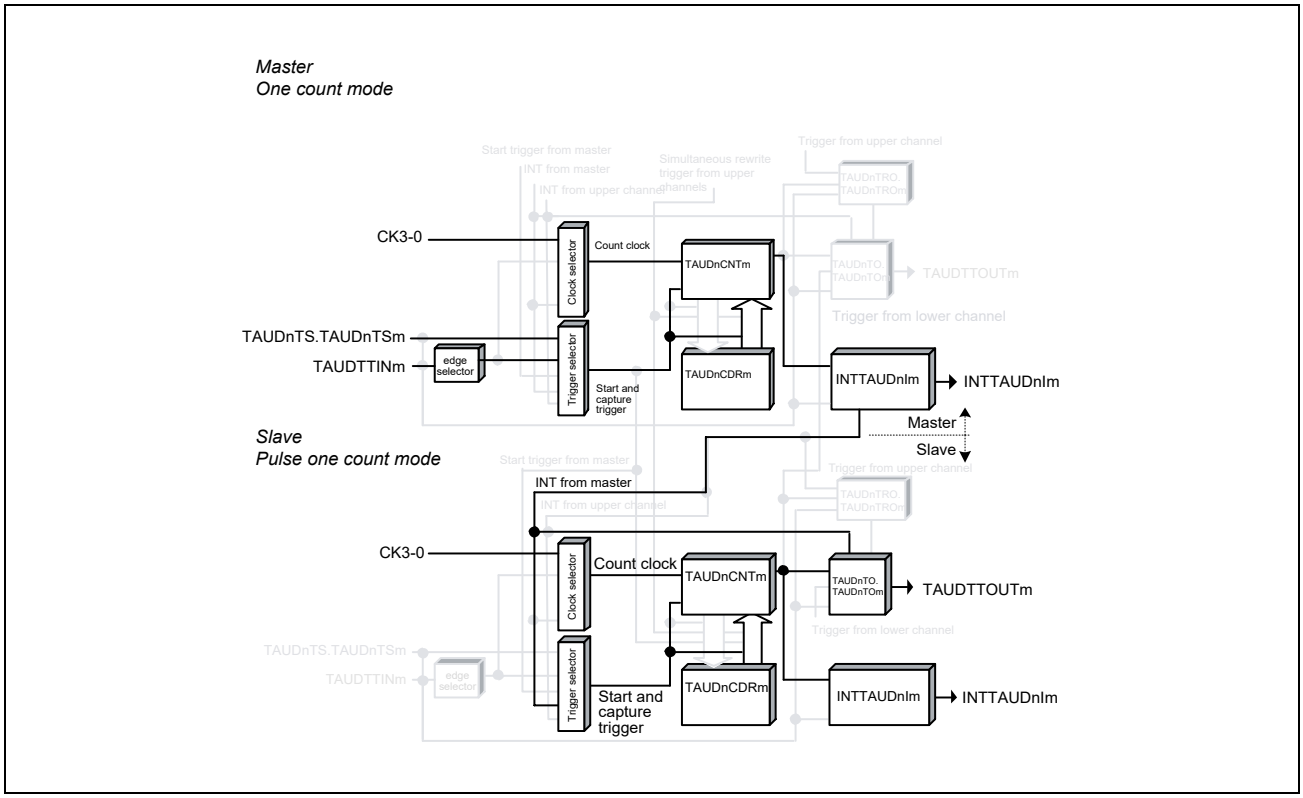

Figure 18.80 Block Diagram of One-Shot Pulse Output Function

The settings in **Figure 18.81, General Timing Diagram of One-Shot Pulse Output Function (in the Case of an External Input Signal)** and **Figure 18.82, General Timing Diagram of One-Shot Pulse Output Function (in the Case of a Software Trigger)** are as follows.

- Start trigger detection is disabled during counting (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

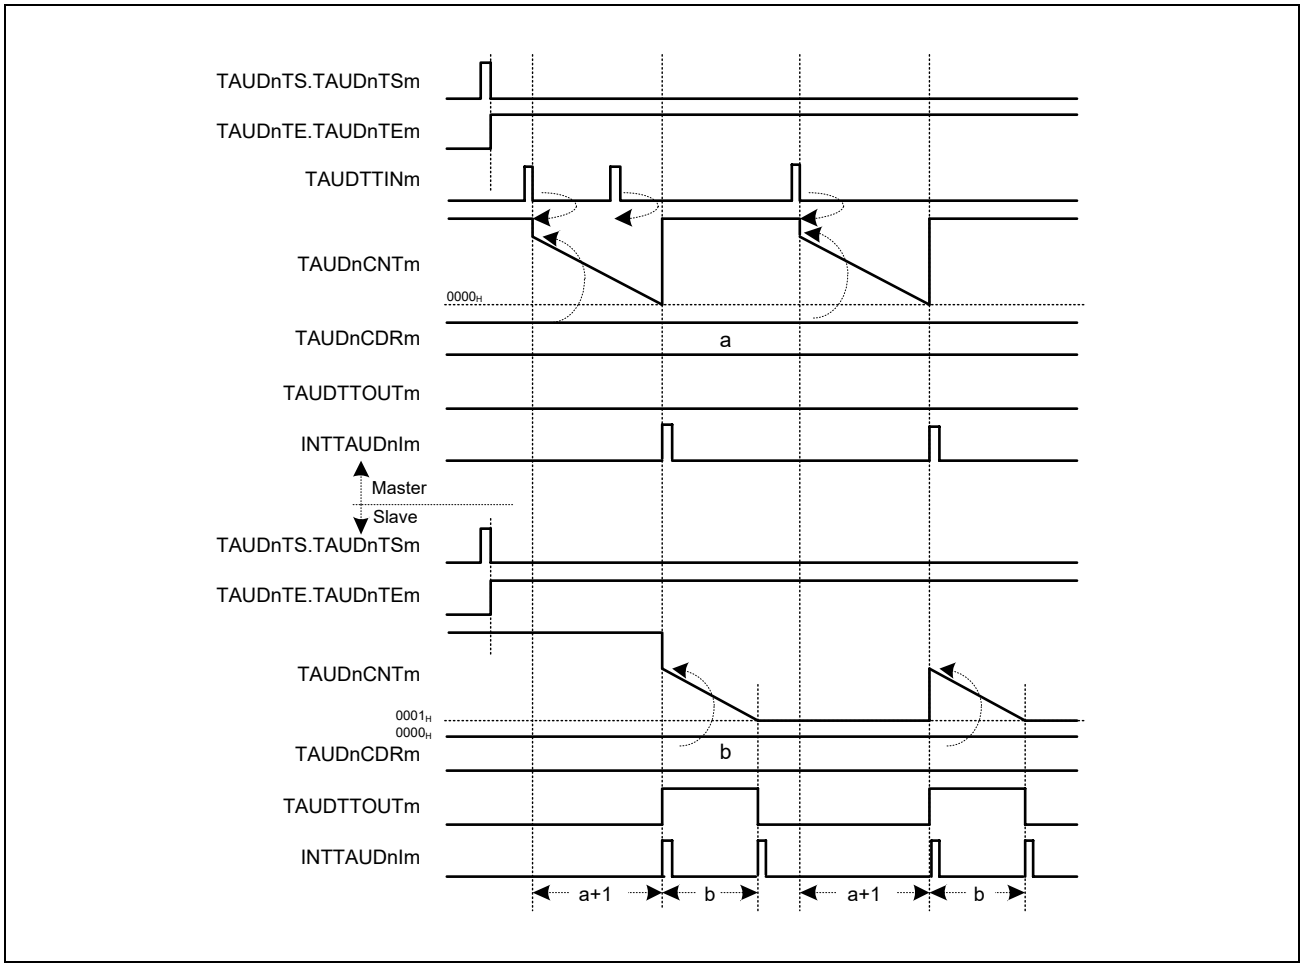

Figure 18.81 General Timing Diagram of One-Shot Pulse Output Function (in the Case of an External Input Signal)

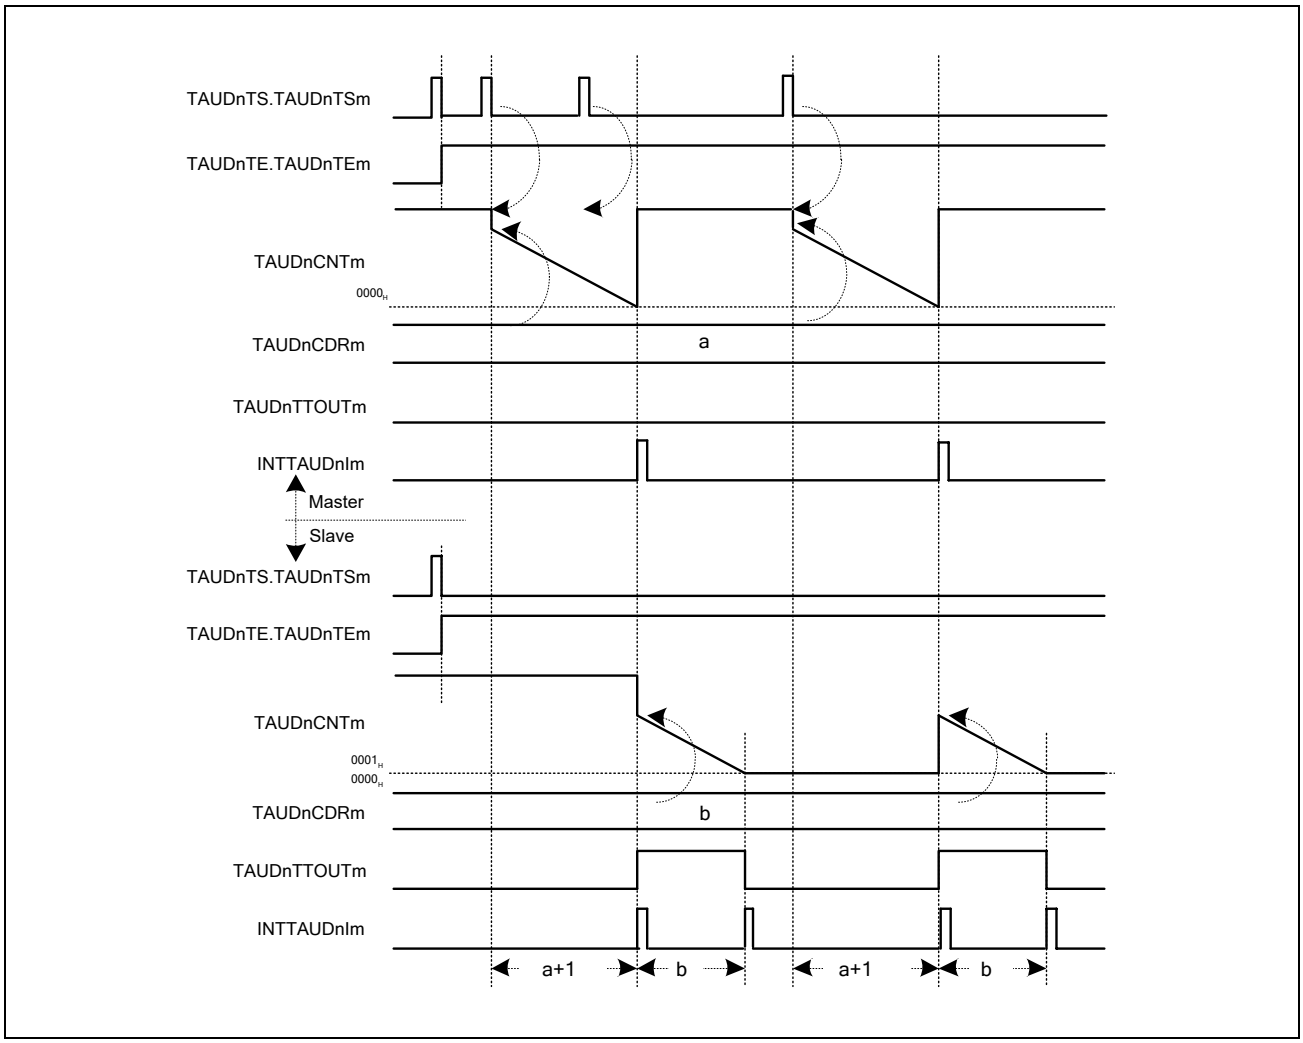

Figure 18.82 General Timing Diagram of One-Shot Pulse Output Function (in the Case of a Software Trigger)

(4) Register Settings for Master Channels

(a) TAUDnCMORm for master channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges

(c) Channel output mode for master channels

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

(d) Simultaneous rewrite for master channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.126 Simultaneous Rewrite Settings for Master Channels of One-Shot Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(5) Register Settings for Slave Channels

(a) TAUDnCMORm for slave channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1010: Pulse one-count mode
0	TAUDnMD0	0: Disables detection of start trigger during count operation. 1: Enables start trigger detection while counting. TAUDnMD0 bit of master and slave channels should have the same value.

(b) TAUDnCMURm for slave channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.128 Contents of TAUDnCMURm Register for Slave Channels of One-Shot Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for the slave channel

Table 18.129 Control Bit Settings in Independent Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for slave channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.130 Simultaneous Rewrite Settings for Slave Channels of One-Shot Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(6) Operating Procedure for One-Shot Pulse Output Function

Table 18.131 Operating Procedure for One-Shot Pulse Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channels: Set TAUDnCMORm/ TAUDnCMURm register and channel output mode as described in **Section (5), Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the master channel awaits a TAUDTTINm input.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	When an effective TAUDTTINm input edge is detected, TAUDnCDRm value of master channel is loaded into TAUDnCNTm to start countdown. When the counter reaches 0000_H: • INTTAUDnIm (master) occurs. • TAUDnCNTm (master) returns to $FFFF_H$ and awaits the next effective TAUDTTINm input edge. • The TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to start counting down. • INTTAUDnIm (slave) occurs. • TAUDTTOUTm (slave) is set. When TAUDnCNTm (slave) reaches 0001_H: • INTTAUDnIm (slave) occurs. • TAUDTTOUTm (slave) is reset. In addition, the counter of slave channel stops. If TAUDTTINm input is detected on the master channel during count operation and TAUDnCMORm.TAUDnMD0 = 0, the input is ignored.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(7) Specific Timing Diagrams

(a) TAUDnCDRm (master) = 0000_H

The following settings apply to this diagram:

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

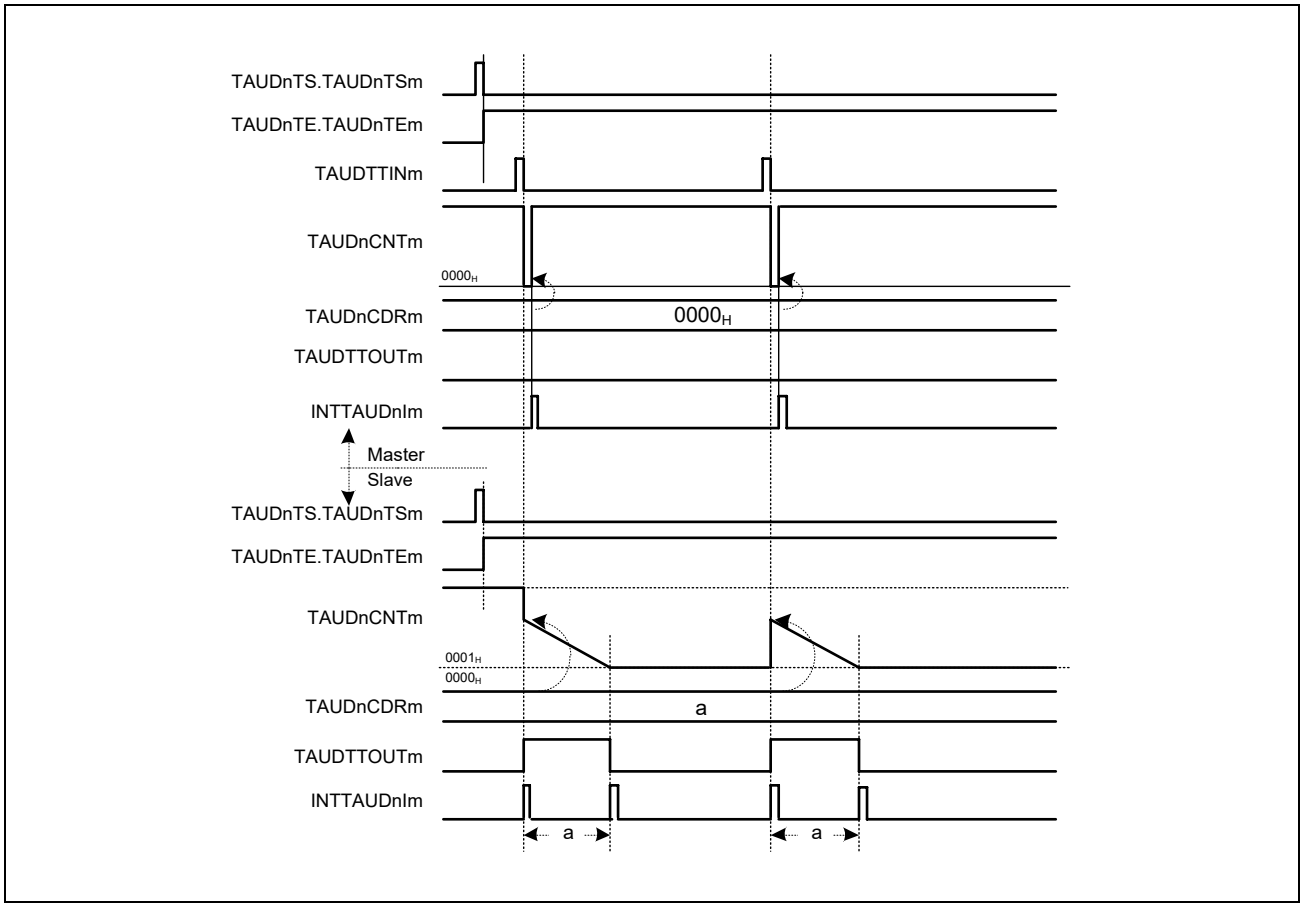

Figure 18.83 TAUDnCDRm (Master) = 0000_H

- When an effective TAUDTTINm input edge is detected, the value 0000_H is written to TAUDnCNTm (master). The counter is set to 0000_H for one count and returns to $FFFF_H$. Thus the slave channel starts to count down one count clock later to TAUDTTINm (master).

(b) TAUDnCDRm (slave) = 0000_H

The following settings apply to this diagram:

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

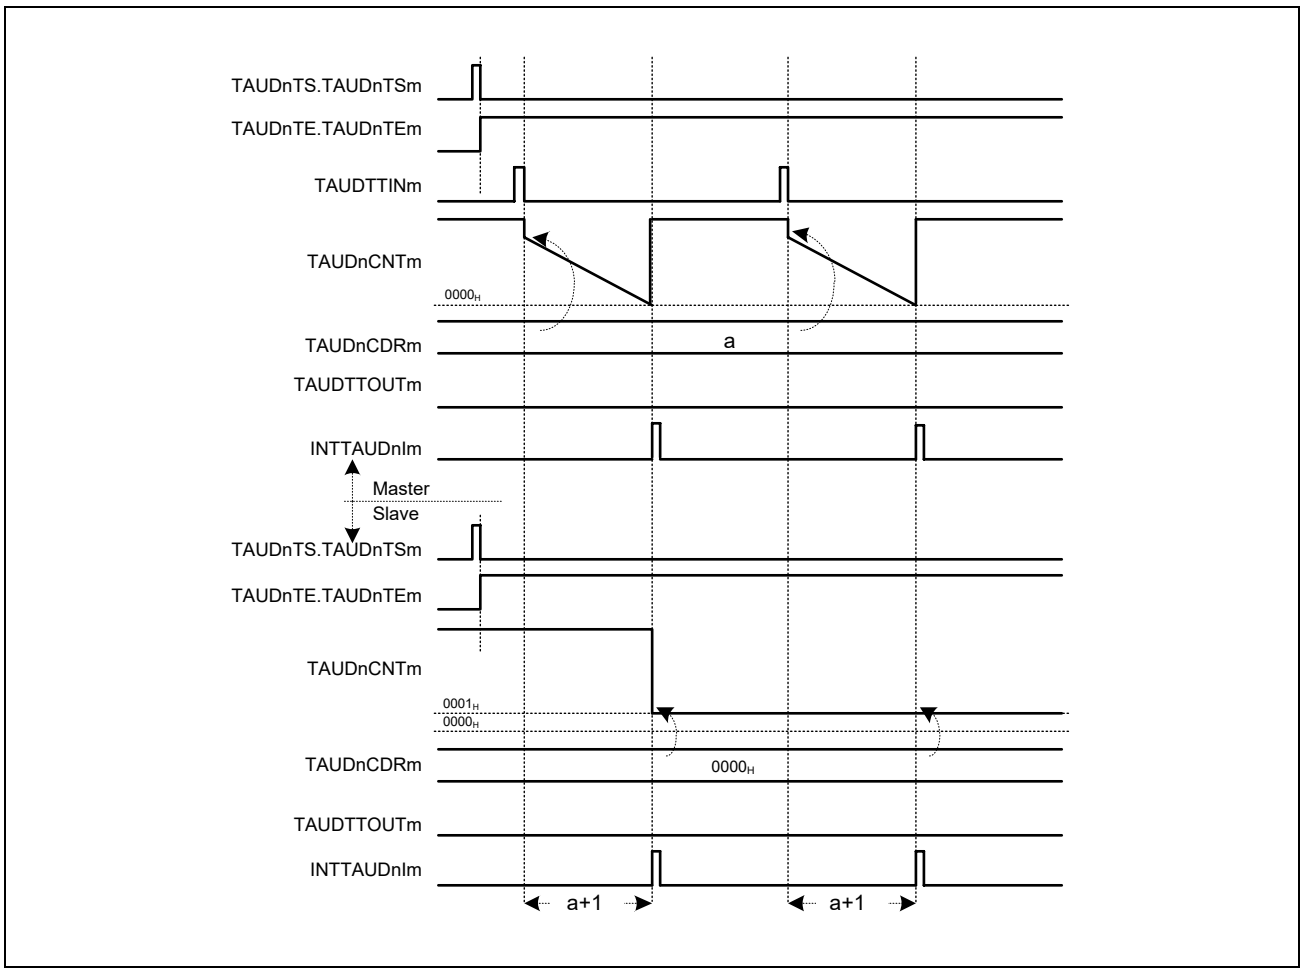

Figure 18.84 TAUDnCDRm (Slave) = 0000_H

- TAUDTTOUTm remains at not active state, because the pulse width is zero.

(c) TAUDnCMORm.TAUDnMD0 = 1

The following settings apply to this diagram:

- Enables start trigger detection while counting. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

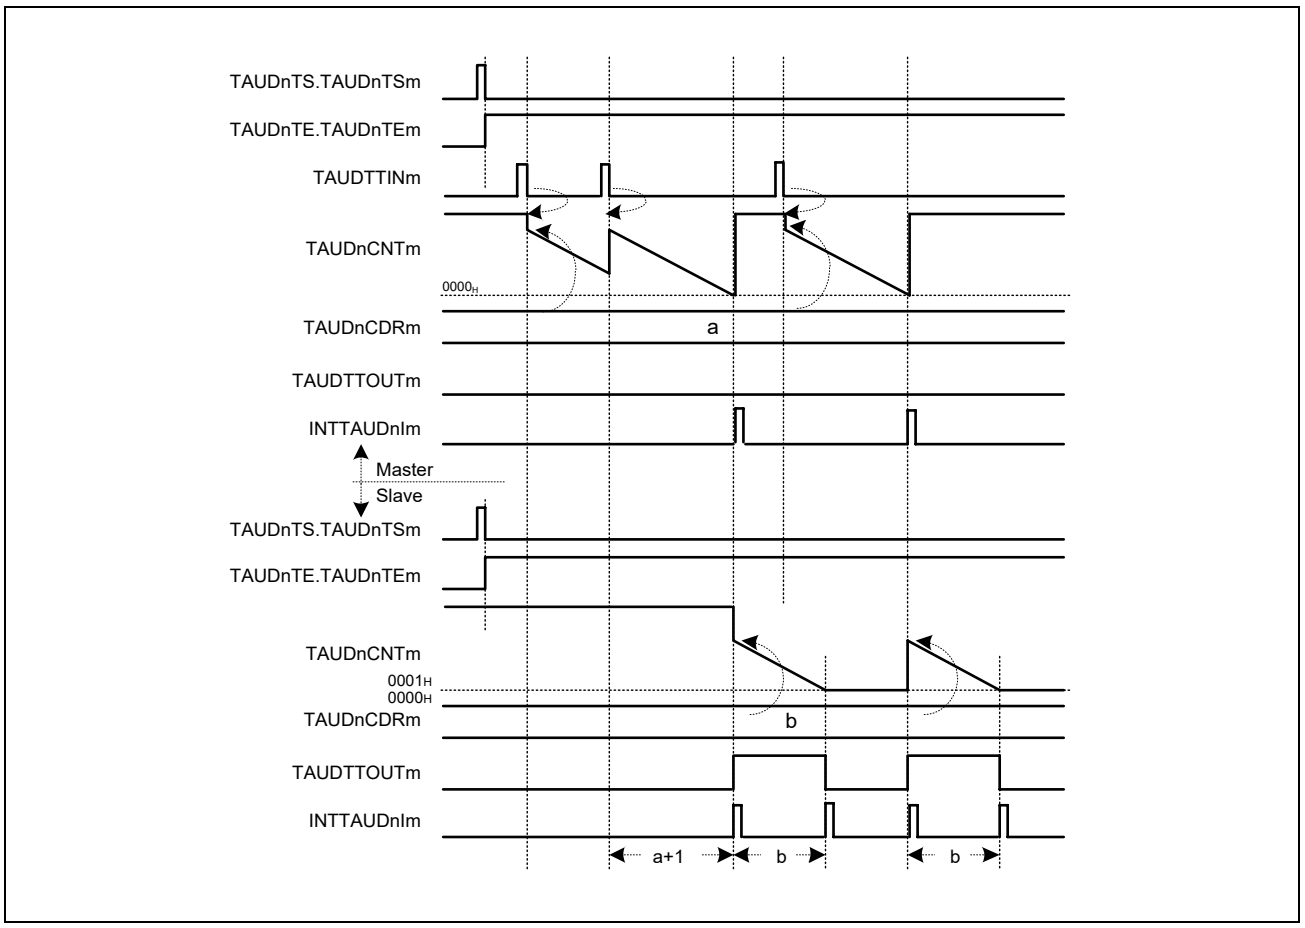

Figure 18.85 TAUDnCMORm.TAUDnMD0 = 1

- If an effective TAUDTTINm input edge is detected while the counter of the master channel counts down, TAUDnCNTm reloads the value of TAUDnCDRm. The counter restarts to count down. This means the delay is extended by the value of TAUDnCNTm at the time an effective TAUDTTINm input edge is detected.

(d) Restarting the master channel while the slave channel is counting

The following settings apply to this diagram:

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

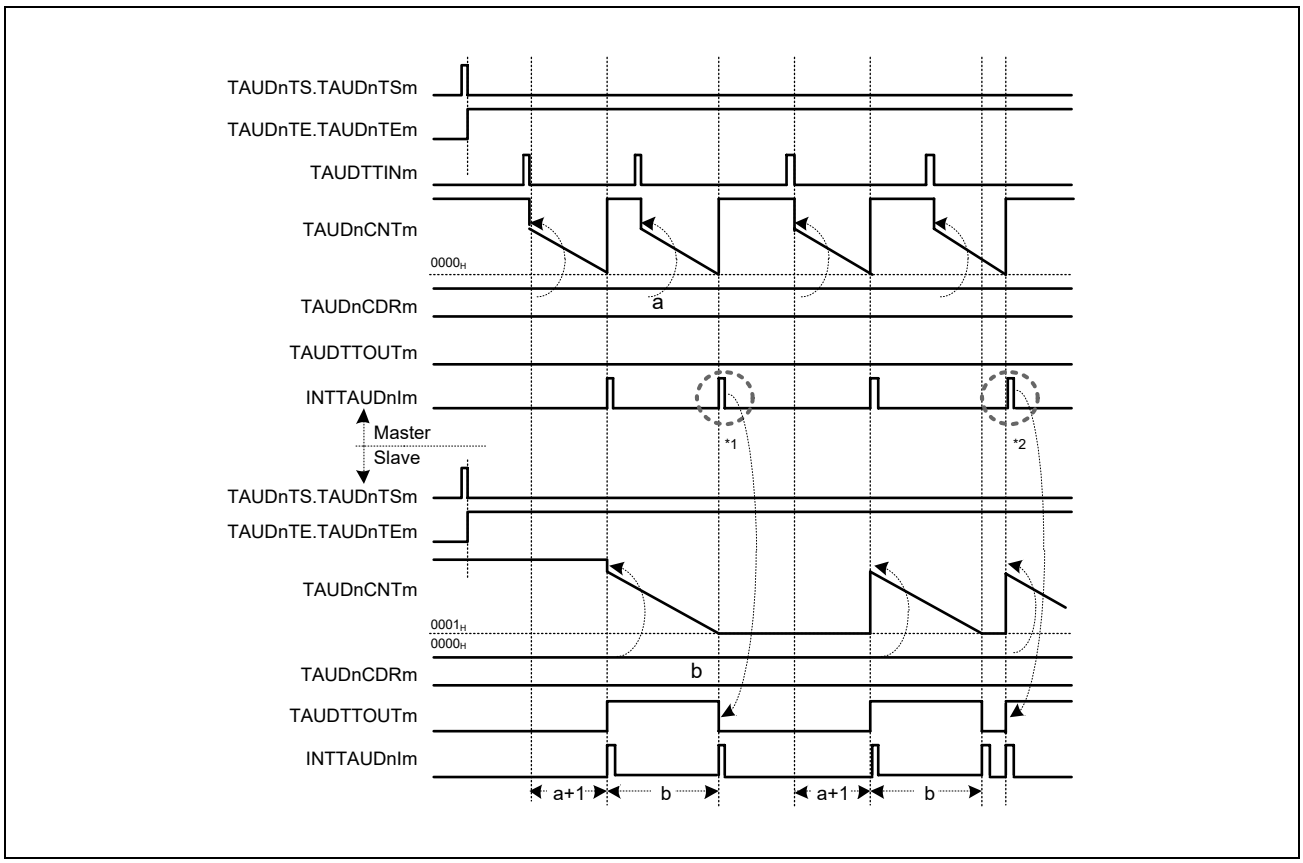

Figure 18.86 Interval of TAUDTTINm ≤ delay time + pulse width + 1

- If the master channel generates an interrupt before the counter of the slave channel has reached 0001_H or exactly when 0001_H is reached (*1), the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUDnCDRm (slave) is reloaded. An interrupt is generated and TAUDTTOUTm toggles. If TAUDnCNTm (master) has started to count down while the TAUDnCNTm (slave) is still counting (*2), TAUDTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

18.4.12.3 Trigger Start PWM Output Function

(1) Overview

Summary

This function generates a PWM output using a master and a slave channel. It enables the pulse cycle (frequency) and the duty of the TAUDTTOUTm to be set. The pulse cycle is specified using the master channel. The duty is specified using the slave channel. The Trigger Start PWM Output Function is identical to the PWM Output Function except that the master channel of this function can be reset by an effective TAUDTTINm input edge.

Prerequisites

- It requires two channels.
- The operation mode of the master channel must be set to Interval Timer Mode (see **Table 18.132, Contents of the TAUDnCMORm Register for the Master Channel of the Trigger Start PWM Output Function**).
- The operation mode of the slave channel must be set to One-Count Mode (see **Table 18.135, Contents of the TAUDnCMORm Register for Slave Channels of the Trigger Start PWM Output Function**).
- The channel output mode of the slave channel must be set to Synchronous Channel Output Mode 1 (see **Section 18.4.4, Channel Output Modes**).
- TAUDTTOUTm is not used with the master channel of this function.

Functional description

The counters (master and slave) are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm, enabling counting. The current value of TAUDnCDRm is loaded to TAUDnCNTm, and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel, and a PWM output is realized by setting and resetting TAUDTTOUTm (slave).

- Master channel:
  The current value of TAUDnCDRm is loaded to the counter (TAUDnCNTm), INTTAUDnIm is generated and the counter starts to count down from this value.
  When the counter reaches 0000_H and the pulse cycle time has elapsed, INTTAUDnIm is generated and the counters (master and slave) reload the current TAUDnCDRm values.
  If an effective TAUDTTINm input edge is detected, the counter of the master channel reloads the current TAUDnCDRm value, restarts counting down and generates an interrupt.
- Slave channel:
  When the slave detects an interrupt from the master channel, it starts to count down from the current value of TAUDnCDRm. The TAUDTTOUTm signal is set to the active level.
  When the counter reaches 0000_H (duty time has elapsed), INTTAUDnIm is generated and the TAUDTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channel, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channel stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. See **Section 18.4.3, Simultaneous Rewrite.**

(2) Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = [TAUDnCDRm (slave) / (TAUDnCDRm (master) + 1)] × 100

- Duty cycle = 0%
  TAUDnCDRm (slave) = 0000_H
- Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

(3) Block Diagram and General Timing Diagram

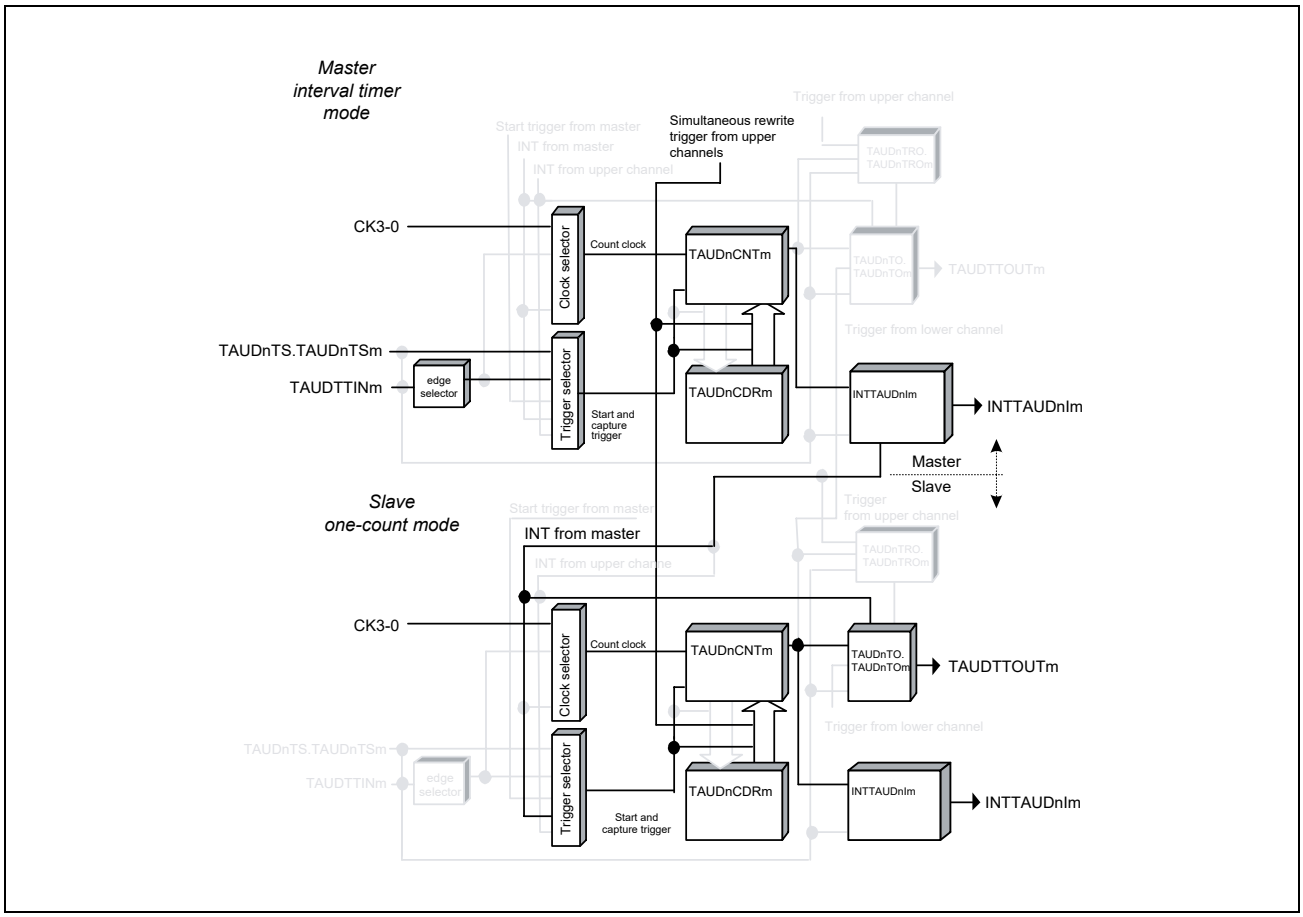

Figure 18.87 Block Diagram for Trigger Start PWM Output Function

The following settings apply to the general timing diagram.

- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)
- Positive logic (TAUDnTOL.TAUDnTOLm (slave) = 0)

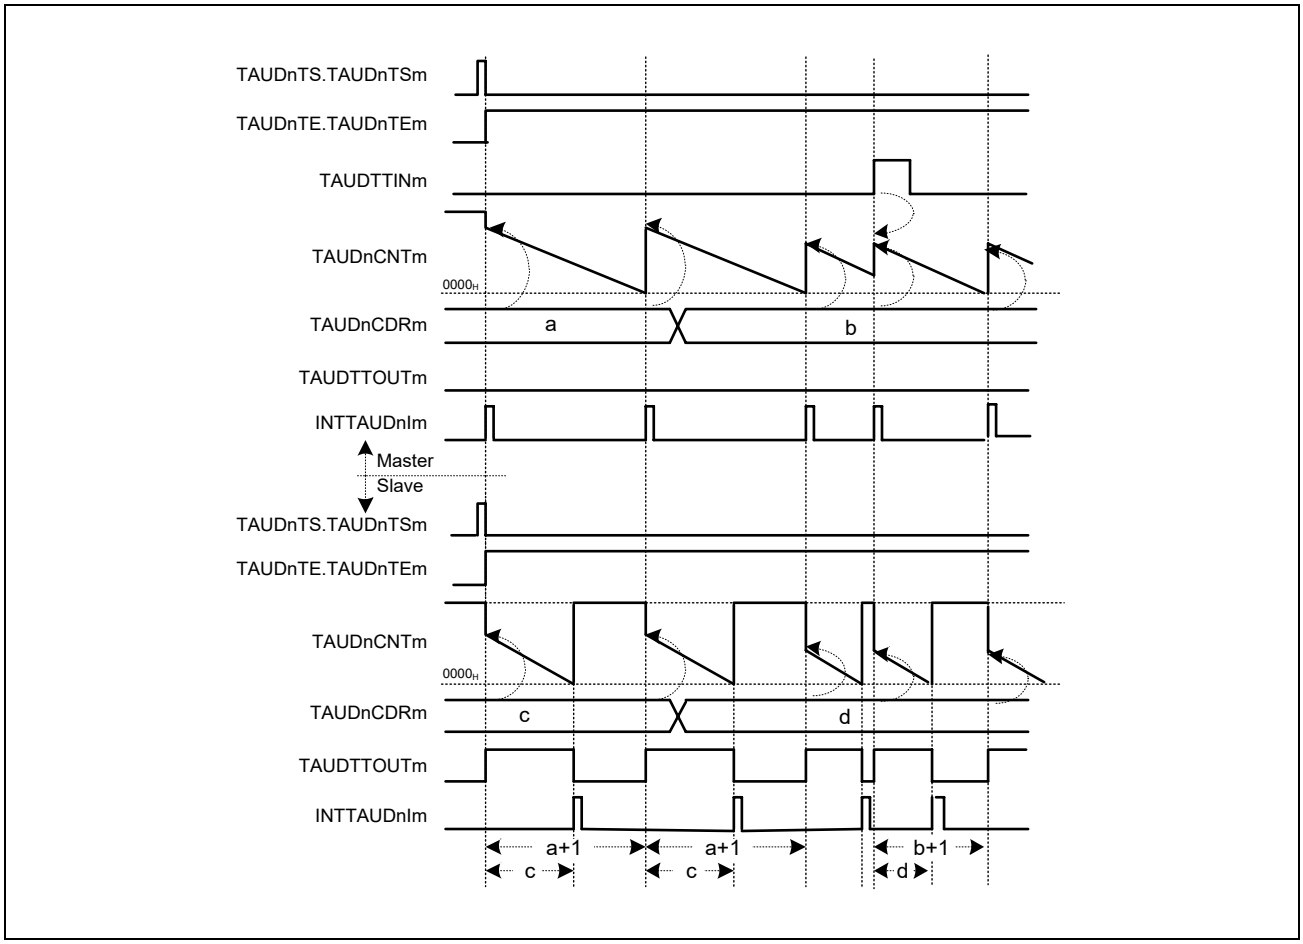

Figure 18.88 General Timing Diagram for Trigger Start PWM Output Function

NOTE

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

(4) Register Settings for Master Channels

(a) TAUDnCMORm for master channels

7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for slave channels

Table 18.137 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode.
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation.
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation.
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0.
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output.
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0.
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel.
TAUDnTME.TAUDnTMEm	0: Disables modulation.

(d) Simultaneous rewrite for slave channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.138 Simultaneous Rewrite Settings for Slave Channels of the Trigger Start PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(6) Operating Procedure for the Trigger Start PWM Output Function

Table 18.139 Operating Procedure for the Trigger Start PWM Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set the TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channels: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section (5), Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channels loads the TAUDnCDRm value and counts down. When the counter reaches 0000_H: • INTTAUDnIm (master) occurs. • The TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue counting. • The TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to start counting down. • TAUDTTOUTm (slave) is set. When TAUDnCNTm of the slave = 0000_H: • INTTAUDnIm (slave) occurs. • TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops. If a TAUDTTINm input is detected on the master channel while the counter is counting down: • TAUDnCNTm (master and slave) reloads the TAUDnCDRm value and counts down. • INTTAUDnIm (master) occurs. • TAUDTTOUTm (slave) is set to the active level.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(7) Specific Timing Diagrams

(a) Duty cycle = 0%

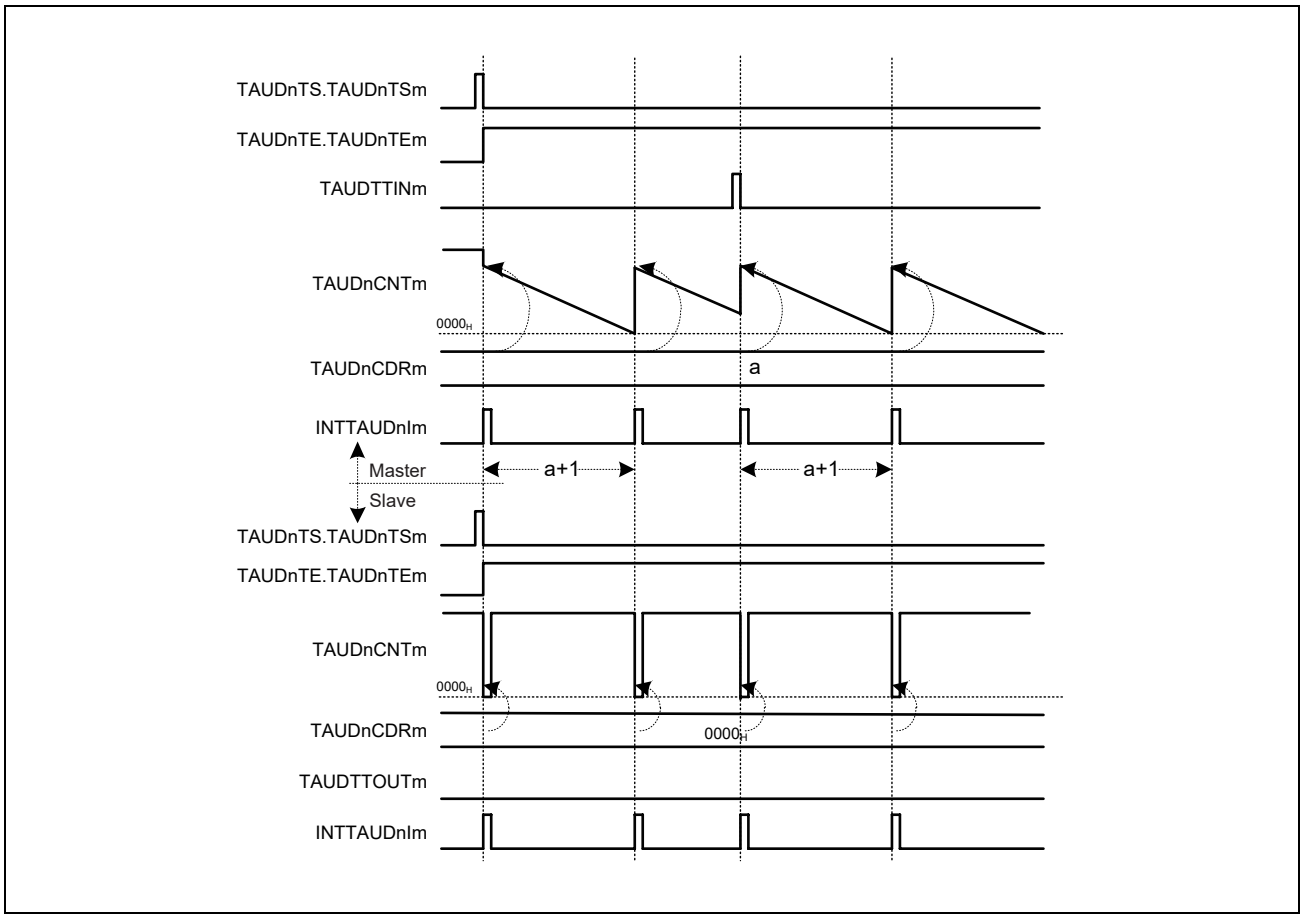

Figure 18.89 TAUDnCDRm (Slave) = 0000_H, Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0) Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

- Every time the master channel generates an interrupt (INTTAUDnIm), 0000_H is written to TAUDnCNTm (slave). Therefore, TAUDnCNTm (slave) cannot start to count and TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The detection of an effective TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).

(b) Duty cycle = 100%

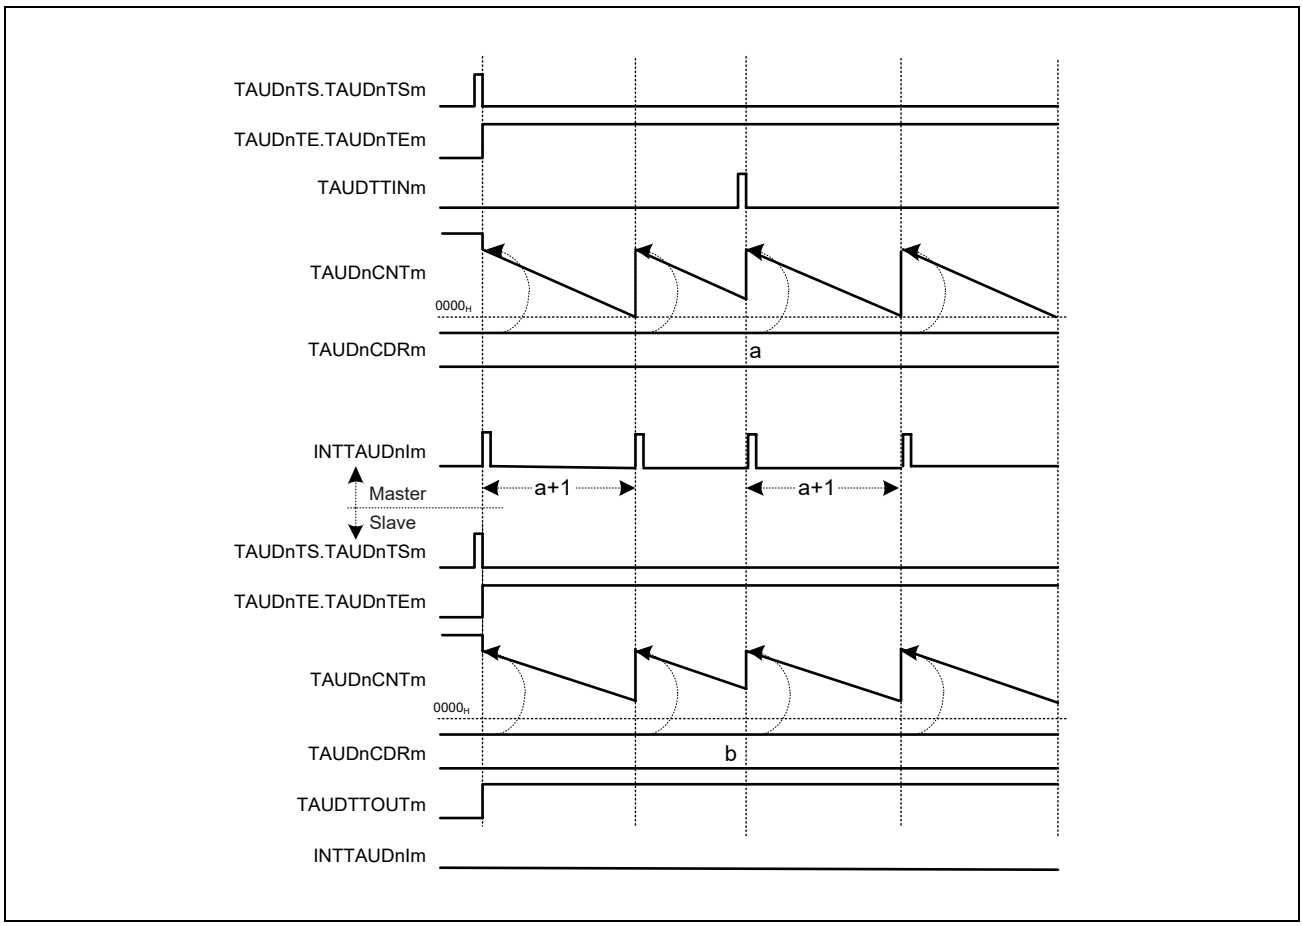

Figure 18.90 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1, Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0) Detection of Falling Edge (TAUDnCMURm.TIS[1:0] = 00_B)

- If the value of TAUDnCDRm (slave) is higher than the value of TAUDnCDRm (master), the counter of the slave channels cannot reach 0000_H and cannot generate interrupts.
  The TAUDTTOUTm remains in the active state.
  The detection of an effective TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).

(c) TAUDTTINm detection and active slave counter

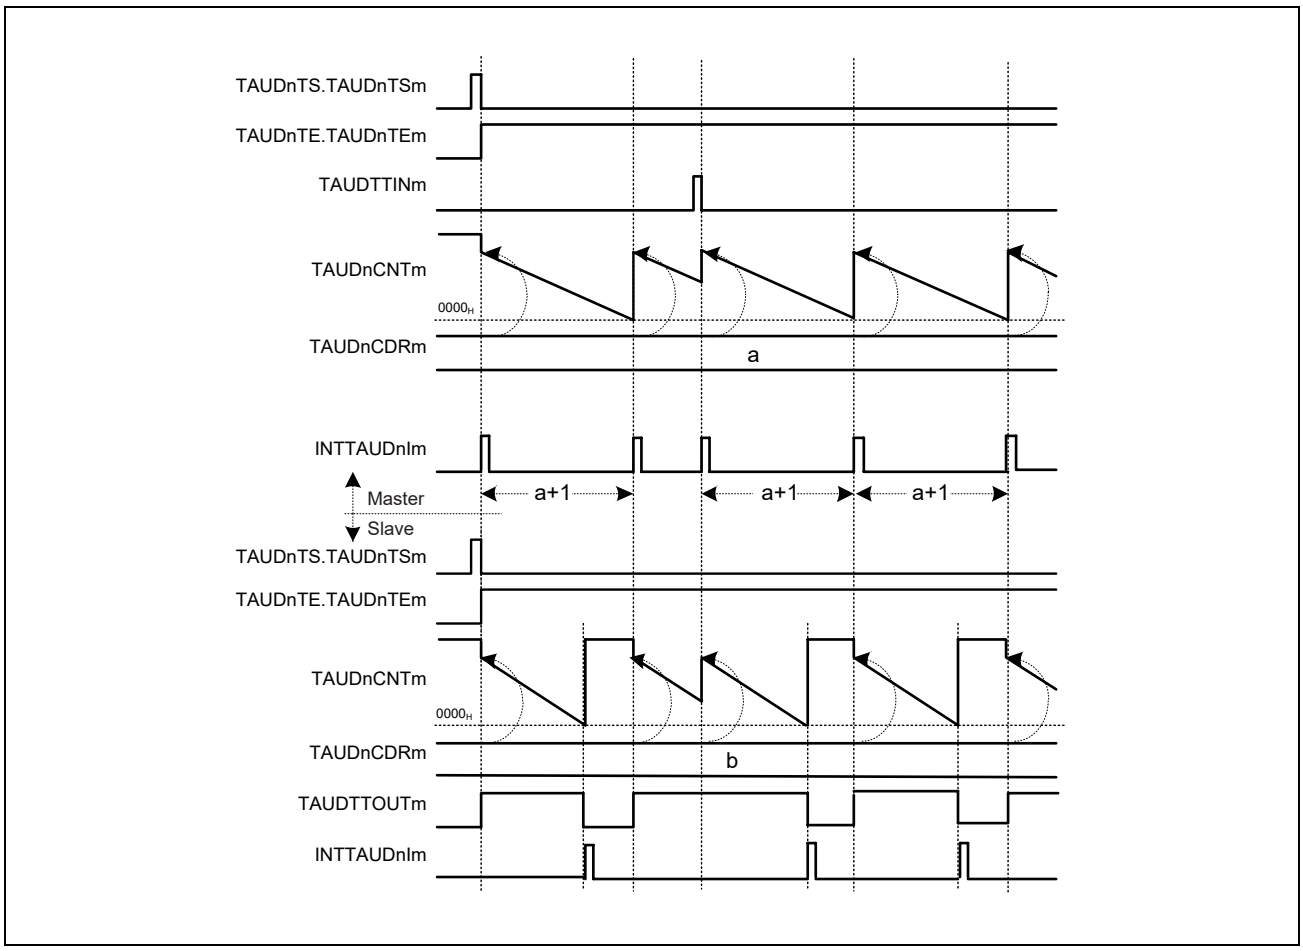

Figure 18.91 Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0), Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

- If TAUDnCNTm (slave) reloads the value of TAUDnCDRm (slave) while it is still counting down, TAUDTTOUTm cannot toggle and extends the duty.
  The duty does not correspond to the value of the slave's data register.

18.4.12.4 Delay Pulse Output Function

(1) Overview

Summary

This function outputs two signals. The pulse width and pulse cycle of the reference signal are defined using the master channel and slave channel 1. Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by the amount specified on slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1. The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified on slave channel 2.

Prerequisites

- It requires four channels.
- The operating mode for the master channel should be set to interval timer mode (see **Table 18.140, Contents of TAUDnCMORm Register for Master Channels of Delay Pulse Output Function**).
- The operating mode for slave channels 1 and 2 should be set to one-count mode (see **Table 18.143, Contents of TAUDnCMORm Register for Slave Channel 1 of Delay Pulse Output Function**).
- The operating mode for slave channel 3 should be set to pulse one-count mode (see **Table 18.147, Contents of TAUDnCMORm Register for Slave Channel 2 of Delay Pulse Output Function**).
- TAUDTTOUTm is not used with the master channel and slave channel 2.
- The channel output mode for slave channel 1 should be set to synchronous channel output mode 1 (see **18.4.4, Channel Output Modes**).
- The channel output mode for slave channel 3 should be set to independent channel output mode 2 (see **18.4.4, Channel Output Modes**).

Functional description

The counters of the channel group are started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation.

- Master channel:
  The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel.
  When the counter value of master channel reaches 0000_H and pulse cycle time has elapsed, INTTAUDnIm is generated. The TAUDnCDRm value is reloaded into the counter to perform count down.
- Slave channels 1 and 2:
  Slave channels 1 and 2 start to count down from the current TAUDnCDRm value when detecting an interrupt from the master channel. TAUDTTOUTm signal (slave 1) is set.
  - Slave channel 1:
    When the counter of slave channel 1 reaches 0000_H (duty time has elapsed), INTTAUDnlm is generated and TAUDTTOUTm signal is reset. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnlm of master channel.
  - Slave channel 2:
    When the counter of slave channel 2 reaches 0000_H and delay time has elapsed, INTTAUDnIm is generated. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnlm of master channel.
    Generating INTTAUDnIm (slave channel 2) triggers the counter of slave channel 3.
- Slave channel 3:
  When slave channel 3 detects an interrupt from slave channel 2, its counter starts counting down from the current value of TAUDnCDRm. INTTAUDnIm is generated and the TAUDTTOUTm signal (slave channel 3) is set.
  When the counter of slave channel 3 reaches 0001_H, INTTAUDnIn is generated and the TAUDTTOUTm signal is reset.
  The delayed PWM pulse is output from slave channel 3.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. See **Section 18.4.3, Simultaneous Rewrite**.

(2) Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty width 1 = (TAUDnCDRm (slave 1)) × count clock cycle

Delay width = (TAUDnCDRm (slave 2) + 1) × count clock cycle

Duty width 2 = (TAUDnCDRm (slave 3)) × count clock cycle

However, the delay width shall be set within the following range:

$0000_H \leq$ TAUDnCDRm (slave 2) < TAUDnCDRm (master)

NOTES

1. The waveform of TAUDTTOUTm (slave 3) becomes the waveform made by delaying the waveform of TAUDTTOUTm (slave 1) by the quantity generated by slave 2. It is impossible to make a delay longer than the pulse cycle.
2. If INTTAUDnIm of slave 2 is generated while slave 3 is counting, slave 3 restarts operation. Therefore, the waveform of TAUDTTOUTm (slave 3) is retained on the active level. In this case, TAUDTTOUTm (Slave-CH-3) cannot output the waveform generated by delaying the basic pulse of TAUDTTOUTm (Slave-CH-1).

(3) Block Diagram and General Timing Diagram

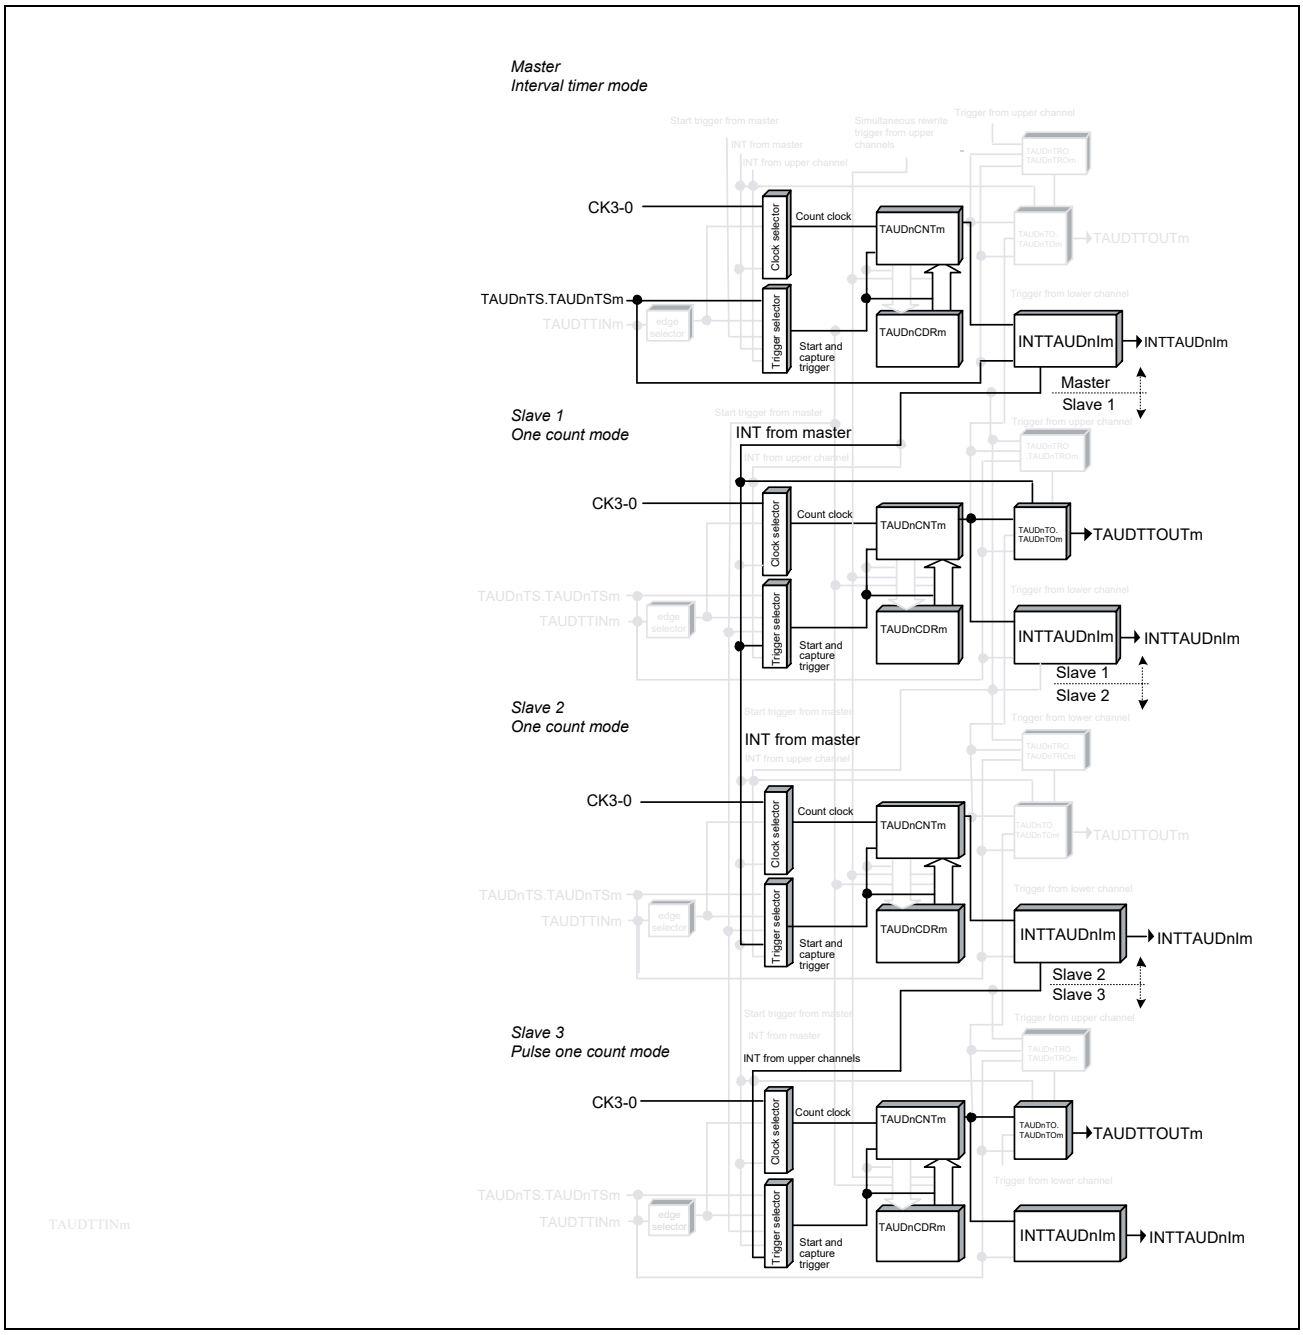

Figure 18.92 Block Diagram of Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUDnTOL.TAUDnTOLm = 0)
- Slave channel 3: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

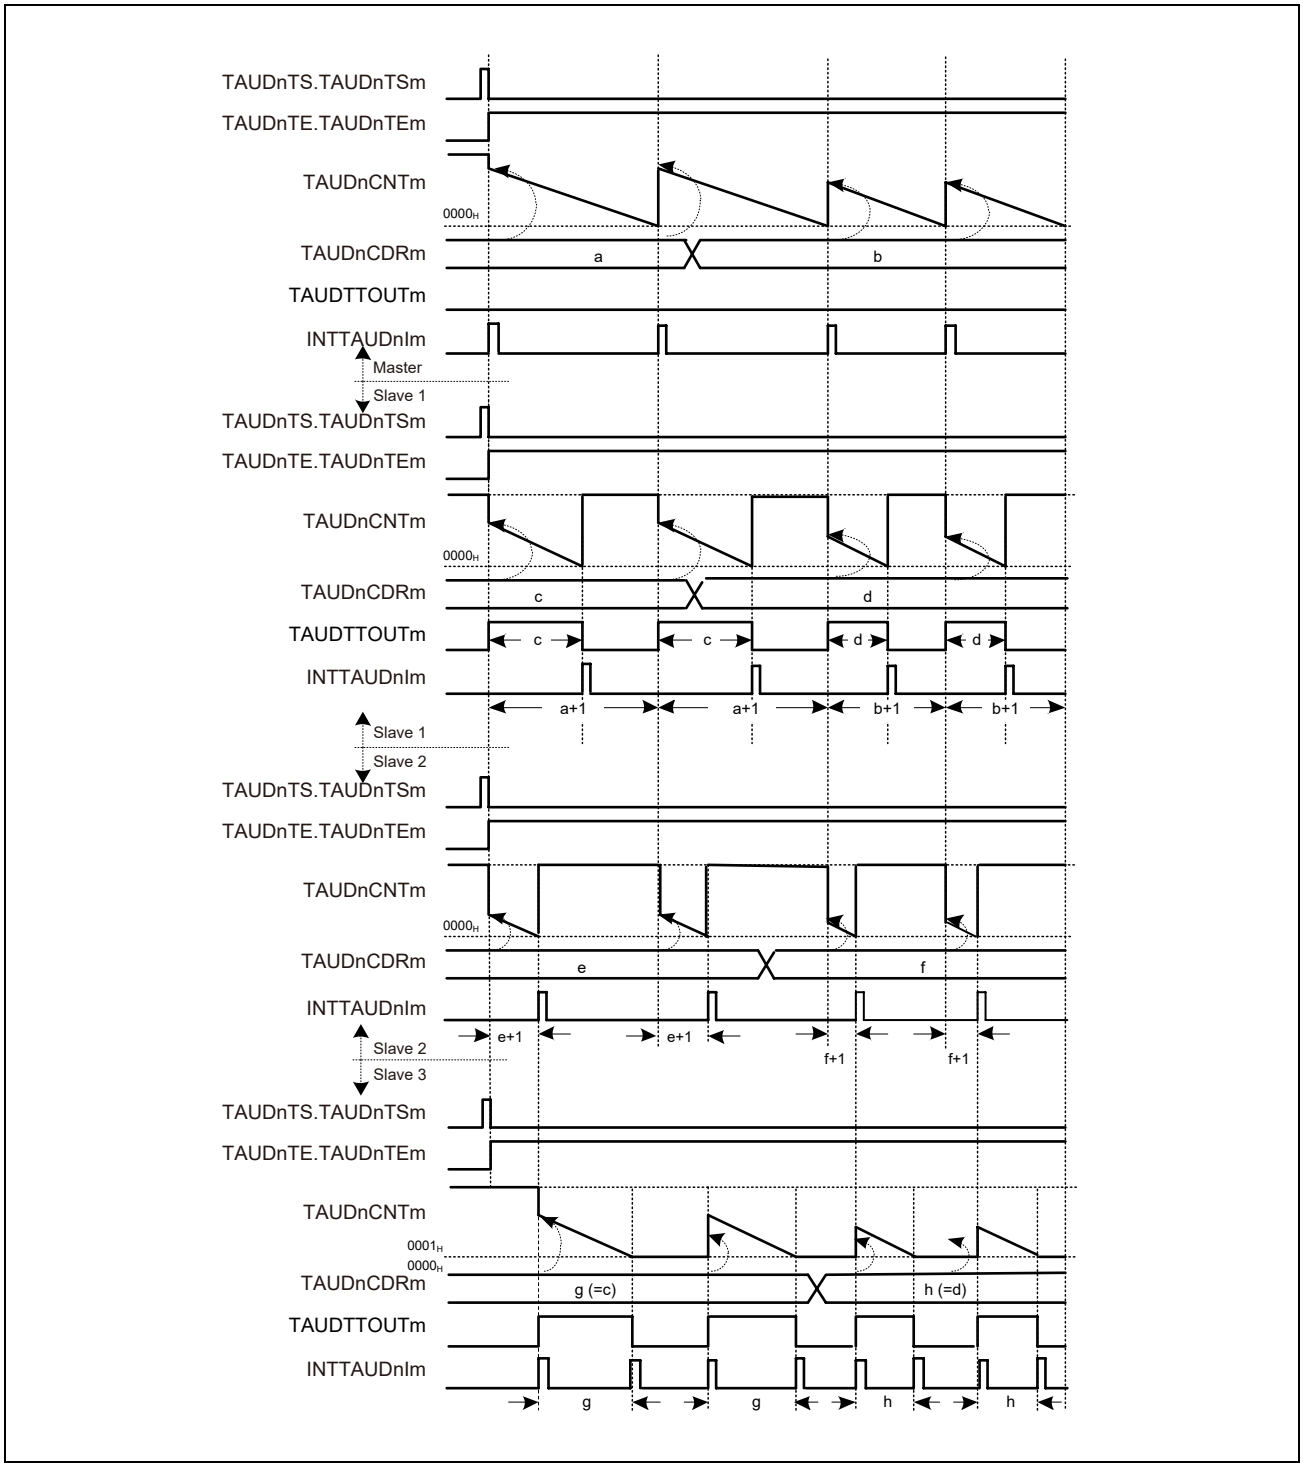

Figure 18.93 General Timing Diagram of Delay Pulse Output Function

NOTE

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

(4) Register Settings for Master Channels

(a) TAUDnCMORm for master channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for slave channel 1

Table 18.145 Control Bit Settings for Slave Channel 1 in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for slave channel 1

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.146 Simultaneous Rewrite Settings for Slave Channel 1 of Delay Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(6) Register Settings for Slave Channel 2

(a) TAUDnCMORm for slave channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0

Table 18.151 Contents of TAUDnCMURm Register for Slave Channel 3 of Delay Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for slave channel 3

Table 18.152 Control Bit Settings in Independent Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for slave channel 3

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.153 Simultaneous Rewrite Settings for Slave channel 3 of Delay Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(8) Operating Procedure for Delay Pulse Output Function

Table 18.154 Operating Procedure for Delay Pulse Output Function (1/2)

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section (5), Register Settings for Slave Channel 1**. Slave channel 2: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section (6), Register Settings for Slave Channel 2**. Slave channel 3: set the TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section (7), Register Settings for Slave Channel 3**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.

Table 18.154 Operating Procedure for Delay Pulse Output Function (2/2)

	Operation	TAUDn Status
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master channel and slave channels 1 and 2 start. INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave channel 1) is set.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channel and slave channels 1 and 2 load TAUDnCDRm value and count down. When the counter of master channel reaches 0000_H: • INTTAUDnIm (master) occurs. • TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave 1/2) to start countdown. • TAUDTTOUTm (slave 1) is set. When TAUDnCNTm (slave 1) reaches 0000_H: • INTTAUDnIm (slave 1) occurs. • TAUDTTOUTm (slave 1) is reset. When TAUDnCNTm (slave 2) reaches 0000_H: • INTTAUDnIm (slave 2) occurs. • INTTAUDnIm (slave 3) occurs. • TAUDTTOUTm (slave 3) is set. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave 3) to start a countdown operation. When TAUDnCNTm (slave 3) reaches 0000_H: • INTTAUDnIm (slave 3) occurs. • TAUDTTOUTm (slave 3) is reset.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(9) Specific Timing Diagrams

(a) Duty cycle (slave 3) = 100%

The following values apply to **Figure 18.94:**

- TAUDnCDRm (master) = $000A_H$
- TAUDnCDRm (slave 1) = $000B_H$
- TAUDnCDRm (slave 2) = 0000_H
- TAUDnCDRm (slave 3) = $000B_H$

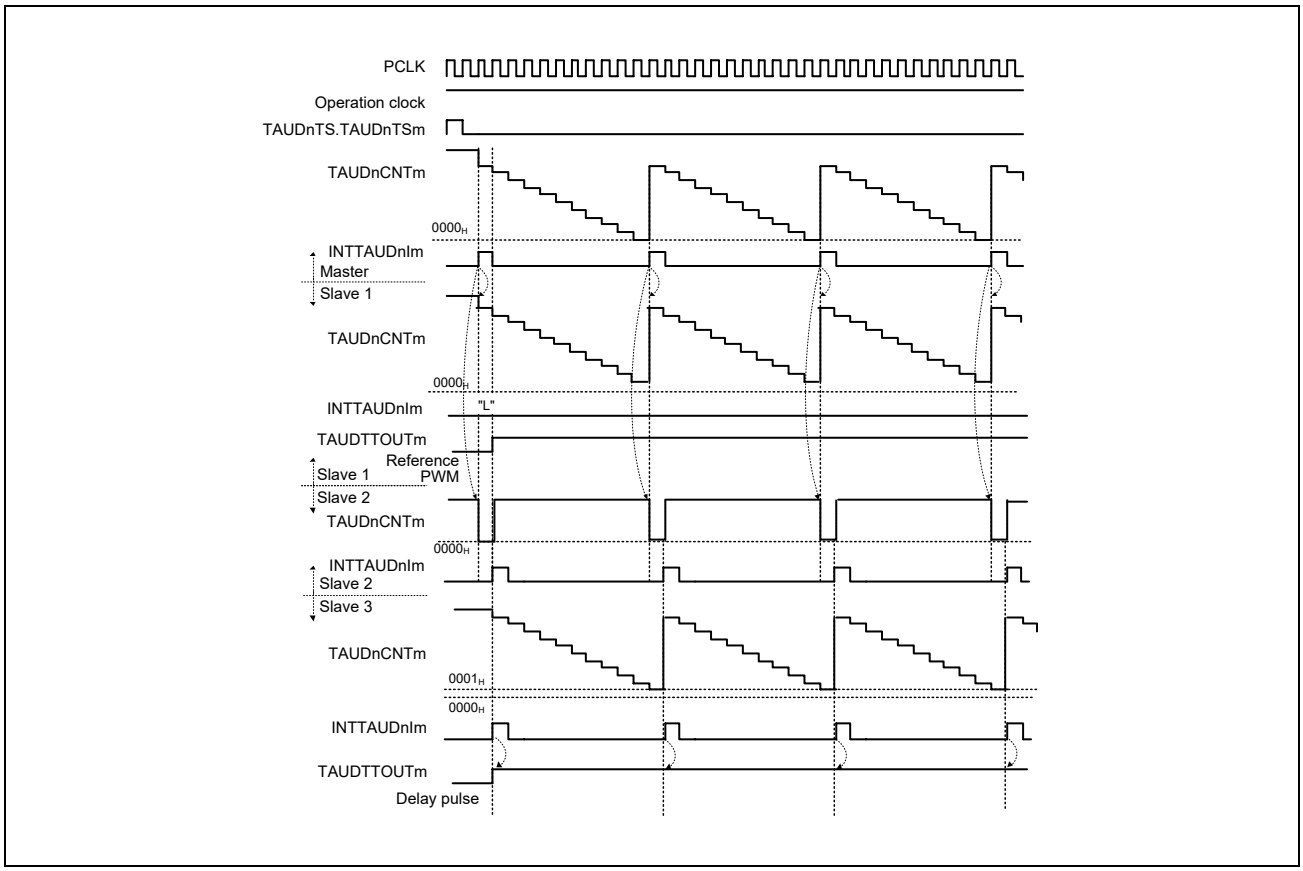

Figure 18.94 Duty Cycle (slave 3) = 100%

- If the value of TAUDnCDRm (slaves 1 and 3) is higher than the value of TAUDnCDRm (master), the counter of slave channel 1 cannot reach 0000_H and cannot generate interrupts. TAUDTTOUTm of channels 1 and 3 remain in the active state.

(b) TAUDTTOUTm (slave 1) = TAUDTTOUTm (slave 3)

The following values apply to **Figure 18.95**.

- TAUDnCDRm (master) = $000A_H$
- TAUDnCDRm (slave 1) = 0005_H
- TAUDnCDRm (slave 2) = 0000_H
- TAUDnCDRm (slave 3) = 0005_H

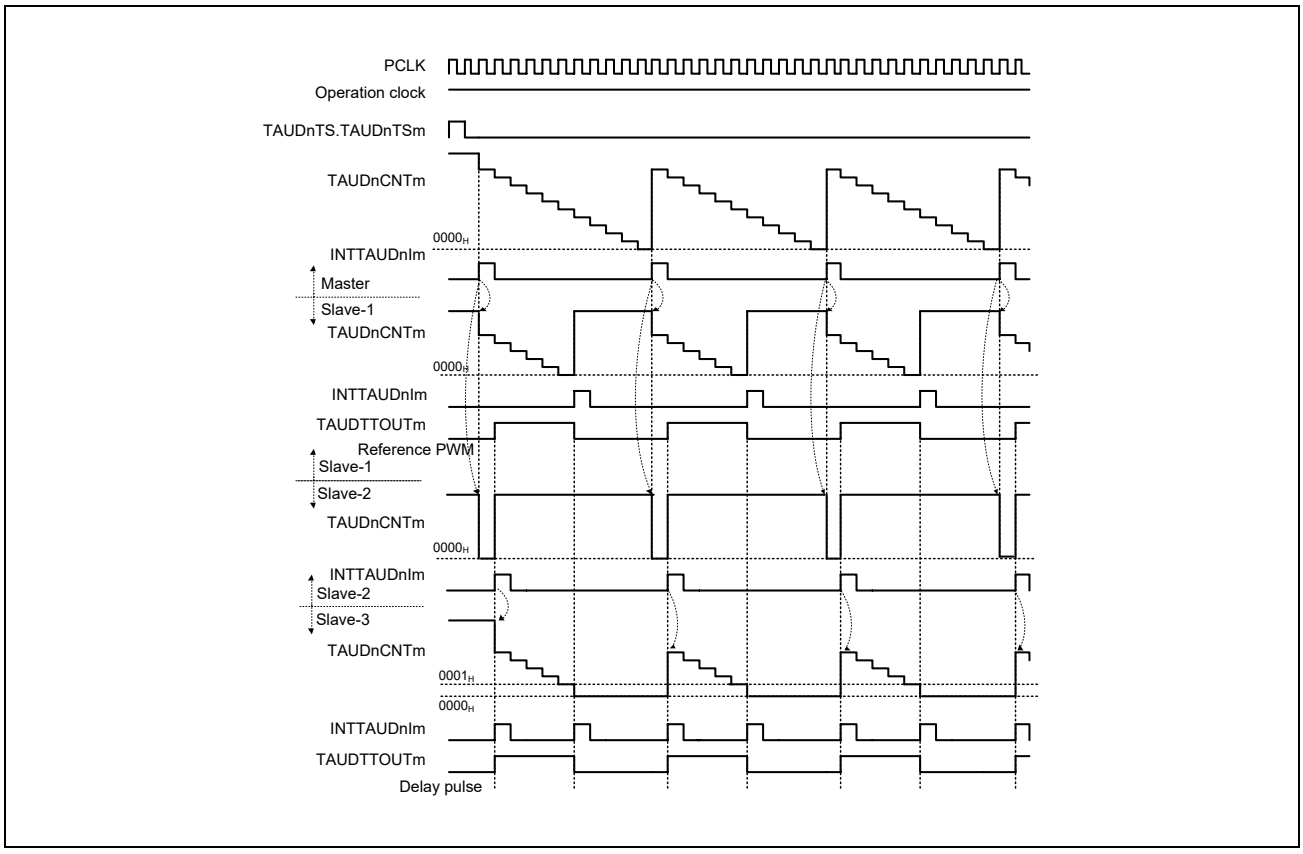

Figure 18.95 TAUDTTOUTm (Slave 1) = TAUDTTOUTm (Slave 3)

- If TAUDnCDRm (slave 2) = 0000_H, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1. The reference pulse and the delay pulse are output with a delay of one clock count.

18.4.12.5 Offset Trigger Output Function

(1) Overview

Summary

This function generates a PWM output using a master channel and a slave channel, enabling the pulse width (duration) of the TAUDTTOUTm to be set. The pulse cycle is set by detecting an effective input edge of master channel. The pulse width is specified on the slave channel.

Prerequisites

- It requires two channels.
- The operating mode for the master channel should be set to capture mode (see **Table 18.155, Contents of TAUDnCMORm Register for Master Channels of Offset Trigger Output Function**).
- The operating mode for slave channels should be set to one-count mode (see **Table 18.158, Contents of TAUDnCMORm Register for Slave Channels of Offset Trigger Output Function**).
- The output mode for slave channels should be set to synchronous channel output mode 1 (see **Section 18.4.4, Channel Output Modes**).
- TAUDTTOUTm is not used with the master channel of this function.

Functional description

The counter can be started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This makes TAUDnTE.TAUDnTEm = 1, enabling the counter to count up. The master channel counter (TAUDnCNTm) starts to count up from 0000_H.

- Master channel:
  When an effective TAUDTTINm input edge is detected, the current value of the counter (TAUDnCNTm) is loaded into the data register of master channel (TAUDnCDRm). INTTAUDnIm is generated and the counter restarts to count up from 0000_H.
- Slave channels:
  The INTTAUDnIm of master channel sets the TAUDTTOUTm (slave) signal and triggers the counter of the slave channel. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave) and the counter starts to count down from this value.
  When the counter reaches 0000_H (duty time has elapsed), INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUDnIm of master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

(2) Equations

Pulse width = (TAUDnCDRm (slave) + 1) × count clock cycle

Duty cycle [%] = [TAUDnCDRm (slave) / TAUDnCDRm (master) + 1)] × 100

- Duty cycle = 0%
  TAUDnCDRm (slave) = 0000_H
- Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

(3) Block Diagram and General Timing Diagram

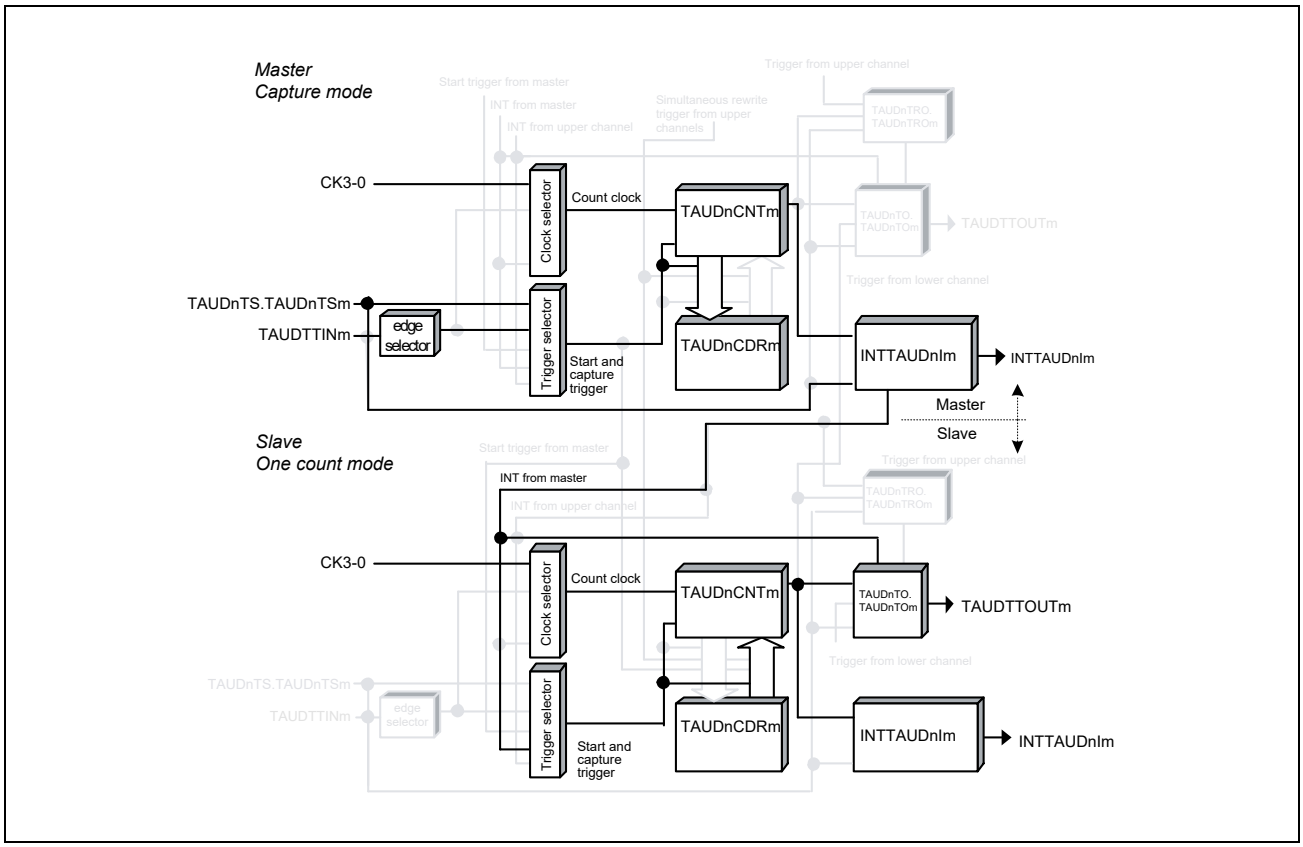

Figure 18.96 Block Diagram of Offset Trigger Output Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

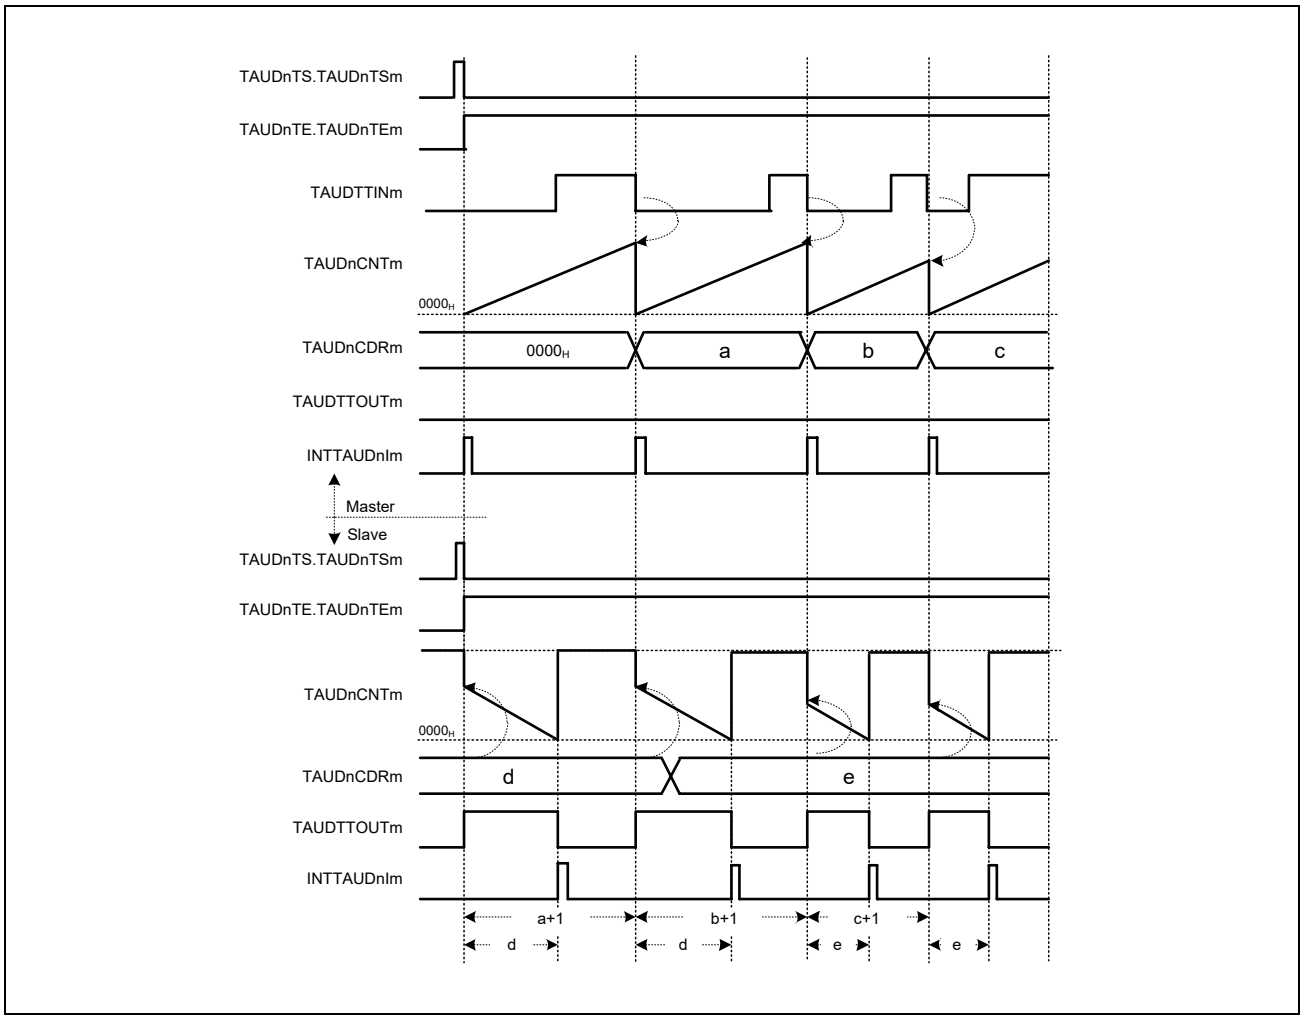

Figure 18.97 General Timing Diagram of Offset Trigger Output Function

NOTE

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

(4) Register Settings for Master Channels

(a) TAUDnCMORm for master channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.155 Contents of TAUDnCMORm Register for Master Channels of Offset Trigger Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	1: Channel is master channel
10 to 8	TAUDnSTS[2:0]	001: An effective TAUDTTINm input edge signal is used as the start trigger
7, 6	TAUDnCOS[1:0]	11: Capture register is updated upon detection of an effective TAUDTTINm input edge or when a counter overflow occurs: • Detection of an effective TAUDTTINm input edge: The counter value is written into TAUDnCDRm. • Occurrence of overflow: $FFFF_H$ is written into TAUDnCDRm. An effective TAUDTTINm input edge to be detected next is ignored. TAUDnCSRm.TAUDnOVF is set when a counter overflow occurs, and cleared by setting TAUDnCSCm.TAUDnCLOV = 1.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0010: Capture mode
0	TAUDnMD0	1: INTTAUDnIm generated at the beginning of operation.

(b) TAUDnCMURm for master channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.156 Contents of TAUDnCMURm Register for Master Channels of Offset Trigger Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges

(c) Channel output mode for master channels

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

(d) Simultaneous rewrite for master channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with this function. Therefore, these registers should be set to 0.

Table 18.157 Simultaneous Rewrite Settings for Master Channels of Offset Trigger Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(5) Register Settings for Slave Channels

(a) TAUDnCMORm for slave channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.158 Contents of TAUDnCMORm Register for Slave Channels of Offset Trigger Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

(b) TAUDnCMURm for slave channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.159 Contents of TAUDnCMURm Register for Slave Channels of Offset Trigger Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for slave channels

Table 18.160 Control Bit Settings for Slave Channel 1 in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for slave channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with this function. Therefore, these registers should be set to 0.

Table 18.161 Simultaneous Rewrite Settings for Slave Channels of Offset Trigger Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(6) Operating Procedure for Offset Trigger Output Function

Table 18.162 Operating Procedure for Offset Trigger Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channels: Set TAUDnCMORm/TAUDnCMURm register and channel output mode as described in **Section (5), Register Settings for Slave Channels**. The TAUDnCDRm register of master channel functions as a capture register. Set the value of TAUDnCDRm register of slave channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start: • TAUDnCNTm (master) counts up. • TAUDnCDRm value is loaded into TAUDnCNTm (slave) to perform count down. INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCSCm.TAUDnCLOV can be set to 1. TAUDnCDRm of slave channel can be changed after the generation of INTTAUDnIm (master). TAUDnCNT.TAUDnCNTm and TAUDnCSRm can be read at any time.	When TAUDnCNTm of the slave = 0000_H: • INTTAUDnIm (slave) occurs. • TAUDTTOUTm (slave) is reset and the counter of slave channel stops. When TAUDTTINm input edge is detected on the master channel: • INTTAUDnIm (master) occurs. • TAUDnCNTm (master) is reset to 0000_H and then continues count operation subsequently. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to perform count down. • TAUDTTOUTm (slave) is set.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(7) Specific Timing Diagrams

(a) Duty cycle = 0%

The following settings apply to this diagram:

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

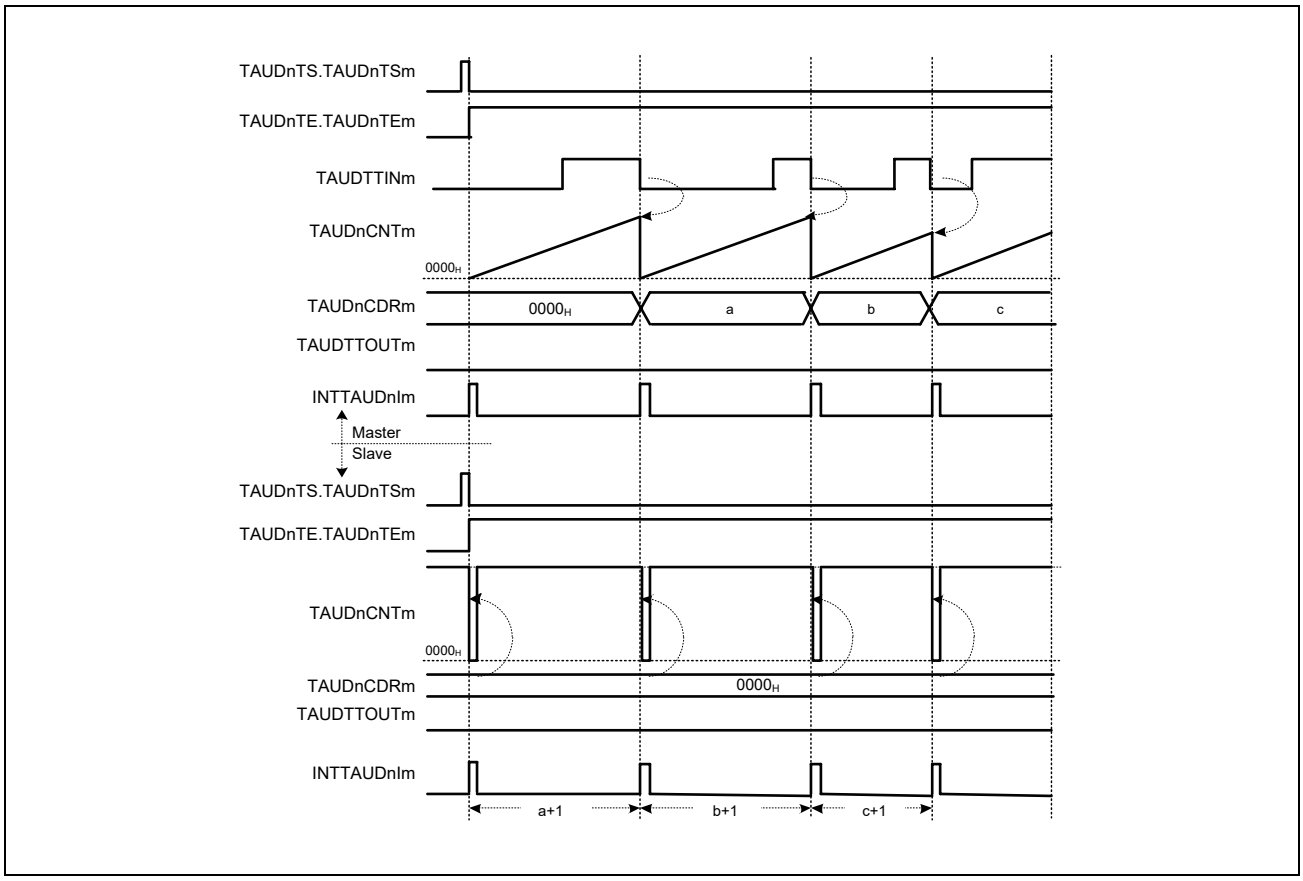

Figure 18.98 TAUDnCDRm (Slave) = 0000_H

- When TAUDnCDRm (slave) = 0000_H, 0000_H is written to TAUDnCNTm every time the master channel generates an interrupt (INTTAUDnIm), and TAUDnCNTm cannot start to count. The TAUDTTOUTm remains at not active state.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The slave and the master channel generate interrupts in the same cycle.

(b) Duty cycle = 100%

The following settings apply to this diagram:

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

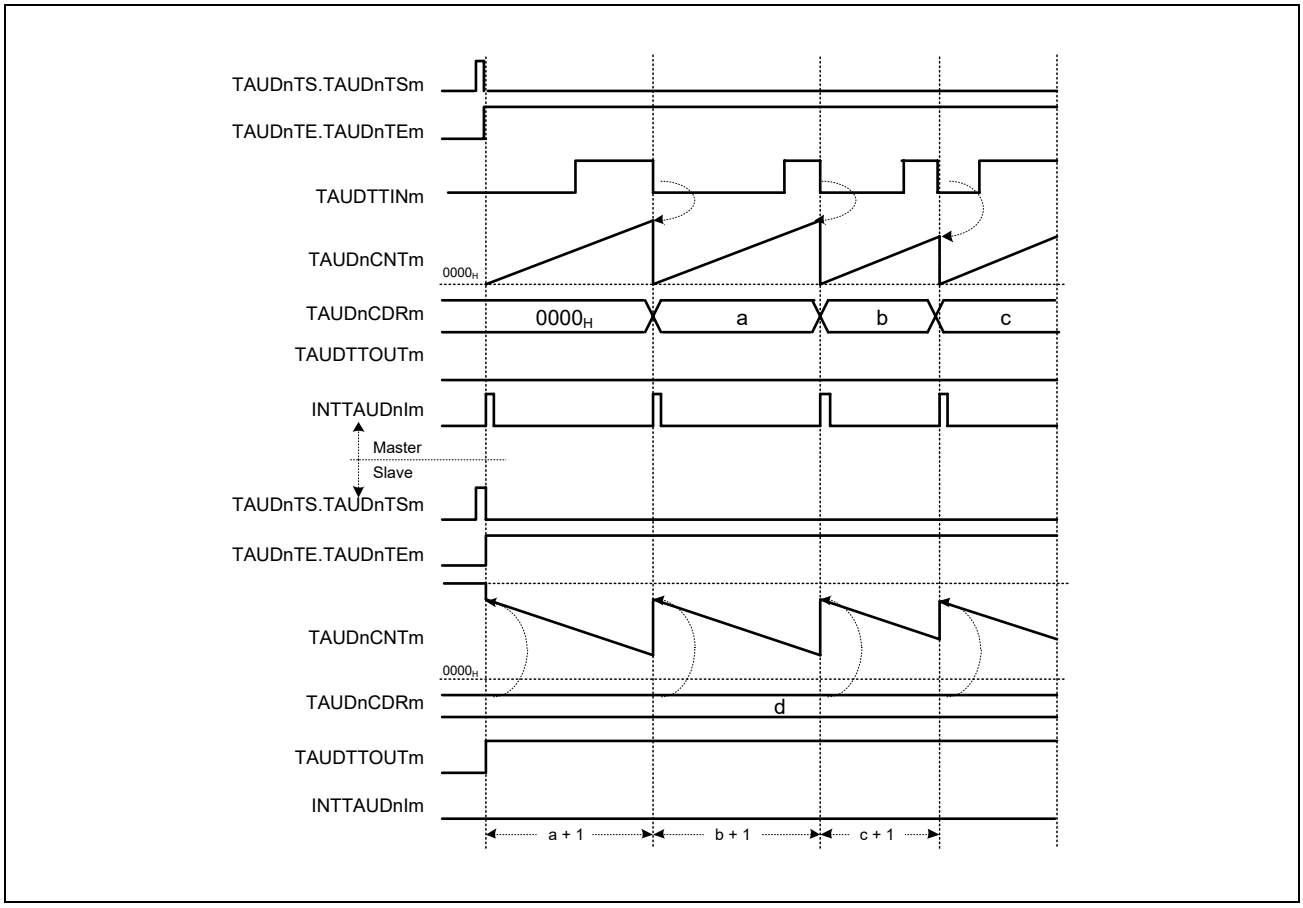

Figure 18.99 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1

- If the value TAUDnCDRm (slave) is higher than the interval of effective input edges, the counter of the slave channel cannot reach 0000_H and cannot generate interrupts. The TAUDTTOUTm remains at active state.

18.4.12.6 A/D Conversion Trigger Output Function Type 1

(1) Overview

Summary

This function is identical to **Section 18.4.12.1, PWM Output Function**, except that TAUDTTOUTm is not output.

This is achieved by setting the channel output mode for the slave to independent channel output mode controlled by software.

(2) Block Diagram and General Timing Diagram

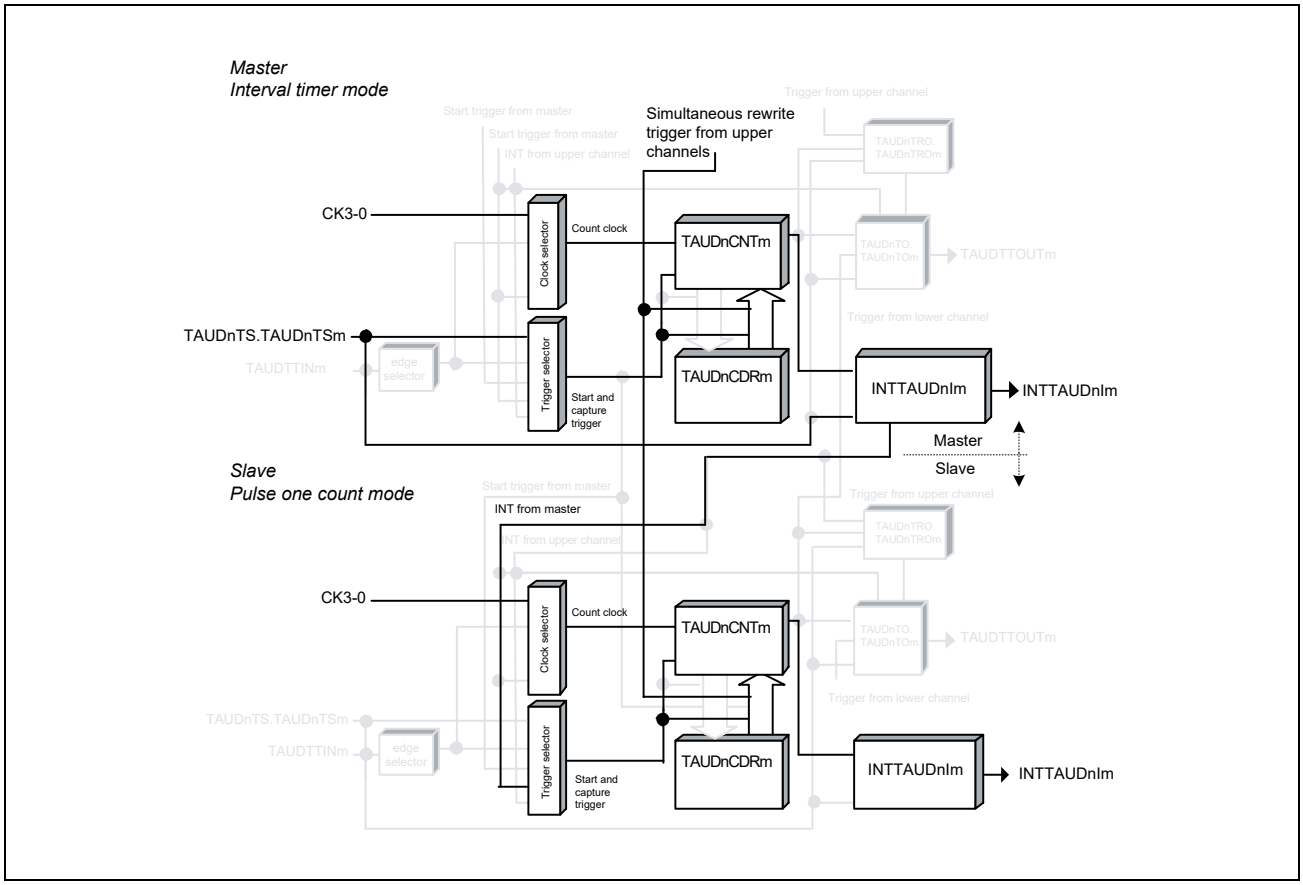

Figure 18.100 Block Diagram of A/D Conversion Trigger Output Function Type 1

The following settings apply to the general timing diagram.

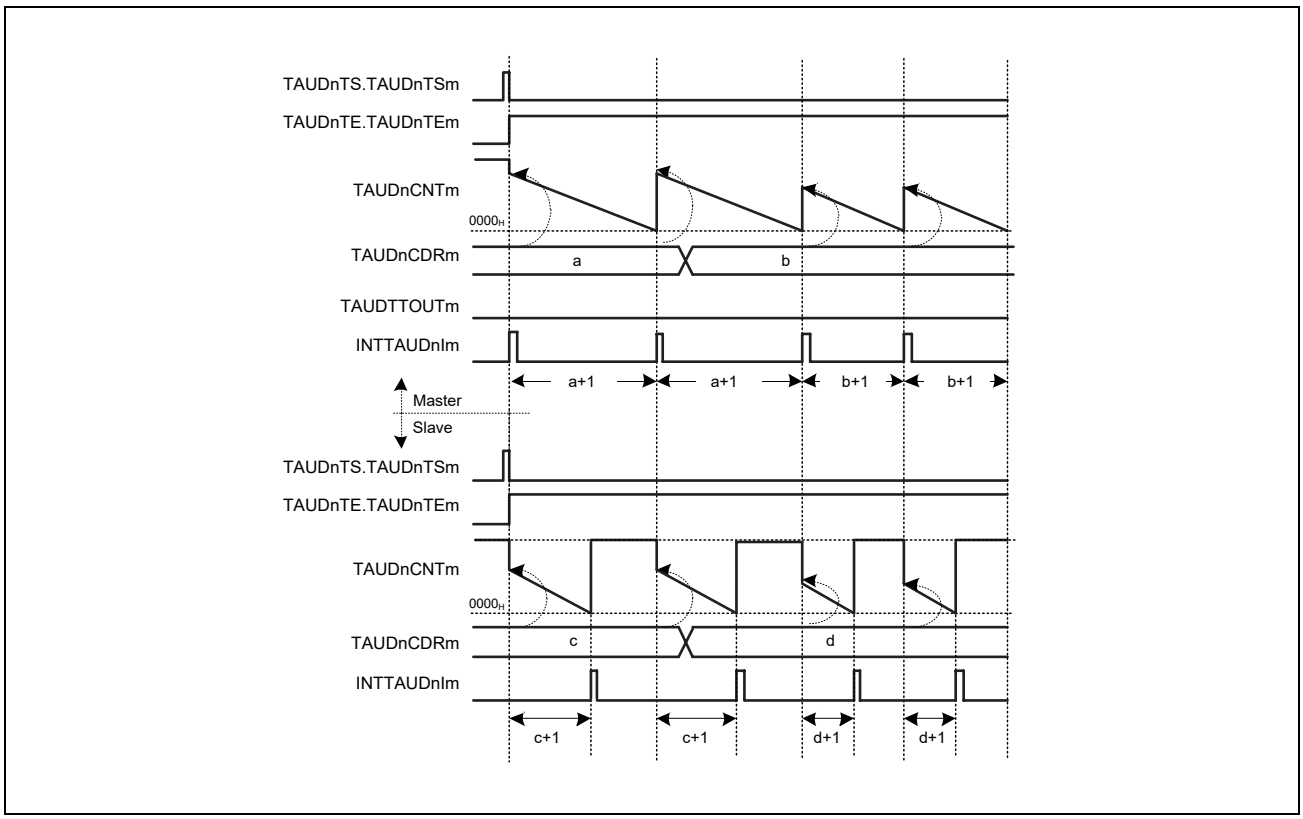

Figure 18.101 General Timing Diagram of A/D Conversion Trigger Output Function Type 1

18.4.12.7 Triangle PWM Output Function

(1) Overview

Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUDTTOUTm to be set using the master and slave channels respectively.

The master channel generates a carrier cycle. The first cycle of master channel controls the down status and the second cycle controls the up status of the slave counter.

Prerequisites

- It requires two channels.
- The operating mode for master channels should be set to interval timer mode (see **Table 18.163, Contents of TAUDnCMORm Register for Master Channels of Triangle PWM Output Function**).
- The operating mode for slave channels should be set up/down count mode (see **Table 18.167, Contents of TAUDnCMORm Register for Slave Channels of Triangle PWM Output Function**).
- The channel output mode for master channels should be set to independent channel output mode 1 (see **Section 18.4.4, Channel Output Modes**).
- The channel output mode for slave channels should be set to synchronous channel output mode 2 (see **Section 18.4.4, Channel Output Modes**).
- The following settings allows TAUDTTOUTm signal to be at high level during the down status of a carrier cycle.
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTOm should be set to 1 while TAUDnTOE.TAUDnTOEm is set to 0 (recommended setting).
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTOm should be set to 0 while TAUDnTOE.TAUDnTOEm is set to 0.

Functional description

The counters are started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for every channel. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation.

The current values of TAUDnCDRm (master and slave) are loaded into TAUDnCNTm (master and slave) and the counters start counting down from these values. When the TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1, an interrupt is generated and TAUDTTOUTm signal of master toggles.

- Master channel:
  When the counter of master channel reaches 0000_H (pulse cycle time has elapsed), INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and counts down.
- Slave channels:
  The INTTAUDnIm of master channel triggers the counter of the slave channel:
  - If the slave counter is counting down, the count direction changes.
  - If the slave counter is counting up, TAUDnCDRm value is reloaded and the counter starts to count down.

  When the counter of the slave channel reaches 0001_H while counting up or down, INTTAUDnIm is generated and the TAUDTTOUTm (slave) signal is set/reset.

  The counter continues count-up/-down and waits for the next INTTAUDnlm of master channel. Setting TAUDnTOL.TAUDnTOLm allows TAUDTTOUTm signal switching between normal phase and reverse phase during operation.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

Conditions

This function enables simultaneous rewrite. See **Section 18.4.3, Simultaneous Rewrite**.

(2) Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

Duty cycle [%] =
[(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave)) / (TAUDnCDRm (master) + 1)] × 100

- Duty cycle = 100%
  TAUDnCDRm (slave) = 0000_H
- Duty cycle = 0%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

(3) Block Diagram and General Timing Diagram

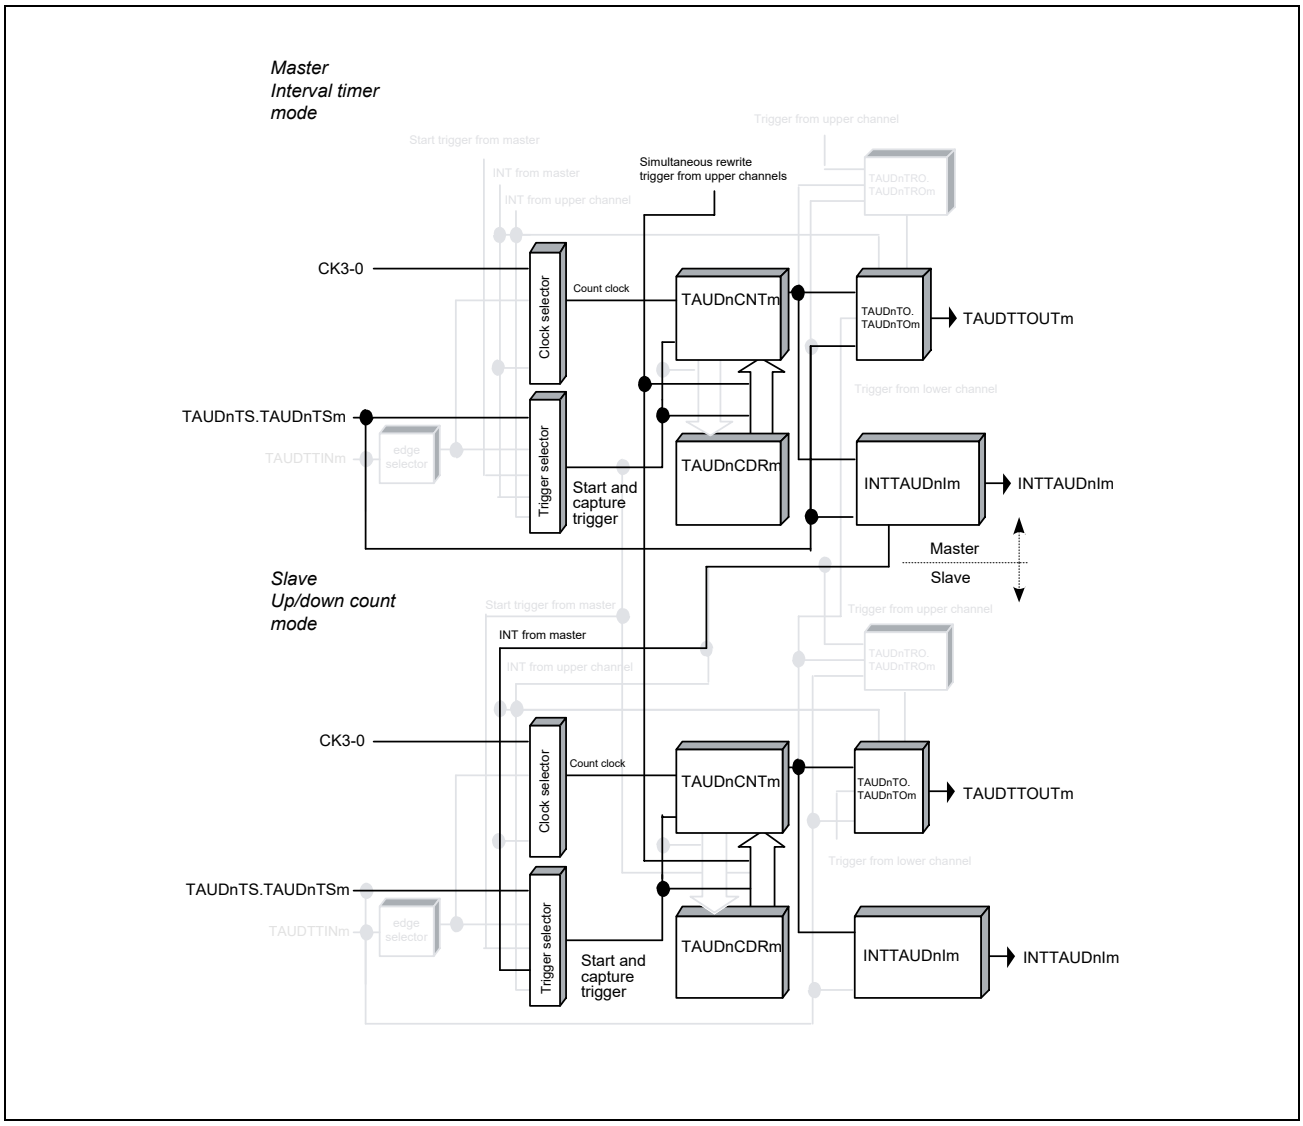

Figure 18.102 Block Diagram of Triangle PWM Output Function

The following settings apply to the general timing diagram.

- Master channel

INTTAUDnIm generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

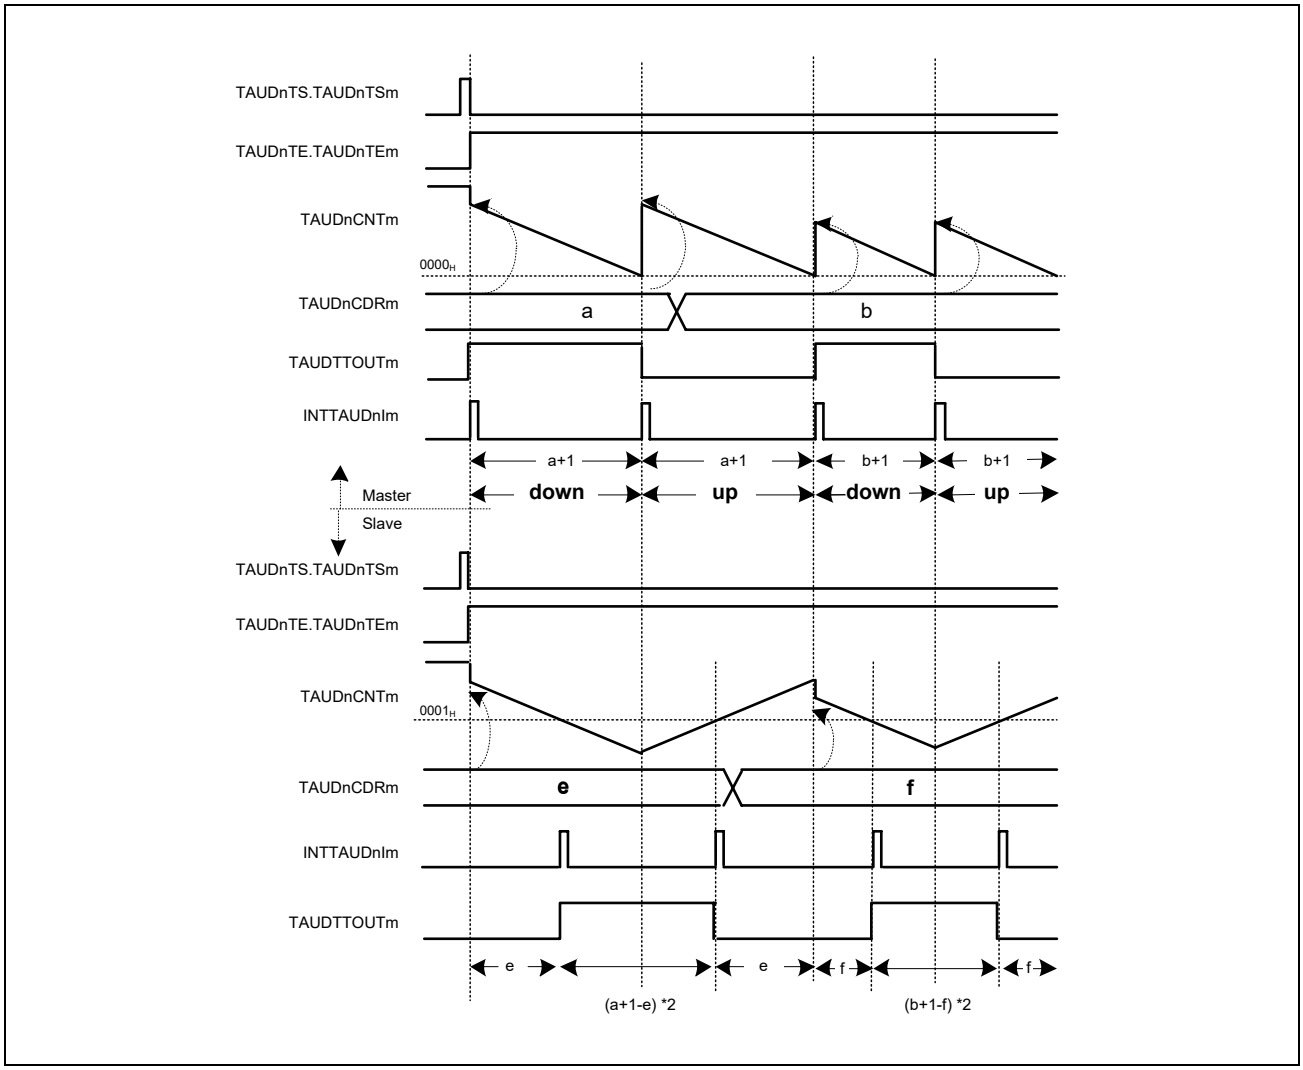

Figure 18.103 General Timing Diagram of Triangle PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	1: Channel is master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated to toggle TAUDTTOUTm at the beginning of an operation. 1: INTTAUDnIm is generated and TAUDTTOUTm is toggled at the beginning of operation.

(b) TAUDnCMURm for master channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.164 Contents of TAUDnCMURm Register for Master Channels of Triangle PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for master channels

Table 18.165 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0.
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel.
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for master channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.166 Simultaneous Rewrite Settings for Master Channels of Triangle PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Selects upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than a master channel to generate a simultaneous rewrite trigger signal.

(5) Register Settings for Slave Channels

(a) TAUDnCMORm for slave channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for slave channels

Table 18.169 Control Bit Settings in Synchronous Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for slave channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.170 Simultaneous Rewrite Settings for Slave Channels of Triangle PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(6) Operating Procedure for Triangle PWM Output Function

Table 18.171 Operating Procedure for Triangle PWM Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (5), Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm (master) is generated on the master channel if TAUDnCMORm.TAUDnMD0 is set to 1.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master and slave channels is loaded into TAUDnCNTm to perform counting down. When the counter of master channel reaches 0000_H: • INTTAUDnIm (master) occurs. • TAUDTTOUTm (master) is toggled. • TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave) or counting is started in opposite direction. When TAUDnCNTm of slave channel reaches 0001_H: • INTTAUDnIm (slave) occurs. • TAUDTTOUTm (slave) is set in the count-down status or reset in count-up status.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(7) Specific Timing Diagrams

(a) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnCDRm = a = 5_H
- Slave channels:
  - TAUDnCDRm = 6_H

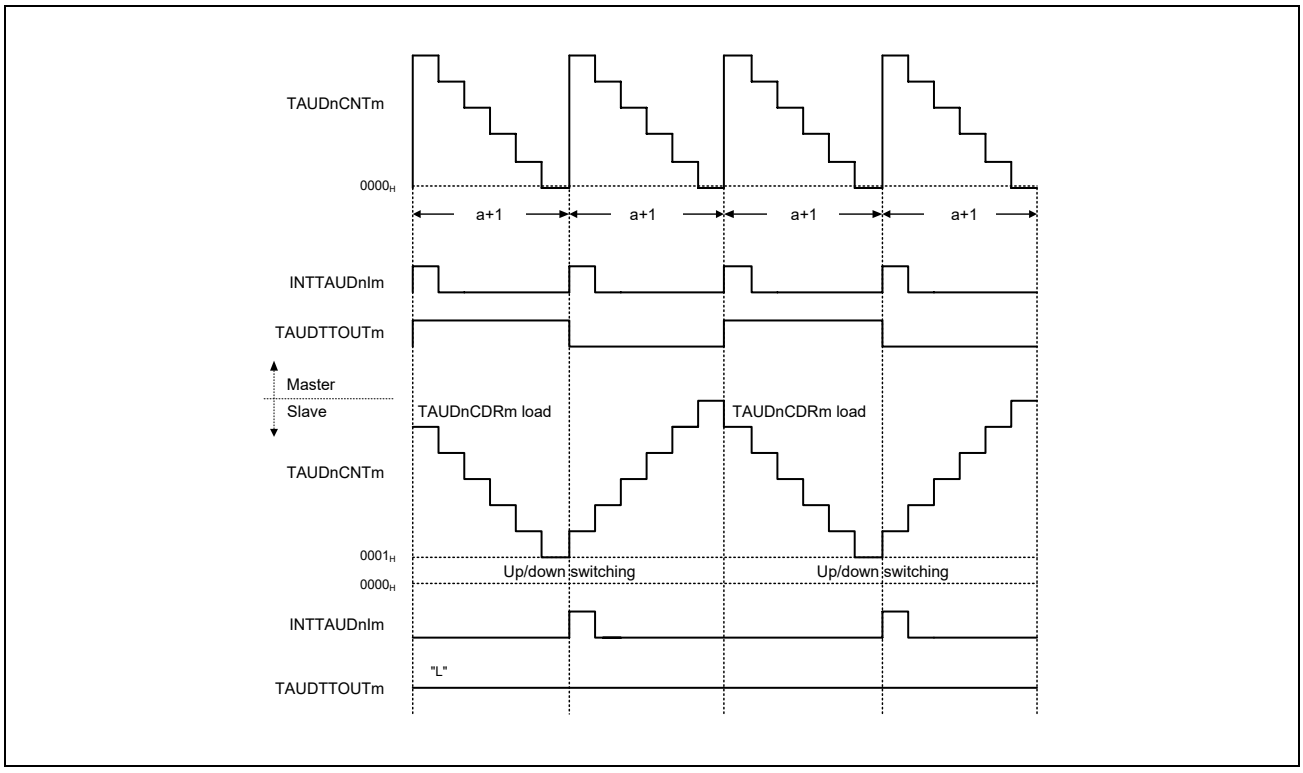

Figure 18.104 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1

- If the TAUDnCDRm (slave) value is greater than the TAUDnCDRm (master) value + 1, INTTAUDnIm of slave channel is not generated while counting down. TAUDTTOUTm remains low because there is no set signal to be detected.

(b) Duty cycle = 100%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnCDRm = a = 5_H
- Slave channels:
  - TAUDnCDRm = 0_H

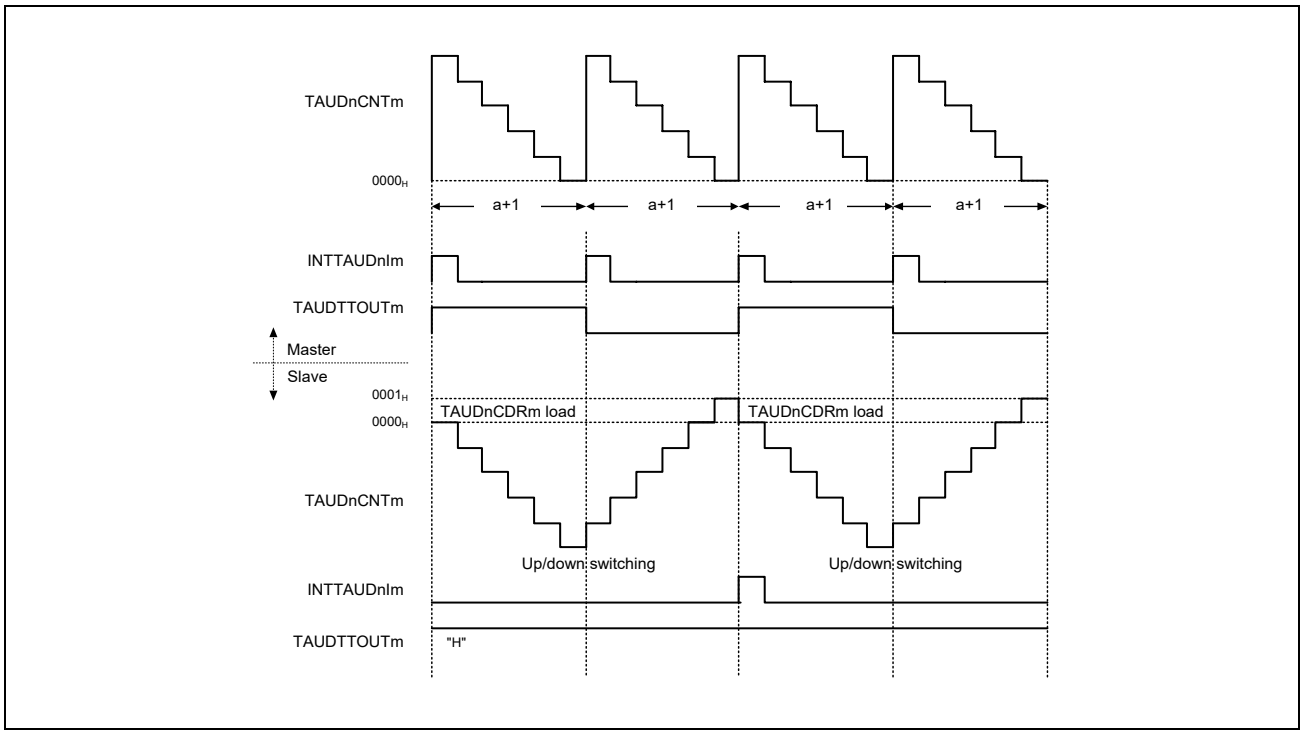

Figure 18.105 TAUDnCDRm (Slave) = 0000_H

- If TAUDnCDRm (slave) = 0000_H, INTTAUDnIm of slave channel is not generated while counting up. TAUDTTOUTm remains high because there is no reset signal to be detected.

18.4.12.8 Triangle PWM Output Function with Dead Time

(1) Overview

Summary

This function generates multiple triangle PWM outputs with a predefined dead time added by using a master and two or more slave channels. The resulting PWM signals are output via TAUDTTOUTm of the slave channels 2 and 3, enabling the pulse cycle (frequency) and the duty cycle of TAUDTTOUTm to be set using the master and slave channels.

Carrier cycles are generated on master channel. The first pulse controls the down status of slave counter and the second one controls the up status.

An interrupt on slave 2 causes TAUDTTOUTm of slave channels to be set/reset. Depending on the settings of TAUDnTDL.TAUDnTDLm, delay time is added to positive or negative logic side of the signal (i.e., whether TAUDTTOUTm is set/reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

Prerequisites

- It requires three channels. For slave channels 2 and 3, select even-numbered channel CH (a) and odd-numbered channel CH (a + 1).
- The operating mode for master channels should be set to interval timer mode (see **Table 18.173, Contents of TAUDnCMORm Register for Master Channels of Triangle PWM Output Function with Dead Time**).
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even-numbered channel, and slave channel 3 is an odd-numbered channel. Slave channel 1 can be used as a separate timer (independent function).
- The operating mode for slave channel 2 should be set to up/down count mode (see **Table 18.177, Contents of TAUDnCMORm Register for Slave Channel 2 of Triangle PWM Output Function with Dead Time**). Slave channel 2 should be an even-numbered channel.
- The operating mode for slave channel 3 should be set to one-count mode (see **Table 18.181 Contents of TAUDnCMORm Register for Slave Channel 3 of Triangle PWM Output Function with Dead Time**). Slave channel 3 should be an odd-numbered channel.
- The channel output mode for master channels should be set to independent channel output mode 1 (see **Section 18.4.4, Channel Output Modes**).
- The output mode for slave channels 2 and 3 should be set to synchronous channel output mode 2 with dead time output (see **Section 18.4.4, Channel Output Modes**).
- The following settings make a TAUDTTOUTm signal at high level during the down status of the carrier cycle:
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTOm should be set to 1 while TAUDnTOE.TAUDnTOEm is set to 0. (recommended setting)
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTOm should be set to 0 while TAUDnTOE.TAUDnTOEm is set to 0.

NOTE

The triangle PWM output function with dead time does not use slave channel 1.

Slave channel 1 can be used as a separate timer (independent function).

Functional description

The counter starts by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This makes TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. If TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1, an interrupt is generated and the master's TAUDTTOUTm signal is toggled.

- Master channel:
  When the counter of master channel reaches 0000_H, an INTTAUDnIm is generated and the TAUDTTOUTm signal is toggled. The TAUDnCDRm value is reloaded to continue countdown.
- Slave channel 2:
  If INTTAUDnIm is generated on the master channel, the counter of slave channel 2 is triggered.
  - If the slave counter is counting down, the counting direction changes.
  - If the slave counter is counting up, the TAUDnCDRm value is reloaded and the counter starts to count down.

  The counter continues to count down/up and waits for the next INTTAUDnlm of master channel. When the counter value of slave channel 2 reaches 0001_H, INTTAUDnIm is generated.
- Slave channel 3:
  If INTTAUDnIm is generated on slave channel 2, the counter of slave channel 3 is triggered. The current value of TAUDnCDRm (slave 3) is loaded into TAUDnCNTm (slave 3) and the counter starts to count down from the TAUDnCDRm value.

  When the counter reaches 0000_H, INTTAUDnIm occurs. The counter returns to $FFFF_H$ and waits for the next INTTAUDnlm of slave channel 2.

As described in **Table 18.172, Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2**, the set/reset timing (right after occurrence of an interrupt or after dead time has elapsed) depends on the TAUDnTDL.TAUDnTDLm setting of the corresponding channel.

The setting of TAUDnTOL.TAUDnTOLm also determines whether a high level signal (TAUDnTOL.TAUDnTOLm = 0) or a low level signal (TAUDnTOL.TAUDnTOLm = 1) is output from the corresponding channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

TAUDTTOUTm can be 100% output by setting the TAUDnCDRm value of slave channel 2 to 0000_H.

Conditions

This function enables simultaneous rewrite. See **Section 18.4.3, Simultaneous Rewrite**.

TAUDnTOL.TAUDnTOLm and TAUDnTDL.TAUDnTDLm should be set before start of count operation. Slave channels 2 and 3 should have the opposite settings of TAUDnTDL.TAUDnTDLm.

Table 18.172 Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2

TAUDnTDL. TAUDnTDLm	Count Direction of Slave Channel 2 upon Occurrence of Interrupt	TAUDTTOUTm Set/Reset Timing
0	Down	Set after the dead time has elapsed
	Up	Reset right after interrupt occurs
1	Down	Set right after interrupt occurs
	Up	Reset after the dead time has elapsed

(2) Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

PWM signal width (normal phase)
= [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2)) × 2 – (TAUDnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (reverse phase)
= [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2)) × 2 + (TAUDnCDRm (slave 3) + 1)] × count clock cycle

(3) Block Diagram and General Timing Diagram

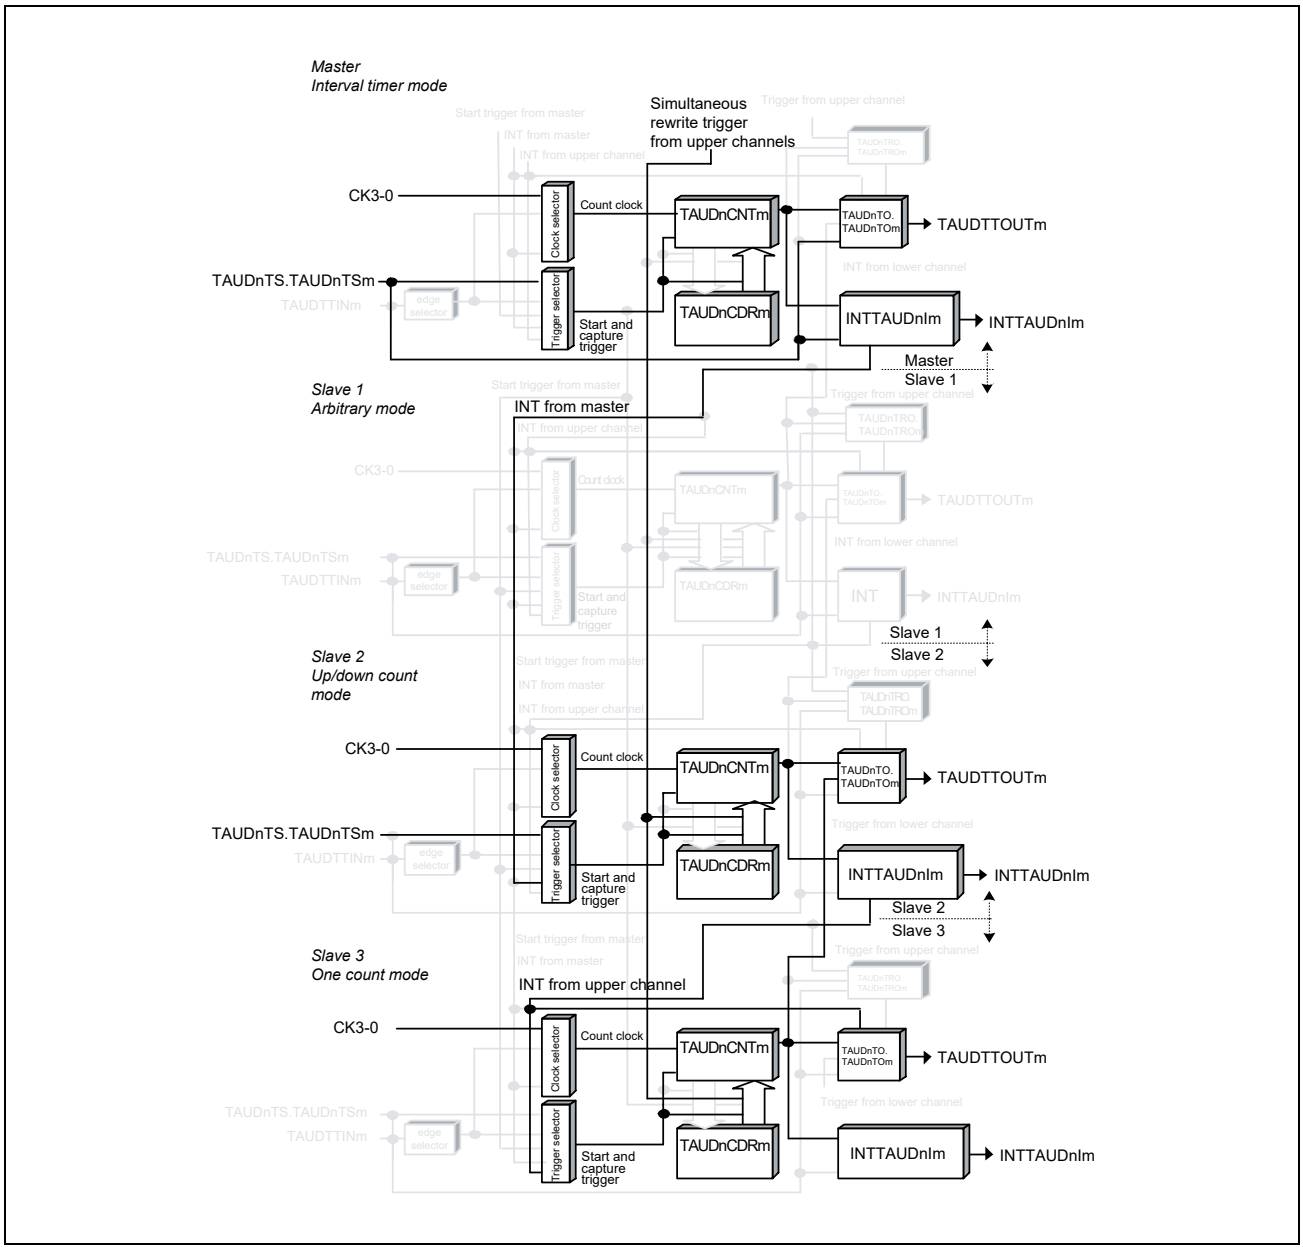

Figure 18.106 Block Diagram of Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Slave channel 2:
  - INTTAUDnIm not generated at the beginning of operation.(TAUDnCMORm.TAUDnMD0 = 0)
  - TAUDnTDL.TAUDnTDLm = 0
  - Positive logic (TAUDnTOL.TAUDnTOLm = 0)
- Slave channel 3:
  - Enables start trigger detection during counting.(TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnTDL.TAUDnTDLm = 1
  - Positive logic (TAUDnTOL.TAUDnTOLm = 0)

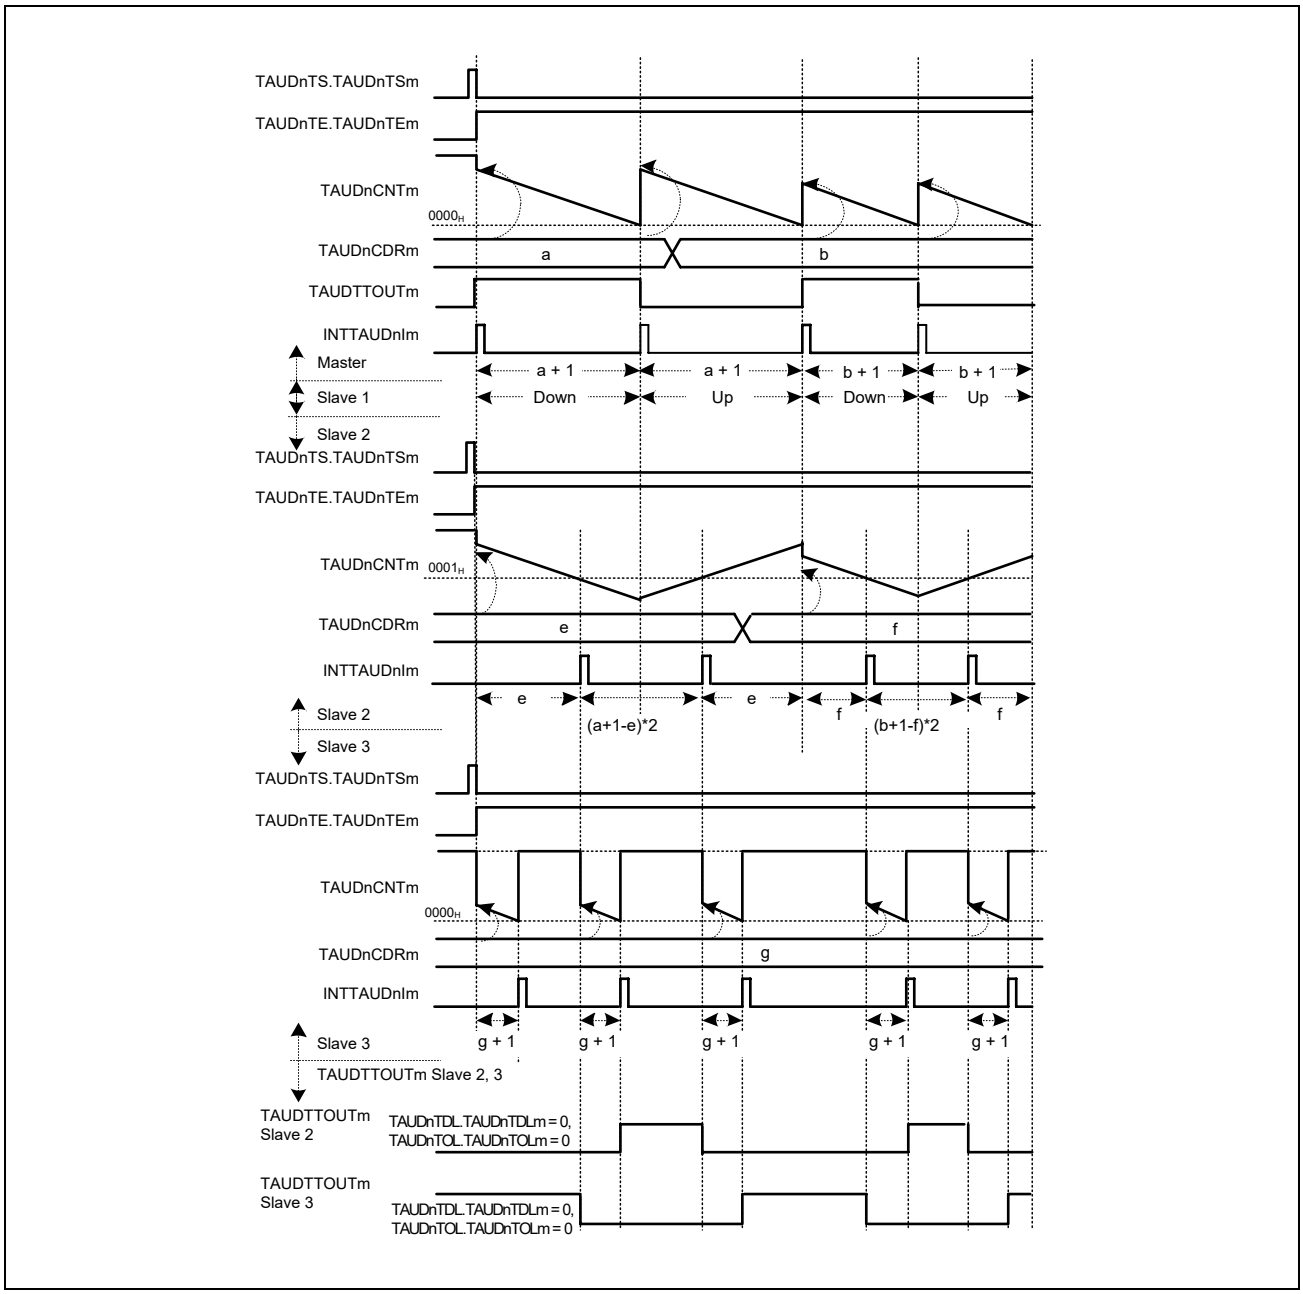

Figure 18.107 General Timing Diagram of Triangle PWM Output Function with Dead Time

(4) Register Settings for Master Channels

(a) TAUDnCMORm for master channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 18.173 Contents of TAUDnCMORm Register for Master Channels of Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	1: Channel is master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated and TAUDTTOUTm is not toggled at the beginning of operation. 1: INTTAUDnIm is generated and TAUDTTOUTm is toggled at the beginning of operation.

(b) TAUDnCMURm for master channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.174 Contents of TAUDnCMURm Register for Master Channels of Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for master channels

Table 18.175 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0.
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel.
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for master channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.176 Simultaneous Rewrite Setting for Master Channels of Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than a master channel to generate a simultaneous rewrite trigger signal.

(5) Register Settings for Slave Channel 2

(a) TAUDnCMORm for slave channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.177 Contents of TAUDnCMORm Register for Slave Channel 2 of Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	111: Up/down output trigger signal of master channel
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1001: Up/down count mode
0	TAUDnMD0	0: INTTAUDnIm not generated at the beginning of operation.

(b) TAUDnCMURm for slave channel 2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.178 Contents of TAUDnCMURm Register for Slave Channel 2 of Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for slave channel 2

Table 18.179 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0.
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel.
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from odd-numbered channels.

(d) Simultaneous rewrite for slave channel 2

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.180 Simultaneous Rewrite Settings for Slave Channel 2 of Triangle PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(6) Register Settings for Slave Channel 3

(a) TAUDnCMORm for slave channel 3

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.181 Contents of TAUDnCMORm Register for Slave Channel 3 of Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	110: Dead time output signal of the TAUDTTOUTm generation unit
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

(b) TAUDnCMURm for slave channel 3

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.182 Contents of TAUDnCMURm Register for Slave Channel 3 of Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for slave channel 3

Table 18.183 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0.
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel.
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from even-numbered channels.

(d) Simultaneous rewrite for slave channel 3

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.184 Simultaneous Rewrite Settings for Slave Channel 3 of Triangle PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(7) Operating Procedure for Triangle PWM Output Function with Dead Time

Table 18.185 Operating Procedure for Triangle PWM Output Function with Dead Time

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channel 2: Set TAUDnCMORm/TAUDnCMURm register and the channel output mode as described in **Section (5), Register Settings for Slave Channel 2**. Slave channel 3: Set TAUDnCMORm/TAUDnCMURm register and the channel output mode as described in **Section (6), Register Settings for Slave Channel 3**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm (master) is generated on the master channel if TAUDnCMORm.TAUDnMD0 is set to 1.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel and slave channel 2 is loaded into TAUDnCNTm to perform counting down. When the counter of master channel reaches 0000_H: • INTTAUDnIm (master) occurs. • TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave 2) or counting is started in opposite direction. When TAUDnCNTm of slave channel 2 reaches 0001_H: • IINTTAUDnIm (slave 2) is generated. • TAUDnCDRm value of slave channel 3 is loaded into TAUDnCNTm perform counting down. When TAUDnCNTm of slave channel 3 reaches 0000_H: • INTTAUDnIm is generated.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(8) Specific Timing Diagrams

(a) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Slave channel 2:
  - Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
  - Negative logic (TAUDnTDL.TAUDnTDLm = 1)

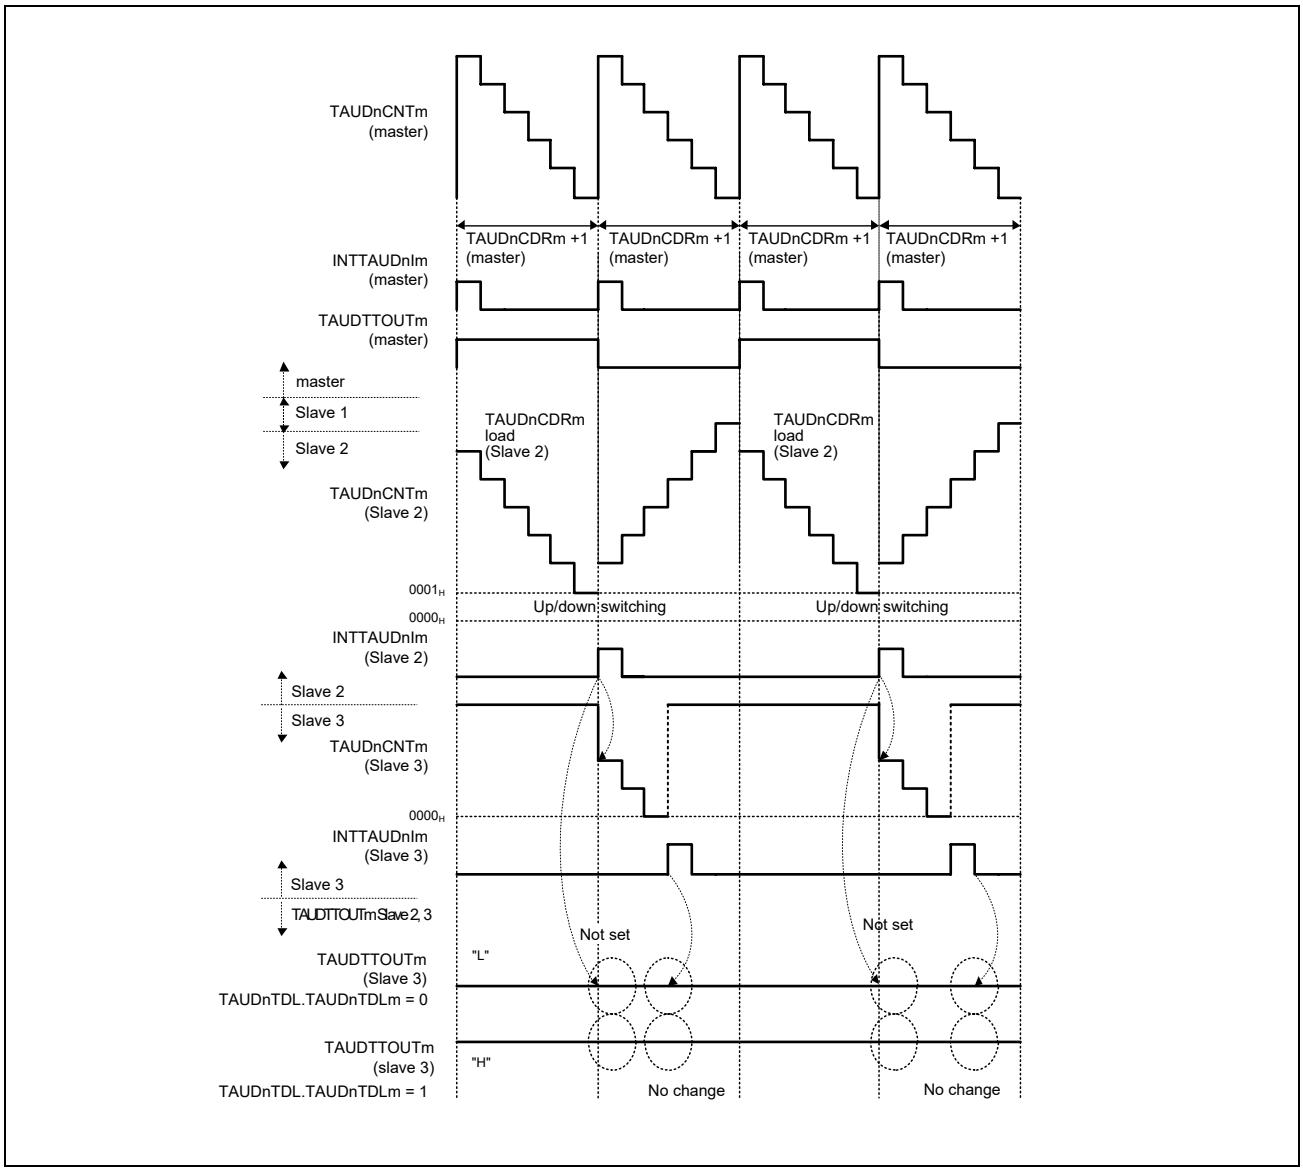

Figure 18.108 TAUDnCDRm (Slave 2) ≥ TAUDnCDRm (Master) + 1

- If TAUDnCDRm (slave 2) is greater than TAUDnCDRm (master), the counter of slave channel does not reach 0000_H while counting down. Therefore, TAUDTTOUTm signal is not set/reset and remains initial. This signal becomes a reset signal because an interrupt occurs on slave channel 2 during count-up operation.

(b) Duty cycle = 100%

The following settings apply to the general timing diagram.

- Slave channel 2:
  - Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
  - Negative logic (TAUDnTDL.TAUDnTDLm = 1)

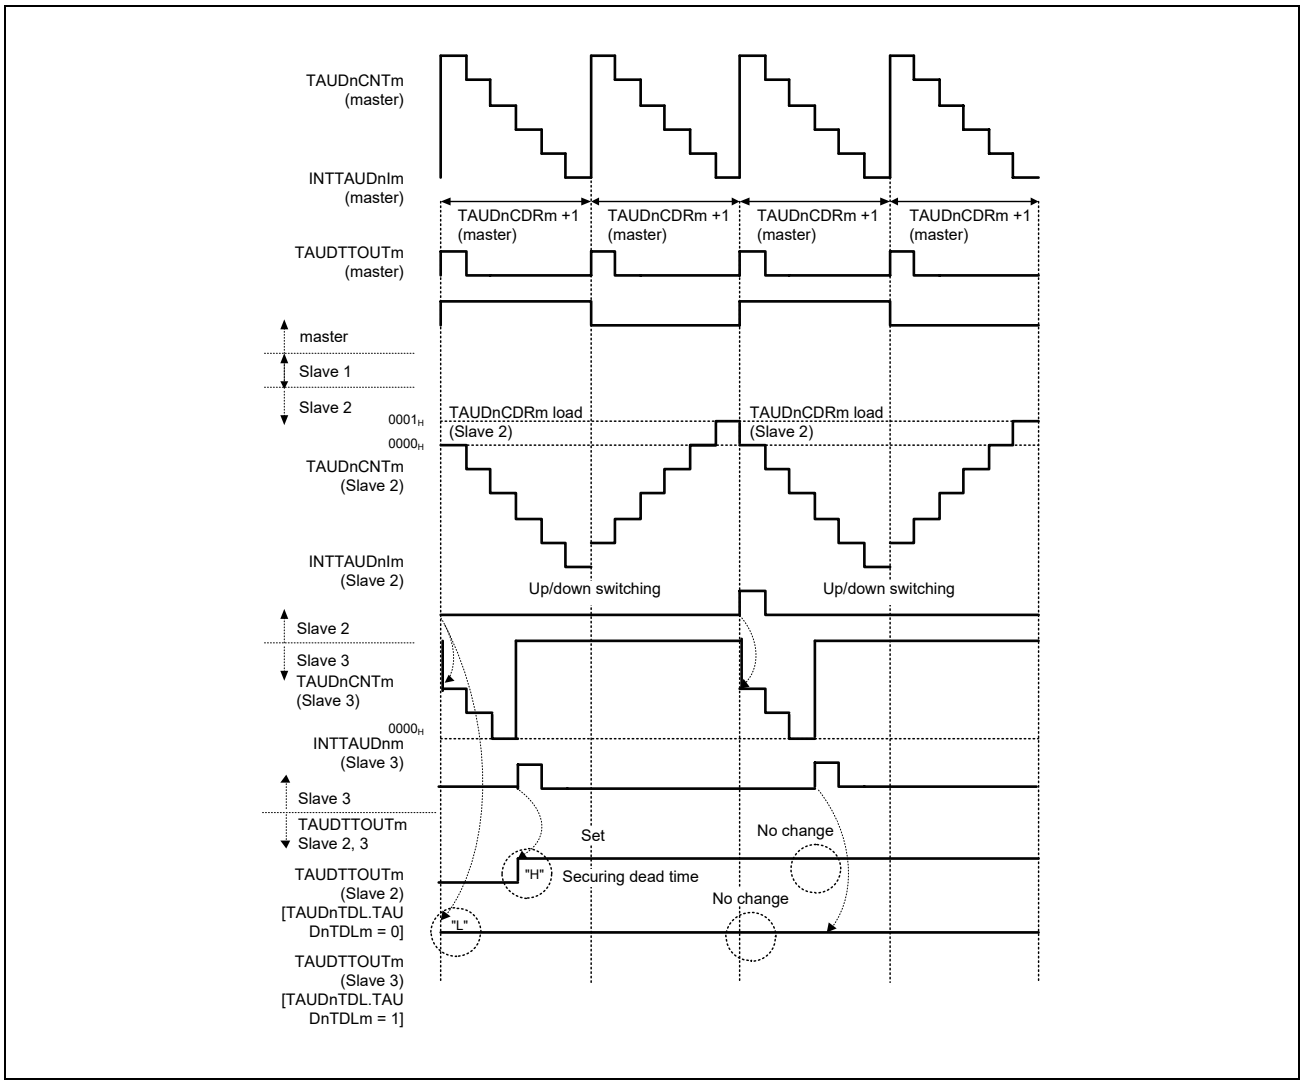

Figure 18.109 TAUDnCDRm (Slave) = 0000_H

- If TAUDnCDRm (slave 2) = 0000_H, the slave channel counter does not reach 0001_H while counting up. Therefore, no INTTAUDnlm occurs during count-up operation.
  - The set conditions for a channel with TAUDnTDL.TAUDnTDLm = 0 are met after elapse of dead time. TAUDTTOUTm is left in a newly set state even if a set/reset is made because no reset conditions are satisfied on such a channel.
  - Slave channel 3 in the above diagram is set when the counter starts. However, TAUDTTOUTm is left in an initial state on the slave channel with TAUDnTDL.TDLm = 1 because no reset conditions are satisfied on that channel.

18.4.12.9 A/D Conversion Trigger Output Function Type 2

(1) Overview

Summary

This function is identical to **Section 18.4.12.7, Triangle PWM Output Function**, except that TAUDTTOUTm is not output.

This function is enabled by setting channel output mode for the slave to independent channel output mode controlled by software.

(2) Block Diagram and General Timing Diagram

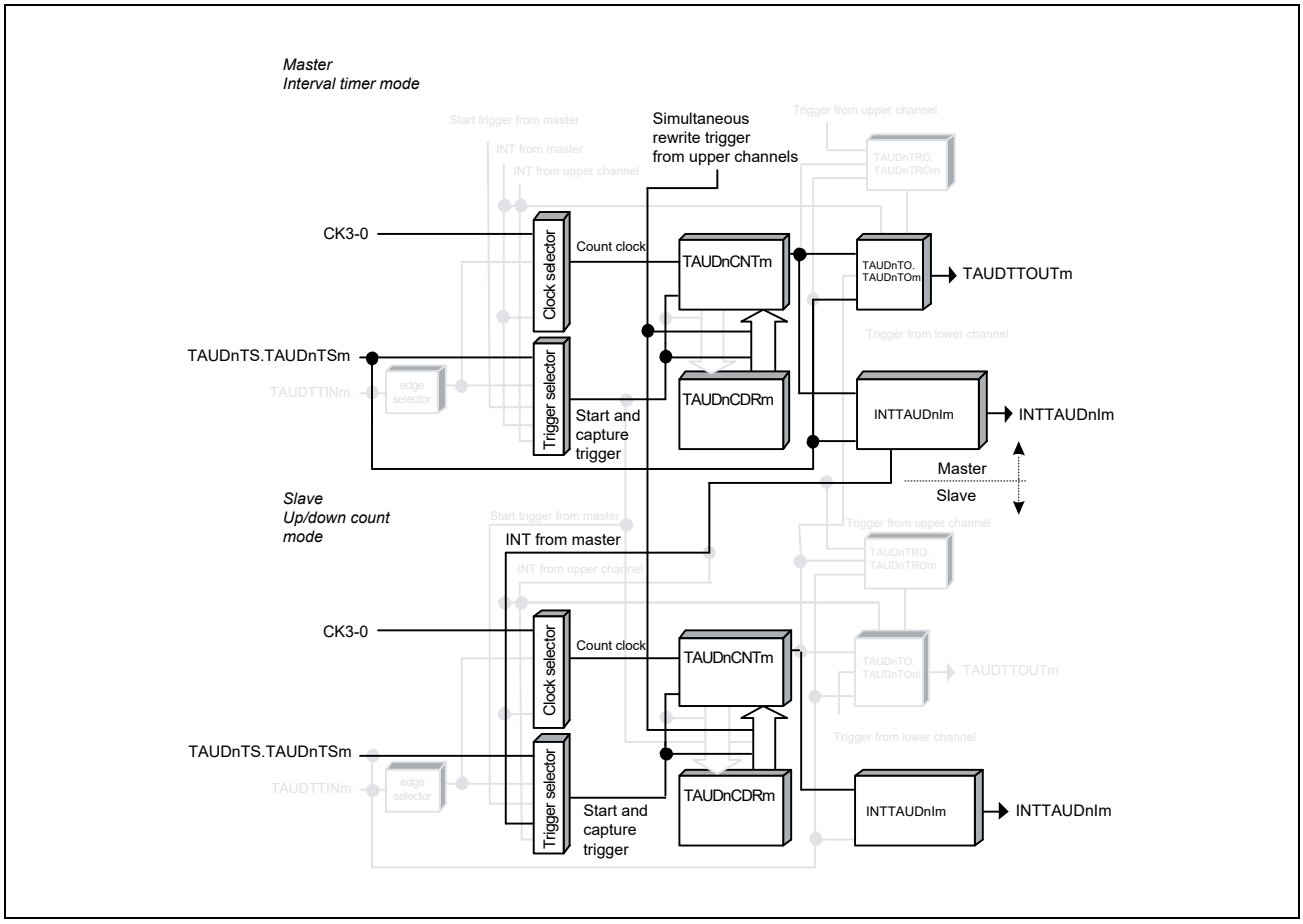

Figure 18.110 Block Diagram of A/D Conversion Trigger Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUDnIm generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

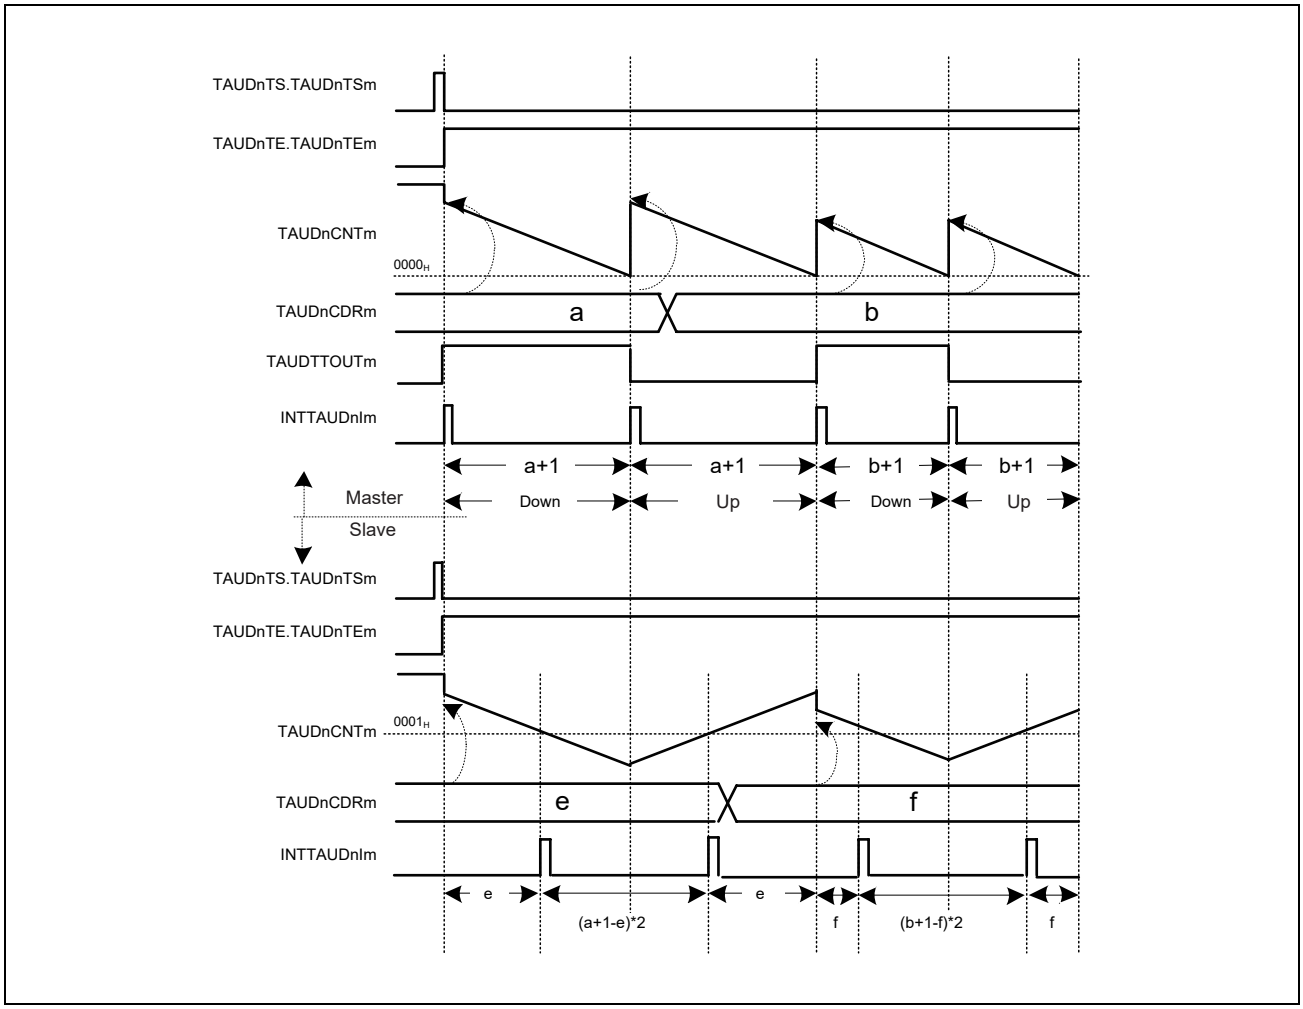

Figure 18.111 General Timing Diagram of A/D Conversion Trigger Output Function Type 2

18.4.12.10 Interrupt Request Signals Culling Function

(1) Overview

Summary

This function divides the number of interrupts of the master channel by a specified value using a slave channel.

The interrupt request signals Culling function is a sub function of the following functions:

- PWM Output Function (see **Section 18.4.12.1, PWM Output Function**)
- Triangle PWM Output Function (see **Section 18.4.12.7, Triangle PWM Output Function**)
- Triangle PWM Output Function with Dead Time
  (see **Section 18.4.12.8, Triangle PWM Output Function with Dead Time**)

Prerequisites

- It requires two channels.
- The operation mode of the master channel must be set to interval timer mode (see **Table 18.186, Contents of TAUDnCMORm Register for Master Channels of Interrupt Request Signals Culling Function**).
- The operation mode of the slave channel must be set to Event Count Mode (see **Table 18.189, Contents of TAUDnCMORm Register for Slave Channels of Interrupt Request Signals Culling Function**).
- TAUDTTOUTm is not used for the master or slave channel of this function.

Functional description

The counters (master and slave) are started by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for both channels. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current value of the data register of the master channel and slave channel (TAUDnCDRm) are written to the counter (TAUDnCNTm).

- Master channel:
  When the counter of the master channel reaches 0000_H, INTTAUDnIm is generated and TAUDnCDRm value is reloaded to TAUDnCNTm.
- Slave channel:
  Every time the master channel generates an INTTAUDnIm, the counter of the slave channel reduces by one. When the counter reaches 0000_H, it awaits the next interrupt from the master channel. This causes TAUDnCNTm (slave) to reload the value of TAUDnCDRm, and an INTTAUDnIm is generated.

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channel(s), which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm of master and slave channel(s) stop but retain their values.

Conditions

This function enables simultaneous rewrite. See **Section 18.4.3, Simultaneous Rewrite**.

(2) Equations

Interrupt division operator = TAUDnCDRm (slave channel)

- One INTTAUDnlm is generated for the INTTAUDnlm count of the master channel defined by TAUDnCDRm (slave channel) + 1.

(3) Block Diagram and General Timing Diagram

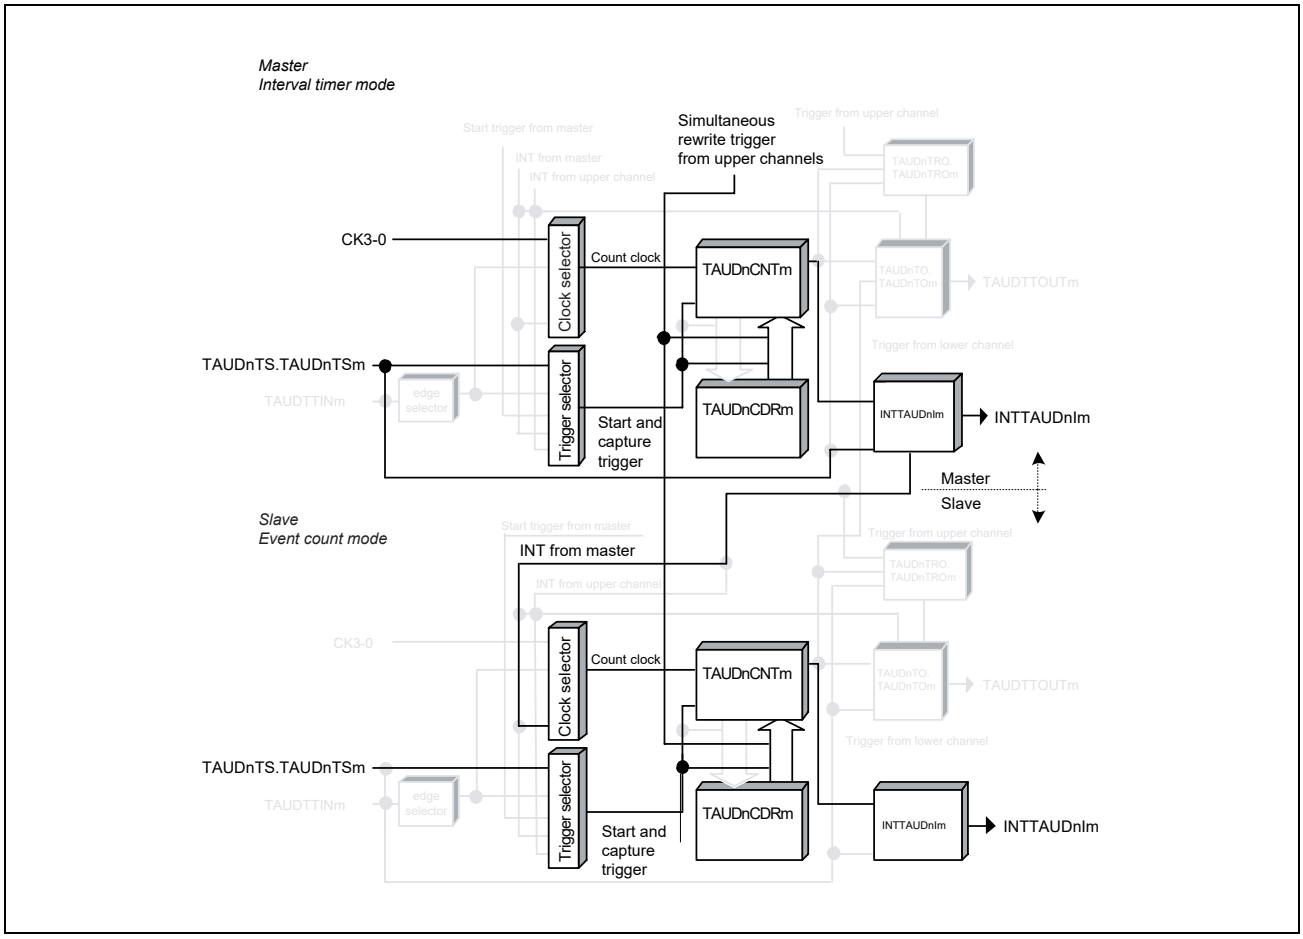

Figure 18.112 Block Diagram of Interrupt Request Signals Culling Function

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

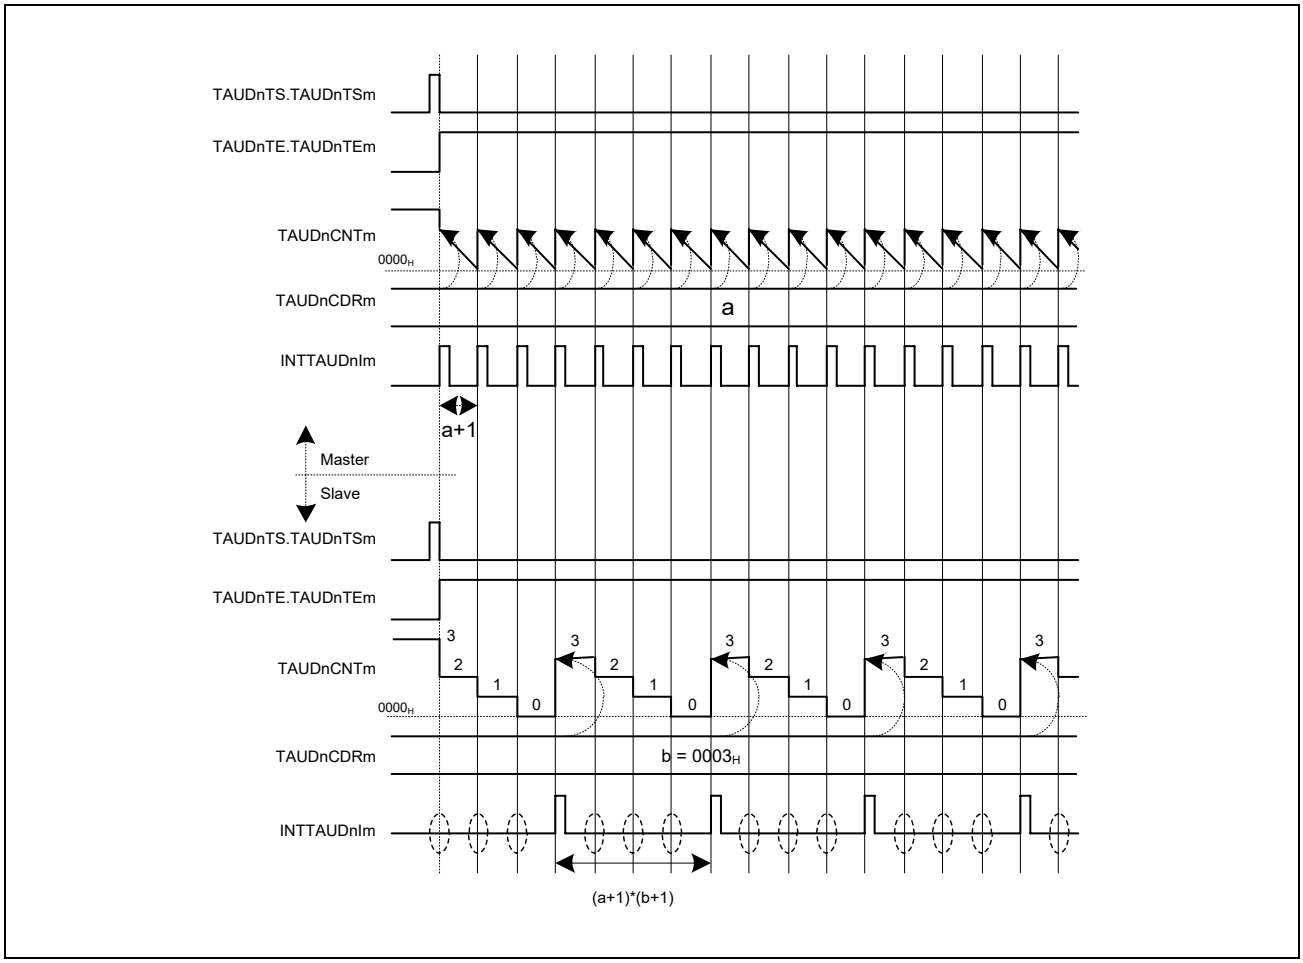

Figure 18.113 General Timing Diagram of Interrupt Request Signals Culling Function

(4) Register Settings for Master Channels

(a) TAUDnCMORm for master channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	1: Channel is master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm not generated at the beginning of operation. 1: INTTAUDnIm generated at the beginning of operation.

(b) TAUDnCMURm for master channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.187 Contents of TAUDnCMURm Register for Master Channels of Interrupt Request Signals Culling Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for master channels

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(d) Simultaneous rewrite for master channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.188 Simultaneous Rewrite Settings for Master channels of Interrupt Request Signals Culling Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(5) Register Settings for Slave Channels

(a) TAUDnCMORm for slave channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	11: INTTAUDnIm of the master channel is used as the count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0011: Event count mode
0	TAUDnMD0	0: INTTAUDnIm not generated at the beginning of operation.

(b) TAUDnCMURm for slave channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.190 Contents of TAUDnCMURm Register for Slave Channels of Interrupt Request Signals Culling Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for the slave channel

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(d) Simultaneous rewrite for slave channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.191 Simultaneous Rewrite Settings for Slave Channels of Interrupt Request Signals Culling Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

(6) Operating Procedure for Interrupt Request Signals Culling Function

Table 18.192 Operating Procedure for Interrupt Request Signals Culling Function

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (5), Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000_H: • INTTAUDnIm (master) occurs. • TAUDnCNTm (master) loads TAUDnCDRm value and continues count operation. • TAUDnCNTm of slave channels counts down each time INTTAUDnIm of master channel is detected. When TAUDnCNTm of the slave = 0000_H: • INTTAUDnIm (slave) occurs. • TAUDnCNTm (slave) loads the TAUDnCDRm value and continues counting.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stop and retain their current values.

Restart

(7) Specific Timing Diagrams

(a) Interrupt count (master) = interrupt count (slave)

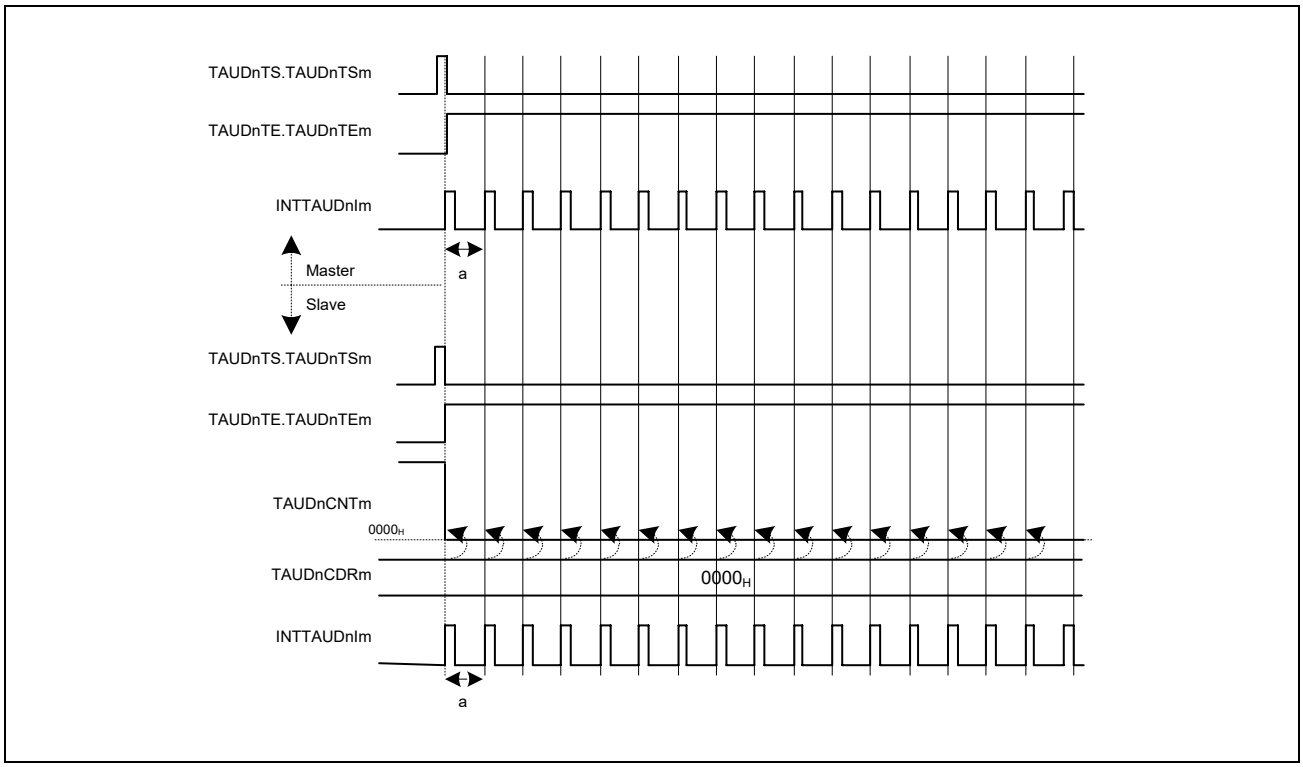

Figure 18.114 TAUDnCDRm (Slave) = 0000_H

- If TAUDnCDRm = 0000_H, TAUDnCDRm value of slave channels is loaded into TAUDnCNTm each time INTTAUDnIm of master channel is detected. In other words, TAUDnCNTm is always 0000_H.
- Therefore, an interrupt occurs on the master channel and simultaneously an interrupt occurs on slave channels.

18.4.12.11 One-Phase PWM Output Function

(1) Overview

Summary

This function adds dead time to a TAUDTTINm input signal. The resulting PWM signal is output via TAUDTTOUTm of the channel and TAUDTTOUTm of upper channels.

Prerequisites

- Each of two (or more) channels is enabled for dead time control (TAUDnTDE.TAUDnTDEm = 1).
- The operating mode for the lower channel should be set to one-count mode (see **Table 18.194, Contents of TAUDnCMORm Register for One-Phase PWM Output Function**).
- Any operating mode can be set to upper channels.
- Channel output mode for upper and lower channels should be set to synchronous channel output mode 2 with one-phase PWN output (see **18.4.4, Channel Output Modes**).

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when an effective TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches 0000_H, an interrupt occurs. The counter is reset to $FFFF_H$ and waits for the next effective TAUDTTINm input start edge.

Table 18.193 TAUDTTOUTm to which Dead Time is Added and State of TAUDTTINm

TAUDnCMURm. TAUDnTIS[1:0]	TAUDnTOL. TAUDnTOLm	TAUDTTOUTm to which Dead Time is Added	TAUDnTDL. TAUDnTDLm	TAUDTTINm_lower State when Added
10	0	TAUDTTOUTm low	0	High
			1	Low
	1	TAUDTTOUTm high	0	High
			1	Low
11	0	TAUDTTOUTm low	0	Low
			1	High
	1	TAUDTTOUTm high	0	Low
			1	High

Conditions

- TAUDnCMURm.TAUDnTIS[1:0] bits specify the type of width measurement:
  - TAUDnCMURm.TAUDnTIS[1:0] = 10_B: Uses both edges as effective edges for detection (Low width measurement).
  - TAUDnCMURm.TAUDnTIS[1:0] = 11_B: Uses both edges as effective edges for detection (High width measurement).
- The TAUDnTDL.TAUDnTDLm bit specifies the operation of TAUDTTOUTm for each channel when an interrupt or effective TAUDTTINm edge is detected on the lower channel:
  - If TAUDnTDL.TAUDnTDLm = 0, an interrupt is used as a TAUDTTOUTm set trigger and an effective TAUDTTINm edge as a TAUDTTOUTm reset trigger.
  - If TAUDnTDL.TAUDnTDLm = 1, an effective TAUDTTINm edge is used as a TAUDTTOUTm set trigger and an interrupt as a TAUDTTOUTm reset trigger.
- This function cannot make a forced restart.

(2) Block Diagram and General Timing Diagram

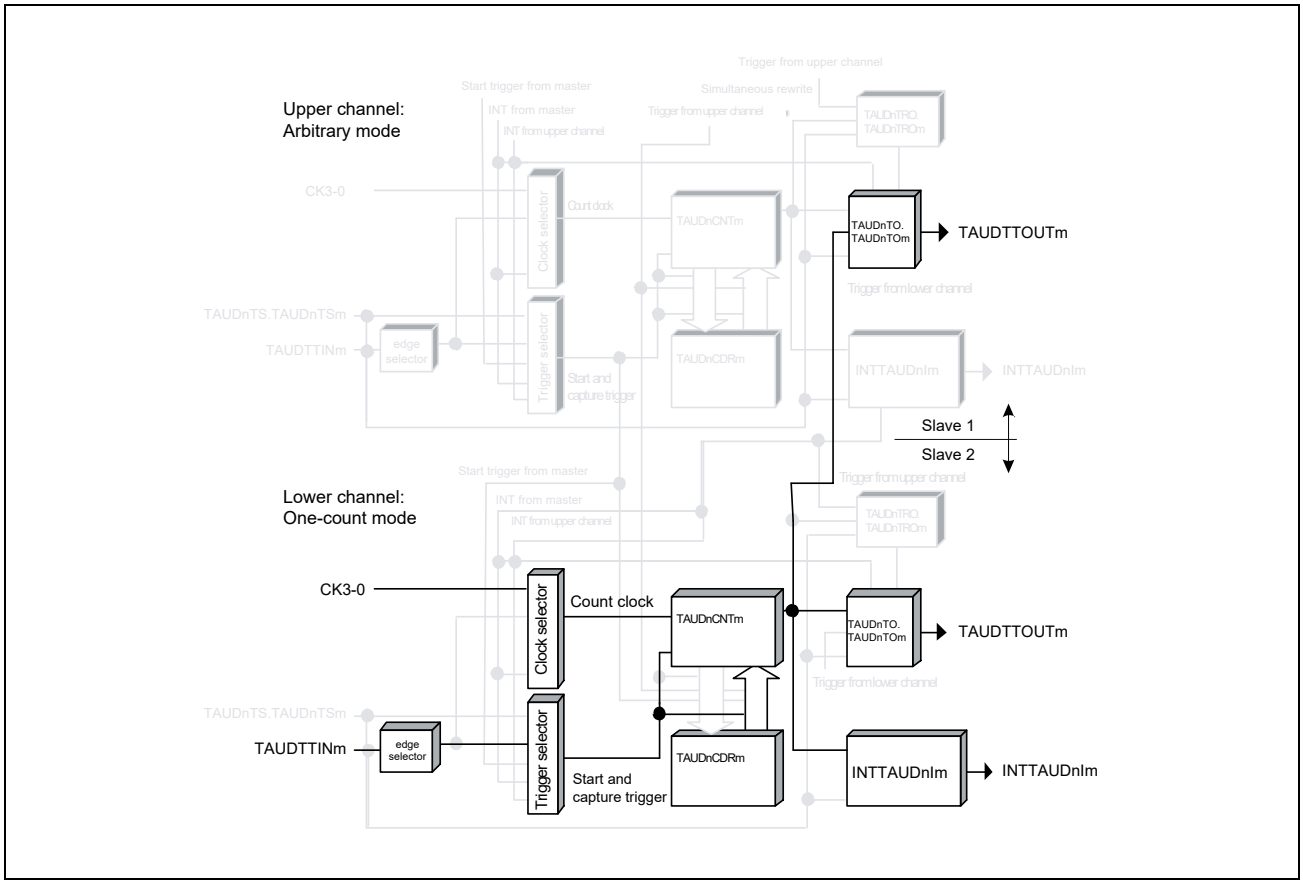

Figure 18.115 Block Diagram of One-Phase PWM Output Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

This setting considers a duty as active high.

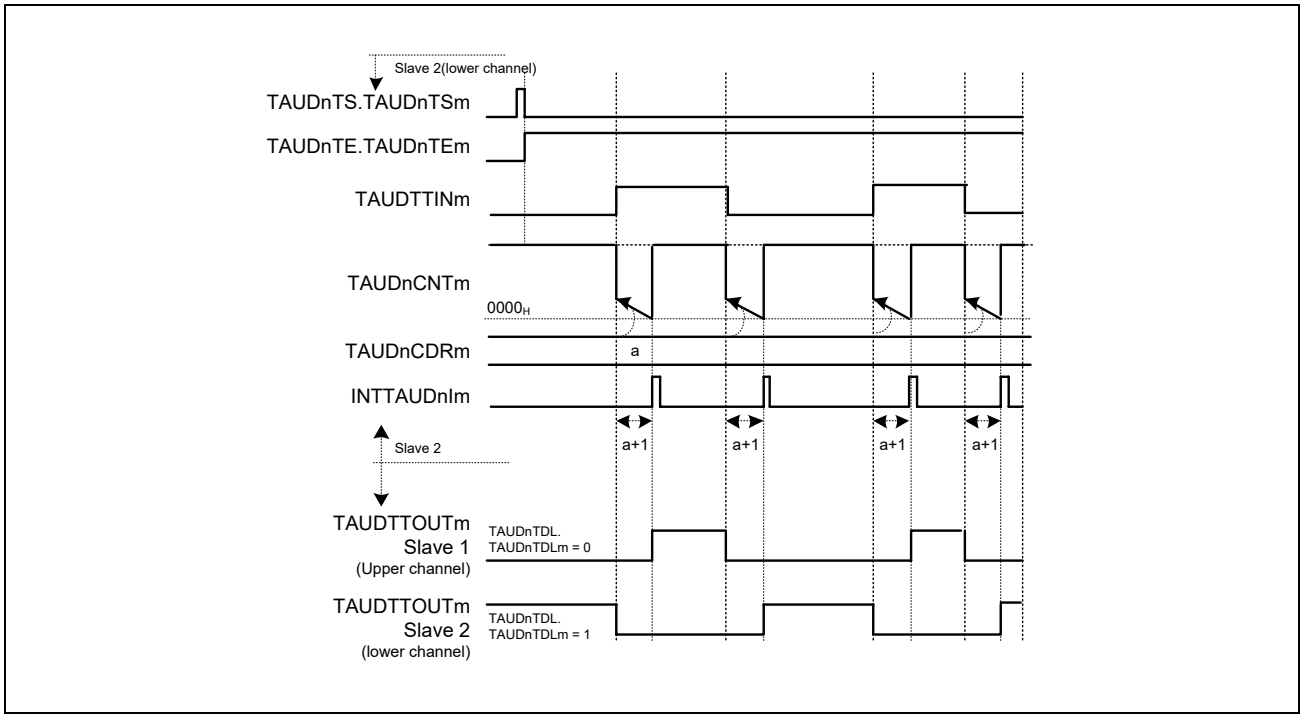

Figure 18.116 General Timing Diagram of One-Phase PWM Output Function

(3) Register Settings for Lower Channels

(a) TAUDnCMORm for lower channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.194 Contents of TAUDnCMORm Register for One-Phase PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Operation clock = CK0 01: Operation clock = CK1 10: Operation clock = CK2 11: Operation clock = CK3
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Independent channel operation. Set to 0.
10 to 8	TAUDnSTS[2:0]	001: Effective edge of the TAUDTTINm input signal is used as an external start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

(b) TAUDnCMURm for lower channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.195 Contents of TAUDnCMURm Register for One-Phase PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	10: Detection of rising and falling edges (low width measurement) 11: Detection of rising and falling edges (high width measurement)

(c) Channel output mode for lower channels

Table 18.196 Control Bit Settings in Synchronous Channel Output Mode 2 with One-Phase PWM Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	1: Adds dead time upon detection of a TAUDTTINm input edge on a lower odd-numbered channel.
TAUDnTDL.TAUDnTDLm	0: Adds dead time of the positive-phase width. 1: Adds dead time of the negative-phase width.
TAUDnTRE.TAUDnTREm	0: Disables real-time output.
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0.
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel.
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm to upper channels exclusively.

(d) Simultaneous rewrite for lower channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with this function. Therefore, these registers should be set to 0.

Table 18.197 Simultaneous Rewrite Settings for One-Phase PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

(4) Register Settings for Upper Channels

(a) TAUDnCMORm for upper channels

TAUDnCMORm register for upper channels can be set arbitrarily.

(b) TAUDnCMURm for upper channels

TAUDnCMURm register for upper channels can be set arbitrarily.

(c) Channel output mode for upper channels

Table 18.198 Control Bit Settings for Upper Channels in Synchronous Channel Output Mode 2 with One-Phase PWM Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	1: Adds dead time upon detection of a TAUDTTINm input edge on a lower odd-numbered channel.
TAUDnTDL.TAUDnTDLm	0: Uses a lower channel interrupt as a TAUDTTOUTm set trigger and an effective lower channel TAUDTTINm edge as a TAUDTTOUTm reset trigger. 1: Uses an effective lower channel TAUDTTINm edge as a TAUDTTOUTm set trigger and a lower channel interrupt as a TAUDTTOUTm reset trigger.
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0.
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel.
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm to lower channels exclusively.

(d) Simultaneous rewrite for upper channels

Simultaneous rewrite register for upper channels can be set arbitrarily.

(5) Operating Procedure for One-phase PWM Output Function

Table 18.199 Operating Procedure for One-phase PWM Output Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for the lower channel as described in **Table 18.194, Contents of TAUDnCMORm Register for One-Phase PWM Output Function** and **Table 18.195, Contents of TAUDnCMURm Register for One-Phase PWM Output Function**. Set TAUDnCMORm and TAUDnCMURm registers for the upper channel as described in **Section (4), Register Settings for Upper Channels**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 18.196, Control Bit Settings in Synchronous Channel Output Mode 2 with One-Phase PWM Output**.	Channel operation is stopped.
Start Operation	Set TAUDnTOE.TAUDnTOEm (slave channels 1 and 2) to 1 (at restart time only). Set TAUDnTS.TAUDnTSm = 1 for slave channel 2. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 (slave channel 2) and TAUDnCNTm waits for detection of TAUDTTINm start edge. TAUDnCNTm loads TAUDnCDRm value.
During Operation	The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at any time.	TAUDnCNTm of slave channel 2 counts down. When the counter reaches 0000_H: • INTTAUDnIm is generated. • TAUDnCNTm stops counting. TAUDTTOUTm is changed by a TAUDTTINm edge detection signal and slave channel 2 INTTAUDnIm signal to output one-phase PWM waveform with dead time. Afterwards, this operation is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm = 1 for slave channel 2. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm and TAUDTTOUTm retain their current values.

Restart

18.4.13 Synchronous Non-Complementary and Complementary Modulation OutputFunctions

This section describes functions that generate six-phase PWM output or triangle PWM output by using a master channel and seven slave channels.

- **Section 18.4.13.1, Non-Complementary Modulation Output Function Type 1**
- **Section 18.4.13.2, Non-Complementary Modulation Output Function Type 2**
- **Section 18.4.13.3, Complementary Modulation Output Function**

18.4.13.1 Non-Complementary Modulation Output Function Type 1

(1) Overview

Summary

This function outputs a PWM signal, a high-level signal, or a low-level signal from TAUDTTOUTm depending on the values of the real-time output bits (TAUDnTRO.TAUDnTROm) and the modulation output enable bits (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

Prerequisites

- It requires one master channel and seven slave channels.
- The operation mode of the master channel must be set to interval timer mode (see **Table 18.201, Contents of TAUDnCMORm Register for Master Channels of Non-Complementary Modulation Output Function Type 1**).
- The operating mode for slave channels 1 to 7 should be set to one-count mode (see **Table 18.204, Contents of TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1**).
- TAUDTTOUTm is not used with the master channel of this function.
- TAUDTTOUTm of slave channel 1 is not used with this function, but TAUDnTRC.TRCm should be set to 1 (see **18.4.4, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 1 with non-complementary modulation output (see **18.4.4, Channel Output Modes**).
- TAUDnCDRm of slave channel 1 should be set to 0000_H.

Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down. When the counter reaches 0000_H, INTTAUDnlm occurs.

- Slave channel 1:
  Slave channel 1 is set as a channel that triggers real-time output (TAUDnTRC.TAUDnTRCm =1). If an interrupt occurs on slave channel 1 (TAUDnCDRm is fixed to 0000_H), the value of real-time output bit (TAUDnTRO.TAUDnTROm) of the channel that has detected the interrupt on slave channel 1 changes. After that, the counter returns to $FFFF_H$ and waits for the next interrupt of master channel.
- Slave channel 2:
  Slave channel 2 generates a PWM output. The master channel specifies a PWM output cycle and slave channel 2 specifies a duty cycle. After generating an interrupt, the counter returns to $FFFF_H$ and awaits the next interrupt from the master channel.

Slave channels 3 to 7 operate like slave channel 2.

As described in **Table 18.200, TAUDTTOUTm Output from One Pair of Slave Channels of Non-Complementary Modulation Output Function Type 1**, a signal output from TAUDTTOUTm depends on the value of the real-time output bit (TAUDnTRO.TAUDnTROm) and modulation output bit (TAUDnTME.TAUDnTMEm) of slave channel.

This function cannot use a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

- If TAUDnTME.TMEm = 0 on slave channels 2 to 7:
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TMEm = 1 on slave channels 2 to 7:
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM corresponding to the channel.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal becomes inverted logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

Table 18.200 TAUDTTOUTm Output from One Pair of Slave Channels of Non-Complementary Modulation Output Function Type 1

TAUDnTME.TAUDnTMEm	TAUDnTRO.TAUDnTROm	TAUDTTOUTm Output
0	0	Low level
	1	High level
1	0	Low level
	1	PWM (positive logic)

- This function enables simultaneous rewrite. See **Section 18.4.3, Simultaneous Rewrite**.
- TAUDnCDRm value of slave channel 1 should be set to 0000_H so that a real-time output is triggered at the same time with PWM generation on slave channels 2 to 7.
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set low before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set high before TAUDnTE.TAUDnTEm is set to 0.

(2) Equations

Slave channels 2 to 7:

PWM output cycle = [TAUDnCDRm (master) + 1] × count clock cycle

PWM output duty time = [TAUDnCDRm (slave)] × count clock cycle

(3) Block Diagram and General Timing Diagram

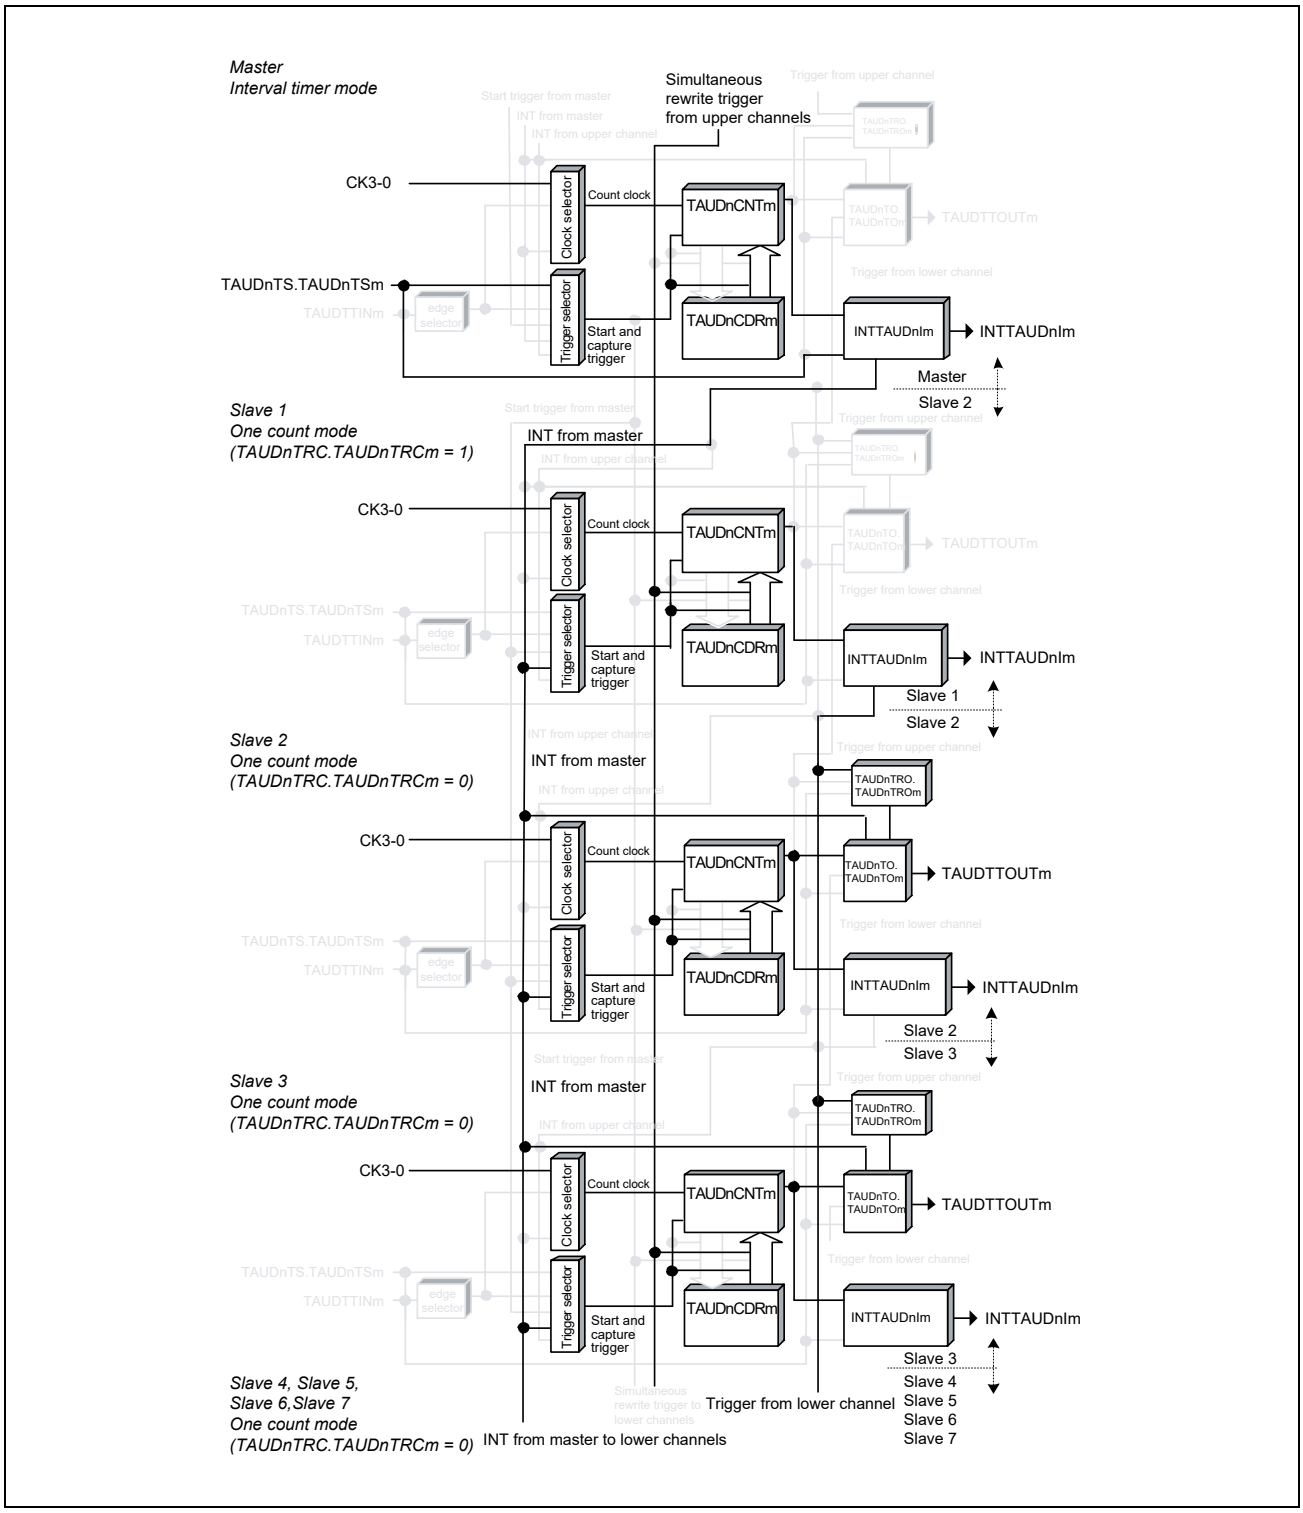

Figure 18.117 Block Diagram of Non-Complementary Modulation Output Function Type 1

The following settings apply to the general timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

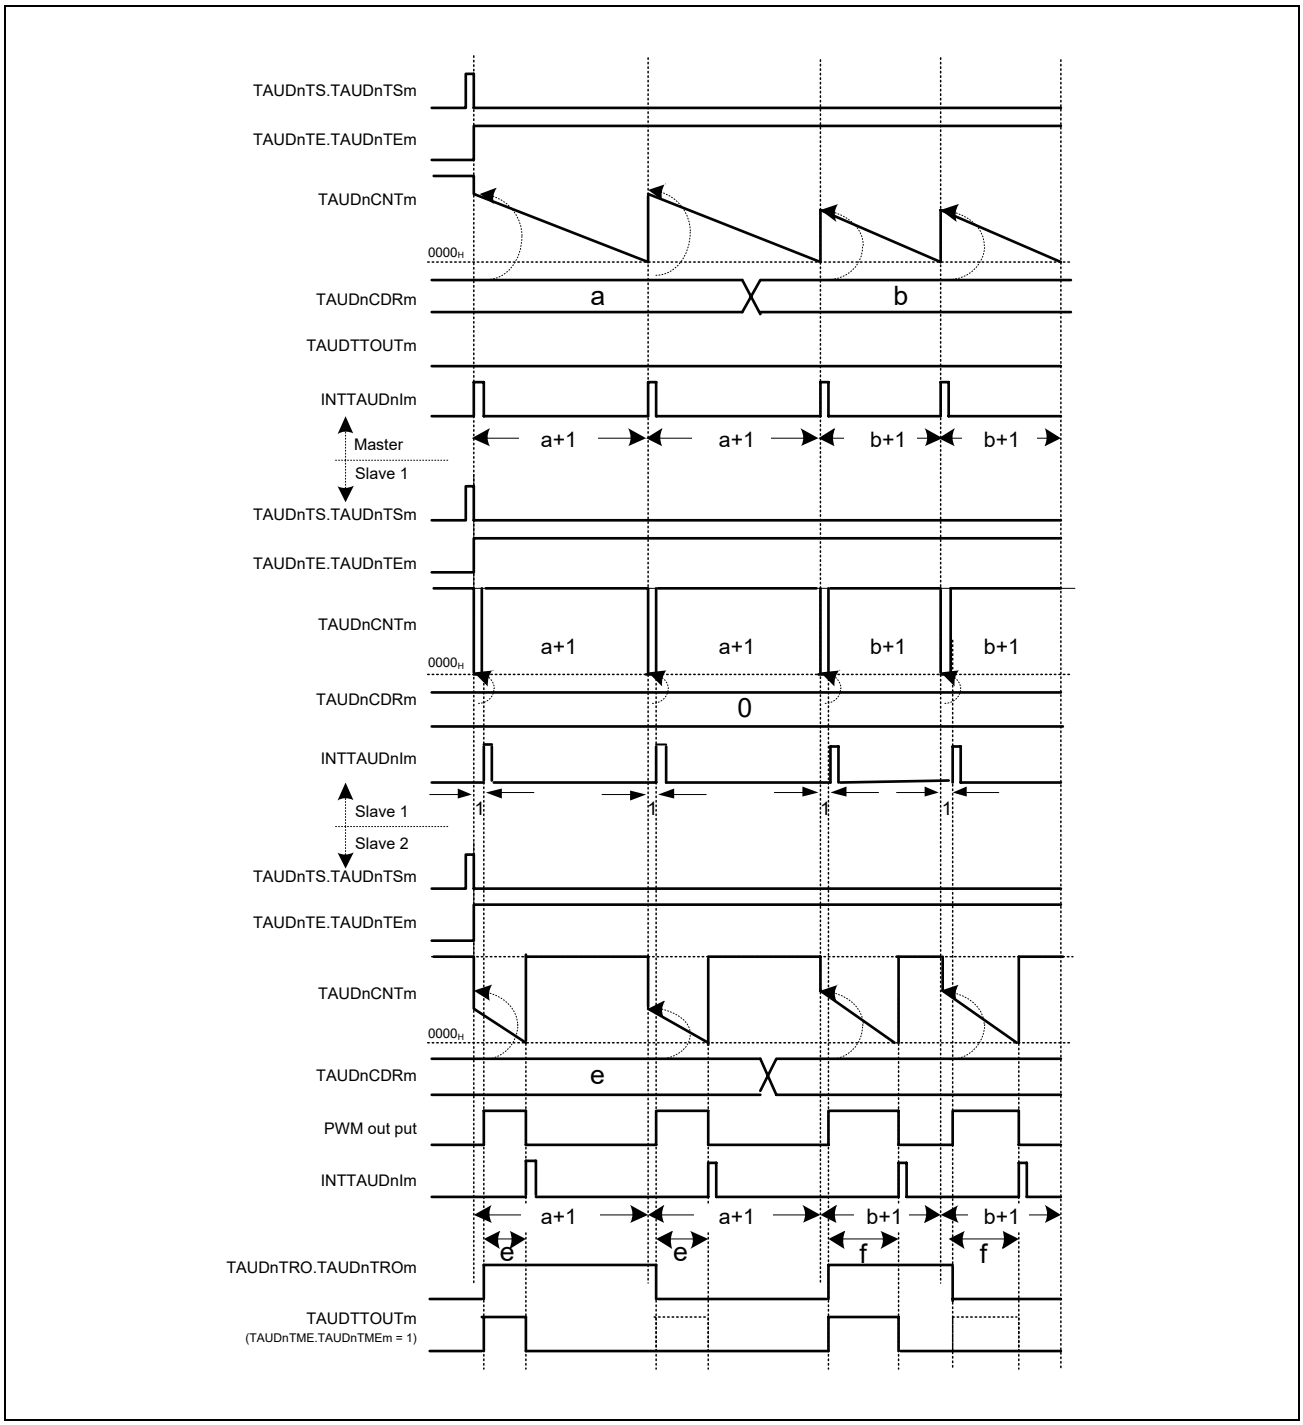

Figure 18.118 General Timing Diagram of Non-Complementary Modulation Output Function Type 1

NOTE

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

(4) Register Settings for Master Channels

(a) TAUDnCMORm for master channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.201 Contents of TAUDnCMORm Register for Master Channels of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Operation clock = CK0 01: Operation clock = CK1 10: Operation clock = CK2 11: Operation clock = CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	1: Channel is master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	1: INTTAUDnIm is generated at the beginning of operation or at a restart time.

(b) TAUDnCMURm for master channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.202 Contents of TAUDnCMURm Register for Master Channels of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for master channels

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

(d) Simultaneous rewrite for master channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.203 Simultaneous Rewrite Settings for Master Channels of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger. When TAUDnRDS.TAUDnRDSm = 0, the master channel is monitored for simultaneous rewrite triggers regardless of the value of this bit.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than a master channel to generate a simultaneous rewrite trigger signal.

Conduct operation settings under the following conditions.

- Simultaneous rewrite trigger output function type 1 setting channel:
  TAUDnRDCm = 1, TAUDnRDSm = 1
  In addition, TAUDnCDRm settings for this channel are as follows.
  = ((TAUDnCDRm setting for the master channel targeted for simultaneous rewrite + 1) × Interrupt count) – 1
- Master channel: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channel: TAUDnRDCm = 0, TAUDnRDSm = 1

(5) Register Settings for Slave Channel 1

(a) TAUDnCMORm for slave channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS [1:0]		TAUDnCCS [1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS [1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.204 Contents of TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Operation clock = CK0 01: Operation clock = CK1 10: Operation clock = CK2 11: Operation clock = CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is enabled.

(b) AUDnCMURm for slave channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.205 Contents of TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function.

CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

(d) Simultaneous rewrite for slave channel 1

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.206 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger. When TAUDnRDS.TAUDnRDSm = 0, the master channel is monitored for simultaneous rewrite triggers regardless of the value of this bit.

(6) Register Settings for Slave Channels 2 to 7

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Operation clock = CK0 01: Operation clock = CK1 10: Operation clock = CK2 11: Operation clock = CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is enabled.

(b) TAUDnCMURm for slave channels 2 to 7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.208 Contents of TAUDnCMURm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for slave channels 2 to 7

Table 18.209 Control Bit Settings for Slave Channels 2 to 7 in Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

(d) Simultaneous rewrite of slave channels 2 to 7

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.210 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger. When TAUDnRDS.TAUDnRDSm = 0, the master channel is monitored for simultaneous rewrite triggers regardless of the value of this bit.

(7) Operating Procedure for Non-Complementary Modulation Output Function Type 1

Table 18.211 Operating Procedure for Non-Complementary Modulation Output Function Type 1 (1/2)

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channel 1: Set TAUDnCMORm/TAUDnCMURm register and the channel output mode as described in **Section (5), Register Settings for Slave Channel 1**. Slave channels 2 to 7: Set TAUDnCMORm/TAUDnCMURm register and the channel output mode as described in **Section (6), Register Settings for Slave Channels 2 to 7**. Set the value of TAUDnCDRm register of every channel. Set a pulse cycle with TAUDnCDRm of master channel, 0000_H in TAUDnCDRm of slave channel 1, and duty width with TAUDnCDRm of slave channels 2 to 7. Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.	Channel operation is stopped.

Table 18.211 Operating Procedure for Non-Complementary Modulation Output Function Type 1 (2/2)

	Operation	TAUDn Status
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down.
During Operation	TAUDnCDRm, TAUDnTRO.TAUDnTROm, and TAUDnTMEm.TAUDnTMEm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel, slave channel 1 and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. When the counter of master channel reaches 0000_H: • INTTAUDnIm is generated. • TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down. • PWM output signals of slave channels 2 to 7 are set/reset. • TAUDnCDRm value of slave channel 1 is reloaded into TAUDnCNTm to perform counting down. • TAUDnCDRm value of slave channels 2 to 7 is reloaded into TAUDnCNTm to perform counting down. When the counter of slave channel 1 or slave channels 2 to 7 reaches 0000_H: • INTTAUDnIm is generated. • The TAUDnTRO.TAUDnTROm value for slave channels 2 to 7 is reflected in the TAUDTTOUTm output. When the counter of slave channels 2 to 7 reaches 0000_H: • INTTAUDnIm is generated. • PWM output signals of slave channels 2 to 7 are reset. TAUDTTOUTm of slave channels 2 to 7 outputs a PWM signal, a high-level signal or low-level signal depending on the values of real-time output bits (TAUDnTRO.TAUDnTROm) and modulation output bit (TAUDnTME.TAUDnTMEm) of a pair of slave channels.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(8) Specific Timing Diagrams

The following settings apply to the specific timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

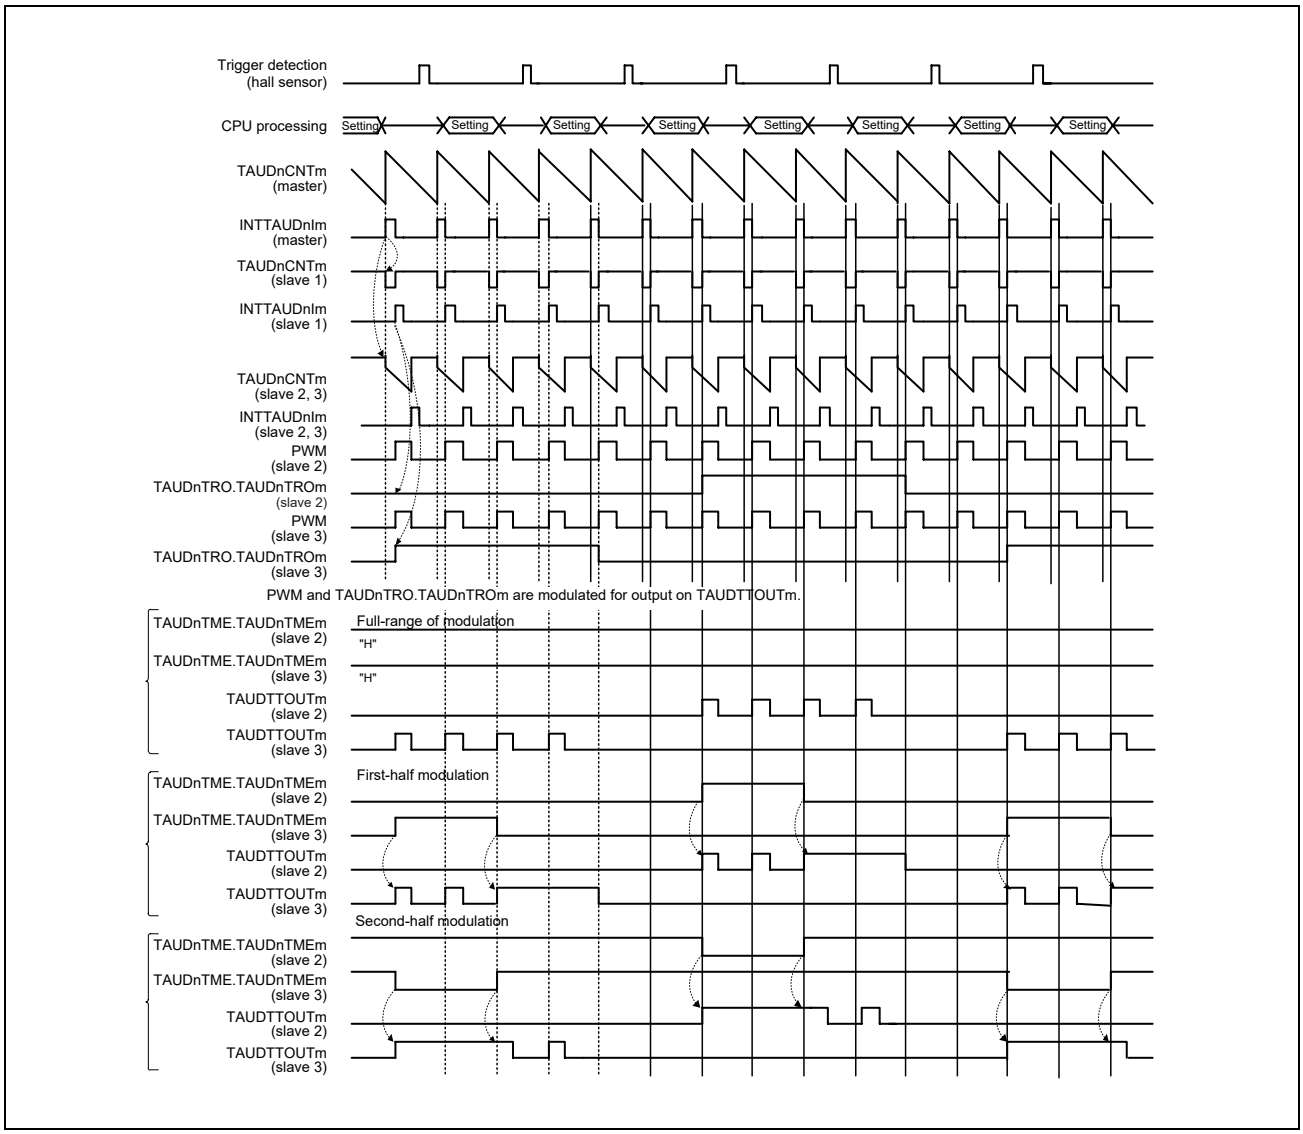

Figure 18.119 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 1

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The “Setting” symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and master channel cycle. According to the modified setting, modulation waveforms are output from TAUDTTOUTm.

TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

18.4.13.2 Non-Complementary Modulation Output Function Type 2

(1) Overview

Summary

This function outputs a PWM signal, a high-level signal, or low-level signal from TAUDTTOUTm depending on the real-time output bit value (TAUDnTRO.TAUDnTROm) and the modulation output enable bit value (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

Prerequisites

- It requires one master channel and seven slave channels.
- The operation mode of the master channel must be set to interval timer mode (see **Table 18.213, Contents of TAUDnCMORm Register for Master Channels of Non-Complementary Modulation Output Function Type 2**).
- The operating mode for slave channel 1 should be set to event count mode (see **Table 18.217, Contents of TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2**).
- The operating mode for slave channels 2 to 7 should be set to up/down count mode (see **Table 18.220, Contents of TAUDnCMORm Register for slave channels 2 to 7 of Non-Complementary Modulation Output Function Type 2**).
- The output mode of the master channel must be set to independent channel output mode 1 (see **Section 18.4.4, Channel Output Modes**).
- This function does not use TAUDTTOUTm of slave channel 1 but TAUDnTRC.TAUDnTRCm should be set to 1 (see **Section 18.4.4, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with non-complementary modulation output (see **Section 18.4.4, Channel Output Modes**).

Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm).

- Master channel:
  The counter of master channel starts to count down. When the counter reaches 0000_H, INTTAUDnIm occurs.
- Slave channel 1:
  When slave channel 1 detects an interrupt from the master channel, the TAUDnCNTm value is decremented. When an interrupt from the master channel is detected for the (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, the TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently. Since slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm = 1), the real-time output bit (TAUDnTRO.TAUDnTROm) of the channel which detects an interrupt on the corresponding channel is reflected to the respective TAUDTTOUTm outputs when an interrupt occurs on slave 1 channel.

- Slave channel 2:
  Once detecting an interrupt from the master channel, TAUDnCNTm counts in the reverse direction. When an interrupt is detected during count-up operation, TAUDnCDRm value is reloaded and then the counter starts to count down.
  If TAUDnCNTm = 0001_H, an interrupt occurs and a PWM output signal is set/reset.

The combined use of the master channel and slave channel 2 generates a PWM output signal. The master channel generates a PWM output cycle and slave channel 2 generate a duty cycle.

Slave channels 3 to 7 operates like slave channel 2.

A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROm) and a modulation output bit value (TAUDnTME.TAUDnTMEm) of the slave channel, as described in **Table 18.212, TAUDTTOUTm Output of a Pair of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0)**.

This function cannot make a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

- If TAUDnTME.TAUDnTMEm = 0 on slave channels (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm = 1 on slave channels (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM corresponding to the channel.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal becomes inverted logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

Table 18.212 TAUDTTOUTm Output of a Pair of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0)

TAUDnTME.TAUDnTMEm	TAUDnTRO.TAUDnTROm	TAUDTTOUTm Output
0	0	Low level
	1	High level
1	0	Low level
	1	PWM (positive logic)

- This function enables simultaneous rewrite. See **Section 18.4.3, Simultaneous Rewrite**.
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set low before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set high before TAUDnTE.TAUDnTEm is set to 0.

(2) Equations

Slave channels 2 to 7:

Carrier cycle (down/up) = [TAUDnCDRm (master) + 1] × 2 × count clock cycle

Duty time = [TAUDnCDRm (master) + 1 – TAUDnCDRm (slave)] × 2 × count clock cycle

(3) Block Diagram and General Timing Diagram

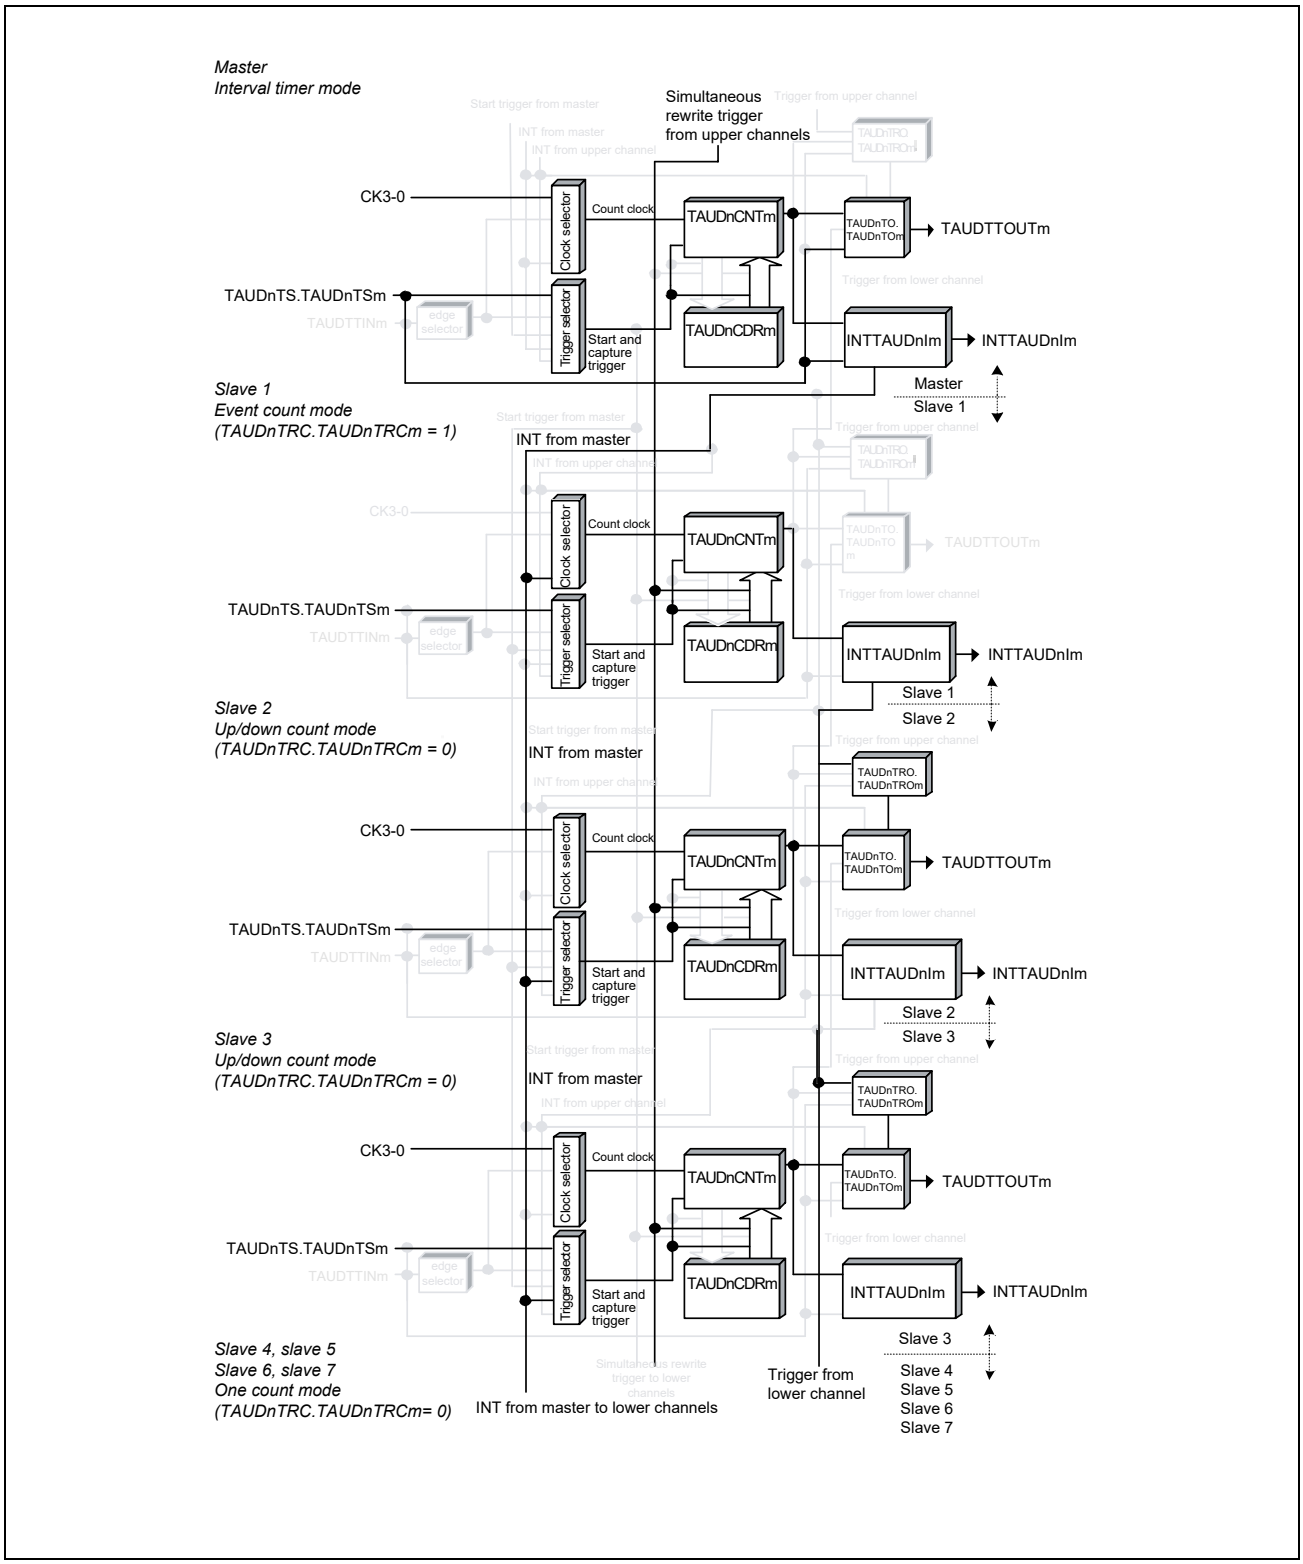

Figure 18.120 Block Diagram of Non-Complementary Modulation Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm not generated at the beginning of operation.(TAUDnCMORm.TAUDnMD0 = 0)
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

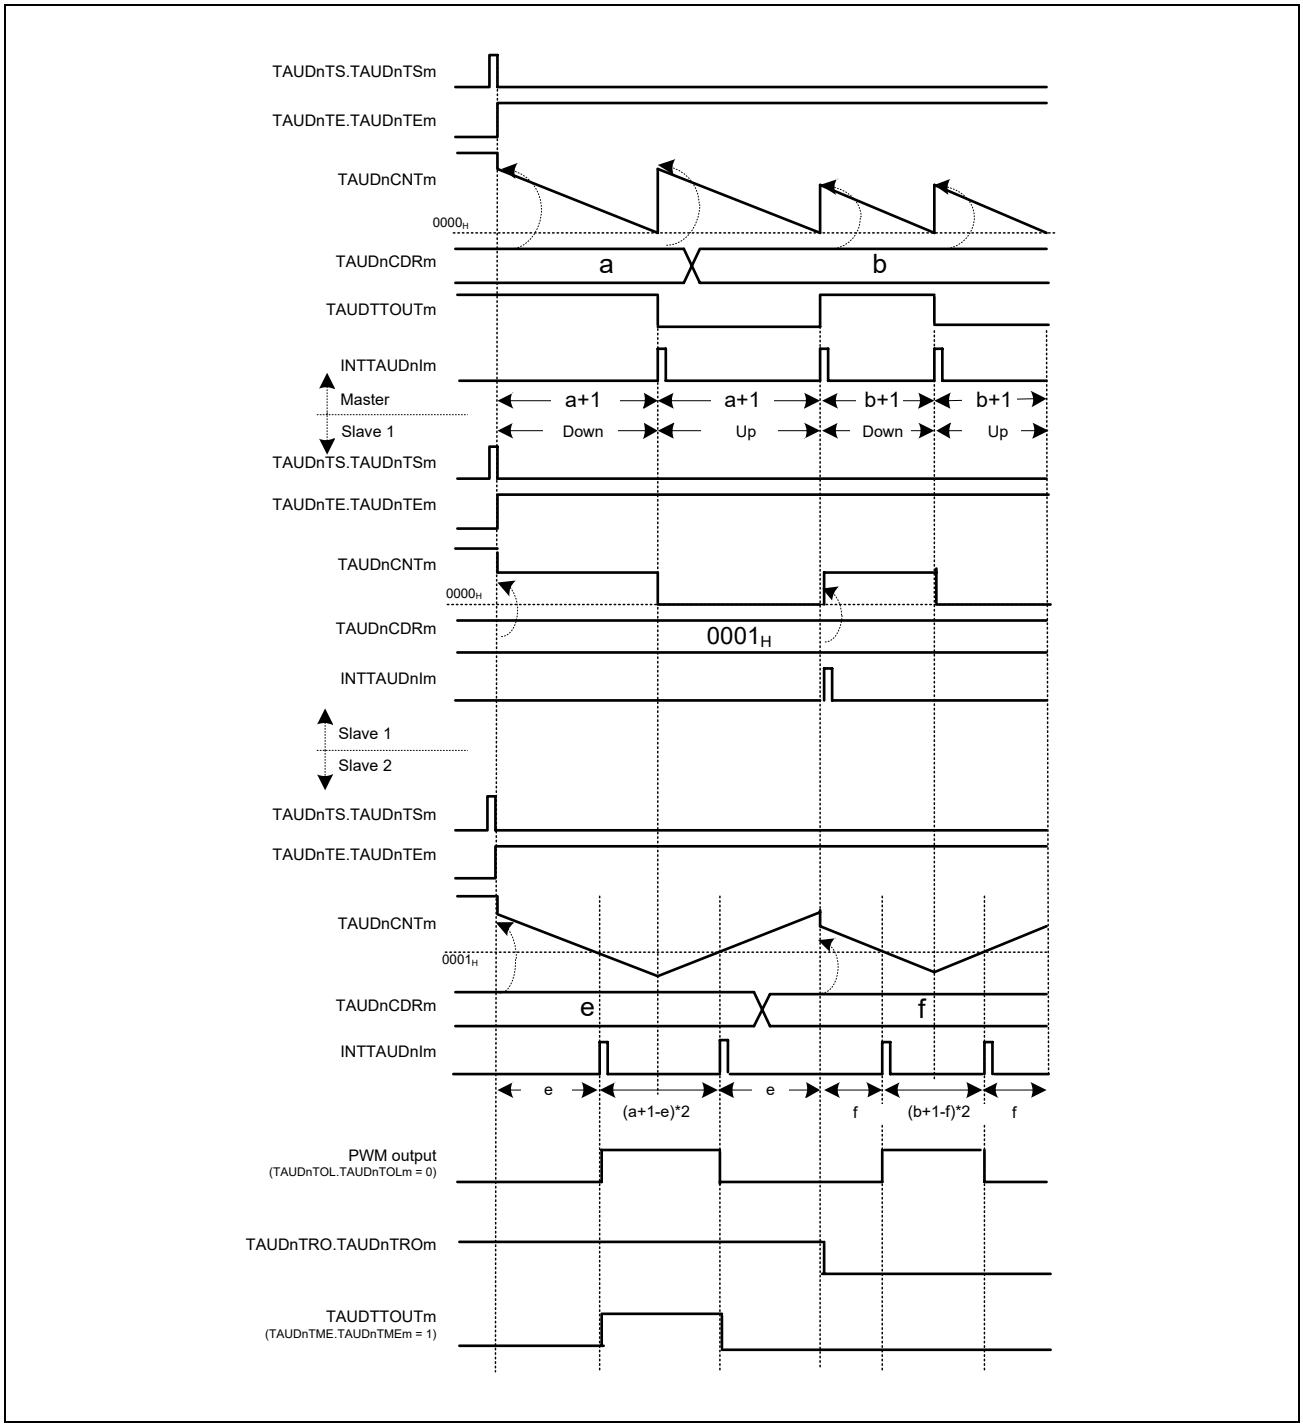

Figure 18.121 General Timing Diagram of Non-Complementary Modulation Output Function Type 2

(4) Register Settings for Master Channels

	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.214 Contents of TAUDnCMURm Register for Master Channels of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode for master channels

Table 18.215 Control Bit Settings for Master Channels in Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (toggle mode with TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for master channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.216 Simultaneous Rewrite Settings for Master Channels of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than a master channel to generate a simultaneous rewrite trigger signal.

(5) Register Settings for Slave Channel 1

(a) TAUDnCMORm for slave channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.217 Contents of TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Operation clock = CK0 01: Operation clock = CK1 10: Operation clock = CK2 11: Operation clock = CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	11: INTTAUDnIm of the master channel is used as the count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software. 011: Triggers simultaneous rewrite.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0011: Event count mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

(b) TAUDnCMURm for slave channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.218 Contents of TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function.

CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

(d) Simultaneous rewrite for slave channel 1

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.219 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger. When TAUDnRDS.TAUDnRDSm = 0, the master channel is monitored for simultaneous rewrite triggers regardless of the value of this bit.

(6) Register settings for slave channels 2 to 7

(a) TAUDnCMORm for slave channels 2 to 7

7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Output mode for slave channels 2 to 7

Table 18.222 Control Bit Settings for Slave Channels 2 to 7 in Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: The upper channel generates the real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

(d) Simultaneous rewrite for slave channels 2 to 7

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.223 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger. When TAUDnRDS.TAUDnRDSm = 0, the master channel is monitored for simultaneous rewrite triggers regardless of the value of this bit.

(7) Operating Procedure for Non-Complementary Modulation Output Function Type 2

Table 18.224 Operating Procedure for Non-Complementary Modulation Output Function Type 2 (1/2)

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channel 1: Set TAUDnCMORm/TAUDnCMURm register and the channel output mode as described in **Section (5), Register Settings for Slave Channel 1**. Slave channels 2 to 7: Set TAUDnCMORm/TAUDnCMURm register and the channel output mode as described in **Section (6), Register settings for slave channels 2 to 7**. Set the value of TAUDnCDRm register of every channel. Set pulse cycle in TAUDnCDRm of master channel, and in TAUDnCDRm of slave channel 1, set the number of interrupts from master channel to be ignored before slave channel 1 generates an input signal. Set duty width in TAUDnCDRm of slave channels 2 to 7. Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.	Channel operation is stopped.

Table 18.224 Operating Procedure for Non-Complementary Modulation Output Function Type 2 (2/2)

	Operation	TAUDn Status
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down.
Start Operation	TAUDnCDRm, TAUDnTRO.TAUDnTROm, and TAUDnTMEm.TAUDnTMEm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel and slave channels 2 to 7 is loaded into TAUDnCNTm to perform count down. The TAUDnCDRm value of slave channel 1 is loaded and the counter waits for an interrupt from the master channel. When the counter of master channel reaches 0000_H: • INTTAUDnIm is generated. • TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down. • The TAUDnCNTm value of slave channel 1 decrements by 1 and the counter waits for a next interrupt from the master channel. • TAUDnCNTm of slave channels 2 to 7 performs counting in opposite direction. • When the counter of slave channel 1 reaches 0000_H, it waits for a next interrupt from the master channel. When an interrupt is detected: - INTTAUDnIm is generated. • When the counter of slave channels 2 to 7 reaches 0001_H: - INTTAUDnIm is generated. - PWM output signals of slave channels 2 to 7 are set/reset. TAUDTTOUTm of slave channels 2 to 7 outputs a PWM signal, a high-level signal or low-level signal depending on the values of real-time output bits (TAUDnTRO.TAUDnTROm) and modulation output bit (TAUDnTME.TAUDnTMEm) of a pair of slave channels.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(8) Specific Timing Diagrams

The following settings apply to the general timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

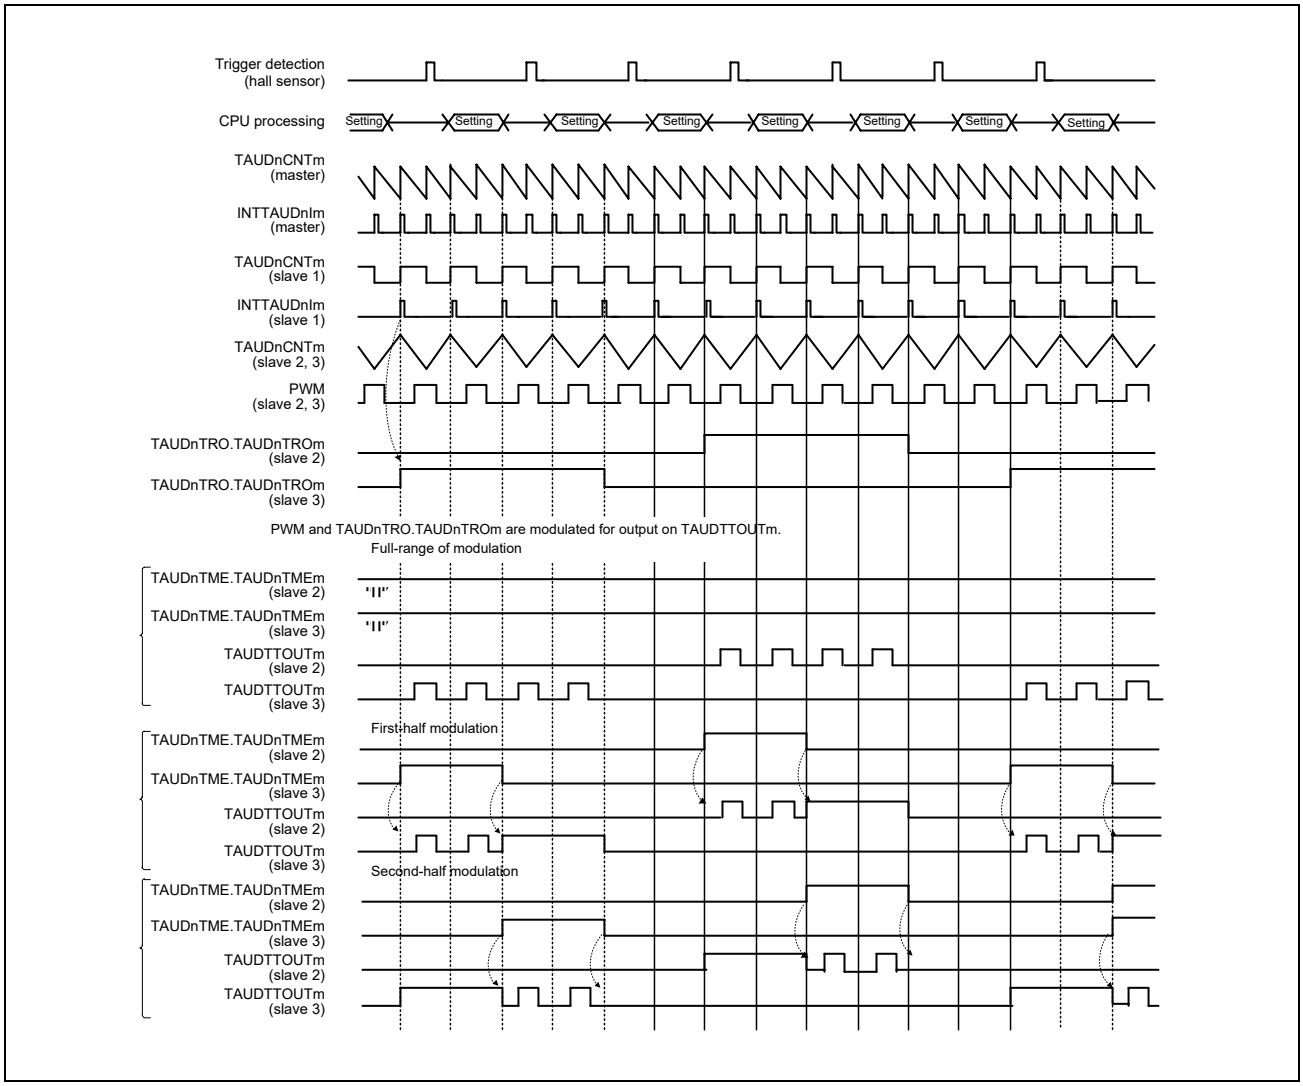

Figure 18.122 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 2

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The “Setting” symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

18.4.13.3 Complementary Modulation Output Function

(1) Overview

Summary

This function outputs a triangle PWM output signal, a high-level signal, or low-level signal from TAUDTTOUTm depending on the real-time output bit value (TAUDnTRO.TAUDnTROm) and the modulation output bit value (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

Prerequisites

- It requires one master channel and seven slave channels.
- The operation mode of the master channel must be set to interval timer mode (see **Table 18.227, Contents of TAUDnCMORm Register for Master Channels of Complementary Modulation Output Function**).
- The operating mode for slave channel 1 should be set to event count mode (see **Table 18.231, Contents of TAUDnCMORm Register for Slave Channel 1 of Complementary Modulation Output Function**).
- The operating mode for slave channels 2, 4 and 6 should be set to up/down count mode (see **Table 18.234, Contents of TAUDnCMORm Register for Slave Channels 2, 4, and 6 of Complementary Modulation Output Function**).
- The operating mode for slave channels 3, 5 and 7 should be set to one-count mode (see **Table 18.238, Contents of TAUDnCMORm Register for Slave Channels 3, 5, and 7 of Complementary Modulation Output Function**).
- The output mode for master channels should be set to independent channel output mode 1 (see **Section 18.4.4, Channel Output Modes**).
- This function does not use TAUDTTOUTm of slave channel 1 but TAUDnTRC.TAUDnTRCm should be set to 1 (see **Section 18.4.4, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with complementary modulation output (see **Section 18.4.4, Channel Output Modes**).

Functional description

- Master channel:
  The counter of master channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) of master channel is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.
  When the counter of master channel reaches 0000_H, INTTAUDnIm occurs. This decrements the counter value of slave channel 1 by 1 and the counter of slave channel 2 starts to count in the opposite direction.
- Slave channel 1:
  When the counter reaches 0000_H, slave channel 1 waits for the next interrupt from the master channel. And the TAUDnCDRm value is reloaded into TAUDnCNTm (slave 1) and INTTAUDnIm is generated.
  Slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm = 1). The value of real-time output bit (TAUDnTRO.TAUDnTROm) of each channel is applied to the channel that detects the occurrence of an interrupt on slave channel 1. The real-time output bit value can be changed in any timing by application software but a new value is not applied until an interrupt occurs on slave channel 1.

- Slave channel 2:
  When the slave channel 2 counter reaches 0001_H, the slave channel 3 counter starts counting down. When the slave channel 3 counter reaches 0000_H, an interrupt occurs.
- Slave channels 2 and 3:
  The combined use of the master channel and slave channels 2 and 3 generates a PWM output signal. The master channel generates a PWM output cycle, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time.
- Slave channels 4 to 7:
  Slave channels 4 and 6 operate like slave channel 2. Slave channels 5 and 7 operate like slave channel 3.

A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROm), a modulation output bit value (TAUDnTME.TAUDnTMEm), and an output level bit value (TAUDnTDL.TAUDnTDLm) of the slave channel, as described in **Table 18.225 TAUDTTOUTm Output (TAUDnTOL.TAUDnTOLm = 0) for a Pair of Slave Channels of Complementary Modulation Output Function**.

It is, however, prohibited that a high-level signal is output from both channel 2 and channel 3 (in order to prevent a motor driver short circuit).

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

- If TAUDnTME.TAUDnTMEm of a pair of channels is set to 1 (TAUDnTOL.TAUDnTOLm = 0):
  - If TAUDnTRO.TAUDnTROm of one channel is set to 1, TAUDTTOUTm outputs the corresponding PWM of the channel.
  - If TAUDnTRO.TAUDnTROm of both channels is set to 0, a pair of TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm of a pair of channels is set to 0 (TAUDnTOL.TAUDnTOLm = 0):
  - If TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm of the channel outputs a high-level signal.
  - If TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm of the channel outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. No PWM signals are changed depending on the setting of TAUDnTOL.TAUDnTOLm. The PWM signal is negative logic.

Table 18.225 TAUDTTOUTm Output (TAUDnTOL.TAUDnTOLm = 0) for a Pair of Slave Channels of Complementary Modulation Output Function

TAUDnTME. TAUDnTME2	TAUDnTME. TAUDnTME3	TAUDnTRO. TAUDnTRO2	TAUDnTRO. TAUDnTRO3	TAUDnTDL. TAUDnTDL2	TAUDnTDL. TAUDnTDL3	TAUDTTOUT2 Output	TAUDTTOUT3 Output
0	0	0	0	—	—	Low level	Low level
		0	1	1	0	Low level	High level
		1	0	0	1	High level	Low level
		1	1	—	—	Setting prohibited	Setting prohibited
1	1	0	0	—	—	Low level	Low level
		0	1	1	0	~PWMm	PWMm
		1	0	0	1	PWMm	~PWMm
		1	1	—	—	Setting prohibited	Setting prohibited

NOTES

1. In the above table, PWM indicates a positive PWM signal and ~PWM indicates an inverted PWM signal (positive logic). PWM and ~PWM are set by TAUDnTDL.TAUDnTDLm.
2. Any settings not listed above are prohibited.

- If TAUDnTME.TAUDnTMEm is continuously set to 1 while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, full modulation is applied.
- If TAUDnTME.TAUDnTMEm is set to 1 at the first half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, first-half modulation is applied.
- If TAUDnTME.TAUDnTMEm is set to 1 at the second half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, second-half modulation is applied.
- Whether dead time is added to a normal or reverse phase PWM signal when two channels become high-level signal outputs simultaneously depends on a TAUDnTDL.TAUDnTDLm bit value.
  - If TAUDnTDL.TAUDnTDLm = 0, dead time is added to a normal phase PWM signal.
  - If TAUDnTDL.TAUDnTDLm = 1, dead time is added to a reverse phase PWM signal.
  - The operation defined by a TAUDnTDL.TAUDnTDLm bit value should be conducted by application software during operation. To modify TAUDnTDL.TAUDnTDLm, rewrite it during the period when TAUDnTRO.TAUDnTROm is 00_B.
- The TAUDnCDRm value of slave channel 1 should be set to the value to generate INTTAUDnIm of slave channel 1 at a carrier cycle (peak interrupt timing).
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7:
  - If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
  - If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.

- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7:
  - If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.
  - If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
  - This function enables simultaneous rewrite. See **Section 18.4.3, Simultaneous Rewrite**.

Table 18.226 TAUDnTDL.TAUDnTDLm Settings (TAUDnTOL.TAUDnTOLm = 0) for a Pair of Slave Channels of Complementary Modulation Output Function

TAUDnTME. TAUDnTME2	TAUDnTME. TAUDnTME3	TAUDnTRO. TAUDnTRO2	TAUDnTRO. TAUDnTRO3	TAUDnTDL. TAUDnTDL2	TAUDnTDL. TAUDnTDL3
0	0	0	0	1	1
		0	1	1	0
		1	0	0	1
1	1	0	0	1	1
		0	1	1	0
		1	0	0	1

- The value of TAUDnCDRm of slave channel 1 should be set to 1 so that INTTAUDnIm is generated on slave channel 1 at the peak of a carrier cycle.
- Set TAUDnCMORm.TAUDnMD0 of master channel to 0.
- This function enables simultaneous rewrite. See **Section 18.4.3, Simultaneous Rewrite**.

(2) Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

For slave channels 2 and 3:

PWM signal width (normal phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2) × 2) – (TAUDnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (reverse phase) = [(TAUDnCDRm (master) + 1 –TAUDnCDRm (slave 2) × 2) + (TAUDnCDRm (slave 3) + 1)] × count clock cycle

For slave channels 4 to 7:

Slave channels 4 and 6 are calculated in the same way as slave channel 2, whereas slave channels 5 and 7 are calculated in the same way as slave channel 3.

(3) Block Diagram and General Timing Diagram

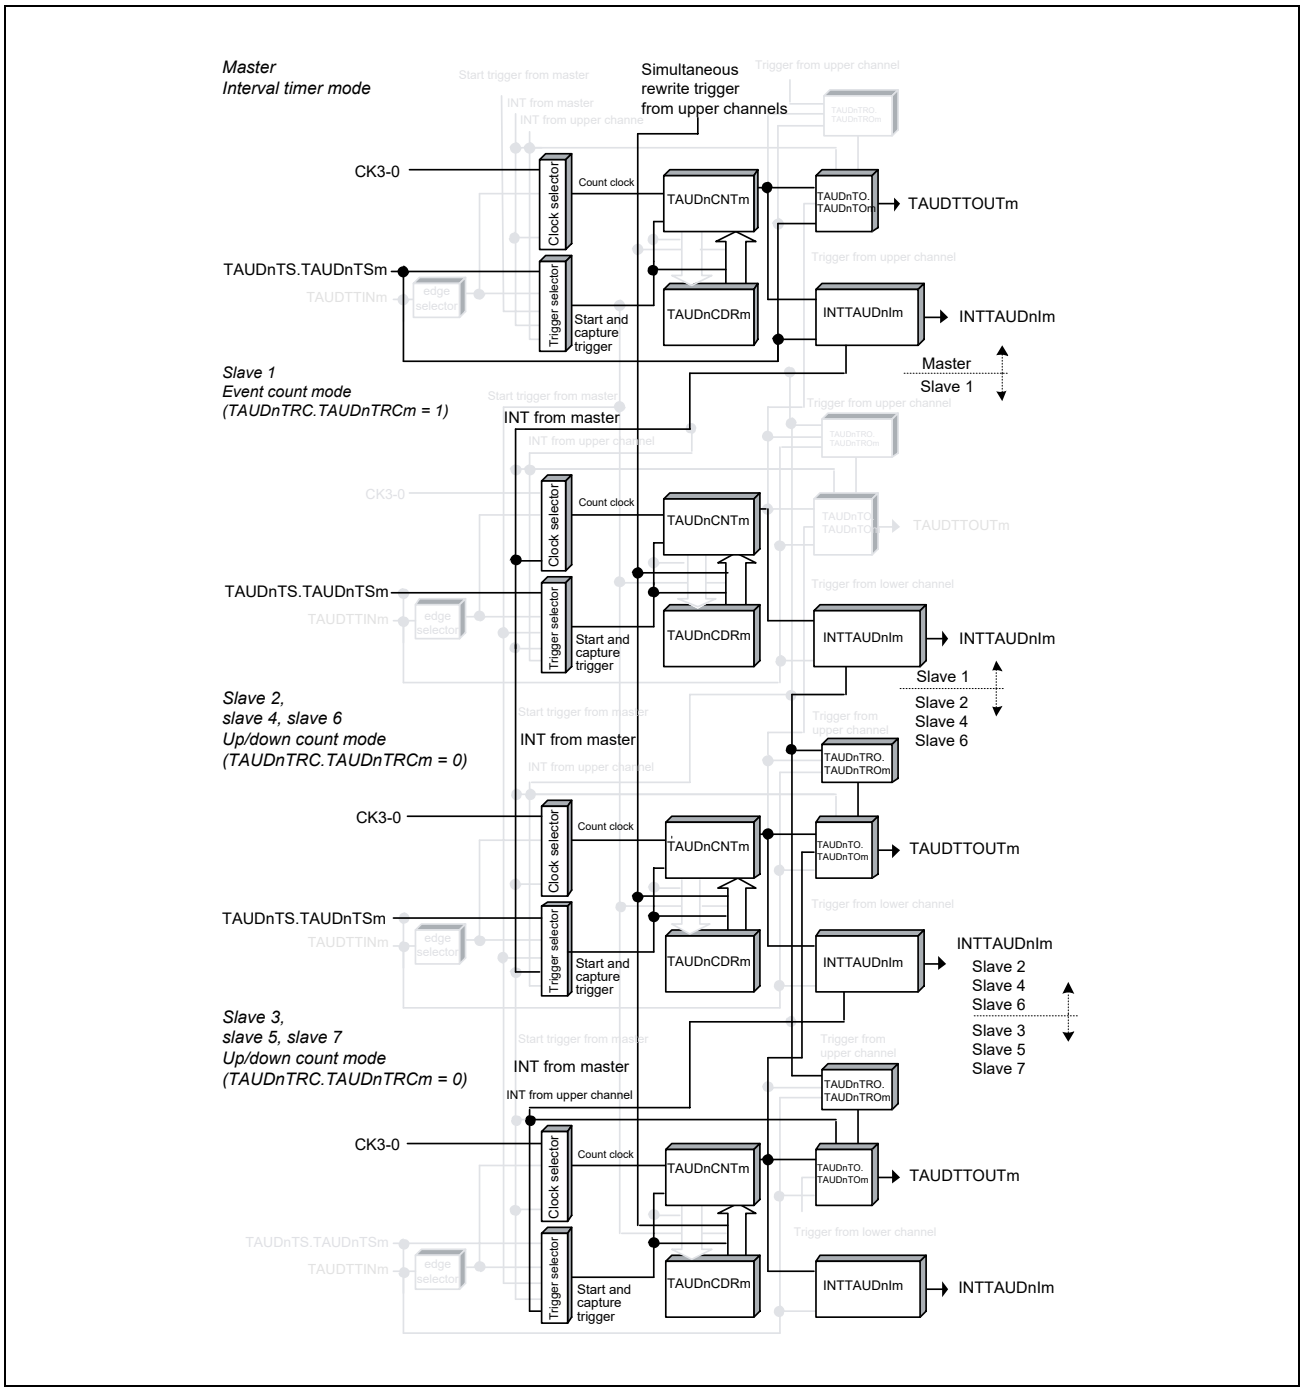

Figure 18.123 Block Diagram of Complementary Modulation Output Function

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm not generated at the beginning of operation.(TAUDnCMORm.TAUDnMD0 = 0)
- Slave channels 1: TAUDnCDRm = 0001_H
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

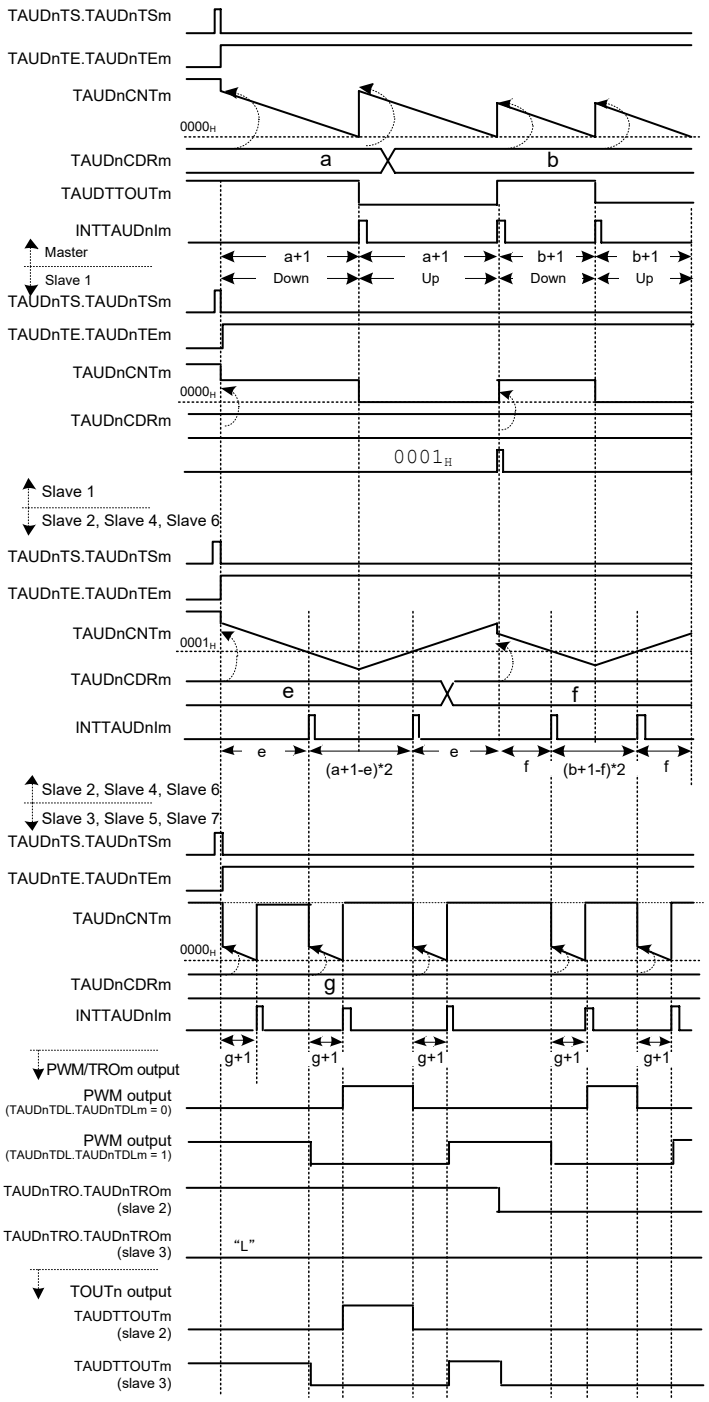

Figure 18.124 General Timing Diagram of Complementary Modulation Output Function

5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated and TAUDTTOUTm is not toggled at the beginning of operation or at a restart time. 1: INTTAUDnIm is generated to toggle TAUDTTOUTm at the beginning of an operation.

(b) TAUDnCMURm for master channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.228 Contents of TAUDnCMURm Register for Master Channels of Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode

Table 18.229 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(d) Simultaneous rewrite for master channels

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.230 Simultaneous Rewrite Settings for Master Channels of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger. When TAUDnRDS.TAUDnRDSm = 0, the master channel is monitored for simultaneous rewrite triggers regardless of the value of this bit.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than a master channel to generate a simultaneous rewrite trigger signal.

(5) Register Settings for Slave Channel 1

(a) TAUDnCMORm for slave channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS [1:0]		TAUDnCCS [1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS [1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.231 Contents of TAUDnCMORm Register for Slave Channel 1 of Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Operation clock = CK0 01: Operation clock = CK1 10: Operation clock = CK2 11: Operation clock = CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	11: INTTAUDnIm of the master channel is used as the count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software. 011: Triggers simultaneous rewrite.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0011: Event count mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

(b) TAUDnCMURm for slave channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.232 Contents of TAUDnCMURm Register for Slave Channel 1 of Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function.

CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

(d) Simultaneous rewrite for slave channel 1

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.233 Simultaneous Rewrite Settings for Slave Channel 1 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger. When TAUDnRDS.TAUDnRDSm = 0, the master channel is monitored for simultaneous rewrite triggers regardless of the value of this bit.

(6) Register settings for slave channels 2, 4, and 6

(a) TAUDnCMORm for slave channels 2, 4, and 6

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS [1:0]		TAUDnCCS [1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS [1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.234 Contents of TAUDnCMORm Register for Slave Channels 2, 4, and 6 of Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Operation clock = CK0 01: Operation clock = CK1 10: Operation clock = CK2 11: Operation clock = CK3 The value of the TAUDnCKS[1:0] bit of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	111: Up/down output trigger signal of master channel
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1001: Up/down count mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

(b) TAUDnCMURm for slave channels 2, 4, and 6

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.235 Contents of TAUDnCMURm Register for Slave Channels 2, 4, and 6 of Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Output mode for slave channels 2, 4, and 6

Table 18.236 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from odd-numbered channels.

(d) Simultaneous rewrite for slave channels 2, 4, and 6

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.237 Simultaneous Rewrite Settings for Slave Channels 2, 4, and 6 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger. When TAUDnRDS.TAUDnRDSm = 0, the master channel is monitored for simultaneous rewrite triggers regardless of the value of this bit.

(7) Register settings for slave channels 3, 5, and 7

(a) TAUDnCMORm for slave channels 3, 5, and 7

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS [1:0]		TAUDnCCS [1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS [1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 18.238 Contents of TAUDnCMORm Register for Slave Channels 3, 5, and 7 of Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	These bits select the operation clock. 00: Operation clock = CK0 01: Operation clock = CK1 10: Operation clock = CK2 11: Operation clock = CK3 The value of TAUDnCKS[1:0] bits must be the same for the master channel and the slave channel.
13, 12	TAUDnCCS[1:0]	00: Uses the operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	110: Dead time trigger
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

(b) UDnCMURm for slave channels 3, 5, and 7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.239 Contents of TAUDnCMURm Register for Slave Channels 3, 5, and 7 of Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(c) Output mode for slave channels 3, 5, and 7

Table 18.240 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from even-numbered channels.

(d) Simultaneous rewrite for slave channels 3, 5, and 7

Both master and slave channels should have the same simultaneous rewrite settings.

Table 18.241 Simultaneous Rewrite Settings for Slave Channels 3, 5, and 7 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger. When TAUDnRDS.TAUDnRDSm = 0, the master channel is monitored for simultaneous rewrite triggers regardless of the value of this bit.

(8) Operating Procedure for Complementary Modulation Output Function

Table 18.242 Operating Procedure for Complementary Modulation Output Function (1/2)

	Operation	TAUDn Status
Initial Channel Setting	Master channels: Set TAUDnCMORm/ TAUDnCMURm register and the channel output mode as described in **Section (4), Register Settings for Master Channels**. Slave channel 1: Set TAUDnCMORm/TAUDnCMURm register and the channel output mode as described in **Section (5), Register Settings for Slave Channel 1**. Slave channels 2, 4, and 6: Set TAUDnCMORm/TAUDnCMURm register and the channel output mode as described in **Section (6), Register settings for slave channels 2, 4, and 6**. Slave channels 3, 5, and 7: Set TAUDnCMORm/TAUDnCMURm register and the channel output mode as described in **Section (7), Register settings for slave channels 3, 5, and 7**. Set the value of TAUDnCDRm register of every channel. Set a pulse cycle using TAUDnCDRm of master channel, and an interrupt count of master channel ignored using TAUDnCDRm of slave channel 1. Also set a duty width in TAUDnCDRm of slave channels 2, 4, and 6, and a dead time delay on slave channels 3, 5, and 7. Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.	Channel operation is stopped.

Table 18.242 Operating Procedure for Complementary Modulation Output Function (2/2)

	Operation	TAUDn Status
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down.
During Operation	TAUDnCDRm, TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel and slave channels 2 to 7 is loaded into TAUDnCNTm to perform count down. TAUDnCDRm value of slave channel 1 is loaded and the counter waits for a master channel interrupt. When the counter of master channel reaches 0000_H: • INTTAUDnIm is generated. • TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down. • TAUDnCNTm value of slave channel 1 decreases by 1 and the counter waits for the next master channel interrupt. • TAUDnCNTm of slave channels 2, 4, and 6 performs counting in the reverse direction. • The TAUDnTME.TAUDnTMEm value of slave channels 2 to 7 is reflected in TAUDTTOUTm output when the TAUDnCDRm value of slave channels 2, 4, and 6 is loaded. • The counter of slave channel 1 waits for the next interrupt from the master channel when reaching 0000_H. When the interrupt is detected: – TAUDnCDRm value is reloaded into TAUDnCNTm and the counter waits for the next master channel interrupt. – INTTAUDnIm is generated. – TAUDnTRO.TAUDnTROm is changeable. When the counter of slave channels 2, 4, and 6 reaches 0001_H: • INTTAUDnIm is generated. • PWM output of slave channel m is set/reset (when the specified condition of the channel output mode is met). • TAUDnCDRm value of slave channels 3, 5, and 7 is loaded into TAUDnCNTm to perform count down. When the counter of slave channels 3, 5, and 7 reaches 0000_H: • INTTAUDnIm is generated. • PWM output of slave channel m is set/reset (when the specified condition of the channel output mode is met). TAUDTTOUTm of slave channels 2 to 7 outputs a PWM signal, a high-level signal or low-level signal depending on the values of real-time output bit (TAUDnTRO.TAUDnTROm), modulation output bit (TAUDnTME.TAUDnTMEm), and output level bit (TAUDnTDL.TAUDnTDLm) of a pair of slave channels.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart

(9) Specific Timing Diagrams

The following settings apply to the timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation.(TAUDnCMORm.TAUDnMD0 = 0)
- Slave channel 1: TAUDnCDRm = 0001_H
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

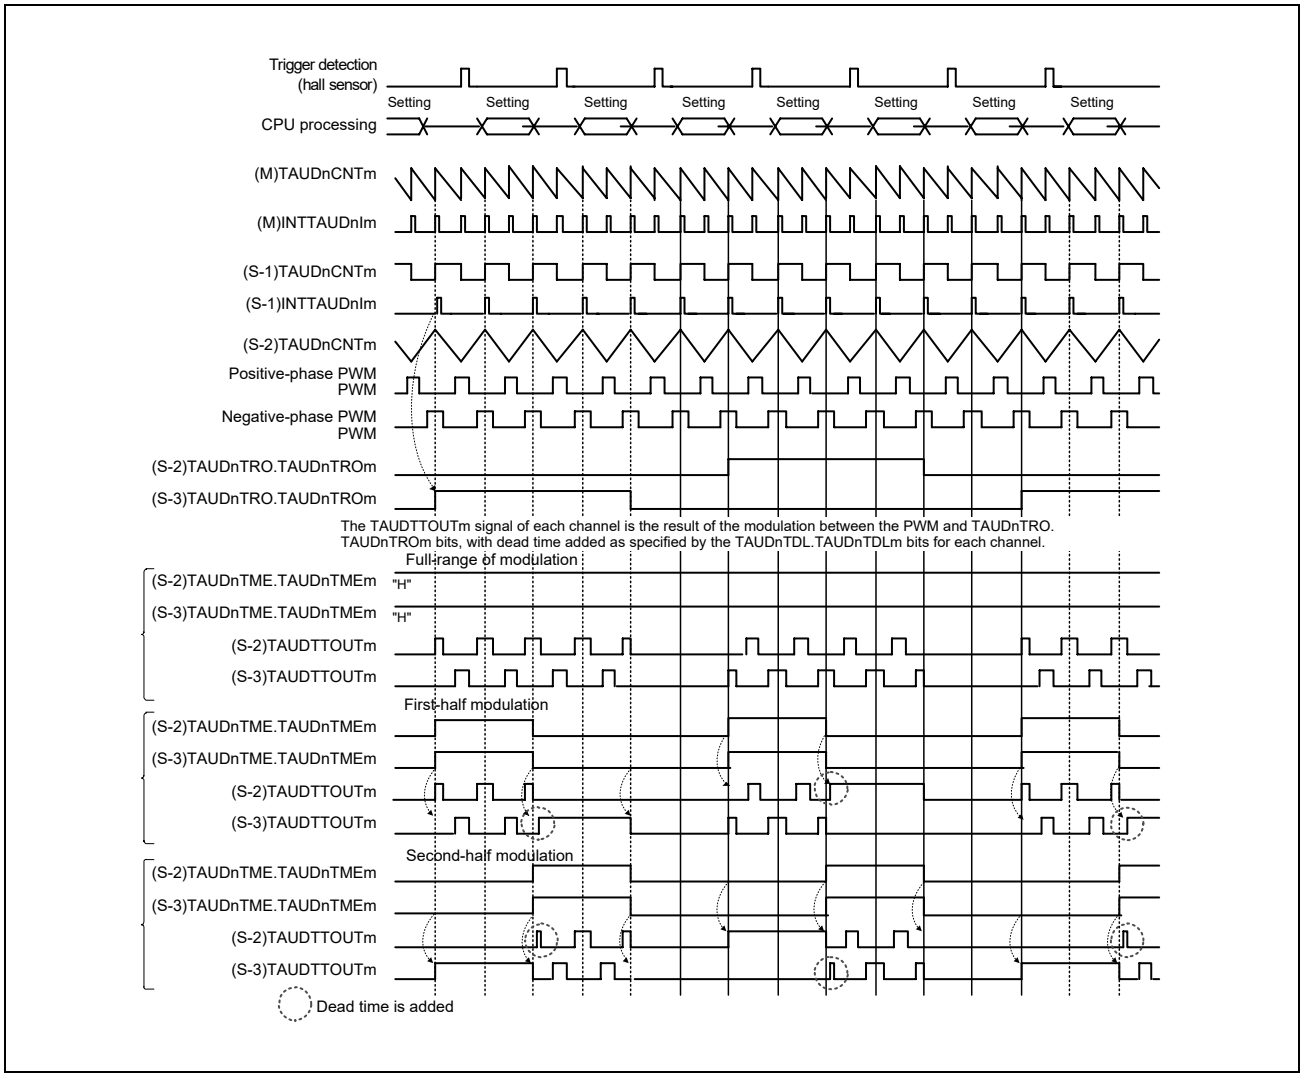

Figure 18.125 Specific Timing Diagram of Complementary Modulation Output Function

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

A modulated PWM output signal and TAUDnTRO.TAUDnTROm bit value are output from slave channels 2 and 3.

TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm settings are reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

The value of the TAUDnTRO.TAUDnTROm bit is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

NOTE

Dead time is added to suppress simultaneous change of PWM edges of normal and reverse phases.

The “Setting” symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, TAUDnTRO.TAUDnTROm, and TAUDnTDL.TAUDnTDLm can be changed.

Section 19 Timer Array Unit J (TAUJ)

This section contains a generic description of the Timer Array Unit J (TAUJ).

The first part of this section describes all RH850/C1M-A specific properties, such as units, register base addresses, input/output signal names, etc.

The remainder of the section describes the features that apply to all implementations.

19.1 Overview of RH850/C1M-A TAUJ

19.1.1 Units

This microcontroller has following number of units of the Timer Array Unit J.

Table 19.1 Units

Product Name	RH850/C1M-A2	RH850/C1M-A1
Number of units	2	1
Name	TAUJn (n = 0,1)	TAUJn (n = 0)

Table 19.2 Indices

Index	Meaning
n	Throughout this section, the individual TAUJ units are identified by the index “n” (n = 0, 1) (n = 0, 1 for RH850/C1M-A2; n = 0 for RH850/C1M-A1); for example, TAUJnTOM is the TAUJn channel output mode register.
m	The TAUJ has four channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 3). A certain channel is denoted as CHm. The even numbered channels (m = 0, 2) are denoted as CHm_even. The odd numbered channels (m = 1, 3) are denoted as CHm_odd.

19.1.2 Register Base Addresses

TAUJ base addresses are listed in the following table.

TAUJ register addresses are given as offsets from the base addresses in general.

Table 19.3 Register Base Addresses

Base Address Name	Base Address
<TAUJ0_base>	FFE5 0000_H
<TAUJ1_base>	FF85 1000_H*1

Note 1. C1M-A1 does not have TAUJ1.

19.1.3 Clock Supply

TAUJ clock supply is listed in the following table.

Table 19.4 TAUJn Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
TAUJ0	PCLK	CLKC_HSB (non-modulated high-speed peripheral clock)
TAUJ1*1	PCLK	CLKC_HSB (non-modulated high-speed peripheral clock)

Note 1. C1M-A1 does not have TAUJ1.

19.1.4 Interrupts and DMA/DTS

TAUJ interrupt requests are listed in the following table.

Table 19.5 Interrupt Requests

Interrupt Name	Outline	Interrupt Number	DMA Trigger Number*1		DTS Trigger Number*1	
			1st	2nd	1st	2nd
TAUJ0						
INTTAUJ0I0	Channel 0 interrupt	90	15	—	15	—
INTTAUJ0I1	Channel 1 interrupt	91	16	—	16	—
INTTAUJ0I2	Channel 2 interrupt	92	17	—	17	—
INTTAUJ0I3	Channel 3 interrupt	93	18	—	18	—
TAUJ1*2						
INTTAUJ10	Channel 0 interrupt	94	—	—	—	—
INTTAUJ11	Channel 1 interrupt	95	—	—	—	—
INTTAUJ12	Channel 2 interrupt	96	—	—	—	—
INTTAUJ13	Channel 3 interrupt	97	—	—	—	—

—: No number is assigned.

Note 1. 1st: Primary channel, 2nd: Secondary channel

Note 2. C1M-A1 does not have TAUJ1.

19.1.5 Reset Sources

TAUJ reset sources are listed in the following table. TAUJ is initialized by these reset sources.

Table 19.6 Reset Sources

Unit Name	Reset Source
TAUJ0	Reset by any reset source
TAUJ1*1	Reset by any reset source

Note 1. C1M-A1 does not have TAUJ1.

19.1.6 External Input/Output Signals

External input/output signals of TAUJ are listed in the following table.

Table 19.7 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal Name
TAUJ0		
TAUJTTIN0-TAUJTTIN3	Channel 0 to 3 input	TAUJ0I0-TAUJ0I3
TAUJTTOUT0-TAUJTTOUT3	Channel 0 to 3 output	TAUJ0O0-TAUJ0O3
TAUJ1*1		
TAUJTTIN0-TAUJTTIN3	Channel 0 to 3 input	TAUJ1I0-TAUJ1I3
TAUJTTOUT0-TAUJTTOUT3	Channel 0 to 3 output	TAUJ1O0-TAUJ1O3

Note 1. C1M-A1 does not have TAUJ1.

19.2 Overview

19.2.1 Functional Overview

The TAUJ has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The timer array unit J is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 4 channels, each equipped with a 32-bit counter TAUJnCNTm and a 32-bit data register TAUJnCDRm to hold the count start value or compare value.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate in two operating modes, either independently or in combination with other channels (synchronously), i.e. multiple channels depend on each other with one master and one or more slave channels.

When a channel is operated independently, it can be operated independent of all other channels.

The synchronous operation function is implemented by using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

19.2.1.1 Terms

In this section, the following terms are used.

Independent channel operation function / synchronous channel operation function

TAUJ consists of four channels which operate both independently (independent channel operation function) and in combination with other channels (synchronous channel operation function).

- The independent channel operation function can use any channel independent of all other channels.
- The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”. A channel group has one master channel and one or more slave channels.

Operating mode

An operating mode can be selected for every channel m. The operating mode defines the basic operation and features of a channel.

In synchronous channel operation, every channel in the channel group can operate in a different operating mode, such as capture mode and interval timer mode.

Channel output mode

The channel output mode defines the operation of TAUJTTOUTm

- of a single channel (independent output operation) or
- of all channels in a channel group (synchronous output operation).

The channel output mode includes independent channel output mode 1.

Channel operation function

The channel operation function defines the complete function and all features

- of a single channel (independent channel operation) or
- of all channels in a channel group (synchronous channel operation).

Upper/lower channel

Depending on the channel number m, a channel with a smaller channel number or larger channel number can be referred to as “upper” or “lower” channel:

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

For instance, as to channel 2, channel 1 is an upper channel and channel 3 is a lower channel. Channel 0 is the highest channel and channel 3 is the lowest channel.

19.2.1.2 Operation Functions

TAUJ provides the following functions by operating individual channels independently or in combination.

Table 19.8 TAUJ Operation Functions

Operation Function	Setting Example Reference Section
Independent Channel Operation Functions	**19.4.9**
Interval timer function	**19.4.9.1**
TAUJTTINm input interval timer function	**19.4.9.2**
TAUJTTINm input pulse interval measurement function	**19.4.9.3**
TAUJTTINm input signal width measurement function	**19.4.9.4**
TAUJTTINm input position detection function	**19.4.9.5**
TAUJTTINm input period count detection function	**19.4.9.6**
Synchronous Channel Operation Functions	**19.4.10**
PWM output function	**19.4.10.1**

19.2.1.3 Input/Output and Interrupt Request Signals

The following diagram illustrates TAUJ input/output and interrupt request signals.

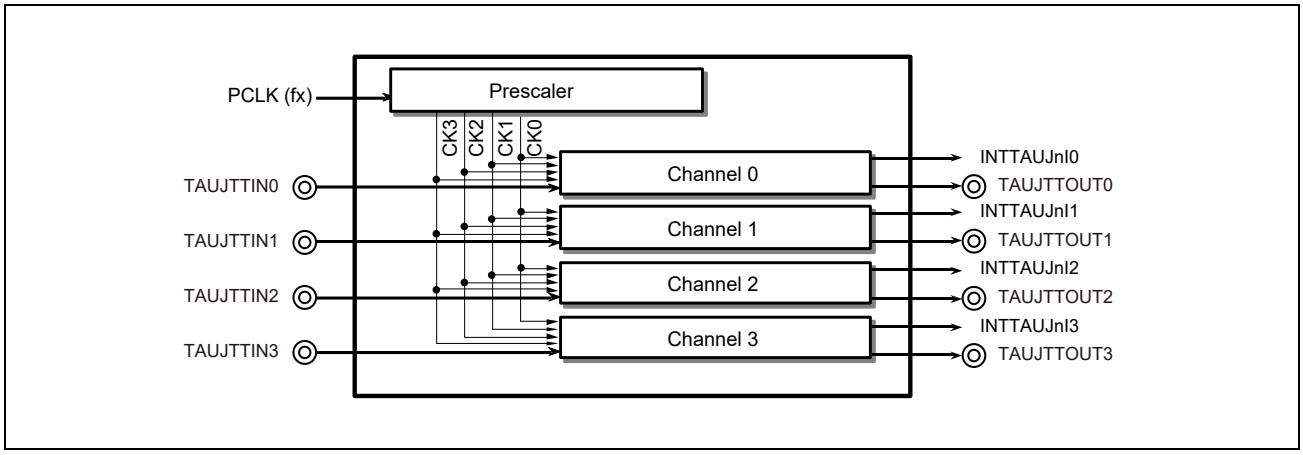

Figure 19.1 TAUJ Input/Output and Interrupt Request Signals

19.2.2 Block Diagram

The following figure shows the main components of the TAUJ:

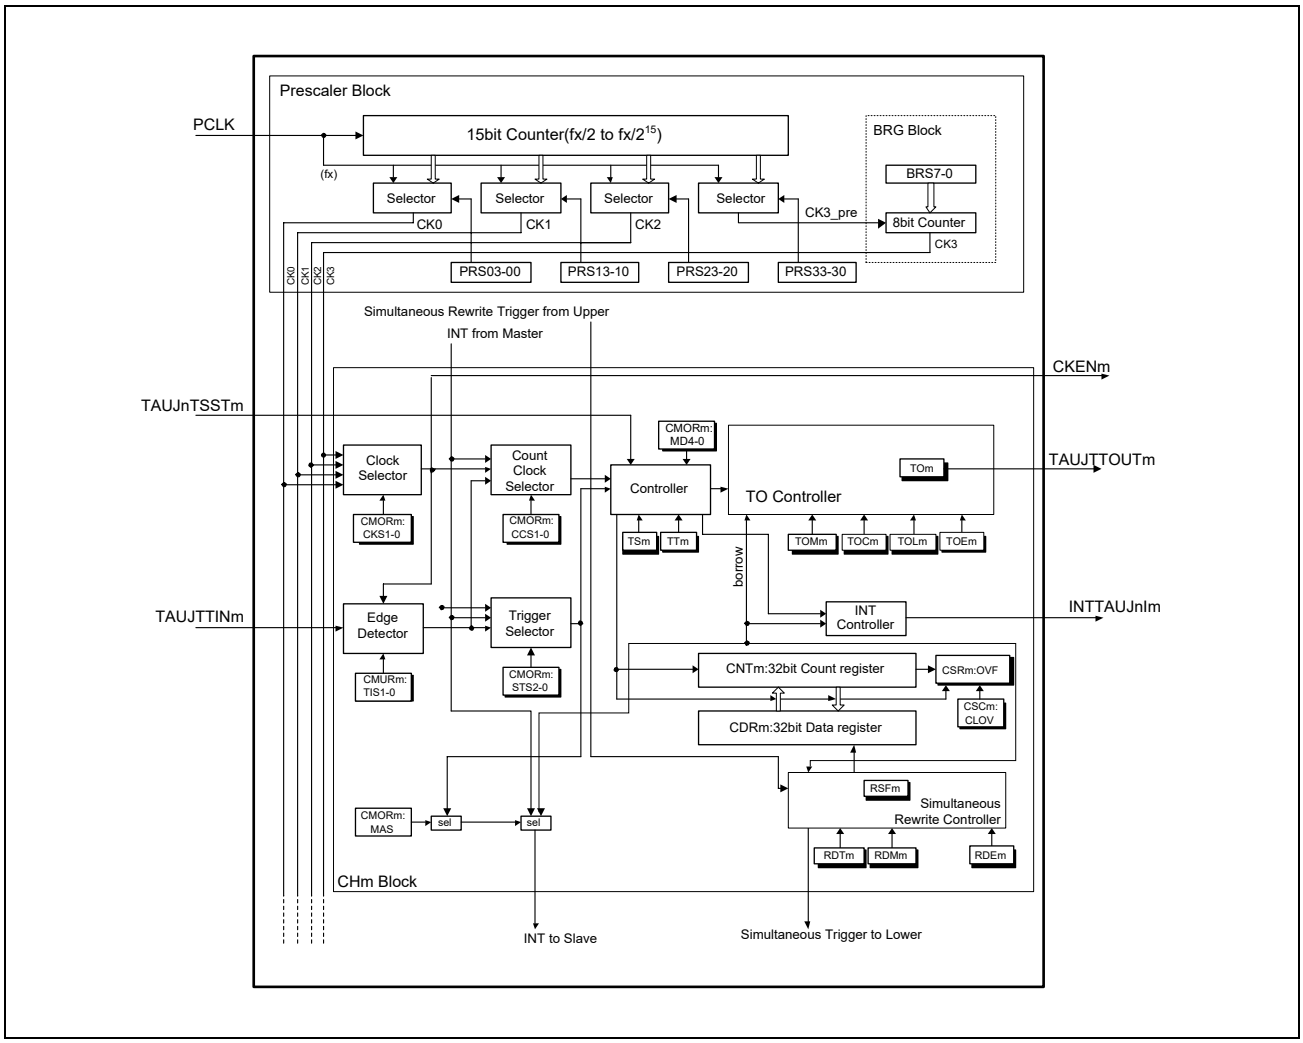

Figure 19.2 Block Diagram of the TAUJ

The prefix “TAUJn” has been omitted from the register names for the sake of clarity in the above figure.

- TAUJnTSSTm: Simultaneous start trigger (input from PIC1B)

19.2.2.1 Description of Blocks

The following describes the functional blocks:

Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived from PCLK by a configurable prescaler division factor of 2^0 to 2^{15}. The fourth count clock CK3 can be adjusted more precisely by an additional division factor that is not a power of 2.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)

Controller

The controller controls the main operations of the counter:

- Operating mode (selected with the TAUJnCMORm.TAUJnMD[4:0] bits)
- Counter start enable (TAUJnTS.TAUJnTSm) and counter stop (TAUJnTT.TAUJnTTm)

When counter start is enabled, status flag TAUJnTE.TAUJnTEm is set.

Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUJnTE.TAUJnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- Synchronous channel start trigger input TAUJnTSSTm
- Effective edge of TAUJTTINm input signal
- INTTAUJnIm from master channel

Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used in synchronous operation functions. The data registers (TAUJnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

TAUJnTO controller

The output control of every channel enables the generation of various output signals such as PWM signals.

19.3 Registers

19.3.1 List of Registers

TAUJ registers are listed in the following table.

For information on <TAUJn_base>, see **Section 19.1.2, Register Base Addresses.**

Table 19.9 TAUJn Registers Overview

Module name	Register name	Shortcut	Address
TAUJn prescaler registers			
TAUJn	TAUJn prescaler clock select register	TAUJnTPS	<TAUJn_base> + 90_H
TAUJn	TAUJn prescaler baud rate setting register	TAUJnBRS	<TAUJn_base> + 94_H
TAUJn control registers			
TAUJn	TAUJn channel data register m	TAUJnCDRm	<TAUJn_base> + m × 4_H
TAUJn	TAUJn channel counter register m	TAUJnCNTm	<TAUJn_base> + 10_H + m × 4_H
TAUJn	TAUJn channel mode OS register m	TAUJnCMORm	<TAUJn_base> + 80_H + m × 4_H
TAUJn	TAUJn channel mode user register m	TAUJnCMURm	<TAUJn_base> + 20_H + m × 4_H
TAUJn	TAUJn channel status register m	TAUJnCSRm	<TAUJn_base> + 30_H + m × 4_H
TAUJn	TAUJn channel status clear trigger register m TAUJnCSCm	TAUJnCSCm	<TAUJn_base> + 40_H + m × 4_H
TAUJn	TAUJn channel start trigger register	TAUJnTS	<TAUJn_base> + 54_H
TAUJn	TAUJn channel enable status register	TAUJnTE	<TAUJn_base> + 50_H
TAUJn	TAUJn channel stop trigger register	TAUJnTT	<TAUJn_base> + 58_H
TAUJn output registers			
TAUJn	TAUJn channel output enable register	TAUJnTOE	<TAUJn_base> + 60_H
TAUJn	TAUJn channel output register	TAUJnTO	<TAUJn_base> + $5C_H$
TAUJn	TAUJn channel output mode register	TAUJnTOM	<TAUJn_base> + 98_H
TAUJn	TAUJn channel output configuration register	TAUJnTOC	<TAUJn_base> + $9C_H$
TAUJn	TAUJn channel output active level register	TAUJnTOL	<TAUJn_base> + 64_H
TAUJn reload data registers			
TAUJn	TAUJn channel reload data enable register	TAUJnRDE	<TAUJn_base> + $A0_H$
TAUJn	TAUJn channel reload data mode register	TAUJnRDM	<TAUJn_base> + $A4_H$
TAUJn	TAUJn channel reload data trigger register	TAUJnRDT	<TAUJn_base> + 68_H
TAUJn	TAUJn channel reload status register	TAUJnRSF	<TAUJn_base> + $6C_H$

19.3.2 TAUJnTPS — TAUJn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescalers. CK3 is generated by dividing CK3_PRE by the factor specified in TAUJnBRS.

Access: Readable/writable in 16-bit units.

Address: <TAUJn_base> + 90_H

Value after reset: $FFFF_H$. Any reset source triggers initialization.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnPRS3[3:0]				TAUJnPRS2[3:0]				TAUJnPRS1[3:0]				TAUJnPRS0[3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.10 TAUJnTPS Register Contents (1/3)

Bit Position	Bit Name	Function
15 to 12	TAUJnPRS3[3:0]	These bits specify CK3_PRE clock. CK3_PRE clock is an input clock to BRG unit which supplies the CK3 operation clock to all channels.

TAUJnPRS3[3:0]	CK3_PRE Clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK3 are stopped (TAUJnTE.TAUJnTEm = 0).

Table 19.10 TAUJnTPS Register Contents (2/3)

Bit Position	Bit Name	Function
11 to 8	TAUJnPRS2[3:0]	These bits specify the CK2 clock.

TAUJnPRS2[3:0]	CK2 Clock
0000_B	$PCLK/2^0$
0001_B	$PCLK/2^1$
0010_B	$PCLK/2^2$
0011_B	$PCLK/2^3$
0100_B	$PCLK/2^4$
0101_B	$PCLK/2^5$
0110_B	$PCLK/2^6$
0111_B	$PCLK/2^7$
1000_B	$PCLK/2^8$
1001_B	$PCLK/2^9$
1010_B	$PCLK/2^{10}$
1011_B	$PCLK/2^{11}$
1100_B	$PCLK/2^{12}$
1101_B	$PCLK/2^{13}$
1110_B	$PCLK/2^{14}$
1111_B	$PCLK/2^{15}$

The above bits are rewritable only when all the counters using CK2 are stopped (TAUJnTE.TAUJnTEm = 0).

7 to 4	TAUJnPRS1[3:0]	These bits specify the CK1 clock.

TAUJnPRS1[3:0]	CK1 Clock
0000_B	$PCLK/2^0$
0001_B	$PCLK/2^1$
0010_B	$PCLK/2^2$
0011_B	$PCLK/2^3$
0100_B	$PCLK/2^4$
0101_B	$PCLK/2^5$
0110_B	$PCLK/2^6$
0111_B	$PCLK/2^7$
1000_B	$PCLK/2^8$
1001_B	$PCLK/2^9$
1010_B	$PCLK/2^{10}$
1011_B	$PCLK/2^{11}$
1100_B	$PCLK/2^{12}$
1101_B	$PCLK/2^{13}$
1110_B	$PCLK/2^{14}$
1111_B	$PCLK/2^{15}$

The above bits are rewritable only when all the counters using CK1 are stopped (TAUJnTE.TAUJnTEm = 0).

Table 19.10 TAUJnTPS Register Contents (3/3)

Bit Position	Bit Name	Function
3 to 0	TAUJnPRS0[3:0]	These bits specify the CK0 clock.

TAUJnPRS0[3:0]	CK0 Clock
0000_B	$PCLK/2^0$
0001_B	$PCLK/2^1$
0010_B	$PCLK/2^2$
0011_B	$PCLK/2^3$
0100_B	$PCLK/2^4$
0101_B	$PCLK/2^5$
0110_B	$PCLK/2^6$
0111_B	$PCLK/2^7$
1000_B	$PCLK/2^8$
1001_B	$PCLK/2^9$
1010_B	$PCLK/2^{10}$
1011_B	$PCLK/2^{11}$
1100_B	$PCLK/2^{12}$
1101_B	$PCLK/2^{13}$
1110_B	$PCLK/2^{14}$
1111_B	$PCLK/2^{15}$

The above bits are rewritable only when all the counters using CK0 are stopped (TAUJnTE.TAUJnTEm = 0).

NOTE

TAUJn clock input PCLK is defined in the first part of this section, **Section 19.1.3, Clock Supply.**

19.3.3 TAUJnBRS — TAUJn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUJnTPS. TAUJnPRS3[3:0].

Access: Readable/writable in 8-bit units.

Address: <TAUJn_base> + 94_H

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	TAUJnBRS[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.11 TAUJnBRS Register Contents

Bit Position	Bit Name	Function
7 to 0	TAUJnBRS [7:0]	These bits specify the division factor of CK3_PRE for generating CK3.

TAUJnBRS[7:0]	CK3 Clock
$0000\ 0000_B$	CK3_PRE / 1
$0000\ 0001_B$	CK3_PRE / 2
$0000\ 0010_B$	CK3_PRE / 3
$0000\ 0011_B$	CK3_PRE / 4
:	:
$1111\ 1110_B$	CK3_PRE / 255
$1111\ 1111_B$	CK3_PRE / 256

19.3.4 TAUJnCDRm — TAUJn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUJnCMORm.TAUJnMD[4:1].

Access: Readable/writable in 32-bit units.
Readable in capture mode. Any write operation is ignored.
Readable/writable in compare mode.

Address: <TAUJn_base> + 0_H + m × 4_H

Value after reset: 0000 0000_H. Any reset source triggers initialization.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TAUJnCDR[31:16]

Table 19.12 TAUJnCDRm Register Contents

Bit Position	Bit Name	Function
31 to 0	TAUJnCDR[31:0]	Data register for capture/compare values

19.3.5 TAUJnCNTm — TAUJn Channel Counter Register

This is a channel m counter register.

Access: This register is read-only in 32-bit units.

Address: <TAUJn_base> + 10_H + m × 4_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TAUJnCNT[31:16]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.13 TAUJnCNTm Register Contents

Bit Position	Bit Name	Function
31 to 0	TAUJnCNT[31:0]	32-bit counter value

The read value depends on a counter, an operating mode change, or TAUJnTS.TAUJnTSm/TAUJnTT.TAUJnTTm bit value.

The initial counter read value depends on the operating mode and how the counter is stopped.

- By a reset
- By a counter stop trigger (TAUJnTT.TAUJnTTm = 1)

The following table lists the initial counter read values after the counting is stopped (TAUJnTE.TAUJnTEm = 0) and re-enabled (TAUJnTS.TAUJnTSm = 1).

The table also contains the counter value which is read one count after the counting is enabled (TAUJnTS.TAUJnTSm = 1) while waiting for a start trigger.

NOTE

If operating mode is changed while the counter is stopped, the initial counter value after the counter is restarted becomes undefined. Operating mode can be changed by the TAUJnCMORm.TAUJnMD[4:1] register.

Table 19.14 TAUJnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUJnCNTm		
		Start Value*1	After Stop Trigger	After One Count
Interval timer mode	Count down	FFFF FFFF$_H$	Stop value	—
Capture mode	Count up	0000 0000$_H$	Stop value	—
One-count mode	Count down	FFFF FFFF$_H$	Stop value	Stop value
Capture and one-count mode	Count up	0000 0000$_H$	Stop value	Capture value + 1 (TAUJnCDRm)
Count capture mode	Count up	0000 0000$_H$	Stop value	—
Capture and gate count mode	Count up	0000 0000$_H$	Stop value	Stop value

Note 1. The value set for TAUJnCNTm when the operation mode is changed after reset release.

19.3.6 TAUJnCMORm — TAUJn Channel Mode OS Register

This register controls channel m operation.

Access: Readable/writable in 16-bit units. Writable only when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + 80$_H$ + m × 4$_H$

Value after reset: 0000$_H$. Any reset source triggers initialization.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnCKS [1:0]		TAUJnCCS [1:0]		TAUJn MAS	TAUJnSTS [2:0]			TAUJnCOS [1:0]		—	TAUJnMD [4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 19.15 TAUJnCMORm Register Contents (1/3)

Bit Position	Bit Name	Function
15, 14	TAUJnCKS[1:0]	These bits select an operation clock, which is used with the TAUJTTINm input edge detection circuit. Setting of TAUJnCMORm.TAUJnCCS[1:0] bit also allows the operation clock to serve as a count clock of TAUJnCNTm.

TAUJn CKS1	TAUJn CKS0	Selection of Operation Clock
0	0	CK0
0	1	CK1
1	0	CK2

19.3.7 TAUJnCMURm — TAUJn Channel Mode User Register

This register specifies a type of effective edge detection used for TAUJTTINm input.

Access: Readable/writable in 8-bit units.

Address: <TAUJn_base> + 20_H + m × 4_H

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 19.16 TAUJnCMURm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	These bits specify an effective edge of TAUJTTINm input signal.

TAUJn TIS1	TAUJn TIS0	Functional Description
0	0	Falling edge
0	1	Rising edge
1	0	Detection of falling and rising edges (selection of low width measurement) Start trigger: Falling edge Stop trigger (capture): Rising edge
1	1	Detection of falling and rising edges (selection of high width measurement) Start trigger: Rising edge Stop trigger (capture): Falling edge

Edge detection of TAUJTTINm input signal is based on the operation clock selected by TAUJnCMORm.TAUJnCKS[1:0].

19.3.8 TAUJnCSRm — TAUJn Channel Status Register

This register indicates the overflow status of channel m.

Access: This register is read-only in 8-bit units.

Address: <TAUJn_base> + 30_H + m × 4_H

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUJnOVF
Value after reset	0	0	0	0	0	0	0	0

Table 19.17 TAUJnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read.
1	Reserved	When read, the value returned is undefined.
0	TAUJnOVF	This bit indicates the counter overflow status: 0: No overflow occurs 1: Overflow occurs This bit is used only in the following modes: • Capture mode • Capture and one-count mode The function of this bit depends on the setting of control bits TAUJnCMORm.TAUJnCOS[1:0].

19.3.9 TAUJnCSCm — TAUJn Channel Status Clear Register

This register is a trigger register for clearing the overflow flag TAUJnCSRm.TAUJnOVF of channel m.

Access: This register can only be written in 8-bit units. The read value is always 00_H.

Address: <TAUJn_base> + 40_H + m × 4_H

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUJnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 19.18 TAUJnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUJnCLOV	0: No function 1: Clears the overflow flag TAUJnCSRm.TAUJnOVF

19.3.10 TAUJnTS — TAUJn Channel Start Trigger Register

This register enables the counter operation for each channel.

Access: This register can only be written in 8-bit units. The read value is always 00_H.

Address: <TAUJn_base> + 54_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTS03	TAUJnTS02	TAUJnTS01	TAUJnTS00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 19.19 TAUJnTS Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	TAUJnTSm	These bits enable the counter operation for channel m: 0: No function 1: Enables the counter operation and sets TAUJnTE.TAUJnTEm = 1 Only the counter operation is enabled even if TAUJnTE.TAUJnTEm = 1. Whether the counter is started or not depends on the selected of operating mode.

19.3.11 TAUJnTE — TAUJn Channel Enable Status Register

This register enables/disables a counter operation.

Access: This register is read-only in 8-bit units.

Address: <TAUJn_base> + 50_H

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTE03	TAUJnTE02	TAUJnTE01	TAUJnTE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 19.20 TAUJnTE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read.
3 to 0	TAUJnTEm	These bits enable or disable channel m's counter operation. 0: Disables the counter operation 1: Enables the counter operation These bits are set to 1 when trigger input of TAUJnTSSTm (synchronous channel start trigger signal) is detected or when TAUJnTS.TAUJnTSm are set to 1. These bits are set to 0 when TAUJnTT.TAUJnTTm are set to 1.

19.3.12 TAUJnTT — TAUJn Channel Stop Trigger Register

This register stops the counter operation of each channel.

Access: This register can only be written in 8-bit units. The read value is always 00_H.

Address: <TAUJn_base> + 58_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTT03	TAUJnTT02	TAUJnTT01	TAUJnTT00

3 to 0	TAUJnTTm	These bits stop channel m's counter operation. 0: No function 1: Stops the counter operation and resets TAUJnTE.TAUJnTEm TAUJnCNTm, TAUJnTO.TAUJnTOm, and TAUJTTOUTm retain the values provided before the counter is stopped.

19.3.13 TAUJnTOE — TAUJn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by Software.

Access: Readable/writable in 8-bit units.

Address: <TAUJn_base> + 60_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOE03	TAUJnTOE02	TAUJnTOE01	TAUJnTOE00
Value after reset	0	0	0	0	0	0	0	0

3 to 0	TAUJnTOEm	These bits enable or disable independent channel output mode: 0: Disables the independent timer output function (controlled by software) 1: Enables the independent timer output function

19.3.14 TAUJnTO — TAUJn Channel Output Register

This register specifies and reads the level of TAUJTTOUTm.

Access: Readable/writable in 8-bit units.

Address: <TAUJn_base> + $5C_H$

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTO03	TAUJnTO02	TAUJnTO01	TAUJnTO00
Value after reset	0	0	0	0	0	0	0	0

Table 19.23 TAUJnTO Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	TAUJnTOm	These bits specify and read the level of TAUJTTOUTm: 0: Low 1: High Only TAUJnTOm bits for which independent channel output function is disabled (TAUJnTOEm = 0) can be written.

19.3.15 TAUJnTOM — TAUJn Channel Output Mode Register

This register specifies the output mode of each channel.

Access: Readable/writable in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + 98_H

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOM03	TAUJnTOM02	TAUJnTOM01	TAUJnTOM00
Value after reset	0	0	0	0	0	0	0	0

Table 19.24 TAUJnTOM Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	TAUJnTOMm	These bits specify the channel output mode: 0: Independent channel output mode 1: Synchronous channel output mode The output mode depends on the setting of the output control bits (TAUJnTOE.TAUJnTOEm) of each channel.

19.3.16 TAUJnTOC — TAUJn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUJnTOMm.

Access: Readable/writable in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + $9C_H$

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOC03	TAUJnTOC02	TAUJnTOC01	TAUJnTOC00

Table 19.25 TAUJnTOC Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	TAUJnTOCm	These bits specify the output mode: 0: Operation mode 1 (= Toggle mode) 1: No function These bits must be set to 0 for all output modes except Independent Channel Output Mode Controlled by Software. The output mode also depends on TAUJnTOM.TAUJnTOMm, as can be seen in the following table.

TAUJn TOMm	TAUJn TOCm	Functional Description
0	0	Toggle mode: Toggle operation is conducted when INTTAUJnIm occurs.
0	1	No function
1	0	Synchronous Channel Operation Mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel.
1	1	No function

19.3.17 TAUJnTOL — TAUJn Channel Output Level Register

This register specifies the output logic of the channel output bit (TAUJnTO.TAUJnTOm).

Access: Readable/writable in 8-bit units.

Address: <TAUJn_base> + 64_H

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOL03	TAUJnTOL02	TAUJnTOL01	TAUJnTOL00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 19.26 TAUJnTOL Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	TAUJnTOLm	These bits specify the output logic of the channel m output bit (TAUJnTO.TAUJnTOm): 0: Positive logic (active high) 1: Negative logic (active low) These bits apply in all channel output modes except independent channel output mode controlled by software and independent channel output mode 1.

19.3.18 TAUJnRDE — TAUJn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUJnCDRm. It also enables and disables simultaneous rewrite of the data register TAUJnTOLm for the PWM output function.

Access: Readable/writable in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

Address: <TAUJn_base> + $A0_H$

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDE03	TAUJnRDE02	TAUJnRDE01	TAUJnRDE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 19.27 TAUJnRDE Register Contents

Bit Position	Bit Name	Function

3 to 0	TAUJnRDEm	These bits enable or disable simultaneous rewrite of the data register of channel m: 0: Disables simultaneous rewrite 1: Enables simultaneous rewrite

19.3.19 TAUJnRDM — TAUJn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

Access: Readable/writable in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm=0.

Address: <TAUJn_base> + $A4_H$

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDM03	TAUJnRDM02	TAUJnRDM01	TAUJnRDM00
Value after reset	0	0	0	0	0	0	0	0

Table 19.28 TAUJnRDM Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	TAUJnRDMm	These bits specify when the signal that triggers simultaneous rewrite is generated: 0: When the master channel counter starts counting 1: No function These bits only apply when TAUJnRDE.TAUJnRDEm = 1.

19.3.20 TAUJnRDT — TAUJn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

Access: This register can only be written in 8-bit units. The read value is always 00_H.

Address: <TAUJn_base> + 68_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDT3	TAUJnRDT2	TAUJnRDT1	TAUJnRDT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 19.29 TAUJnRDT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	TAUJnRDTm	These bits trigger the simultaneous rewrite enabling state: 0: No function 1: Simultaneous rewrite enabling state is triggered. The simultaneous rewrite enabling flag (TAUJnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger. The setting of these bits is applied only to the following case: • TAUJnRDE.TAUJnRDEm = 1

19.3.21 TAUJnRSF — TAUJn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

Access: This register is read-only in 8-bit units.

Address: <TAUJn_base> + $6C_H$

Value after reset: 00_H. Any reset source triggers initialization.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRSF03	TAUJnRSF02	TAUJnRSF01	TAUJnRSF00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 19.30 TAUJnRSF Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read.
3 to 0	TAUJnRSFm	These bits indicate the simultaneous rewrite status: 0: Indicates that simultaneous rewrite has been completed due to the generation of simultaneous rewrite trigger. 1: Indicates that the system waits for a simultaneous rewrite trigger in the simultaneous rewrite enabling state (TAUJnRDTm = 1).

19.4 Function

19.4.1 General Operating Procedure

The following lists the general operation procedure for the TAUJn:

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUJTTOUTm is also initialized and outputs a low level.

(1) Set the TAUJnTPS and TAUJnBRS registers to specify the clock frequency of CK0 to CK3.

(2) Configure the desired TAUJn function:

- Set the operation mode
- Set any other control bits

(3) Enable the counter by setting the TAUJnTS.TAUJnTSm bit to 1.
The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.

(4) Stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUJnTT.TAUJnTTm bit to 1. The counter can be forcibly restarted by setting the TAUJnTS.TAUJnTSm bit to 1.

(5) Stop the function by setting the TAUJnTT.TAUJnTTm bit to 1.

NOTE

A detailed description of the required control bits and the operation of the individual functions is given in **Section 19.4.9, Independent Channel Operation Functions**, **Section 19.4.10, Synchronous Channel Operation Functions**.

19.4.2 Concepts of Synchronous Channel Operation Function

The synchronous channel operation function is implemented using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in **Section 19.4.2.1, Rules of Synchronous Channel Operation Function**.

Two special features for the synchronous channel operation function are detailed in the following section:

- **Section 19.4.10, Synchronous Channel Operation Functions**

19.4.2.1 Rules of Synchronous Channel Operation Function

Number of master and slave channels

- Only even-numbered channels (CH0, CH2) can be set as master channels. Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and several slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 can be set as slave channel.
- If two master channels are used, slave channels cannot cross the master.
  Example: If CH0 and CH2 are master channels, CH1 can be set as slave channels for CH0, but CH3 cannot.

Count clock

- The same count clock should be set for the master channel and the slave channels synchronizing to the master channel. This is achieved by setting the same value in the TAUJnCMORm.TAUJnCKS[1:0] bits of the master and slave channels.

Control trigger signal for master/salve channels

- Master channels can output control trigger signals to slave channels.
- Slave channels can use control trigger signals from master channels but cannot output control trigger signals for their own to lower channels.
- Master channels cannot use control trigger signals from upper master channels.

The basic concepts of master/slave usage and count clocks are illustrated in **Figure 19.3**.

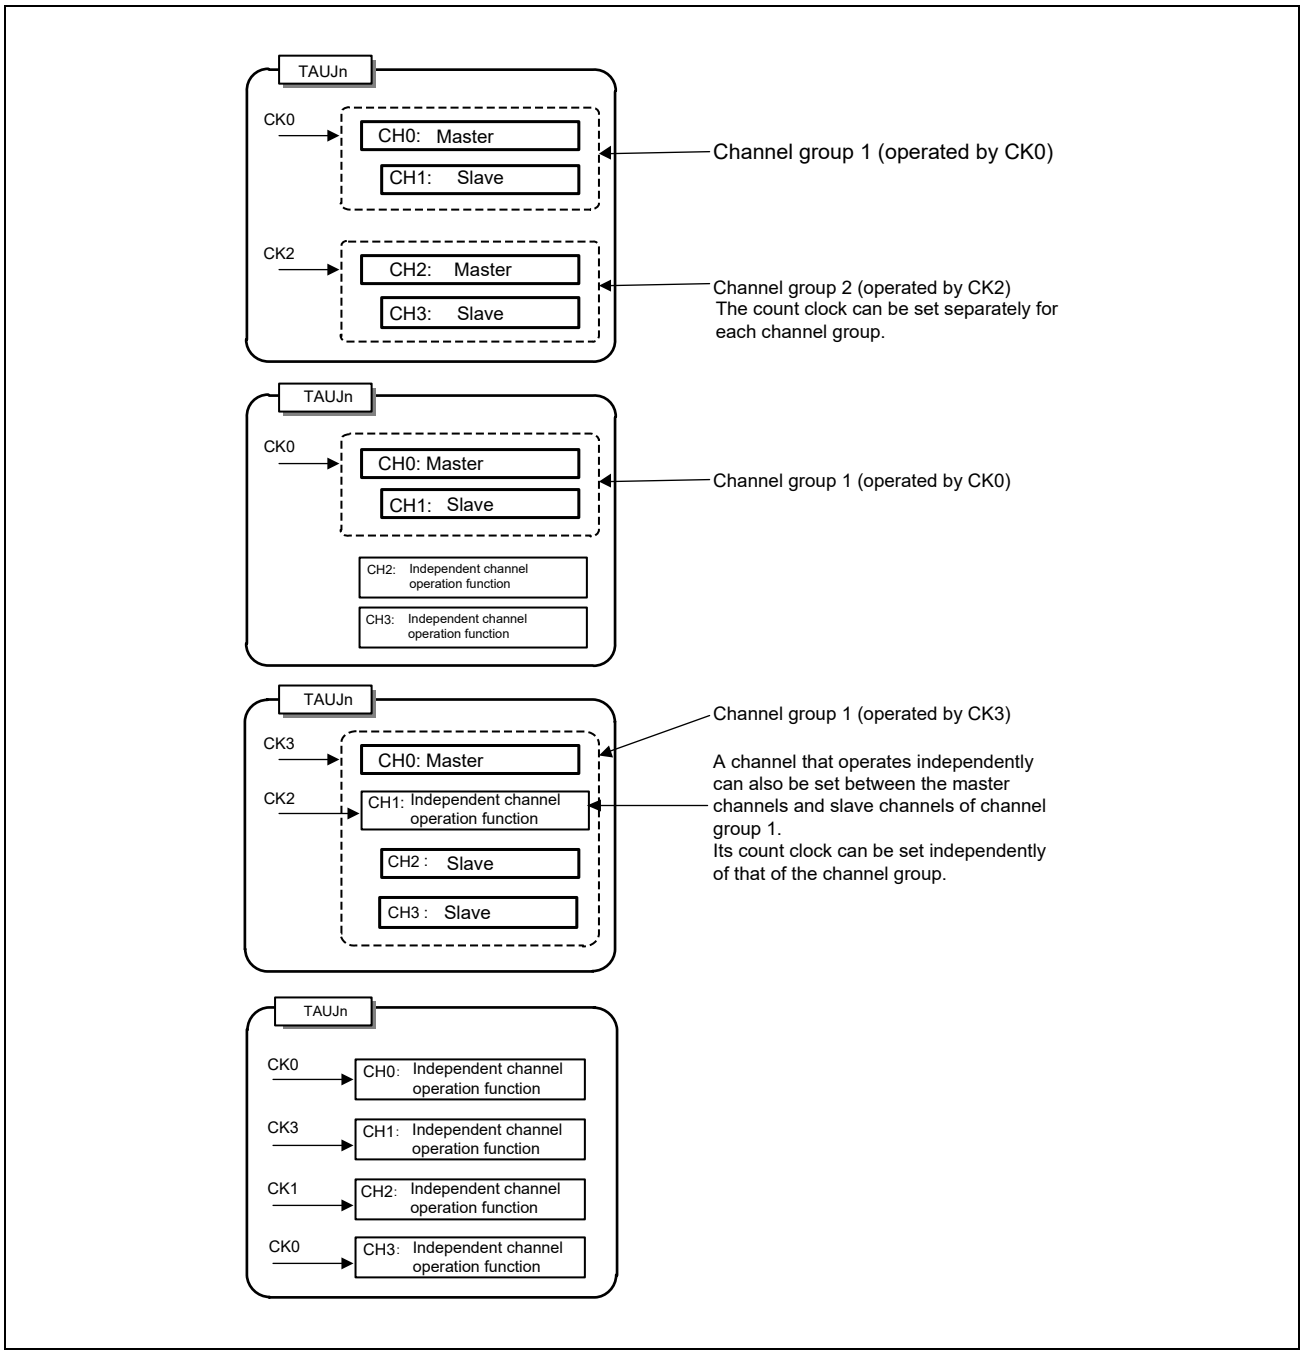

Figure 19.3 Grouping of Channels and Assignment of Count Clocks

19.4.2.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously, both within a TAUJ unit and between TAUJ units.

(1) Simultaneous start and stop within a TAUJ unit

- To simultaneously start synchronized channels, the TAUJnTS.TAUJnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUJnTT.TAUJnTTm bits of the channels should be set at the same time.

Setting 1 in the TAUJnTS.TAUJnTSm bits sets the corresponding TAUJnTE.TAUJnTEm bits to 1, enabling counting. The count start timing of the counter depends on the operating mode.

(2) Simultaneous start between TAUJ units

Counters in different TAUJ units can also be started simultaneously if the relevant counters are enabled before receiving the simultaneous trigger signal.

19.4.3 Simultaneous Rewrite

19.4.3.1 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite. The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

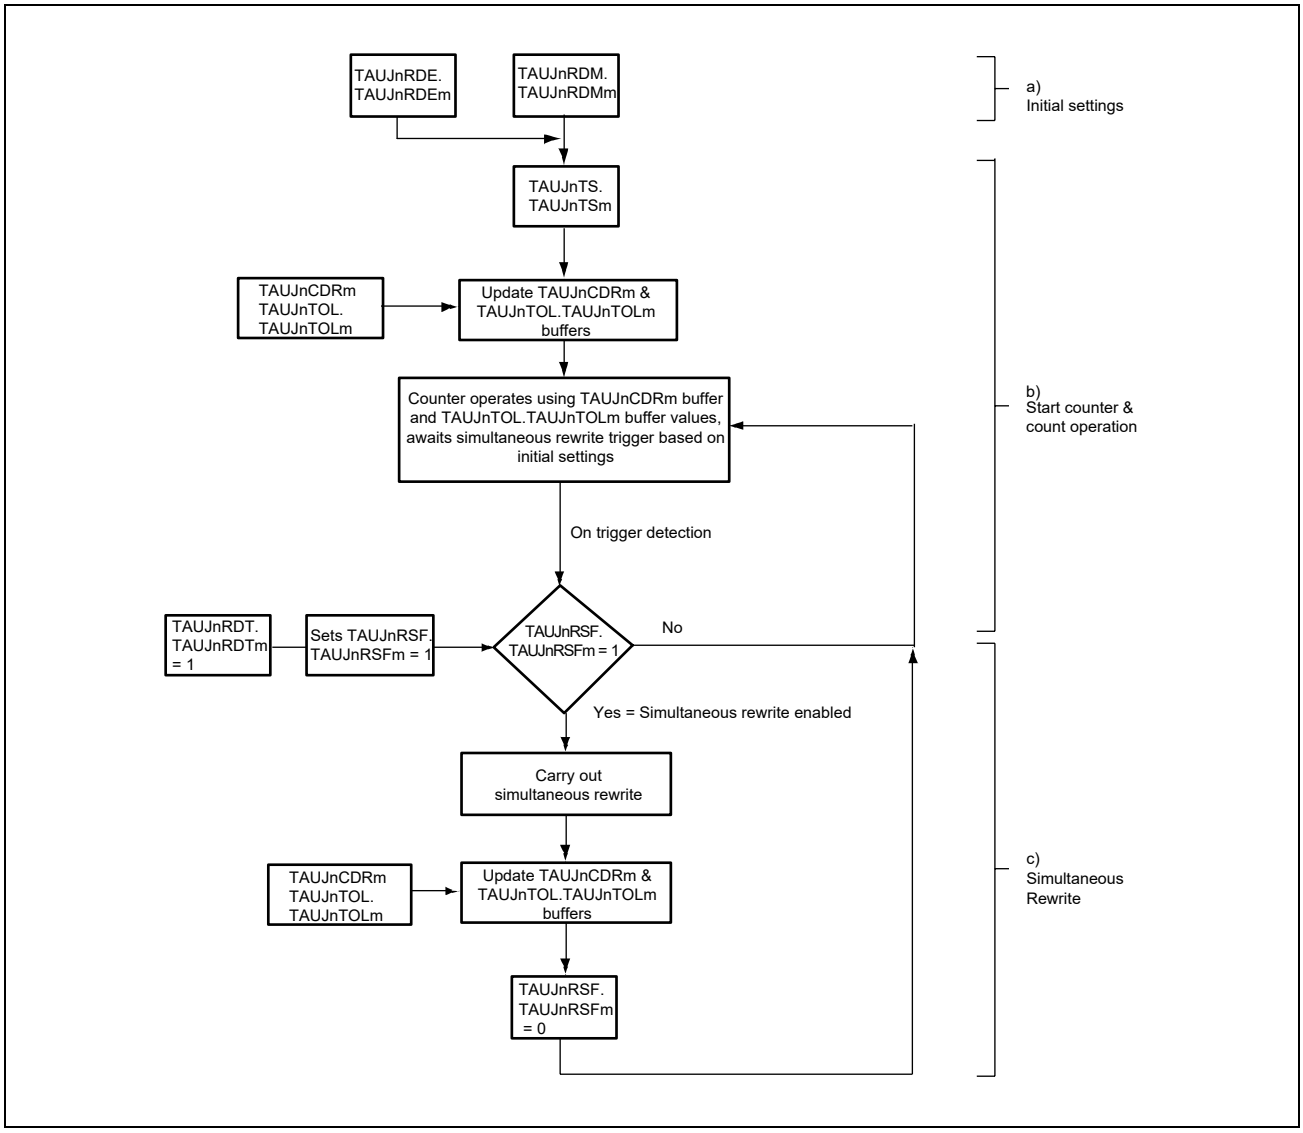

Figure 19.4 General Procedure for Simultaneous Rewrite

(1) Initial settings

- To enable simultaneous rewrite in channel m, set TAUJnRDE.TAUJnRDEm = 1
- To select simultaneous rewrite when the master channel starts counting, set TAUJnRDM.TAUJnRDMm

(2) Start counter and count operation

- To start all the TAUJnCNTm counters in the channel group, set the corresponding TAUJnTS.TAUJnTSm bits to 1. TAUJnTOL.TAUJnTOLm and the values in the data registers (TAUJnCDRm) are loaded into the corresponding TAUJnTOL.TAUJnTOLm buffer (TAUJnTOL.TAUJnTOLm buf) and data buffer registers (TAUJnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUJnRDT.TAUJnRDTm) to 1 sets the reload flag (TAUJnRSF.TAUJnRSFm) to 1, enabling simultaneous rewrite. TAUJnRSF.TAUJnRSFm remains set to 1 until simultaneous rewrite is completed.
- When a specified trigger for simultaneous rewrite is detected, the TAUJnRSF.TAUJnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1). If enabled, simultaneous rewrite is carried out. Otherwise simultaneous rewrite is not carried out and the system waits for detection of the next simultaneous rewrite trigger.

(3) Simultaneous rewrite

- When the simultaneous rewrite trigger is detected and simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1), the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and the values are applied the next time the counter starts or restarts.
- When the simultaneous rewrite is completed, the TAUJnRSF.TAUJnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

19.4.3.2 Other General Rules for Simultaneous Rewrite

The following rules also apply.

- TAUJnRDE.TAUJnRDEm and TAUJnRDM.TAUJnRDMm cannot be changed while the counter is in operation (TAUJnTE.TAUJnTEm = 1).
- TAUJnTOL.TAUJnTOLm can be rewritten only during operation using the PWM output function. For all other functions, TAUJnTOL.TAUJnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUJTTOUTm outputs an invalid wave.

19.4.3.3 Simultaneous Rewrite Procedure

The simultaneous rewrite procedure in the PWM output function is described in the following figure.

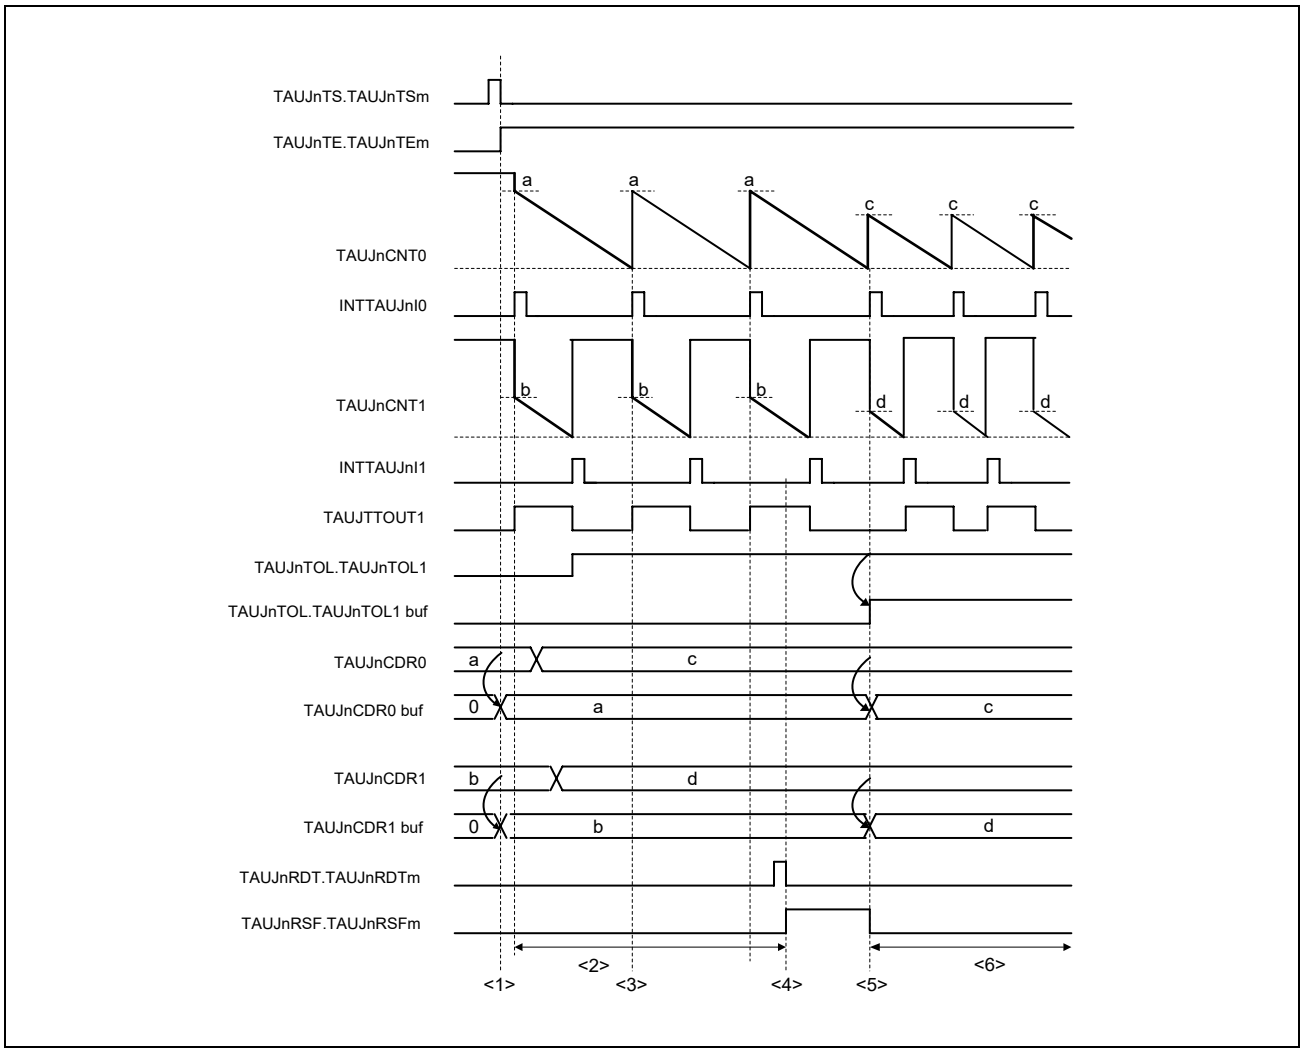

Figure 19.5 Simultaneous Rewrite when the Master Channel Starts/Restarts to Count

Setting

CH0 is a master channel of the PWM output function, and CH1 represents a slave channel of the PWM output function. Simultaneous rewrite is applied when the master channel starts counting.

Description:

(1) When TAUJnTS.TAUJnTSm = 1 is set, the value of TAUJnCDRm is copied to the TAUJnCDRm buffer and the value of TAUJnTOL.TAUJnTOLm is copied to the TAUJnTOL.TAUJnTOLm buffer.

(2) The TAUJnCDRm and TAUJnTOL.TAUJnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUJnRSF.TAUJnRSFm = 0).

(4) The reload data trigger bit (TAUJnRDT.TAUJnRDTm) is set to 1 which sets the status flag (TAUJnRSF.TAUJnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite is triggered when CH0 restarts counting, because simultaneous rewrite is enabled. The TAUJnCDRm value is loaded into the TAUJnCDRm buffer and the TAUJnTOL.TAUJnTOLm value is loaded into the TAUJnTOL.TAUJnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUJnCDRm and TAUJnTOL.TAUJnTOLm can be changed again.

19.4.4 Channel Output Modes

The output of the TAUJTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUJnTOE.TAUJnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUJnTO.TAUJnTOm) is sent out of the output pin (TAUJTTOUTm).
- By TAUJ signals (TAUJnTOE.TAUJnTOEm = 1)
  When controlled by TAUJ signals, the output level of TAUJTTOUTm is set or reset or toggled by internal signals. The value of TAUJnTO.TAUJnTOm is updated accordingly to reflect the value of TAUJTTOUTm.
  - Independently (TAUJnTOM.TAUJnTOMm = 0)
    In case of independent operation, the output of the TAUJTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUJnTOM.TAUJnTOMm = 0).
  - Synchronously (TAUJnTOM.TAUJnTOMm = 1)
    In case of synchronous operation, the output of the TAUJTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUJnTOM.TAUJnTOMm = 1).

The TAUJnTO.TAUJnTOm bit can always be read to determine the current value of TAUJTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 19.31, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 19.4.4.2, Channel Output Modes Controlled Independently by TAUJn Signals**
- **Section 19.4.4.3, Channel Output Modes Controlled Synchronously by TAUJn Signals**

Batch operation of TAUJnTOm bit

Whether a set value is reflected to the TAUJnTOm bit or not is controlled by the TAUJnTOE.TAUJnTOEm bit.

The TAUJnTOm setting is written only to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 0 when a write to the TAUJnTO register is attempted. No TAUJnTOm setting is reflected to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 1.

NOTE

TAUJnTO.TAUJnTOm bit is placed so that its bit number corresponds to a channel number.

Output logic

Positive or negative logic of the output is specified by control bit TAUJnTOL.TAUJnTOLm.

The value of TAUJnTOL.TAUJnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function. Otherwise, changes to TAUJnTOL.TAUJnTOLm result in an invalid TAUJTTOUTm signal output.

See **Section 19.4.3, Simultaneous Rewrite**.

Table 19.31 lists the various channel output modes and the channel output control bits.

Table 19.31 Channel Output Modes

Channel Output Mode	TAUJnTOE.TAUJnTOEm	TAUJnTOM.TAUJnTOMm
By software		
Independent channel output mode controlled by software	0	X
By TAUJ signals, independently		
Independent channel output mode 1	1	0
By TAUJ signals, synchronously		
Synchronous channel output mode 1	1	1

CAUTIONS

1. All combinations not listed in this table are forbidden.
2. Bits marked with an x can be set to any value.
3. The following bits cannot be changed during counter operation (TAUJnTE.TAUJnTEm = 1):
   - TAUJnTOM.TAUJnTOMm
   - TAUJnTOC.TAUJnTOCm

19.4.4.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUJTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUJnTOE.TAUJnTOEm = 0).

(1) Set TAUJnTO.TAUJnTOm to specify the initial level of the TAUJTTOUTm output.

(2) Set channel output mode according to **Table 19.31, Channel Output Modes**, and the output logic using the TAUJnTOL.TAUJnTOLm bit.

(3) Start the counter (TAUJnTS.TAUJnTSm = 1).

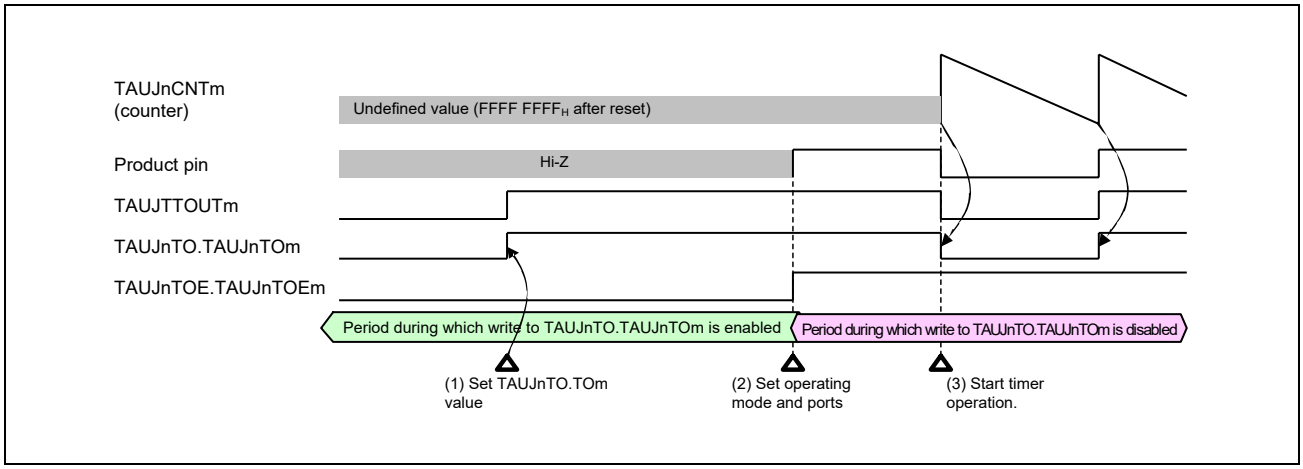

Figure 19.6 General Procedure for Specifying a TAUJTTOUTm Channel Output Mode

19.4.4.2 Channel Output Modes Controlled Independently by TAUJn Signals

This section lists the channel output modes that are controlled independently by TAUJn signals. The control bits used to specify a mode are listed in **Table 19.31, Channel Output Modes**.

(1) Independent channel output mode 1

Set/reset conditions

In this output mode, TAUJTTOUTm toggles when INTTAUJnIm is detected. The value of TAUJnTOL.TAUJnTOLm is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 19.31, Channel Output Modes**.

19.4.4.3 Channel Output Modes Controlled Synchronously by TAUJn Signals

This section lists the channel output modes that are controlled synchronously by TAUJn signals. The control bits used to specify a mode are listed in **Table 19.31, Channel Output Modes**.

(1) Synchronous channel output mode 1

Set/reset conditions

In this output mode, INTTAUJnIm of master channel serves as a set signal and INTTAUJnIm of the slave channel as a reset signal. If INTTAUJnIm of master channel and INTTAUJnIm of the slave channel are generated at the same time, INTTAUJnIm of the slave channel (reset signal) has priority over INTTAUJnIm (set signal) of master channel, i.e., the master channel is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 19.31, Channel Output Modes**.

19.4.5 Start Timing in Each Operating Mode

This section describes the timing at which the counter starts after TAUJnTS.TAUJnTSm is set to 1 in each operating mode.

In all modes, the value of data register (TAUJnCDRm) and whether or not an interrupt occurs depends on mode and register settings.

CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

19.4.5.1 Interval Timer Mode, Capture Mode, and Count Capture Mode

The counter starts operating with the next count clock after TAUJnTS.TAUJnTSm is set to 1. The value of data register is also loaded when the counter starts.

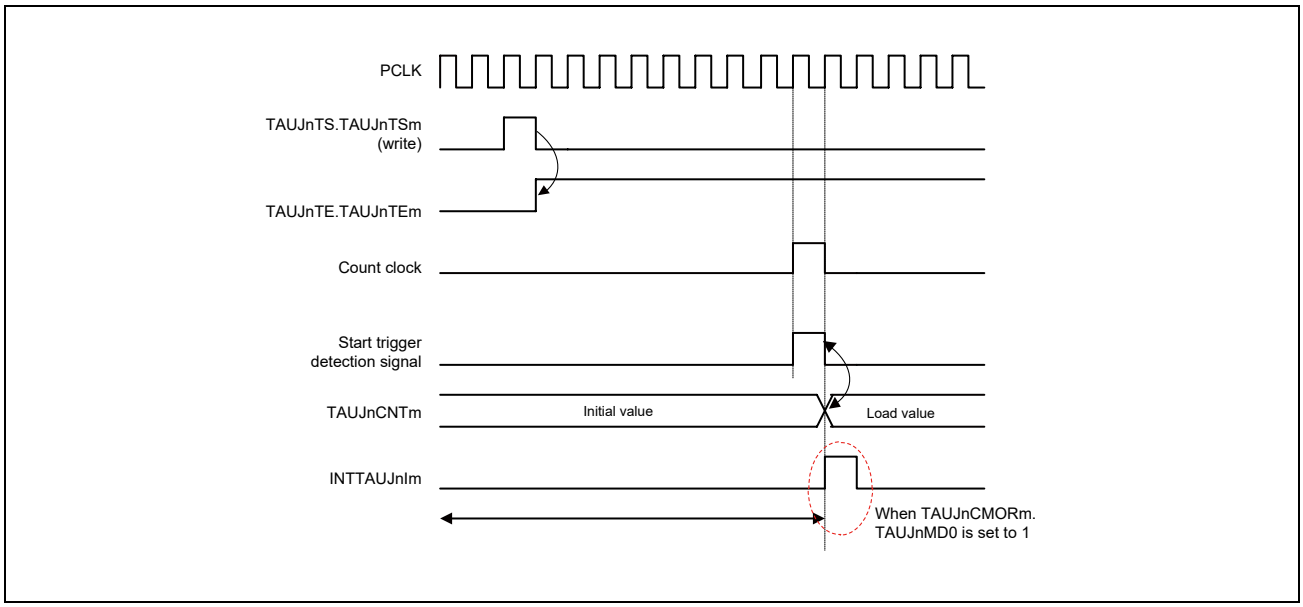

Figure 19.7 Start Timing in Interval Timer Mode, Capture Mode, and Count Capture Mode

19.4.5.2 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of an effective edge of TAUJTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which is irrelevant to start of counter operation, determine the frequency with which all operations take place.

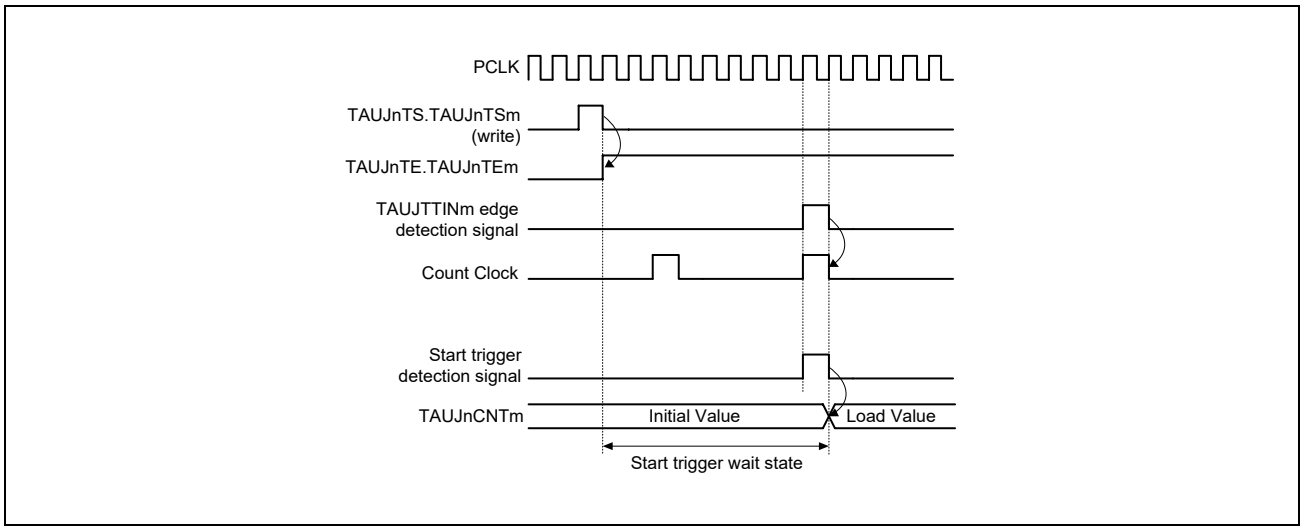

Figure 19.8 Start Timing in Other Operating Modes

19.4.6 TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUJnIm is generated using the TAUJnCMORm.TAUJnMD0 bit. The effect of the bit depends on the selected mode, as shown in the table below. The effect of INTTAUJnIm on TAUJTTOUTm depends on the selected channel operation function.

Table 19.32 Effect of TAUJnCMORm.TAUJnMD0 Bit on Generation of INTTAUJnIm when Counter is Triggered

Mode	TAUJnCMORm.TAUJnMD0 Bit	INTTAUJnIm Generated when Counter Starts or Restarts or when TAUJTTINm Input Signal Trigger is Detected
Interval timer mode Capture mode Count capture mode	0	No
	1	Yes
Capture and one-count mode Capture and gate count mode	0	No
One-count mode	0/1	No, regardless of setting of TAUJnCMORm.TAUJnMD0 bit.

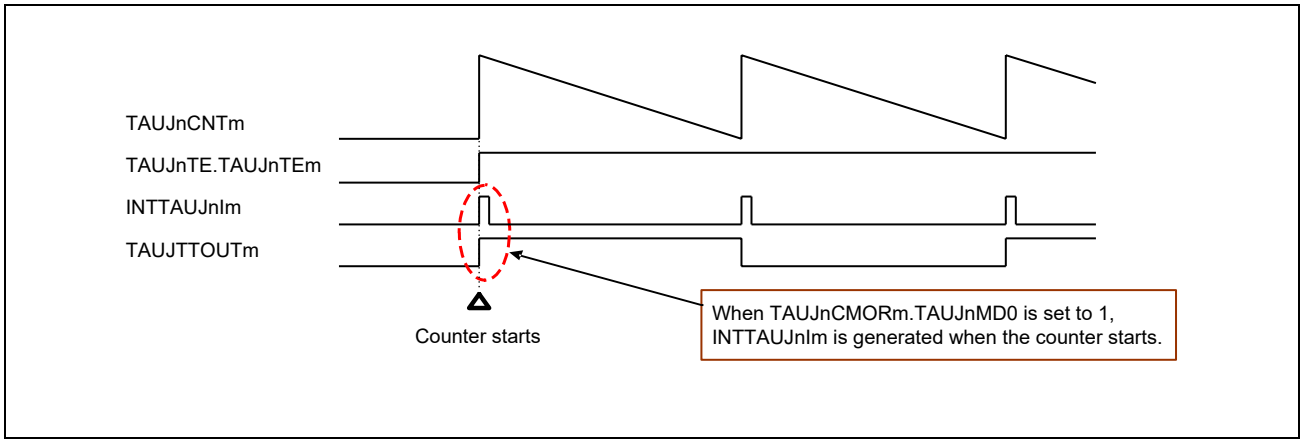

Figure 19.9 INTTAUJnIm Generated when Counter Starts

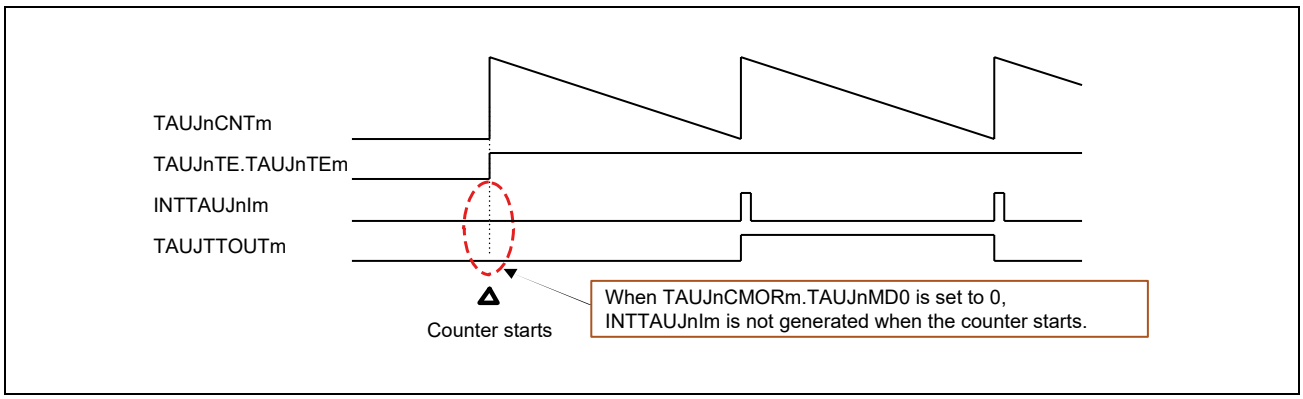

Figure 19.10 INTTAUJnIm Not Generated when Counter Starts

19.4.7 Interrupt Generation upon Overflow

With some independent functions, an interrupt will not be generated when the up counter overflows by reaching FFFF FFFF$_H$. This section describes how it is possible to generate an interrupt, by combining a channel operating in one of these modes with a channel in a different operation mode which counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operating mode for the second channel that counts down in such a manner, that it reaches 0000 0000$_H$ at the same time as the first channel overflows (TAUJnCNTm = FFFF FFFF$_H$).
- Set TAUJnCDRm of the second channel to FFFF FFFF$_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUJTTINm input.
- The trigger detection settings (TAUJnCMORm.TAUJnSTS[2:0] and TAUJnCMURm.TAUJnTIS[1:0]) must be identical for both channels.

Result:

The down-counter of the second channel reaches 0000 0000$_H$ at exactly the same time as the up-counter of the first channel overflows (TAUJnCNTm = FFFF FFFF$_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

19.4.7.1 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

When the capture trigger is input simultaneously to TAUJTTINm of both channels, INTTAUJnIm of the interval timer function can detect the overflow when TAUDJnCNTm of the TAUJTTINm input position detection function exceeds FFFF FFFF$_H$.

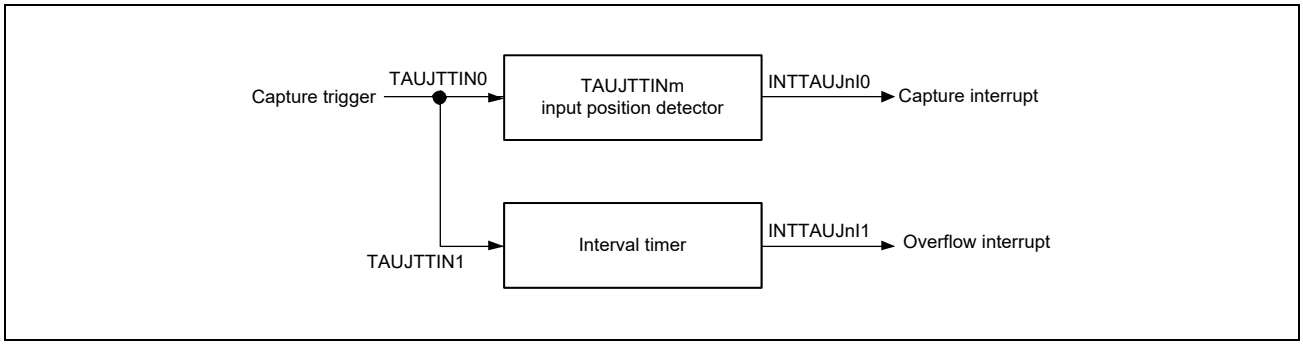

Figure 19.11 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

Timing diagram

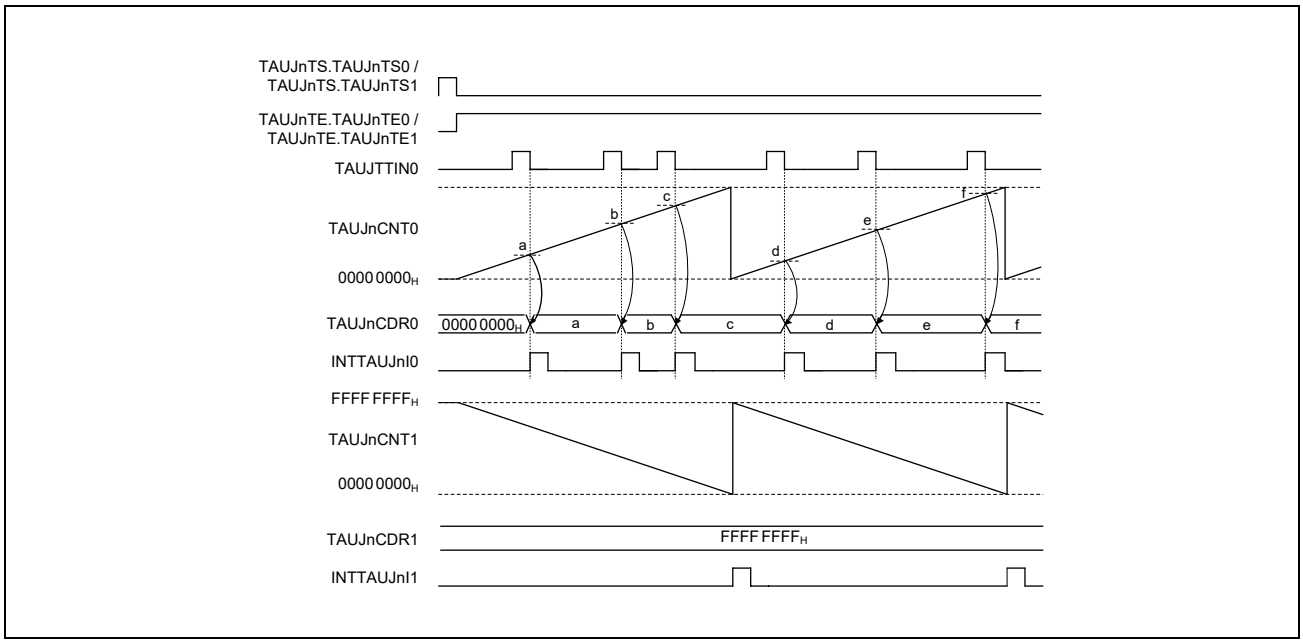

Figure 19.12 Interrupt Generation via Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

19.4.8 TAUJTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

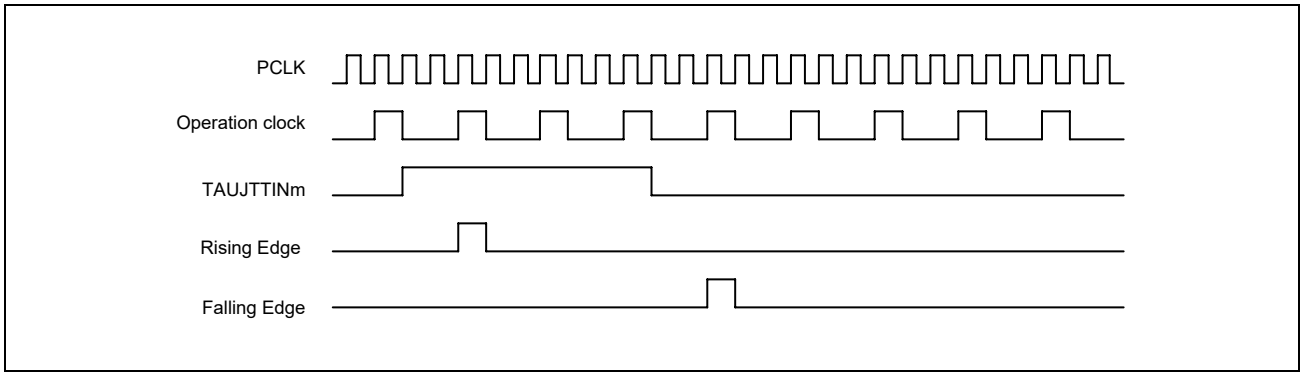

Figure 19.13 Basic Edge Detection Timing

CAUTION

Figure 19.13 shows an image of operation timing. In the actual operation, delay time occurs due to noise filter and synchronization circuit between the TAUJnIm pin and TAUJn.

19.4.9 Independent Channel Operation Functions

19.4.9.1 Interval Timer Function

(1) Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operating mode must be set to interval timer mode (see **Table 19.33, Contents of TAUJnCMORm Register for Interval Timer Function**.
- The channel output mode must be set to independent channel output mode 1. See **Section 19.4.4, Channel Output Modes**.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is written to TAUJnCNTm and the counter starts to count down from this value.

When the counter reaches 0000 0000_H, INTTAUJnIm is generated and the TAUJTTOUTm signal toggles. TAUJnCNTm then loads the TAUJnCDRm value and subsequently continues to operate.

The value of TAUJnCDRm can be rewritten at any time, and the changed value of TAUJnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0. TAUJnCNTm and TAUJTTOUTm stop but retain their values. The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.

Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUJTTOUTm does not toggle. This results in an inverted TAUJTTOUTm signal compared to when TAUJnCMORm.TAUJnMD0 is set to 1. For details refer to **Section 19.4.6, TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts**.

(2) Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTTOUTm square wave cycle = count clock cycle × (TAUJnCDRm + 1) × 2

(3) Block diagram and general timing diagram

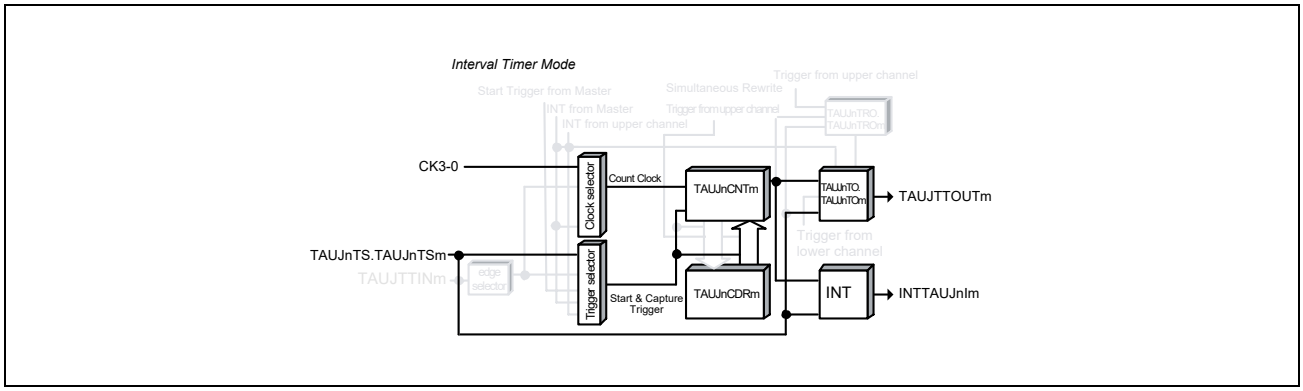

Figure 19.14 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram:

- INTTAUJnIm is generated at operation start (TAUJnCMORm.(TAUJnMD0 = 1)

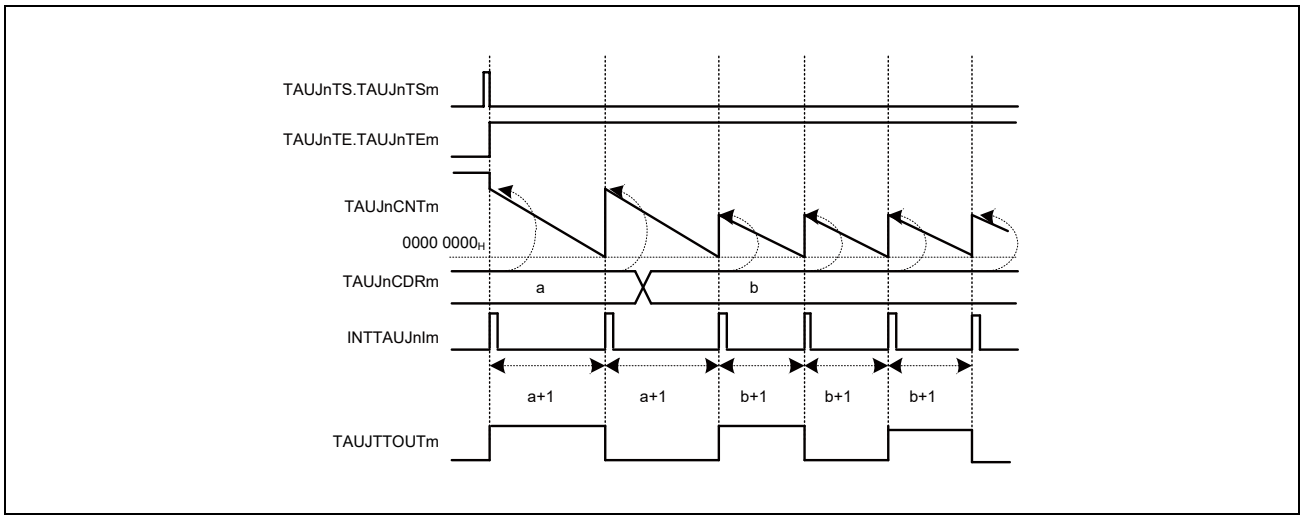

Figure 19.15 General Timing Diagram for Interval Timer Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Not used, so set to 00

(c) Channel output mode

Table 19.35 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUJnTOE.TAUJnTOEm	1: Enables independent channel output mode
TAUJnTO.TAUJnTOm	0: Low level 1: High level
TAUJnTOM.TAUJnTOMm	0: Independent channel output
TAUJnTOC.TAUJnTOCm	0: Toggle mode
TAUJnTOL.TAUJnTOLm	0: Positive logic

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details refer to **Section 19.4.4, Channel Output Modes**.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the Interval Timer Function. Therefore, these registers must be set to 0.

Table 19.36 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0

(5) Operating procedure for interval timer function

Table 19.37 Operating Procedure for Interval Timer Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 19.33, Contents of TAUJnCMORm Register for Interval Timer Function** and **Table 19.34, Contents of TAUJnCMURm Register for Interval Timer Function**. Set the value of the TAUJnCDRm register. Set the channel output mode by setting the control bits as described in **Table 19.35, Control Bit Settings for Independent Channel Output Mode 1**.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. • TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm loads the TAUJnCDRm value. • When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTTOUTm toggles.
During operation	The TAUJnCDRm register value can be changed at any time. The TAUJnCNTm register can be read at all times.	TAUJnCNTm counts down. When the counter reaches 0000 0000_H: • TAUJnCNTm reloads the TAUJnCDRm value and continues count operation • INTTAUJnIm is generated and TAUJTTOUTm toggles.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. • TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. • TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart

(6) Specific timing diagrams

(a) TAUJnCDRm = 0000 0000H, count clock = PCLK/2

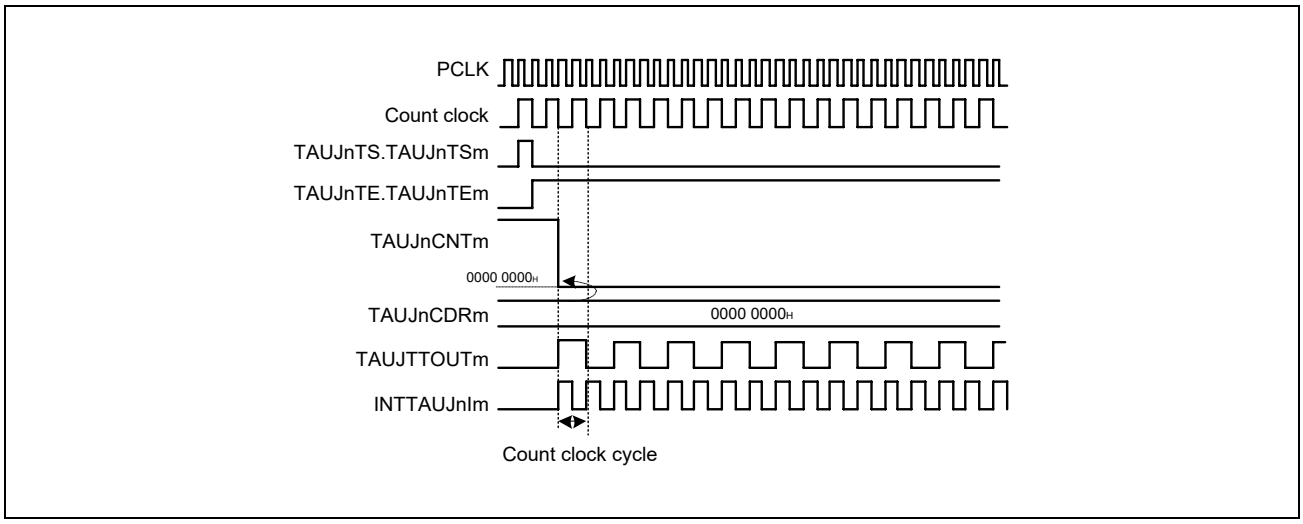

Figure 19.16 TAUJnCDRm = 0000 0000H, Count Clock = PCLK/2

- If TAUJnCDRm = 0000 0000H and the count clock = PCLK/2, the TAUJnCDRm value is written to TAUJnCNTm every count clock, meaning that TAUJnCNTm is always 0000 0000H.
- INTTAUJnIm is generated every count clock, resulting in TAUJTTOUTm toggling every count clock.

(b) TAUJnCDRm = 0000 0000H, count clock = PCLK

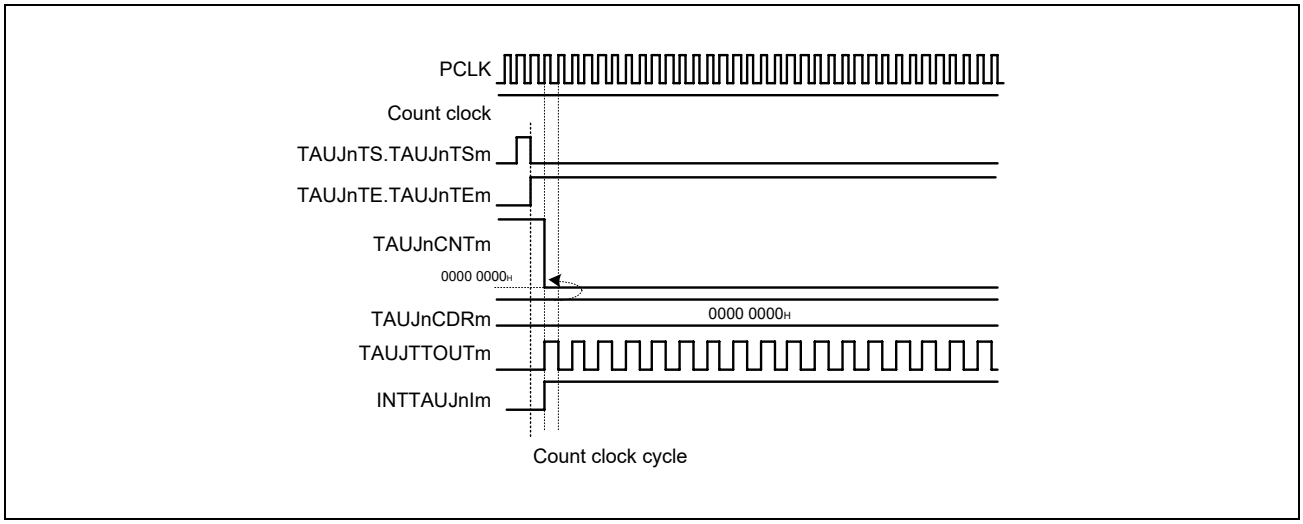

Figure 19.17 TAUJnCDRm = 0000 0000H, Count Clock = PCLK

- If TAUJnCDRm = 0000 0000H and the count clock = PCLK, the TAUJnCDRm value is written to TAUJnCNTm every PCLK clock, meaning that TAUJnCNTm is always 0000 0000H.
- INTTAUJnIm is generated continuously, resulting in TAUJTTOUTm toggling every PCLK clock.

(c) Operation stop and restart

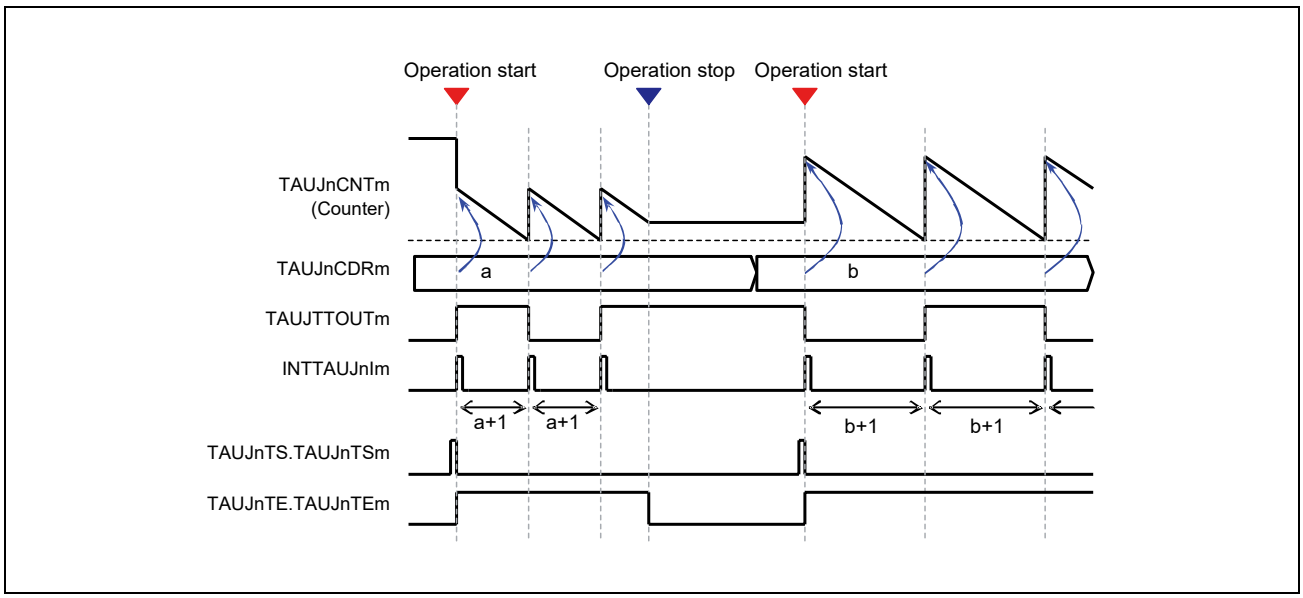

Figure 19.18 Operation Stop and Restart, TAUJnCMORm.TAUJnMD0 = 1

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1.

(d) Forced restart

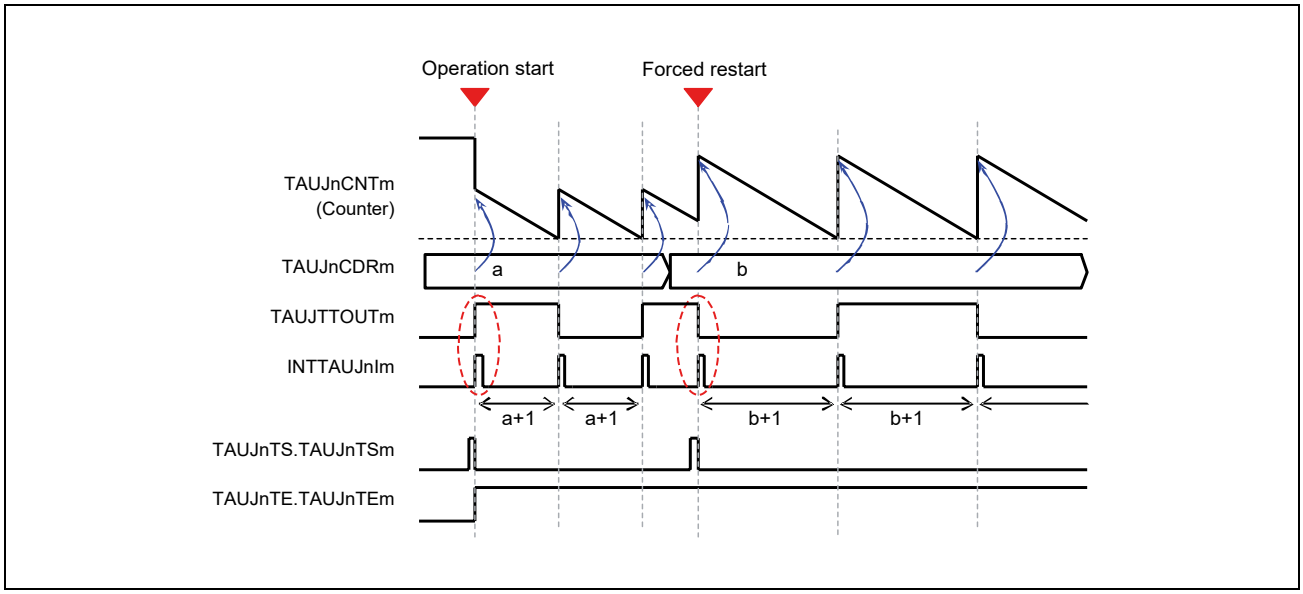

Figure 19.19 Forced Restart Operation, TAUJnCMORm.TAUJnMD0 = 1

- The counter can be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.
- If the TAUJnCMORm.TAUJnMD0 bit is set to 1, the first interrupt after a start or restart is generated.

19.4.9.2 TAUJTTINm Input Interval Timer Function

(1) Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals or when an effective TAUJTTINm input edge is detected. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operating mode must be set to interval timer mode (see **Table 19.15, TAUJnCMORm Register Contents**).
- The channel output mode must be set to independent channel output mode 1. See **Table 19.31, Channel Output Modes**.

Descriptions

This function operates in an identical manner to the Interval Timer Function (see **Section 19.4.9.1, Interval Timer Function**), except that this function is restarted by an effective TAUJTTINm input edge. The type of edge used as the trigger is specified using the TAUJnCMURm.TAUJnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edge can be selected.

(2) Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTTOUTm square wave cycle = count clock cycle × (TAUJnCDRm + 1) × 2

(3) Block diagram and general timing diagram

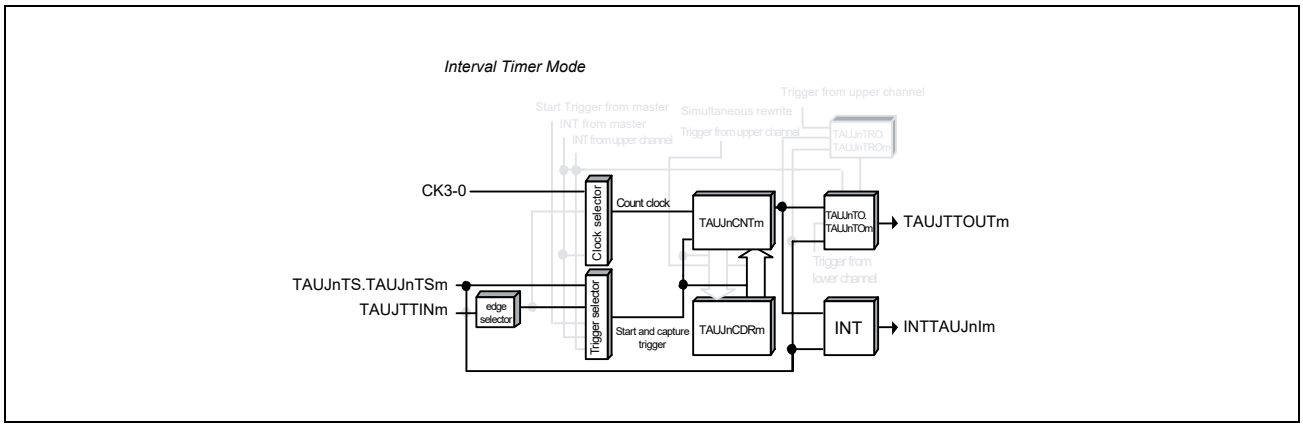

Figure 19.20 Block Diagram for TAUJTTINm Input Interval Timer Function

The following settings apply to the general timing diagram:

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1)
- Rising edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 01_B)

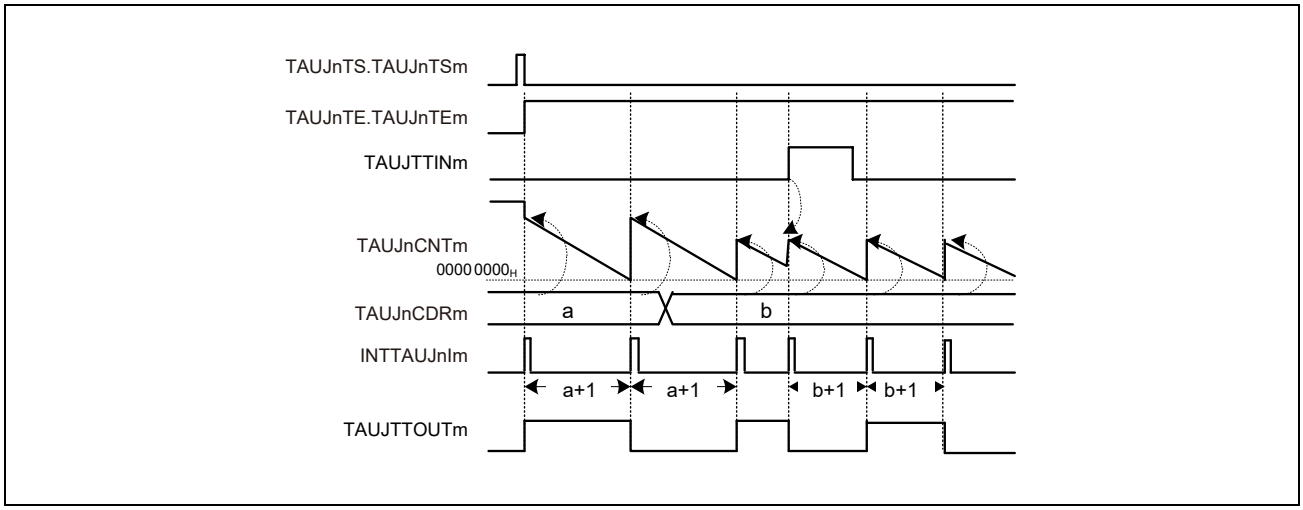

Figure 19.21 General Timing Diagram for TAUJTTINm Input Interval Timer Function

1, 0	TAUJnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection

(c) Channel output mode

Table 19.40 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUJnTOE.TAUJnTOEm	1: Enables independent channel output mode
TAUJnTO.TAUJnTOm	0: Low level 1: High level
TAUJnTOM.TAUJnTOMm	0: Independent channel output
TAUJnTOC.TAUJnTOCm	0: Operating mode 1 (toggle mode if TAUJnTOM.TAUJnTOMm = 0)
TAUJnTOL.TAUJnTOLm	0: Positive logic

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details refer to **Section 19.4.4, Channel Output Modes**.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm Input Interval Timer Function. Therefore, these registers must be set to 0.

Table 19.41 Simultaneous Rewrite Settings for TAUJTTINm Input Interval Timer Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0

(5) Operating procedure for TAUJTTINm input interval timer function

Table 19.42 Operating Procedure for TAUJTTINm Input Interval Timer Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 19.38, Contents of TAUJnCMORm Register for TAUJTTINm Input Interval Timer Function** and **Table 19.39, Contents of TAUJnCMURm Register for TAUJTTINm Input Interval Timer Function**. Set the value of the TAUJnCDRm register Set the channel output mode by setting the control bits as described in **Table 19.40, Control Bit Settings for Independent Channel Output Mode 1**.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. • TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm loads the TAUJnCDRm value. • When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTTOUTm toggles.
During operation	The values of the TAUJnCMURm.TAUJnTIS[1:0] and TAUJnCDRm registers can be changed at any time. The TAUJnCNTm register can be read at all times. Detection of TAUJTTINm edge	TAUJnCNTm counts down. When the counter reaches 0000 0000_H: • TAUJnCNTm reloads the TAUJnCDRm value and continues count operation • INTTAUJnIm is generated and TAUJTTOUTm toggles When an effective TAUJTTINm input edge is detected during count operation, TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. • TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. • TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart

(6) Specific timing diagrams

The timing diagrams in **Section 19.4.9.1, Interval Timer Function** apply, and in addition the counter can also be restarted by an effective TAUJTTINm input edge.

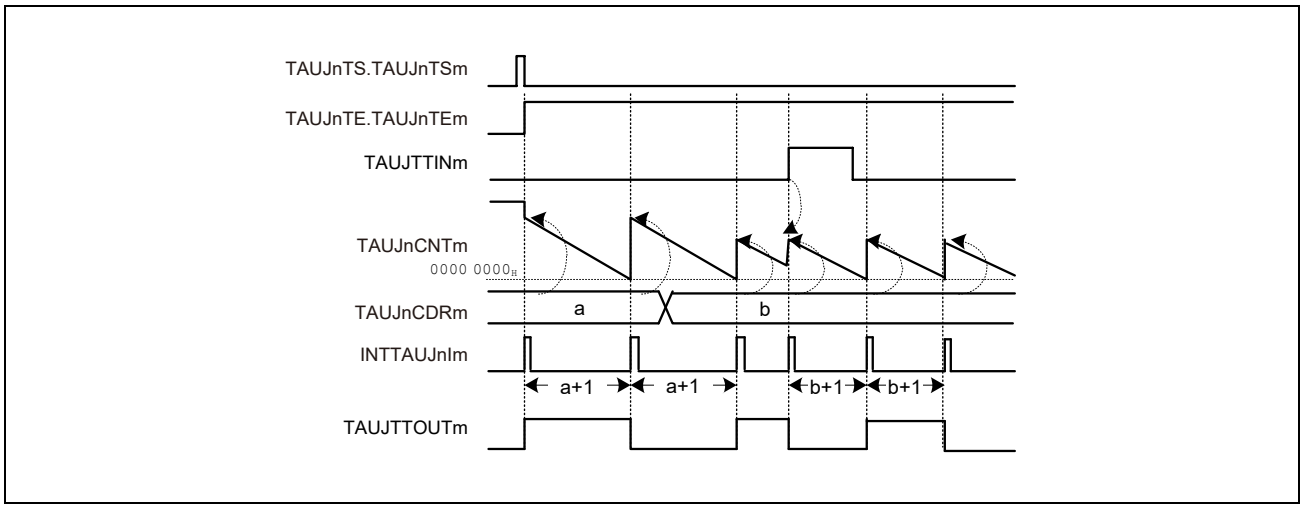

Figure 19.22 Counter Triggered by Rising TAUJTTINm Input Edge (TAUJnCMURm.TAUJnTIS[1:0] = 01_B), TAUJnCMORm.TAUJnMD0 = 1

If an effective TAUJTTINm input edge is detected, an interrupt is generated which causes TAUJTTOUTm to toggle. In this example, the effective edge is a rising edge (TAUJnCMURm.TAUJnTIS[1:0] = 01_B).

19.4.9.3 TAUJTTINm Input Pulse Interval Measurement Function

(1) Overview

Summary

This function captures the count value and uses this value and the overflow bit TAUJnCSRm.TAUJnOVF to measure the interval of the TAUJTTINm input signal.

Prerequisites

- The operating mode must be set to capture mode (see **Table 19.44, Contents of TAUJnCMORm Register for TAUJTTINm Input Pulse Interval Measurement Function**).
- TAUJTTOUTm is not used with this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter TAUJnCNTm starts counting up from 0000 0000_H. When an effective TAUJTTINm edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter resets to 0000 0000_H and subsequently continues to operate.

If the counter reaches FFFF $FFFF_H$ before an effective TAUJTTINm edge is detected, it overflows to 0000 0000_H. The counter is reset to 0000 0000_H and subsequently continues to operate. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0]:

Table 19.43 Effects of an Overflow

TAUJnCMORm. TAUJnCOS[1:0]	When Overflow Occurs		When an Effective TAUJTTINm Input is then Detected	
	TAUJnCDRm	TAUJnCSRm.TAUJnOVF	TAUJnCDRm, TAUJnCNTm	TAUJnCSRm.TAUJnOVF
00	Unchanged	0	TAUJnCNTm written to TAUJnCDRm	1
01		1		
10	Set to FFFF $FFFF_H$	0	TAUJnCNTm set to 0, TAUJnCDRm unchanged	Unchanged
11		1		

If an overflow is set (TAUJnCSRm.TAUJnOVF = 1) when TAUJnCMORm.TAUJnCOS[0] = 1, it can only be cleared by setting TAUJnCSCm.TAUJnCLOV = 1.

The combination of the value of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the interval of the TAUJTTINm signal. However, if an overflow occurs multiple times before an effective TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

The function can be stopped by setting TAUJnTT.TAUJnTTm = 1, which in turn sets TAUJnTE.TAUJnTEm = 0. TAUJnCNTm stops but retains its value. While the function is stopped, effective TAUJTTINm input edge detection and TAUJnCNTm capture are not performed.

The counter is reset to 0000 0000_H and subsequently continues to operate.

Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details refer to **Section 19.4.6, TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts**.

NOTE

When TAUJnCMORm.TAUJnCOS[1:0] = 1, the value of TAUJnCNTm is not written to TAUJnCDRm when the first effective TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

(2) Equations

TAUJTTINm input pulse interval = count clock cycle ×
[(TAUJnCSRm.TAUJnOVF × (FFFF FFFF$_H$ + 1)) + TAUJnCDRm capture value + 1]

(3) Block diagram and general timing diagram

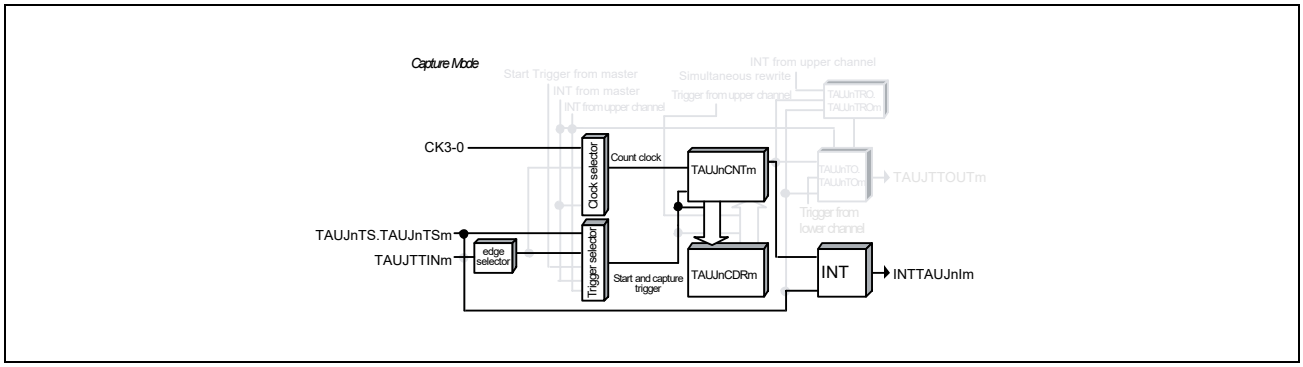

Figure 19.23 Block Diagram for TAUJTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram:

- INTTAUJnIm not generated at operation start (TAUJnCMORm.TAUJnMD0 = 0)
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00$_B$)
- When an effective TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = 00$_B$)

	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 19.45 Contents of TAUJnCMURm Register for TAUJTTINm Input Pulse Interval Measurement Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection

(c) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used by this function.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm Input Pulse Interval Measurement Function. Therefore, these registers must be set to 0.

Table 19.46 Simultaneous Rewrite Settings for TAUJTTINm Input Pulse Interval Measurement Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0

(5) Operating procedure for TAUJTTINm input pulse interval measurement function

Table 19.47 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 19.44, Contents of TAUJnCMORm Register for TAUJTTINm Input Pulse Interval Measurement Function** and **Table 19.45, Contents of TAUJnCMURm Register for TAUJTTINm Input Pulse Interval Measurement Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. • TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. • TAUJnCNTm is cleared to 0000 0000_H. INTTAUJnIm is generated when TAUJnCMORm.TAUJnMD0 is set to 1.
During operation	Detection of TAUJTTINm edges. The TAUJnCMURm. TAUJnTIS[1:0] bits can be changed at any time. The TAUJnCDRm and TAUJnCSRm registers can be read at any time. TAUJnCSCm.TAUJnCLOV bit can be written to 1 (TAUJnCSRm.TAUJnOVF bit is cleared to 0).	TAUJnCNTm starts to count up from 0000 0000_H. When an effective TAUJTTINm edge is detected: • TAUJnCNTm transfers (captures) its value to TAUJnCDRm, and returns to 0000 0000_H • INTTAUJnIm is then generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. • TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. • TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values.

Restart

(6) Specific timing diagrams: overflow behavior

(a) TAUJnCMORm.TAUJnCOS[1:0] = 00_B

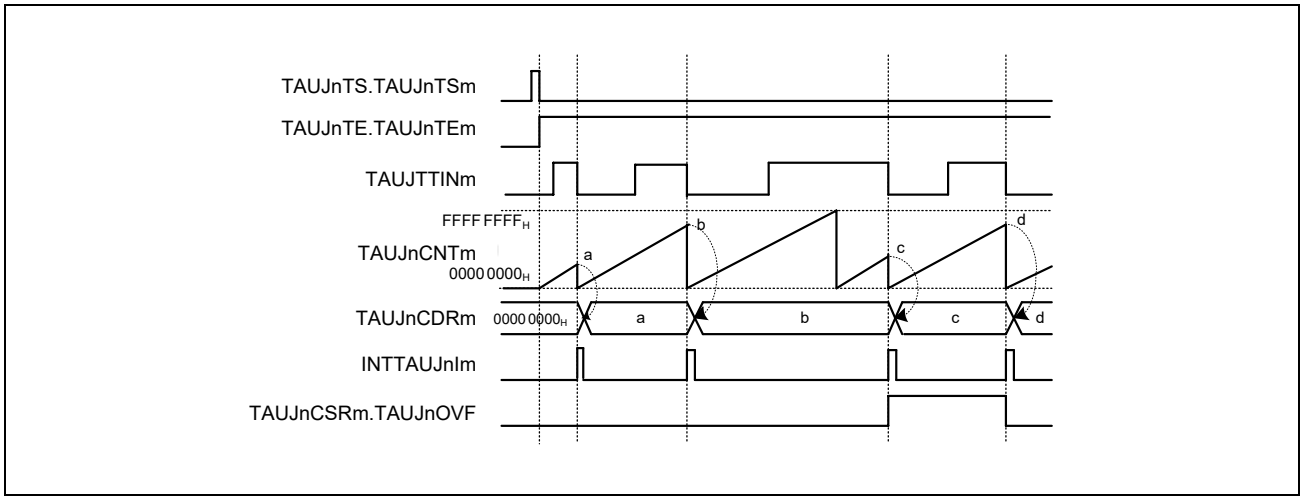

Figure 19.25 TAUJnCMORm.TAUJnCOS[1:0] = 00_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and TAUJnCSRm.TAUJnOVF remains = 0.
- Upon detection of the next effective TAUJTTINm input edge, the value of TAUJnCNTm is written to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- If the next effective TAUJTTINm input edge is detected when no overflow occurs, TAUJnCSRm.TAUJnOVF is cleared to 0.

(b) TAUJnCMORm.TAUJnCOS[1:0] = 01_B

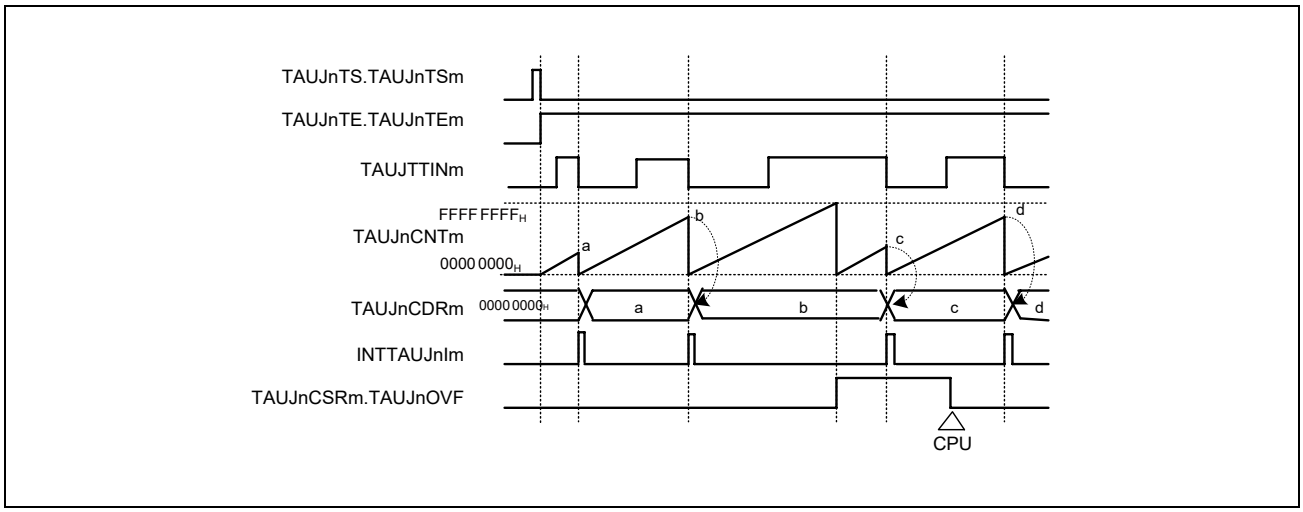

Figure 19.26 TAUJnCMORm.TAUJnCOS[1:0] = 01_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next effective TAUJTTINm input edge, the value of TAUJnCNTm is written to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

(c) TAUJnCMORm.TAUJnCOS[1:0] = 10_B

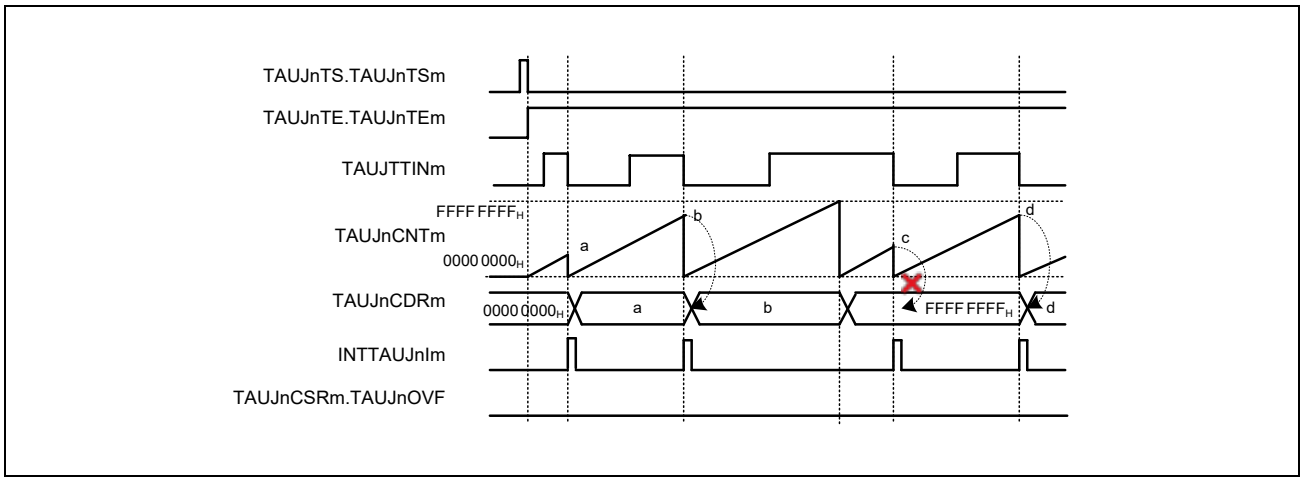

Figure 19.27 TAUJnCMORm.TAUJnCOS[1:0] = 10_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$ and TAUJnCSRm.TAUJnOVF remains = 0.
- Upon detection of the next effective TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next effective TAUJTTINm input edge after the overflow is ignored.

(d) TAUJnCMORm.TAUJnCOS[1:0] = 11_B

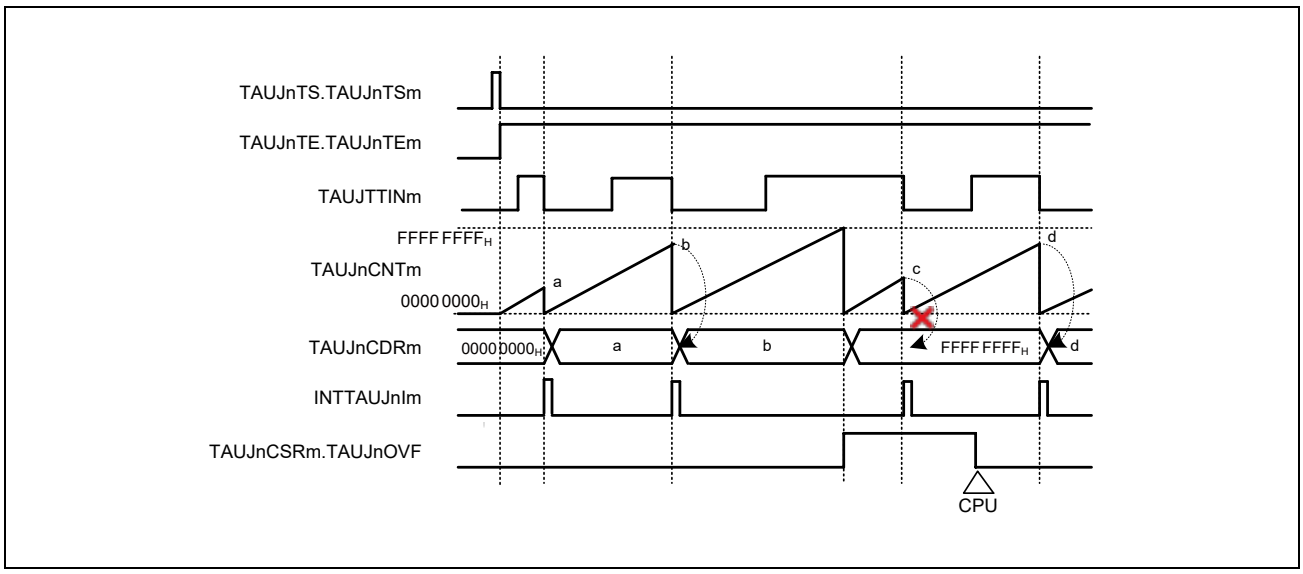

Figure 19.28 TAUJnCMORm.TAUJnCOS[1:0] = 11_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, TAUJnCDRm is set to FFFF $FFFF_H$, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next effective TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next effective TAUJTTINm input edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

19.4.9.4 TAUJTTINm Input Signal Width Measurement Function

(1) Overview

Summary

This function measures the width of a TAUJTTINm signal by starting counting on one edge of the TAUJTTINm signal and capturing the counter value on the opposite edge.

Prerequisites

- The operating mode should be set to capture and one-count mode (see **Table 19.49, Contents of TAUJnCMORm Register for TAUJTTINm Input Signal Width Measurement Function**).
- TAUJTTOUTm is not used with this function.
- TAUJnCMORm.TAUJnMD0 should be set to 0.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. When an effective TAUJTTINm start edge is detected, the counter TAUJnCNTm starts counting up from 0000 0000_H. When an effective TAUJTTINm stop edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter retains its value and awaits the next effective TAUJTTINm input start edge.

If the counter reaches FFFF $FFFF_H$ before an effective TAUJTTINm stop edge is detected, it overflows. The counter is reset to 0000 0000_H and subsequently continues to operate. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0]:

Table 19.48 Effects of an Overflow

TAUJnCMORm.TAUJnCOS[1:0]	When Overflow Occurs		When an Effective TAUJTTINm Input Stop Edge is Detected	
	TAUJnCDRm	TAUJnCSRm.TAUJnOVF	TAUJnCDRm, TAUJnCNTm	TAUJnCSRm.TAUJnOVF
00	Unchanged	0	TAUJnCNTm written to TAUJnCDRm	1
01		1		
10	Set to FFFF $FFFF_H$	0	TAUJnCNTm stops counting TAUJnCDRm unchanged	Unchanged
11		1		

If an overflow is set (TAUJnCSRm.OVF = 1) when TAUJnCMORm.TAUJnCOS[0] = 1, it can only be cleared by setting TAUJnCSCm.TAUJnCLOV = 1.

The combination of the value of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the width of the TAUJTTINm signal. However, if an overflow occurs multiple times before an effective TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

This function cannot be forcibly restarted.

NOTE

When TAUJnCMORm.TAUJnCOS[1] = 1, the value of TAUJnCNTm is not written to TAUJnCDRm when the first effective TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

(2) Equations

TAUJTTINm input signal width = count clock cycle ×
[(TAUJnCSRm.TAUJnOVF × (FFFF FFFF$_H$ + 1)) + TAUJnCDRm capture value + 1]

(3) Block diagram and general timing diagram

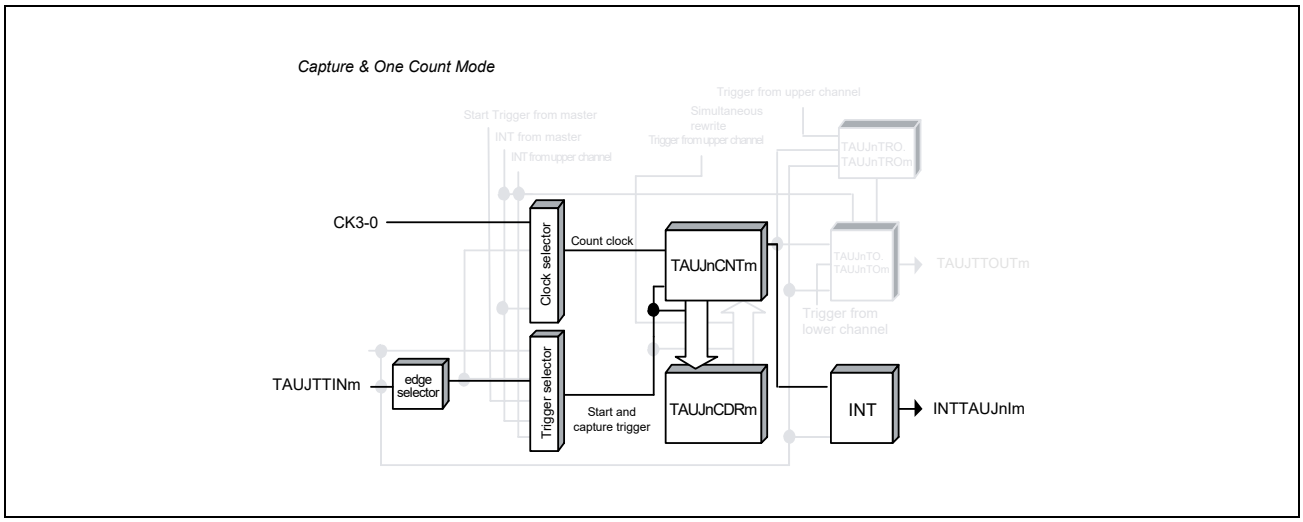

Figure 19.29 Block Diagram for TAUJTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram:

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)
- When an effective TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = 00_B)

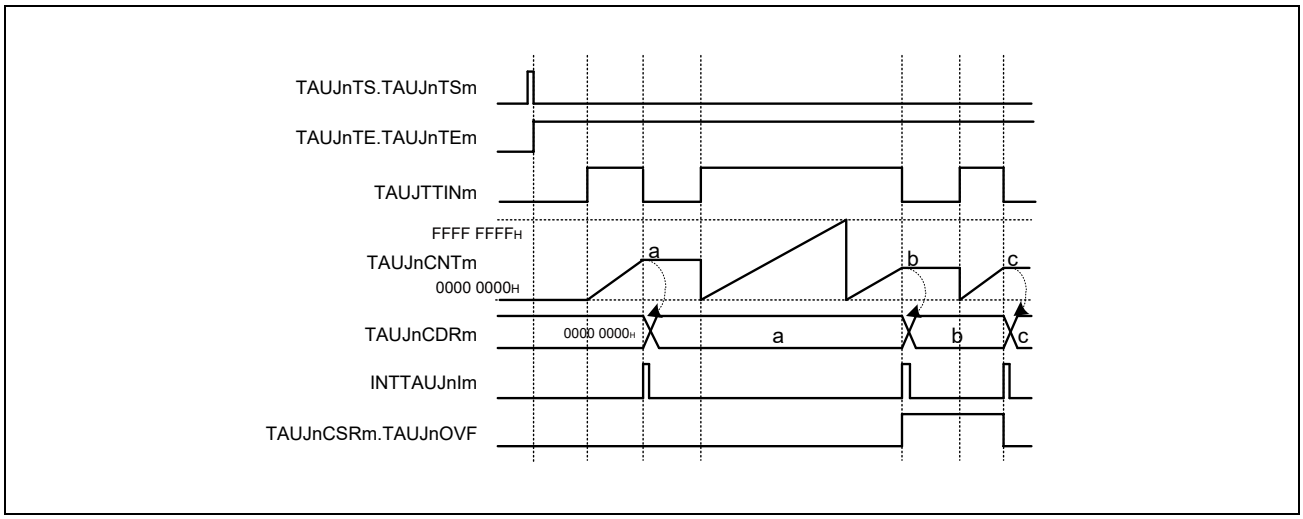

Figure 19.30 General Timing Diagram for TAUJTTINm Input Signal Width Measurement Function

7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (low width measurement) 11: Rising and falling edge detection (high width measurement)

(c) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm Input Signal Width Measurement Function. Therefore, these registers must be set to 0.

Table 19.51 Simultaneous Rewrite Settings for TAUJTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0

(5) Operating procedure for TAUJTTINm input signal width measurement function

Table 19.52 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 19.49, Contents of TAUJnCMORm Register for TAUJTTINm Input Signal Width Measurement Function** and **Table 19.50, Contents of TAUJnCMURm Register for TAUJTTINm Input Signal Width Measurement Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. • TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge. When a TAUJTTINm start edge is detected, TAUJnCNTm starts to count up.
During operation	Detection of TAUJTTINm edges. The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time. The TAUJnCSCm.TAUJnCLOV bit can be set to 1.	TAUJnCNTm starts to count up from 0000 0000_H. When an effective TAUJTTINm edge is detected: • AUJnCNTm transfers (captures) its value to TAUJnCDRm, and retains its value • INTTAUJnIm is then generated. • Counting stops at the value that transferred to TAUJnCDRm + 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. • TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. • TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values.

Restart

(6) Specific timing diagrams: overflow behavior

(a) TAUJnCMORm.TAUJnCOS[1:0] = 00_B

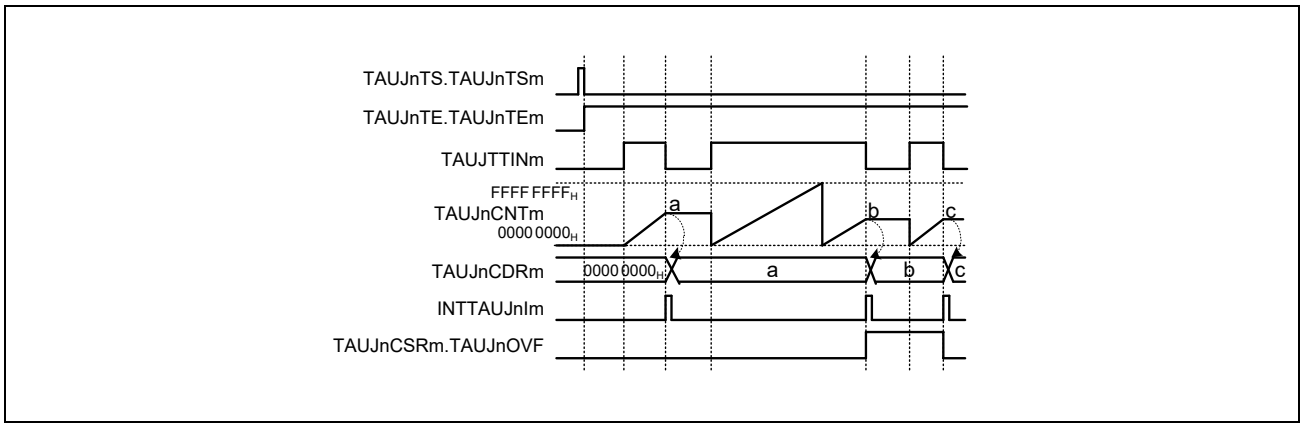

Figure 19.31 TAUJnCMORm.TAUJnCOS[1:0] = 00_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and TAUJnCSRm.TAUJnOVF remains = 0.
- Upon detection of the next effective TAUJTTINm input edge, the value of TAUJnCNTm is written to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next effective TAUJTTINm input edge with no overflow occurring, TAUJnCSRm.TAUJnOVF is cleared to 0.

(b) TAUJnCMORm.TAUJnCOS[1:0] = 01_B

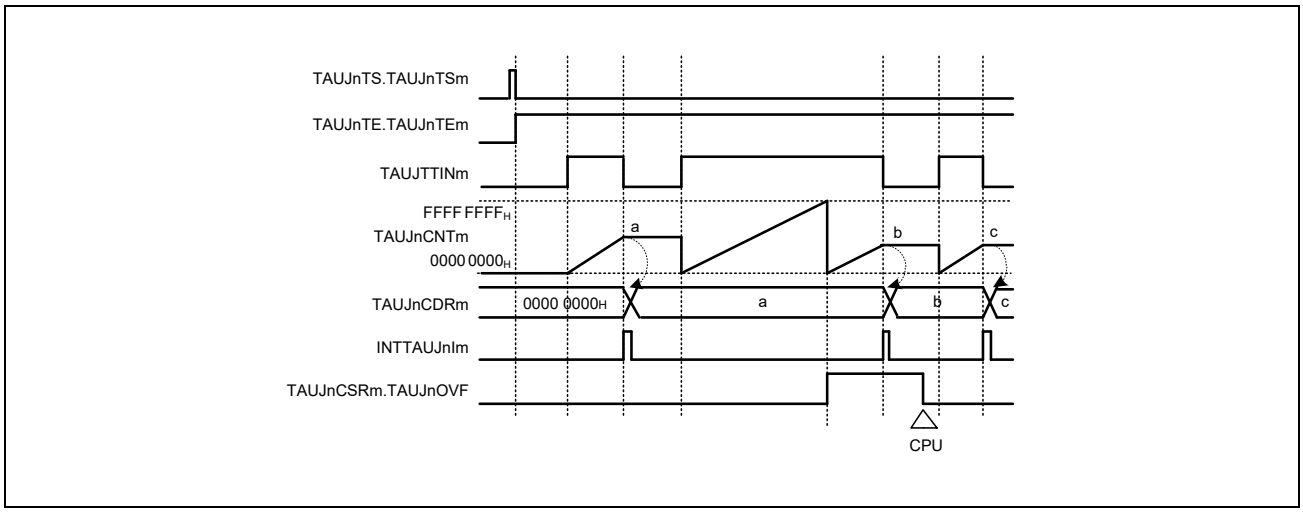

Figure 19.32 TAUJnCMORm.TAUJnCOS[1:0] = 01_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next effective TAUJTTINm input edge, the value of TAUJnCNTm is written to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting TAUJnCSCm.TAUJnCLOV bit = 1).

(c) TAUJnCMORm.TAUJnCOS[1:0] = 10_B

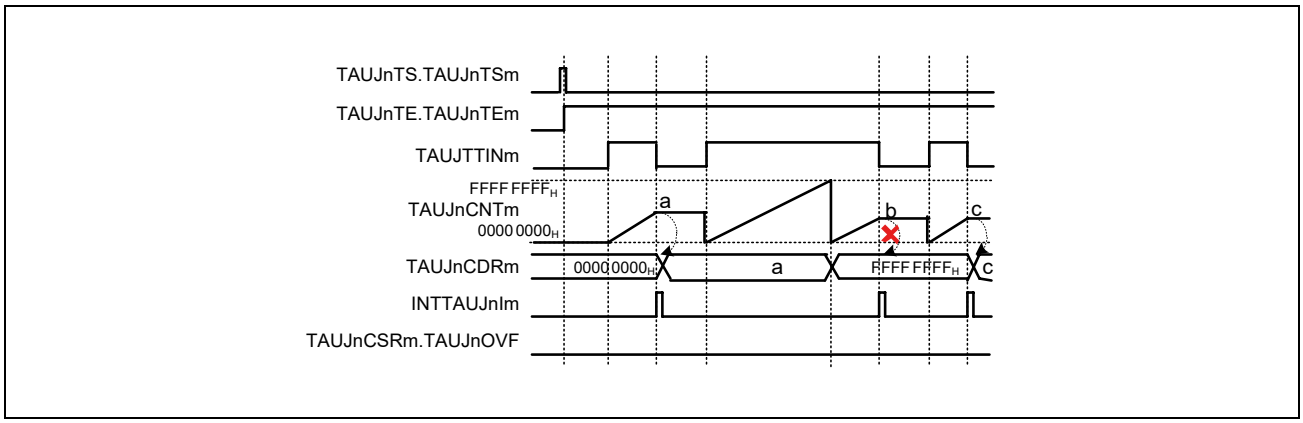

Figure 19.33 TAUJnCMORm.TAUJnCOS[1:0] = 10_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, TAUJnCDRm is set to FFFF $FFFF_H$ and TAUJnCSRm.TAUJnOVF remains = 0.
- Upon detection of the next effective TAUJTTINm input edge, the counter of TAUJnCNTm is stopped, and TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next effective TAUJTTINm input edge after the overflow is ignored.

(d) TAUJnCMORm.TAUJnCOS[1:0] = 11_B

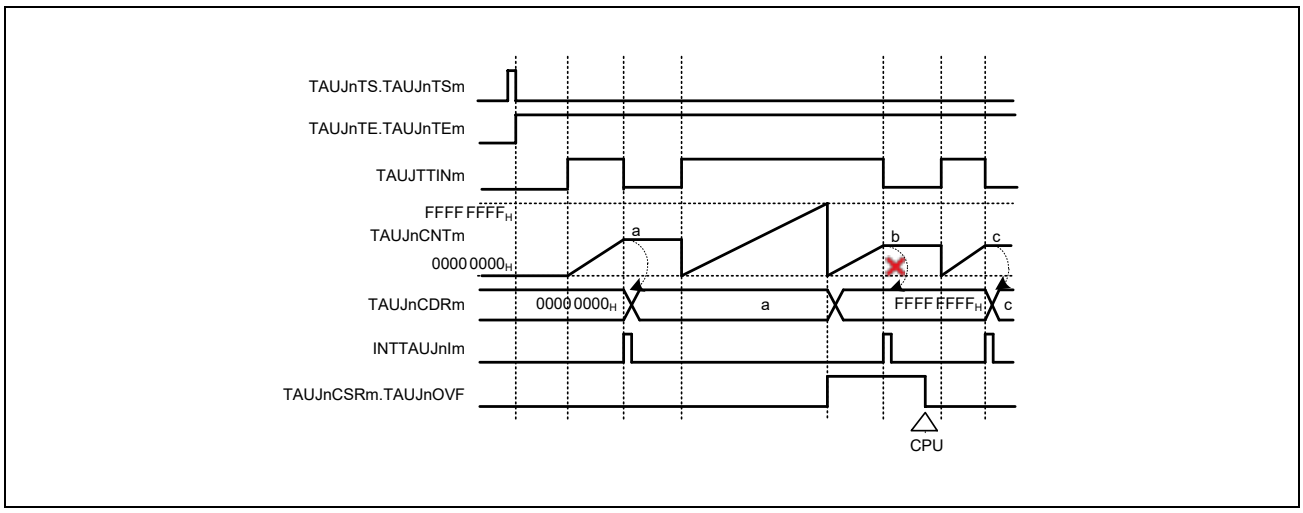

Figure 19.34 TAUJnCMORm.TAUJnCOS[1:0] = 11_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next effective TAUJTTINm input edge, the counter of TAUJnCNTm is stopped, and TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next effective TAUJTTINm input edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

19.4.9.5 TAUJTTINm Input Position Detection Function

(1) Overview

Summary

This function measures the interval of an input signal by capturing the counter value on an effective edge of the TAUJTTINm signal.

NOTE

The input TAUJTTINm is sampled at the frequency of the operation clock, specified by the TAUJnCMORm.TAUJnCKS[1:0] bits. As a result, the output cycle of TAUJTTOUTm has an error of ± 1 operation clock cycle.

Prerequisites

- The operating mode should be set to count capture mode (see **Table 19.53, Contents of TAUJnCMORm Register for TAUJTTINm Input Position Detection Function**).
- TAUJTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter starts to count from 0000 0000_H. When an effective TAUJTTINm input stop edge is detected, the current TAUJnCNTm value is written to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter continues to count.

When the counter reaches FFFF $FFFF_H$, the counter restarts from 0000 0000_H.

Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 19.4.6, TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts**.

(2) Equations

Function duration at a TAUJTTINm input pulse = count clock cycle × (TAUJnCDRm capture value + 1)

(3) Block diagram and general timing diagram

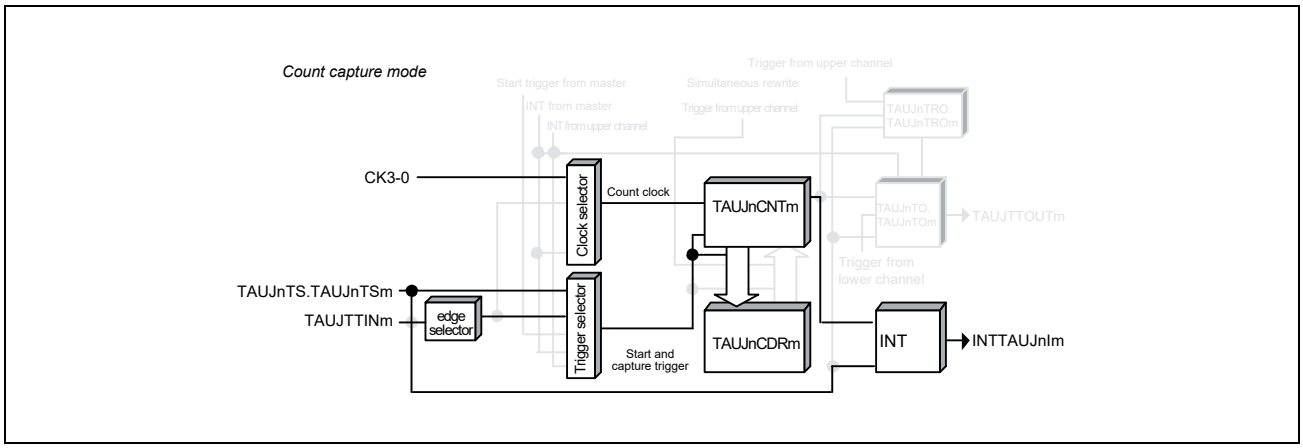

Figure 19.35 Block Diagram of TAUJTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram:

- INTTAUJnIm not generated at operation start (TAUJnCMORm.TAUJnMD0 = 0)
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00_B)

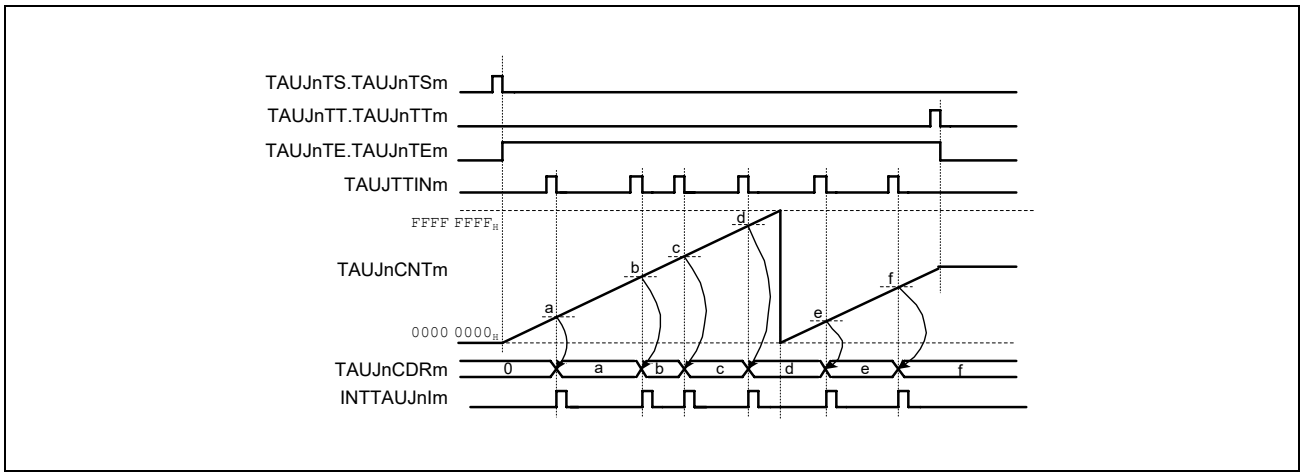

Figure 19.36 General Timing Diagram for TAUJTTINm Input Position Detection Function

1, 0	TAUJnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection

(c) Channel output mode

The channel output mode is not used by this function.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm Input Position Detection Function. Therefore, these registers must be set to 0.

Table 19.55 Simultaneous Rewrite Settings for TAUJTTINm Input Position Detection Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0

(5) Operating procedure for TAUJTTINm input position detection function

Table 19.56 Operating Procedure for TAUJTTINm Input Position Detection Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 19.53, Contents of TAUJnCMORm Register for TAUJTTINm Input Position Detection Function** and **Table 19.54, Contents of TAUJnCMURm Register for TAUJTTINm Input Position Detection Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. • TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. • INTTAUJnIm is generated when TAUJnCMORm.TAUJnMD0 is set to 1.
During operation	The TAUJnCMURm.TAUJnTIS[1:0] bits can be changed at any time. The TAUJnCDRm and TAUJnCSRm registers can be read at any time.	TAUJnCNTm starts to count up from 0000 0000_H. When an effective TAUJTTINm edge is detected: • TAUJnCNTm transfers (captures) its value to TAUJnCDRm • INTTAUJnIm is output. • The counter value is not cleared to 0000 0000_H and TAUJnCNTm continues count operation. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TTm to 1. • TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. • TAUJnCNTm stops. TAUJnCNTm retains its current value.

Restart

(6) Specific timing diagrams

(a) Operation stop and restart

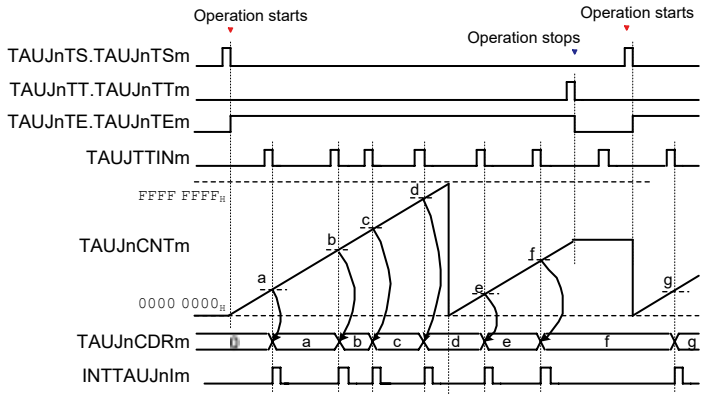

Figure 19.37 Operation Stop and Restart, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, effective TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. TAUJnCNTm restarts to count from $0000\ 0000_H$.

19.4.9.6 TAUJTTINm Input Period Count Detection Function

(1) Overview

Summary

This function measures the cumulative width of a TAUJTTINm input signal.

Prerequisites

- The operating mode should be set to capture and gate count mode (see **Table 19.57, Contents of TAUJnCMORm Register for TAUJTTINm Input Period Count Detection Function**).
- TAUJTTOUTm is not used for this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter awaits an effective TAUJTTINm input edge.

When an effective TAUJTTINm input start edge is detected, the counter starts to count from 0000 0000_H.

When an effective TAUJTTINm input stop edge is detected, the current TAUJnCNTm value is written to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter stops and retains its value until the next effective TAUJTTINm input start edge is detected.

When the next effective TAUJTTINm input start edge is detected, the counter restarts counting from the stop value.

If the counter reaches FFFF $FFFF_H$, the counter restarts from 0000 0000_H.

NOTE

The input TAUJTTINm signal is sampled at the frequency of the operation clock, specified by the TAUJnCMORm.TAUJnCKS[1:0] bits.

Conditions

The effective start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits:

- If TAUJnCMURm.TAUJnTIS[1:0] = 10_B, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11_B, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

(2) Equations

Cumulative TAUJTTINm input width = count clock cycle × (TAUJnCDRm capture value + 1)

(3) Block diagram and general timing diagram

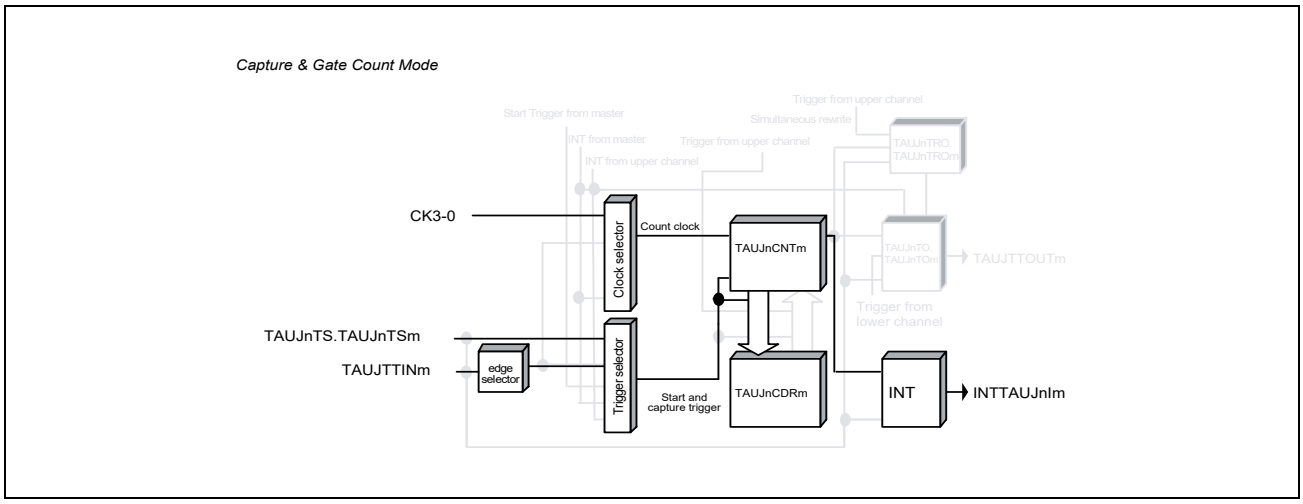

Figure 19.38 Block Diagram for TAUJTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram:

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

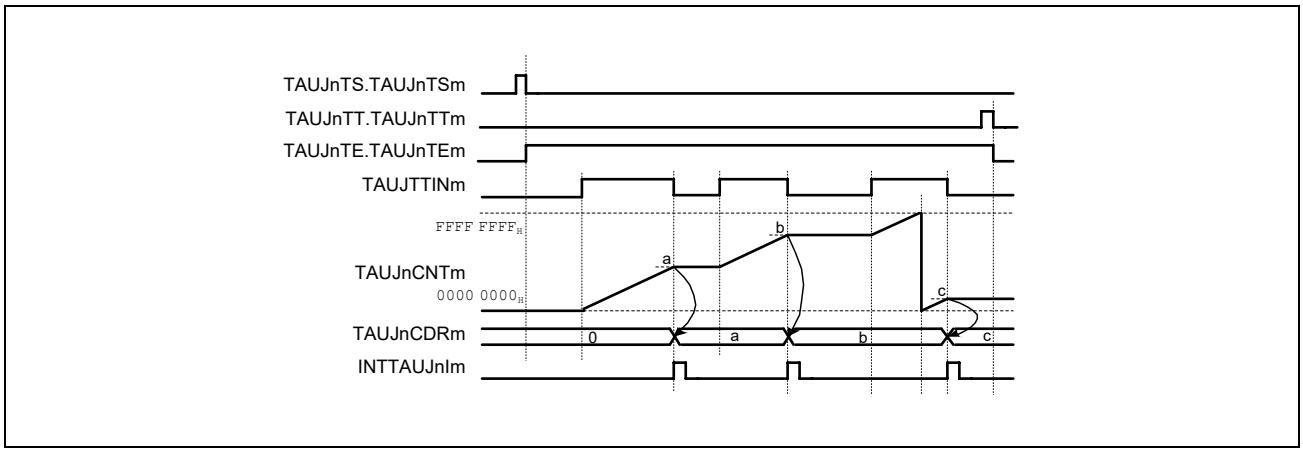

Figure 19.39 General Timing Diagram for TAUJTTINm Input Period Count Detection Function

(4) Register settings

Table 19.57 Contents of TAUJnCMORm Register for TAUJTTINm Input Period Count Detection Function

Bit Position	Bit Name	Function
15, 14	TAUJnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3
13, 12	TAUJnCCS[1:0]	00: Uses the operation clock as a counter clock.
11	TAUJnMAS	0: Not used, so set to 0
10 to 8	TAUJnSTS[2:0]	010: Effective edge of the TAUJTTINm input signal is used as an external start trigger and the reverse edge as a stop trigger.
7, 6	TAUJnCOS[1:0]	01: This value must be set.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUJnMD[4:1]	1101: Capture and gate count mode
0	TAUJnMD0	0: Disables the start trigger during operation.

(b) TAUJnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 19.58 Contents of TAUJnCMURm Register for TAUJTTINm Input Period Count Detection Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (Low width measurement) 11: Rising and falling edge detection (High width measurement)

(c) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(d) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm Input Period Count Detection Function. Therefore, these registers must be set to 0.

Table 19.59 Simultaneous Rewrite Settings for TAUJTTINm Input Period Count Detection Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0

(5) Operating procedure for TAUJTTINm input period count detection function

Table 19.60 Operating Procedure for TAUJTTINm Input Period Count Detection Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 19.57, Contents of TAUJnCMORm Register for TAUJTTINm Input Period Count Detection Function** and **Table 19.58, Contents of TAUJnCMURm Register for TAUJTTINm Input Period Count Detection Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. • TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUJTTINm start edge.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge. When a start edge is detected, TAUJnCNTm is cleared to 0000 0000_H and TAUJnCNTm starts to count up.
During operation	Detection of TAUJTTINm edges. The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time.	When a TAUJTTINm start edge (rising edge for high level width measurement, falling edge for low level width measurement) is detected, TAUJnCNTm starts to count up from the stop value. • When TAUJnCNTm detects a start edge (falling edge for high level width measurement, rising edge for low level width measurement), it transfers the value to TAUJnCDRm and INTTAUJnIm is generated. • Counting stops at the “value transferred to TAUJnCDRm + 1” and TAUJnCNTm waits for detection of the TAUJTTINm start edge. • If the TAUJnCNTm reaches FFFF $FFFF_H$, the counter restarts count operation from 0000 0000_H. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TTm to 1. • TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. • TAUJnCNTm stops. TAUJnCNTm retains its current value.

Restart

(6) Specific timing diagrams

(a) Operation stop and restart

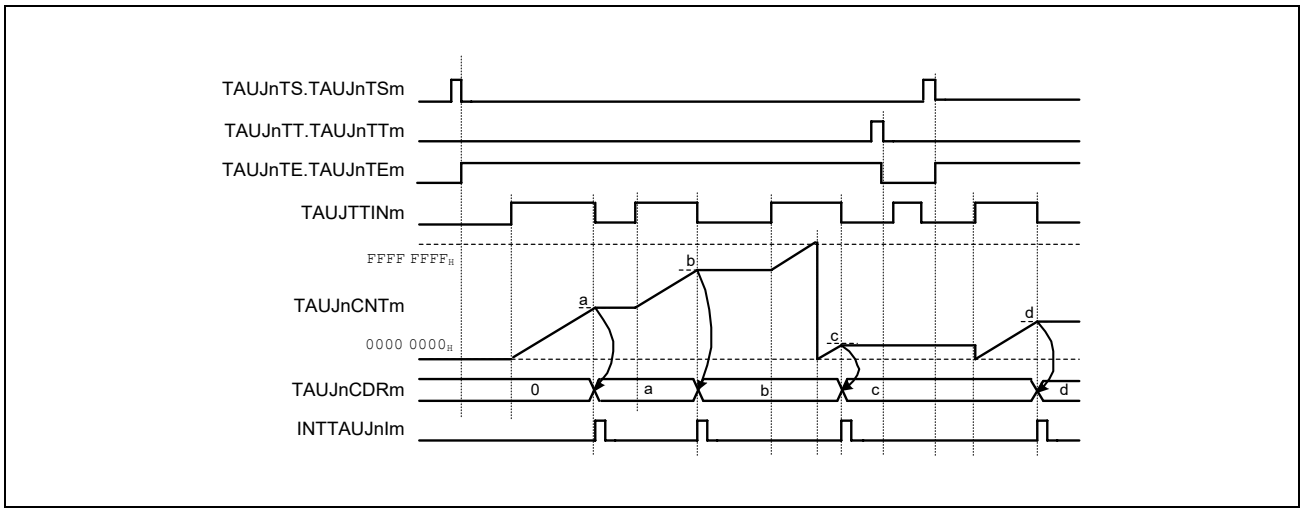

Figure 19.40 Operation Stop and Restart, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, effective TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS. TAUJnTSm to 1. TAUJnCNTm restarts to count from $0000\ 0000_H$.

19.4.10 Synchronous Channel Operation Functions

- **Section 19.4.10.1, PWM Output Function**

19.4.10.1 PWM Output Function

(1) Overview

Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty of the TAUJTTOUTm to be set. The pulse cycle is set in the master channel. The duty is set in the slave channel.

Prerequisites

- Two channels
- The operating mode for the master channel should be set to interval timer mode (see **Table 19.61, Contents of TAUJnCMORm Register of Master Channel for PWM Output Function**).
- The operating mode for the slave channels should be set to one-count mode (see **Table 19.64, Contents of TAUJnCMORm Register of Slave Channel for PWM Output Function**).
- TAUJTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channels should be set to synchronous channel output mode 1 (see **Section 19.4.4, Channel Output Modes**).

Description

The counters are enabled by setting the channel trigger bits (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is written to TAUJnCNTm and the counters start to count down from these values. INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set or reset to realize the PWM output.

- Master channel:
  When the counter of the master channel reaches 0000 0000_H, pulse cycle time has elapsed and INTTAUJnIm is generated. The TAUJnCDRm value is realized to TAUJnCNTm, and the counter counts down.
- Slave channel(s):
  The INTTAUJnIm of the master channel triggers the counter of the slave channel(s). The current value of TAUJnCDRm (slave) is written to TAUJnCNTm (slave) and the counter starts to count down from this value. The TAUJTTOUTm signal is set, to the active level.
  When the counter reaches 0000 0000_H, i.e. duty time has elapsed, INTTAUJnIm is generated and the TAUJTTOUTm signal is set to the inactive level. The counter returns to FFFF $FFFF_H$ and awaits the next INTTAUJnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1 for the master and slave channel(s), which in turn sets TAUJnTE.TAUJnTEm to 0. TAUJnCNTm and TAUJTTOUTm of master and slave channel(s) stop but retain their values. The counters can be restarted by setting TAUJnTS.TAUJnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. Please refer to **Section 19.4.3, Simultaneous Rewrite**.

(2) Equations

Pulse cycle = (TAUJnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUJnCDRm (slave) / (TAUJnCDRm (master) +1)) × 100

- Duty cycle = 0%
  TAUJnCDRm (slave) = $0000\ 0000_H$
- Duty cycle = 100%
  TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1

(3) Block diagram and general timing diagram

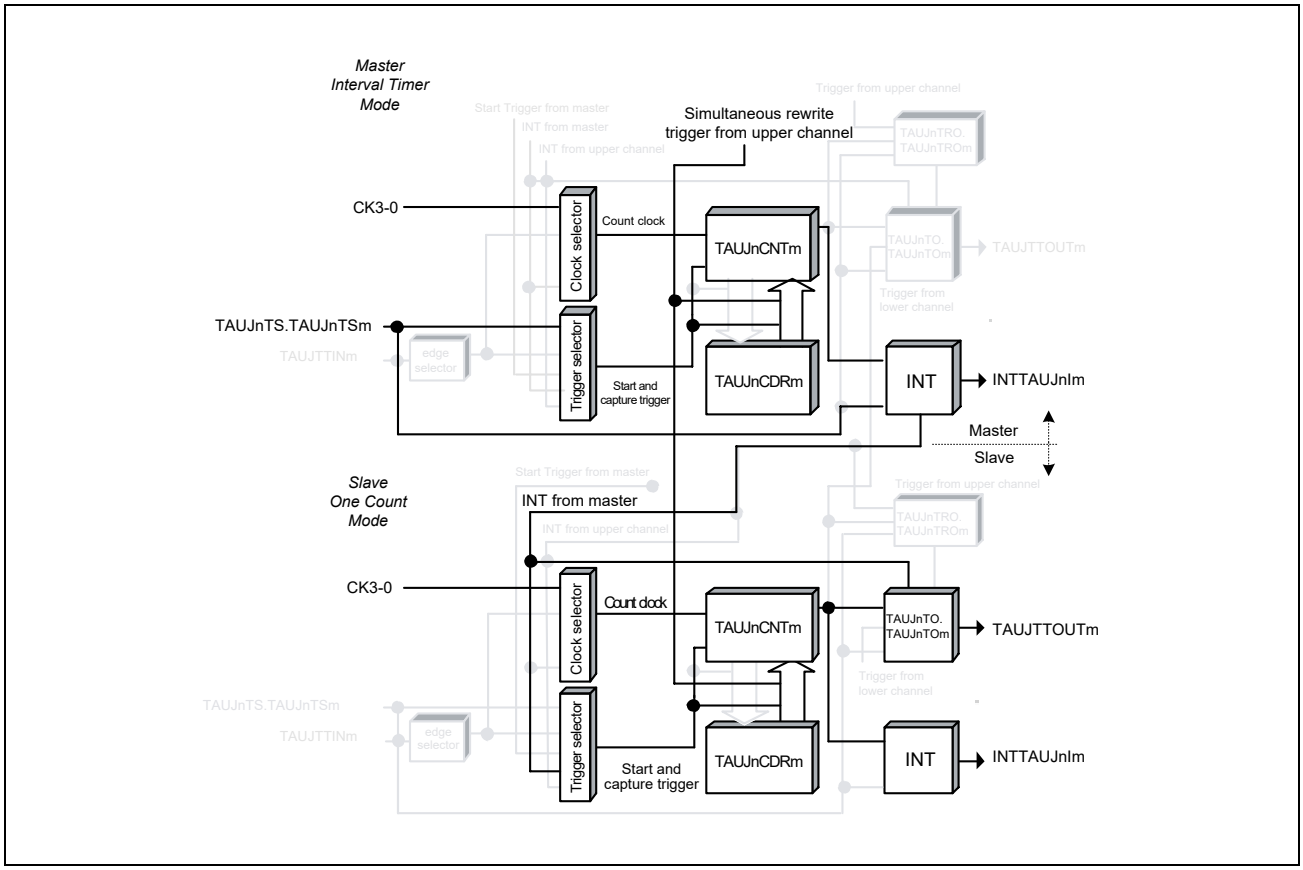

Figure 19.41 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram:

- Slave channel: Positive logic (TAUJnTOL.TAUJnTOLm = 0)

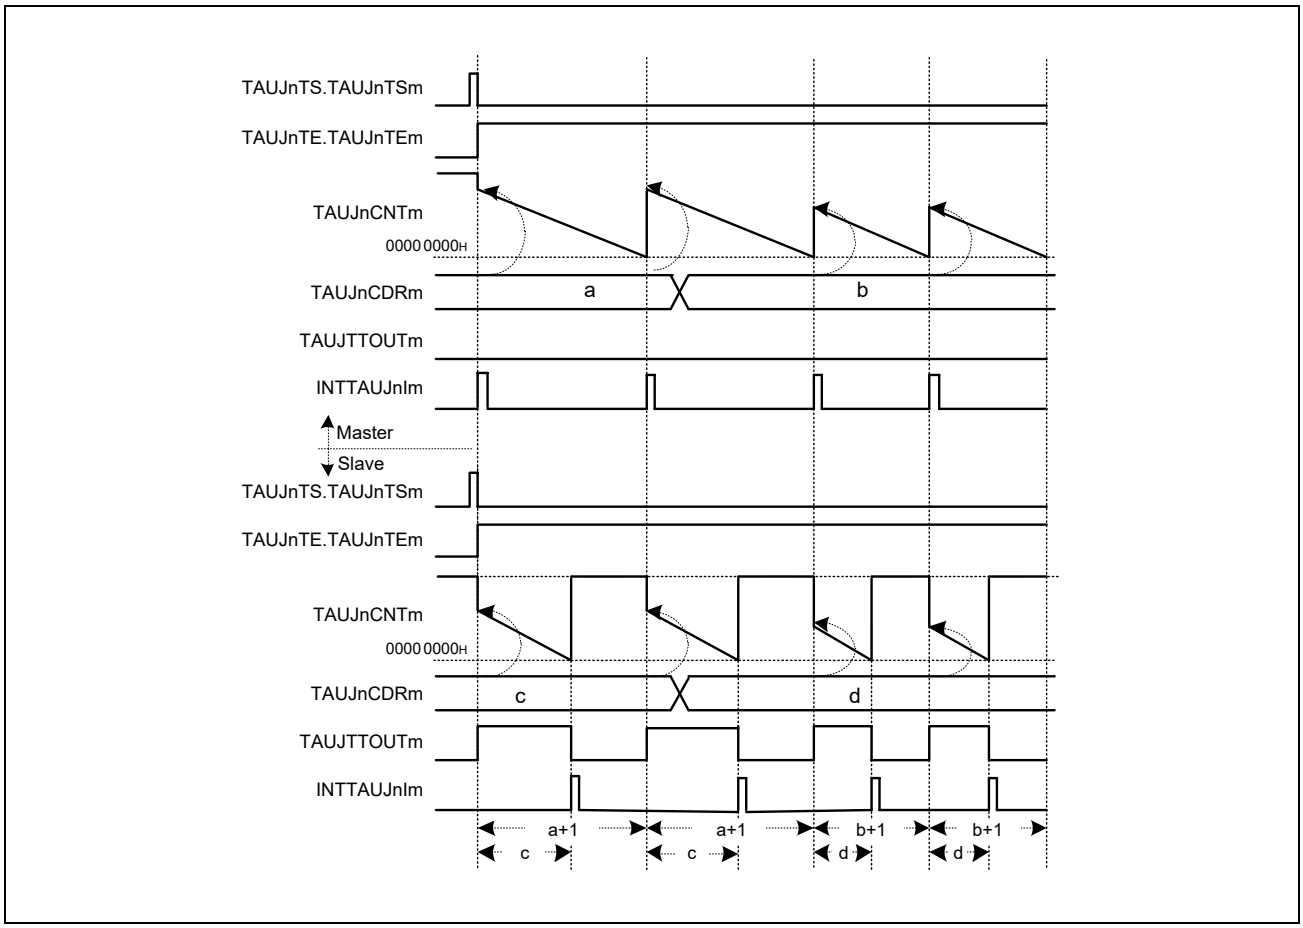

Figure 19.42 General Timing Diagram for PWM Output Function

NOTES

- The interval between the slave channel starting to count and an interrupt being generated is the value of corresponding TAUJnCDRm, whereas for the master channel the interval is the corresponding TAUJnCDRm + 1.
- TAUJTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUJnIm of the master channel.

(4) Register settings for the master channel

(a) TAUJnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnCKS [1:0]		TAUJnCCS [1:0]		TAUJn MAS	TAUJnSTS [2:0]			TAUJnCOS [1:0]		—	TAUJnMD [4:1]				TAUJn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUJnTIS [1:0]	00: Not used so set to 00

(c) Channel output mode for the master channel

The channel output mode is not used by this function.

(d) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 19.63 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	1: Enables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting

(5) Register settings for the slave channel(s)

(a) TAUJnCMORm for the slave channel(s)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnCKS [1:0]		TAUJnCCS [1:0]		TAUJn MAS	TAUJnSTS [2:0]			TAUJnCOS [1:0]		—	TAUJnMD [4:1]				TAUJn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 19.64 Contents of TAUJnCMORm Register of Slave Channel for PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUJnCKS[1:0]	These bits select the operation clock. 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUJnCKS[1:0] bit of the master and slave channel(s) must be identical.
13, 12	TAUJnCCS[1:0]	00: Uses the operation clock as a counter clock.
11	TAUJnMAS	0: Channel is slave channel
10 to 8	TAUJnSTS[2:0]	100: INTTAUJnIm of master channel is a start trigger.
7, 6	TAUJnCOS[1:0]	00: Not used, so set to 00
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 1	TAUJnMD[4:1]	0100: One-count mode
0	TAUJnMD0	1: INTTAUJnIm is generated at the start of operation.

(b) TAUJnCMURm for the slave channel(s)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 19.65 Contents of TAUJnCMURm Register of Slave Channel for PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Not used so set to 00

(c) Channel output mode for the slave channel(s)

Table 19.66 Control Bit Settings for Synchronous Channel Output Mode 1

Bit Name	Setting
TAUJnTOE.TAUJnTOEm	1: Enables independent channel output mode
TAUJnTO.TAUJnTOm	0: Low level 1: High level
TAUJnTOM.TAUJnTOMm	1: Synchronous channel operation
TAUJnTOC.TAUJnTOCm	0: Operating mode 1
TAUJnTOL.TAUJnTOLm	0: Positive logic 1: Negative logic

(d) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 19.67 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	1: Enables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting

(6) Operating procedure for PWM output function

Table 19.68 Operating Procedure for PWM Output Function

	Operation	Status of TAUJn
Initial channel setting	Master channel: set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in **Section (4) Register settings for the master channel**. Slave channel: set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in **Section (5) TAUJnCMURm for the slave channel(s)**. Set the values of the TAUJnCDRm registers of all channels	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm of the master and slave channels to 1 simultaneously. • TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set.
During operation	TAUJnCDRm can be changed at any time. TAUJnCNTm and TAUJnRSF.TAUJnRSFm can be read at any time. TAUJnRDT.TAUJnRDTm can be changed during operation.	TAUJnCNTm of the master channel loads TAUJnCDRm and counts down. When the counter reaches 0000 0000_H: • INTTAUJnIm (master) is generated • TAUJnCNTm (master) loads the TAUJnCDRm value and continues count operation • TAUJnCNTm (slave) loads the TAUJnCDRm value and counts down • TAUJTTOUTm (slave) is set to the active level. When TAUJnCNTm (slave) reaches 0000 0000_H: • INTTAUJnIm (slave) is generated • TAUJTTOUTm (slave) is set to the inactive level.
Stop operation	Set TAUJnTT.TAUJnTTm of the master and slave channels to 1 simultaneously. • TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. • TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart

(7) Specific timing diagrams

(a) Duty cycle = 0%

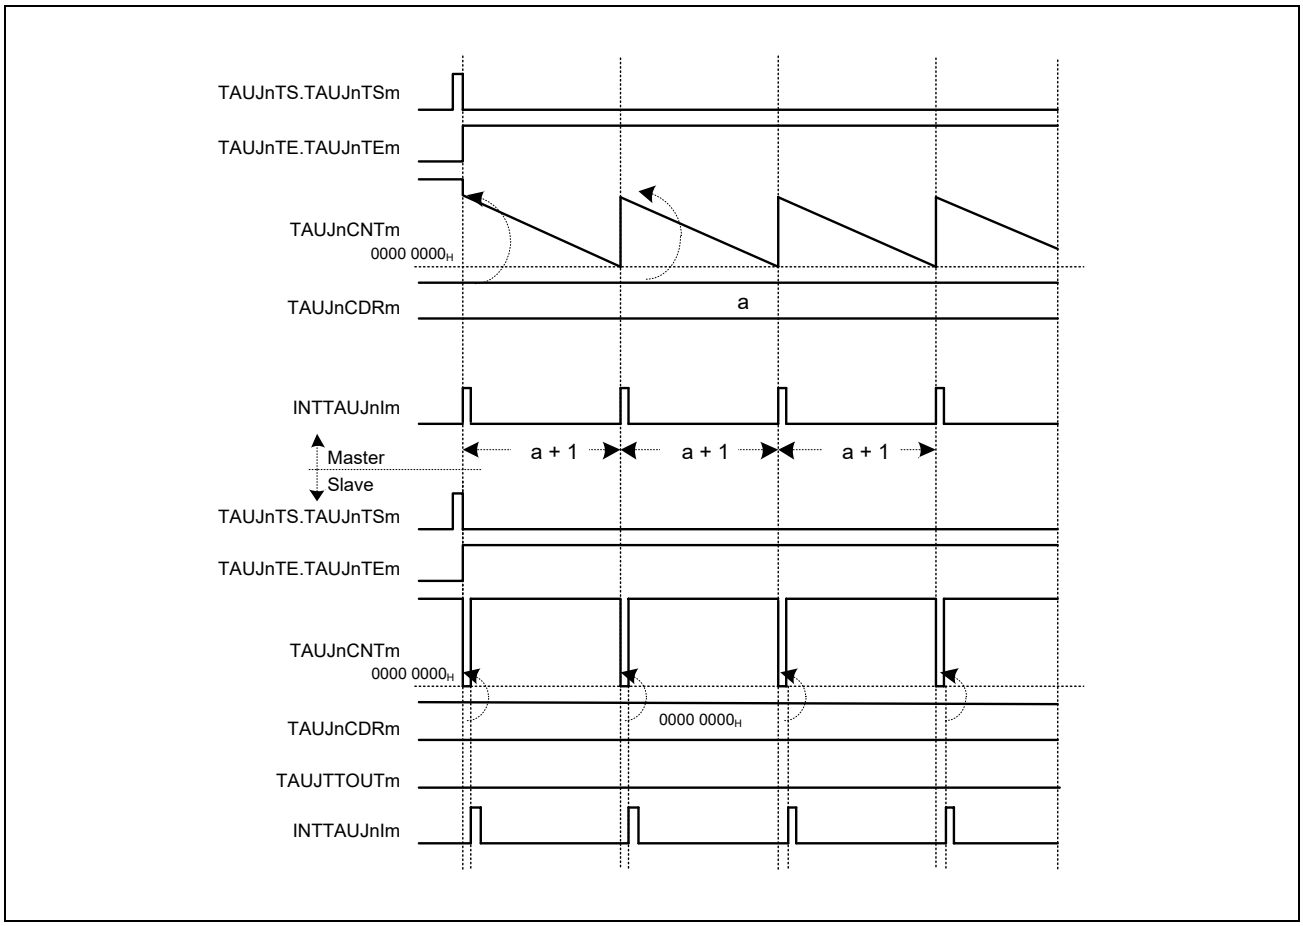

Figure 19.43 TAUJnCDRm (slave) = 0000 0000$_H$, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

- Every time the master channel generates an interrupt (INTTAUJnIm), 0000 0000$_H$ is written to TAUJnCNTm (slave). Therefore, TAUJnCNTm (slave) cannot start to count and TAUJTTOUTm remains at not active state.
- The value of TAUJnCDRm is loaded into TAUJnCNTm (slave) to generate an interrupt.

(b) Duty cycle = 100%

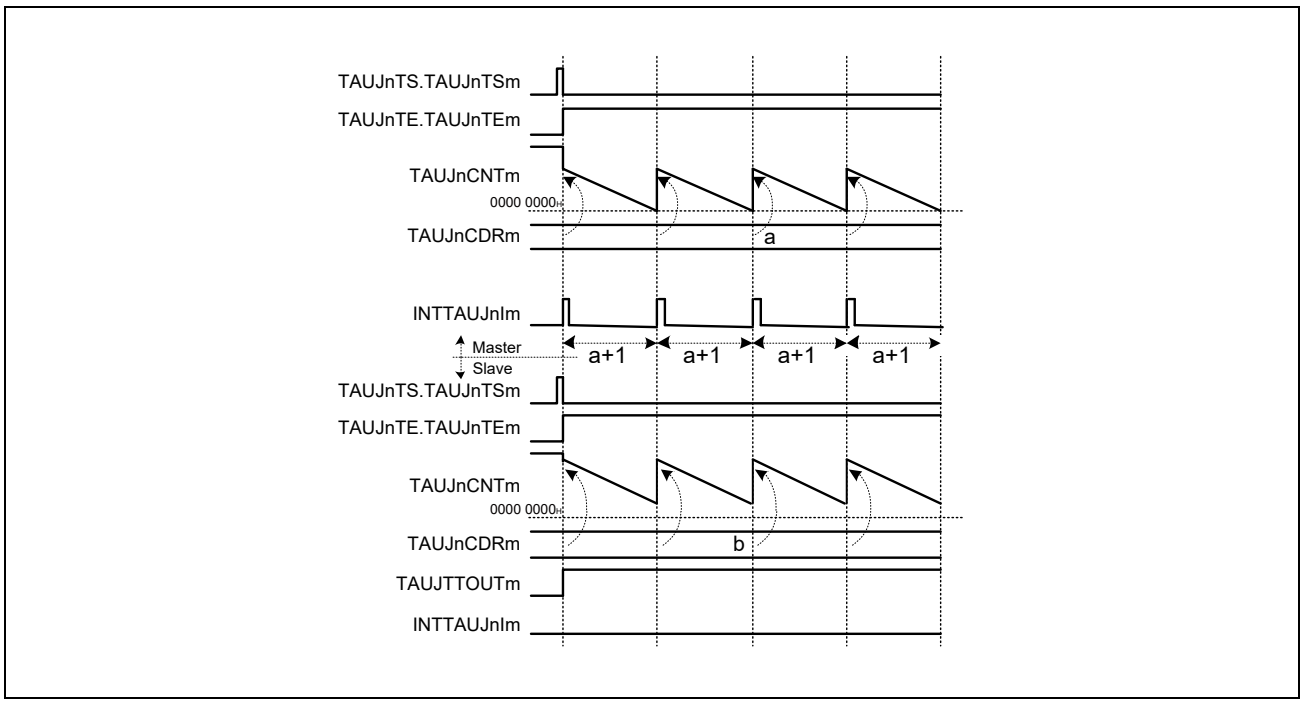

Figure 19.44 TAUJnCDRm (Slave) ≥ TAUJnCDRm (Master) + 1, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

If the TAUJnCDRm (slave) value is greater than the TAUJnCDRm (master) value, no interrupt occurs because the counter of the slave channel does not reach 0000 0000_H. TAUJTTOUTm remains active.

(c) Operation stop and restart

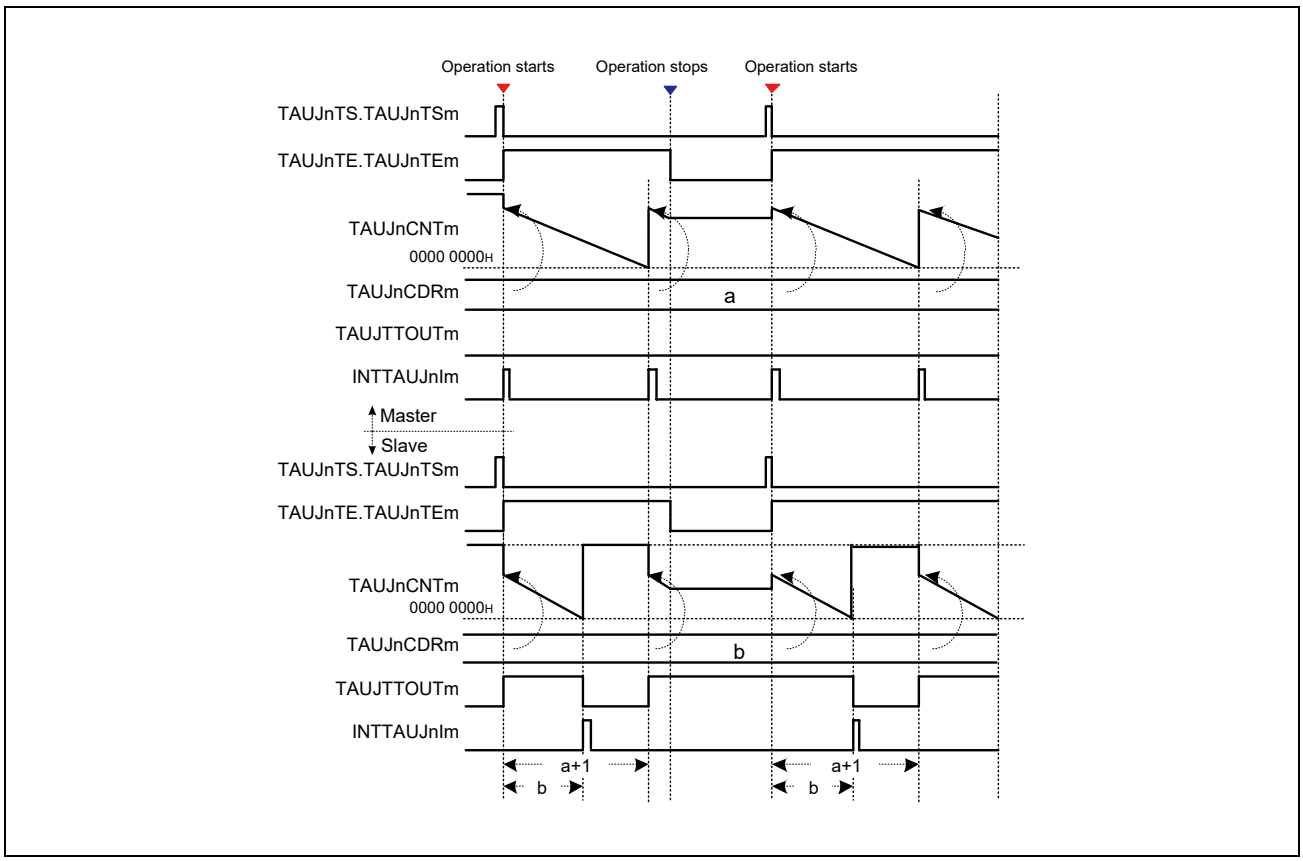

Figure 19.45 Stop and Restart Operation, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm of master and slave channels to 1. This sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTTOUTm of every channel stop and retain their current values. No interrupt occurs.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm of master and slave channels to 1. TAUJnCDRm value of master and slave channels is loaded into TAUJnCNTm. The counter starts to count down from this value.

Section 20 Motor Control Timer (TSG3)

This section contains a generic description of the motor control timer (TSG3).

The first part of the section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the TSG3.

20.1 Features of RH850/C1M-A TSG3

20.1.1 Number of Units

This LSI has the following number of units of TSG3.

Table 20.1 Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of Units	3	2
Name	TSG3n (n = 0 to 2)	TSG3n (n = 0, 1)

Note: TSG32 does not support the functions of synchronous operation with EMU3, linkage with ENCA, and external pattern input.

Table 20.2 Index

Index	Meaning
n	Throughout this section, the individual TSG3 units are identified by the index “n” (n = 0 to 2), for example, TSG3nCTL0 for the TSG3n control register 0.
m, k	Throughout this section, the variables used for description are indicated by the letter “m” or “k”, for example, TSG3nCMPmE is a non-specified compare register.

20.1.2 Register Base Address

TSG3 base addresses are listed in the following table.

TSG3 register addresses are given as offsets from the base addresses in general.

Table 20.3 Register Base Address

Base Address Name	Base Address
<TSG30_base>	FFE7 0000_H
<TSG31_base>	FF87 1000_H
<TSG32_base>	FFE7 2000_H*1

Note 1. Not supported for RH850/C1M-A1.

20.1.3 Clock Supply

Clock supply by and to TSG3 is listed in the following table.

Table 20.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
TSG3n	PCLK	CLKC_HSB (Non-modulated high-speed peripheral clock)

20.1.4 Interrupt Requests

TSG3 interrupt requests are listed in the following table.

Table 20.5 Interrupt Requests (1/2)

Unit Interrupt Signal	Outline	Interrupt Number	DMA Trigger Number*1		DTS Trigger Number*1	
			1st	2nd	1st	2nd
TSG30						
INTTSG30I0	TSG30 compare match interrupt 0	232	—	—	—	—

INTTSG32IPEK	TSG32 peak interrupt	239	97	—	97	—
INTTSG32IVLY	TSG32 trough interrupt	240	98	—	98	—
INTTSG32IER	TSG32 error interrupt	230	—	—	—	—
INTTSG32IWN	TSG32 warning interrupt	231	—	—	—	—

Note 1. 1st: Primary channel, 2nd: Secondary channel

Note 2. Not supported for RH850/C1M-A1.

"—": No number is assigned

20.1.5 Reset Sources

TSG3 reset sources are listed in the following table.

TSG3 is initialized by this reset source.

Table 20.6 Reset Source

Unit Name	Reset Source
TSG3n	All reset sources

20.1.6 External Input/Output Signals

External input/output signals of TSG3 are listed in the following table.

Table 20.7 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal Name
TSG30		
TSG30PTSI0-TSG30PTSI2	External pattern input	ENCA0E0, ENCA0E1, ENCA0EC*1
TSG30O0-TSG30O7	Timer output	TSG30O0-TSG30O7
TSG31		
TSG31PTSI0-TSG31PTSI2	External pattern input	ENCA1E0, ENCA1E1, ENCA1EC*1
TSG31O0-TSG31O7	Timer output	TSG31O0-TSG31O7
TSG32*2		
TSG32O0-TSG32O7	Timer output	TSG32O0-TSG32O7

Note 1. For the RH850/C1M-A products, external pattern input is shared with ENCAn input. For the detailed specification, see **Section 24.2.2.21, PIC1BTSGHALLSEL – Hall Sensor Input Select Register**.

Note 2. Not supported for RH850/C1M-A1.

20.2 Overview

20.2.1 Functional Overview

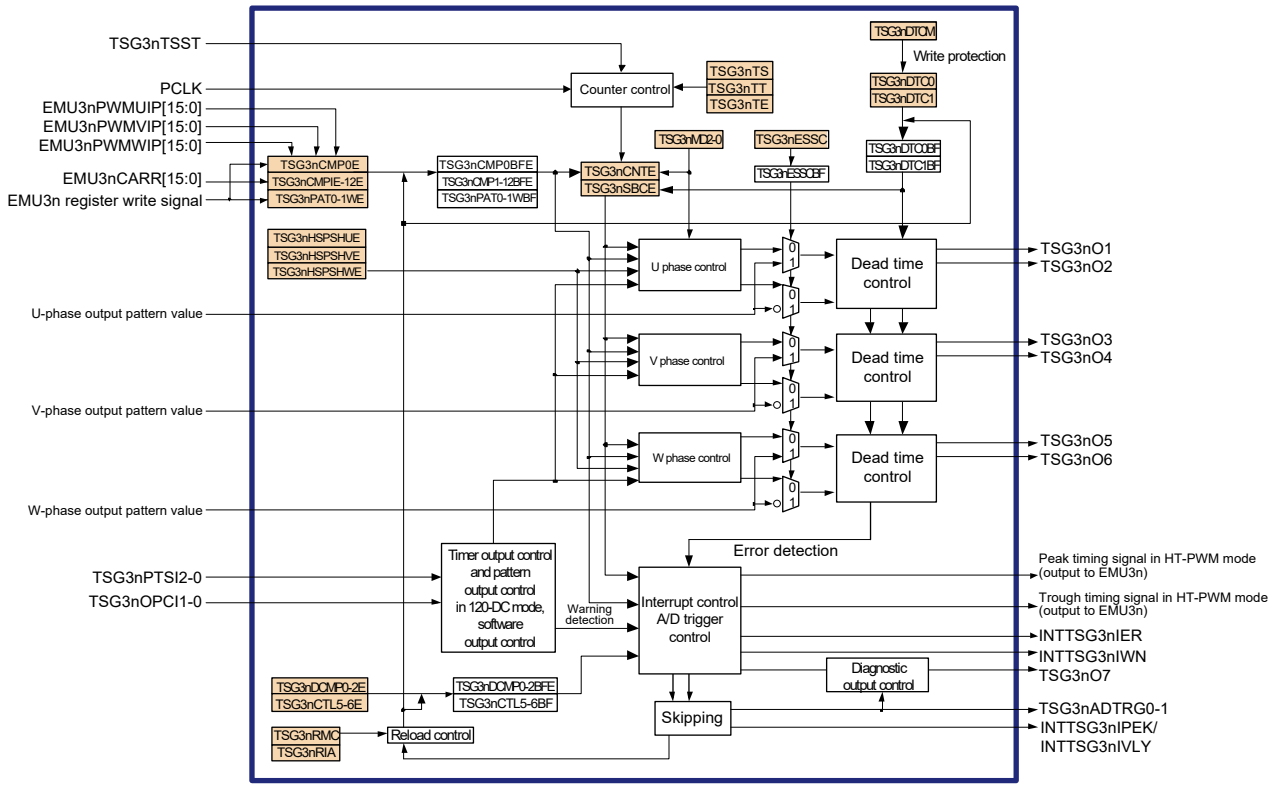
The TSG3n is an 18-bit timer counter with various motor control functions.

- Count clock resolution: Minimum 12.5 ns (count clock = 80 MHz)
- Operating mode corresponding to various motor control methods
- Compare registers with reload buffer
- 10-bit dead time counter
  - Dead time counter with reload buffer.
  - Independent dead time can be set for positive to inverse phase change and inverse to positive phase change.
- A/D conversion trigger signal generation
  - Three A/D conversion trigger signals can be generated by the compare registers TSG3nDCMP0E, TSG3nDCMP1E, and TSG3nDCMP2E.
  - Skipping function of A/D conversion trigger signals TSG3nADTRG0 and TSG3nADTRG1 can be set independently. The skipping ratio can be selected among 1/1, 1/2, 1/4, and 1/8.
  - The dedicated pin (TSG3nO7) can be used to output the toggle or diagnostic signal set by the TSG3nADTRG0 signal and reset by the TSG3nADTRG1 signal.
- Interrupt skipping
  - Skipping rate: 1/1 to 1/32
- Forced output stop function
  - Using the timer option (TAPA) function allows the high impedance control of the TSG3nO1 to TSG3nO6 pin outputs.
- Compare value setting
  - Reload (simultaneous rewrite) or anytime rewrite can be selected.
- Reload mode
  - Writing to TSG3nCMP1E enables reload (the reload request flag (TSG3nRSF) is set), and allows simultaneous transfer of the values of multiple registers.
  - Data can be transferred at peak/trough/peak or trough reload timing
  - Reload request flag (TSG3nRSF)
  - Register address assignment allowing DMA transfer

Reload skipping

- HT-PWM mode
  - 0 to 100% PWM duty cycle output is possible (with possible dead time reduction).
  - The LSB in the compare register can be used to append an additional pulse to the PWM output during count up, thus improving the output resolution without extra load on software.
- 120-DC control*[1]
  - Semi-automatic cruise function (trigger signal can be generated by an offset in conjunction with two-phase encoder, three-phase encoder, or ENCA).
- Three-phase encoder function (hall sensor signals can be input).*[1]
- Active level of the output pins TSG3nO1 to TSG3nO6 can be set individually.
- Fail-safe function (warning interrupt or error interrupt can be generated)
  - Simultaneous active output detect function for positive and inverse phases.
  - Abnormal input detection function of the three-phase encoder
- Direct transfer of carrier-cycle setting and PWM duty setting from EMU3.*[1]
- Output selectable between rectangular waveform output from EMU3 and PWM generate by TSG3.*[1]

Note 1. TSG32 does not support the functions of synchronous operation with EMU3, linkage with ENCA, and external pattern input.



NOTE

In this section, the active level is assumed to be high.

20.2.2 Block Diagram

The block diagram below shows the major components of TSG3 (EMU30, EMU31*1).

Note 1. RH850/C1M-A1 does not have EMU31.

Note: EMU3nPWMUIP[15:0]: EMU3n U-phase compare value register (input from EMU3n)
EMU3nPWMVIP[15:0]: EMU3n V-phase compare value register (input from EMU3n)
EMU3nPWMWIP[15:0]: EMU3n W-phase compare value register (input from EMU3n)
EMU3nCARR[15:0]: EMU3n carrier cycle register (input from EMU3n)
EMU3n register write signal: Write timing signal of the above register value (input from EMU3n)
U-phase output pattern value: Input from EMU3n rectangular waveform generator
V-phase output pattern value: Input from EMU3n rectangular waveform generator
W-phase output pattern value: Input from EMU3n rectangular waveform generator

20.3 Registers

20.3.1 List of Registers

TSG3n registers are listed in the following table.

For <TSG3n_base>, see **Section 20.1.2, Register Base Address.**

Table 20.8 List of Registers (1/3)

Module Name	Register Name	Symbol	Address	Reload
TSG3n	TSG3n control register 0	TSG3nCTL0	<TSG3n_base> + 208_H	Disabled
TSG3n	TSG3n control register 1	TSG3nCTL1	<TSG3n_base> + $20C_H$	Disabled
TSG3n	TSG3n control register 3	TSG3nCTL3	<TSG3n_base> + 004_H	Disabled
TSG3n	TSG3n control register 4	TSG3nCTL4	<TSG3n_base> + $07C_H$	Enabled
TSG3n	TSG3n control register 5	TSG3nCTL5	<TSG3n_base> + 008_H	Disabled
TSG3n	TSG3n control register 6	TSG3nCTL6	<TSG3n_base> + $00C_H$	Disabled
TSG3n	TSG3n control register 7	TSG3nCTL7	<TSG3n_base> + 218_H	Disabled
TSG3n	TSG3n control register 8	TSG3nCTL8	<TSG3n_base> + $21C_H$	Disabled
TSG3n	TSG3n I/O control register 0	TSG3nIOC0	<TSG3n_base> + 200_H	Disabled
TSG3n	TSG3n I/O control register 1	TSG3nIOC1	<TSG3n_base> + 204_H	Disabled
TSG3n	TSG3n I/O control register 2	TSG3nIOC2	<TSG3n_base> + 000_H	Disabled
TSG3n	TSG3n I/O control register 3	TSG3nIOC3	<TSG3n_base> + 074_H	Enabled

TSG3n	TSG3n HSP-PWM V phase compare register	TSG3nHSPCMVE	<TSG3n_base> + 130_H	Enabled
TSG3n	TSG3n HSP-PWM U phase compare register	TSG3nHSPCMUE	<TSG3n_base> + 134_H	Enabled
TSG3n	TSG3n dead timer protection register	TSG3nDTPR	<TSG3n_base> + 210_H	Disabled

20.3.2 TSG3nCTL0 — TSG3n Control Register 0

This register specifies the pulse width for the diagnostic output and operating mode of the TSG3n.

Access: This register can be read/written in 8-bit units.

Address: <TSG3n_base> + 208_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TSG3nDWD	—	TSG3nMD[2:0]		
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R/W	R/W	R/W

Table 20.9 TSG3nCTL0 Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4	TSG3nDWD	Selects the pulse width for the diagnostic output. 0: The output pulse width is set to 8 clocks. 1: The output pulse width is set to 16 clocks. The setting of this bit is valid when diagnostic output is enabled (TSG3nIOC1.TSG3nTGS = 1).
3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2 to 0	TSG3nMD[2:0]	Selects timer mode

TSG3n MD2	TSG3n MD1	TSG3n MD0	Timer Mode
0	0	0	PWM mode
0	0	1	HT-PWM mode(HT-PWM)
0	1	0	Shift pulse PWM mode(SP-PWM)
0	1	1	120-DC mode
1	0	0	High-accuracy shift pulse PWM mode (HSP-PWM)
Other than above			Setting prohibited

CAUTION

This register should be set when the timer is stopped (TSG3nSTR0.TSG3nTE = 0). Only the same value can be written during timer operation (TSG3nSTR0.TSG3nTE = 1). If the different value is written to this register when TSG3nSTR0.TSG3nTE = 1, timer operation cannot be guaranteed. If this register is erroneously rewritten, set this register again after stopping the timer

20.3.3 TSG3nCTL1 — TSG3n Control Register 1

This register controls the flags of TSG3n.

Access: This register can be read/written in 16-bit units.

Address: <TSG3n_base> + $20C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSG3nTBA2	TSG3nTBA1	TSG3nTBA0	TSG3nPPC	TSG3nPEC	TSG3nTDC	TSG3nNDC	TSG3nPRC	TSG3nPTC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 20.10 TSG3nCTL1 Register Contents (1/2)

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is read. When writing, write the value after reset.
9	TSG3nTBA2	Enables or disables detection of the simultaneous active states of the TSG3nO5 and TSG3nO6 pins. 0: Disables detection of simultaneous active states of the TSG3nO5 and TSG3nO6 pins. 1: Enables detection of simultaneous active states of the TSG3nO5 and TSG3nO6 pins. If the simultaneous active state is detected when the TSG3nIOC1.TSG3nEOC and TSG3nTBA2 bits are 1, the positive phase and inverse phase simultaneous active state detection flag 2 (TSG3nTBF2) is set to 1, and an error interrupt (INTTSG3nIER) is generated.
8	TSG3nTBA1	Enables or disables detection of the simultaneous active states of the TSG3nO3 and TSG3nO4 pins. 0: Disables detection of simultaneous active states of the TSG3nO3 and TSG3nO4 pins. 1: Enables detection of simultaneous active states of the TSG3nO3 and TSG3nO4 pins. If the simultaneous active state is detected when the TSG3nIOC1.TSG3nEOC and TSG3nTBA1bits are 1, the positive phase and inverse phase simultaneous active state detection flag 1 (TSG3nTBF1) is set to 1, and an error interrupt (INTTSG3nIER) is generated.
7	TSG3nTBA0	Enables or disables detection of the simultaneous active states of the TSG3nO1 and TSG3nO2 pins. 0: Disables detection of simultaneous active states of the TSG3nO1 and TSG3nO2 pins. 1: Enables detection of simultaneous active states of the TSG3nO1 and TSG3nO2 pins. If the simultaneous active state is detected when the TSG3nIOC1.TSG3nEOC and TSG3nTBA0 bits are 1, the positive phase and inverse phase simultaneous active state detection flag 0 (TSG3nTBF0) is set to 1, and an error interrupt (INTTSG3nIER) is generated.
6	TSG3nPPC	Enables or disables detection of the pattern phase difference (TSG3nSTR2.TSG3nPPF) between the TSG3nPTSI2-0 and TSG3nOPF2-0. 0: Disables detection of I/O pattern difference. 1: Enables detection of I/O pattern difference
5	TSG3nPEC	Enables or disables detection of the pattern error (TSG3nSTR2.TSG3nPEF) of the TSG3nPTSI2-0 pins. 0: Disables detection of the pattern error of the TSG3nPTSI2-0 pins. 1: Enables detection of the pattern error of the TSG3nPTSI2-0 pins.

<tr><td>1</td><td>1</td><td>Enables detection of an abnormal toggle of the TSG3nPTSI2-0 pins. When an abnormal toggle is detected, the pattern output switch trigger is automatically switched from trigger switch to pattern switch (TSG3nPOT is switched from 1 to 0.)</td></tr>
</table></td></tr>
</table>

CAUTIONS

1. If TSG3nDTC0 or TSG3nDTC1 is set to 0000_H (without dead time), the TSG3nTBA2-0 bits should be set to 0.
2. This register should be set when the timer is stopped (TSG3nSTR0.TSG3nTE = 0). Only the same value can be written during timer operation (TSG3nSTR0.TSG3nTE = 1). If the different value is written to this register when TSG3nSTR0.TSG3nTE = 1, timer operation cannot be guaranteed. If this register is erroneously rewritten, set this register again after stopping the timer

20.3.4 TSG3nCTL3 — TSG3n Control Register 3

This register selects the rewrite method of the compare registers.

Access: This register can be read/written in 8-bit units.

Address: <TSG3n_base> + 004_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSG3nRIA	TSG3nRMC
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 20.11 TSG3nCTL3 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	TSG3nRIA	Selects the reload timing of the compare register values. 0: The reload timing is set to peak reload timing (set by TSG3nCTL4.TSG3nPRE) and trough reload timing (set by TSG3nCTL4.TSG3nVRE). 1: The reload timing is set to peak interrupt timing and trough interrupt timing. The setting of this bit is valid in reload mode (TSG3nRMC = 0).
0	TSG3nRMC	Selects the transfer timing of the compare register values. 0: Reload mode (simultaneous rewrite) Writing to registers to be reloaded enables reloading and the register values are rewritten simultaneously at the next reload timing. Writing to any register other than registers to be reloaded does not enable reloading. For the register to be reloaded, see **Section 20.3.1, List of Registers.** 1: Anytime rewrite mode The compare registers are rewritten independently. Whenever a value is written to the compare register, the written value is reflected immediately. TSG3nRSF is cleared. Do not set TSG3nRMC to 1 when operated in 120-DC mode or in HSP-PWM mode.

20.3.5 TSG3nCTL4 — TSG3n Control Register 4

This register enables or disables generation of a peak interrupt and a trough interrupt, and the reload timing.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + $07C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 20.12 TSG3nCTL4 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8	TSG3nPRE	Enables or disables the peak reload timing. 0: Disables reload operation at the peak timing of the 18-bit counter. 1: Enables reload operation at the peak timing of the 18-bit counter. • The peak reload timing means the peak timing of the 18-bit counter in HT-PWM mode and the clear timing of the 18-bit counter by compare match in any mode other than HT-PWM mode. • When the reload operation at the peak timing of the 18-bit counter is disabled (TSG3nPRE = 0), reload is not executed in any mode other than HT-PWM mode.
7	TSG3nVRE	Enables or disables the trough reload timing. 0: Disables reload operation at the trough timing of the 18-bit counter. 1: Enables reload operation at the trough timing of the 18-bit counter. The setting of this bit is valid only in HT-PWM mode.
6	TSG3nPIE	Enables or disables generation of a peak interrupt (INTTSG3nIPEK). 0: Disables generation of a peak interrupt (INTTSG3nIPEK) at the peak timing of the 18-bit counter. Interrupts are not skipped. 1: Enables generation of a peak interrupt (INTTSG3nIPEK) at the peak timing of the 18-bit counter. Interrupts are skipped.
5	TSG3nVIE	Enables or disables generation of a trough interrupt (INTTSG3nIVLY). 0: Disables generation of a trough interrupt (INTTSG3nIVLY) at the trough timing of the 18-bit counter. Interrupts are not skipped. 1: Enables generation of a trough interrupt (INTTSG3nIVLY) at the trough timing of the 18-bit counter. Interrupts are skipped. The setting of this bit is valid only in HT-PWM mode.

Table 20.12 TSG3nCTL4 Register Contents (2/2)

Table 20.13 TSG3nCTL5 Register Contents (1/2)

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is read. When writing, write the value after reset.
11, 10	TSG3nACC[01:00]	Specifies the skipping rate of the A/D conversion trigger (TSG3nADTRG0). TSG3n ACC01 / TSG3n ACC00 / Skipping Rate 0 / 0 / Skipping disabled 0 / 1 / 1/2 1 / 0 / 1/4 1 / 1 / 1/8 When a write access is made (including a write of the same value to TSG3nACC01 and TSG3nACC00) to TSG3nCTL5 during timer operation (TSG3nSTR0.TSG3nTE = 1), the interrupt skipping counter is cleared.
9	TSG3nAT09	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the (peak) timing when the 18-bit sub-counter switches from incrementing to decrementing. 0: Disables generation of the A/D conversion trigger at the peak timing of the 18-bit sub-counter. 1: Enables generation of the A/D conversion trigger at the peak timing of the 18-bit sub-counter. • The TSG3nAT09 bit can be set to 1 only in HT-PWM mode. In other modes, the TSG3nAT09 bit should be set to 0. • Do not set the TSG3nAT09 bit to 1 when TSG3nDTC0W is not 0000_H and TSG3nDTC1W is 0000_H. A/D conversion trigger is not generated at the peak timing of the 18-bit sub-counter even if set so.
8	TSG3nAT08	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the (trough) timing when the 18-bit sub-counter switches from decrementing to incrementing. 0: Disables generation of the A/D conversion trigger at the trough timing of the 18-bit sub-counter. 1: Enables generation of the A/D conversion trigger at the trough timing of the 18-bit sub-counter. • The TSG3nAT08 bit can be set to 1 only in HT-PWM mode. In other modes, the TSG3nAT08 bit should be set to 0. • Do not set the TSG3nAT08 bit to 1 when TSG3nDTC0W is 0000_H and TSG3nDTC1W is not 0000_H. A/D conversion trigger is not generated at the trough timing of the 18-bit sub-counter even if set so.

Table 20.13 TSG3nCTL5 Register Contents (2/2)

Bit Position	Bit Name	Function
7	TSG3nAT07	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP2E value. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP2E value. 1: Enables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP2E value. This bit can be set to 1 only in HT-PWM mode. In other modes, this bit should be set to 0.
6	TSG3nAT06	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP2E value. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP2E value. 1: Enables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP2E value
5	TSG3nAT05	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP1E value. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP1E value. 1: Enables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP1E value. This bit can be set to 1 only in HT-PWM mode. In other modes, this bit should be set to 0.
4	TSG3nAT04	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP1Evalue. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP1E. 1: Enables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP1E value.
3	TSG3nAT03	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP0E value. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP0E value. 1: Enables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP0E value. This bit can be set to 1 only in HT-PWM mode. In other modes, this bit should be set to 0.
2	TSG3nAT02	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP0E value. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP0E value. 1: Enables generation of the A/D conversion trigger at the timing of the 18-bit counter value during incrementation with the TSG3nDCMP0E.
1	TSG3nAT01	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the timing (peak interrupt) when the 18-bit counter switches from incrementing to decrementing. 0: Disables generation of the A/D conversion trigger at the timing of a peak interrupt (INTTSG3nIPEK) after being skipped. 1: Enables generation of the A/D conversion trigger at the timing of a peak interrupt (INTTSG3nIPEK) after being skipped.
0	TSG3nAT00	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the timing (trough interrupt) when the 18-bit counter switches from decrementing to incrementing. 0: Disables generation of the A/D conversion trigger at the timing of a trough interrupt (INTTSG3nIVLY) after being skipped. 1: Enables generation of the A/D conversion trigger at the timing of a trough interrupt (INTTSG3nIVLY) after being skipped. This bit can be set to 1 only in HT-PWM mode. In other modes, this bit should be set to 0.

20.3.7 TSG3nCTL6 — TSG3n Control Register 6

This register controls the A/D conversion trigger output (TSG3nADTRG1).

Access: This register can be read/written in 16-bit units.

Address: <TSG3n_base> + $00C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 20.14 TSG3nCTL6 Register Contents (1/2)

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is read. When writing, write the value after reset.
11, 10	TSG3nACC [11:10]	Specifies the skipping rate of the A/D conversion trigger (TSG3nADTRG1). TSG3n ACC11 / TSG3n ACC10 / Skipping Rate 0 / 0 / Skipping disabled 0 / 1 / 1/2 1 / 0 / 1/4 1 / 1 / 1/8 When a write access is made (including a write of the same value to TSG3nACC11 and TSG3nACC10) to TSG3nCTL5 during timer operation (TSG3nSTR0.TSG3nTE = 1), the interrupt skipping counter is cleared.
9	TSG3nAT19	Specifies generation of A/D conversion trigger (TSG3nADTRG1) at the (peak) timing when the 18-bit sub-counter switches from incrementing to decrementing. 0: Disables generation of the A/D conversion trigger at the peak timing of the 18-bit sub-counter. 1: Enables generation of the A/D conversion trigger at the peak timing of the 18-bit sub-counter. • The TSG3nAT19 bit can be set to 1 only in HT-PWM mode. In other modes, the TSG3nAT19 bit should be set to 0. • Do not set the TSG3nAT19 bit to 1 when TSG3nDTC0W is not 0000_H and TSG3nDTC1W is 0000_H. A/D conversion trigger is not generated at the peak timing of the 18-bit sub-counter even if set so.
8	TSG3nAT18	Specifies generation of A/D conversion trigger (TSG3nADTRG0) at the (trough) timing when the 18-bit sub-counter switches from decrementing to incrementing. 0: Disables generation of the A/D conversion trigger at the trough timing of the 18-bit sub-counter. 1: Enables generation of the A/D conversion trigger at the trough timing of the 18-bit sub-counter. • The TSG3nAT18 bit can be set to 1 only in HT-PWM mode. In other modes, the TSG3nAT18 bit should be set to 0. • Do not set the TSG3nAT08 bit to 1 when TSG3nDTC0W is 0000_H and TSG3nDTC1W is not 0000_H. A/D conversion trigger is not generated at the trough timing of the 18-bit sub-counter even if set so.

Table 20.14 TSG3nCTL6 Register Contents (2/2)

Bit Position	Bit Name	Function
7	TSG3nAT17	Specifies generation of A/D conversion trigger (TSG3nADTRG1) at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP2E value. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP2E value. 1: Enables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP2E value. This bit can be set to 1 only in HT-PWM mode. In other modes, this bit should be set to 0.
6	TSG3nAT16	Specifies generation of A/D conversion trigger (TSG3nADTRG1) at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP2E value. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP2E value. 1: Enables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP2E value
5	TSG3nAT15	Specifies generation of A/D conversion trigger (TSG3nADTRG1) at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP1E value. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP1E value. 1: Enables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP1E value. This bit can be set to 1 only in HT-PWM mode. In other modes, this bit should be set to 0.
4	TSG3nAT14	Specifies generation of A/D conversion trigger (TSG3nADTRG1) at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP1Evalue.. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP1E. 1: Enables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP1E value.
3	TSG3nAT13	Specifies generation of A/D conversion trigger (TSG3nADTRG1) at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP0E value. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP0E value. 1: Enables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during decrementation with the TSG3nDCMP0E value. This bit can be set to 1 only in HT-PWM mode. In other modes, this bit should be set to 0.
2	TSG3nAT12	Specifies generation of A/D conversion trigger (TSG3nADTRG1) at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP0E value. 0: Disables generation of the A/D conversion trigger at the match timing of the 18-bit counter value during incrementation with the TSG3nDCMP0E value. 1: Enables generation of the A/D conversion trigger at the timing of the 18-bit counter value during incrementation with the TSG3nDCMP0E.
1	TSG3nAT11	Specifies generation of A/D conversion trigger (TSG3nADTRG1) at the timing (peak interrupt) when the 18-bit counter switches from incrementing to decrementing. 0: Disables generation of the A/D conversion trigger at the timing of a peak interrupt (INTTSG3nIPEK) after being skipped. 1: Enables generation of the A/D conversion trigger at the timing of a peak interrupt (INTTSG3nIPEK) after being skipped.
0	TSG3nAT10	Specifies generation of A/D conversion trigger (TSG3nADTRG1) at the timing (trough interrupt) when the 18-bit counter switches from decrementing to incrementing. 0: Disables generation of the A/D conversion trigger at the timing of a trough interrupt (INTTSG3nIVLY) after being skipped. 1: Enables generation of the A/D conversion trigger at the timing of a trough interrupt (INTTSG3nIVLY) after being skipped. This bit can be set to 1 only in HT-PWM mode. In other modes, this bit should be set to 0.

20.3.8 TSG3nCTL7 — TSG3n Control Register 7

This register sets the level of PWM output from the TSG3O1 to TSG3O6 pins at operation start (TSG3nTE is changed from 0 to 1) and at operation restart in SP-PWM mode.

This register can be written only when the SP-PWM mode is selected (TSG3nMD2-0 = 010) and when the operation is stopped (TSG3nTE = 0).

Do not rewrite this register when other modes are selected (PWM mode, HT-PWM mode, 120-DC mode, and HSP-PWM mode), or during operation (TSG3nTE = 1).

Access: This register can be read/written in 8-bit units.

Address: <TSG3n_base> + 218_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TSG3n SPSTL2	TSG3n SPSTL1	TSG3n SPSTL0
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 20.15 TSG3nCTL7 Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2	TSG3nSPSTL2	SP-PWM Mode Start Level Control Bit 2 0: TSG3nO5 (W phase) is cleared and TSG3nO6 (WB phase) is set at operation start (TSG3nTE changed from 0 to 1) or restart in SP-PWM mode. 1: TSG3nO5 (W phase) is set and TSG3nO6 (WB phase) is cleared at operation start (TSG3nTE changed from 0 to 1) or restart in SP-PWM mode.
1	TSG3nSPSTL1	SP-PWM Mode Start Level Control Bit 1 0: TSG3nO3 (V phase) is cleared and TSG3nO4 (VB phase) is set at operation start (TSG3nTE changed from 0 to 1) or restart in SP-PWM mode. 1: TSG3nO3 (V phase) is set and TSG3nO4 (VB phase) is cleared at operation start (TSG3nTE changed from 0 to 1) or restart in SP-PWM mode.
0	TSG3nSPSTL0	SP-PWM Mode Start Level Control Bit 0 0: TSG3nO1 (U phase) is cleared and TSG3nO2 (UB phase) is set at operation start (TSG3nTE changed from 0 to 1) or restart in SP-PWM mode. 1: TSG3nO1 (U phase) is set and TSG3nO2 (UB phase) is cleared at operation start (TSG3nTE changed from 0 to 1) or restart in SP-PWM mode.

NOTE

The settings of bits TSG3nSPSTL2 to TSG3nSPSTL0 affect output on the TSG3nO1 to TSG3nO6 pins when operation starts or is restarted. The set dead time is always inserted at these times.

20.3.9 TSG3nCTL8 — TSG3n Control Register 8

This register specifies timer output timing when input patterns are changed in 120-DC mode.

This register can be written only when 120-DC mode is selected (TSG3nMD2-0 = 011) and the timer is stopped (TSG3nTE = 0).

Do not rewrite this register in other modes (PWM mode, SP-PMW mode, HT-PWM mode, HSP-PWM mode) or while the timer is operating (TSG3nTE = 1).

Access: This register can be read/written in 8-bit units.

Address: <TSG3n_base> + $21C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TSG3n S120DCO
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 20.16 TSG3nCTL8 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	TSG3nS120DCO	120-DC Mode Control Bit 0 0: When the input patterns are changed while 120-DC mode is selected, the main counter (TSG3nCNTE) is cleared and the change of input patterns is immediately reflected to timer output. 1: When the input patterns are changed while 120-DC mode is selected, the change of input patterns is reflected to timer output after a match of the main counter (TSG3nCNTE) with TSG3nCMP0E (from the next timer period).

CAUTION

When TSG3nS120DCO is set to 1 in 120DC mode, set the TSG3nOPT0.TSG3nSOC and TSG3nOPT2.TSG3nESSC bits to 0.

The settings of the TSG3nOPT0.TSG3nSTE and TSG3nOPT0.TSG3nPOT bits must not be changed while the timer is operating (TSG3nSTR0.TSG3nTE = 1).

20.3.10 TSG3nIOC0 — TSG3n I/O Control Register 0

This register controls the timer output pins (TSG3nO1 to TSG3nO6).

Access: This register can be read/written in 8-bit units.

Address: <TSG3n_base> + 200_H

Value after reset: $7E_H$

Bit	7	6	5	4	3	2	1	0

R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 20.17 TSG3nIOC0 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 1	TSG3nTOE6-TSG3nTOE1	Enables or disables TSG3nIOC2 controlling TSG3nO6 to TSG3nO1.(Rewriting by TSG3nIOC2 is ignored when these bits are 1.) 0: Disabled 1: Enabled
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

CAUTION

This register should be set when the timer is stopped (TSG3nSTR0.TSG3nTE = 0). Only the same value can be written during timer operation (TSG3nSTR0.TSG3nTE = 1). If the different value is written to this register when TSG3nSTR0.TSG3nTE = 1, timer operation cannot be guaranteed. If this register is erroneously rewritten, set this register again after stopping the timer.

20.3.11 TSG3nIOC1 — TSG3n I/O Control Register 1

This register controls the timer output pins (TSG3nO1 to TSG3nO6).

Access: This register can be read/written in 8-bit units.

Address: <TSG3n_base> + 204_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TSG3nPTS	TSG3nEOC	TSG3nWOC	TSG3nTGS	TSG3nTOS
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 20.18 TSG3nIOC1 Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4	TSG3nPTS	Enables or disables output of the edge detection signal (TSG3nPTE) of TSG3nPTSI0 to TSG3nPTSI2 and two-phase encoder count signal (TSG3nPEC). 0: Disables output of the toggle signal by edge detection of TSG3nPTSI0 to TSG3nPTSI2. 1: Enables output of the toggle signal by edge detection of TSG3nPTSI0 to TSG3nPTSI2.
3	TSG3nEOC	Enables or disables detection of the error condition at the motor control. 0: Disables generation of an error interrupt (INTTSG3nIER). 1: Enables generation of an error interrupt (INTTSG3nIER). For details on controlling the error interrupt, see **Section 20.4.6.1, Error Interrupt Function**.
2	TSG3nWOC	Enables or disables detection of the warning condition at the motor control. 0: Disables generation of a warning interrupt (INTTSG3nIWN). 1: Enables generation of a warning interrupt (INTTSG3nIWN). For details on the controlling generation of warning interrupt, see **Section 20.4.6.2, Warning Interrupt Function**.
1	TSG3nTGS	Selects the A/D conversion trigger diagnostic output (TSG3nO7) signal. 0: Selects A/D conversion trigger output. 1: Selects diagnostic output.
0	TSG3nTOS	Selects the timer counter increment/decrement status output (TSG3nO0) signal. 0: Outputs the up/down count flag of the 18-bit counter. 1: Outputs the up/down count flag of the 18-bit sub-counter. When TSG3nTOS is 0, the status of TSG3nSTR0.TSG3nCUF is output to TSG3nO0. When TSG3nTOS is 1, the status of TSG3nSTR0.TSG3nSUF is output to TSG3nO0. The setting of this bit is valid only in HT-PWM mode.

CAUTION

This register should be set when the timer is stopped (TSG3nSTR0.TSG3nTE = 0). Only the same value can be written during timer operation (TSG3nSTR0.TSG3nTE = 1). If the different value is written to this register when TSG3nSTR0.TSG3nTE = 1, timer operation cannot be guaranteed. If this register is erroneously rewritten, set this register again after stopping the timer.

20.3.12 TSG3nIOC2 — TSG3n I/O Control Register 2

This register controls the timer output pins (TSG3nO1 to TSG3nO6).

Access: This register can be read/written in 16-bit units.

Address: <TSG3n_base> + 000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	TSG3nOL6	TSG3nOL5	TSG3nOL4	TSG3nOL3	TSG3nOL2	TSG3nOL1	—	—	TSG3nTO6	TSG3nTO5	TSG3nTO4	TSG3nTO3	TSG3nTO2	TSG3nTO1	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 20.19 TSG3nIOC2 Register Contents

Bit Position	Bit Name	Function
15	Reserved	When read, the value after reset is read. When writing, write the value after reset.
14 to 9	TSG3nOL6 to TSG3nOL1	Specifies the active level of TSG3nO6 to TSG3nO1 outputs. 0: Active level is high level 1: Active level is low level
8 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 1	TSG3nTO6 to TSG3nTO1	Specifies the latch level of the output buffer of the TSG3nO6 to TSG3nO1. 0: Latch level of output buffer is low level 1: Latch level of output buffer is high level
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

CAUTION

When counting is stopped (TSG3nSTR0.TSG3nTE = 0), the TSG3nO1-6 pins maintain their previous output states. The output level should be changed by setting the TSG3nIOC0.TSG3nTOEm bit to 0, using the TSG3nTOm bit. This register can be rewritten when TSG3nIOC0.TSG3nTOEm = 0 (m = 1 to 6).

NOTE

While the timer is stopped (TSG3nSTR0.TSG3nTE = 0) and control of TSG3nOm by rewriting TSG3nIOC2 is enabled (TSG3nIOC0.TSG3nTOEm = 0), any level of the following can be output on TSG3nOm by the combination of the values of TSG3nOLm and TSG3nTOm of TSG3nIOC2.

TSG3nOLm	TSG3nTOm	Output level of TSG3nOm
0	0	Low level
0	1	High level
1	0	High level
1	1	Low level

20.3.13 TSG3nIOC3 — TSG3n I/O Control Register3

This register controls timer output pins (TSG3nO1 to TSG3nO6).

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 074_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	TSG3n TOL6	TSG3n TOL5	TSG3n TOL4	TSG3n TOL3	TSG3n TOL2	TSG3n TOL1	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 20.20 TSG3nIOC3 Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 1	TSG3nTOL6 to TSG3nTOL1	Controls the set/clear level of output. 0: Outputs the normal level. 1: Outputs the reversed level. Setting of this bit is reflected at the start of output. The change of the output level is reflected at the next compare match timing after the change.
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

CAUTION

TSG3nTOL6 to 1 should be set to 0 in HT-PWM mode and HSP-PWM mode.

20.3.14 TSG3nSTR0 — TSG3n Status Register 0

This register consists of various status flags.

Access: This register can be read only in 8-bit units.

Address: <TSG3n_base> + 010_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TSG3nCUF	TSG3nSUF	TSG3nRSF	TSG3nTE
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 20.21 TSG3nSTR0 Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read.
3	TSG3nCUF	Indicates the count direction of the 18-bit counter. 0: The 18-bit counter is incremented. 1: The 18-bit counter is decremented. TSG3nCUF is valid only in HT-PWM mode. In other modes, it is invalid (TSG3nCUF = 0).
2	TSG3nSUF	Indicates the count direction of the 18-bit sub-counter. 0: The 18-bit sub-counter is incremented. 1: The 18-bit sub-counter is decremented. • TSG3nSUF detects counting of the 18-bit sub-counter from 0000_H to (TSG3nCMP0E value - 0002_H) as up-counting, and counting from the TSG3nCMP0E value to 0002_H as down-counting. • This bit is valid only in HT-PWM mode.
1	TSG3nRSF	Indicates whether there is a reload request. 0: No reload request or reload has completed. 1: There is a reload request. • This bit is valid only in TSG3nRMC = 0. • This bit indicates that the data to be transferred next is held. • This bit is set to 1 by writing to registers to be reloaded, and cleared to 0 when reload has completed. • When TSG3nRMC is changed from 0 to 1 in HT-PWM mode, TSG3nRSF is cleared to 0. For registers to be reloaded, see **Section 20.3.1, List of Registers.**
0	TSG3nTE	Indicates the TSG3n operation status. 0: TSG3n is stopped. 1: TSG3n is operating. This bit is set when TSG3nTRG0.TSG3nTS = 1, and cleared when TSG3nTRG1.TSG3nTT = 1.

20.3.15 TSG3nSTR1 — TSG3n Status Register 1

This register consists of various status flags.

Access: This register can be read only in 8-bit units.

Address: <TSG3n_base> + 014_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TSG3nTSF	TSG3nOPF[2:0]		
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 20.22 TSG3nSTR1 Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read.
3	TSG3nTSF	Indicates the pattern change order of TSG3nPTSI0 to TSG3nPTSI2. 0: Indicates that patterns are input to TSG3nPTSI0 to TSG3nPTSI2 in the normal rotation pattern order 1: Indicates that patterns are input to TSG3nPTSI0 to TSG3nPTSI2 in the reverse rotation pattern order. Normal Rotation → Reverse Rotation ← TSG3nPTSI2-TSG3nPTSI0: [1,0,1] [1,0,0] [1,1,0] [0,1,0] [0,1,1] [0,0,1] Normal or reverse rotation can be detected from the first change of TSG3nPTSI0 to TSG3nPTSI2 after TSG3nTRG0.TSG3nTS has been set to 1. For details, see **Section 20.4.3.5(b), Detection of Input Pattern Order**.
2 to 0	TSG3nOPF[2:0]	Indicates the output pattern of the timer output pins (TSG3nO1 to TSG3nO6).

20.3.16 TSG3nSTR2 — TSG3n Status Register 2

This register consists of various status flags.

Access: This register can be read only in 16-bit units.

Address: <TSG3n_base> + 018_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSG3nTBF2	TSG3nTBF1	TSG3nTBF0	TSG3nPPF	TSG3nPEF	TSG3nTDF	TSG3nNDF	TSG3nPRF	TSG3nPTF	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 20.23 TSG3nSTR2 Register Contents (1/3)

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is read.
9	TSG3nTBF2	Indicates whether the simultaneous active state of the positive phase and inverse phase is detected when TSG3nCTL1.TSG3nTBA2 is 1. 0: Positive phase (TSG3nO5) and inverse phase (TSG3nO6) are not active simultaneously. 1: Positive phase (TSG3nO5) and inverse phase (TSG3nO6) are active simultaneously. • TSG3nTBF2 is set to 1 when the simultaneous active state of the positive phase (TSG3nO5) and inverse phase (TSG3nO6) is detected, and an error interrupt (INTTSG3nIER) is generated. TSG3nTBF2 can be cleared by changing TSG3nSTR0.TSG3nTE from 0 to 1 (operation start) or by writing 1 to TSG3nSTC.TSG3nTBR2. • The simultaneous active state is not detected when TSG3nTBA2 = 0.
8	TSG3nTBF1	Indicates whether the simultaneous active state of the positive phase and inverse phase is detected when TSG3nCTL1.TSG3nTBA1 is 1. 0: Positive phase (TSG3nO3) and inverse phase (TSG3nO4) are not active simultaneously. 1: Positive phase (TSG3nO3) and inverse phase (TSG3nO4) are active simultaneously. • TSG3nTBF1 is set to 1 when the simultaneous active state of the positive phase (TSG3nO3) and inverse phase (TSG3nO4) is detected, and an error interrupt (INTTSG3nIER) is generated. TSG3nTBF1 can be cleared by changing TSG3nSTR0.TSG3nTE from 0 to 1 (operation start) or by writing 1 to TSG3nSTC.TSG3nTBR1. • The simultaneous active state is not detected when TSG3nTBA1 = 0.
7	TSG3nTBF0	Indicates whether the simultaneous active state of the positive phase and inverse phase is detected when TSG3nCTL1.TSG3nTBA0 is 1. 0: Positive phase (TSG3nO1) and inverse phase (TSG3nO2) are not active simultaneously. 1: Positive phase (TSG3nO1) and inverse phase (TSG3nO2) are active simultaneously. • TSG3nTBF0 is set to 1 when the simultaneous active state of the positive phase (TSG3nO1) and inverse phase (TSG3nO2) is detected, and an error interrupt (INTTSG3nIER) is generated. TSG3nTBF0 can be cleared by changing TSG3nSTR0.TSG3nTE from 0 to 1 (operation start) or by writing 1 to TSG3nSTC.TSG3nTBR0. • The simultaneous active state is not detected when TSG3nTBA0 = 0.

Table 20.23 TSG3nSTR2 Register Contents (2/3)

Bit Position	Bit Name	Function
6	TSG3nPPF	Indicates detection of the difference between the input patterns (TSG3nPTSI0 to TSG3nPTSI2) and the output patterns (TSG3nO1 to TSG3nO6) after they are compared. 0: No phase difference detected between the input patterns (TSG3nPTSI0 to TSG3nPTSI2) and the output patterns (TSG3nO1 to TSG3nO6). 1: A phase difference detected between the input patterns (TSG3nPTSI0 to TSG3nPTSI2) and the output patterns (TSG3nO1 to TSG3nO6). • TSG3nPPF is set to 1 when a difference between input and output patterns is detected, and a warning interrupt (INTTSG3nIWN) is generated. This bit can be cleared either by changing TSG3nSTR0.TSG3nTE from 0 to 1 (starting operation), setting TSG3nTRG0.TSG3nTS to 1 (starting the timer), input to TSG3nTSST (restarting the timer), or writing 1 to TSG3nSTC.TSG3nPPR.
5	TSG3nPEF	Indicates whether an abnormal input (000_B or 111_B is input to TSG3nPTSI0 to TSG3nPTSI2) is detected. 0: No abnormal input (000_B or 111_B) to TSG3nPTSI0 to TSG3nPTSI2 detected. 1: Abnormal input (000_B or 111_B) to TSG3nPTSI0 to TSG3nPTSI2 detected. TSG3nPEF is set to 1 when an input of 000_B or 111_B to TSG3nPTSI0 to TSG3nPTSI2 is detected, and a warning interrupt (INTTSG3nIWN) is generated. TSG3nPEF can be cleared by changing TSG3nSTR0.TSG3nTE from 0 to 1 (starting operation), by setting TSG3nTRG0.TSG3nTS to 1 (starting timer operation), by input to TSG3nTSST (restarting the timer), or by writing 1 to TSG3nSTC.TSG3nPER. TSG3nPEF is valid when TSG3nCTL1.TSG3nPEC = 1.
4	TSG3nTDF	Indicates whether simultaneous generation of the TSG3nOPCI0 and TSG3nOPCI1 triggers is detected. 0: Simultaneous generation of the TSG3nOPCI0 and TSG3nOPCI1 triggers not detected. 1: Simultaneous generation of the TSG3nOPCI0 and TSG3nOPCI1 triggers detected. TSG3nTDF is set to 1 when simultaneous generation of the TSG3nOPCI0 and TSG3nOPCI1 triggers is detected, and a warning interrupt (INTTSG3nIWN) is generated. TSG3nTDF can be cleared by changing TSG3nSTR0.TSG3nTE from 0 to 1 (starting operation), by setting TSG3nTRG0.TSG3nTS to 1 (starting timer operation), by input to TSG3nTSST (restarting the timer), or by writing 1 to TSG3nSTC.TSG3nTDR. TSG3nTDF is valid when TSG3nCTL1.TSG3nTDC = 1.
3	TSG3nNDF	Indicates whether noise on TSG3nPTSI0 to TSG3nPTSI2 is detected. 0: Noise on TSG3nPTSI0 to TSG3nPTSI2 due to simultaneous change of two or more pins not detected. 1: Noise on TSG3nPTSI0 to TSG3nPTSI2 due to simultaneous change of two or more pins detected. TSG3nNDF is set to 1 when simultaneous change of two or more pins in TSG3nPTSI0 to TSG3nPTSI2 is detected, and a warning interrupt (INTTSG3nIWN) is generated. TSG3nNDF can be cleared by changing TSG3nSTR0.TSG3nTE from 0 to 1 (starting operation), by setting TSG3nTRG0.TSG3nTS to 1(starting timer operation), by input to TSG3nTSST (restarting the timer), or by writing 1 to TSG3nSTC.TSG3nNDR. TSG3nNDF is valid when TSG3nCTL1.TSG3nNDC = 1.

Table 20.23 TSG3nSTR2 Register Contents (3/3)

Bit Position	Bit Name	Function
2	TSG3nPRF	Indicates whether reversal of the TSG3nPTSI0 to TSG3nPTSI2 input order is detected. 0: The reversal of the TSG3nPTSI0 TSG3nPTSI2 input order not detected. 1: The reversal of the TSG3nPTSI0 to TSG3nPTSI2 input order detected. TSG3nPRF is set to 1 when TSG3nSTR1.TSG3nTSF changes, and a warning interrupt (INTTSG3nIWN) is generated. TSG3nPRF can be cleared by changing TSG3nSTR0.TSG3nTE from 0 to 1 (operation start), by setting TSG3nTRG0.TSG3nTS to 1 (timer operation start), by input to TSG3nTSST(timer restart), or by writing 1 to TSG3nSTC.TSG3nPRR. Detection is possible from the second TSG3nPTSI0 to TSG3nPTSI2 change timing after setting TSG3nTRG0.TSG3nTS = 1. TSG3nPRF is valid when TSG3nCTL1.TSG3nPRC = 1.
1	TSG3nPTF	Indicates whether an abnormal toggle of TSG3nPTSI0 to TSG3nPTSI2 is detected. 0: No abnormal toggle of TSG3nPTSI0 to TSG3nPTSI2 detected. 1: An abnormal toggle of TSG3nPTSI0 to TSG3nPTSI2 detected. TSG3nPTF is set to 1 when TSG3nPTSI0 to TSG3nPTSI2 (TSG3nPTE signal toggle) are changed three times or more during TSG3nOPCI0 trigger or TSG3nPTSI0 to TSG3nPTSI2 (TSG3nPTE signal toggle) are changed three times or more during TSG3nOPCI1 trigger, and a warning interrupt (INTTSG3nIWN) is generated. TSG3nPTF can be cleared by changing TSG3nSTR0.TSG3nTE from 0 to 1 (starting operation), by setting TSG3nTRG0.TSG3nTS to 1 (starting timer operation), by input to TSG3nTSST (restarting the timer), or by writing 1 to TSG3nSTC.TSG3nPTR. TSG3nPTF is valid when TSG3nCTL1.TSG3nPTC[1:0] = 10_B or 11_B.
0	Reserved	When read, the value after reset is read.

20.3.17 TSG3nSTC — TSG3n Status Clear Trigger Register

This register controls the flags.

Access: This register can be written only in 16-bit units.

Address: <TSG3n_base> + $01C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSG3nTBR2	TSG3nTBR1	TSG3nTBR0	TSG3nPPR	TSG3nPER	TSG3nTDR	TSG3nNDR	TSG3nPRR	TSG3nPTR	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W	W	W	W	W	W	W	W	R

Table 20.24 TSG3nSTC Register Contents (1/2)

Bit Position	Bit Name	Function
15 to 10	Reserved	When writing, write the value after reset.
9	TSG3nTBR2	This is a trigger bit that clears TSG3nSTR2.TSG3nTBF2. 0: Does not clear TSG3nTBF2. 1: Clears TSG3nTBF2. When TSG3nTBR2 writing and TSG3nSTR2.TSG3nTBF2 setting occur simultaneously, TSG3nSTR2.TSG3nTBF2 setting has a priority, and the flag is not cleared.
8	TSG3nTBR1	This is a trigger bit that clears TSG3nSTR2.TSG3nTBF1. 0: Does not clear TSG3nTBF1. 1: Clears TSG3nTBF1. When TSG3nTBR1 writing and TSG3nSTR2.TSG3nTBF1 setting occur simultaneously, TSG3nSTR2.TSG3nTBF1 setting has a priority, and the flag is not cleared.
7	TSG3nTBR0	This is a trigger bit that clears TSG3nSTR2.TSG3nTBF0. 0: Does not clear TSG3nTBF0. 1: Clears TSG3nTBF0. When TSG3nTBR0 writing and TSG3nSTR2.TSG3nTBF0 setting occur simultaneously, TSG3nSTR2.TSG3nTBF0 setting has a priority, and the flag is not cleared.
6	TSG3nPPR	This is a trigger bit that clears TSG3nSTR2.TSG3nPPF. 0: Does not clear TSG3nPPF. 1: Clears TSG3nPPF. When TSG3nPPR writing and TSG3nSTR2.TSG3nPPF setting occur simultaneously, TSG3nSTR2.TSG3nPPF setting has a priority, and the flag is not cleared.
5	TSG3nPER	This is a trigger bit that clears TSG3nSTR2.TSG3nPEF. 0: Does not clear TSG3nPEF. 1: Clears TSG3nPEF. When TSG3nPER writing and TSG3nSTR2.TSG3nPEF setting occur simultaneously, TSG3nSTR2.TSG3nPEF setting has a priority, and the flag is not cleared.

Table 20.24 TSG3nSTC Register Contents (2/2)

Bit Position	Bit Name	Function
4	TSG3nTDR	This is a trigger bit that clears TSG3nSTR2.TSG3nTDF. 0: Does not clear TSG3nTDF. 1: Clears TSG3nTDF. When TSG3nTDR writing and TSG3nSTR2.TSG3nTDF setting occur simultaneously, TSG3nSTR2.TSG3nTDF setting has a priority, and the flag is not cleared.
3	TSG3nNDR	This is a trigger bit that clears TSG3nSTR2.TSG3nNDF. 0: Does not clear TSG3nNDF. 1: Clears TSG3nNDF. When TSG3nNDR writing and TSG3nSTR2.TSG3nNDF setting occur simultaneously, TSG3nSTR2.TSG3nNDF setting has a priority, and the flag is not cleared.
2	TSG3nPRR	This is a trigger bit that clears TSG3nSTR2.TSG3nPRF. 0: Does not clear TSG3nPRF. 1: Clears TSG3nPRF. When TSG3nPRR writing and TSG3nSTR2.TSG3nPRF setting occur simultaneously, TSG3nSTR2.TSG3nPRF setting has a priority, and the flag is not cleared.
1	TSG3nPTR	This is a trigger bit that clears TSG3nSTR2.TSG3nPTF. 0: Does not clear TSG3nPTF. 1: Clears TSG3nPTF. When TSG3nPTR writing and TSG3nSTR2.TSG3nPTF setting occur simultaneously, TSG3nSTR2.TSG3nPTF setting has a priority, and the flag is not cleared.
0	Reserved	When writing, write the value after reset (or a fixed value).

20.3.18 TSG3nOPT0 — TSG3n Option Register 0

This register sets the optional functions.

Access: This register can be read/written in 8-bit units.

Address: <TSG3n_base> + 020_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W*1	R/W*1	R/W	R/W	R/W	R

Note 1. TSG32 is not writable.

Table 20.25 TSG3nOPT0 Register Contents (1/2)

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6	TSG3nSOC	Enables or disables control of the timer output (TSG3nO1 to TSG3nO6 pins) by software. 0: Disables control by software. 1: Enables control by software. When TSG3nSOC is set to 1, timer output is switched to the software control/trigger control output pattern specified by TSG3nSPC2 to TSG3nSPC0. The dead time is secured by the dead time counter.
5	TSG3nSTE	Enables or disables control by the pattern output trigger. 0: Disables the TSG3nPTSI0 to TSG3nPTSI2 and TSG3nOPCI0, and TSG3nOPCI1 inputs. 1: Enables TSG3nPTSI0 to TSG3nPTSI2 and TSG3nOPCI0, and TSG3nOPCI1 inputs. • The pattern output trigger is selected by TSG3nPOT. • TSG3nSTE is valid in 120-DC mode and when software output control function is enabled.
4	TSG3nPOT	Selects the pattern output trigger. 0: Switches the output pattern by the external pattern input pins (TSG3nPTSI0 to TSG3nPTSI2) (pattern switch method). 1: Switches the output pattern by the rising edge of the TSG3nOPCI0 and TSG3nOPCI1 (trigger switch method).
3	TSG3nPSS	Selects the pattern output order switch factor. 0: The pattern output order is not switched by TSG3nPSC. 1: The pattern output order is switched by TSG3nPSC.
2	TSG3nIDC	Determines the output pattern from the TSG3nO1 to TSG3nO6 pins in combination with the TSG3nIDC and TSG3nSTR1.TSG3nTSF and TSG3nPSC signals. For the timer output order and patterns to be output, see **Figure 20.88** to **Figure 20.91**, Example of Operation in 120-DC Mode, in **Section 20.4.7.6(5), Operation in 120-DC Mode**.

Table 20.25 TSG3nOPT0 Register Contents (2/2)

Bit Position	Bit Name	Function
1	TSG3nPSC	Selects the pattern output order when the semi-automatic cruise function is enabled. 0: Switches the timer output (TSG3nO1 to TSG3nO6) in the normal rotation. 1: Switches the timer output (TSG3nO1 to TSG3nO6) in the reverse rotation. • TSG3nPSC specifies the timer output pattern order assuming the output pattern specified by TSG3nSPC2 to TSG3nSPC0 as the initial pattern. TSG3nPSC is valid when TSG3nPOT = 1 and TSG3nPSS = 1. • It is recommended to rewrite TSG3nPSC when TSG3nSTR0.TSG3nTE = 0 or TSG3nPOT = 0. If TSG3nPSC is rewritten when TSG3nPOT = 1, the unexpected timer output pattern might be caused. • If the signal input to TSG3nPTSI0 to TSG3nPTSI2 changes with TSG3n operation being stopped (TSG3nSTR0.TSG3nTE = 0), the TSG3nTRG0.TSG3nTS bit should be set to 1 after matching the input signal change logic with the TSG3nPSC order. • For output order in normal or reverse rotation, see **Section 20.4.7.6, 120-DC Mode**. Here, normal rotation and reverse rotation refer to the change of output, and they are different from normal rotation and reverse rotation of a motor.
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

20.3.19 TSG3nOPT1 — TSG3n Option Register 1

This register sets the optional functions.

Access: This register can be read/written in 8-bit units.

Address: <TSG3n_base> + 024_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TSG3nSPC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 20.26 TSG3nOPT1 Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2 to 0	TSG3nSPC[2:0]	Specifies the timer output pattern when software output function is enabled and in 120-DC mode. For the output pattern, see **Section 20.4.7.10, Software Output Control Function**, and **Section 20.4.7.6, 120-DC Mode**.

20.3.20 TSG3nOPT2 — TSG3n Option Register 2

This register sets rectangular waveform output from EMU3 to be used as PWM output by TSG3. This register can be set to 1 only when HT-PWM mode is selected (TSG3nMD2-0 = 001) and the timer is stopped (TSG3nRMC = 0). Do not rewrite this register in other modes (PWM mode, SP-PMW mode, 120-DC mode, HSP-PWM mode) or while the timer is operating (TSG3nRMC = 1).

Access: This register can be read/written in 8-bit units.

Address: <TSG3n_base> + $03C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TSG3nESSC
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W*1

Note 1. TSG32 is not writable.

Table 20.27 TSG3nOPT2 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	TSG3nESSC	EMU3 Rectangular Waveform Select Control 0: Timer output of TSG3 is set to HT-PWM mode selected by TSG3nMD2-0. 1: Timer output of TSG3 is switched to U-phase output pattern value, V-phase output pattern value, or W-phase output pattern value, input from EMU3 (ESW function). When TSG3nESSC is changed from 0 to 1, the timer output is switched to U-phase output pattern value, V-phase output pattern value, or W-phase output pattern value immediately. When TSG3nESSC is changed from 1 to 0, the timer output is switched to HT-PWM mode at the next reload timing.

20.3.21 TSG3nOPT2BF — TSG3n Option 2 Buffer Register

TSG3nOPT2BF is the buffer register for TSG3nOPT2. The value set in TSG3nOPT2 is captured at the timing described below.

TSG3nOPT2BF is a read-only register that indicates whether the output from TSG3nO1-6 is the rectangular waveform from EMU3. Writing to this register is ignored.

Access: This register can be read only in 8-bit units.

Address: <TSG3n_base> + $0CC_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TSG3nESSCBF
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 20.28 TSG3nOPT2BF Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read.
0	TSG3nESSCBF	EMU3 Rectangular Waveform Select Control Buffer 0: Timer output of TSG3 (TSG3nO1-6) is set to the PWM output mode selected by TSG3nMD2-0. 1: Timer output of TSG3 (TSG3nO1-6) is switched to the output using ESW function (dead time is added to U-phase output pattern value, V-phase output pattern value, or W-phase output pattern value, input from EMU3).

Capture Timing

- At operation start (1 is written to TSG3nTS when TSG3nTE = 0).
- At restart (1 is written to TSG3nTS when TSG3nTE = 1).
- At rising of the next PCLK if TSG3nESSC is changed from 0 to 1.
- At the next reload timing if TSG3nESSC is changed from 1 to 0.

20.3.22 TSG3nTRG0 — TSG3n Trigger Register 0

This register controls the start of the timer.

Access: This register can be written only in 8-bit units.

Address: <TSG3n_base> + 030_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TSG3nTS
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 20.29 TSG3nTRG0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TSG3nTS	This bit is a trigger bit that controls the start of the timer. 0: The timer is not started. 1: The timer is started (restarted if TSG3nSTR0.TSG3nTE = 1). When restarted, the 18-bit counter is initialized. This bit is always read as 0.

20.3.23 TSG3nTRG1 — TSG3n Trigger Register 1

This register controls the stop of the timer.

Access: This register can be written only in 8-bit units.

Address: <TSG3n_base> + 034_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TSG3nTT
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 20.30 TSG3nTRG1 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TSG3nTT	This is a trigger bit that controls the stop of the timer. 0: The timer is not stopped. 1: The timer is stopped (TSG3nSTR0.TSG3nTE = 0). This bit is always read as 0.

20.3.24 TSG3nTRG2 — TSG3n Trigger Register 2

TSG3nTRG2 is a trigger bit to reflect the PWM duty setting to TSG3nO1-6 in anytime rewrite mode of HT-PWM mode.

This register can be set to 1 only in HT-PWM mode and when anytime rewrite mode is selected (TSG3nRMC = 1). Do not rewrite this register in other modes (PWM mode, SP-PMW mode, 120-DC mode, HSP-PWM mode) or when reload mode is selected (TSG3nRMC = 0).

Access: This register can be written only in 8-bit units.

Address: <TSG3n_base> + 038_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TSG3nIMT
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 20.31 TSG3nTRG2 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TSG3nIMT	Anytime Rewrite Trigger 0: Disabled 1: Changes in duty settings for U, V, and W phases are reflected to timer output in HT-PWM mode and when anytime rewrite mode is selected.

20.3.25 TSG3nCNT — TSG3n Counter Read Buffer Register

This register can access the 16 lower-order bits of the 18-bit register TSG3nCNTE.

For the operation of this register, see **Section 20.3.26, TSG3nCNTE — TSG3n Bit-Extended Counter Read Buffer Register**.

Access: This register can be read only in 16-bit units.

Address: <TSG3n_base> + 028_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	16-bit counter															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

20.3.26 TSG3nCNTE — TSG3n Bit-Extended Counter Read Buffer Register

The counter values can be read from this register. This register mirrors the contents of TSG3nCNT from which the 16 lower-order bits of this register can be accessed.

Access: This register can be read only in 32-bit units.

Address: <TSG3n_base> + $1A0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	18-bit counter	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	18-bit counter															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

18-bit counter

This register is a timer read buffer register from which the 18-bit counter value can be read. In HT-PWM mode, the 18-bit counter provides the triangular waveform control in which the counter value is incremented and decremented by 2. Bit 0 is always read as 0.

In other modes, the 18-bit counter provides the sawtooth waveform control in which the counter value is incremented by 1.

Table 20.32 TSG3nCNTE Register Count Value

Operating mode	At the Beginning	Minimum Value	Maximum Value
HT-PWM mode	TSG3nDTC0	TSG3nDTC0	TSG3nDTC0 + TSG3nCMP0E*1
Other modes	00000_H	00000_H	TSG3nCMP0E

Note 1. Set the value as TSG3nDTC0+TSG3nCMP0E < $3FFFF_H$.

20.3.27 TSG3nSBC — TSG3n Sub-Counter Read Buffer Register

This register can access the 16 lower-order bits of the 18-bit register TSG3nSBCE.

For the operation of this register, see **Section 20.3.28,** TSG3nSBCE — TSG3n Bit Extended Sub-Counter Read Buffer Register.

Access: This register can be read only in 16-bit units.

Address: <TSG3n_base> + $02C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	16-bit sub-counter															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

20.3.28 TSG3nSBCE — TSG3n Bit Extended Sub-Counter Read Buffer Register

The sub-counter values can be read from this register. This register mirrors the contents of TSG3nSBC from which the 16 lower-order bits of this register can be accessed.

Access: This register can be read only in 32-bit units.

Address: <TSG3n_base> + $1A4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	18-bit sub-counter	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	18-bit sub-counter															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

18-bit counter

This register is a timer read buffer register from which the 18-bit sub-counter value can be read. In HT-PWM mode, the 18-bit counter provides the triangular waveform control in which the counter value is incremented and decremented by 2. Bit 0 is always read as 0. (Available only in HT-PWM mode.).

Table 20.33 TSG3nSBCE Register Count Value

Operating mode	At the Beginning	Minimum Value	Maximum Value
HT-PWM mode	TSG3nDTC0	00000_H	TSG3nDTC0 + TSG3nDTC1 + TSG3nCMP0E*1
Other modes	00000_H	00000_H	00000_H

Note 1. Set the value as TSG3nDTC0 + TSG3nDTC1 + TSG3nCMP0E < $3FFFF_H$.

20.3.29 TSG3nCMP0 — TSG3n Compare Register 0

This register can access the 16 lower-order bits of the 18-bit register TSG3nCMP0E.

For the operation of this register, see **Section 20.3.30, TSG3nCMP0E — TSG3n Bit Extended Compare Register 0**.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 058_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	16-bit compare register

20.3.30 TSG3nCMP0E — TSG3n Bit Extended Compare Register 0

This register is an 18-bit compare register that specifies the PWM period in all modes. This register mirrors the contents of TSG3nCMP0 from which the 16 lower-order bits of this register can be accessed.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + $14C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	18-bit compare register	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 20.34 TSG3nCMP0E Register Setting

Operating mode	At the Beginning	Minimum Value	Maximum Value
HT-PWM mode	TSG3nCMP0E*1	00002_H	$3FFFE_H$
Other modes	TSG3nCMP0E + 1	1 (TSG3nCMP0E = 00000_H)	40000_H (TSG3nCMP0E = $3FFFF_H$)

Note 1. In HT-PWM mode, the least significant bit is ignored.

20.3.31 TSG3nCMP1W — TSG3n Compare Register 1, 2

This register can access the 16 lower-order bits of the 18-bit register TSG3nCMP1E and TSG3nCMP2E.

For the operation of this register, see **Section 20.3.38, TSG3nCMP1E to TSG3nCMP12E — TSG3n Bit Extended Compare Registers 1 to 12**.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 040_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

20.3.32 TSG3nCMP3W — TSG3n Compare Register 3, 4

This register can access the 16 lower-order bits of the 18-bit register TSG3nCMP3E and TSG3nCMP4E.

For the operation of this register, see **Section 20.3.38, TSG3nCMP1E to TSG3nCMP12E — TSG3n Bit Extended Compare Registers 1 to 12**.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + $04C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

20.3.33 TSG3nCMP5W — TSG3n Compare Register 5, 6

This register can access the 16 lower-order bits of the 18-bit register TSG3nCMP5E and TSG3nCMP6E.

For the operation of this register, see **Section 20.3.38, TSG3nCMP1E to TSG3nCMP12E — TSG3n Bit Extended Compare Registers 1 to 12**.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 044_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

20.3.34 TSG3nCMP7W — TSG3n Compare Registers 7, 8

This register can access the 16 lower-order bits of the 18-bit register TSG3nCMP7E and TSG3nCMP8E.

For the operation of this register, see **Section 20.3.38, TSG3nCMP1E to TSG3nCMP12E — TSG3n Bit Extended Compare Registers 1 to 12.**

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 050_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

20.3.35 TSG3nCMP9W — TSG3n Compare Registers 9, 10

This register can access the 16 lower-order bits of the 18-bit register TSG3nCMP9E and TSG3nCMP10E.

For the operation of this register, see **Section 20.3.38, TSG3nCMP1E to TSG3nCMP12E — TSG3n Bit Extended Compare Registers 1 to 12**.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 048_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

20.3.36 TSG3nCMP11W — TSG3n Compare Registers 11, 12

This register can access the 16 lower-order bits of the 18-bit register TSG3nCMP11E and TSG3nCMP12E.

For the operation of this register, see **Section 20.3.38, TSG3nCMP1E to TSG3nCMP12E — TSG3n Bit Extended Compare Registers 1 to 12**.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 054_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

20.3.37 TSG3nCMP1 to TSG3nCMP12 — TSG3n Compare Registers 1 to 12

These registers can access the 16 lower-order bits of the 18-bit registers TSG3nCMP1E-12E.

For the operation of these registers, see **Section 20.3.38, TSG3nCMP1E to TSG3nCMP12E — TSG3n Bit Extended Compare Registers 1 to 12**.

Access: This register can be read/written in 16-bit units.

Address: TSG3nCMP1 <TSG3n_base> + 080_H
TSG3nCMP2 <TSG3n_base> + 084_H
TSG3nCMP3 <TSG3n_base> + 098_H
TSG3nCMP4 <TSG3n_base> + $09C_H$
TSG3nCMP5 <TSG3n_base> + 088_H
TSG3nCMP6 <TSG3n_base> + $08C_H$
TSG3nCMP7 <TSG3n_base> + $0A0_H$

20.3.38 TSG3nCMP1E to TSG3nCMP12E — TSG3n Bit Extended Compare Registers 1 to 12

The compare value is set by these registers. These registers mirror the contents of TSG3nCMP1-12, TSG3nCMP1W, 3W, 5W, 7W, 9W, and 11W from which the 16 lower-order bits of these registers can be accessed.

Access: This register can be read/written in 32-bit units.

Address: TSG3nCMP1E <TSG3n_base> + $17C_H$
TSG3nCMP2E <TSG3n_base> + 178_H
TSG3nCMP3E <TSG3n_base> + 164_H
TSG3nCMP4E <TSG3n_base> + 160_H

Table 20.35 TSG3nCMP1E-TSG3nCMP12E Register Setting (1/2)

Register	PWM Mode	HT-PWM Mode	SP-PWM Mode	120-DC Mode	HSP-PWM Mode
TSG3nCMP1E	TSG3nO1 clear timing	TSG3nO1 clear timing / TSG3nO2 set timing		Duty when TSG3nO1, 3, or 5 output pattern is selected by TSG3nPAT0.	TSG3nO1 clear timing
TSG3nCMP2E	TSG3nO1 set timing	TSG3nO1 set timing / TSG3nO2 clear timing			TSG3nO1 set timing
TSG3nCMP3E	TSG3nO2 clear timing	—		Duty whenTSG3nO2, 4, or 6 output pattern is selected by TSG3nPAT1.	TSG3nO2 clear timing
TSG3nCMP4E	TSG3nO2 set timing	—			TSG3nO2 set timing
TSG3nCMP5E	TSG3nO3 clear timing	TSG3nO3 clear timing / TSG3nO4 set timing		Duty when TSG3nO1, 3, or 5 output pattern is selected by TSG3nPAT0.	TSG3nO3 clear timing
TSG3nCMP6E	TSG3nO3 set timing	TSG3nO3 set timing / TSG3nO4 clear timing			TSG3nO3 set timing

Table 20.35 TSG3nCMP1E-TSG3nCMP12E Register Setting (2/2)

Register	PWM Mode	HT-PWM Mode	SP-PWM Mode	120-DC Mode	HSP-PWM Mode
TSG3nCMP7E	TSG3nO4 clear timing	—		Duty when TSG3nO2, 4, or 6 output pattern is selected by TSG3nPAT1.	TSG3nO4 clear timing
TSG3nCMP8E	TSG3nO4 set timing	—			TSG3nO4 set timing
TSG3nCMP9E	TSG3nO5 clear timing	TSG3nO5 clear timing / TSG3nO6 set timing		Duty when TSG3nO1, 3, or 5 output pattern is selected by TSG3nPAT0.	TSG3nO5 clear timing
TSG3nCMP10E	TSG3nO5 set timing	TSG3nO5 set timing / TSG3nO6 clear timing			TSG3nO5 set timing
TSG3nCMP11E	TSG3nO6 clear timing	—		Duty when TSG3nO2, 4, or 6 output pattern is selected by TSG3nPAT1.	TSG3nO6 clear timing
TSG3nCMP12E	TSG3nO6 set timing	—			TSG3nO6 set timing

NOTE

The dead time function is used in all operating modes.

In HT-PWM mode, a compare match occurs not only in TSG3nCNTE but also in TSG3nSBCE.

In 120-DC mode, the output from TSG3nO1-6 is controlled by the TSG3nCMPmE, TSG3nPAT0, and TSG3nPAT1 registers.

20.3.39 TSG3nDCMP0W — TSG3n Diagnostic Output Compare Register 0, 1

This register can access the 16 lower-order bits of the 18-bit register TSG3nDCMP0E and TSG3nDCMP1E.

For the operation of this register, see **Section 20.3.41, TSG3nDCMP0E to 2E — TSG3n Bit Extended Diagnostic Output Compare Register 0 to 2**.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + $05C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

20.3.40 TSG3nDCMP2 — TSG3n Diagnostic Output Compare Register 2

This register can access the 16 lower-order bits of the 18-bit register TSG3nDCMP2E.

For the operation of this register, see **Section 20.3.41, TSG3nDCMP0E to 2E — TSG3n Bit Extended Diagnostic Output Compare Register 0 to 2**.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 060_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

20.3.41 TSG3nDCMP0E to 2E — TSG3n Bit Extended Diagnostic Output Compare Register 0 to 2

The compare value is set by these registers. These registers mirror the contents of TSG3nDCMP0W and TSG3nDCMP2 from which the 16 lower-order bits of these registers can be accessed.

Access: This register can be read/written in 32-bit units.

Address: TSG3nDCMP0E <TSG3n_base> + 148_H

TSG3nDCMP1E <TSG3n_base> + 144_H

TSG3nDCMP2E <TSG3n_base> + 140_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	18-bit compare register	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	18-bit compare register															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

These registers control the diagnostic output timing or AD conversion trigger timing in all modes. A pulse is generated at the match timing of the 18-bit counter value with this register.

20.3.42 TSG3nPAT0W — TSG3n Pattern Register 0

This register specifies the output pattern.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 064_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PAT5T	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PAT5T	PAT4T			PAT3T			PAT2T			PAT1T			PAT0T		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Output Pattern

This register controls UT/VT/WT output in 120-DC mode.

Table 20.36 TSG3nPAT0W Register Setting value and Output Control

PATmT Value	Output Control
000	Fixed Low level
001	PWM output set by TSG3nCMP1E
010	PWM output set by TSG3nCMP2E
011	PWM output set by TSG3nCMP5E
100	PWM output set by TSG3nCMP6E
101	PWM output set by TSG3nCMP9E
110	PWM output set by TSG3nCMP10E
111	Fixed High level

Note: m = 0, 1, 2, 3, 4, 5

20.3.43 TSG3nPAT1W — TSG3n Pattern Register 1

This register specifies the output pattern.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 068_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PAT5B	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PAT5B	PAT4B			PAT3B			PAT2B			PAT1B			PAT0B		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Output Pattern

This register controls UB/VB/WB output in 120-DC mode.

Table 20.37 TSG3nPAT1W Register Setting value and Output Control

PATmB Value	Output Control
000	Fixed Low level
001	PWM output set by TSG3nCMP3E
010	PWM output set by TSG3nCMP4E
011	PWM output set by TSG3nCMP7E
100	PWM output set by TSG3nCMP8E
101	PWM output set by TSG3nCMP11E
110	PWM output set by TSG3nCMP12E
111	Fixed High level

Note: m = 0, 1, 2, 3, 4, 5

20.3.44 TSG3nDTC0W — TSG3n Dead Time Setting Register 0

This register sets the dead time value (the period from inverse phase inactivation to positive phase activation).

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + $06C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	Write Protection Code Check														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSG3nDTC0(10-bit dead time compare)									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

To rewrite TSG3nDTC0W[0:9], set bit 14 to bit 0 and TSG3nDTCM to 0 in TSG3nDTPR, and rewrite the TSG3nDTC0W. At this time, when the rewritten value of TSG3nDTC0W[30:16] and the TSG3nDTPR value match, TSG3nDTC0W is rewritten.

During timer operation (TSG3nSTR0.TSG3nTE = 1), rewriting should be performed in reload mode (TSG3nCTL3.TSG3nRMC = 0).

20.3.45 TSG3nDTC1W — TSG3n Dead Time Setting Register 1

This register sets the dead time (the period from positive phase inactivation to inverse phase activation).

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 070_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	Write Protection Code Check														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSG3nDTC1(10-bit dead time compare)									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

To rewrite TSG3nDTC1W[0:9], set bit 14 to bit 0 and TSG3nDTCM to 0 in TSG3nDTPR, and rewrite the TSG3nDTC1W. At this time, when the rewritten value of TSG3nDTC1W[30:16] and the TSG3nDTPR value match, TSG3nDTC1W is rewritten.

During timer operation (TSG3nSTR0.TSG3nTE = 1), rewriting should be performed in reload mode (TSG3nCTL3.TSG3nRMC = 0).

20.3.46 TSG3nCMPU — TSG3n HT-PWM U Phase Compare Register

This register can access the 16 lower-order bits of the 18-bit register TSG3nCMPUE.

For the operation of this register, see **Section 20.3.49, TSG3nCMPUE — TSG3n Bit Extended HT-PWM U Phase Compare** Register.

Access: This register can be read/written in 16-bit units.

Address: <TSG3n_base> + $0B0_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSG3nCMPU(16-bit compare register)															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

20.3.47 TSG3nCMPV — TSG3n HT-PWM V Phase Compare Register

This register can access the 16 lower-order bits of the 18-bit register TSG3nCMPVE.

For the operation of this register, see **Section 20.3.50, TSG3nCMPVE — TSG3n Bit Extended HT-PWM V Phase Compare** Register.

Access: This register can be read/written in 16-bit units.

Address: <TSG3n_base> + $0B4_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSG3nCMPV (16-bit compare register)															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

20.3.48 TSG3nCMPW — TSG3n HT-PWM W Phase Compare Register

This register can access the 16 lower-order bits of the 18-bit register TSG3nCMPWE.

For the operation of this register, see **Section 20.3.51, TSG3nCMPWE — TSG3n Bit Extended HT-PWM W Phase Compare** Register.

Access: This register can be read/written in 16-bit units.

Address: <TSG3n_base> + $0B8_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

20.3.49 TSG3nCMPUE — TSG3n Bit Extended HT-PWM U Phase Compare Register

This register sets the compare value for U phase in HT-PWM. In addition to the functions of TSG3nCMP1E and TSG3nCMP2E, this register can access specific registers.

The data written to this register is stored in the TSG3nCMP1E and TSG3nCMP2E registers which allows a generation of symmetry triangular waveform of PWM by one write access (see **Figure 20.3**). When this register is read, the same value as TSG3nCMP1E is returned. This register mirrors the contents of TSG3nCMPU from which the 16 lower-order bits of this register can be accessed.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 188_H

Value after reset: $0000\ 0000_H$

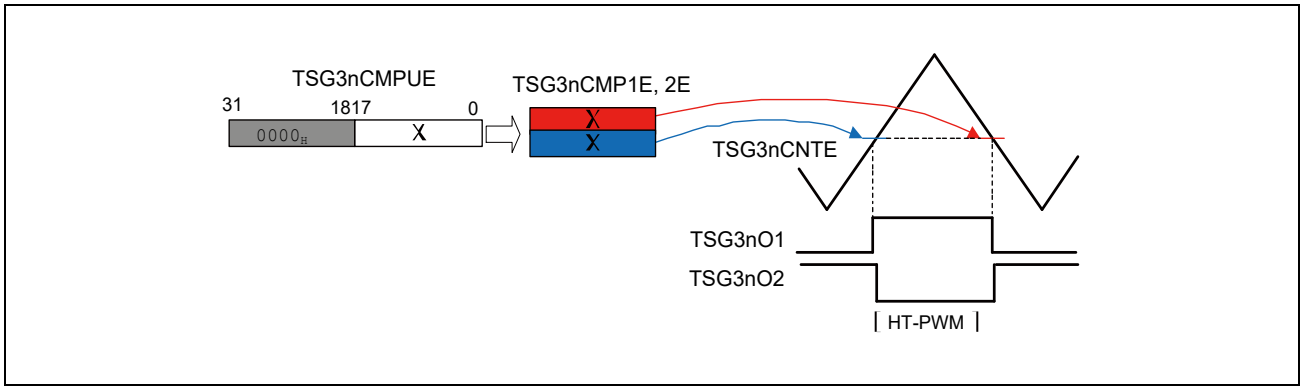

Figure 20.3 TSG3nCMPUE Register Accesses

20.3.50 TSG3nCMPVE — TSG3n Bit Extended HT-PWM V Phase Compare Register

This register sets the compare value for V phase in HT-PWM. In addition to the functions of TSG3nCMP5E and TSG3nCMP6E, this register can access specific registers.

The data written to this register is stored in the TSG3nCMP5E and TSG3nCMP6E registers which allows a generation of symmetry triangular waveform of PWM by one write access (see **Figure 20.4**). When this register is read, the same value as TSG3nCMP5E is returned. This register mirrors the contents of TSG3nCMPV from which the 16 lower-order bits of this register can be accessed.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 184_H

Value after reset: $0000\ 0000_H$

20.3.51 TSG3nCMPWE — TSG3n Bit Extended HT-PWM W Phase Compare Register

This register sets the compare value for W phase in HT-PWM. In addition to the functions of TSG3nCMP9E and TSG3nCMP10E, this register can access specific registers.

The data written to this register is stored in the TSG3nCMP9E and TSG3nCMP10E registers which allows a generation of symmetry triangular waveform of PWM by one write access (see **Figure 20.5**). When this register is read, the same value as TSG3nCMP9E is returned. This register mirrors the contents of TSG3nCMPW from which the 16 lower-order bits of this register can be accessed.

Access: This register can be read/written in 32-bit units.

20.3.55 TSG3nUPWE — TSG3n Bit Extended SP-PWM U Phase Active Width Register

This register sets the active width for U phase in SP-PWM mode. The sum of the TSG3nUPWE value and the TSG3nCMP2E value is stored in TSG3nCMP1E (see **Figure 20.6**). When this register is read, the same value as TSG3nCMP1E is returned. This register mirrors the contents of TSG3nUPW from which the 16 lower-order bits of this register can be accessed.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 198_H

Value after reset: $0000\ 0000_H$

20.3.58 TSG3nHSPCMUE — TSG3n HSP-PWM Mode U Phase Compare Register

This register sets the PWM output width for U phase in HSP-PWM mode.

When a write access is made to this register, the values are set to TSG3nCMP1E to TSG3nCMP4E registers according to the formulas described in **Section 20.4.7.8, Compare Register Set Value in HSP-PWM Mode**.

When this register is read, the same value as TSG3nCMP1E is returned.

Access: This register can be read/written in 32-bit units.

Address: <TSG3n_base> + 134_H

Value after reset: $0000\ 0000_H$

Table 20.38 TSG3nDTPR Register Contents

Bit Position	Bit Name	Function
15	TSG3nDTCM	Enables or disables rewriting of TSG3nDTC0 and TSG3nDTC1. 0: Enables rewriting of TSG3nDTC0 and TSG3nDTC1. 1: Disables rewriting of TSG3nDTC0 and TSG3nDTC1.
14 to 0	TSG3nDTPR[14:0]	Sets the write protection code (any value from 0000 to 7FFF).

This register protects TSG3nDTC0 and TSG3nDTC1 from illegal rewriting.

Functions are described below.

- TSG3nDTCM enables or disables rewriting of TSG3nDTC0 and TSG3nDTC1.
- Rewriting of TSG3nDTC0 and TSG3nDTC1 is enabled or disabled by checking a match of the write protection code (bits 30 to 16) of TSG3nDTC0 with TSG3nDTC1 and the write protection code of TSG3nDTPR, and the TSG3nDTCM setting.

CAUTION

This register should be set when the timer is stopped (TSG3nSTR0.TSG3nTE = 0). Only the same value can be written during timer operation (TSG3nSTR0.TSG3nTE = 1). If the different value is written to this register when TSG3nSTR0.TSG3nTE = 1, timer operation cannot be guaranteed. If this register is erroneously rewritten, set this register again after stopping the timer.

20.4.1 Basic Operation

20.4.1.1 Basic Operation of 18-Bit Counter

The basic operation of the 18-bit counter is described. For details, see **Section 20.4.7, Operating Modes**.

Counting start

The 18-bit counter of TSG3n starts counting in HT-PWM mode when the initial value is 00000_H and after the TSG3nDTC0 value is loaded. The counter starts counting from the initial value 00000_H in all modes except for HT-PWM mode.

In HT-PWM mode, the counter value is incremented by 2 from the value of TSG3nDTC0 and decremented by 2 up to the value of TSG3nDTC0 after the counter value matches with the value of TSG3nCMP0E + TSG3nDTC0. The counter increments from 00000_H, 00001_H, 00002_H, 00003_H, … in all modes except for HT-PWM mode.

Counter clear

The 18-bit counter is cleared by the match of the counter value and the value of TSG3nCMP0E in all modes except for HT-PWM mode. (Clearing operation is not available in HT-PWM mode.)

Counter read during counting

In the TSG3n, the 18-bit counter value during counting can be read through TSG3nCNTE.

Count stop operation

When count operation is stopped (when TS0TE is changed from 1 to 0), TSG3nCNTE and TSG3nSBCE retain the counter value when stopped.

Interrupt operation

In the TSG3n, the following interrupts are generated.

- INTTSG3nI0: A period interrupt by a match of the 18-bit counter value with the TSG3nDTC0 value in HT-PWM mode. A compare match interrupt of the 18-bit counter value with the TSG3nCMP0E buffer register in any mode other than HT-PWM mode.
- INTTSG3nI1: A compare match interrupt of the 18-bit counter value with the TSG3nCMP1E buffer register.
- INTTSG3nI2: A compare match interrupt of the 18-bit counter value with the TSG3nCMP2E buffer register.
- INTTSG3nI3: A compare match interrupt of the 18-bit counter value with the TSG3nCMP3E buffer register.
- INTTSG3nI4: A compare match interrupt of the 18-bit counter value with the TSG3nCMP4E buffer register.
- INTTSG3nI5: A compare match interrupt of the 18-bit counter value with the TSG3nCMP5E buffer register.
- INTTSG3nI6: A compare match interrupt of the 18-bit counter value with the TSG3nCMP6E buffer register.
- INTTSG3nI7: A compare match interrupt of the 18-bit counter value with the TSG3nCMP7E buffer register.
- INTTSG3nI8: A compare match interrupt of the 18-bit counter value with the TSG3nCMP8E buffer register.
- INTTSG3nI9: A compare match interrupt of the 18-bit counter value with the TSG3nCMP9E buffer register.
- INTTSG3nI10: A compare match interrupt of the 18-bit counter value with the TSG3nCMP10E buffer register.
- INTTSG3nI11: A compare match interrupt of the 18-bit counter value with the TSG3nCMP11E buffer register.
- INTTSG3nI12: A compare match interrupt of the 18-bit counter value with the TSG3nCMP12E buffer register.
- INTTSG3nIPEK: A peak interrupt when the 18-bit counter switches from incrementing to decrementing.
- INTTSG3nIVLY: A trough interrupt when the 18-bit counter switches from decrementing to incrementing
- INTTSG3nIER: A simultaneous active state detection interrupt of the positive phase and inverse phase
- INTTSG3nIWN: A warning detection interrupt

20.4.1.2 Function of Compare Registers

The functions of the compare registers in each operating mode are shown in the following tales.

Table 20.40 Compare Register Functions in Each Mode (1/7)

Operating Mode	TSG3nCMP0E	TSG3nCMP1E	TSG3nCMP2E

TSG3nCMP5E-8E is set based on the TSG3nHSPCMVE set value and the set values of TSG3nCMP0E, TSG3nDTC0, TSG3nDTC1, and TSG3nHSPSHVE.	TSG3nCMP9E-12E is set based on the TSG3nHSPCMWE set value and the set values of TSG3nCMP0E, TSG3nDTC0, TSG3nDTC1, and TSG3nHSPSHWE.

20.4.1.3 Compare Register Rewrite Operation

TSG3 can be set to reload mode or anytime rewrite mode using theTSG3nRMC bit.

Reload mode is enabled when TSG3nRMC = 0. The registers listed as “enabled” on the “Reload” column in **Section 20.3.1, List of Registers** are simultaneously updated at the reload timing.

Anytime rewrite mode is enabled when TSG3nRMC = 1. The registers are updated independently every time the value is written to the relevant register.

The update timing of the registers to be reloaded in reload mode and anytime rewrite mode in each mode are listed in the following table.

Table 20.41 Updating Timing of Compare Registers by Mode

Mode	Anytime Rewrite TSG3nRMC = 1	Reload TSG3nRMC = 0
PWM mode	TSG3nCMP0E: At the next counter clear timing of the 18-bit counter	At reload timing
	Registers other than TSG3nCMP0E: At a write access to the register	
HT-PWM mode	TSG3nCMP0E: At the next peak or trough timing of TSG3nCNTE	At reload timing
	TSG3nCMP1E, 2E, 5E, 6E, 9E, 10E: At writing 1 to the TSG3nIMT bit	
	Registers other than TSG3nCMP0E,1E, 2E, 5E, 6E, 9E, 10E: At a write access to the register	
SP-PWM mode	TSG3nCMP0E: At the next counter clear timing of the 18-bit counter	At reload timing
	Registers other than TSG3nCMP0E: At a write access to the register	
120-DC mode	Setting prohibited	At reload timing
HSP-PWM mode	Setting prohibited	At reload timing

Anytime Rewrite Mode

In this mode, the compare registers are rewritten independently. Whenever a value is written to the compare register, the written value is reflected at the timing of **Table 20.41**.

Reload mode (Simultaneous Rewrite Function)

Writing to TSG3nCMP1E (TSG3nCMP1, TSG3nCMP1W, TSG3nCMPUE, TSG3nCMPU, TSG3nUPWE, TSG3nUPW, and TSG3nHSPCMUE) enables reload (sets the reload request flag TSG3nSTR0.TSG3nRSF), and the values of all the pertinent registers are updated simultaneously at the next reload timing (reload).

The reload timing is the peak or trough timing of the 18-bit counter when the TSG3nTRG0.TSG3nTS bit is changed from 0 to 1. Reloading is controlled by TSG3nCTL4.TSG3nPRE, and TSG3nVRE.

Writing to any register other than TSG3nCMP1E (TSG3nCMP1, TSG3nCMP1W, TSG3nCMPUE, TSG3nCMPU, TSG3nUPWE, TSG3nUPW, and TSG3nHSPCMUE) does not enable reloading.

Do not write to the registers to be reloaded until the next reload timing after reloading is enabled by writing to TSG3nCMP1E (TSG3nCMP1, TSG3nCMP1W, TSG3nCMPUE, TSG3nCMPU, TSG3nUPWE, TSG3nUPW, and TSG3nHSPCMUE).

The pertinent registers should be rewritten when the reload request flag (TSG3nSTR0.TSG3nRSF) is 0.

Rewriting registers to be reloaded by DMA transfer

Some of the registers to be reloaded can be rewritten by DMA transfer. DMA transfer is performed as follows.

Table 20.42 Example of DMA Transfer Order of Registers to be Reloaded

Address	Register Name	DMA Transfer Order (Example)
<TSG3n_base> + 040_H	TSG3nCMP1W	*1
<TSG3n_base> + 044_H	TSG3nCMP5W	*1
<TSG3n_base> + 048_H	TSG3nCMP9W	*1
<TSG3n_base> + $04C_H$	TSG3nCMP3W	*1
<TSG3n_base> + 050_H	TSG3nCMP7W	*1
<TSG3n_base> + 054_H	TSG3nCMP11W	*1
<TSG3n_base> + 058_H	TSG3nCMP0	*1
<TSG3n_base> + $05C_H$	TSG3nDCMP0W	*1
<TSG3n_base> + 060_H	TSG3nDCMP2	*1
<TSG3n_base> + 064_H	TSG3nPAT0W	*1
<TSG3n_base> + 068_H	TSG3nPAT1W	*1
<TSG3n_base> + $06C_H$	TSG3nDTC0W	*1
<TSG3n_base> + 070_H	TSG3nDTC1W	*1

Note 1. Greater addresses correspond to higher priority levels.

Table 20.43 Example of DMA Transfer Order of Registers to be Reloaded

Address	Register Name	DMA Transfer Order (Example)
<TSG3n_base> + 140_H	TSG3nDCMP2E	*1
<TSG3n_base> + 144_H	TSG3nDCMP1E	*1
<TSG3n_base> + 148_H	TSG3nDCMP0E	*1
<TSG3n_base> + $14C_H$	TSG3nCMP0E	*1
<TSG3n_base> + 150_H	TSG3nCMP12E	*1
<TSG3n_base> + 154_H	TSG3nCMP11E	*1
<TSG3n_base> + 158_H	TSG3nCMP8E	*1
<TSG3n_base> + $15C_H$	TSG3nCMP7E	*1
<TSG3n_base> + 160_H	TSG3nCMP4E	*1
<TSG3n_base> + 164_H	TSG3nCMP3E	*1
<TSG3n_base> + 168_H	TSG3nCMP10E	*1
<TSG3n_base> + $16C_H$	TSG3nCMP9E	*1
<TSG3n_base> + 170_H	TSG3nCMP6E	*1
<TSG3n_base> + 174_H	TSG3nCMP5E	*1
<TSG3n_base> + 178_H	TSG3nCMP2E	*1
<TSG3n_base> + $17C_H$	TSG3nCMP1E	*1

Note 1. Smaller addresses correspond to higher priority levels

Table 20.44 Duty Setting in HT-PWM Mode

Address	Register Name	DMA Transfer Order (Example)
<TSG3n_base> + 180_H	TSG3nCMPWE	*1
<TSG3n_base> + 184_H	TSG3nCMPVE	*1
<TSG3n_base> + 188_H	TSG3nCMPUE	*1

Note 1. Smaller addresses correspond to higher priority levels.

Table 20.45 Active Width Setting in SP-PWM Mode

Address	Register Name	DMA Transfer Order (Example)
<TSG3n_base> + 190_H	TSG3nWPWE	*1
<TSG3n_base> + 194_H	TSG3nVPWE	*1
<TSG3n_base> + 198_H	TSG3nUPWE	*1

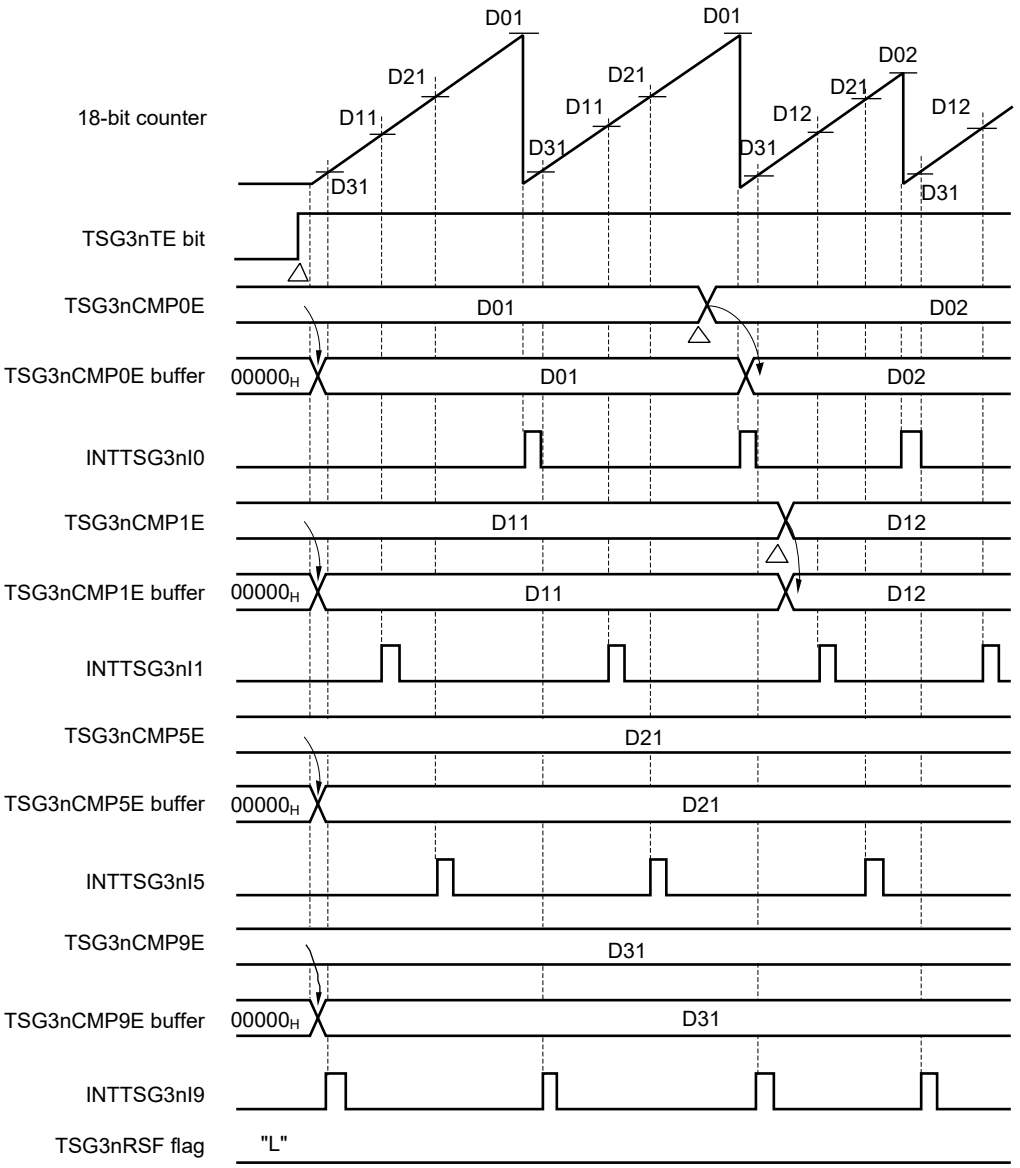
Note 1. Smaller addresses correspond to higher priority levels.

Table 20.46 Shift Width and Duty Setting in HSP-PWM Mode

Address	Register Name	DMA Transfer Order (Example)
<TSG3n_base> + 120_H	TSG3nHSPSHWE	*1
<TSG3n_base> + 124_H	TSG3nHSPSHVE	*1
<TSG3n_base> + 128_H	TSG3nHSPSHUE	*1
<TSG3n_base> + $12C_H$	TSG3nHSPCMWE	*1
<TSG3n_base> + 130_H	TSG3nHSPCMVE	*1
<TSG3n_base> + 134_H	TSG3nHSPCMUE	*1

Note 1. Smaller addresses correspond to higher priority levels.

NOTES



1. TSG3nCTL4 and TSG3nIOC3 should be rewritten individually.
2. Since writing to TSG3nCMP1E (including TSG3nCMP1, TSG3nCMP1W, TSG3nCMPUE, TSG3nCMPU, TSG3nUPWE, TSG3nUPW, and TSG3nHSPCMUE) enables reloading, it should be rewritten after all the other registers to be reloaded have been rewritten (ready to be reloaded)

(1) Example of Operation in Anytime Rewrite Mode

In this mode, the values written to the compare registers (TSG3nCMP1E to TSG3nCMP12E) are transferred to the internal buffer registers immediately, and are compared with the counter value.

The values are transferred to the internal compare buffer registers one clock cycle (PCLK) after being written to the compare registers (TSG3nCMP1E to TSG3nCMP12E).

The transfer timing of the TSG3nCMP0E is the peak or trough timing (only in HT-PWM mode) of the 18-bit counter after being written to the compare registers, or at the match timing of the TSG3nCMP0E value with the 18-bit counter value (in any mode other than HT-PWM mode).

Note: D01, D02: TSG3nCMP0E setting value (00000_H-$3FFFF_H$)
D11, D12: TSG3nCMP1E setting value (00000_H-$3FFFF_H$)
D21: TSG3nCMP5E setting value (00000_H-$3FFFF_H$)
D31: TSG3nCMP9E setting value (00000_H-$3FFFF_H$)
Δ: Write Access

Figure 20.9 Anytime Rewrite Timing (Example in PWM Mode)

(a) Data reflection on PWM an Anytime Rewrite in HT-PWM

In anytime rewrite operation in HT-PWM mode, the values are transferred to the buffer at the timing to write 1 to the TSG3nIMT bit after the settings of TSG3nCMP1E, 2E, 5E, 6E, 9E, and 10E registers are modified and PWM output is forcibly set/cleared depending on the modified set value.

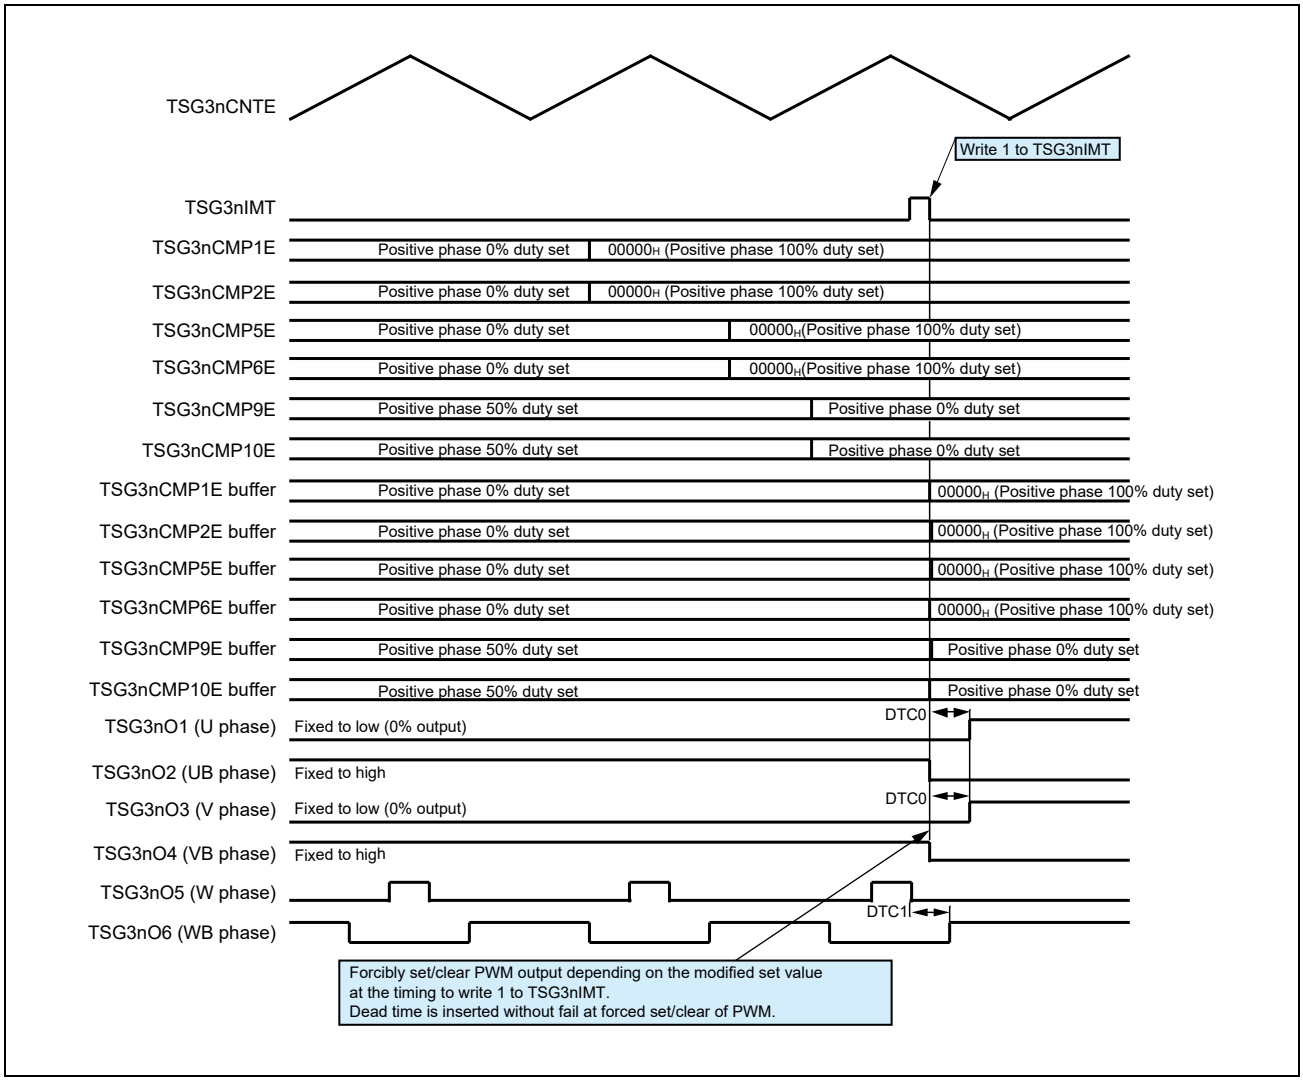


Figure 20.10 Update Timing of TSG3nCMP1E, 2E, 5E, 6E, 9E, and 10E at Anytime Rewrite Operation in HT-PWM Mode

(2) Example of Operation in Reload Mode (Simultaneous Rewrite Function)

The rewritten values of the registers to be reloaded (the registers listed in the **Section 20.3.1, List of Registers** with "Enabled" in the column of "Reload") can be transferred to the corresponding buffer registers simultaneously at the reload timing.

The registers should be rewritten when the pertinent reload request flag (TSG3nSTR0.TSG3nRSF) is 0.

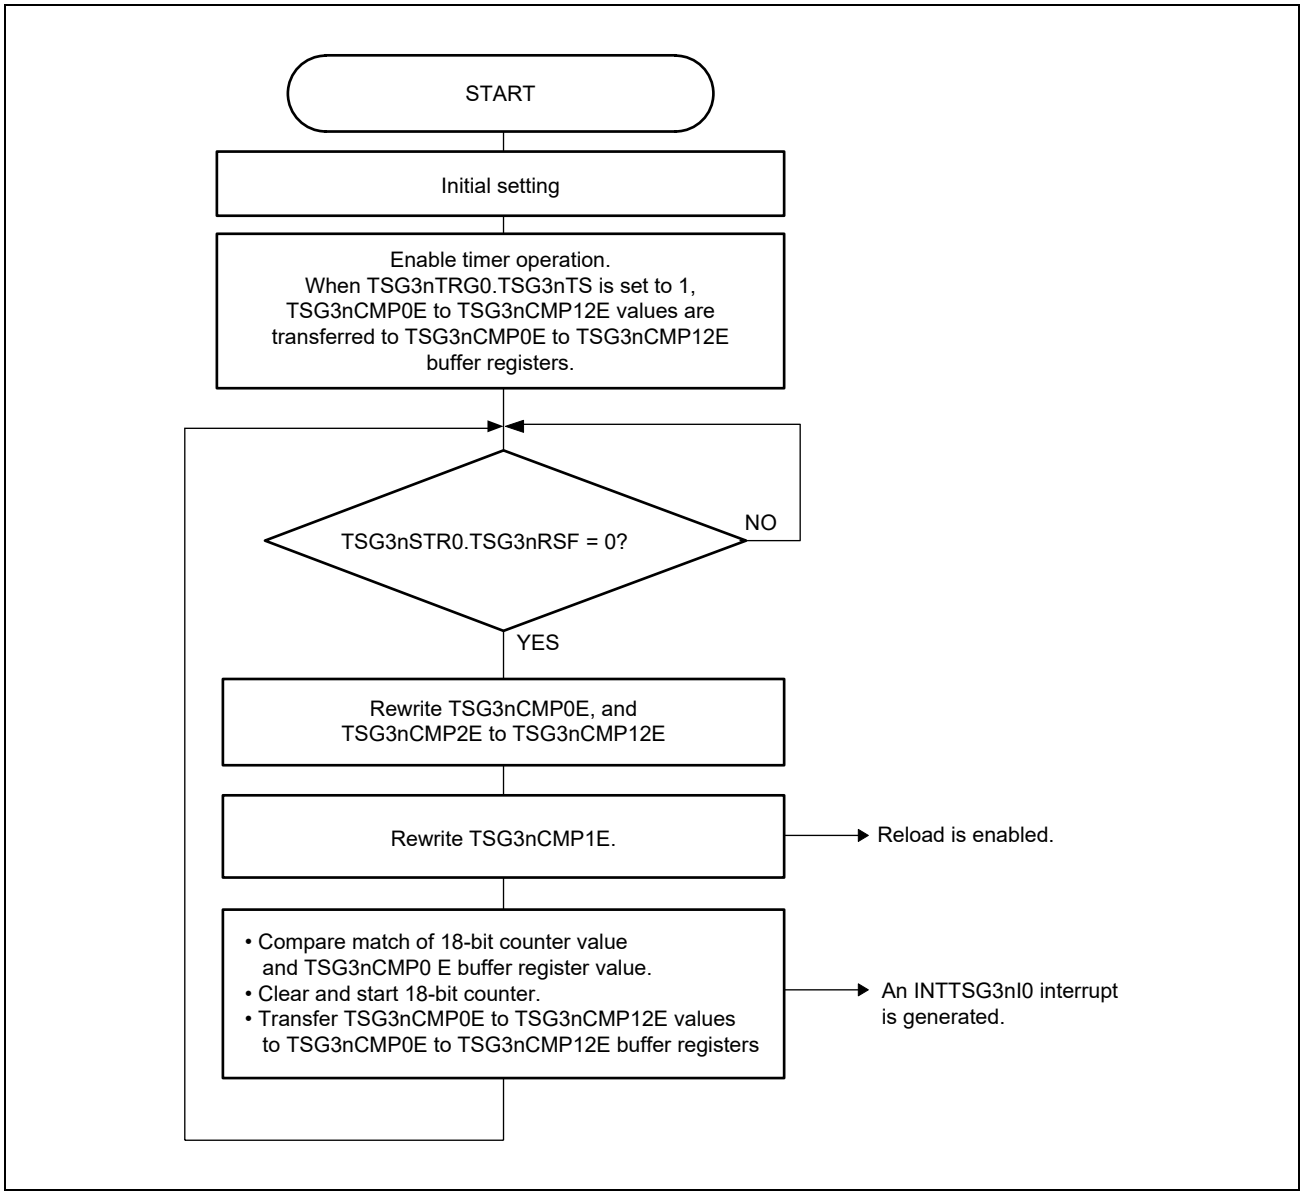

Figure 20.11 Basic Operation Flow in Reload Mode (Simultaneous Rewrite Function) (Example of PWM Mode)

CAUTION

Writing to TSG3nCMP1E also enables reloading. Therefore, TSG3nCMP1E should be rewritten after TSG3nCMP0E and TSG3nCMP2E to TSG3nCMP12E registers have been rewritten.

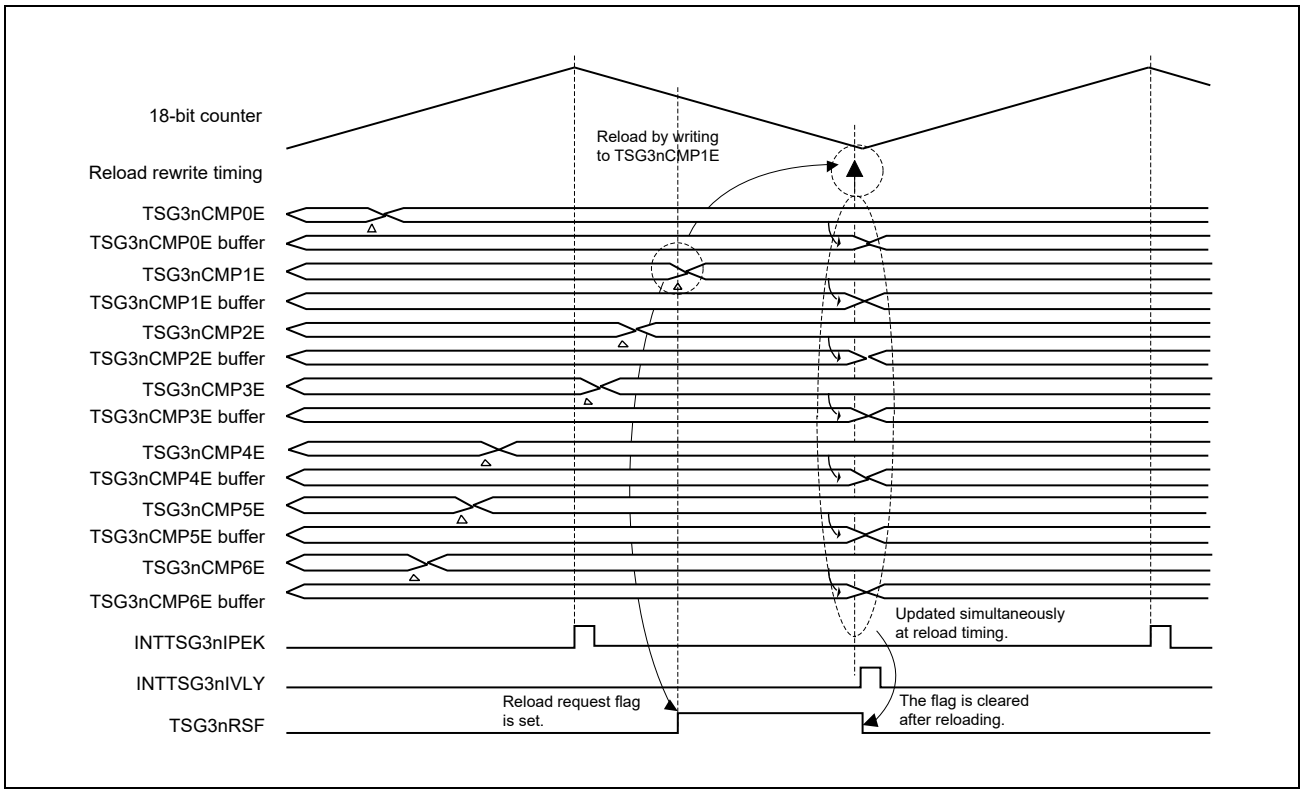

Figure 20.12 Simultaneous Rewrite Timing (Example of HT-PWM Mode) (1/2)

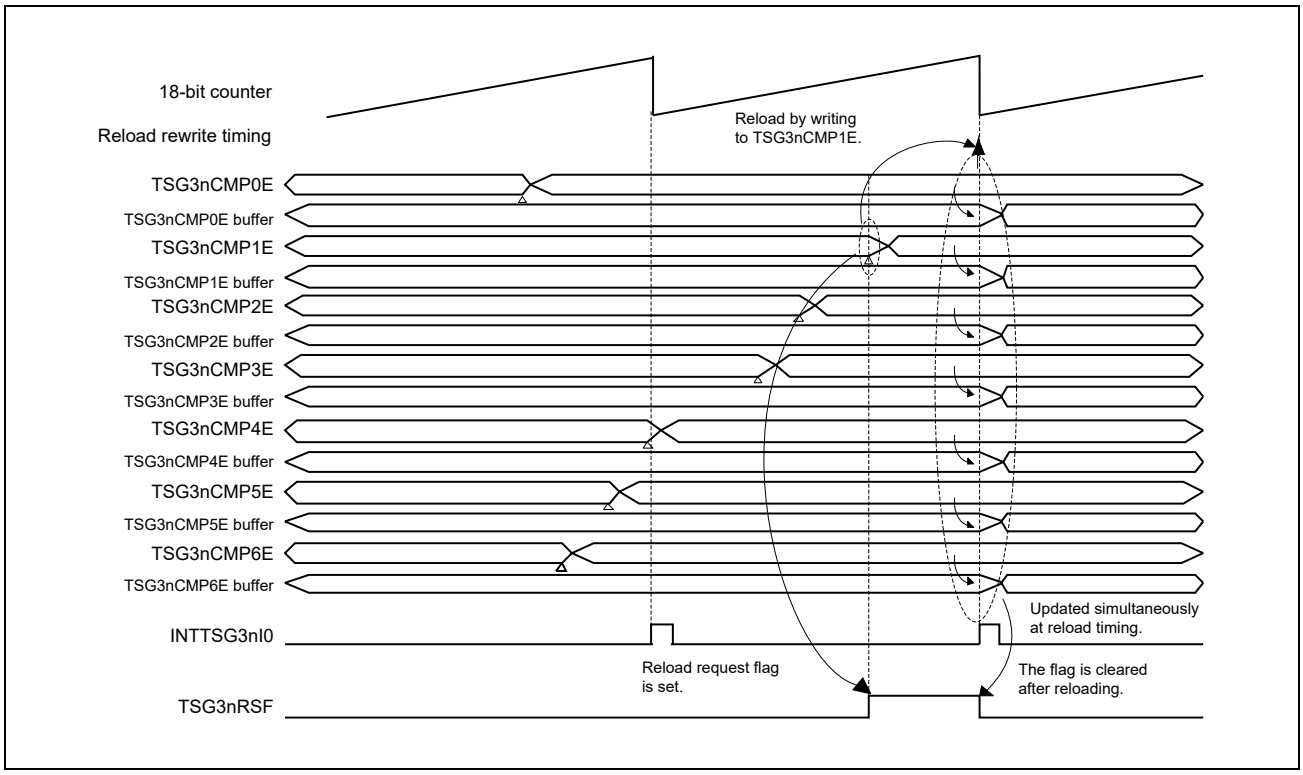

Figure 20.12 Simultaneous Rewrite Timing (Example of PWM Mode) (2/2)

(a) Reload Rewrite Setting Example in Each Mode

Reloading conditions and setting examples are shown in the following tables.

Table 20.47 List of Reload Settings (when TSG3nCTL3.TSG3nRIA = 0)

Mode	TSG3nCTL4.TSG3nPRE	TSG3nCTL4.TSG3nVRE	TSG3nCTL4.TSG3nPIE	TSG3nCTL4.TSG3nVIE	TSG3nCTL4.TSG3nRCC04-TSG3nRCC00	Reload

20.4.1.4 List or Outputs in Each Mode

The list of timer outputs (TSG3nO0-7 pins) in each mode is shown in the following tables.

Table 20.49 List of Timer Outputs in Each mode (1/3)

Operating Mode	TSG3nO0 Pin	TSG3nO1 Pin	TSG3nO2 Pin
PWM mode	— (Fixed to low)	Outputs a PWM signal by compare match of TSG3nCMP1E and TSG3nCMP2E.	Outputs a PWM signal by compare match of TSG3nCMP3E and TSG3nCMP4E.
HT-PWM mode	Outputs the status indicating whether the 18-bit counter or 18-bit sub-counter is incremented or decremented.	Outputs a positive phase PWM signal (with dead time) by compare match of TSG3nCMP1E and TSG3nCMP2E.	Outputs an inverse phase PWM signal (with dead time) to TSG3nO1 pin.
SP-PWM mode	— (Fixed to low)	Outputs a positive phase PWM signal (with dead time) by compare match of TSG3nCMP1E and TSG3nCMP2E.	Outputs an inverse phase PWM signal (with dead time) to TSG3nO1.
120-DC mode	— (Fixed to low)	Outputs a PWM signal by TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, and TSG3nCMP10E.	Outputs a PWM signal by TSG3nCMP3E, TSG3nCMP4E, TSG3nCMP7E, TSG3nCMP8E, TSG3nCMP11E, and TSG3nCMP12E.
HSP-PWM mode	— (Fixed to low)	Outputs a PWM signal by compare match of TSG3nCMP1E and TSG3nCMP2E.	Outputs a PWM signal by compare match of TSG3nCMP3E and TSG3nCMP4E.

Table 20.49 List of Timer Outputs in Each mode (2/3)

Operating Mode	TSG3nO3 Pin	TSG3nO4 Pin	TSG3nO5 Pin
PWM mode	Outputs a PWM signal by compare match of TSG3nCMP5E and TSG3nCMP6E.	Outputs a PWM signal by compare match of TSG3nCMP7E and TSG3nCMP8E.	Outputs a PWM signal by compare match of TSG3nCMP9E and TSG3nCMP10E.
HT-PWM mode	Outputs a positive phase PWM signal (with dead time) by compare match of TSG3nCMP5E and TSG3nCMP6E.	Outputs an inverse phase PWM signal (with dead time) to TSG3nO3.	Outputs a positive phase PWM signal (with dead time) by compare match of TSG3nCMP9E and TSG3nCMP10E.
SP-PWM mode	Outputs a positive phase PWM signal (with dead time) by compare match of TSG3nCMP5E and TSG3nCMP6E.	Outputs an inverse phase PWM signal (with dead time) to TSG3nO3.	Outputs a positive phase PWM signal (with dead time) by compare match of TSG3nCMP9E and TSG3nCMP10E.
120-DC mode	Outputs a PWM signal by TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, and TSG3nCMP10E.	Outputs a PWM signal by TSG3nCMP3E, TSG3nCMP4E, TSG3nCMP7E, TSG3nCMP8E, TSG3nCMP11E, and TSG3nCMP12E.	Outputs a PWM signal by TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, and TSG3nCMP10E.
HSP-PWM mode	Outputs a PWM signal by compare match of TSG3nCMP5E and TSG3nCMP6E.	Outputs a PWM signal by compare match of TSG3nCMP7E and TSG3nCMP8E.	Outputs a PWM signal by compare match of TSG3nCMP9E and TSG3nCMP10E.

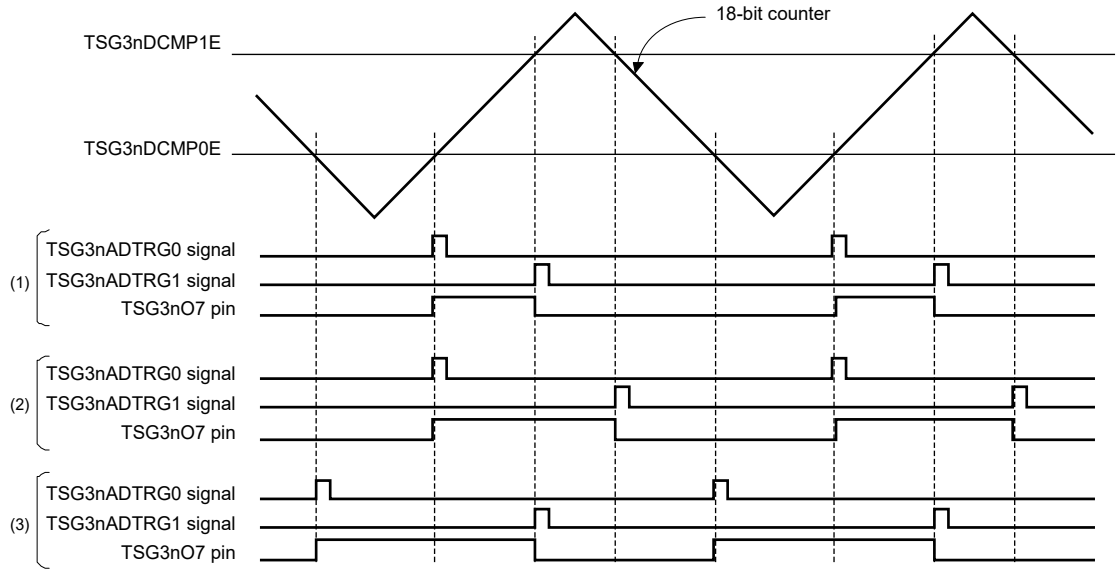

Table 20.49 List of Timer Outputs in Each mode (3/3)

Operating Mode	TSG3nO6 Pin	TSG3nO7 Pin
PWM mode	Outputs a PWM signal by compare match of TSG3nCMP11E and TSG3nCMP12E.	Outputs a diagnostic signal or A/D conversion trigger.*1
HT-PWM mode	Outputs an inverse phase PWM signal (with dead time) to TSG3nO5.	Outputs a diagnostic signal or A/D conversion trigger.*1
SP-PWM mode	Outputs an inverse phase PWM signal (with dead time) to TSG3nO5.	Outputs a diagnostic signal or A/D conversion trigger.*1
120-DC mode	Outputs a PWM signal by TSG3nCMP3E, TSG3nCMP4E, TSG3nCMP7E, TSG3nCMP8E, TSG3nCMP11E, and TSG3nCMP12E.	Outputs a diagnostic signal or A/D conversion trigger.*1
HSP-PWM mode	Outputs a PWM signal by compare match of TSG3nCMP11E and TSG3nCMP12E.	Outputs a diagnostic signal or A/D conversion trigger.*1

Note 1. For TSG3nO7, see **Section 20.4.1.4(a), TSG3nO7 Pin Output Control**.

(a) TSG3nO7 Pin Output Control

The TSG3nO7 pin can output a pulse of A/D conversion trigger (TSG3nIOC1.TSG3nTGS = 0) or diagnostic output (TSG3nIOC1.TSG3nTGS = 1). When outputting a pulse of A/D conversion trigger, the TSG3nO7 pin is activated at the rising edge of the TSG3nADTRG0 signal, and inactivated at the rising edge of the TSG3nADTRG1 signal. When the TSG3nADTRG0 signal is detected while the TSG3nO7 pin is active, the TSG3nO7 pin remains active. When the TSG3nADTRG1 signal is detected while the TSG3nO7 pin is inactive, the TSG3nO7 pin remains inactive. If TSG3nADTRG0 and TSG3nADTRG1 signal triggers occur simultaneously, the TSG3nO7 pin is inactivated.

Note: (1) When TSG3nDCMP0E register<TSG3nDCMP1E register, TSG3nCTL5 register = 0004_H, and TSG3nCTL6 register = 0010_H
(2) When TSG3nDCMP0E register<TSG3nDCMP1E register, TSG3nCTL5 register = 0004_H, and TSG3nCTL6 register = 0020_H
(3) When TSG3nDCMP0E register<TSG3nDCMP1E register, TSG3nCTL5 register = 0008_H, and TSG3nCTL6 register = 0010_H

Figure 20.13 Example of A/D Trigger Output Timing of TSG3nO7 Pin (TSG3nIOC1.TSG3nTGS = 0)

During diagnostic output, the active level is output on the TSG3nO7 pin with the width specified by the TSG3nCTL0.TSG3nDWD bit when the values of the TSG3nDCMP0E to TSG3nDCMP2E bits match that of the 18-bit counter. If a TSG3nDCMP0E to TSG3nDCMP2E value again matches the value of the 18-bit counter value while the diagnostic output on the TSG3nO7 pin is already at the active level, pulse output on the TSG3nO7 pin continues for the number of cycles of PCLK (8 or 16) set by the TSG3nDWD bit from the point of the later match.

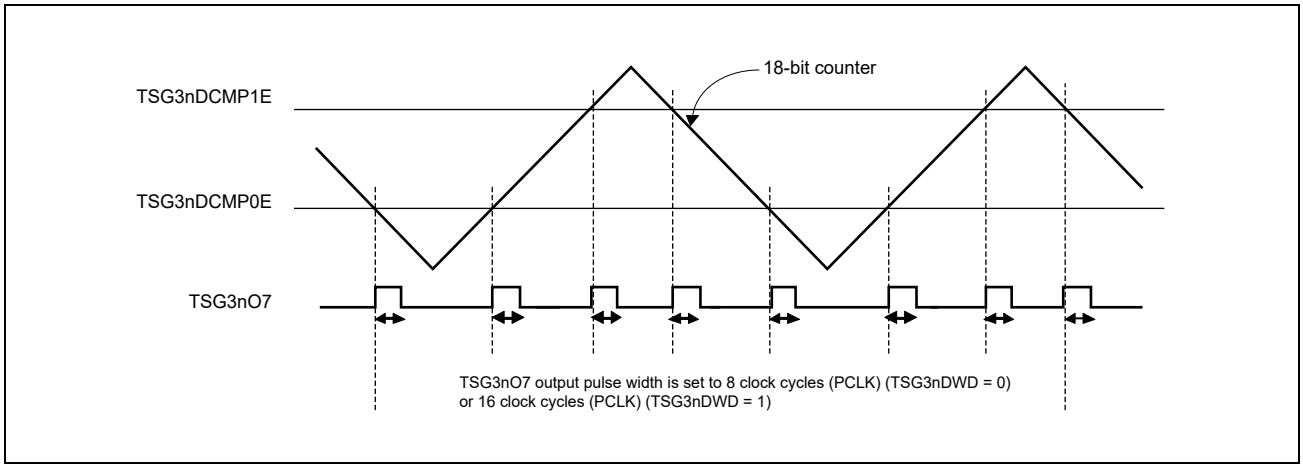

Figure 20.14 Example of TSG3nO7 Pin Diagnostic Pulse Output Timing (1) (TSG3nIOC1.TSG3nTGS = 1)

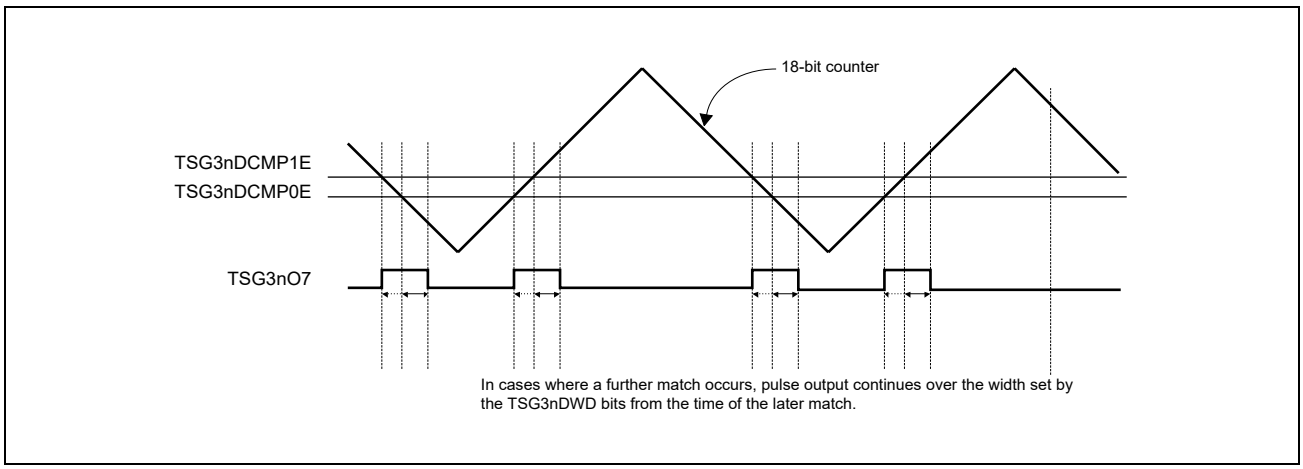

Figure 20.15 Example of TSG3nO7 Pin Diagnostic Pulse Output Timing (2) (with Pulse Output Width Overlapped)

20.4.2 Match Interrupt

The TSG3n can generate interrupts such as a compare match interrupt (INTTSG3nIm), a peak interrupt (INTTSG3nIPEK), and a trough interrupt (INTTSG3nIVLY). For an error interrupt and warning interrupt (INTTSG3nIER and INTTSG3nIWN), see Section **20.4.6, Error/Warning Interrupt**.

A period interrupt (INTTSG3nI0) is generated for each timer period. In HT-PWM mode, it is generated when the TSG3nDTC0 buffer register value matches with the 18-bit counter value. When the 18-bit counter performs sawtooth waveform operation (PWM mode, SP-PWM mode, 120-DC mode, and HSP-PWM mode), it is generated after the 18-bit counter value has matched with the TSG3nCMP0E buffer register value.

A compare-match interrupt (INTTSG3nIm) is generated by a match of the TSG3nCMPmE buffer register value with the 18-bit counter value depending on the compare register to be used in each operating mode (m = 1 to 12).

A peak interrupt (INTTSG3nIPEK) is generated in all the modes. In HT-PWM mode, it is generated when the 18-bit counter switches from incrementing to decrementing. When the 18-bit counter performs sawtooth waveform operation (PWM mode, SP-PWM mode, 120-DC mode, and HSP-PWM mode), it is generated after the 18-bit counter value has matched with the TSG3nCMP0E buffer register value (the same timing as an INTTSG3nI0 interrupt).

A trough interrupt (INTTSG3nIVLY) is generated when the 18-bit counter switches from decrementing to incrementing in HT-PWM mode.

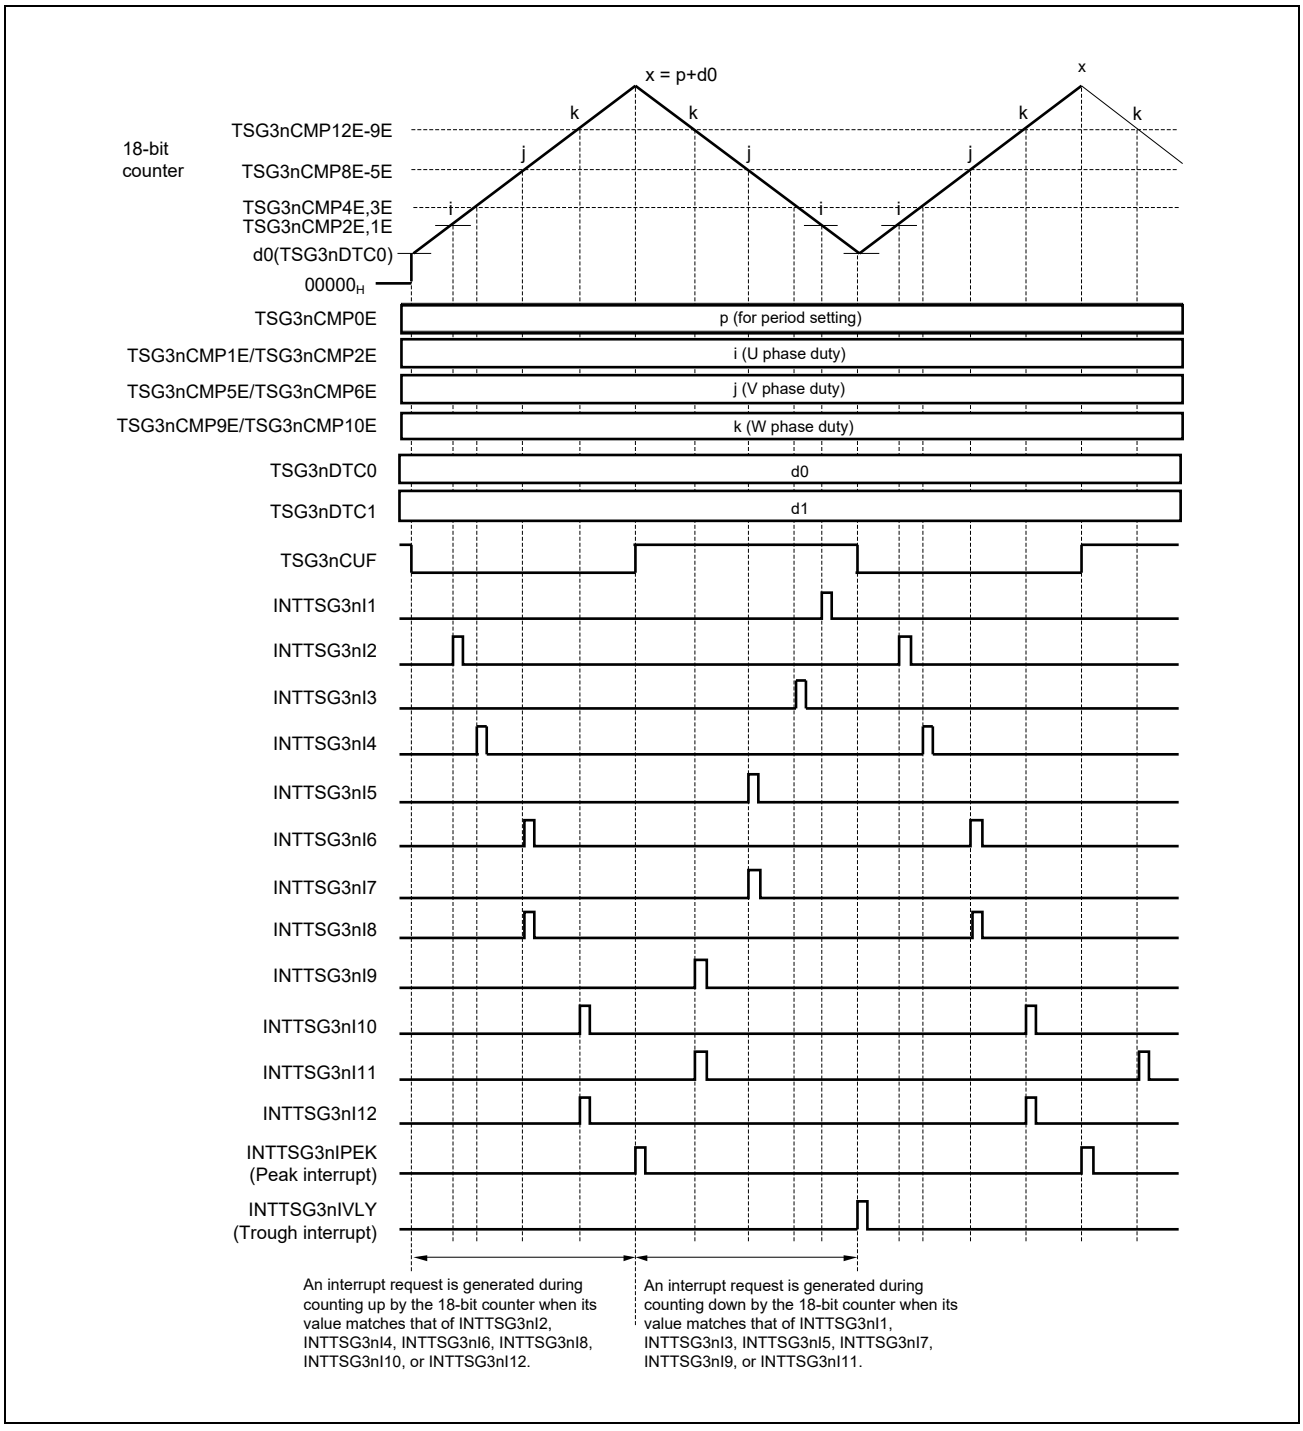

Figure 20.16 Interrupt Generation Example (Example of HT-PWM Mode)

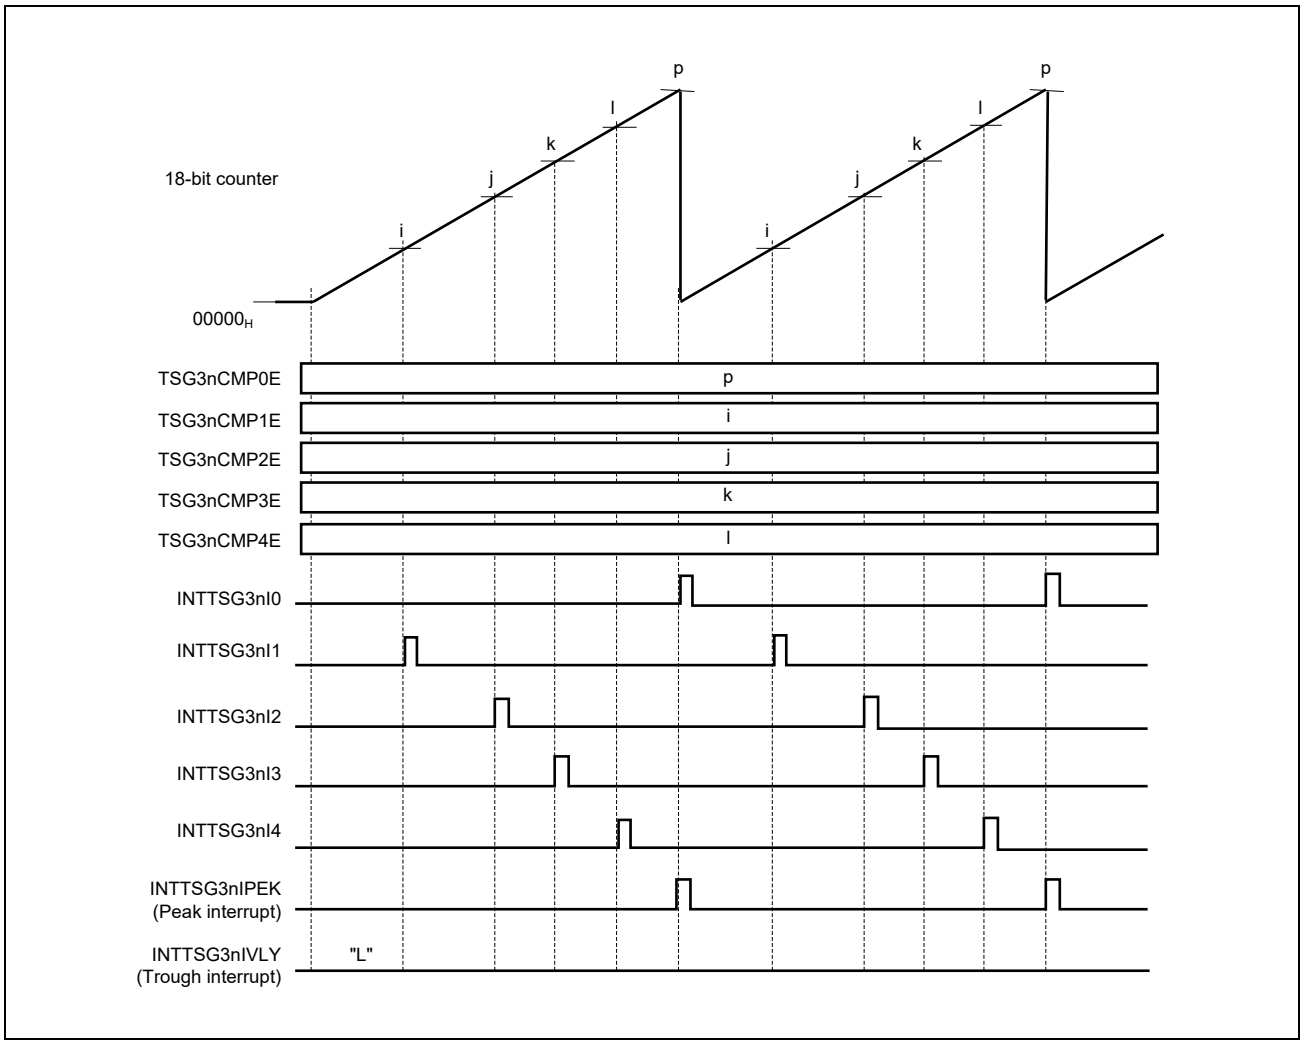

Figure 20.17 Interrupt Generation Example (Example of PWM Mode)

Interrupt in each mode (INTTSG3nI0 to INTTSG3nI12, INTTSG3nIPEK, INTTSG3nIVLY, INTTSG3nIER, and INTTSG3nIWN) are listed in **Table 20.50**.

Table 20.50 List of Interrupts in Each Mode (1/5)

Operating Mode	INTTSG3nI0	INTTSG3nI1	INTTSG3nI2	INTTSG3nI3
PWM mode	TSG3nCMP0E compare match interrupt	TSG3nCMP1E compare match interrupt*1	TSG3nCMP2E compare match interrupt*1	TSG3nCMP3E compare match interrupt*1
HT-PWM mode	Period interrupt	TSG3nCMP1E compare match interrupt*2 when decrementing (TSG3nCUF = 1)	TSG3nCMP2E compare match interrupt*2 when incrementing (TSG3nCUF = 0)	TSG3nCMP3E compare match interrupt*2 when decrementing (TSG3nCUF = 1)
SP-PWM mode	TSG3nCMP0E compare match interrupt	TSG3nCMP1E compare match interrupt*1	TSG3nCMP2E compare match interrupt*1	—
120-DC mode	TSG3nCMP0E compare match interrupt	TSG3nCMP1E compare match interrupt*1	TSG3nCMP2E compare match interrupt*1	TSG3nCMP3E compare match interrupt*1
HSP-PWM mode	TSG3nCMP0E compare match interrupt	TSG3nCMP1E compare match interrupt*1	TSG3nCMP2E compare match interrupt*1	TSG3nCMP3E compare match interrupt*1

Note 1. A compare match interrupt is not generated when TSG3nCMP0E < TSG3nCMPmE (m = 1 to 12).

Note 2. A compare match interrupt is not generated when $00000_H \leq$ TSG3nCMPmE < TSG3nDTC0, (TSG3nCMP0E + TSG3nDTC0) < TSG3nCMPmE

Table 20.50 List of Interrupts in Each Mode (2/5)

Operating Mode	INTTSG3nI4	INTTSG3nI5	INTTSG3nI6	INTTSG3nI7
PWM mode	TSG3nCMP4E compare match interrupt*1	TSG3nCMP5E compare match interrupt*1	TSG3nCMP6E compare match interrupt*1	TSG3nCMP7E compare match interrupt*1
HT-PWM mode	TSG3nCMP4E compare match interrupt*2 when incrementing (TSG3nCUF = 0)	TSG3nCMP5E compare match interrupt*2 when decrementing (TSG3nCUF = 1)	TSG3nCMP6E compare match interrupt*2 when incrementing (TSG3nCUF = 0)	TSG3nCMP7E compare match interrupt*2 when decrementing (TSG3nCUF = 1)
SP-PWM mode	—	TSG3nCMP5E compare match interrupt*1	TSG3nCMP6E compare match interrupt*1	—

20.4.3.1 Up Count Flag (TSG3nCUF, TSG3nSUF)

Name

Up count flag (TSG3nSTR0.TSG3nCUF and TSG3nSUF)

Description

There are following two up count flags.

TSG3nCUF is an up/down count flag of the 18-bit counter.

TSG3nSUF is an up/down count flag of the 18-bit sub-counter.

For both TSG3nCUF and TSG3nSUF, 0 means increment, and 1 means decrement. TSG3nCUF and TSG3nSUF can be used only in HT-PWM mode.

Example of operation

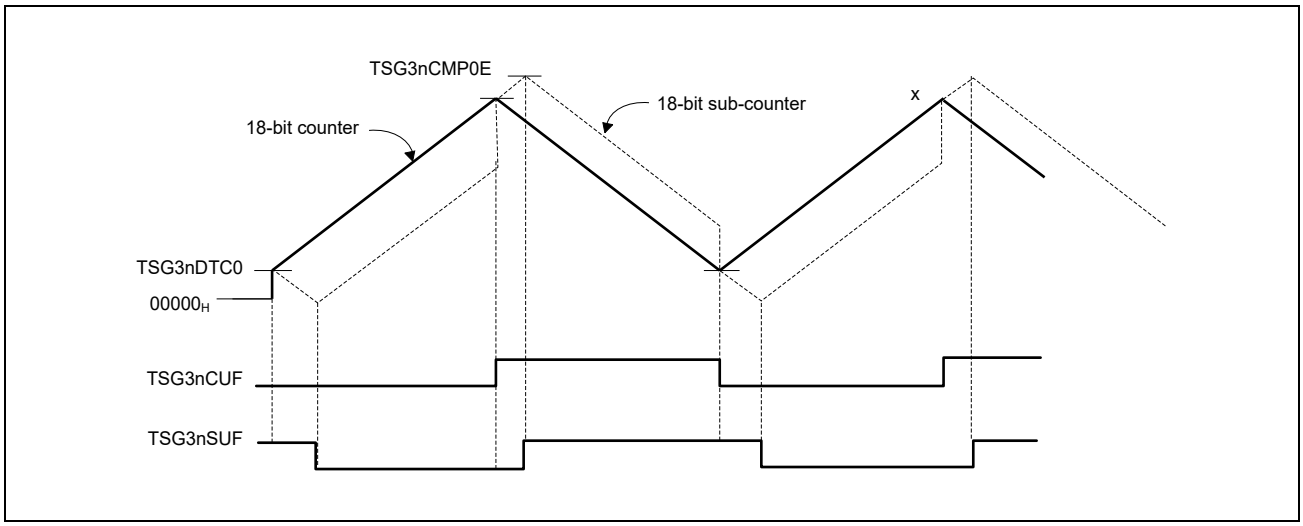

Figure 20.18 Example of Up Count Flag Operation

NOTES

1. TSG3nCUF value is:
   0 (up count) when TSG3nDTC0 ≤ 18-bit counter ≤ (TSG3nCMP0E + TSG3nDTC0-2)
   1 (down count) when (TSG3nCMP0E + TSG3nDTC0) ≥ 18-bit counter ≥ TSG3nDTC0 + 2
2. TSG3nSUF value is:
   0 (up count) when 0 ≤ 18-bit sub-counter ≤ (TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1-2)
   1 (down count) when (TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1) ≥ 18-bit sub-counter ≥ 2

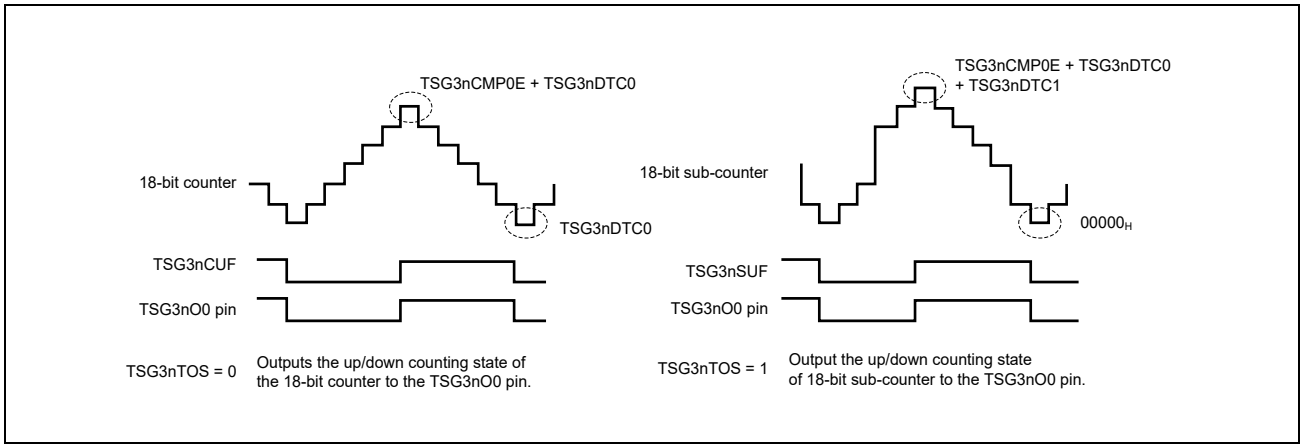

Figure 20.19 TSG3nO0 Pin Output depending on TSG3nIOC1.TSG3nTOS Setting

Operating Mode

TSG3nCUF and TSG3nSUF can be used only in HT-PWM mode.

20.4.3.2 Positive Phase and Inverse Phase Simultaneous Active State Detection Flag (TSG3nTBF0 to TSG3nTBF2)

Name

Positive phase and inverse phase simultaneous active state detection flag
(TSG3nSTR2.TSG3nTBF0 to TSG3nTBF2 flags)

Description

When any of TSG3nCTL1.TSG3nTBA2 to TSG3nTBA0 is 1, TSG3nTBF0 to TSG3nTBF2 can detect the simultaneous active state of the positive phase and inverse phase of TSG3n.

When the simultaneous active state of the positive phase and inverse phase of the TSG3n is detected, the corresponding TSG3nTBF0 to TSG3nTBF2 flags are set to 1, and an error interrupt (INTTSG3nIER) is generated. The flags are cleared when 1 is written to TSG3nSTC.TSG3nTBR0 to TSG3nTBR2, respectively.

Example of operation

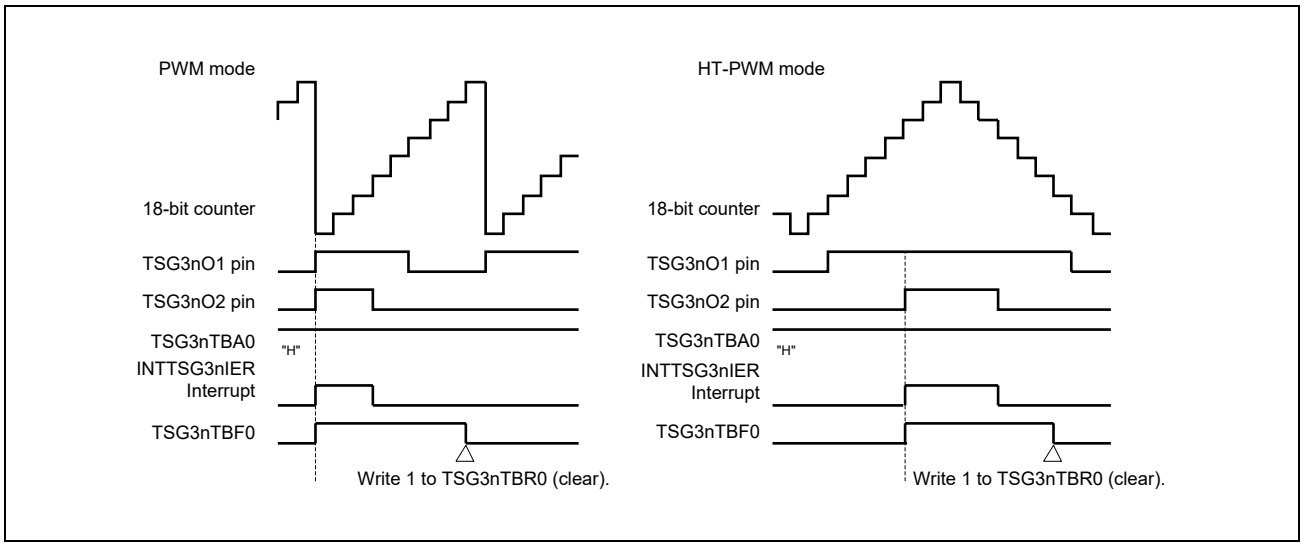

Figure 20.20 Example of Positive Phase and Inverse Phase Simultaneous Active State Detection Flag Operation

Operating Mode

Available in all operating modes.

CAUTION

TSG3nTBF0 to TSG3nTBF2 are valid only when TSG3nCTL1.TSG3nTBA0 to TSG3nTBA2 = 1 and TSG3nSTR0.TSG3nTE = 1.

20.4.3.3 Reload Request Flag (TSG3nRSF)

Name

Reload request flag (TSG3nSTR0.TSG3nRSF)

Description

TSG3nRSF is set to 1 when a reload request is generated (when a value is written to TSG3nCMP1E (TSG3nCMP1, TSG3nCMP1W, TSG3nCMPUE, TSG3nCMPU, TSG3nUPWE, TSG3nUPW, and TSG3nHSPCMUE)), and cleared to 0 when the value is transferred to all the buffer registers.

Example of operation

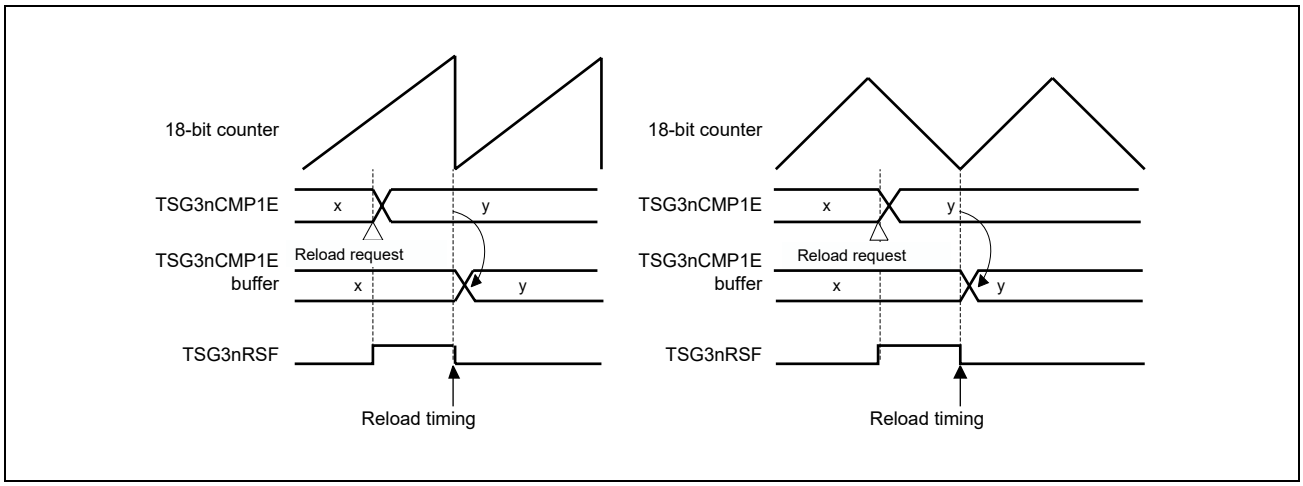

Figure 20.21 Example of Reload Request Flag Operation

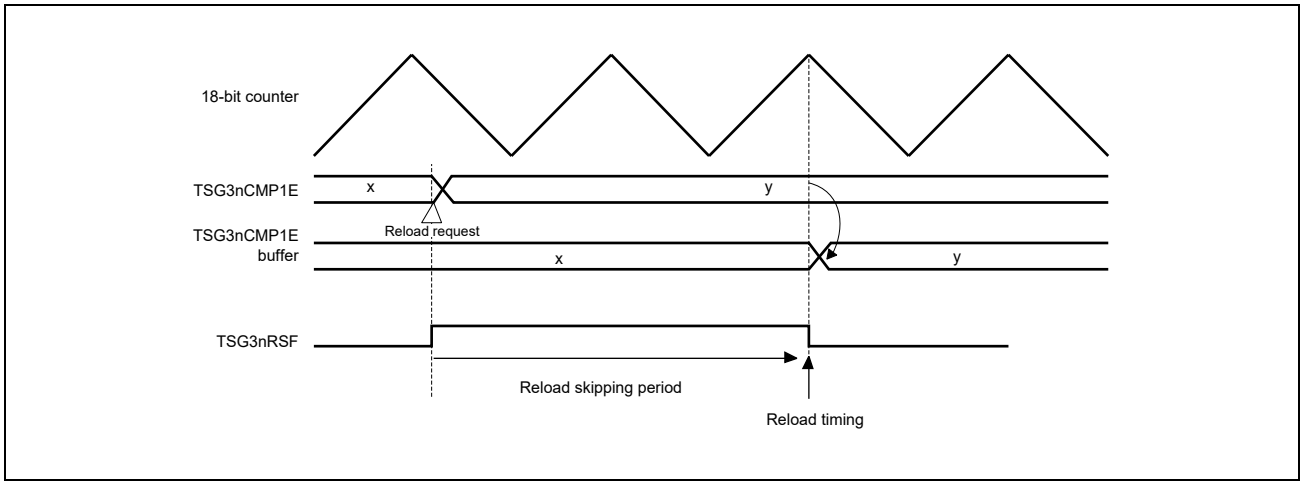

Figure 20.22 Reload Request Flag and Reload Skipping Period

Operating Mode

Available in all operating modes.

20.4.3.4 Noise Detection Flag (TSG3nNDF)

Name

Noise detection flag (TSG3nSTR2.TSG3nNDF)

Description

TSG3nNDF can detect that two or more pins of TSG3nPTSI2 to TSG3nPTSI0 have changed simultaneously (a noise is generated).

TSG3nNDF is set to 1 when two or more pins of TSG3nPTSI2 to TSG3nPTSI0 have changed simultaneously (a noise is generated), and a warning interrupt (INTTSG3nIWN) is generated. The TSG3nNDF flag is cleared to 0 when 1 is written to the TSG3nSTC.TSG3nNDR bit.

Example of operation

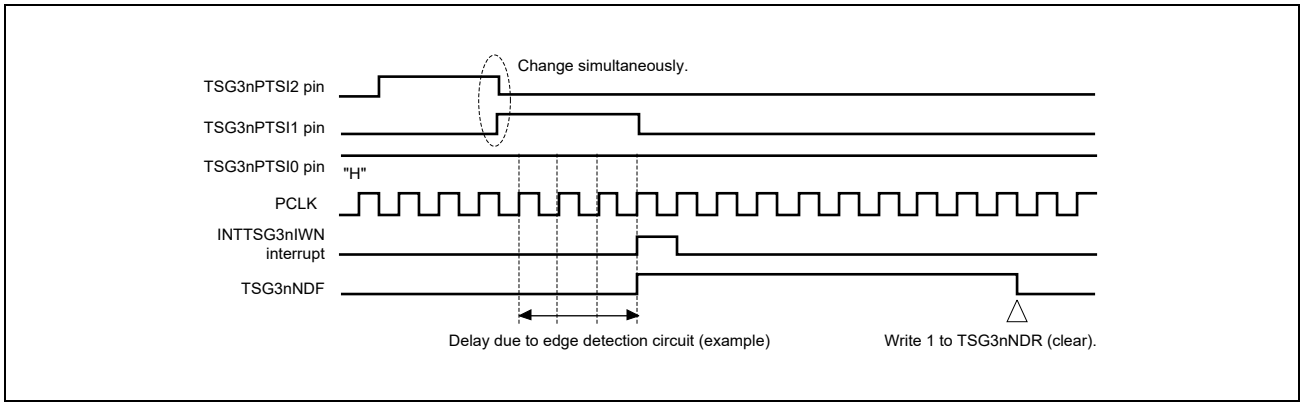

Figure 20.23 Example of Noise Detection Flag Operation

Operation mode

Available in all operating modes.

CAUTION

TSG3nNDF is valid only when TSG3nCTL1.TSG3nNDC = 1 and TSG3nSTR0.TSG3nTE = 1.

20.4.3.5 Pattern Order Detection Flag (TSG3nTSF)

Name

Pattern order detection flag (TSG3nSTR1.TSG3nTSF)

Description

TSG3nTSF can detect the order of patterns input to the TSG3nPTSI2 to TSG3nPTSI0 pins.

TSG3nTSF is set depending on the values input to the TSG3nPTSI2 to TSG3nPTSI0 pins as shown in the table below

Table 20.52 Pattern Order Detection Flag and Pattern Input Order

TSG3nTSF	Values Input to TSG3nPTSI2 to TSG3nPTSI0 Pins
0	[1,0,1] → [1,0,0] → [1,1,0] → [0,1,0] → [0,1,1] → [0,0,1]
1	[1,0,1] ← [1,0,0] ← [1,1,0] ← [0,1,0] ← [0,1,1] ← [0,0,1]

Example of operation

(a) When Normal Input to TSG3nPTSI2 to TSG3nPTSI0 Pins is Detected

As shown in **Figure 20.24**, if the TSG3nPTSI2 to TSG3nPTSI0 pins change in the normal order, 0 or 1 is set according to the change order at the change timing.

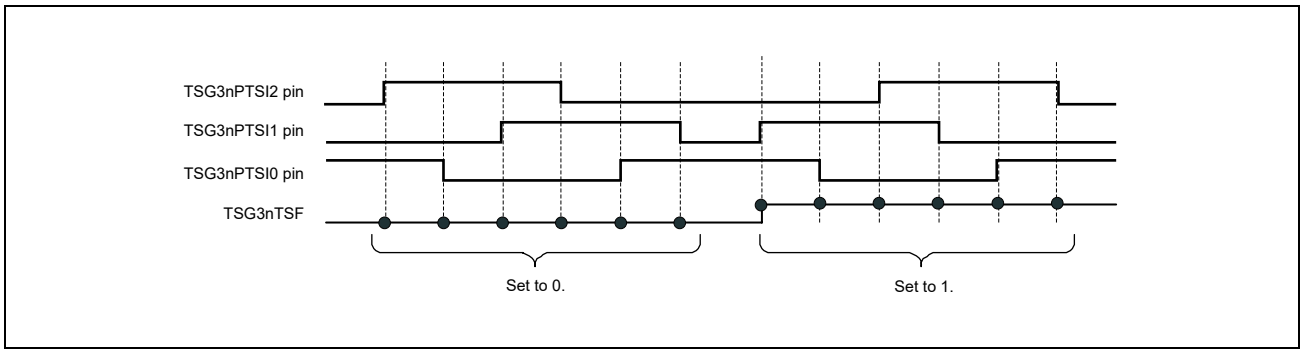

Figure 20.24 Example of Pattern Order Detection Flag Operation (Normal Operation)

(b) Detection of Input Pattern Order

Immediately after TSG3n starts operation, the rotation direction cannot be determined. Therefore, TSG3nTSF cannot detect the change (normal or reverse rotation) in the patterns input to the TSG3nPTSI2 to TSG3nPTSI0 pins. To enable detection of change immediately after the beginning of operation, TSG3nPSC should be set before operation starts (when TSG3nTE = 0, the TSG3nPSC value is reflected).

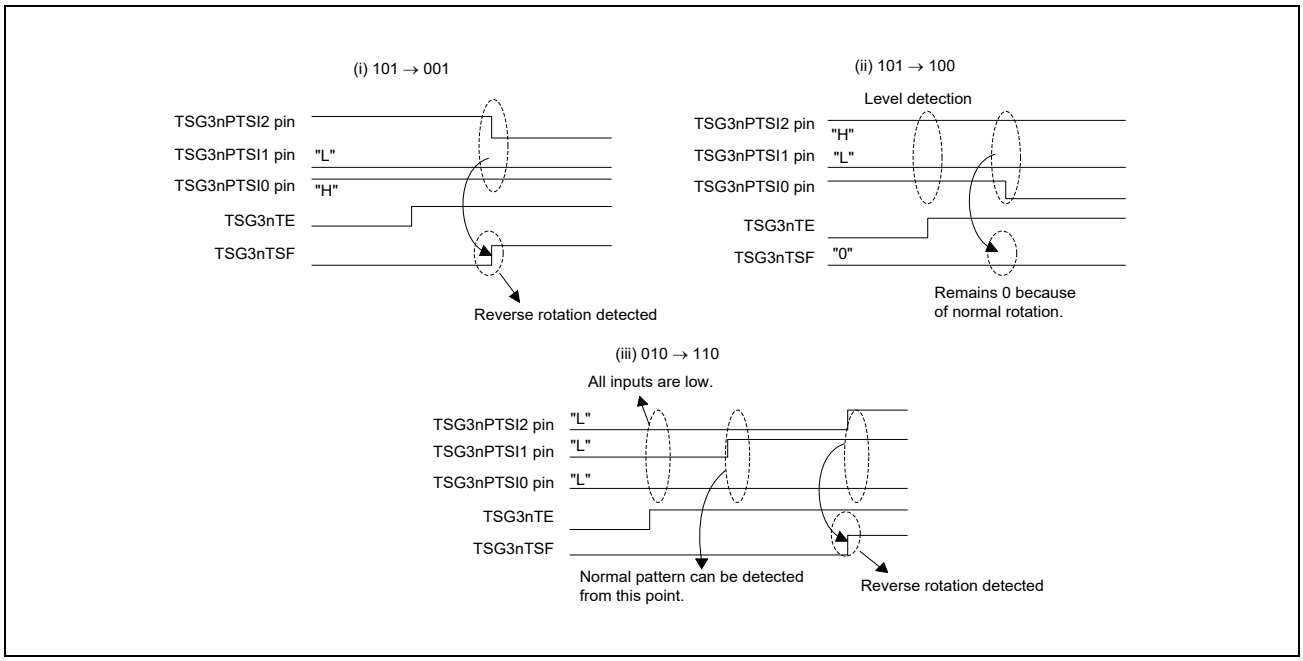

Figure 20.25 Example of Detecting Change (Normal/Reverse Rotation) in Pattern Input to TSG3nPTSI2 to TSG3nPTSI0 Pins

(c) When Abnormal Input to TSG3nPTSI2 to TSG3nPTSI0 Pins is Detected

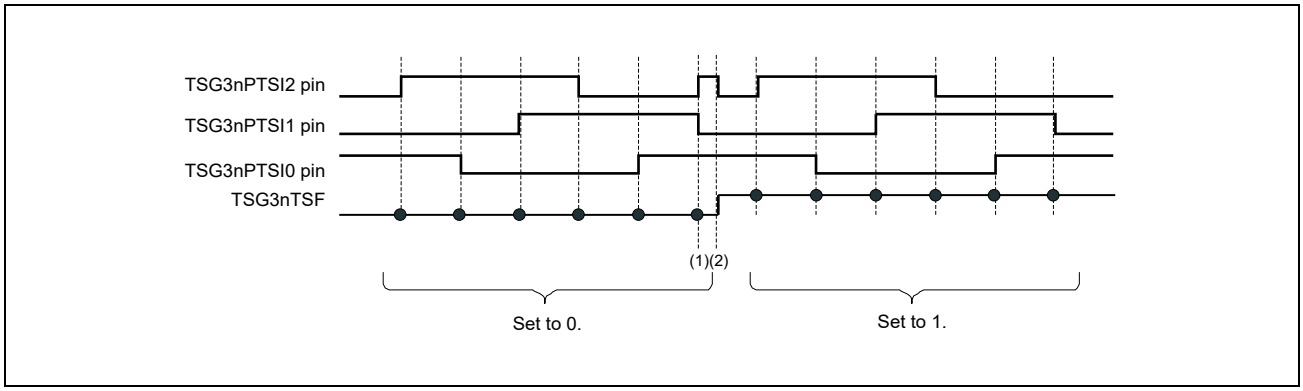

Figure 20.26 Example of Operation when Values Input to Two Pins of TSG3nPTSI2 to TSG3nPTSI0 Change (Abnormal Operation)

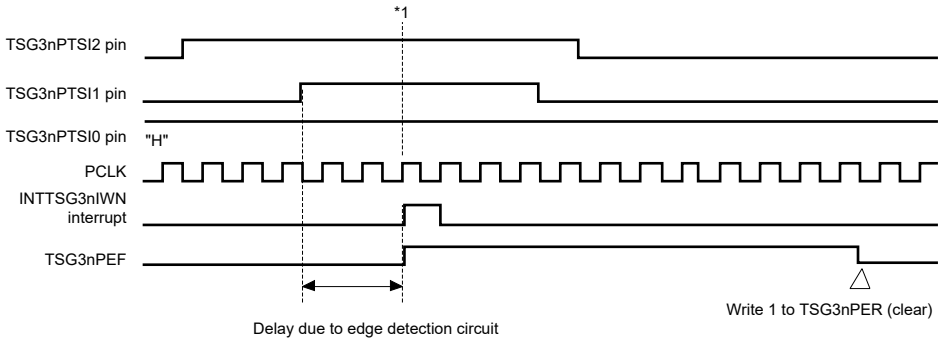
(1) TSG3nTSF does not change at this point because it expects the input pattern change to {0, 1, 0} or {0, 0, 1} (if values of two pins change, TSG3nTSF does not change).
(2) TSG3nPTSI2 to TSG3nPTSI0 pins are determined to have been changed from {1, 0, 1} to {0, 0, 1}, and TSG3nTSF is set to 1.

Operation mode

Available in all operating modes.

20.4.3.6 Pattern Error Detection Flag (TSG3nPEF)

Name



Pattern error detection flag (TSG3nSTR2.TSG3nPEF)

Description

TSG3nPEF can detect that 000 or 111 is input to the TSG3nPTSI2 to TSG3nPTSI0 pins.

TSG3nPEF is set to 1 when the levels of the TSG3nPTSI2 to TSG3nPTSI0 pins are 111 or 000, and a warning interrupt (INTTSG3nIWN) is generated. TSG3nPEF is cleared to 0 when 1 is written to TSG3nSTC.TSG3nPER.

Example of operation

Note 1. 111 is detected

Figure 20.27 Example of Pattern Error Detection Flag Operation (TSG3nPTSI2 to TSG3nPTSI0 Pins = 111)

Operation mode

Available in all operating modes.

CAUTION

TSG3nPEF is valid only when TSG3nCTL1.TSG3nPEC = 1 and TSG3nSTR0.TSG3nTE = 1.

20.4.3.7 Pattern Reversal Detection Flag (TSG3nPRF)

Name

Pattern reversal detection flag (TSG3nSTR2.TSG3nPRF)

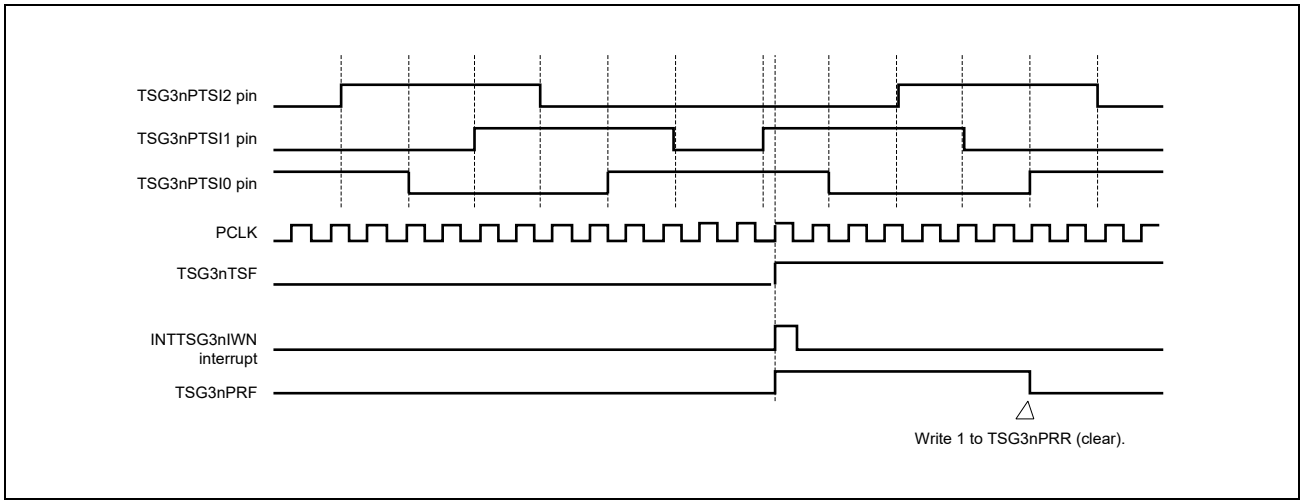
Description

TSG3nPRF can detect that the pattern change order of the TSG3nPTSI2 to TSG3nPTSI0 pins have been reversed.

TSG3nPRF is set to 1 when the pattern order detection flag (TSG3nTSF) changes, and a warning interrupt (INTTSG3nIWN) is generated. However, immediately after TSG3nSTR0.TSG3nTE is set to 1, TSG3nPRF is valid at the timing of the second and subsequent change in TSG3nPTSI2 to TSG3nPTSI0 pins.

TSG3nPRF is cleared to 0 when 1 is written to the TSG3nSTC.TSG3nPRR bit.

Example of operation



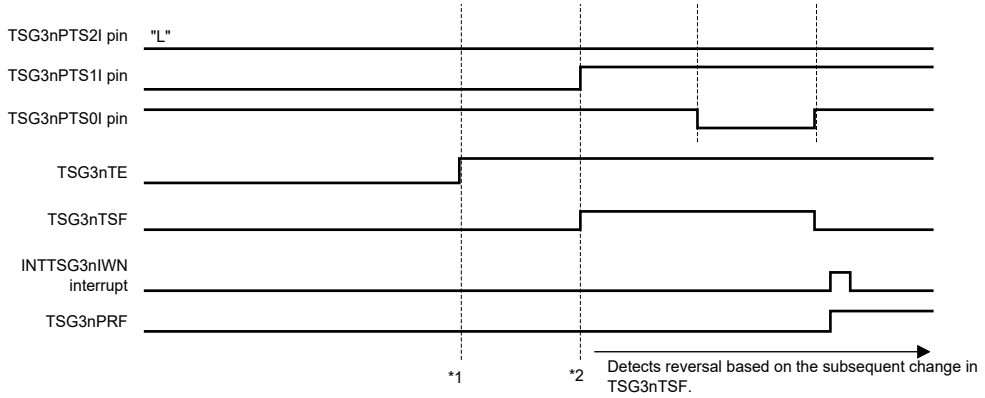


Figure 20.28 Example of Pattern Reversal Detection Flag Operation

Note 1. Operation starts.

Note 2. If TSG3nTSF is set to 1 by the first change in the TSG3nPTSI2 to TSG3nPTSI0 pins immediately after TSG3nTE is set to 1, reversal is not detected.

Figure 20.29 Example of Operation immediately after TSG3nTE Flag in TSG3nSTR0 is Set to 1

Operation mode

Available in all operating modes.

CAUTION

TSG3nPRF is valid only when TSG3nCTL1.TSG3nPRC = 1 and TSG3nSTR0.TSG3nTE = 1.

20.4.3.8 TSG3nPTSI2 to TSG3nPTSI0 Pin Abnormal Toggle Detection Flag (TSG3nPTF)

Name

TSG3nPTSI2 to TSG3nPTSI0 pin abnormal toggle detection flag (TSG3nSTR2.TSG3nPTF)

Description

TSG3nPTF can detect that the values of the TSG3nPTSI2 to TSG3nPTSI0 pins change three or more times during the TSG3nOPCI0 or TSG3nOPCI1 signal trigger.

TSG3nPTF is set to 1 when the third trigger of TSG3nOPCI0 or TSG3nOPCI1 signal occurs simultaneously with the change in TSG3nPTSI2 to TSG3nPTSI0, and a warning interrupt (INTTSG3nIWN) is generated.

TSG3nPTF is cleared to 0 when 1 is written to TSG3nSTC.TSG3nPTR.

Example of operation

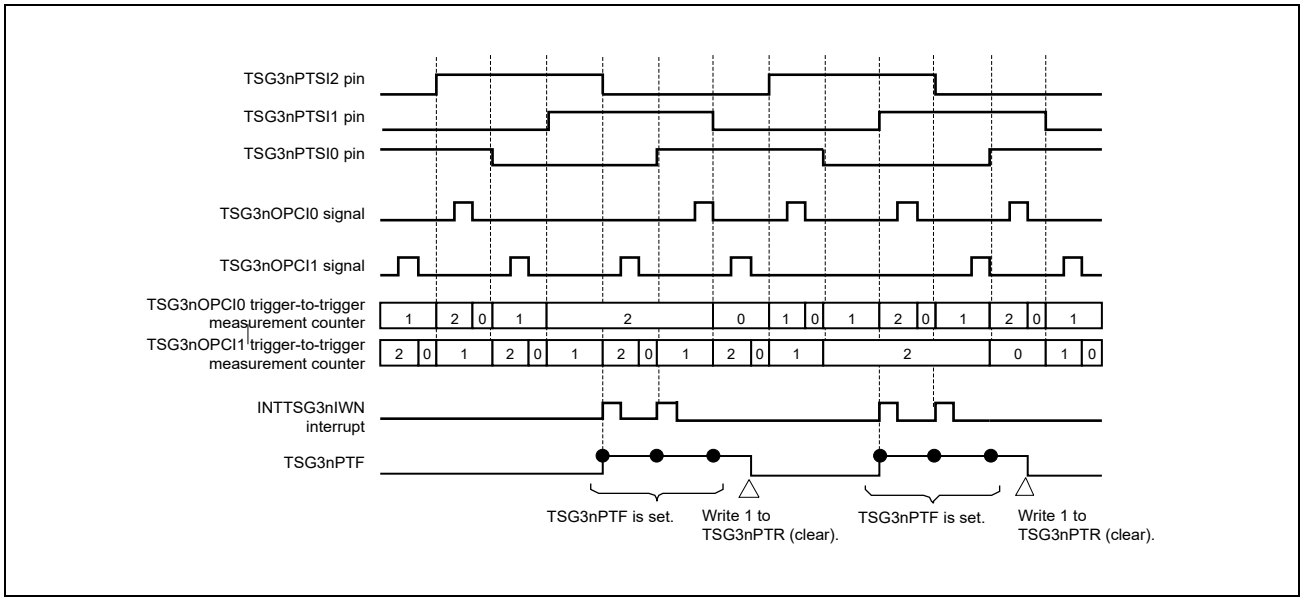

Figure 20.30 Operation of TSG3nPTSI2 to TSG3nPTSI0 Pin Abnormal Toggle Detection Flag Operation

Operating mode

Available in all operating modes.

NOTES

1. TSG3nPTF is valid only when TSG3nCTL1.TSG3nPTC1 bit = 1 and TSG3nSTR0.TSG3nTE = 1.
2. When TSG3nPTC0 bit = 1 and TSG3nPTC1 bit = 1, TSG3nO1 to TSG3nO6 pin output switch control is automatically switched to pattern switch method (TSG3nOPT0.TSG3nPOT bit = 0) if an abnormal toggle is detected.

20.4.3.9 TSG3nOPCI0, TSG3nOPCI1 Signal Simultaneous Trigger Detection Flag (TSG3nTDF)

Name

TSG3nOPCI0 and TSG3nOPCI1 signal simultaneous trigger detection flag (TSG3nSTR2.TSG3nTDF)

Description

TSG3nTDF can detect that TSG3nOPCI0 and TSG3nOPCI1 signals are generated simultaneously.

TSG3nTDF is set to 1 when the TSG3nOPCI0 and TSG3nOPCI1 signals are generated simultaneously, and a warning interrupt (INTTSG3nIWN) is generated. TSG3nTDF is cleared to 0 when 1 is written to TSG3nSTC.TSG3nTDR.

Example of operation

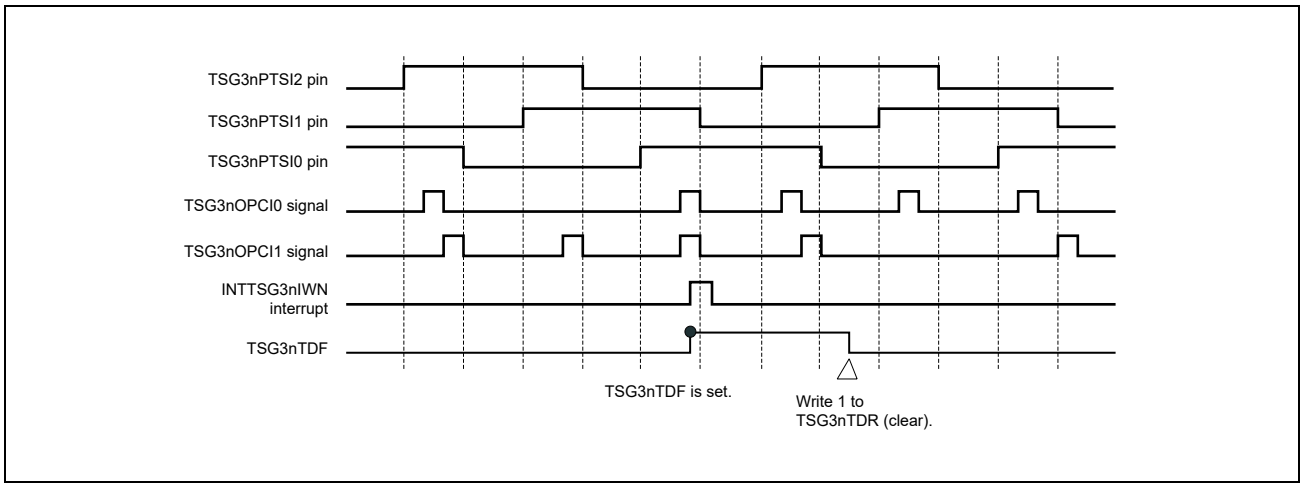

Figure 20.31 Operation of TSG3nPTSI2 to TSG3nPTSI0 Pin Abnormal Toggle Detection Flag Operation

Operating mode

Available in all operating modes.

CAUTION

TSG3nTDF is valid only when TSG3nCTL1.TSG3nTDC = 1 and TSG3nSTR0.TSG3nTE = 1.

20.4.3.10 Pattern Phase Difference Detection Flag (TSG3nPPF)

Name

Pattern phase difference detection flag (TSG3nSTR2.TSG3nPPF)

Description

TSG3nPPF can detect the phase difference between the input pattern (TSG3nPTSI2 to TSG3nPTSI0 pins) and the output pattern (TSG3nSTR1.TSG3nOPF2 to TSG3nOPF0 flags).

TSG3nPPF is set to 1 when the pattern phase difference is detected when the TSG3nOPCI0 and TSG3nOPCI1 signal triggers are input, and a warning interrupt (INTTSG3nIWN) is generated. TSG3nPPF remains 1 until it is cleared to 0 when 1 is written to TSG3nSTC.TSG3nPPR by software. When the phase difference is detected, TSG3nPPF is set at each operation clock cycle (PCLK). TSG3nPPF should be cleared to 0 when no phase difference occurs.

Table 20.53 Correspondence between Normal Input Patterns and Output Patterns

TSG3nPTSI2 to TSG3nPTSI0 pins (Input)	“1, 0, 1”	“1, 0, 0”	“1, 1, 0”	“0, 1, 0”	“0, 1, 1”	“0, 0, 1”
TSG3nOPF2 to TSG3nOPF0 flags (Output)	“0, 0, 1” “1, 0, 1” “1, 0, 0”	“1, 0, 1” “1, 0, 0” “1, 1, 0”	“1, 0, 0” “1, 1, 0” “0, 1, 0”	“1, 1, 0” “0, 1, 0” “0, 1, 1”	“0, 1, 0” “0, 1, 1” “0, 0, 1”	“0, 1, 1” “0, 0, 1” “1, 0, 1”

Example of operation

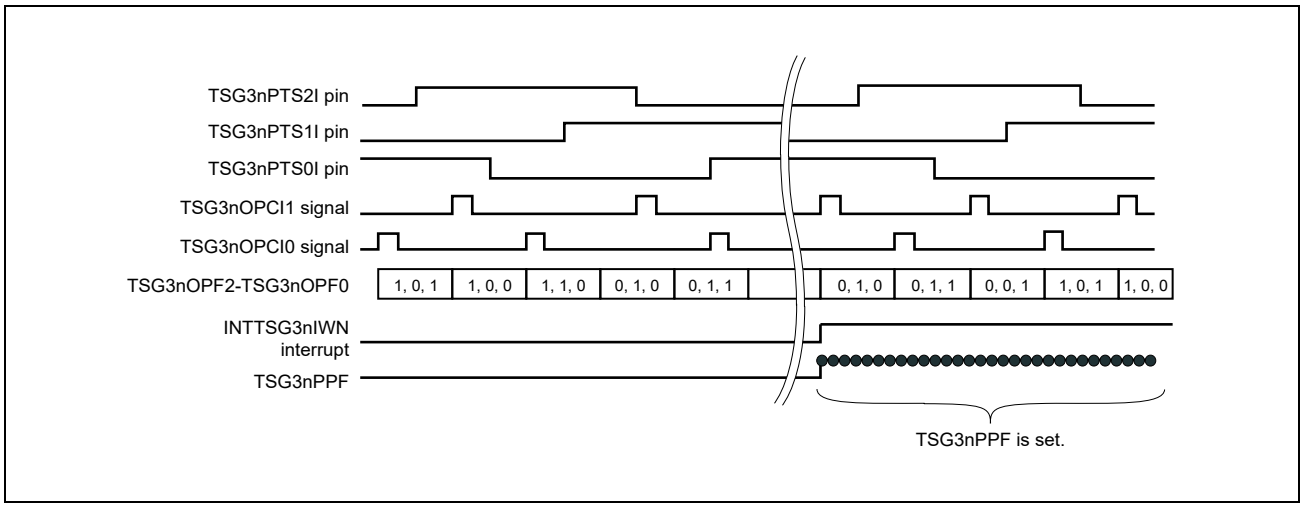

Figure 20.32 Example of Pattern Difference Detection Flag Operation

Operating mode

Available in all operating modes.

CAUTIONS

1. TSG3nPPF is valid only when TSG3nCTL1.TSG3nPPC = 1 and TSG3nSTR0.TSG3nTE = 1.
2. When 000 or 111 is input to the TSG3nPTSI2 to TSG3nPTSI0 pins, or when TSG3nOPF2 to TSG3nOPF0 are set to 000 or 111, TSG3nPPF is not set.

20.4.3.11 Timer Output Pattern Flag (TSG3nOPF2-TSG3nOPF0)

Name

Timer output pattern flag (TSG3nSTR1.TSG3nOPF2 to TSG3nOPF0)

Description

TSG3nOPF2 to TSG3nOPF0 flags indicate the timer output patterns.

For details, see **Section 20.4.7.6, 120-DC Mode**, and **Section 20.4.7.10, Software Output Control Function**.

Operating mode

Available in all operating modes.

20.4.3.12 Pattern Switch Detection Signal (TSG3nPTE)

Name

Pattern switch detection signal (TSG3nPTE signal)

Description

The TSG3nPTE signal toggles when the input pattern (TSG3nPTSI2 to TSG3nPTSI0 pins) changes. The toggle pattern is determined by the TSG3nPSC bit (TSG3nOPT0.TSG3nPSS = 1).

Table 20.54 Change Timing of Pattern Switch Detection Signal (1/2)

- TSG3nPSC = 0

		TSG3nPTSI2-TSG3nPTSI0 Pins after Change							
		000	111	101	100	110	010	011	001
Current TSG3nPTSI2 to TSG3nPTSI0 pins	000	—	—	—	—	—	—	—	—

Example of operation

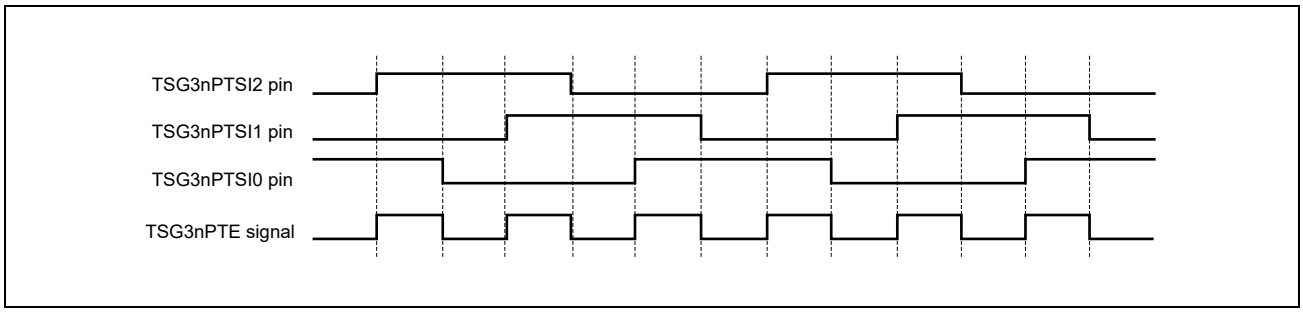

Figure 20.33 Example of Pattern Switch Detection Signal Operation

Operating mode

Available in all operating modes.

CAUTION

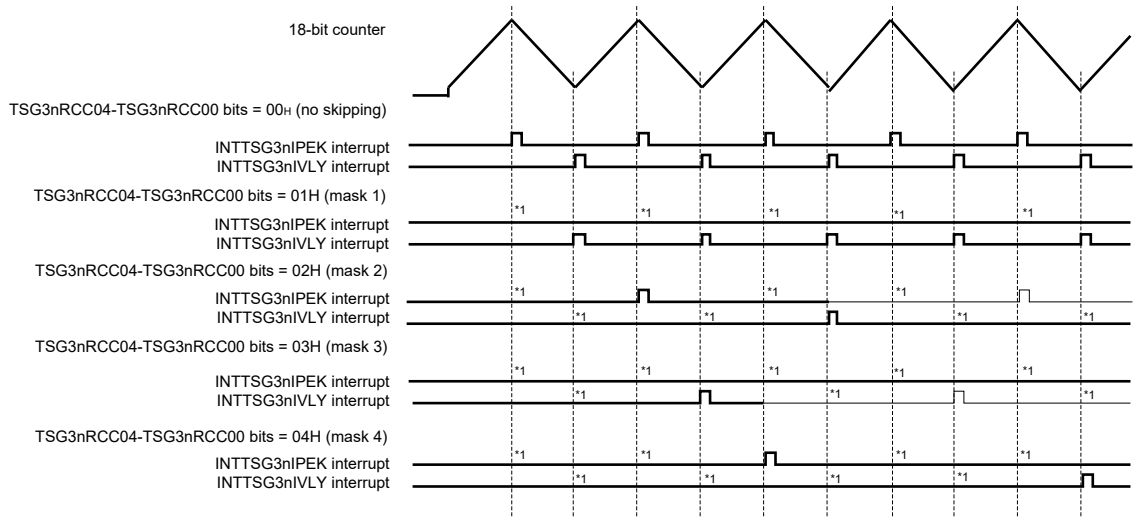
The TSG3nPTE signal is valid only when TSG3nIOC1.TSG3nPTS = 1 and TSG3nSTR0.TSG3nTE = 1.

20.4.4 Interrupt Skipping Function

Operation related to the interrupt skipping function is described below.

- Peak interrupts (INTTSG3nIPEK) and trough interrupts (INTTSG3nIVLY) can be skipped.
- TSG3nCTL4.TSG3nPIE enables outputting of the INTTSG3nIPEK interrupt and specifies whether to skip the interrupts.
- TSG3nCTL4.TSG3nVIE enables outputting of the INTTSG3nIVLY interrupt and specifies whether to skip the interrupts.

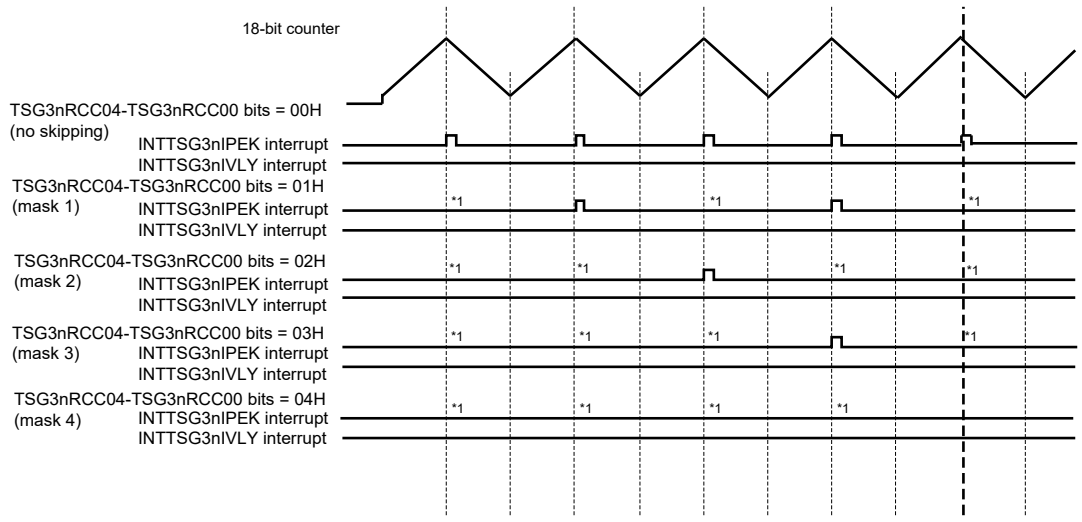
When TSG3nCTL3.TSG3nRIA is set to 1 (with reload skipping), reload is executed at the same timing as the interrupt after being skipped.



When TSG3nCTL3.TSG3nRIA is set to 0 (without reload skipping), reload is executed at the specified reload timing regardless of interrupt skipping.

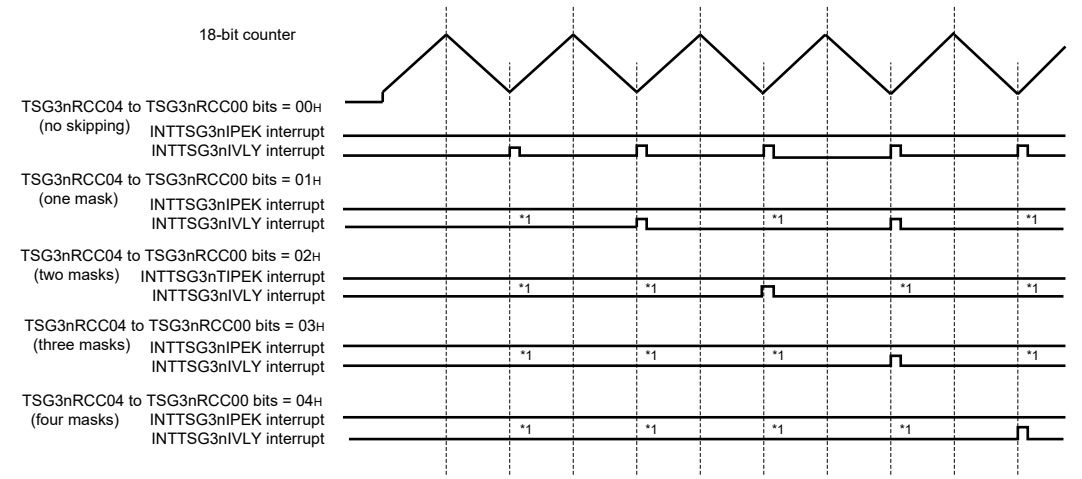
CAUTION

When a value is written to TSG3nCTL4, and TSG3nRCC04 to TSG3nRCC00 are transferred to the buffer register, the interrupt skipping counter is cleared. Therefore, when the interrupt skipping function is used, interrupt interval may be long temporarily. To avoid this, the interrupt skipping count should be changed with the reload timing being set to the interrupts skipped (TSG3nCTL3.TSG3nRIA = 1).



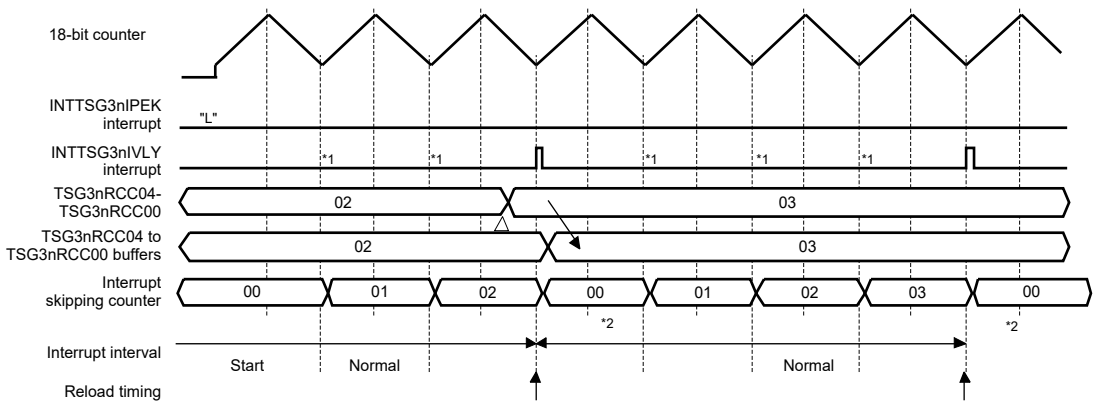
20.4.4.1 Operation of Interrupt Skipping Function

Timing diagram of interrupt skipping function in various conditions are shown in the following figures.



Note 1. Skipped interrupt request

Figure 20.34 Interrupt Skipping Operation when TSG3nPIE = 1 and TSG3nVIE = 1 in TSG3nCTL4 (Peak and Trough Interrupt Generation in HT-PWM Mode)



Note 1. Skipped interrupt request

Figure 20.35 Interrupt Skipping Operation when TSG3nPIE = 1 and TSG3nVIE = 0 in TSG3nCTL4 Register (only Peak Interrupt Generation in HT-PWM Mode)

Note 1. Skipped interrupt request

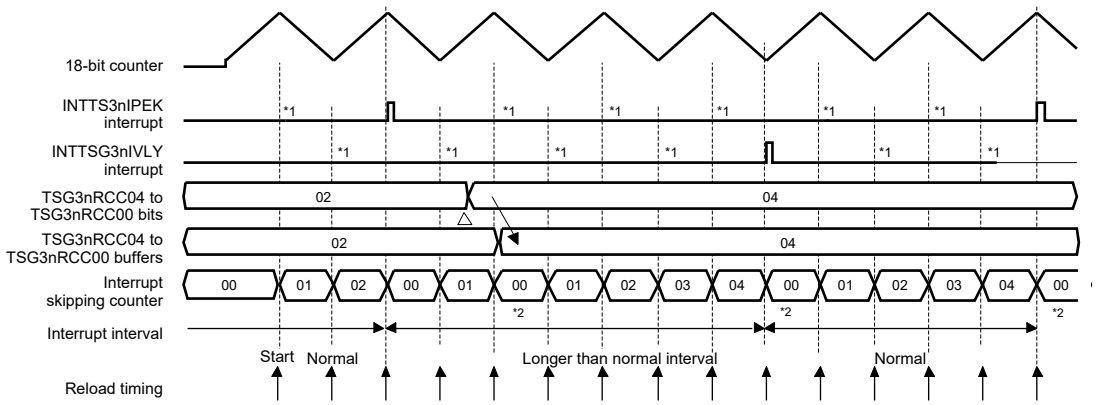


Figure 20.36 Interrupt Skipping Operation when TSG3nPIE = 0 and TSG3nVIE = 1 in TSG3nCTL4 Register (only Trough Interrupt Generation in HT-PWM Mode)

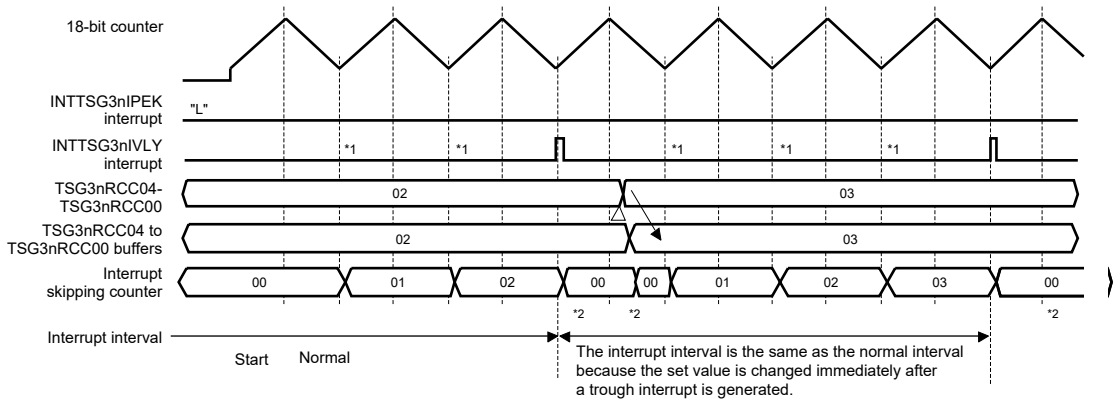
Note 1. Skipped interrupt request

Note 2. Interrupt skipping counter is cleared

Figure 20.37 When TSG3nRMC = 0, TSG3nRIA = 1 in TSG3nCTL3 (with Reload Skipping)



Note 1. Skipped interrupt request

Note 2. Interrupt skipping counter is cleared

Figure 20.38 When TSG3nRMC = 0, TSG3nRIA = 0 in TSG3nCTL3 (without Reload Skipping)

CAUTION

The interrupt interval might be longer.

Note 1. Skipped interrupt request

Note 2. Interrupt skipping counter is cleared

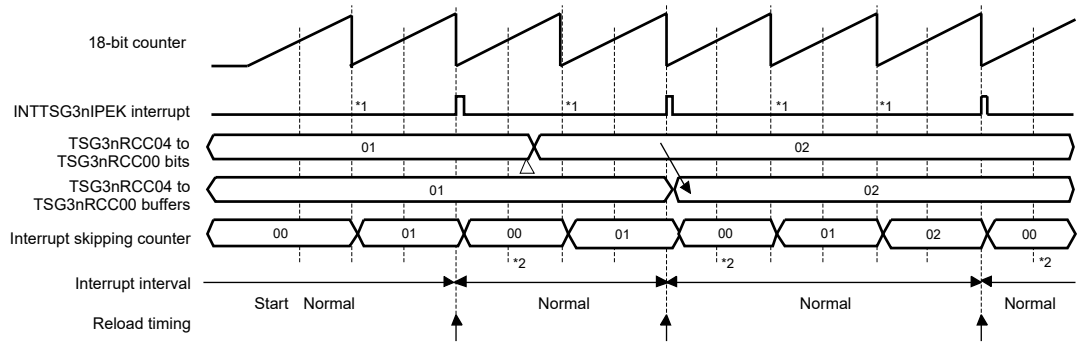
Figure 20.39 When TSG3nRMC = 1 in TSG3nCTL3 (Anytime Rewrite Mode)

NOTE

After rewriting, the value is reflected immediately regardless of the reload timing. The interrupt skipping counter is cleared when the value is transferred to the TSG3nRCC04 to TSG3nRCC00 buffers, not when the pertinent register is rewritten.

20.4.4.2 Example of Operation when Peak Interrupt is Generated (in PWM Mode)

Operation related to the interrupt skipping function in PWM mode is described below.



- Trough interrupts (INTTSG3nIPEK) can be skipped. In PWM mode, it is generated by compare match of TSG3nCMP0E buffer register and 18-bit counter.
- TSG3nCTL4.TSG3nPIE enables outputting of the INTTSG3nIPEK interrupt and specifies whether to skip the interrupts.
- The setting of TSG3nCTL4.TSG3nVIE is disabled. At this time, the INTTSG3nIVLY interrupt is not generated.

  When TSG3nCTL3.TSG3nRIA is set to 1 (with reload skipping), reload is executed at the same timing as the interrupt after being skipped.

CAUTION

When a value is written to TSG3nCTL4, and TSG3nRCC04 to TSG3nRCC00 are transferred to the buffer register, the interrupt skipping counter is cleared. Therefore, when the interrupt skipping function is used, interrupt interval may be long temporarily. To avoid this, the interrupt skipping count should be changed with the reload timing being set to the interrupts skipped (TSG3nCTL3.TSG3nRIA = 1).

Example of operation

Note 1. Skipped interrupt request

Note 2. Interrupt skipping counter is cleared.

Figure 20.40 When TSG3nCTL3.TSG3nRMC = 0, TSG3nRIA = 1, TSG3nCTL4.TSG3nPRE = 1 (Recommended Setting)

NOTE

When TSG3nCTL3.TSG3nRIA = 1, reload is executed at the same timing as the interrupt after being skipped.

20.4.5 A/D Conversion Trigger Function

A/D conversion trigger operation is described below.

The TSG3nDCMP0E, TSG3nDCMP1E, and TSG3nDCMP2E registers are used as compare registers of the A/D conversion trigger function.

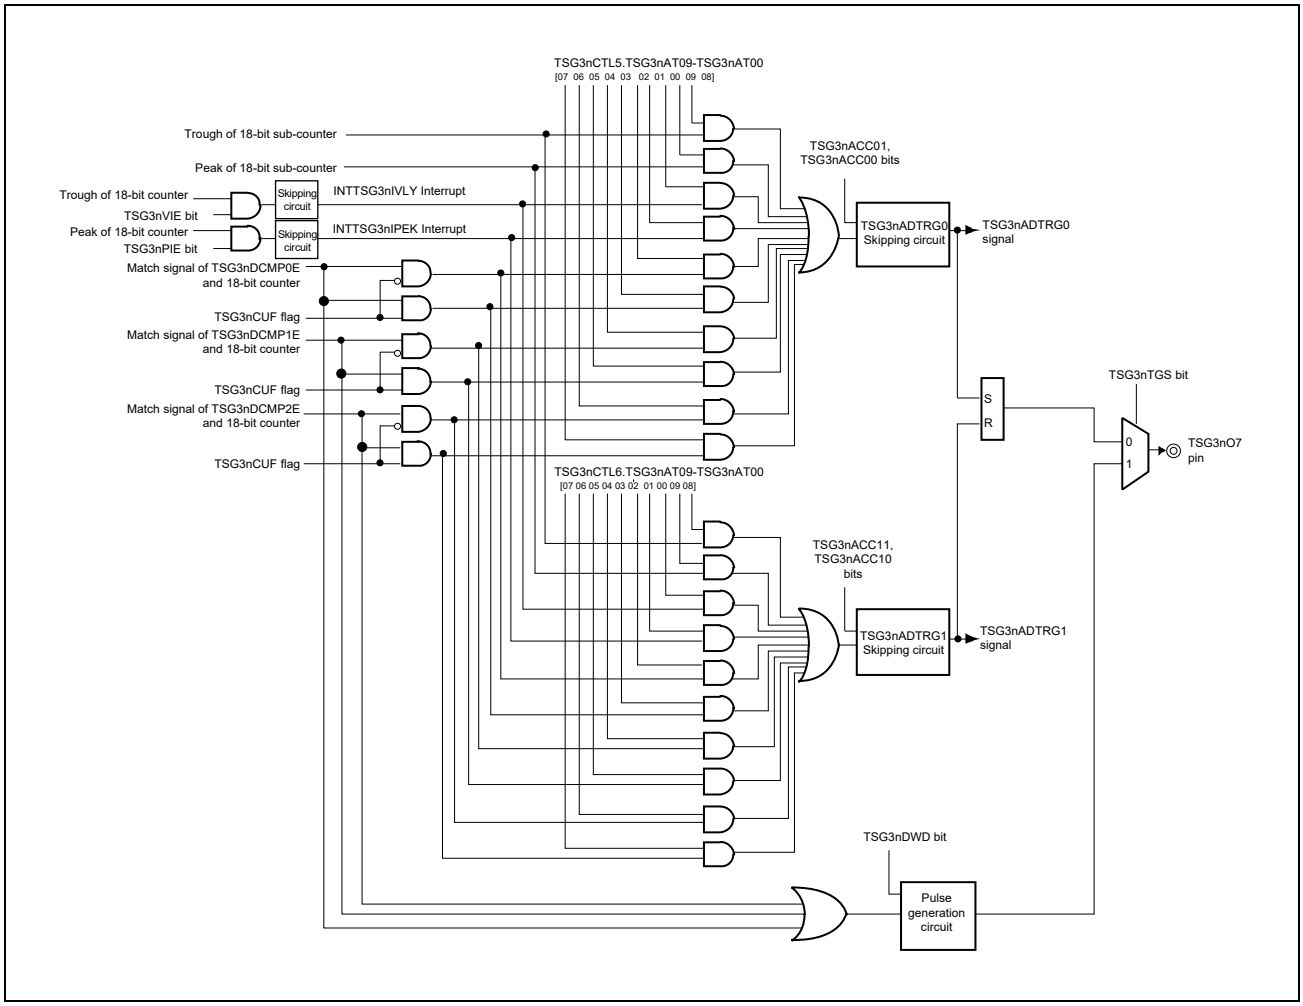


Figure 20.41 A/D Conversion Trigger and Diagnostic Output Control Circuit

As shown in **Figure 20.41**, a logical ORed signal can be generated by selecting the compare match of TSG3nDCMP0E to TSG3nDCMP2E with the 18-bit counter, a peak interrupt (INTTSG3nIPEK) and a trough interrupt (INTTSG3nIVLY) of the 18-bit counter, the peak timing of 18-bit sub-counter, and the trough timing of 18-bit sub-counter.

TSG3n has two channels of the identical A/D conversion trigger control circuits, which can be controlled independently. TSG3n also provides the A/D conversion trigger skipping function with the skipping rate of 1/1, 1/2, 1/4, or 1/8.

20.4.5.1 Operation of A/D Conversion Trigger

TSG3n has a function to generate A/D conversion start triggers (TSG3nADTRG0 and TSG3nADTRG1 signals) by selecting any of ten trigger sources as required. The trigger sources are selected by TSG3nAT09 to TSG3nAT00 in TSG3nCTL5 and TSG3nAT19 to TSG3nAT10 in TSG3nCTL6.

(1) TSG3nADTRG0/TSG3nADTRG1 Signal Output Control (TSG3nCTL5 and TSG3nCTL6)

[Trigger sources]

- TSG3nAT00/TSG3nAT10 = 1 : A trough interrupt (INTTSG3nIVLY) causes an A/D conversion trigger pulse to be generated.
- TSG3nAT01/TSG3nAT11 = 1 : A peak interrupt (INTTSG3nIPEK) causes an A/D conversion trigger pulse to be generated.
- TSG3nAT02/TSG3nAT12 = 1 : While the 18-bit counter is counting up, a TSG3nDCMP0E compare match enables A/D conversion trigger to be generated.
- TSG3nAT03/TSG3nAT13 = 1 : While the 18-bit counter is counting down, a TSG3nDCMP0E compare match enables A/D conversion trigger to be generated.
- TSG3nAT04/TSG3nAT14 = 1 : While the 18-bit counter is counting up, a TSG3nDCMP1E compare match enables A/D conversion trigger to be generated.
- TSG3nAT05/TSG3nAT15 = 1 : While the 18-bit counter is counting down, a TSG3nDCMP1E compare match enables A/D conversion trigger to be generated.
- TSG3nAT06/TSG3nAT16 = 1 : While the 18-bit counter is counting up, a TSG3nDCMP2E compare match enables A/D conversion trigger to be generated.
- TSG3nAT07/TSG3nAT17 = 1 : While the 18-bit counter is counting down, a TSG3nDCMP2E compare match enables A/D conversion trigger to be generated.
- TSG3nAT08/TSG3nAT18 = 1 : A trough timing of the 18-bit sub-counter (at a switch from decrementing to incrementing) enables A/D conversion trigger to be generated.
- TSG3nAT09/TSG3nAT19 = 1 : A peak timing of 18-bit sub-counter (at a switch from incrementing to decrementing) enables A/D conversion trigger to be generated.

[Skipping setting]

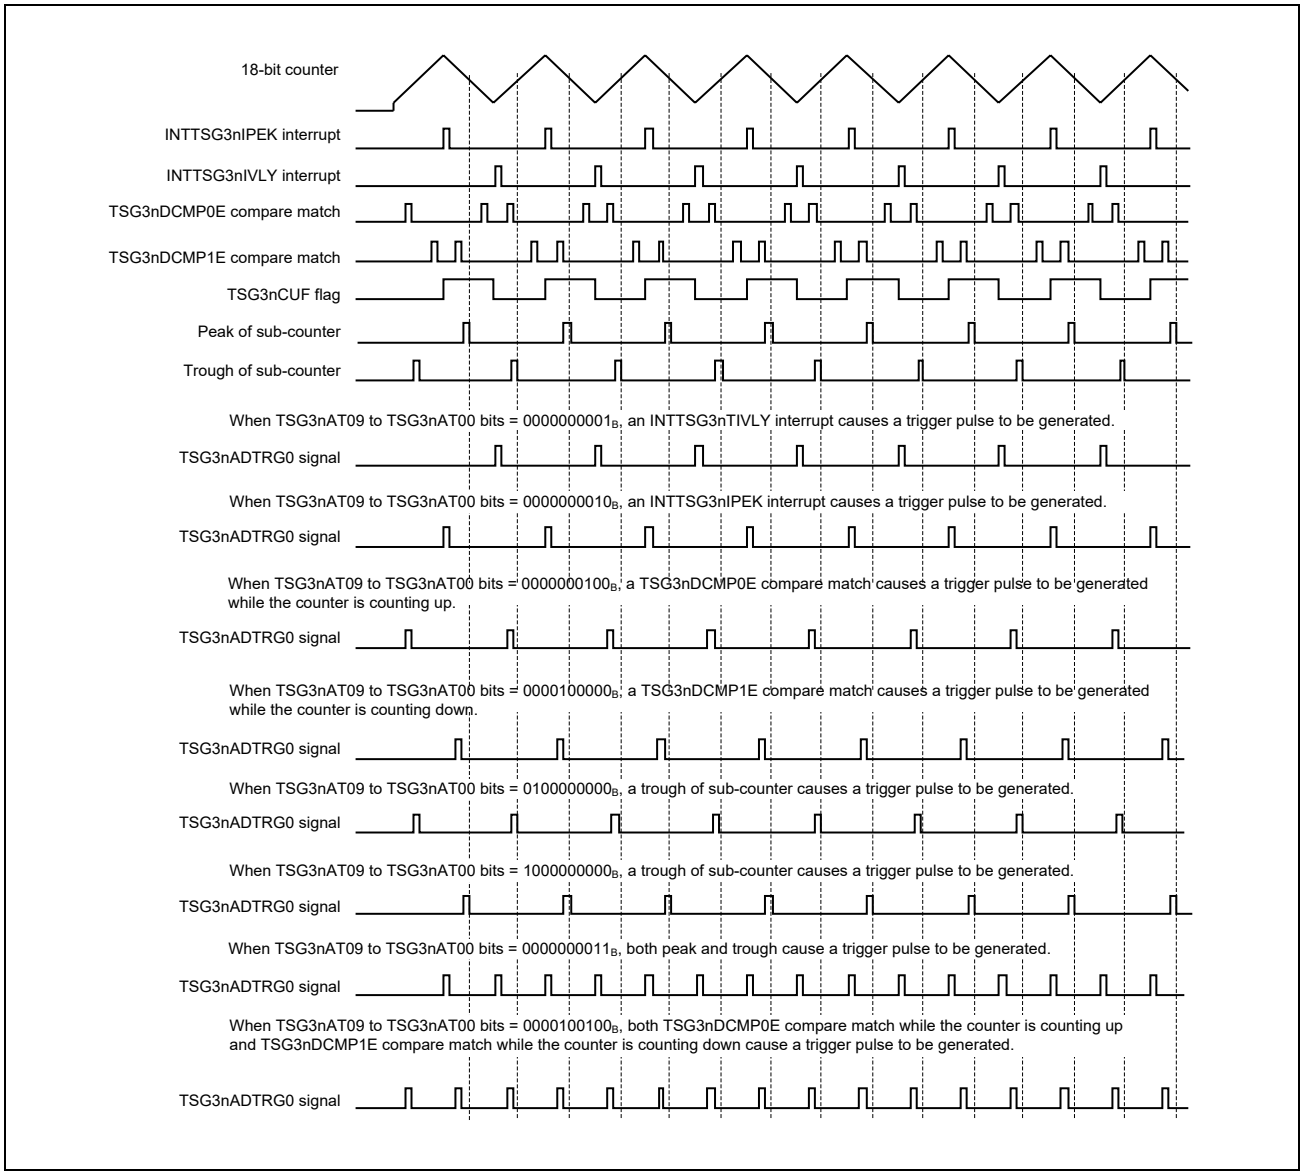
- TSG3nACC01, TSG3nACC00 and TSG3nACC11, TSG3nACC10 :
  Set the skipping rate of TSG3nADTRG0/TSG3nADTRG1

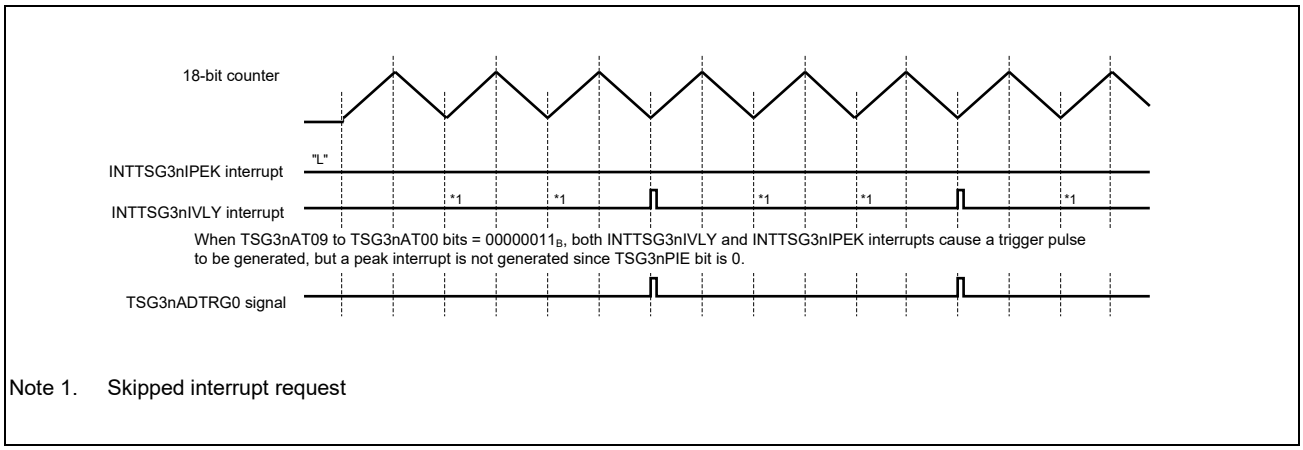
All A/D conversion triggers selected by TSG3nAT09 to TSG3nAT00 and TSG3nAT19 to TSG3nAT10 are logically ORed, and the resultant signals are subjected to skipping control specified by TSG3nACC01 and TSG3nACC00, and TSG3nACC11 and TSG3nACC10, and then the TSG3nADTRG0 and TSG3nADTRG1 signals are generated.

A peak interrupt (INTTSG3nIPEK) and a trough interrupt (INTTSG3nIVLY) selected by TSG3nAT00 and TSG3nAT01, and TSG3nAT10 and TSG3nAT11 are interrupt signals obtained after skipped. Therefore, they are output at the timing according to interrupt skipping control. If the interrupt output is not enabled by TSG3nCTL4.TSG3nPIE and TSG3nVIE, A/D conversion trigger is not output.

TSG3nACC01, TSG3nACC00, and TSG3nAT09 to TSG3nAT00, and TSG3nACC11, TSG3nACC10, and TSG3nAT19 to TSG3nAT10 can be rewritten during timer operation.

If A/D conversion trigger setting bits are rewritten during operation, the rewritten values are reflected on the A/D conversion trigger output status immediately. Such control bits are rewritten at anytime regardless of operating modes. If a write access is made to TSG3nCTL5 and TSG3nCTL6 (including a rewrite of the same value), the A/D conversion trigger skipping counter is cleared and starts counting from zero.





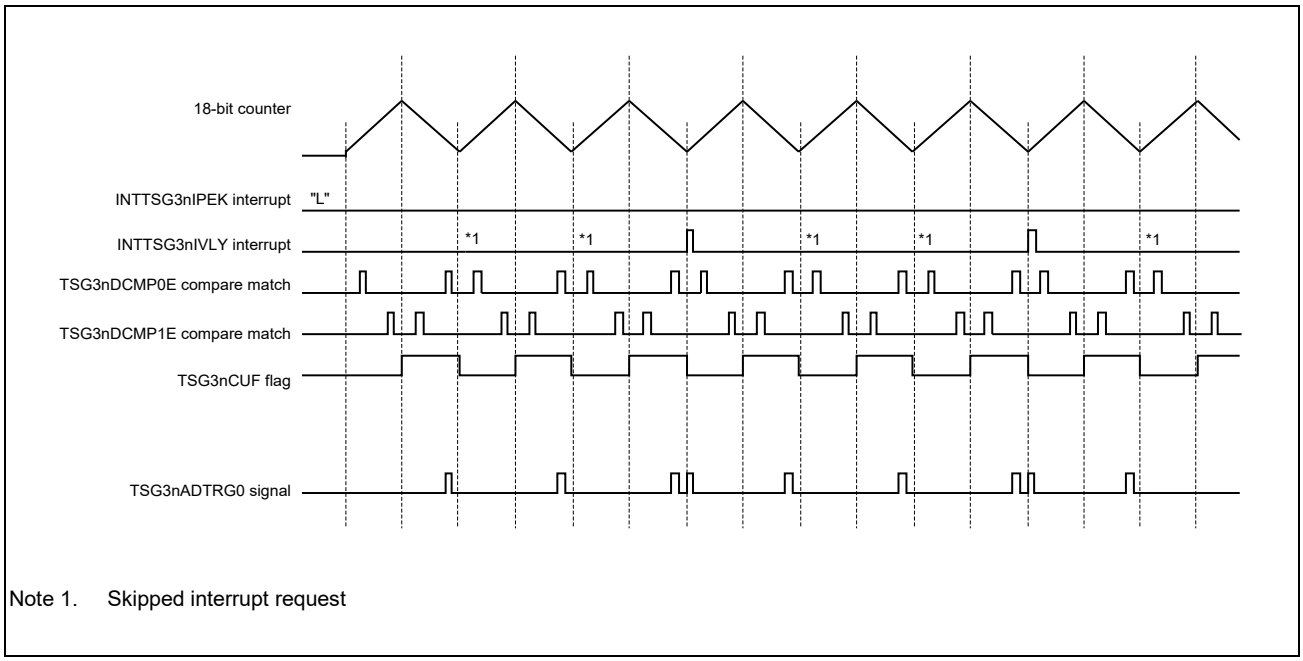


Figure 20.42 When TSG3nPIE = 1, TSG3nVIE = 1, and TSG3nRCC04 to TSG3nRCC00 = 00_H in TSG3nCTL4, and TSG3nACC01 and TSG3nACC00 = 00_B in TSG3nCTL5 (HT-PWM Mode)

Note 1. Skipped interrupt request

Figure 20.43 When TSG3nPIE = 0, TSG3nVIE = 1, and TSG3nRCC04 to TSG3nRCC00 = 02_H in TSG3nCTL4 and TSG3nACC01 and TSG3nACC00 = 00_B in TSG3nCTL5 (HT-PWM Mode)

Note 1. Skipped interrupt request

Figure 20.44 When TSG3nPIE = 0, TSG3nVIE = 1, and TSG3nRCC04 to TSG3nRCC00 = 02_H in TSG3nCTL4 and TSG3nACC01 and TSG3nACC00 = 00_B, and TSG3nAT09 to TSG3nAT00 = 0000 1001_B in TSG3nCTL5 (HT-PWM Mode)

(2) A/D Conversion Trigger Skipping Function

Example of operation of the A/D conversion trigger skipping function is shown in **Figure 20.45.**

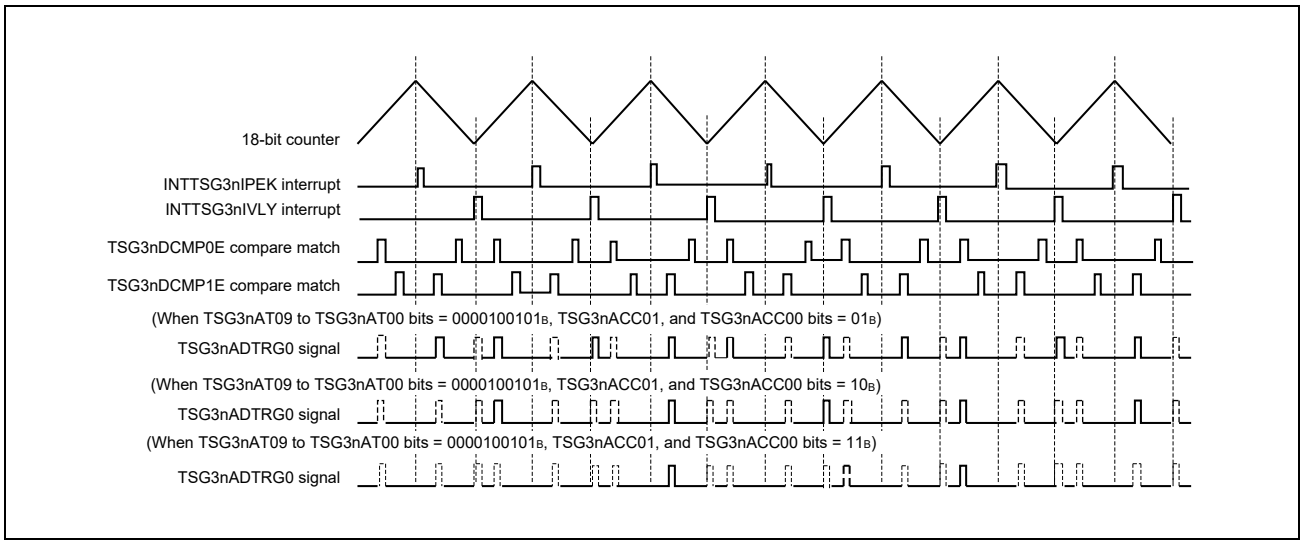

Figure 20.45 Example of Operation of A/D Conversion Trigger Skipping Function

NOTE

Broken-lined pulses indicate A/D conversion trigger pulses skipped by the A/D conversion trigger skipping function.

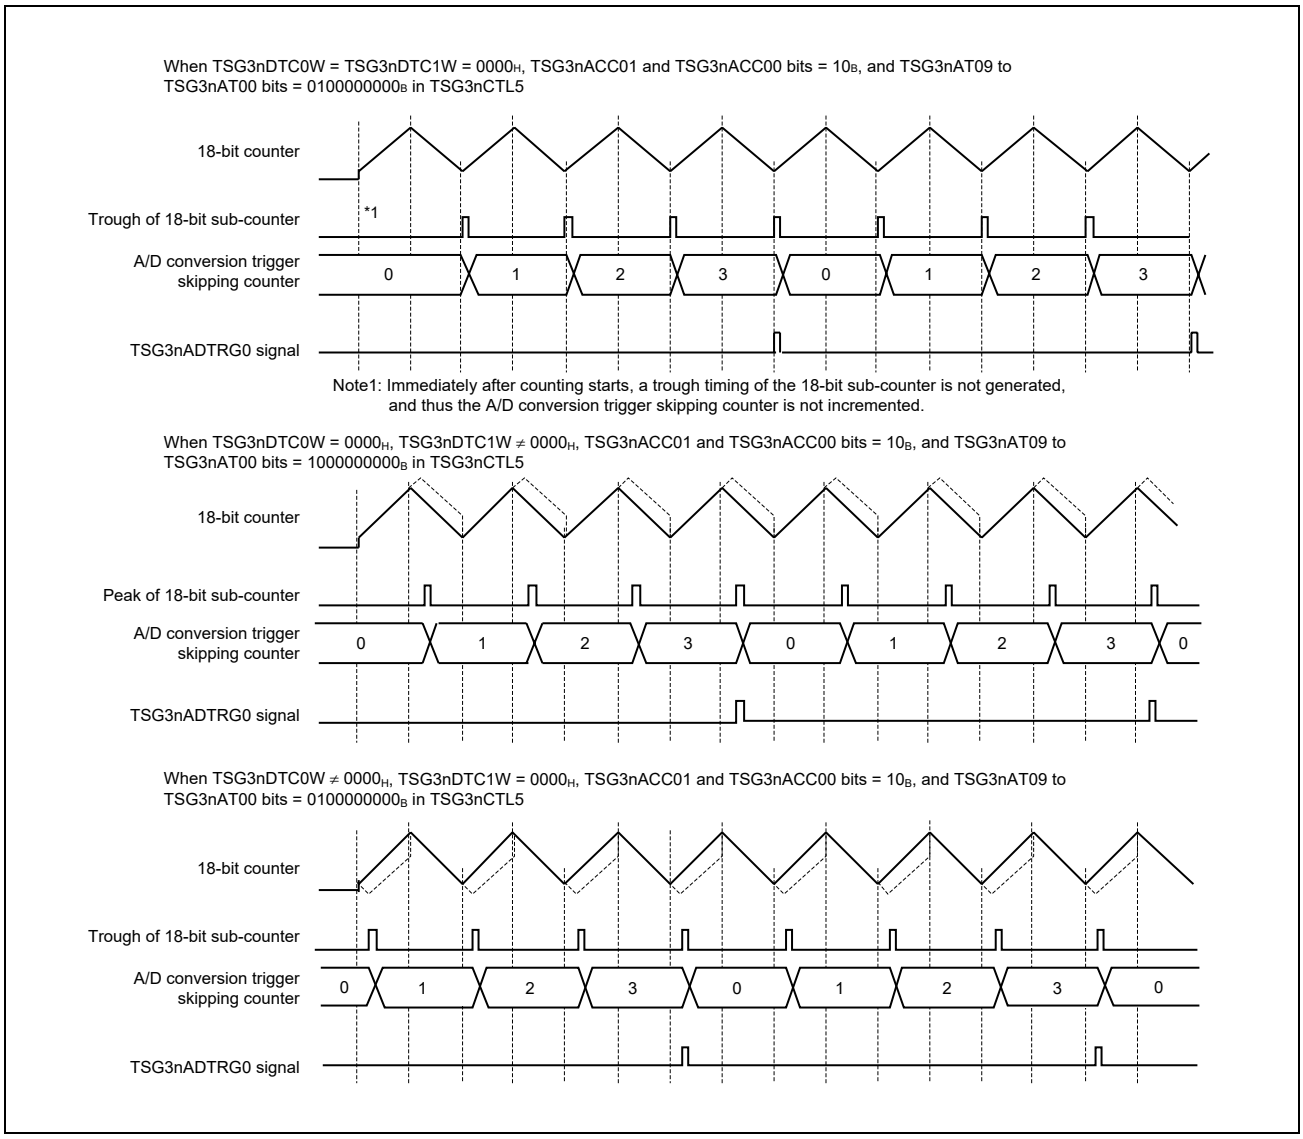

Figure 20.46 Example of Operation of A/D Conversion Trigger Skipping Function

(3) Notes on A/D Conversion Trigger

- If the same value is written to TSG3nDCMP0E and TSG3nDCMP1E or TSG3nDCMP2E, and the same condition (when the 18-bit counter increments or decrements) is set as the valid A/D conversion trigger, A/D conversion trigger skipping counter is incremented by one and one trigger pulse is output upon a match of the 18-bit counter with these registers.
- In PWM mode, SP-PWM mode, 120-DC mode, and HSP-PWM mode, a trough interrupt (INTTSG3nIVLY) is not generated. Only a peak interrupt (INTTSG3nIPEK) is valid.
- In 120-DC mode, when TSG3nS120DCO is set to 0, the 18-bit counter may be cleared during the carrier period due to switch of the output pattern. The A/D conversion trigger is not generated if TSG3nDCMP2E to TSG3nDCMP0E values do not match with the 18-bit counter value and a peak interrupt (INTTSG3nIPEK) is not generated.

20.4.6 Error/Warning Interrupt

20.4.6.1 Error Interrupt Function

If the simultaneous active state of the positive phase and inverse phase is detected after the error interrupt function is enabled (TSG3nIOC1.TSG3nEOC = 1), TSG3nSTR2.TSG3nTBF is set, and an error interrupt (INTTSG3nIER) of TSG3n is generated. Whether or not to detect an error of each phase (TSG3nO1 and TSG3nO2, TSG3nO3 and TSG3nO4, and TSG3nO5 and TSG3nO6 pins) can be selected by TSG3nCTL1.TSG3nTBA2 to TSG3nTBA0, respectively.

When an error occurs, outputs of the TSG3nO1 to TSG3nO6 pins can be set to high-impedance. For details, see **Section 21.4.1, Asynchronous Hi-Z Control Function**.

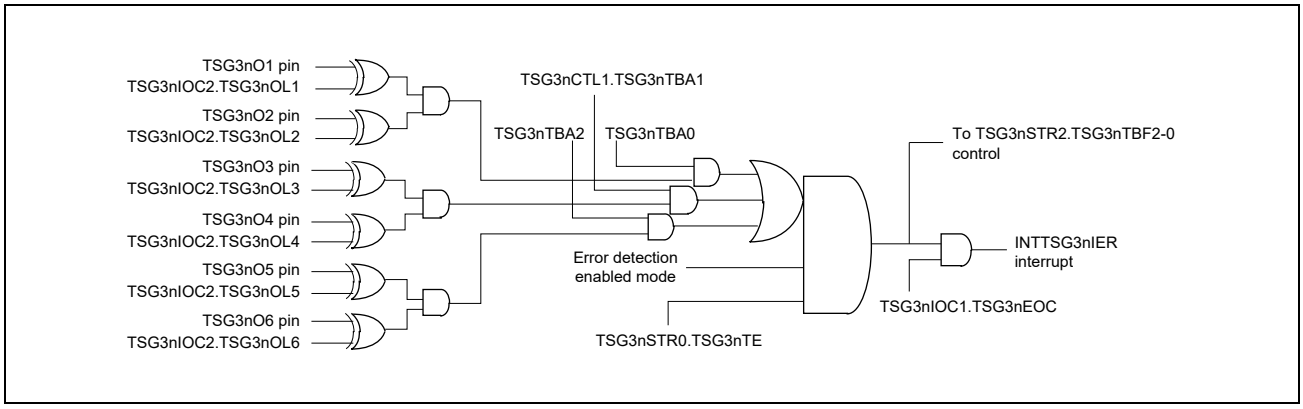

Figure 20.47 Error Interrupt (INTTSG3nIER) Generation Control Circuit

CAUTION

When an error interrupt is generated, the error status should be canceled (write 1 to TSG3nSTC.TSG3nTBR2 to TSG3nSTC.TSG3nTBR0) during an error interrupt handling. Otherwise, subsequent error interrupts are not generated.

(1) PWM Mode, 120-DC Mode and HSP-PWM Mode

In PWM mode, and HSP-PWM Mode if TSG3nCMP1E and TSG3nCMP2E, and TSG3nCMP3E and TSG3nCMP4E are set so that the TSG3nO1 and TSG3nO2 pins output the active level simultaneously, an error interrupt (INTTSG3nIER) is generated. With the same setting, if TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP7E, TSG3nCMP8E, TSG3nCMP9E, TSG3nCMP10E, TSG3nCMP11E, and TSG3nCMP12E are set so that the TSG3nO3 and TSG3nO4, and TSG3nO5 and TSG3nO6 pins output the active level simultaneously, an error interrupt (INTTSG3nIER) is generated.

In 120-DC mode, if TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, TSG3nCMP10E, TSG3nCMP3E, TSG3nCMP4E, TSG3nCMP7E, TSG3nCMP8E, TSG3nCMP11E, TSG3nCMP12E, TSG3nPAT0W, and TSG3nPAT1W are set so that the TSG3nO1 and TSG3nO2 pins output the active level simultaneously, an error interrupt (INTTSG3nIER) is generated. With the same setting, the TSG3nO3 and TSG3nO4, and TSG3nO5 and TSG3nO6 pins also output the active level simultaneously, an error interrupt (INTTSG3nIER) is generated.

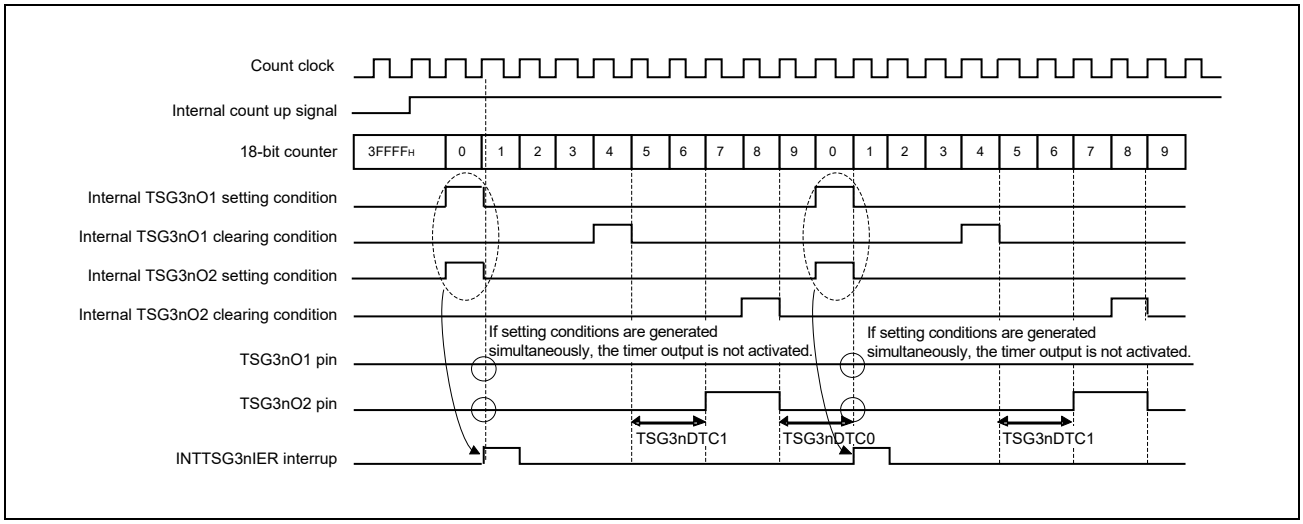

Figure 20.48 Example of Error Interrupt (INTTSG3nIER) Generation (PWM Mode)

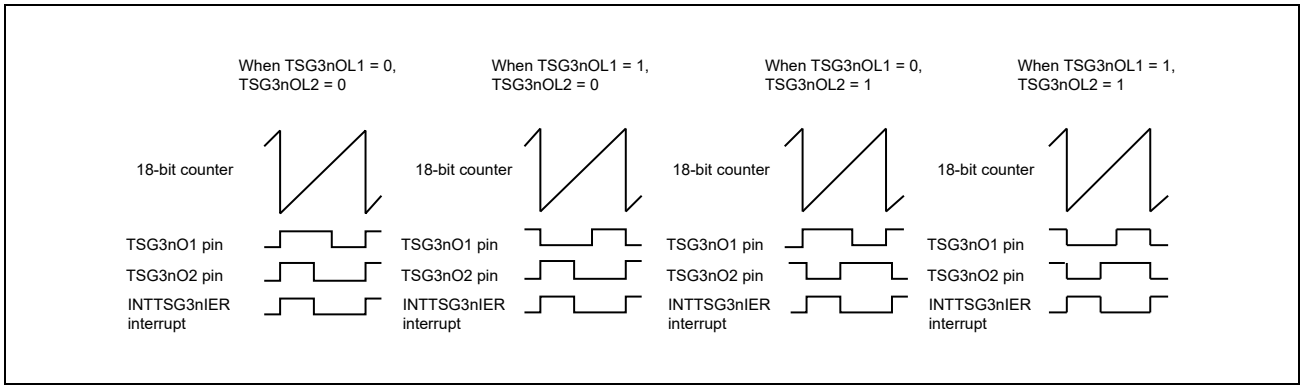
NOTE

TSG3nO3 and TSG3nO4, and TSG3nO5 and TSG3nO6 behave the same.

When the active level of output is switched by operation TSG3nIOC2.TSG3nOL1 and TSG3nOL2, an error interrupt is generated as shown in the following figure.



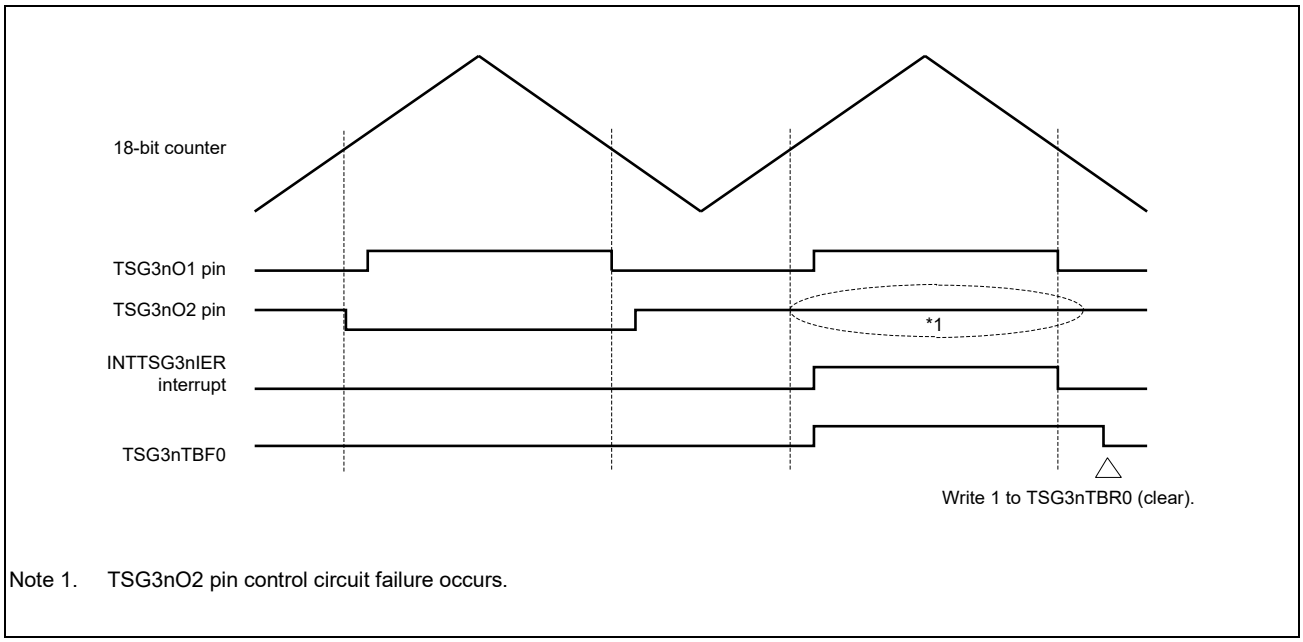


Figure 20.49 Example of Error Interrupt (INTTSG3nIER) Generation for each Active Level

(2) HT-PWM Mode and SP-PWM Mode

Either TSG3n dead time setting register 0 or 1 (TSG3nDTC0W or TSG3nDTC1W) is 0000_H, an error may occur.

NOTE

If an error occurs when the dead time control function is used (both TSG3nDTC0W and TSG3nDTC1W are not 0000_H), internal circuit failure may occur.

Note 1. TSG3nO2 pin control circuit failure occurs.

Figure 20.50 Example of Error Interrupt Operation

20.4.6.2 Warning Interrupt Function

TSG3n has a warning interrupt (INTTSG3nIWN).

Warning interrupt (INTTSG3nIWN) is generated when any of the following conditions is detected. For details, see Section **20.4.3, Flags**.

- When simultaneous change in two or more pins of TSG3nPTSI2 to TSG3nPTSI0 is detected:
  See **Section 20.4.3.4, Noise Detection Flag (TSG3nNDF)**.
- When reversal is detected of the TSG3nPTSI2 to TSG3nPTSI0 pins:

  See **Section 20.4.3.7, Pattern Reversal Detection Flag (TSG3nPRF)**.
- When 000 or 111 is detected from the TSG3nPTSI2 to TSG3nPTSI0 pins:

  See **Section 20.4.3.6, Pattern Error Detection Flag (TSG3nPEF)**.
- When a toggle of the TSG3nPTSI2 to TSG3nPTSI0 pins is generated three times or more between TSG3nOPCI0 and TSG3nOPCI1 signal triggers:

  See **Section 20.4.3.8, TSG3nPTSI2 to TSG3nPTSI0 Pin Abnormal Toggle Detection Flag**.
- When the TSG3nOPCI0 and TSG3nOPCI1 signal triggers are detected simultaneously:

  See **Section 20.4.3.9, TSG3nOPCI0, TSG3nOPCI1 Signal Simultaneous Trigger Detection Flag**.
- When the phase difference between the input pattern (TSG3nPTSI2 to TSG3nPTSI0 pins) and output pattern (TSG3nOPF2 to TSG3nOPF0) is detected:

  See **Section 20.4.3.10, Pattern Phase Difference Detection Flag (TSG3nPPF)**.

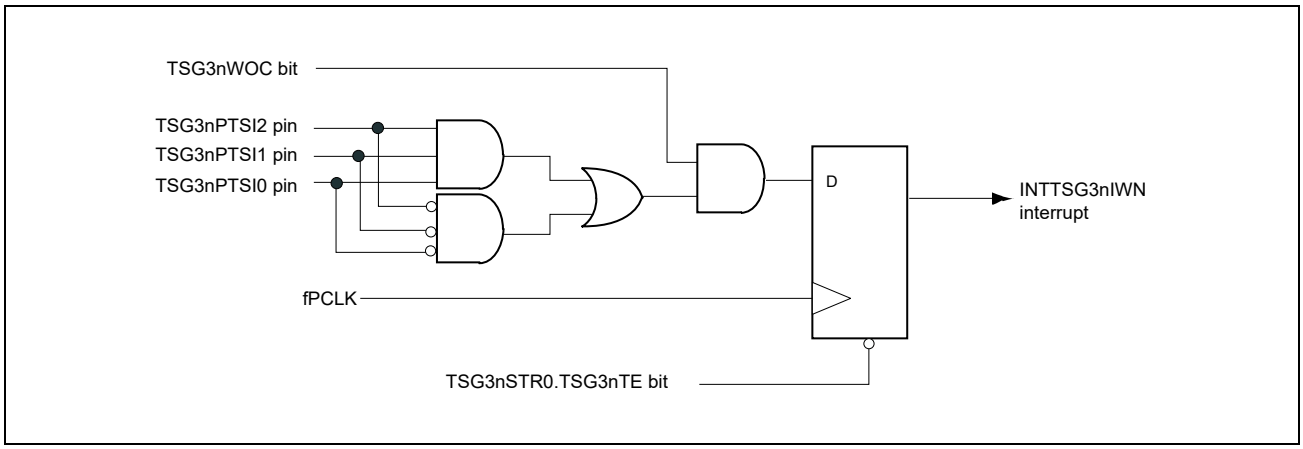

Figure 20.51 Detection of Abnormality of TSG3nPTSI2-TSG3nPTSI0 Pins

20.4.7 Operating Modes

20.4.7.1 PWM Mode

Overview

A PWM signal is output at the TSG3nO1 to TSG3nO6 pins according to set timing/clear timing of TSG3nCMP1E to TSG3nCMP12E registers with the PWM period set in the TSG3nCMP0E register.

Prerequisites

- Set the set timing to the compare register with an even number:

  TSG3nCMP2E (set timing of the TSG3nO1 output), TSG3nCMP4E (set timing of the TSG3nO2 output), TSG3nCMP6E (set timing of the TSG3nO3 output), TSG3nCMP8E (set timing of the TSG3nO4 output), TSG3nCMP10E (set timing of the TSG3nO5 output) and TSG3nCMP12E (set timing of the TSG3nO6 output)

- Set the clear timing to the compare register with an odd number:

  TSG3nCMP1E (clear timing of the TSG3nO1 output), TSG3nCMP3E (clear timing of the TSG3nO2 output), TSG3nCMP5E (clear timing of the TSG3nO3 output), TSG3nCMP7E (clear timing of the TSG3nO4 output), TSG3nCMP9E (clear timing of the TSG3nO5 output) and TSG3nCMP11E (clear timing of the TSG3nO6 output)

Functional description

Set the PWM period and set/clear timing of the TSG3nO1 to TSG3nO6 outputs. Set TSG3nTRG0.TSG3nTS = 1 to start the timer counter.

The TSG3nO1 to TSG3nO6 outputs are set to the inactive state at the same time counting begins. The outputs are set to the active state by the match of the buffer registers TSG3nCMP2E, TSG3nCMP4E, TSG3nCMP6E, TSG3nCMP8E, TSG3nCMP10E, and TSG3nCMP12E with the 18-bit counter.

Next, the TSG3nO1 to TSG3nO6 outputs are set to the inactive state by the match of the buffer registers TSG3nCMP1E, TSG3nCMP3E, TSG3nCMP5E, TSG3nCMP7E, TSG3nCMP9E, and TSG3nCMP11E with the 18-bit counter.

During counting, a compare match interrupt (INTTSG3nI0 to INTTSG3nI12) is generated by the match of the buffer register TSG TSG3nCMP0E-TSG3nCMP12E.

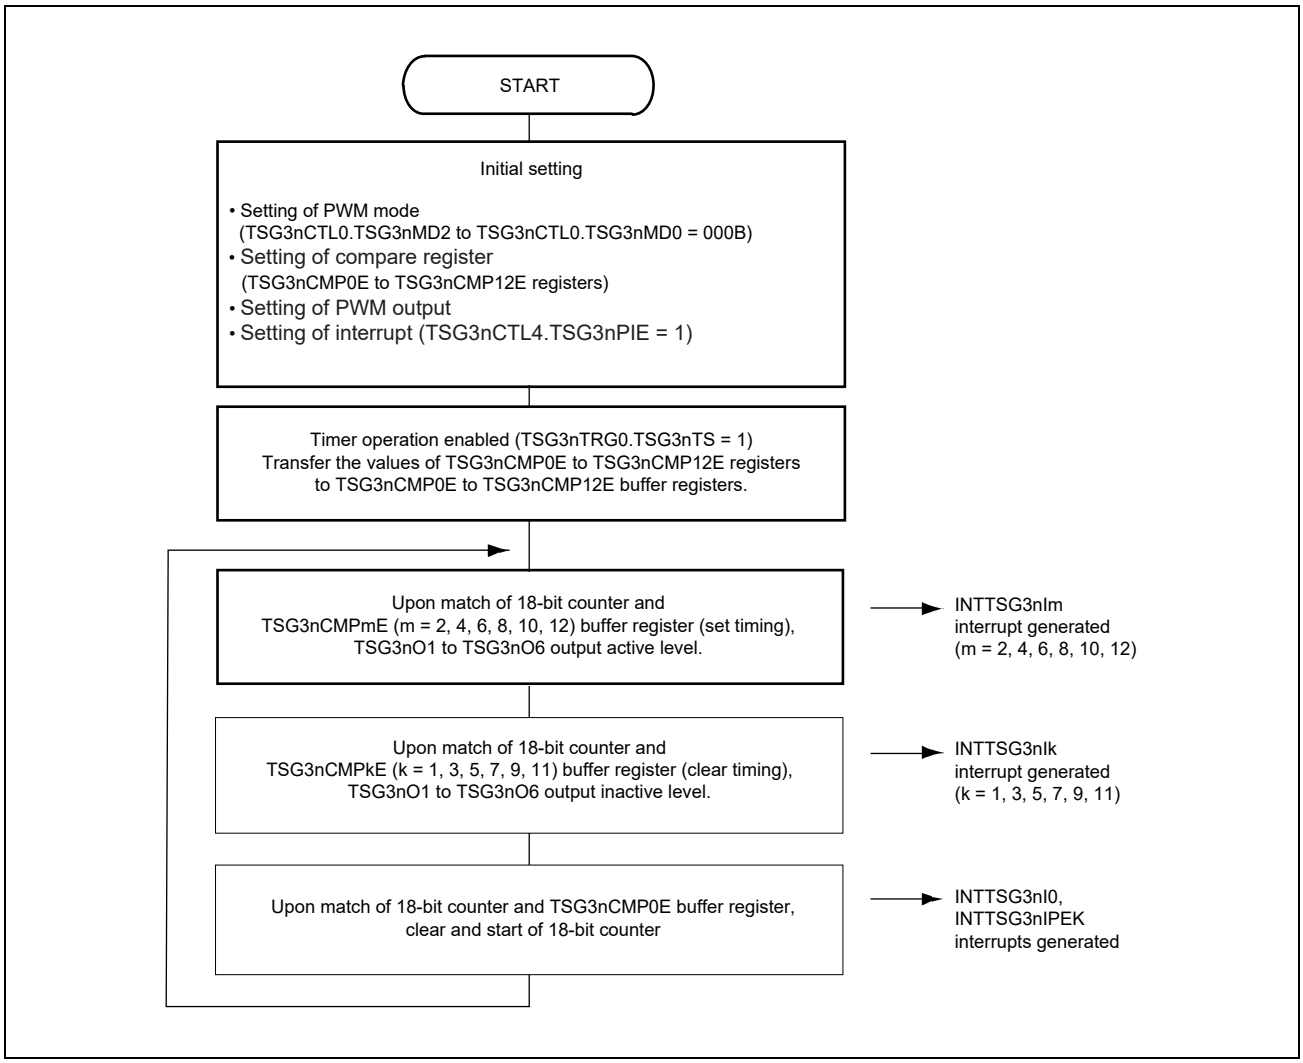
CAUTION

Reload is executed when writing to the TSG3nCMP1E register at TSG3nCTL3.TSG3nRMC = 0. Therefore, even when it is needed to rewrite only the value of the TSG3nCMP0E register, a write operation to the TSG3nCMP1E register is necessary. When only the TSG3nCMP0E register is rewritten, reload is not done.

NOTE

The PWM mode is set when TSG3nCTL0.TSG3nMD2-TSG3nMD0 = 000_B

(1) When TSG3nCMP0E and TSG3nCMP1E to TSG3nCMP12E are Not Rewritten during Timer Operation



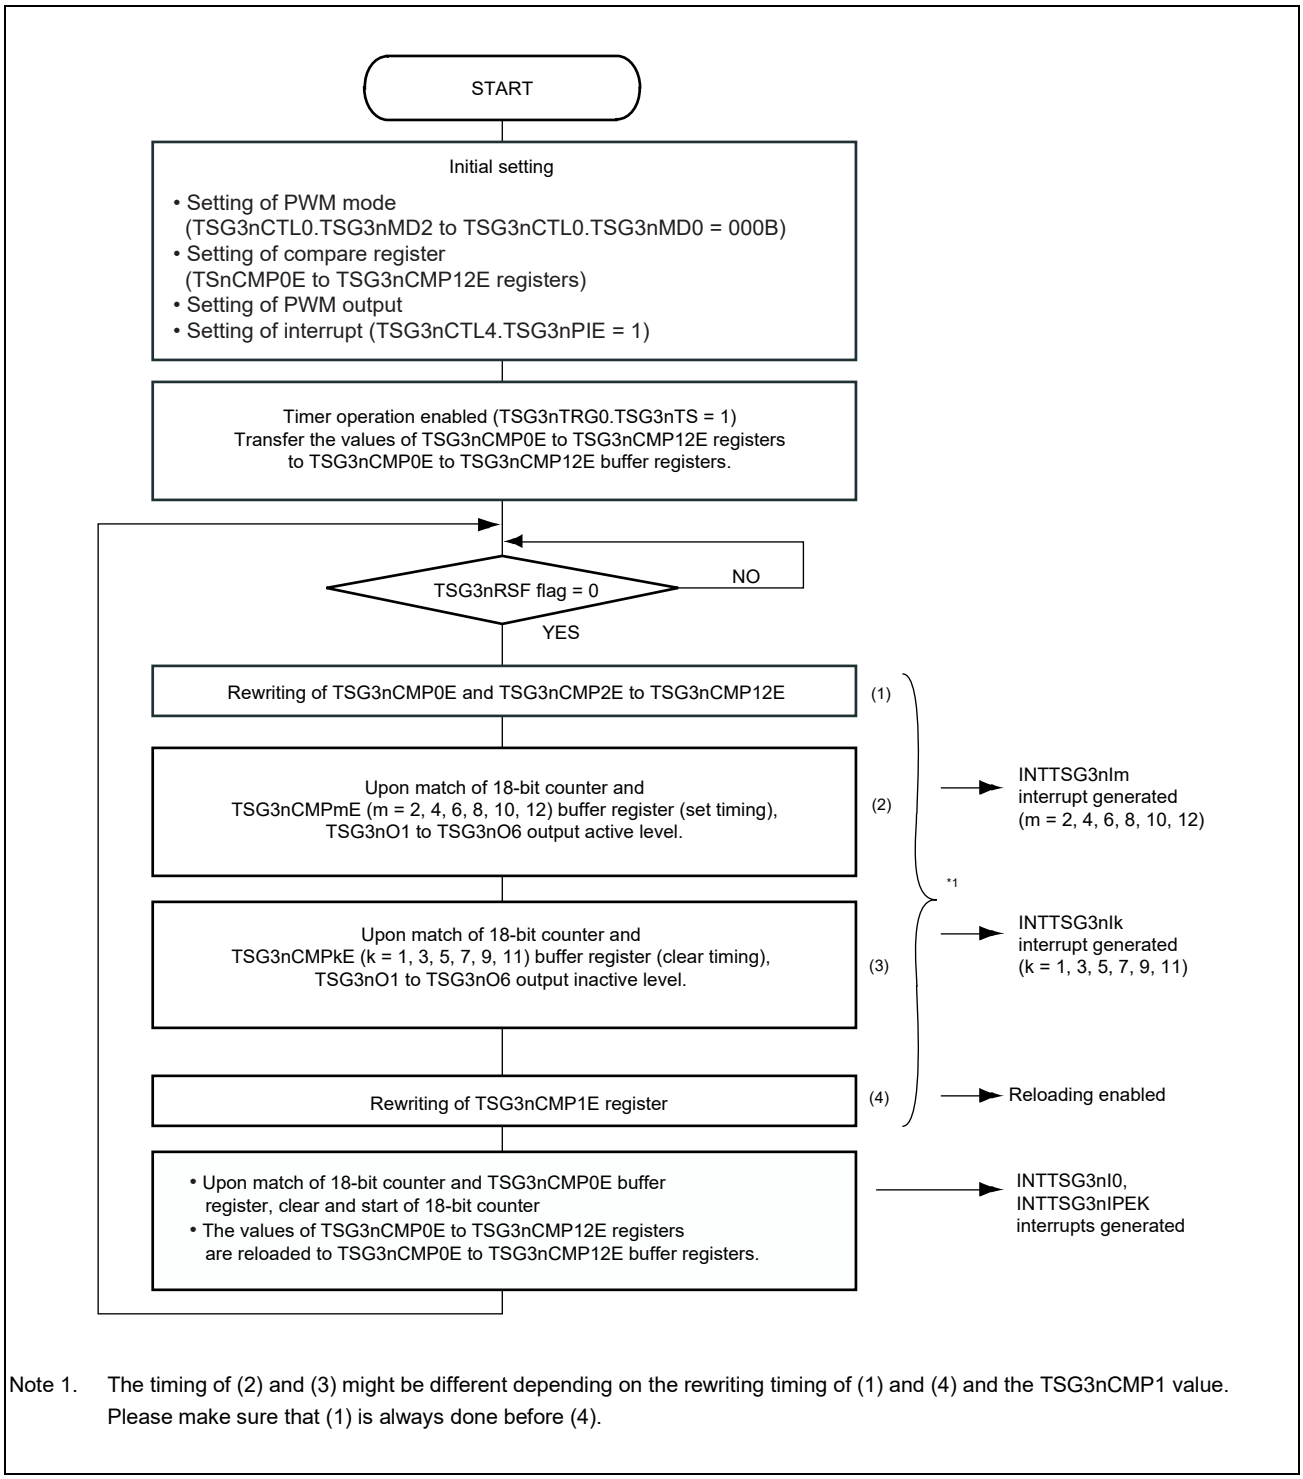


Figure 20.52 Basic Operation Flow of PWM Mode (1/2)

(2) When TSG3nCMP0E and TSG3nCMP1E to TSG3nCMP12E are Rewritten during Timer Operation

Note 1. The timing of (2) and (3) might be different depending on the rewriting timing of (1) and (4) and the TSG3nCMP1 value. Please make sure that (1) is always done before (4).

Figure 20.52 Basic Operation Flow of PWM Mode (2/2)

CAUTION

Please rewrite compare registers after confirming that the reload request flag TSG3nRSF is 0.

(3) List of Operations in PWM Mode

Table 20.55 Counter Functions in PWM Mode

Operation		Setting Condition
18-bit counter	Start	TSG3nTRG0.TSG3nTS = 0 → 1, or a simultaneous start trigger
	Clear	Compare match of TSG3nCMP0E buffer register and 18-bit counter
	Stop	TSG3nTRG1.TSG3nTT = 0 → 1

Table 20.56 Functions of Compare Registers and Dead Time Setting Register in PWM Mode

Register	Rewriting Methods	Rewrite During Operation	Function
TSG3nCMP0E	Reload/Anytime rewrite	Possible	Setting period
TSG3nCMPmE (m = 1 to 12)	Reload/Anytime rewrite	Possible	Setting set/clear timing
TSG3nDCMP0E, TSG3nDCMP1E, TSG3nDCMP2E	Reload/Anytime rewrite	Possible	Diagnostic output or A/D conversion trigger
TSG3nDTC0W, TSG3nDTC1W	Reload	Possible*1	Setting dead time

Note 1. For details, see **(5), Controlling Dead Time in PWM Mode**.

Table 20.57 Timer Output in PWM Mode

Pin	Function
TSG3nOm (m = 1 to 6)	PWM output by compare match of TSG3nCMPkE buffer register and 18-bit counter (k = 1 to 12)
TSG3nO7	Diagnostic signal output or pulse output by A/D conversion trigger

Table 20.58 Interrupt Requests in PWM Mode

Interrupt	Function
INTTSG3nIm (m = 0 to 12)	Compare match of TSG3nCMPmE buffer register and 18-bit counter (m = 0 to 12)
INTTSG3nIER	Error (simultaneous active state of TSG3nO1 and TSG3nO2, or TSG3nO3 and TSG3nO4, or TSG3nO5 and TSG3nO6)
INTTSG3nIVLY	—
INTTSG3nIPEK	Peak interrupt (generated at the same timing as INTTSG3nI0)
INTTSG3nIWN	Warning interrupt

Note: "—": Not available in PWM mode

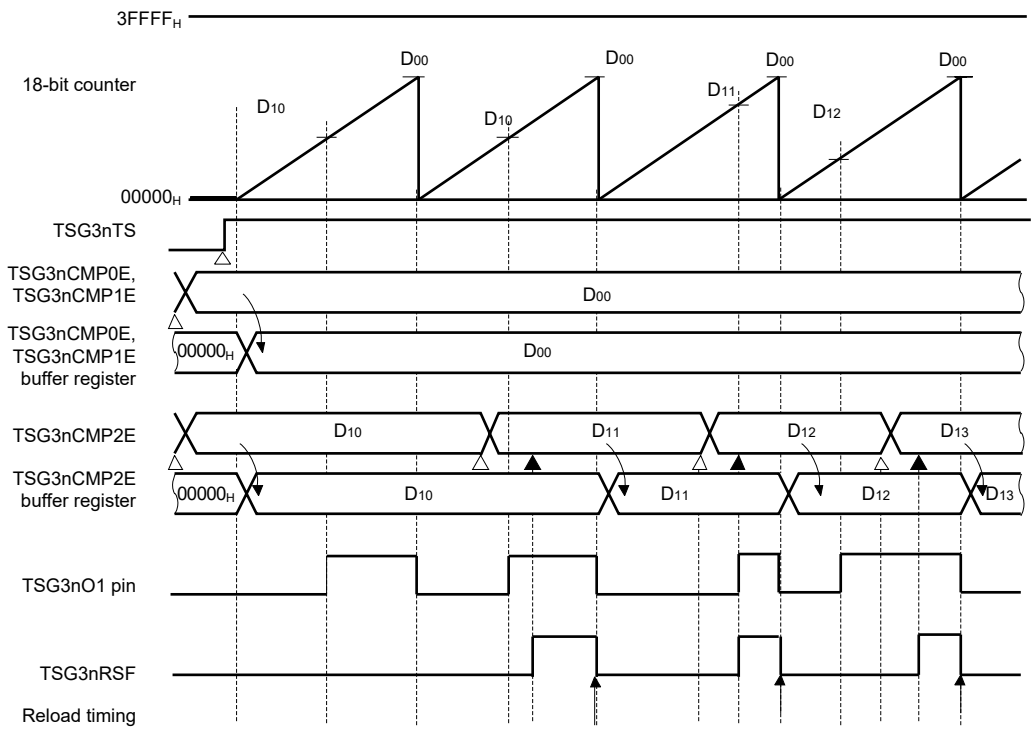

Table 20.59 Compare Match Timing in PWM Mode

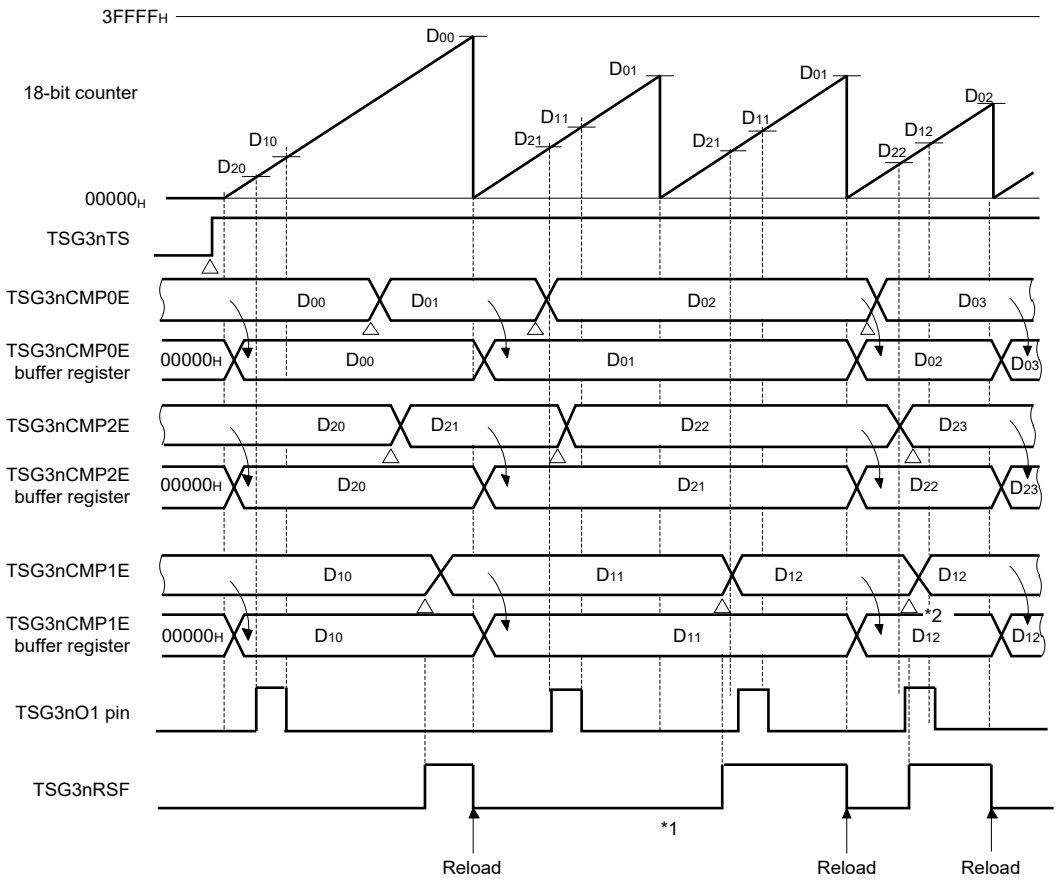
Compare Match	Timing
TSG3nCMP0E	When 18-bit counter changes from TSG3nCMP0E to 00000_H
TSG3nCMPmE (m = 1 to 12)	After detecting the match of 18-bit counter and TSG3nCMPmE (m = 1 to 12)

Table 20.60 Example of Setting each Timer Output Condition in PWM Mode

Pin	Item	Output Period	Output Duty	
			Output Condition	Setting Condition
TSG3nOm (m = 1 to 6)	PWM output	(TSG3nCMP0E + 1) × count clock	Output an inactive level throughout one period (duty cycle 0%)	TSG3nCMPmE = TSG3nCMP (m + 1)E or TSG3nCMP (m + 1) E> TSG3nCMP0E (m = 1, 3, 5, 7, 9, 11)
			Output an active level of one count clock in one period	TSG3nCMPmE = TSG3nCMP (m + 1)E + 1 TSG3nCMP (m + 1)E = TSG3nCMPmE - 1 (m = 1, 3, 5, 7, 9, 11)
			Output an inactive level of one count clock in one period	TSG3nCMPmE = TSG3nCMP (m + 1)E - 1 SG3nCMP (m + 1)E = TSG3nCMPmE + 1 (m = 1, 3, 5, 7, 9, 11)
			Output an active level throughout one period (duty cycle 100%)	TSG3nCMPmE > TSG3nCMP0E TSG3nCMP (m + 1) E ≤ TSG3nCMP0E (m = 1, 3, 5, 7, 9, 11)

- When only TSG3nCMP2E is rewritten and the TSG3nO1 pin output is used (TSG3nIOC0.TSG3nTOE1 = 1, TSG3nIOC2.TSG3nOL1 = 0)



Note: Δ: Write access
▲: TSG3nCMP1E write access (equivalent)

Figure 20.53 Example of Basic Operation Timing in PWM Mode (1/2)

NOTES

1. D00: Set values of TSG3nCMP0E and TSG3nCMP1E (00000_H-$3FFFF_H$)
   D10, D11, D12 and D13: Set values of TSG3nCMP2E (00000_H-$3FFFF_H$)
2. TSG3nO1 (PWM) duty cycle = (TSG3nCMP1E-TSG3nCMP2E) × (count lock)
   TSG3nO1 (PWM) period = (Set value of TSG3nCMP0E + 1) × (count lock)
3. TSG3nO2-TSG3nO6 pins behave similarly to the TSG3nO1 pin

- When TSG3nCMP0E-TSG3nCMP2E are rewritten, and the TSG3nO1 pin output is used (TSG3nIOC0.TSG3nTOE1 = 1, TSG3nIOC2.TSG3nOL1 = 0)

Note 1. The TSG3nCMP0E buffer register is not reloaded, because the TSG3nCMP1E register was not rewritten.

Note 2. Equivalent writing

Note: Δ: Write access

Figure 20.53 Example of Basic Operation Timing in PWM Mode (2/2)

NOTES

1. D00, D01, D02, D03: Set point of TSG3nCMP0E (00000_H-$3FFFF_H$)
   D10, D11, D12, D13: Set point of TSG3nCMP1E (00000_H-$3FFFF_H$)
   D20, D21, D22, D23: Set point of TSG3nCMP2E (00000_H-$3FFFF_H$)
2. Outputs from TSG3nO2 to TSG3nO6 behave similarly to the TSG3nO1 pin.

(4) Interrupt/Reload Skipping Function in PWM Mode

By setting TSG3nCTL4.TSG3nPRE and TSG3nPIE to 1 and setting TSG3nRCC04 to TSG3nRCC00 and TSG3nCTL3.TSG3nRIA, the reload and interrupt skipping function can be used.

By setting TSG3nPRE to 1 and setting TSG3nRCC04 to TSG3nRCC00, the interrupt skipping function can be used.

(5) Controlling Dead Time in PWM Mode

By setting the dead time value in the TSG3nDTC0W and TSG3nDTC1W registers in PWM mode, it is possible to control the dead time. The dead time is controlled according to the switch timing of the TSG3nO1 and TSG3nO2 pin outputs, the TSG3nO3 and TSG3nO4 pin outputs, and the TSG3nO5 and TSG3nO6 pin outputs.

Table 20.61 Dead Time in PWM Mode

Switch Timing	Dead Time
TSG3nO1: High level to low level TSG3nO2: Low level to high level	Value of TSG3nDTC1W register
TSG3nO2: High level to low level TSG3nO1: Low level to high level	Value of TSG3nDTC0W register
TSG3nO3: High level to low level TSG3nO4: Low level to high level	Value of TSG3nDTC1W register
TSG3nO4: High level to low level TSG3nO3: Low level to high level	Value of TSG3nDTC0W register
TSG3nO5: High level to low level TSG3nO6: Low level to high level	Value of TSG3nDTC1W register
TSG3nO6: High level to low level TSG3nO5: Low level to high level	Value of TSG3nDTC0W register

NOTE

Dead time counter keeps operating even when operation stop (TSG3nTE = 0) setting collided with dead time insert timing, and the dead time set in TSG3nO1 and TSG3nO2 are always inserted.

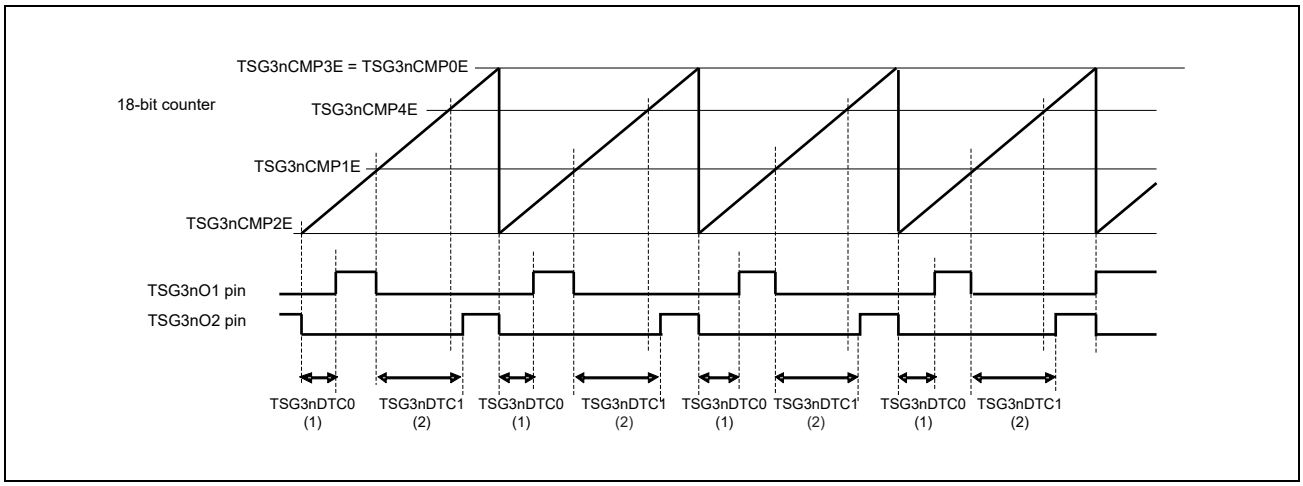


Figure 20.54 Example of Dead Time Control between TSG3nO1 and TSG3nO2 Outputs (1/2)

During (1), the dead time counter starts counting at the falling edge of the TSG3nO2 output. At this time, even after the 18-bit counter reaches 00000_H, the TSG3nO1 output stays inactive because the dead time counter is still operating. The TSG3nO1 output becomes active at the timing when the dead time count operation ends.

At (2), the dead time counter starts counting at the falling edge of the TSG3nO1 output. Even after the match of the 18-bit counter and TSG3nCMP4E, the TSG3nO2 output stays inactive because the dead time counter is still operating. The TSG3nO2 output becomes active at the timing when the dead time count operation ends.

NOTES

1. The TSG3nO1 and TSG3nO2 pins are set to active high
2. The TSG3nO3 and TSG3nO4 pins and the TSG3nO5 and TSG3nO6 pins outputs behave similarly.

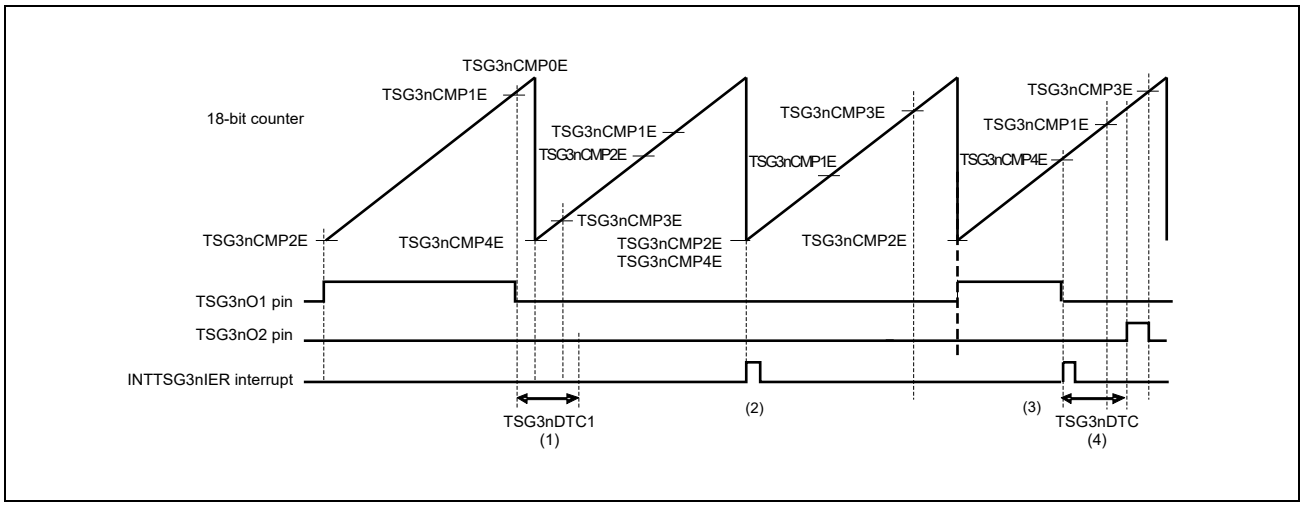

Figure 20.54 Example of Dead Time Control between TSG3nO1 and TSG3nO2 Outputs (2/2)

During (1), the dead time counter starts counting at the falling edge of the TSG3nO1 output. Even after the 18-bit counter reaches 00000_H and the match occurs between the 18-bit counter and TSG3nCMP4E, the TSG3nO2 output stays inactive because the dead time counter is still operating. Moreover, since the TSG3nCMP3E register compare match occurs before the operation of the dead time counter ends, the TSG3nO2 output stays inactive.

- TSG3nCMP1E + TSG3nDTC1 ≥ TSG3nCMP0E + TSG3nCMP2E (TSG3nO2 stays inactive)
- TSG3nCMP2E + TSG3nDTC0 ≥ TSG3nCMP0E + TSG3nCMP1E (TSG3nO1 stays inactive)

At (2), the INTTSG3nIER interrupt occurs because the TSG3nCMP2E register and the TSG3nCMP4E register are set so that the TSG3nO1 and TSG3nO2 outputs rise simultaneously. Here, the TSG3nO1 output and the TSG3nO2 output are inactive.

At (3), compare match with the TSG3nCMP4E register generates an INTTSG3nIER interrupt and both TSG3nO1 and TSG3nO2 outputs become inactive.

At (4), the falling edge (inactive) of the TSG3nO1 output is caused by the simultaneous active state detected and the dead time counter starts counting. After the end of the dead time counter operation, the TSG3nO2 output becomes active.

NOTES

1. The TSG3nO1 and TSG3nO2 pins are set to active high.
2. The TSG3nO3 and TSG3nO4 pins and the TSG3nO5 and TSG3nO6 pins outputs behave similarly.

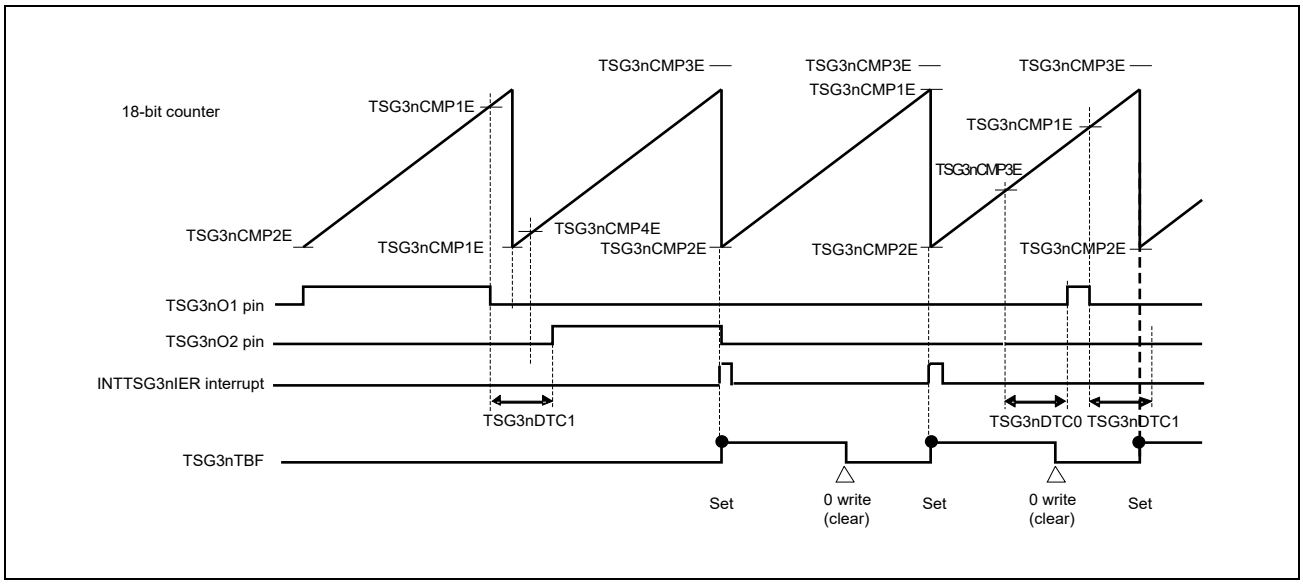

Figure 20.55 Example of 100% Duty Output at Dead Time Control

When the TSG3nO2 pin is set to duty cycle of 100% (TSG3nCMP3E ≥ TSG3nCMP0E + 1), the output of the TSG3nO1 pin is fixed to a low level. This control is intended to mask the active condition of TSG3nO1 output since the TSG3nO2 output is active before the TSG3nO1 output becomes active. In this case, the INTTSG3nIER interrupt is also generated because TSG3nO1 and TSG3nO2 outputs become high simultaneously.

NOTES

1. The TSG3nO1 and TSG3nO2 pins are set to active high.
2. The TSG3nO3 and TSG3nO4 pins and the TSG3nO5 and TSG3nO6 pins outputs behave similarly.

(6) Dead Time Rewriting during Timer Operation in PWM Mode

In PWM mode, it is possible to rewrite TSG3n dead time setting registers TSG3nDTC0W and TSG3nDTC1W while counting. The new settings are active at reload timing. It is not possible to change the dead time setting by rewriting at any time.

Please enable reloading by writing to the TSG3nCMP1E register.

20.4.7.2 HT-PWM mode (High Accuracy Triangular Pulse Width Modulation Mode)

Overview

In this mode, the 18-bit counter (up/down count by ± 2 bits, practically 17 bits) and the 18-bit compare registers (LSB is used to control additional pulse) are used to generate a 6-phase PWM signal.

Prerequisites

- Set the carrier wave period to TSG3nCMP0E.
- Set the duty cycle of the voltage data signals of the U phase, V phase, and W phase with TSG3nCMPUE, TSG3nCMPVE, and TSG3nCMPWE. (The values set to TSG3nCMPUE, TSG3nCMPVE, and TSG3nCMPWE are reflected immediately to the corresponding TSG3nCMPmE (m = 1, 2, 5, 6, 9, 10)).
- Symmetric triangular wave control is described in this section. Please refer to **Section (10), Asymmetric Triangular Wave Control in HT-PWM Mode**, for asymmetric triangular wave control.

Functional description

Set the period of carrier wave and the duty cycle of the U phase, the V phase, and the W phase. Counting up begins when TSG3nTRG0.TSG3nTS is set to 1.

The 18-bit counter counts up from TSG3nDTC0 as the minimum value, and counts down upon the match of the maximum value of TSG3nCMP0E + TSG3nDTC0.

The dead time is set with TSG3nDTC0 and TSG3nDTC1. TSG3nDTC0 sets the dead time of inverse phase (OFF) to positive phase (ON) switch and TSG3nDTC1 sets the dead time of positive phase (OFF) to inverse phase (ON) switch. The 10-bit counters (TSG3nDTT1 to TSG3nDTT3) for dead time generation load the set values of TSG3nDTC0 and TSG3nDTC1 by the compare match of the 18-bit counter and the TSG3nCMPm buffer register (m = 1, 2, 5, 6, 9, 10), and start down-counting.

The INTTSG3nIm interrupts (m = 1, 2, 5, 6, 9, 10) are generated by the compare match of the 18-bit counter with the TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, and TSG3nCMP10E buffer registers.

INTTSG3nIm interrupts (m = 3, 4, 7, 8, 11, 12) are generated by the compare match of the 18-bit counter with the TSG3nCMP3E, 7E, and 11E buffer registers when counting down (TSG3nCUF = 1), and with the TSG3nCMP4E, 8E, and 12E buffer registers when counting up (TSG3nCUF = 0).

NOTE

The HT-PWM mode is enabled when TSG3nCTL0.TSG3nMD2-TSG3nMD0 = 001_B.

(1) Block Diagram and Basic Timing Chart

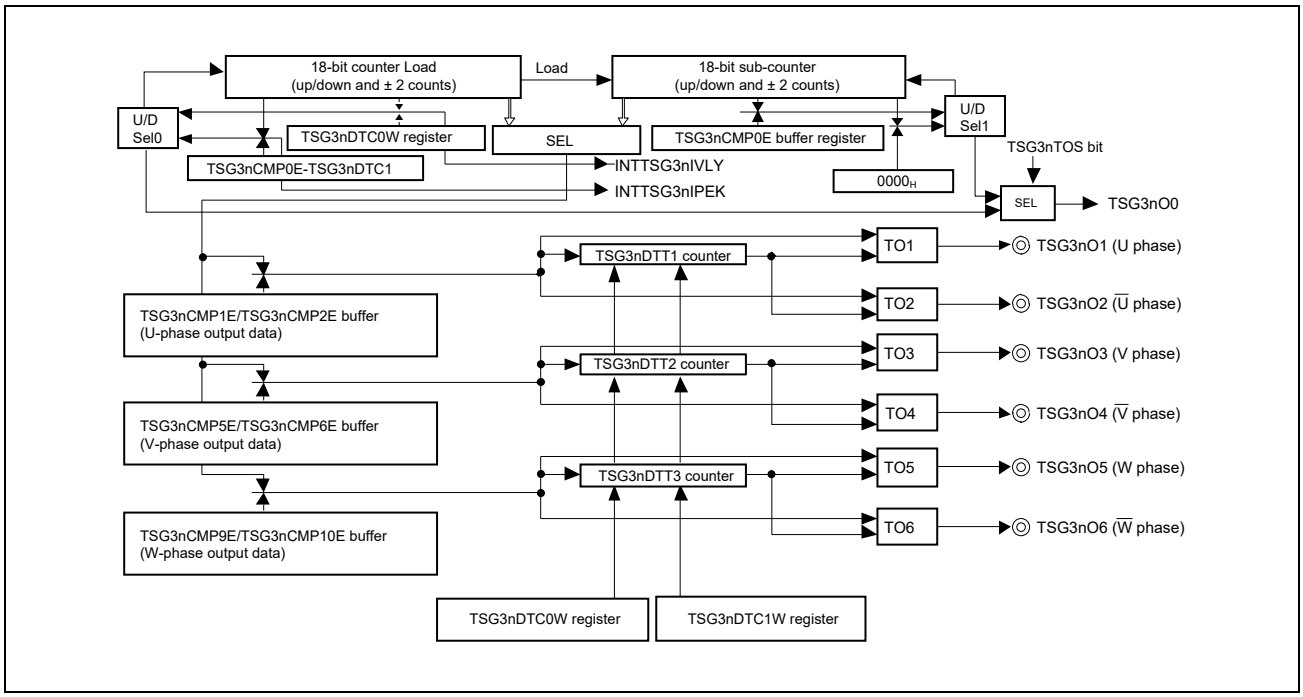

Figure 20.56 Block Diagram in HT-PWM Mode

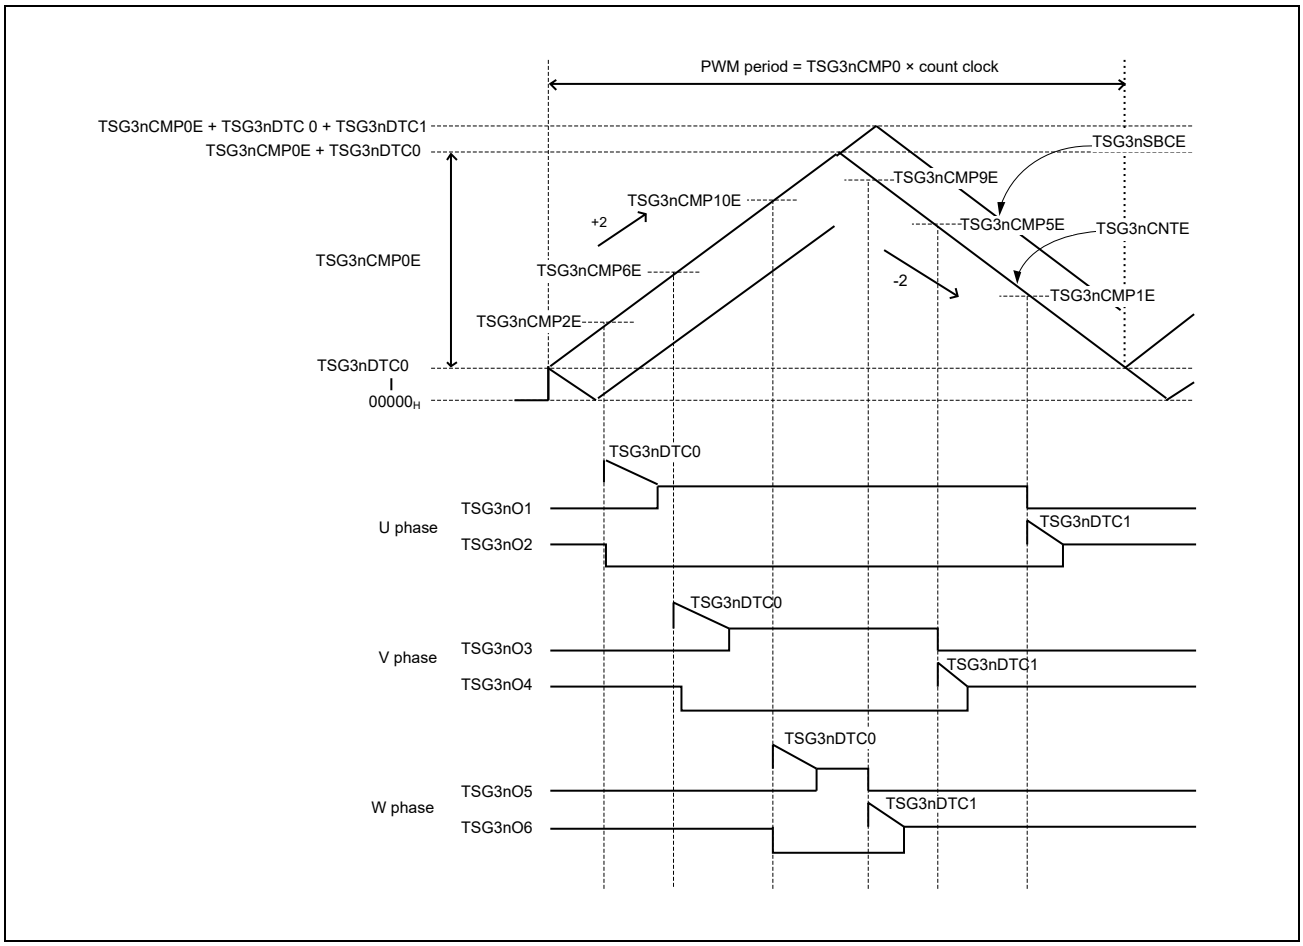

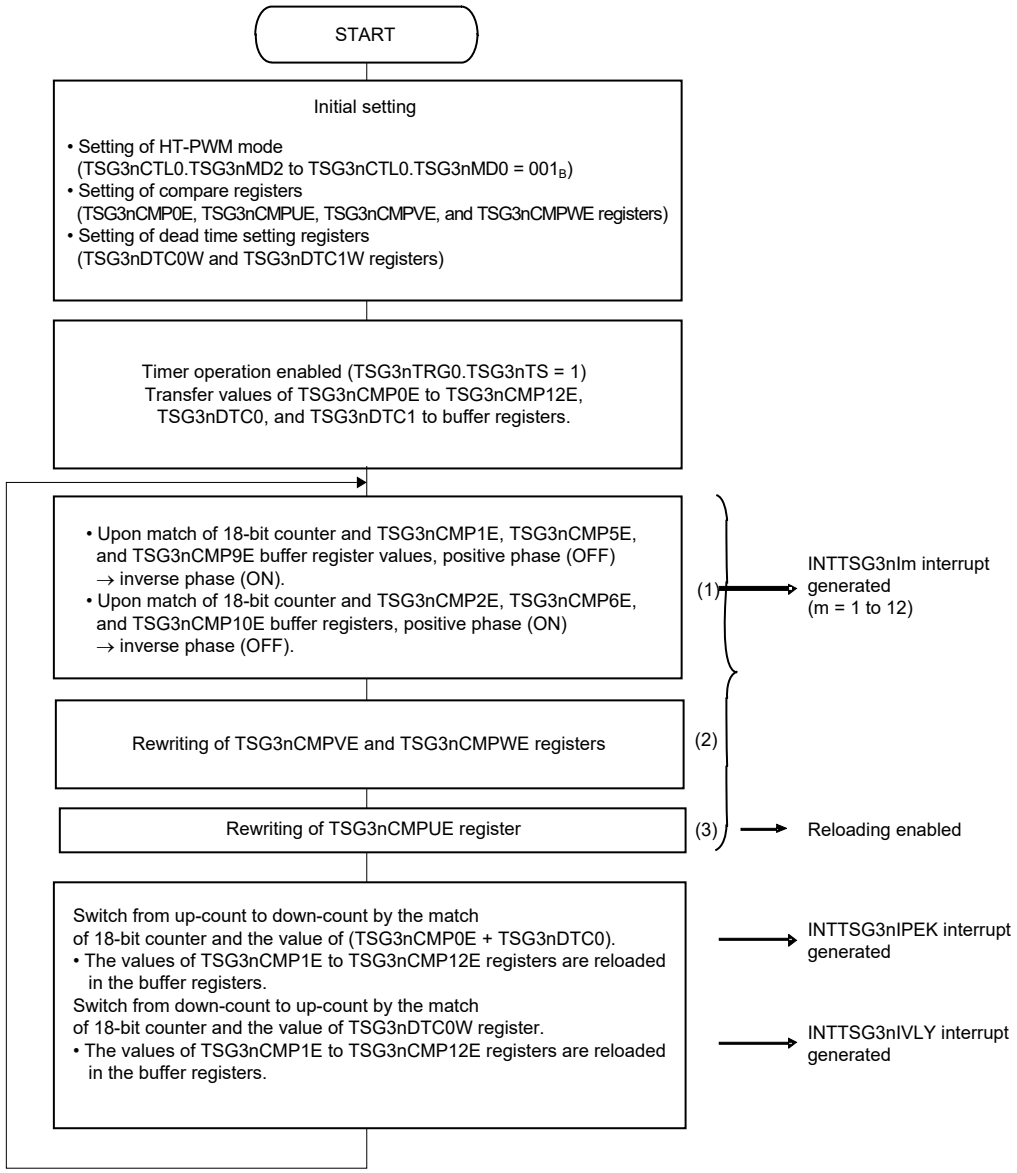

Figure 20.57 Basic Timing in HT-PWM Mode

Note: Write access to TSG3nCMPUE (TSG3nCMP1E) includes the operation to enable reloading. Therefore, (3) must be done after (2).

The INTTSG3nIPEK interrupt is generated only when TSG3nCTL4.TSG3nPRE = 1.

The INTTSG3nIVLY interrupt is generated only when TSG3nCTL4.TSG3nVRE = 1.

INTTSG3nI3, INTTSG3nI7, and INTTSG3nI11 outputs an interrupt at the match timing of TSG3nCMP3E, 7E, and 11E with TSG3nCNTE when counting down (TSG3nCUF = 1). INTTSG3nI4, INTTSG3nI8, and INTTSG3nI12 outputs an interrupt at the match timing of TSG3nCMP4E, 8E, and 12E with TSG3nCNTE when counting up (TSG3nCUF = 0).

Figure 20.58 Basic Operation Flow in HT-PWM Mode

(2) List of HT-PWM Mode Operations

Table 20.62 Counter Function in HT-PWM Mode

Operation		Setting Condition
18-bit counter	Start	TSG3nTRG0.TSG3nTS = 0 → 1 or simultaneous start trigger (counting up from TSG3nDTC0)
	Up count	Compare match of TSG3nDTC0 buffer register and 18-bit counter
	Down count	Compare match of TSG3nCMP0E + TSG3nDTC0 buffer register and 18-bit counter
	Clear	—
	Stop	TSG3nTRG1.TSG3nTT = 0 → 1
18-bit sub-counter	Start	TSG3nTRG0.TSG3nTS = 0 → 1 or simultaneous start trigger (counting down from TSG3nDTC0)
	Up count	Underflow
	Down count	Compare match of TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 buffer register and 18-bit sub-counter
	Load	• TSG3nCMP0E + TSG3nDTC0: When value of 18-bit counter matches the value of buffer register TSG3nCMP0E + TSG3nDTC0 • TSG3nDTC0: When value of 18-bit counter matches the value of the buffer register TSG3nDTC0
	Clear	—
	Stop	TSG3nTRG1.TSG3nTT = 0 → 1

Table 20.63 Compare Register and Dead Time Setting Register Functions in HT-PWM Mode

Register	Rewrite Method	Rewrite during Operation	Function
TSG3nCMP0E	Reload/Anytime rewrite	Possible	Setting period
TSG3nCMPUE	—	Possible	PWM control for U phase
TSG3nCMP1E, TSG3nCMP2E	Reload/Anytime rewrite		
TSG3nCMPVE	—	Possible	PWM control for V phase
TSG3nCMP5E, TSG3nCMP6E	Reload/Anytime rewrite		
TSG3nCMPWE	—	Possible	PWM control for W phase
TSG3nCMP9E, TSG3nCMP10E	Reload/Anytime rewrite		
TSG3nDCMP0E, TSG3nDCMP1E, TSG3nDCMP2E	Reload/Anytime rewrite	Possible	Diagnostic signal output or A/D conversion trigger
TSG3nDTC0W, TSG3nDTC1W	Reload	Possible conditionally	Period and dead time setting

NOTE

- The rewritten values of TSG3nCMPUE, TSG3nCMPVE, and TSG3nCMPWE are set to TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E and TSG3nCMP10E.
- For rewriting method of TSG3nDTC0 and TSG3nDTC1, see **Section 20.4.7.2(8)(a), TSG3nDTC0 and TSG3nDTC1 Rewriting**.

Table 20.64 Timer Output Function in HT-PWM Mode

Pin	Function
TSG3nO0	Outputs an inactive level while the 18-bit counter or the 18-bit sub-counter counts up and an active level while the 18-bit counter or the 18-bit sub-counter counts down.
TSG3nO1	Outputs a PWM signal with dead time on a compare match of the TSG3nCMP1E buffer register with the 18-bit counter (counting down) or the TSG3nCMP2E buffer register with the 18-bit counter (counting up). Outputs a PWM signal on a compare match of the TSG3nCMP1E buffer register with the 18-bit sub-counter (counting down) or the TSG3nCMP2E buffer register with the 18-bit sub-counter (counting up) while TSG3nCMP1E < DTC0.
TSG3nO2	Outputs an inverse phase to TSG3nO1
TSG3nO3	Outputs a PWM with dead time on a compare match of the TSG3nCMP5E buffer register and the 18-bit counter (counting down) or the TSG3nCMP6E buffer register and the 18-bit counter (counting up). Outputs a PWM on a compare match of the TSG3nCMP3E buffer register and the 18-bit sub-counter (counting down) or the TSG3nCMP6E buffer register and the 18-bit sub-counter (counting up) while TSG3nCMP5E < DTC0.
TSG3nO4	Outputs an inverse phase to TSG3nO3
TSG3nO5	Outputs a PWM signal with dead time on a compare match of the TSG3nCMP9E buffer register and the 18-bit counter (counting down) and the TSG3nCMP10E buffer register and the18-bit counter (counting up). Outputs a PWM signal on a compare match of the TSG3nCMP5E buffer register and the 18-bit sub-counter (counting down) or the TSG3nCMP10E buffer register and the 18-bit sub-counter (counting up) while TSG3nCMP9E < DTC0
TSG3nO6	Outputs an inverse phase to TSG3nO5
TSG3nO7	Outputs a diagnostic signal or a pulse in response to an AD conversion trigger

NOTES

1. State of TSG3nO0 output can be switched by using the TSG3nIOC1.TSG3nTOS bit.
2. When the peak and trough values of the 18-bit sub-counter are set in TSG3nCMP1E and TSG3nCMP2E, clearing takes precedence.

Table 20.65 Interrupt Request in HT-PWM Mode

Interrupt	Function
INTTSG3nI0	Compare match of the TSG3nDTC0 buffer register with the 18-bit counter (periodic interrupt)
INTTSG3nIm (m = 1, 2, 5, 6, 9, 10)	Compare match of the TSG3nCMPmE buffer register with the 18-bit counter (m = 1, 2, 5, 6, 9, 10)
INTTSG3nIER	Error interrupt
INTTSG3nIVLY	Trough interrupt
INTTSG3nIPEK	Peak interrupt
INTTSG3nIWN	Warning interrupt

Table 20.66 Compare Match Timing in HT-PWM Mode

Compare Match	Timing
TSG3nCMP0E	When the 18-bit counter changes from TSG3nDTC0 to TSG3nDTC0 + 2
TSG3nCMPmE (m = 1, 2, 5, 6, 9, 10)	When 18-bit counter changes from TSG3nCMPmE to TSG3nCMPmE ± 2 (m = 1, 2, 5, 6, 9, 10)

Table 20.67 Example of Setting Each Timer Output Condition in HT-PWM Mode

Pin	Item	Output Period	Output Duty	
			Output Condition	Setting Condition
TSG3nO0	Toggle output	TSG3nCMP0E × count clock	Outputs an inactive level when counting up, and an active level when counting down.	—
TSG3nO1, TSG3nO3, TSG3nO5	PWM output	TSG3nCMP0E × count clock	Outputs an inactive level throughout one period (0% duty)	TSG3nCMP0E ≤ TSG3nCMPmE ≤ TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 (m = U, V, W)
			Outputs an active level of one count clock in one period	TSG3nCMPmE = TSG3nCMP0E – 1 (m = U, V, W)
			Outputs an inactive level of one count clock in one period	TSG3nCMPmE = 0001_H (m = U, V, W)
			Outputs an active level throughout one period (100% duty)	TSG3nCMPmE = 0000_H (m = U, V, W)
TSG3nO2, TSG3nO4, TSG3nO6	PWM output		Outputs an inactive level throughout one period (0% duty)	TSG3nCMPmE ≤ TSG3nDTC0 + TSG3nDTC1 (m = U, V, W)
			Outputs an active level of one count clock in one period	TSG3nCMPmE = TSG3nDTC0 + TSG3nDTC1 + 1 (m = U, V, W)
			Outputs an inactive level of one count clock in one period	TSG3nCMPmE = TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 – 1 (m = U, V, W)
			Outputs an active level throughout one period (100% duty)	TSG3nCMPmE = TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 (m = U, V, W)
TSG3nO7	Diagnostic signal output or pulse output by A/D conversion trigger	TSG3nCMP0E × count clock	See **Section 20.4.5, A/D Conversion Trigger Function**.	

(3) Settings of HT-PWM Mode

Mode setting

HT-PWM mode is entered by setting TSG3nCTL0.TSG3nMD2-TSG3nMD0 to 001_B.

Setting timer output

The output pins TSG3nO1 to TSG3nO6 are controlled by setting TSG3nIOC0, TSG3nIOC2, and TSG3nIOC3.

The output pin TSG3nO0 indicates the state of the 18-bit counter or the 18-bit sub-counter, whether counting up or down. The states between these counters are switched by using the TSG3nIOC1.TSG3nTOS bit.

The TSG3nO7 pin outputs pulses of the diagnostic output or the A/D conversion trigger. Please set it as required.

Enabling error interrupt generation

Error interrupt (INTTSG3nIER) due to the detection of the simultaneous active state of the positive phase and inverse phase is enabled by setting TSG3nIOC1.TSG3nEOC to 1. In HT-PWM mode, with any value set in the compare register, the simultaneous active state of the positive phase and inverse phase is not possible. For the detail, see **Section 20.4.6, Error/Warning Interrupt**.

Setting register rewriting timing with reload function

With TSG3nCTL3.TSG3nRMC, reload (simultaneous rewrite) or rewrite (anytime) is specified for the registers with reload function. The default setting is 0 (reload). To reload, set TSG3nCTL4.TSG3nPRE or TSG3nVRE to 1.

The reload timing is not generated if both the TSG3nPRE bits and TSG3nVRE bits are set to 0.

When “anytime rewrite” is specified, the unintended output may be generated depending on the rewrite timing.

Setting interrupts and skipping function

Interrupts and the skipping function are set with TSG3nCTL4. TSG3nPIE should be set to 1 when peak interrupt (INTTSG3nIPEK) is necessary and TSG3nVIE to 1 when trough interrupt (INTTSG3nIVLY) is necessary. To use the skipping function for peak/trough interrupts, the TSG3nRCC4 to TSG3nRCC0 must be set.

Setting A/D conversion trigger output

To set A/D conversion trigger 0 (TSG3nADTRG0 signal), use TSG3nCTL5.TSG3nAT09 to TSG3nAT00.

With TSG3nAT09 to TSG3nAT00, A/D conversion trigger output is enabled or disabled at the match of the 18-bit counter (during up count) with TSG3nDCMP2E to TSG3nDCMP0E, the match of the 18-bit counter (during down count) with TSG3nDCMP2E to TSG3nDCMP0E, the 18-bit counter peak interrupt (INTTSG3nIPEK), the 18-bit counter trough interrupt (INTTSG3nIVLY), the 18-bit sub-counter peak timing, and 18-bit sub-counter trough timing.

To set A/D conversion trigger 1 (TSG3nADTRG1 signal), use TSG3nCTL6.TSG3nAT19 to TSG3nAT10.

To set the match timing of 18-bit counter and TSG3nDCMP2E to TSG3nDCMP0E, set the compare value to the pertinent register.

The skipping function can be used for TSG3nADTRG0 and the TSG3nADTRG1 signals. Use TSG3nACC01, TSG3nACC00 of TSG3nCTL5, TSG3nACC10, and TSG3nACC11 of TSG3nCTL6 to select the skipping rate among 1/1, 1/2, 1/4, and 1/8.

CAUTION

Set TSG3nCTL5, TSG3nCTL6, and TSG3nDCMP2E-TSG3nDCMP0E correctly when using the TSG3nO7 output for the A/D conversion trigger timing pulse.

Setting dead time

The dead time can be set with TSG3nDTC0 and TSG3nDTC1.

The dead time is calculated by the following expressions:

- PCLK × TSG3nDTC0
- PCLK × TSG3nDTC1

TSG3nDTC0 can set the time between a change of TSG3nO2, TSG3nO4, and TSG3nO6 to the inactive state and a change of TSG3nO1, TSG3nO3, and TSG3nO5 to the active state, respectively.

TSG3nDTC1 can set the time between a change of TSG3nO1, TSG3nO3, TSG3nO5 to the inactive state and a change of TSG3nO2, TSG3nO4, and TSG3nO6 to the active state, respectively.

TSG3nDTC0 and TSG3nDTC1 can only be set to an even value.

Carrier period

Set the carrier period with TSG3nCMP0E according to the following expression:

TSG3nCMP0E = Carrier period/count clock period (PCLK)

Satisfy the following requirements when setting the TSG3nCMP0E register regarding the dead time:

- TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 ≤ $3FFFE_H$
- TSG3nCMP0E > TSG3nDTC0
- TSG3nCMP0E > TSG3nDTC1
- TSG3nCMP0E > 3 × MAX (TSG3nDTC0, TSG3nDTC1)
- TSG3nCMP0E: Even number

NOTE

MAX (A, B) indicates the larger value of A and B.

Duty (PWM width) setting

The duty of the U phase, the V phase, and the W phase is set with TSG3nCMPmE (m = U, V, W, or 1, 2, 5, 6, 9, and 10), respectively. The setting range of the compare registers is as follows:

00000_H ≤ TSG3nCMPmE ≤ TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1

LSB (least significant bit) of TSG3nCMPUE, TSG3nCMPVE, and TSG3nCMPWE indicates the setting of an additional pulse. When TSG3nCMPUE = 00003_H, the change in the inverse phase (TSG3nO2 output) is done one count clock later compared to the TSG3nCMPUE = 00002_H setting (when the 18-bit counter is up-counting). The additional pulse cannot be set to TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, or TSG3nCMP10E (only even numbers can be set to these registers).

(4) H18-bit counter Operation in HT-PWM Mode

The 18-bit counter is initialized to 00000_H and the value of TSG3nDTC0 is loaded immediately after starting the TSG3n timer operation (TSG3nTRG0.TSG3nTS = 1). Afterwards, counting is done by +2. After 18-bit counter reaches the value of TSG3nCMP0E + TSG3nDTC0, counting is done by -2.

The following figure shows 18-bit counter operation.

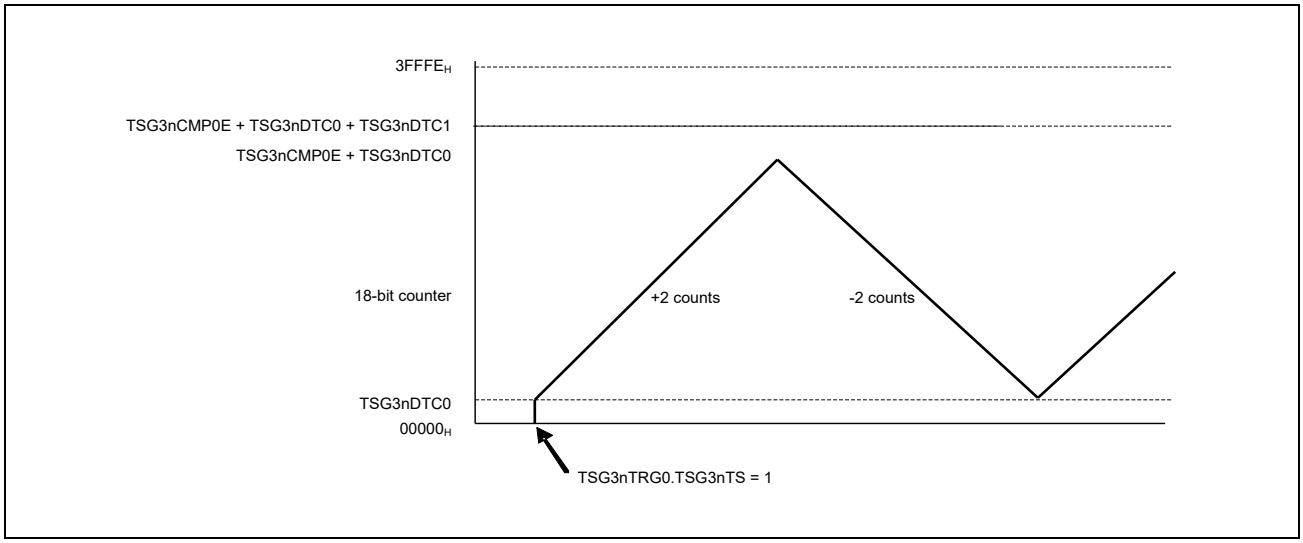

Figure 20.59 Example of 18-bit counter Operation in HT-PWM Mode

NOTE

Minimum 18-bit counter value: TSG3nDTC0
Maximum 18-bit counter value: TSG3nCMP0E + TSG3nDTC0
Carrier period: TSG3nCMP0E × count clock period (PCLK)

The 18-bit sub-counter is initialized to 00000_H and the value of TSG3nDTC0 is loaded immediately after starting the TSG3n timer operation (TSG3nTRG0.TSG3nTS = 1). Afterwards, counting by -2 is done until 00000_H is reached and counting by +2 begins. Next, the value of the 18-bit counter is loaded into the 18-bit sub-counter at a change timing of the 18-bit counter into the down count. Counting up by the 18-bit sub-counter continues until the value reaches the value of TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1, and then counting by -2 begins. Similarly, when the 18-bit counter value matches the TSG3nDTC0 value, the 18-bit counter value is loaded to the 18-bit sub-counter and the down count is continued.

The following figure shows the 18-bit sub-counter operation.

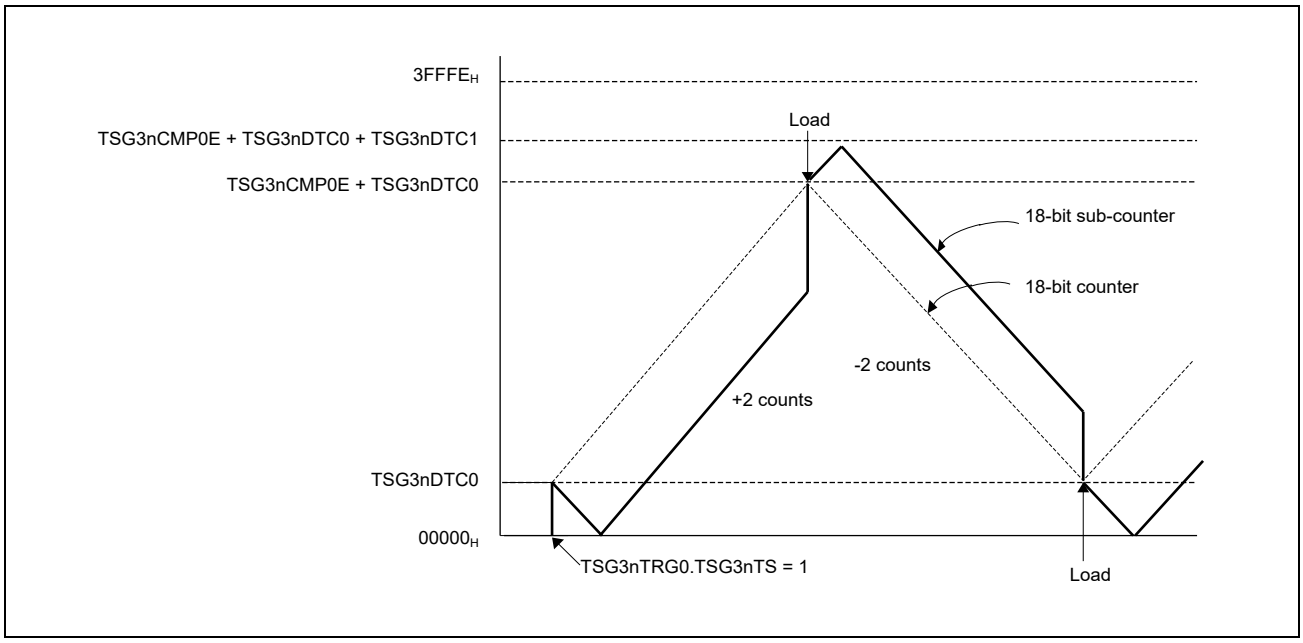

Figure 20.60 Example of 18-bit Sub-Counter Operation in HT-PWM Mode

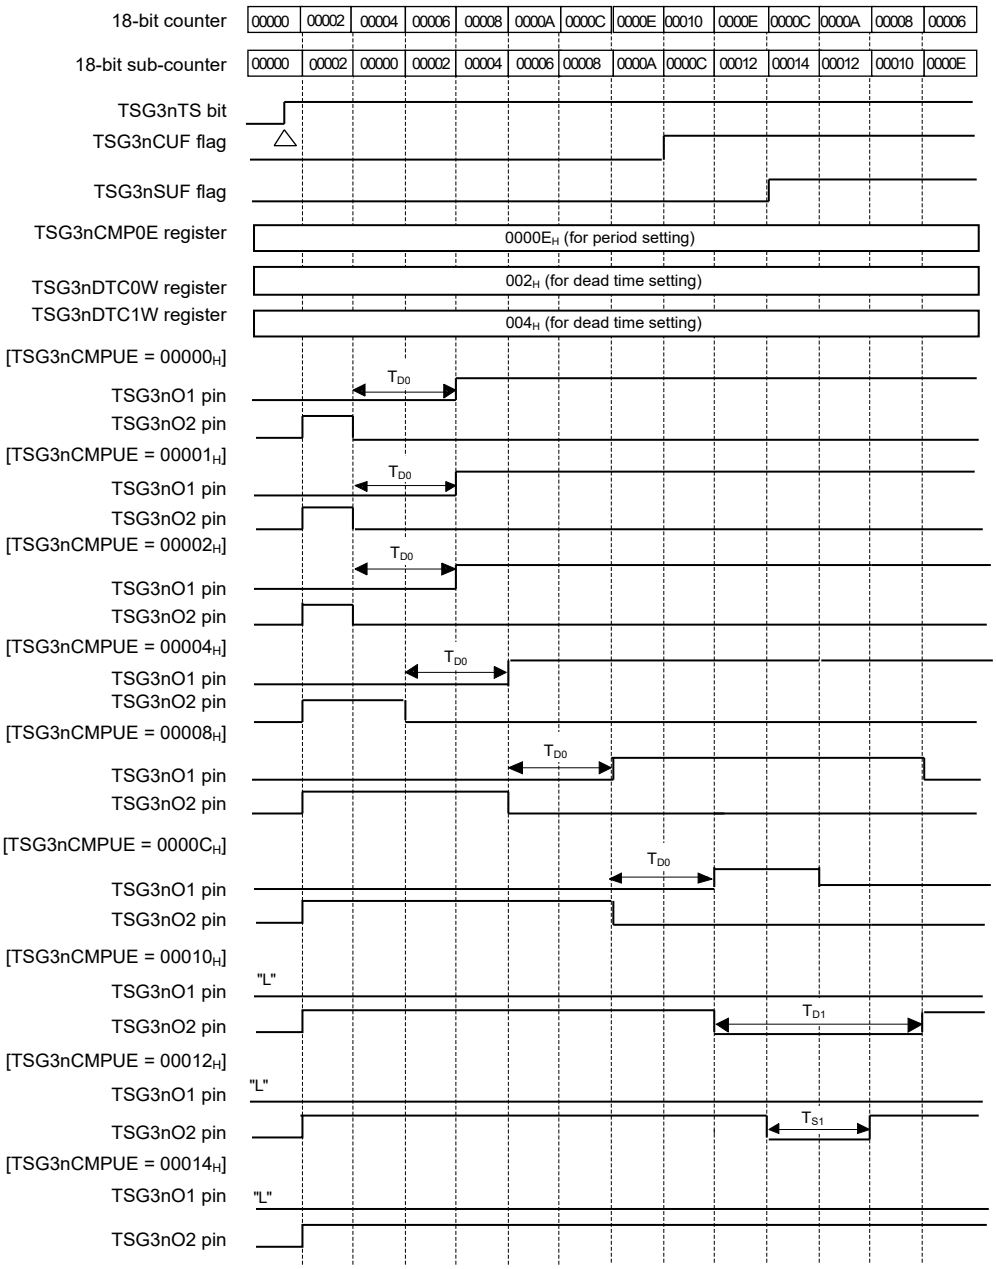
NOTE

Minimum 18-bit sub-counter value: 00000_H
Maximum 18-bit sub-counter value: TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1



(5) Basic Operation of HT-PWM Mode

(a) Example of Timer Output Immediately after the Start of the TSG3n Timer Operation

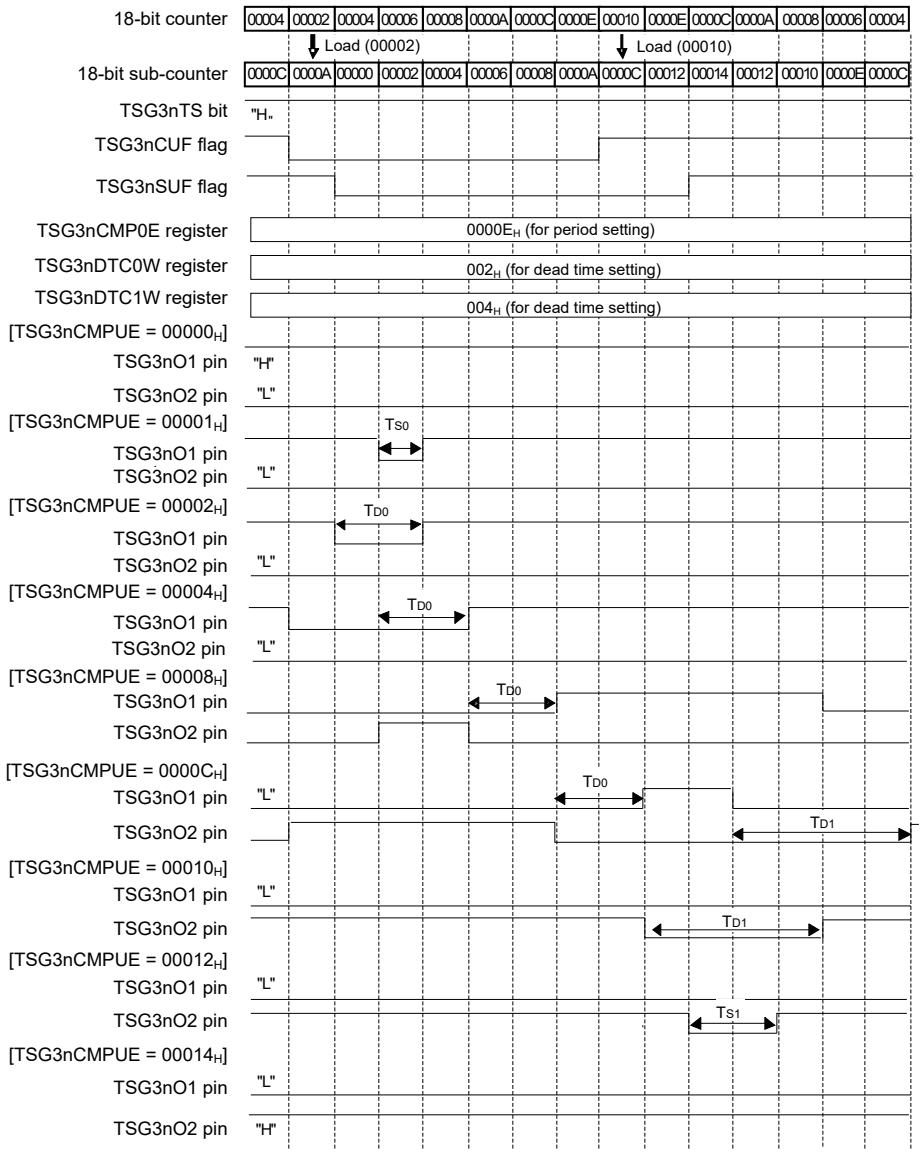
The following figure shows the timing chart when TSG3nCMP0E = $0000E_H$, TSG3nDTC0 = 002_H, TSG3nDTC1 = 004_H and TSG3nCMPUE = 00000_H to 00014_H (excerpt). In this example, TSG3nIOC2.TSG3nOL1 to TSG3nOL6 = 000000_B.

When operation starts (TSG3nTRG0.TSG3nTS = 1), the level of the TSG3nO2 pin changes to active. Afterwards, if TSG3nCMPUE ≤ TSG3nDTC0, the TSG3nO2 pin is cleared after 1 count clock cycle.

The TSG3nO2 pin is cleared upon a match of the 18-bit counter and the compare register (TSG3nCMP2E), or a match of the 18-bit sub-counter and the compare register (TSG3nCMP2E) if TSG3nCMPUE ≥ TSG3nDTC0. Afterwards, the TSG3nO1 pin is set after the set dead time period (the TSG3nO1 pin is not set if TSG3nCMPUE ≥ TSG3nCMP0E).

Note: Δ: Write access

Figure 20.61 Example of Timer Output when TSG3nTS is Set to 1 (Initial State) in HT-PWM Mode



NOTES

1. TSG3nCMP0E = $0000E_H$, TSG3nDTC0 = 002_H, TSG3nDTC1 = 004_H
2. T_{D0}: Time depending on setting of the dead time in the TSG3nDTC0W register
   T_{D1}: Time depending on setting of the dead time in the TSG3nDTC1W register
   T_{S1}: Time decided by compare match of the 18-bit sub-counter and TSG3nCMPUE register, when TSG3nCMPUE >18-bit counter maximum value

(b) Example of Timer Output during TSG3n Timer Operation

The following figure shows the timing chart when TSG3nCMP0E = $0000E_H$, TSG3nDTC0 = 002_H, TSG3nDTC1 = 004_H, and TSG3nCMPUE is set to 00000_H-00014_H (excerpt). In this example, TSG3nIOC2.TSG3nOL1-TSG3nOL6 = 000000_B.

The range of the active (high level) width of a positive phase (TSG3nO1) output is $00000_H \leq$ TSG3nCMPUE $\leq$ TSG3nCMP0E (for the additional pulse). The range of the active (high level) width of an inverse phase (TSG3nO2) output is TSG3nDTC0 + TSG3nDTC1 $\leq$ TSG3nCMPUE $\leq$ TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1.

Note 1. TSG3nCMP0E = $0000E_H$, TSG3nDTC0 = 002_H, TSG3nDTC1 = 004_H

Note 2. T_{D0}: Time depending on setting of the dead time in the TSG3nDTC0 register
T_{D1}: Time depending on setting of the dead time in the TSG3nDTC1 register
T_{S0}: Time decided by compare match of 18-bit sub-counter and the TSG3nCMPUE register, when TSG3nCMPUE < 18-bit counter minimum value
T_{S1}: Time decided by compare match of the 18-bit sub-counter and the TSG3nCMPUE register, when TSG3nCMPUE > 18-bit counter maximum value

Figure 20.62 Example of Timer Output during TSG3n Operation in HT-PWM Mode

(6) Additional Pulse Control in HT-PWM Mode

The HT-PWM mode can generate an additional pulse by setting 1 to the LSB of the duty setting registers (TSG3nCMPUE, TSG3nCMPVE, and TSG3nCMPWE). This allows more precise control of the pulse duty than standard pulse control.

The following sections describe two examples of pulse output of TSG3nO1: additional pulse control is used in one example and additional pulse control is not used in another.

(a) Example of Pulse Output when Additional Pulse Control Is Used

Figure 20.63 shows the additional pulse control when an odd value is set to TSG3nCMPUE.

The arrows and numerical values show the width of the duty cycle of the TSG3nO1 output in one period.

When the additional pulse control is used as shown in **Figure 20.63**, the width of the output of the TSG3nO1 (duty cycle) can be set within a range from the width of 12 clock cycles to the width of 0 clock cycles in one-clock-cycle step.

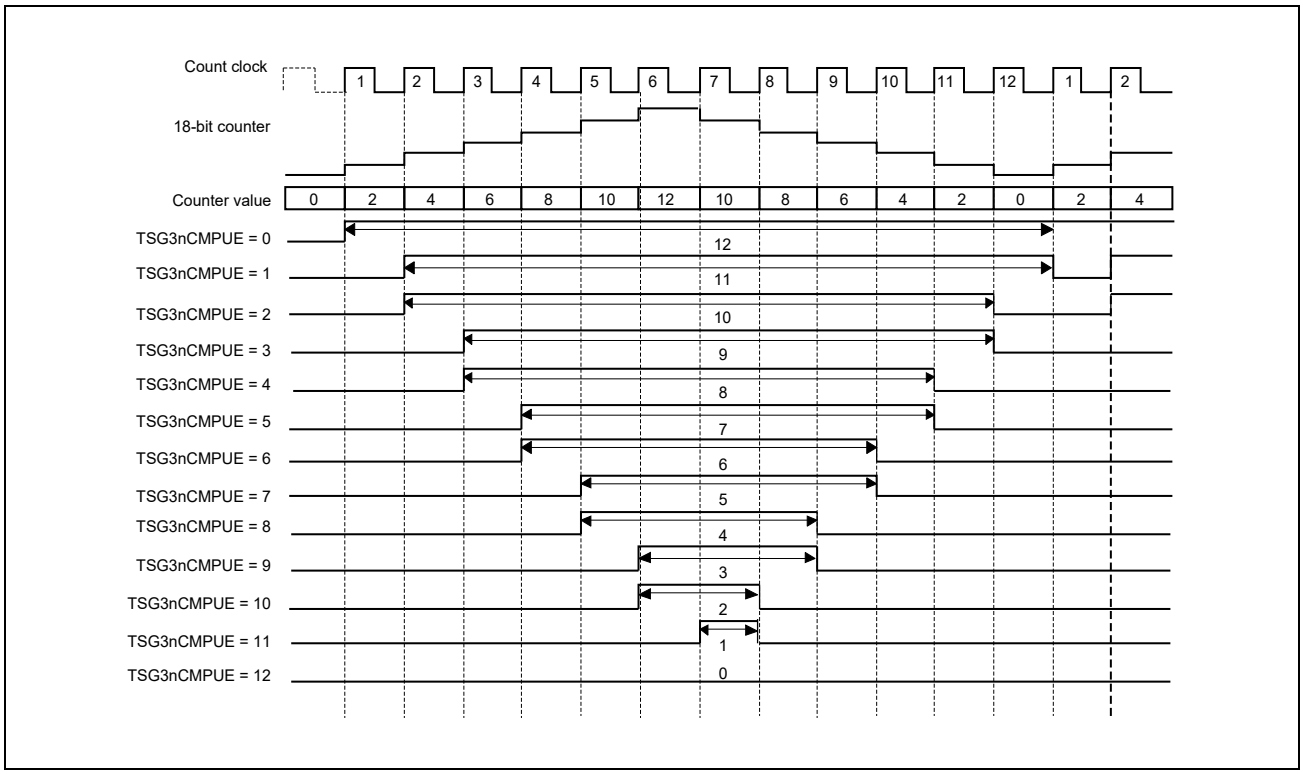


Figure 20.63 Example of TSG3nO1 Output when Additional Pulse Control Is Used in HT-PWM Mode

NOTE

TSG3nCMP0E = 12, TSG3nDTC0 = 0, TSG3nDTC1 = 0

(b) Example of Pulse Output when Additional Pulse Control Is Not Used

The arrows and numerical values in **Figure 20.64** show the width of the duty cycle of the TSG3nO1 output in one period.

When the additional pulse control is not used, the width of the TSG3nO1 output can be set within a range from the width of 12 clock cycles to the width of 0 clock cycles in two-clock-cycle step. In this case, the change in duty cycle is larger than that in the case when the additional pulse control is used.

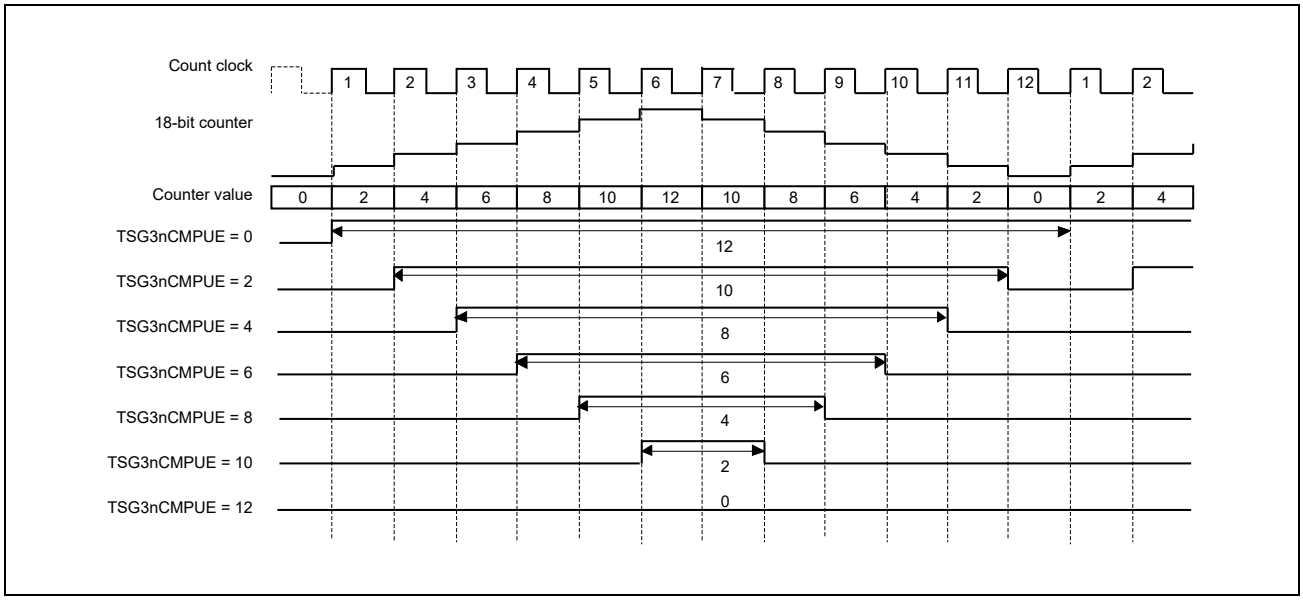

Figure 20.64 Example of Output when Additional Pulse Control is Not Used in HT-PWM Mode

NOTE

TSG3nCMP0E = 12, TSG3nDTC0 = 0, TSG3nDTC1 = 0

(7) Dead Time Control in HT-PWM Mode

Duty setting registers are TSG3nCMPUE, TSG3nCMPVE, and TSG3nCMPWE in HT-PWM mode. The 6-phase PWM waveform of a variable duty is output by using these registers. To achieve the dead time control, there are two dead time setting registers (TSG3nDTC0W and TSG3nDTC1W) and six 10-bit down counters that operate synchronously with the count clock of the 18-bit counter. TSG3nDTC0 is used for setting a dead time from a change of the inverse phase to the inactive state to a change of the positive phase to the active state. TSG3nDTC1 is used for setting a dead time from a change of the positive phase to the inactive state to a change of the inverse phase to the active state.

The following figure shows the output waveform when TSG3nDTC0 = x and TSG3nDTC1 = y.

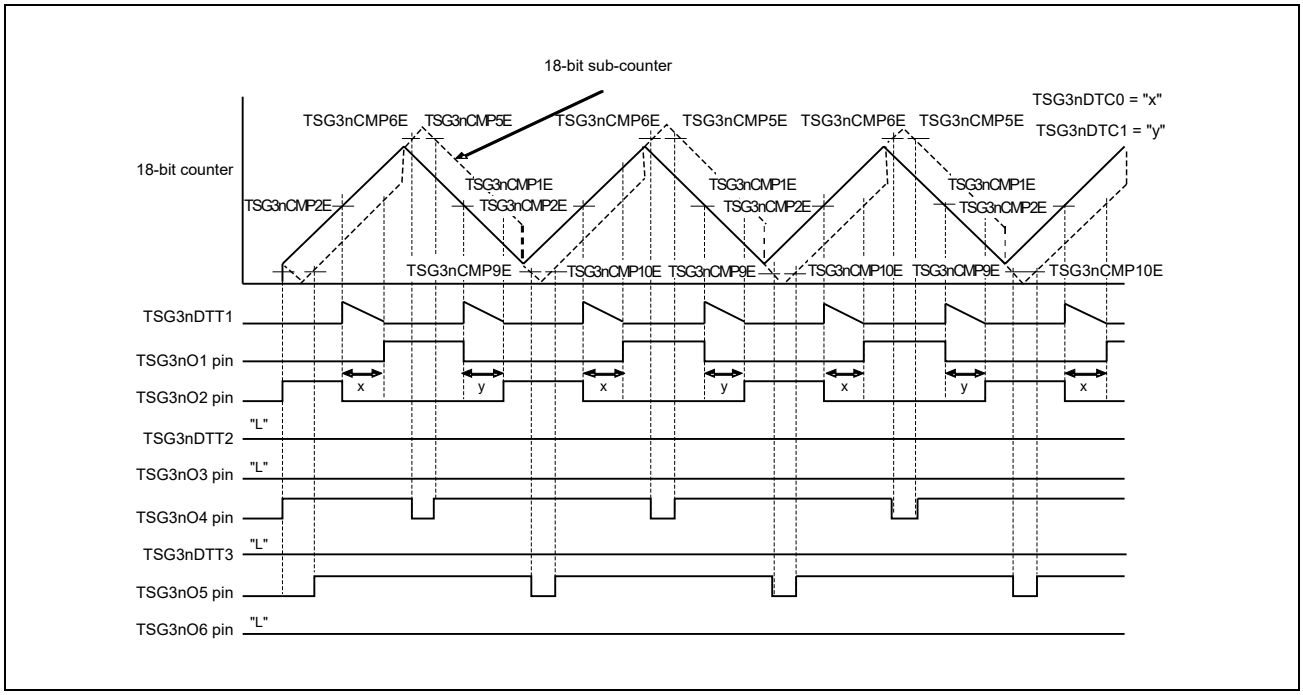

Figure 20.65 Example of Output Waveform with Dead Time in HT-PWM Mode

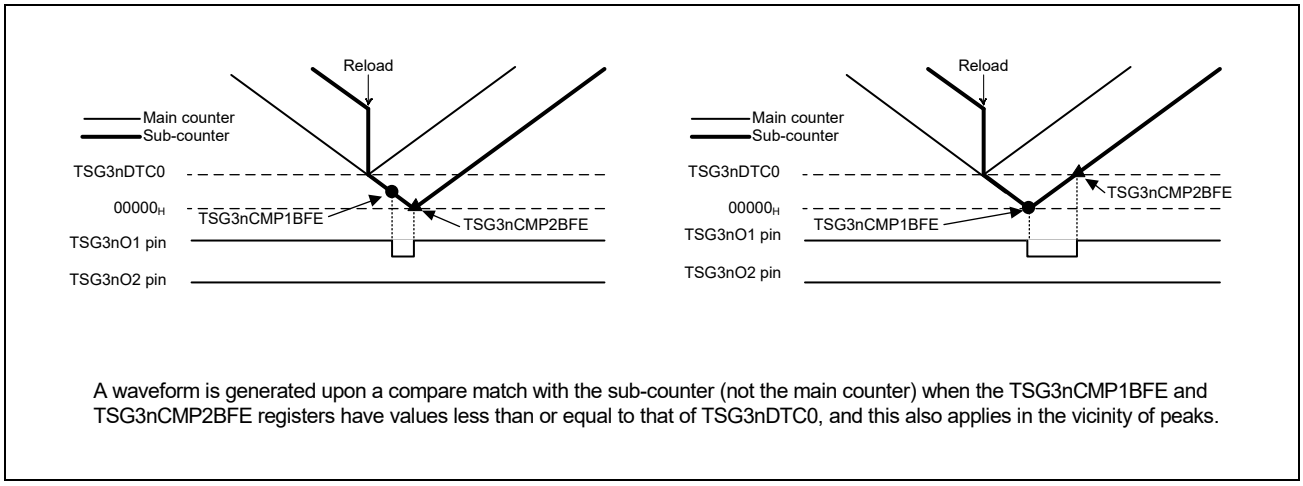

Figure 20.66 Example of Output Waveform near Trough after Reloading

(8) Notes Concerning Dead Time Control in HT-PWM Mode

(a) TSG3nDTC0 and TSG3nDTC1 Rewriting

It is possible to rewrite the dead time setting in TSG3nDTC0 and TSG3nDTC1 registers during timer operation.

CAUTIONS

1. Rewrite TSG3nDTC0 and TSG3nDTC1 when the reload function is used (TSG3nRMC = 0).
2. The write protection code check function is applied when TSG3nDTC0 and TSG3nDTC1 are rewritten. For the detail, see the pertinent register descriptions (**Section 20.3.44, 20.3.45, 20.3.64).**
3. When the TSG3nCMP0E and TSg3nDTC1 are updated at the peak of the 18-bit counter:
   When the set value of TSG3nCMPmE is greater than the updated TSG3nCMP0E + TSG3nDTC0 (new maximum value of the main counter), the match interrupt (INTTSG3nIm) is not generated immediately after reloading (m = 2, 6, or 10).

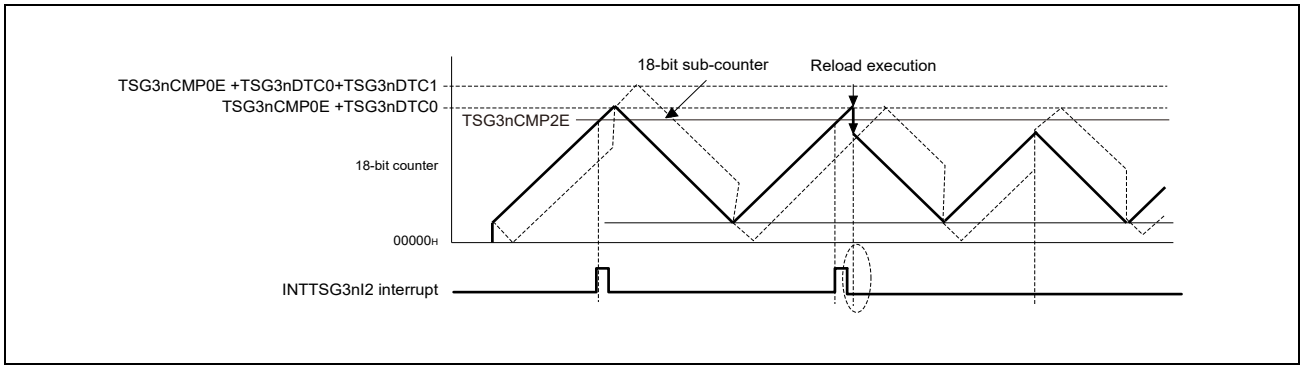

Figure 20.67 Example of Operation During Reloading at 18-Bit Counter Peak Timing

4. When the TSG3nDTC0 is updated at the trough of the 18-bit counter:
   When the TSG3nCMPmE set value is smaller than the updated TSG3nDTC0 (new minimum value of the main counter), the match interrupt (INTTSG3nlm) is not generated immediately after reloading (m = 1, 5, or 9).

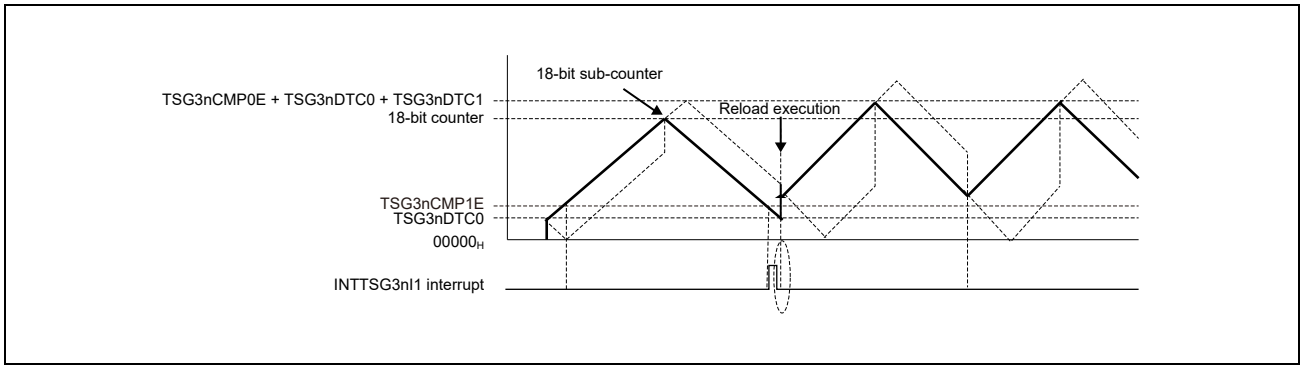

Figure 20.68 Example of Operation During Reloading at 18-Bit Counter Trough Timing

(9) Software Output Control Function in HT-PWM Mode

TSG3nOPT0.TSG3nSOC, TSG3nIDC, and TSG3nOPT1.TSG3nSPC2-TSG3nSPC0 are used in HT-PWM mode for software control of timer output control.

As shown in **Figure 20.69**, with TSG3nSTE = 0, the output control is switched immediately when TSG3nSOC is set to 1. If the dead time is set, the period of the dead time is guaranteed. After that, when TSG3nSOC is set to 0, output control is retained. When the reload timing is generated, output control is switched to HT-PWM mode output control.

For details, refer to **Section 20.4.7.10, Software Output Control Function**.

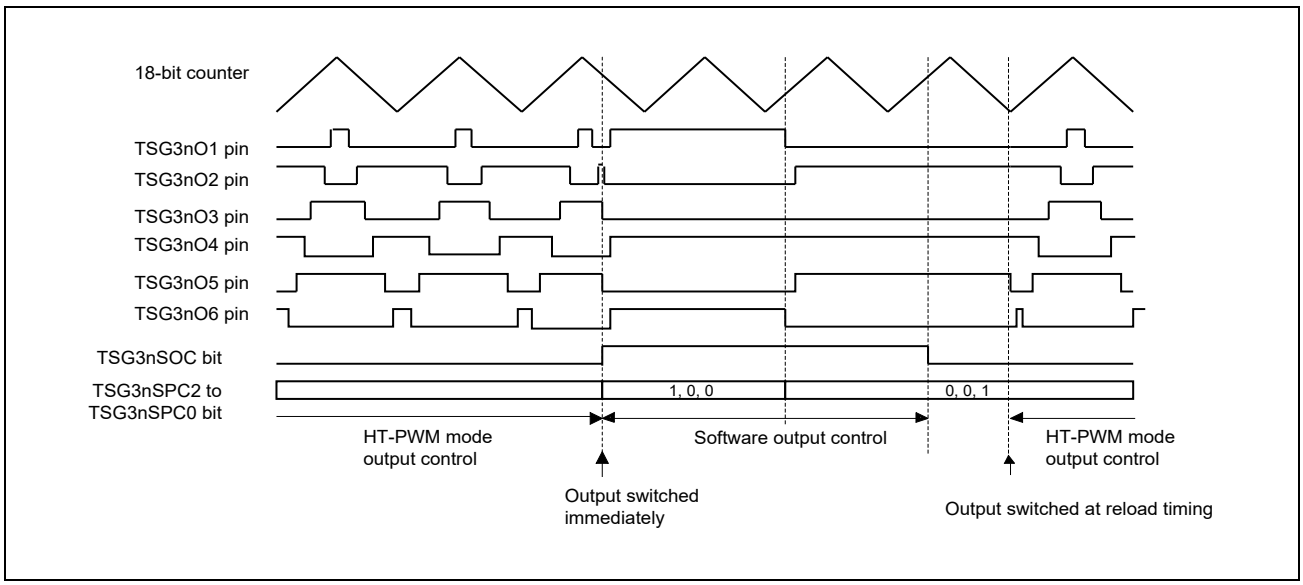

Figure 20.69 Example of Software Output Control Switching in HT-PWM Mode

CAUTION

Use reload (simultaneous rewrite) mode (TSG3nCTL3.TSG3nRMC = 0) when software output control function is used.

(a) Procedure for Software Output Control

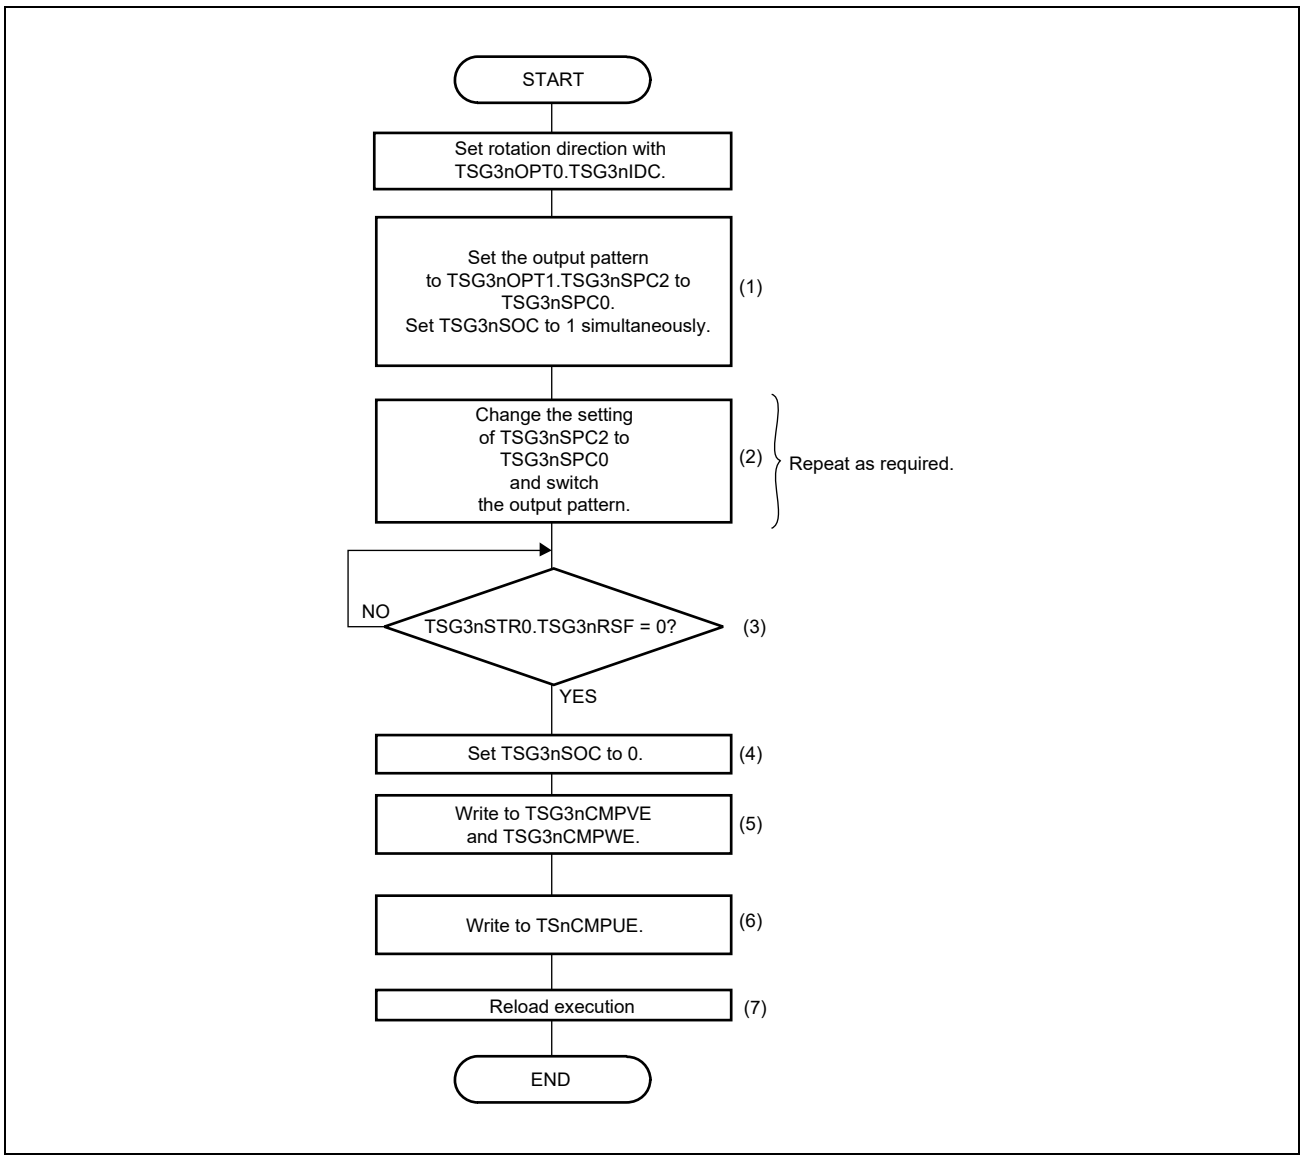

Figure 20.70 Flow of Software Output Control

The procedure for software output control is described below.

(1) Set the output pattern to the TSG3nOPT1.TSG3nSPC2-TSG3nSPC0. To enable software output control, set TSG3nOPT0.TSG3nSOC to 1 simultaneously.

(2) Change the output pattern setting of the TSG3nSPC2-TSG3nSPC0 to change the timer output.

(3) Confirm that reload request flag TSG3nSTR0.TSG3nRSF = 0. In case TSG3nRSF = 1, do not proceed to the following step until TSG3nRSF = 0.

(4) Setting TSG3nSOC to 0 starts releasing of the software control (it is not released here yet).

(5) Make necessary settings of the compare registers that will be used after the software output control is released. Proceed to the following step when the register settings are not required. Here, change the registers with the reload function.

(6) Write to TSG3nCMPUE (TSG3nCMP1E) to start reloading.

(7) Reload is executed and software output is released.

CAUTION

Execute reload after executing steps (3), (4), (5), and (6). When reload cannot be executed, the software output cannot be released.

(10) Asymmetric Triangular Wave Control in HT-PWM Mode

In HT-PWM mode, it is possible to control output by an asymmetric triangular waveform by setting the different timings for setting and clearing the U, V, and W phases.

The following describes the differences of the asymmetric triangular wave control from the symmetric triangular wave control.

(a) PWM Setting

When a symmetric triangular wave is used, the output control of each of the U phase, V phase, and W phase is done by setting the set timing and the clear timing to the same value to the TSG3nCMPUE, TSG3nCMPVE, and TSG3nCMPWE. When an asymmetric triangular wave is used, the output control of each phase is done by setting TSG3nCMPmE as follows (m = 1, 2, 5, 6, 9, 10).

Prerequisites

- The clear timing of PWM of the voltage data signal of U, V and W phases is set with TSG3nCMP1E, TSG3nCMP5E, and TSG3nCMP9E.
- The set timing of PWM of the voltage data signal of U, V, and W phases is set with TSG3nCMP2E, TSG3nCMP6E, and TSG3nCMP10E.
- The set and clear timings of each phase can also be set with TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP5E, TSG3nCMP9E, and TSG3nCMP10E.
- TSG3nCMPmE can only be set to an even value (m = 1, 2, 5, 6, 9, 10).

(b) Timer Output

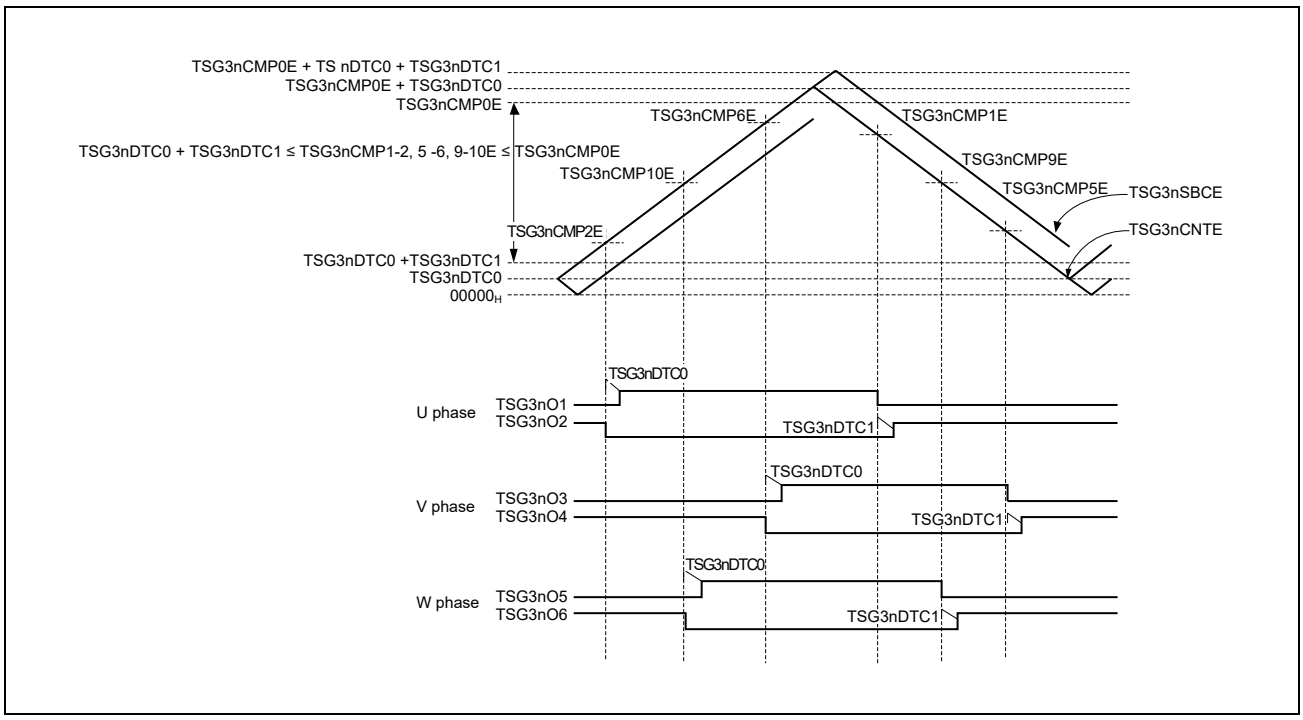

Figure 20.71 Example of Timer Output Waveform in HT-PWM Mode

NOTE

When output is controlled by the asymmetric triangular waveform, the following conditions apply to setting of TSG3nCMPmE (m = 1, 2, 5, 6, 9, 10).

- TSG3nDTC0+TSG3nDTC1 ≤ TSG3nCMPmE ≤ TSG3nCMP0E
- Only when TSG3nCMPmE = TSG3nCMP (m + 1) E, or TSG3nCMPmE = TSG3nCMP (m+ 1) E + 2, it is possible to set TSG3nCMPmE under the condition 00000_H ≤ TSG3nCMPmE ≤ TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1, which also applies to the case where the symmetric triangular wave is used.

20.4.7.3 Data Transfer from EMU3

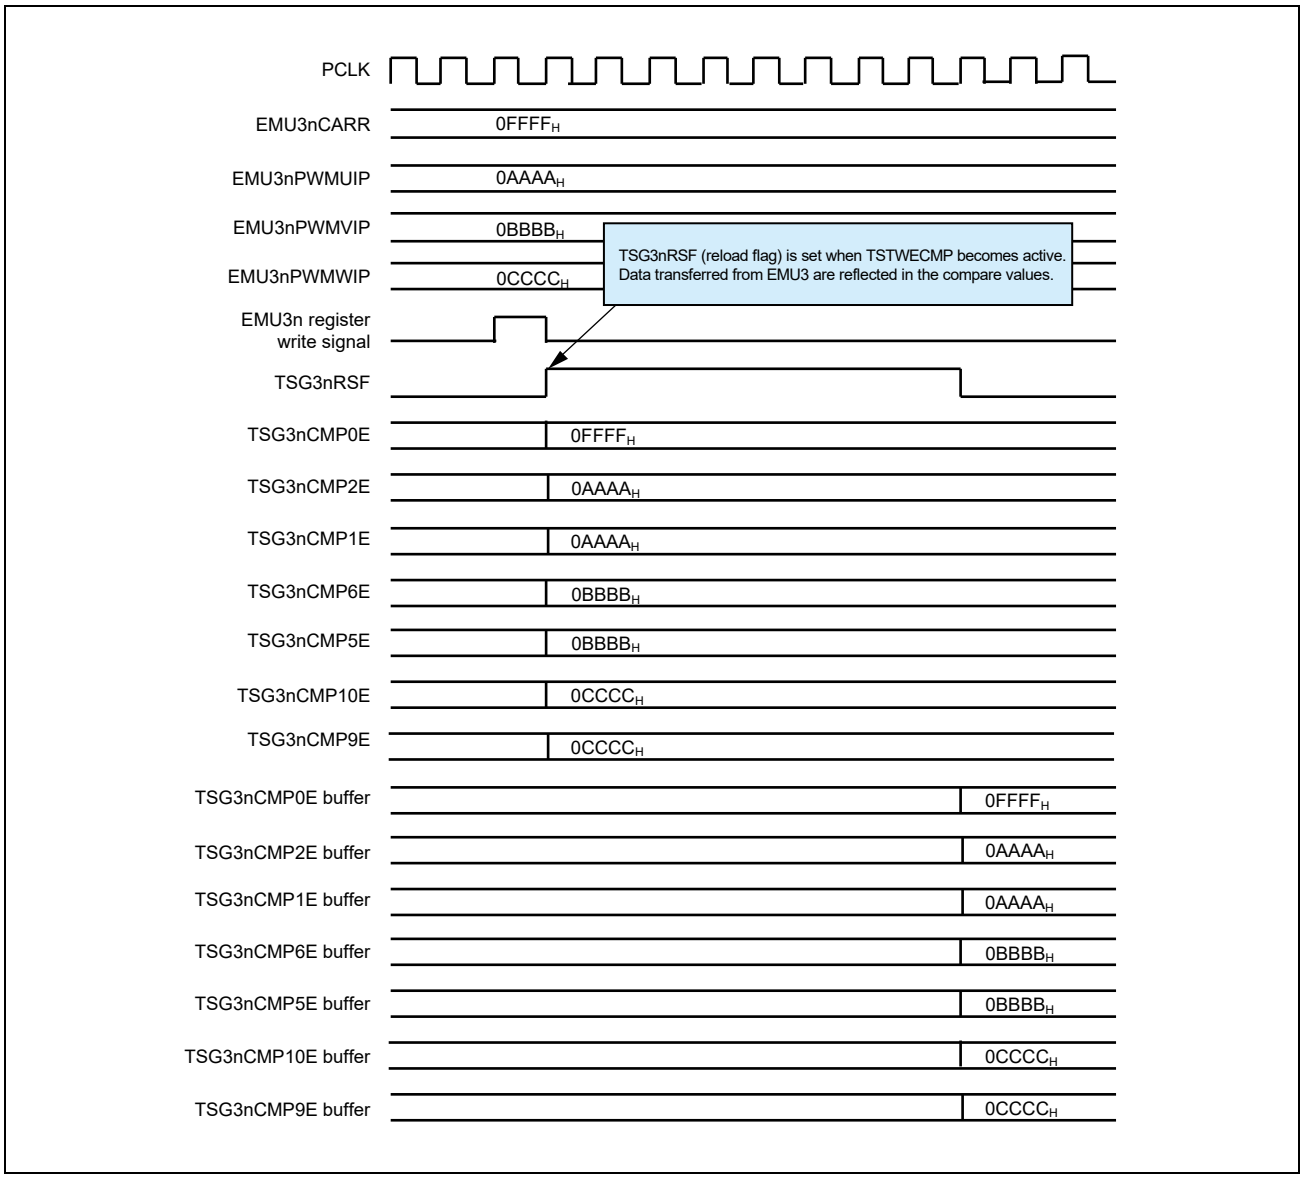
TSG3 can directly reflect the values of carrier cycle set in EMU3 and the U, V, and W phase duty calculated by EMU3 to the compare registers TSG3nCMP0E, 1E, 2E, 5E, 6E, 9E, and 10E.

When the carrier cycle value EMU3nCARR from EMU3 and the compare values EMU3nPWMUIP, EMU3nPWMVIP, and EMU3nPWMWIP of U, V, and W phases are input to TSG3 and the EMU3n register write signal is set to 1, the TSG3 compare registers TSG3nCMP0E, 1E, 2E, 5E, 6E, 9E, and 10E are updated.

When the calculation of the PWM IP in EMU3n is completed, the EMU3n register write signal is set to 1. In addition, the signal can also be controlled by software.

For details, see **Section 25.4.5, PWM IP** in **Section 25, Enhanced Motor Control Unit 3 (EMU3)**.

Note that TSG32 does not support synchronous operation with EMU3.



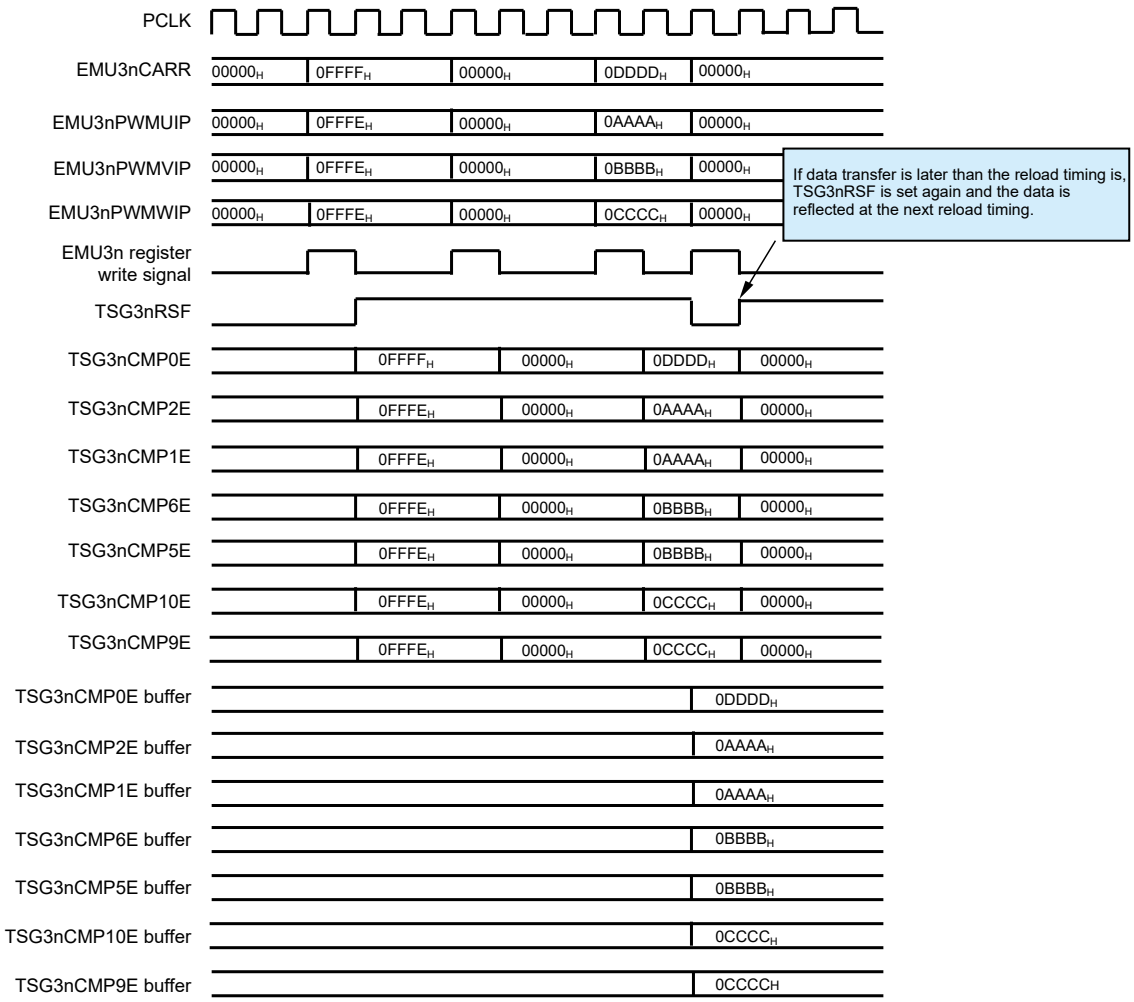


Figure 20.72 Transfer Timing of Data from EMU3

CAUTION

Transfer from EMU3 is enabled only in HT-PWM mode (TSG3nMD2-0 = 001) and in reload mode operation (TSG3nRMC = 0). Do not transfer data in PWM mode, SP-PWM mode, 120-DC mode, HSP-PWM mode or in anytime rewrite mode (TSG3nRMC = 1).

If transfers of data from EMU3 are performed sequentially before a reload timing is generated, the last transferred data is effective.

Note 1. If a transfer of data from EMU3 occurs at the same time as reload timing, TSG3nRSF is not cleared and the transferred data conflicted is reflected at the next reload timing.

Note 2. Transfer of data from EMU3 occurs at the same time as a write access to a register, the write access is effective. For example, in the case of writing to TSG3nCMP0E and transfer of data from EMU3, writing makes effects to the TSG3nCMP0E register and transferred data is reflected in the other registers TSG3nCMP1E, 2E, 5E, 6E, 9E, and 10E.

Figure 20.73 Transfer Timing of Data from EMU3

20.4.7.4 ESW Function

ESW function outputs PWM which is not generated using the counter/compare value of TSG3 but adding the set dead time to the rectangular waveform from EMU3 to TSG3.

CAUTION TSG32 does not support the ESW function.

(1) PWM Output Using ESW Function

Setting 1 to the TSG3nOPT2.TSG3nESSC bit enables the ESW function. PWM output is switched from the one using TSG3 counter/compare values to the one derived from the rectangular waveform input from EMU3.

With the ESW function, the U-phase output pattern value, V-phase output pattern value, and W-phase output pattern value input from EMU3 are positive output (TSG3nO1, 3, and 5), and the inverse of the U-phase output pattern value, V-phase output pattern value, and W-phase output pattern value signals are inverse output (TSG3nO2, 4, and 6).

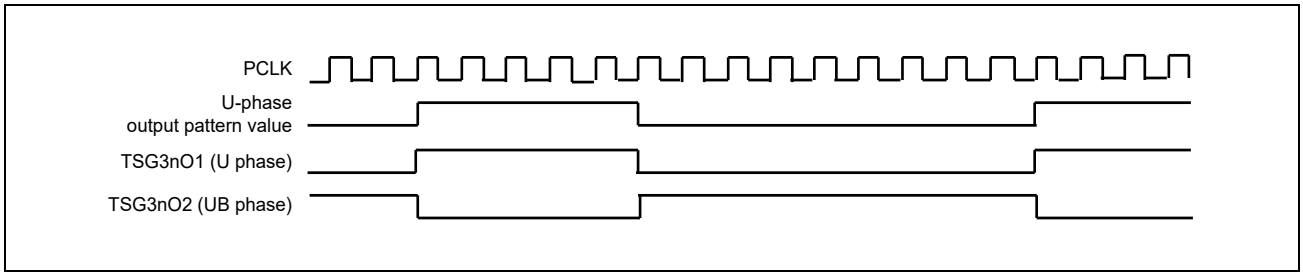

Figure 20.74 PWM Output Using ESW Function (With 0 Dead Time)

The setting of dead time is also effective in ESW function. The dead time set to TSG3nDTC0 is inserted to the positive phase (TSG3nO1, 3, and 5), and the dead time set to TSG3nDTC1 is inserted to the negative phase (TSG3nO2, 4, and 6).

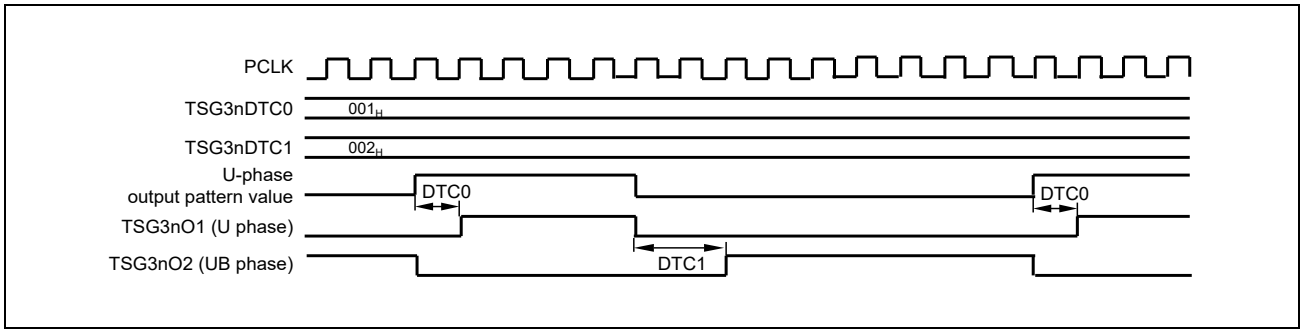

Figure 20.75 PWM Output Using ESW Function (TSG3nDTC0 = 1, TSG3nDTC1 = 2)

(2) Switching Operation to ESW Function

Changing the TSG3nOPT2.TSG3nESSC bit from 0 to 1 immediately enables the ESW function and PWM output is switched from to one derived from rectangular waveform input from EMU3. When the TSG3nESSC bit is changed from 1 to 0, time output is synchronized with the counter and switched to HT-PWM mode at reload timing.

(3) Dead Time Insertion when Switching to ESW function

The set dead time is always inserted when switching to ESW function. If PWM output is switched from positive-phase high-level output to positive-phase high-level output of rectangular waveform, output at high level is continued (not to become inactive by switching to ESW function).

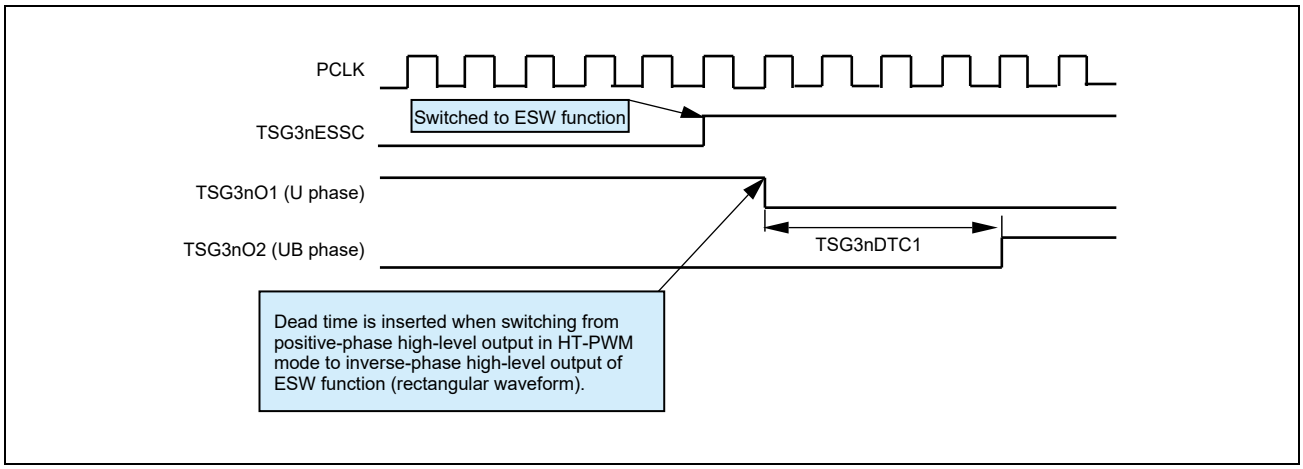

Figure 20.76 Switching Operation to ESW Function (From Positive-Phase High-Level to Inverse-Phase High-Level)

Dead time setting is also effective when ESW function is used. The dead time set in TSG3nDTC0 is inserted to the positive phase (TSG3nO1, 3, and 5), and the dead time set in TSG3nDTC1 is inserted to the inverse phase (TSG3nO2, 4, and 6).

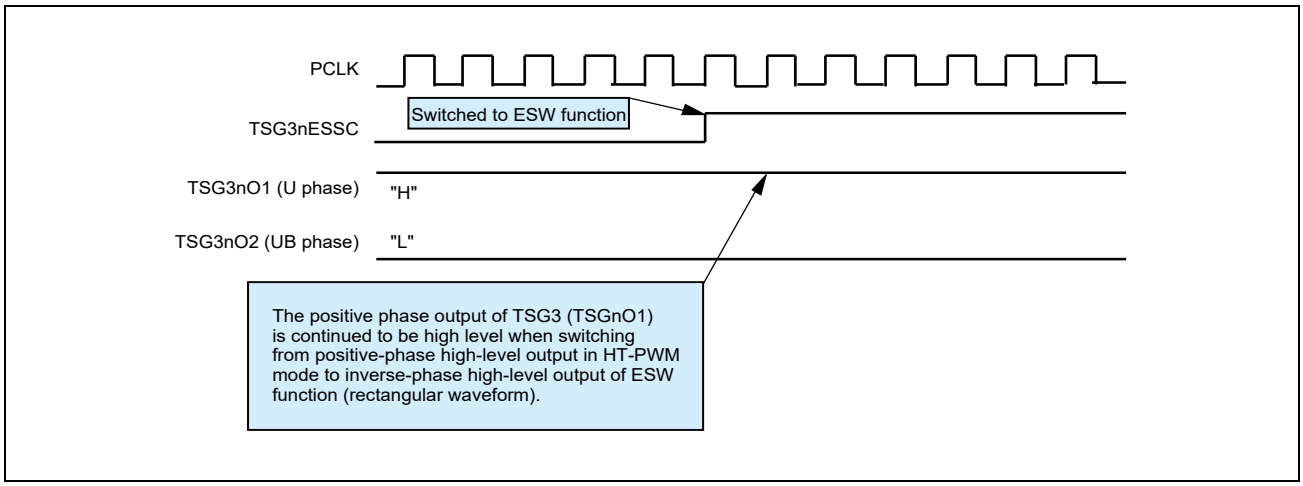

Figure 20.77 Switching Operation to ESW Function (From Positive-Phase High-Level to Positive-Phase High-Level)

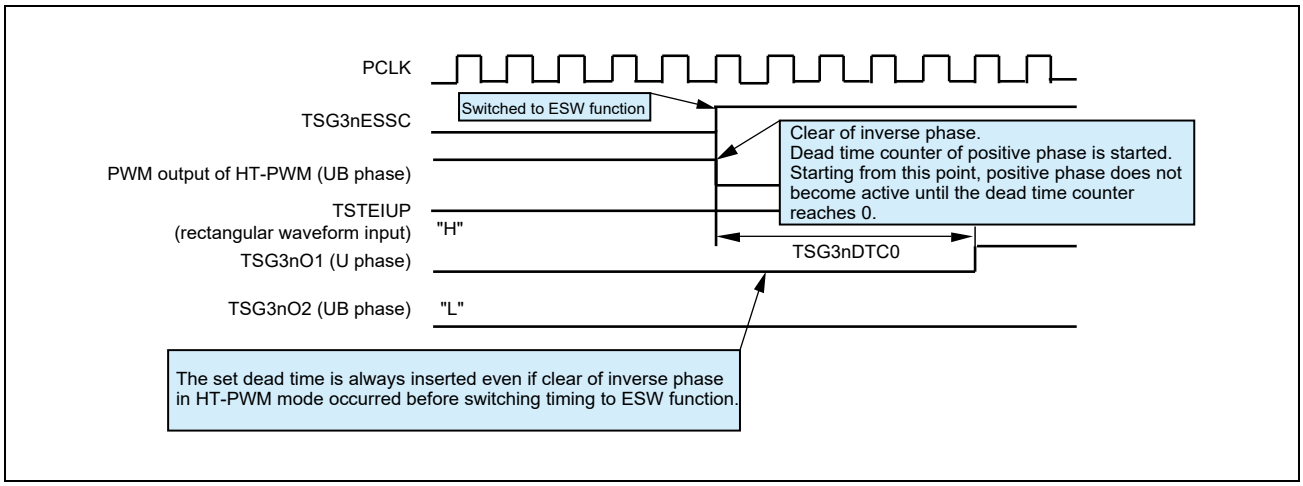

Figure 20.78 Switching Operation to ESW Function (Inverse Phase Cleared Before Switching)

(4) Settings for Operation using ESW Function

Use ESW function with the following settings of bits. Do not modify settings during operation (TSG3nTE = 1).

Table 20.68 List of Settings for Operation using ESW Function

Bit Name	Setting Value	Description
TSG3nCTL0.TSG3nMD2-0	001_B	Switchable only in HT-PWM mode.
TSG3nCTL3.TSG3nRMC	0	Available only in reload mode.
TSG3nIOC3.TSG3nTOL6-1	000000_B	Setting of logical inverse of PWM set/clear is prohibited (HT-PWM mode limitation)
TSG3nOPT0.TSG3nSOC	0	Switching to software control function is prohibited.
TSG3nOPT0.TSG3nSTE	0	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nOPT0.TSG3nPOT	0	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nOPT0.TSG3nPSS	0	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nOPT0.TSG3nIDC	0	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nOPT0.TSG3nPSC	0	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nOPT1.TSG3nSPC2-0	000_B	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nPAT0W	000000_H	Operation setting of 120-DC mode (value after reset).
TSG3nPAT1W	000000_H	Operation setting of 120-DC mode (value after reset).

20.4.7.5 SP-PWM Mode (Shifted-Pulse - Pulse Width Modulation Mode)

Overview

In this mode, a 6-phase PWM can be generated by using the 18-bit counter and the 18-bit compare registers.

Prerequisites

- The PWM signal cycle is set in TSG3nCMP0E.
- The set timings of the U phase, V phase, and W phase are set with TSG3nCMP2E, TSG3nCMP6E, and TSG3nCMP10E, while the clear timings of these phases are set with TSG3nCMP1E, TSG3nCMP5E, and TSG3nCMP9E (when set timing and clear timing are used for control).
- The set timings of the U phase, V phase, and W phase are set with TSG3nCMP2E, TSG3nCMP6E, and TSG3nCMP10E while the active periods of these phases are set with TSG3nUPWE, TSG3nVPWE, and TSG3nWPWE. The sum of the set values of TSG3nCMP2E, TSG3nCMP6E, TSG3nCMP10E, and the set values of TSG3nUPWE, TSG3nVPWE, TSG3nWPWE are set to TSG3nCMP1E, TSG3nCMP5E, and TSG3nCMP9E respectively (when set timing and active period are used for control). The value after addition must be no greater than $3FFFF_H$. Truncate values having 19 or more bits.

Functional description

Set the carrier period and the set timings and duty of U phase, V phase, and W phase. The counting up begins when TSG3nTRG0.TSG3nTS is set to 1.

The 18-bit counter counts up from 00000_H and is cleared by a match with TSG3nCMP0E.

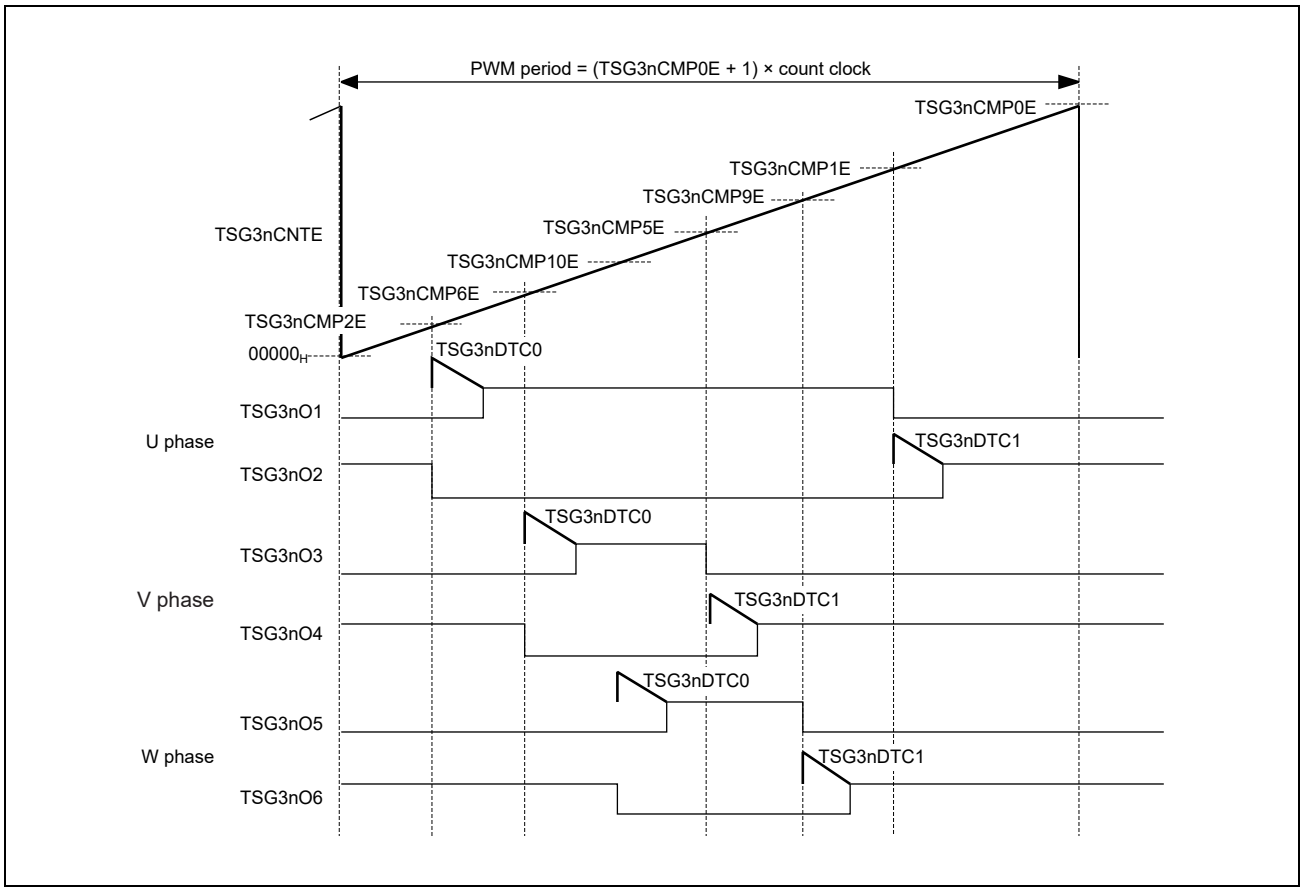
The dead time is set with TSG3nDTC0 and TSG3nDTC1. TSG3nDTC0 sets the dead time of inverse phase (OFF) to positive phase (ON) switch while TSG3nDTC1 sets that of positive phase (OFF) to inverse phase (ON) switch. The 10-bit counters (TSG3nDTT1 to TSG3nDTT3) for dead time generation load the set values of TSG3nDTC0 and TSG3nDTC1 at compare match of the 18-bit counter with the TSG3nCMPmE buffer register (m = 1, 2, 5, 6, 9, 10) and start down-counting.

INTTSG3nIm interrupts (m = 1, 2, 5, 6, 9, 10) are generated by the compare match of the 18-bit counter with the TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, and TSG3nCMP10E buffer registers.

NOTE

SP-PWM mode is enabled when TSG3nCTL0.TSG3nMD2-TSG3nMD0 = 010_B.

(1) Basic Timing Chart



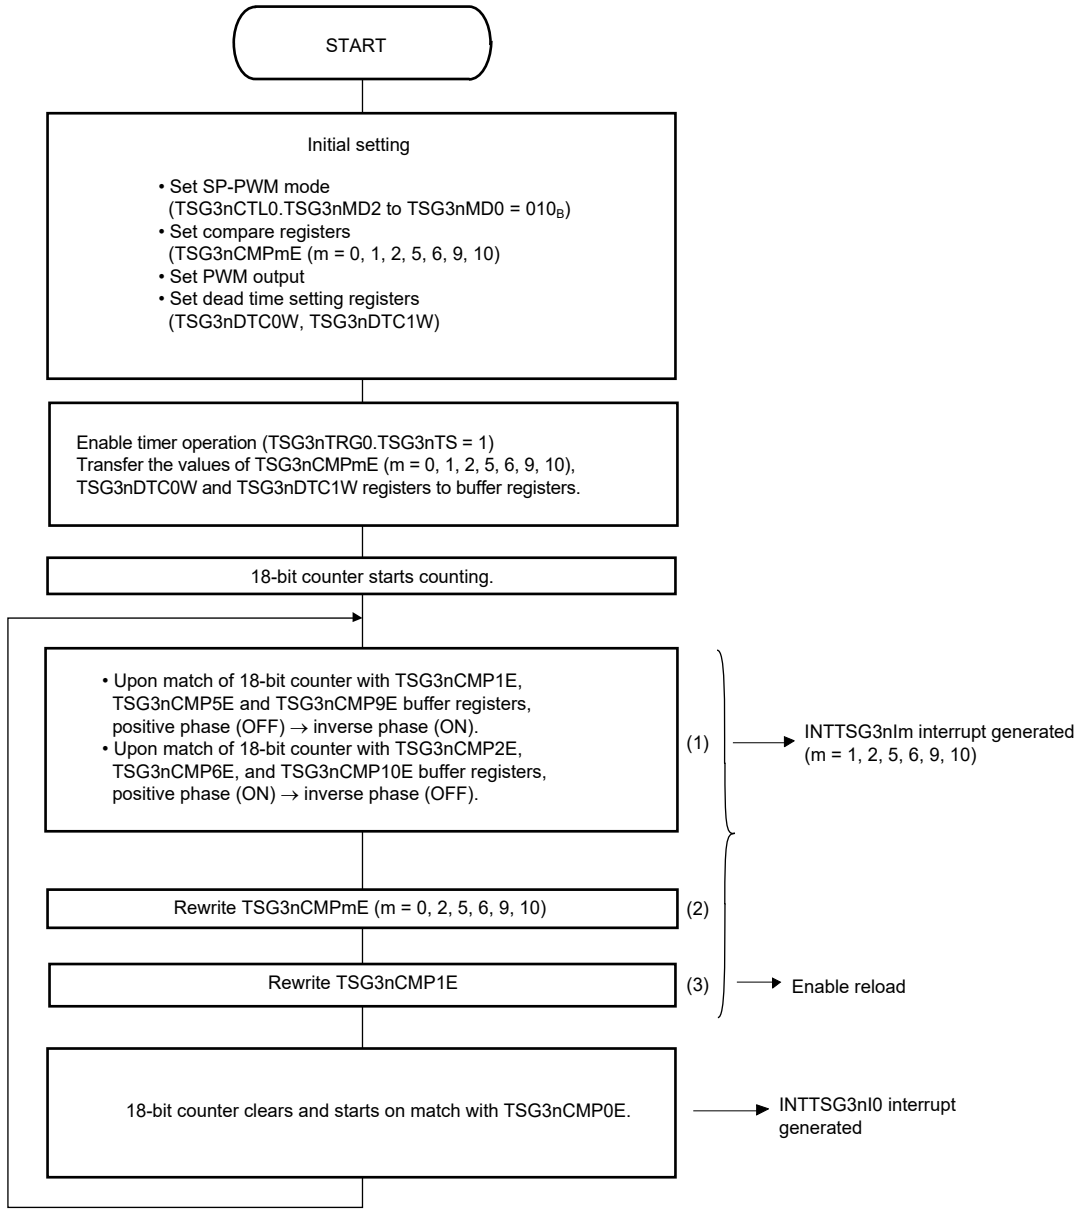


Figure 20.79 Basic Timing in SP-PWM Mode

Note: The timing of (1) may be different depending on the rewriting timing of (2) and (3) and the TSG3nCMP1E value. Be sure to rewrite (2) followed by rewriting (3).

Figure 20.80 Basic Operation Flow in SP-PWM Mode

(2) List of SP-PWM Mode Operations

Table 20.69 Counter Functions in SP-PWM Mode

Operation		Setting Condition
18-bit counter	Start	TSG3nTRG0.TSG3nTS = 0 → 1 or simultaneous start trigger
	Clear	Compare match of TSG3nCMP0E buffer register with 18-bit counter
	Stop	TSG3nTRG1.TSG3nTT = 0 → 1

Table 20.70 Compare Registers and Dead Time Setting Register Functions in SP-PWM Mode

Register	Rewriting Method	Rewrite During Operation	Function
TSG3nCMP0E	Reload/Anytime rewrite	Possible	Setting period
TSG3nUPWE	Reload/Anytime rewrite	Possible	PWM control for U phase
TSG3nCMP1E, TSG3nCMP2E	Reload/Anytime rewrite		
TSG3nVPWE	Reload/Anytime rewrite	Possible	PWM control for V phase
TSG3nCMP5E, TSG3nCMP6E	Reload/Anytime rewrite		
TSG3nWPWE,	Reload/Anytime rewrite	Possible	PWM control for W phase
TSG3nCMP9E, TSG3nCMP10E	Reload/Anytime rewrite		
TSG3nDCMP0E, TSG3nDCMP1E, TSG3nDCMP2E	Reload/Anytime rewrite	Possible	Diagnostic output or A/D conversion trigger
TSG3nDTC0W, TSG3nDTC1W	Reload	Possible	Period and dead time

Table 20.71 Output Functions in SP-PWM Mode

Pin	Function
TSG3nO1	PWM output with dead time by compare match of TSG3nCMP1E buffer register (clear timing) or TSG3nCMP2E buffer register (set timing) with 18-bit counter
TSG3nO2	Output inverse phase with respect to TSG3nO1 (with dead time)
TSG3nO3	PWM output with dead time by compare match of TSG3nCMP5E buffer register (clear timing) or TSG3nCMP6E buffer register (set timing) with 18-bit counter
TSG3nO4	Output inverse phase with respect to TSG3nO3 (with dead time)
TSG3nO5	PWM output with dead time by compare match of the TSG3nCMP9E buffer register (clear timing) or the TSG3nCMP10E buffer register (set timing) with the 18-bit counter
TSG3nO6	Output inverse phase with respect to TSG3nO5 (with dead time)
TSG3nO7	Diagnostic signal output or pulse output by A/D conversion trigger

Table 20.72 Interrupt Requests in SP-PWM Mode

Interrupt	Function
INTTSG3nIm (m = 0, 1, 2, 5, 6, 9, 10)	Compare match of TSG3nCMPmE buffer register with 18-bit counter (m = 0, 1, 2, 5, 6, 9, 10)
INTTSG3nIER	Error
INTTSG3nIVLY	—
INTTSG3nIPEK	Peak interrupt (generated at the same timing as INTTSG3nI0 interrupt)
INTTSG3nIWN	Warning

Table 20.73 Compare Match Timing in SP-PWM Mode

Compare Match	Timing
TSG3nCMP0E	When 18-bit counter changes from TSG3nCMP0E to 00000_H
TSG3nCMPmE (m = 1, 2, 5, 6, 9, 10)	After match of 18-bit counter and TSG3nCMPmE is detected (m = 1, 2, 5, 6, 9, 10)

Table 20.74 Example of Setting Each Timer Output Condition in SP-PWM Mode

Pin	Item	Output Period	Output Duty	
			Output Condition	Setting Condition
TSG3nO1, TSG3nO3, TSG3nO5	PWM output	(TSG3nCMP0E + 1) × count clock	Output an inactive level throughout one period (duty 0%)	TSG3nCMPmE = TSG3nCMP (m + 1) E or TSG3nCMP (m + 1) E > TSG3nCMP0E (m = 1, 5, 9)
			Output an active level of one count clock in one period	TSG3nCMPmE = TSG3nCMP (m + 1) E + 1 TSG3nCMP (m + 1) E = TSG3nCMPmE – 1 (m = 1, 5, 9)
			Output an inactive level of one count clock in one period	TSG3nCMPmE = TSG3nCMP (m + 1) E - 1 TSG3nCMP (m + 1) E = TSG3nCMPmE + 1 (m = 1, 5, 9)
			Output an active level throughout one period (duty 100%)	TSG3nCMPmE > TSG3nCMP0E TSG3nCMP (m + 1) E ≤ TSG3nCMP0E (m = 1, 5, 9)
TSG3nO2, TSG3nO4, TSG3nO6	PWM output	(TSG3nCMP0E + 1) × count clock	Output an inactive level throughout one period (duty 0%)	TSG3nCMP (m – 1) E > TSG3nCMP0E (m = 2, 6, 10)
			Output an active level of one count clock in one period	TSG3nCMPmE = TSG3nCMP (m – 1) E - 1 TSG3nCMP (m – 1) E = TSG3nCMPmE + 1 (m = 2, 6, 10)
			Output an inactive level of one count clock in one period	TSG3nCMPmE = TSG3nCMP (m – 1) E + 1 TSG3nCMP (m – 1) E = TSG3nCMPmE – 1 (m = 2, 6, 10)
			Output an active level throughout one period (duty 100%)	TSG3nCMPmE = TSG3nCMP (m – 1) E or TSG3nCMPmE > TSG3nCMP0E (m = 2, 6, 10)
TSG3nO7	Diagnostic signal output or pulse output by A/D conversion trigger	(TSG3nCMP0E + 1) × count clock	Please refer to **Section 20.4.5, A/D Conversion Trigger Function**.	

(3) Various Settings of SP-PWM Mode

Mode setting

SP-PWM mode is entered by setting TSG3nCTL0.TSG3nMD2-TSG3nMD0 to 010_B.

Setting timer output

The output pins TSG3nO1-TSG3nO6 are controlled by setting TSG3nIOC0, TSG3nIOC2, and TSG3nIOC3.

The TSG3nO7 pin provides output pulse as diagnostic output or A/D conversion trigger. The pin should be set as necessary.

Enabling error interrupt generation

Error interrupt (INTTSG3nIER) due to the detection of the simultaneous active state of the positive and inverse phases is enabled by setting TSG3nIOC1.TSG3nEOC to 1. For details, refer to **Section 20.4.6, Error/Warning Interrupt.**

Setting rewriting timing of register with reload function

With the TSG3nCTL3.TSG3nRMC, reload (simultaneous rewrite) or rewrite (anytime) is specified for the registers with reload function. The default setting is 0 (reload). To reload, set TSG3nCTL4.TSG3nPRE to 1.

No reload timing is generated when TSG3nPRE = 0.

When “anytime rewrite” is specified, the unintended output may be generated depending on the rewrite timing.

Setting A/D conversion trigger output

The A/D conversion trigger 0 (TSG3nADTRG0 signal) is set with TSG3nCTL5.TSG3nAT09 to TSG3nAT00.

TSG3nAT09 to TSG3nAT00 is used to enable or disable the A/D conversion trigger output on timing match of TSG3nDCMP2E to TSG3nDCMP0E with the 18-bit counter (up count).

TSG3nCTL6.TSG3nAT19 to TSG3nAT10 is used to set the A/D conversion trigger 1 (TSG3nADTRG1 signal).

To set the match timing of the 18-bit counter and TSG3nDCMP2E to TSG3nDCMP0E, set the compare value to each register.

The skipping function can be used for TSG3nADTRG0 and TSG3nADTRG1 signals. TSG3nACC00 and TSG3nACC01 of TSG3nCTL5, and TSG3nACC10 and TSG3nACC11 of TSG3nCTL6 can be used to select the skipping rate among 1/1, 1/2, 1/4, and 1/8.

CAUTION

- Be sure to set TSG3nCTL5, TSG3nCTL6, and TSG3nDCMP2E to TSG3nDCMP0E correctly when the timing pulse of A/D conversion trigger is output to TSG3nO7.
- In SP-PWM mode, no trough interrupt (INTTSG3nIVLY) is generated. Therefore, TSG3nCTL5.TSG3nAT00 and TSG3nCTL6.TSG3nAT10 must be set to 0.
- In SP-PWM mode, the 18-bit sub-counter does not operate. Therefore, TSG3nAT09, and TSG3nAT08 in TSG3nCTL5, and TSG3nAT19, and TSG3nAT18 in TSG3nCTL6 must be set to 0.
- In SP-PWM mode, down counting by the 18-bit counter is not generated. Therefore, TSG3nAT07, TSG3nAT05, and TSG3nAT03 in TSG3nCTL5 and TSG3nAT17, TSG3nAT15, and TSG3nAT13 in TSG3nCTL6 should be set to 0.

Setting dead time

The dead time can be set with TSG3nDTC0 and TSG3nDTC1. The dead time is calculated by the following expressions:

- PCLK × TSG3nDTC0
- PCLK × TSG3nDTC1

TSG3nDTC0 can set the time between a change of TSG3nO2, TSG3nO4, and TSG3nO6 to the inactive state and a change of TSG3nO1, TSG3nO3, and TSG3nO5 to the active state, respectively.

TSG3nDTC1 can set the time between a change of TSG3nO1, TSG3nO3, and TSG3nO5 to the inactive state, and a change of TSG3nO2, TSG3nO4, and TSG3nO6 to the active state, respectively.

Carrier period

Set the carrier period with TSG3nCMP0E according to the following expression:

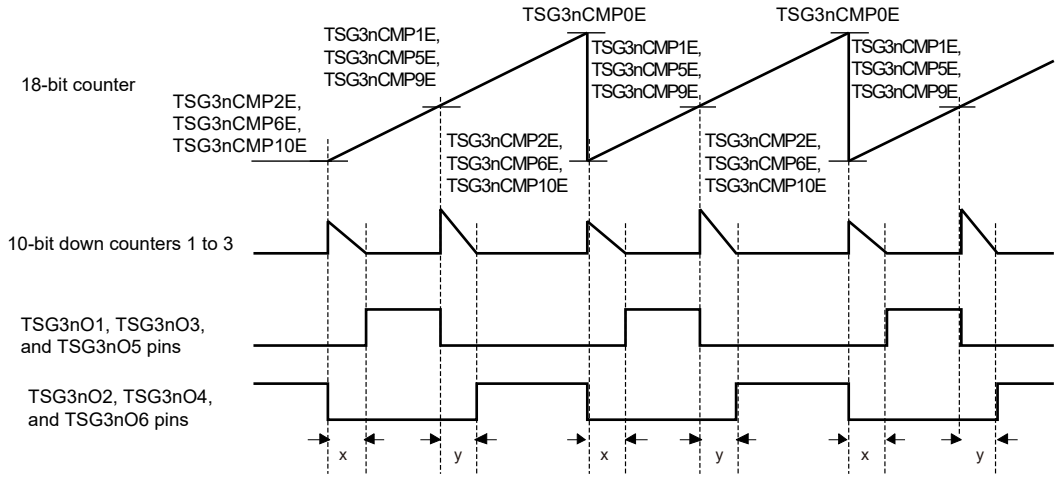
- TSG3nCMP0E = (carrier period/count clock period) – 1

CAUTION

PWM output with 100% duty cannot be produced when TSG3nCMP0E = $3FFFF_H$.

Setting duty (PWM width)

The duty of U phase, V phase, and W phase is set with TSG3nCMPmE, TSG3nUPWE, TSG3nVPWE, and TSG3nWPWE (m = 1, 2, 5, 6, 9, 10), respectively.



- The set timings of the U phase, V phase, and W phase are set with TSG3nCMP2E, TSG3nCMP6E, and TSG3nCMP10E, and the clear timings are set with TSG3nCMP1E, TSG3nCMP5E, and TSG3nCMP9E. (The set and clear timing setting is used for control.)
- The set timings of U phase, V phase, and W phase is set with TSG3nCMP2E, TSG3nCMP6E, and TSG3nCMP10E while the active periods of these phases are set with TSG3nUPWE, TSG3nVPWE, and TSG3nWPWE. The sum of the set values of TSG3nCMP2E, TSG3nCMP6E, and TSG3nCMP10E, and the set values of TSG3nUPWE, TSG3nVPWE, and TSG3nWPWE are set to TSG3nCMP1E, TSG3nCMP5E, and TSG3nCMP9E respectively (when set timing and active period are used for control).

(4) Dead Time Control in SP-PWM mode

Duty setting registers are TSG3nCMPmE (m = 1, 2, 5, 6, 9, 10), TSG3nUPWE, TSG3nVPWE, and TSG3nWPWE and register for setting the period is TSG3nCMP0E. The 6-phase PWM waveform of a variable duty is output by using these registers. To achieve the dead time control, there are six 10-bit down counters that operate synchronously with the count clock of the 18-bit counter and two dead time setting registers (TSG3nDTC0W and TSG3nDTC1W). TSG3nDTC0W is used for setting a dead time from a change of the inverse phase to the inactive state to a change of the positive phase to the active state. TSG3nDTC1W is used for setting a dead time from a change of the positive phase to the inactive state to a change of the inverse phase to the active state.

Dead time counter keeps operating even when operation stop (TSG3nTE = 0) setting collided with dead time insert timing, and the dead time set in TSG3nO1 and TSG3nO2 are always inserted.

The following figure shows an example of the output waveform.

Note: x: TSG3nDTC0 register values, y: TSG3nDTC1 register values

Figure 20.81 Example of Output Waveform in SP-PWM Mode

(5) Software Output Control Function in SP-PWM Mode

TSG3nOPT0.TSG3nSOC, TSG3nIDC, and TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0 are used to control timer output by software.

As shown in **Figure 20.82**, the output control is switched immediately when TSG3nSOC is set to 1. If the dead time is set, the period of the dead time is guaranteed. After that, when TSG3nSOC is set to 0, output control is retained. When the reload timing is generated, output control is switched to SP-PWM mode output control.

For details, refer to **Section 20.4.7.10, Software Output Control Function**.

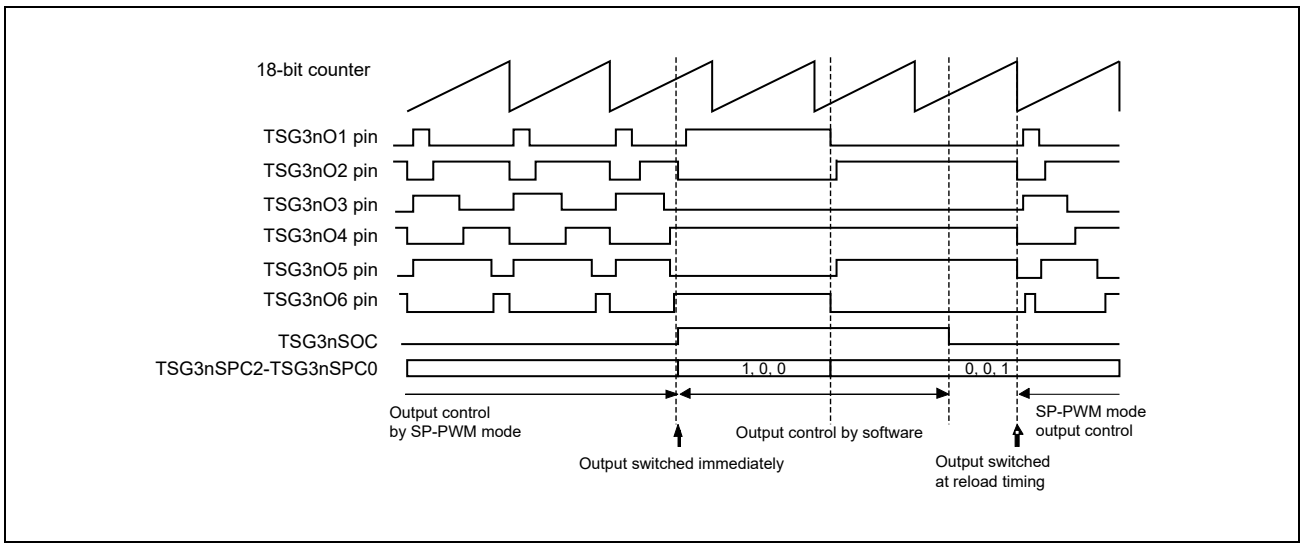


Figure 20.82 Example of Output Control Switching from SP-PWM Mode Control to Software Control

(a) Procedure on Software Output Control Processing

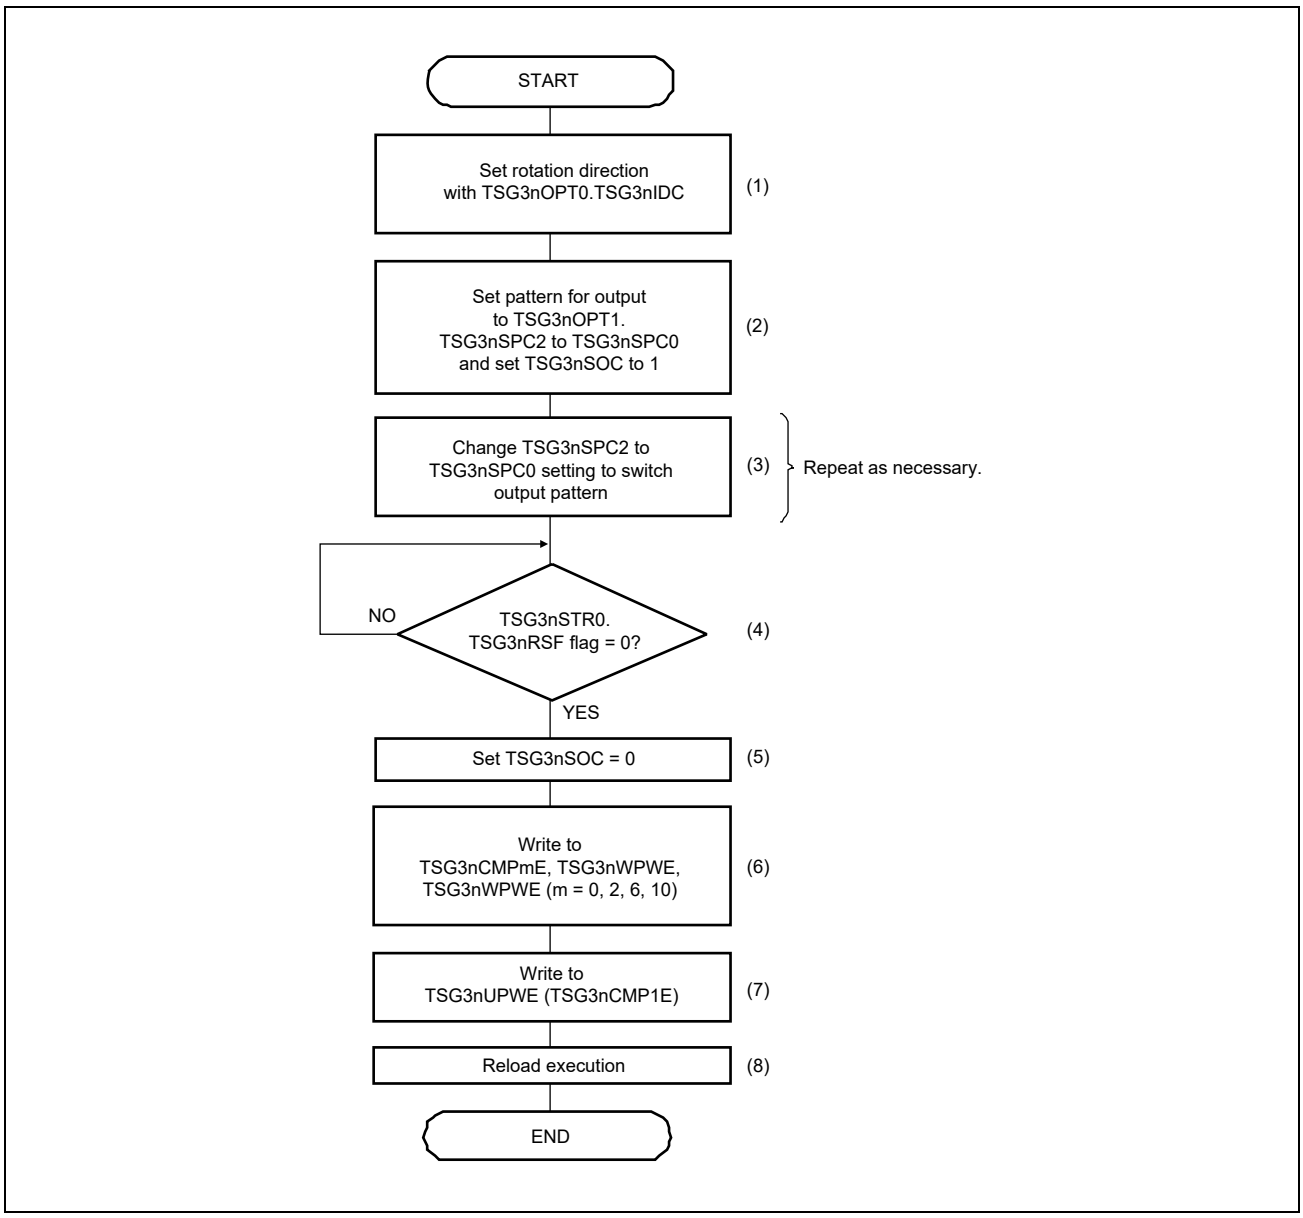

Figure 20.83 Flow of Software Output Control

The procedure for software output control is described below.

(1) Set TSG3nIDC to determine the electric current direction. The timer output has a 180-degreephase shift between when TSG3nIDC = 0 and when TSG3nIDC = 1. When this bit is rewritten with the software output control function, the output pattern will change according to the new setting at the next timer cycle.

(2) Set the pattern for output to TSG3nSPC2-0. At the same time, set TSG3nSOC to 1 to switch to software output control mode.

(3) Change the output pattern setting for TSG3nSPC2-0 to change the timer output.

(4) Ensure that the reload request flag TSG3nRSF is 0. If TSG3nRSF is 1, do not shift to the following procedure until it goes 0.

(5) Clearing TSG3nSOC to 0 starts releasing of software control (it is not released here yet).

(6) Make necessary settings of the compare registers that will be used after the software output control is released. Proceed to the following step when the register settings are not required. Here, change the registers with the reload function.

(7) Write TSG3nUPWE (TSG3nCMP1E) to start reloading.

(8) Reload is executed and software output control is released.

CAUTION

Be sure to execute reload after execution of steps (4), (5), (6), and (7). Unless reload can be executed, software output control cannot be released

20.4.7.6 120-DC Mode

Overview

In this mode, PWM output period set to TSG3nCMP0E and timer output (TSG3nO1 to TSG3nO6) according to the duty cycle set to TSG3nCMP1E to TSG3nCMP12E are controlled with three types of pattern inputs (software output control method, pattern switch method, and trigger switch method) to perform 120-DC control.

Note that pattern switch method and trigger switch method cannot be used with TSG32 because it does not support the functions of external pattern input and linkage with ENCA.

Prerequisites

- Set the PWM period to TSG3nCMP0E.
- Set the PWM duty to TSG3nCMP1E to TSG3nCMP12E and set the output pattern to TSG3nPAT0W and TSG3nPAT1W.

Functional description

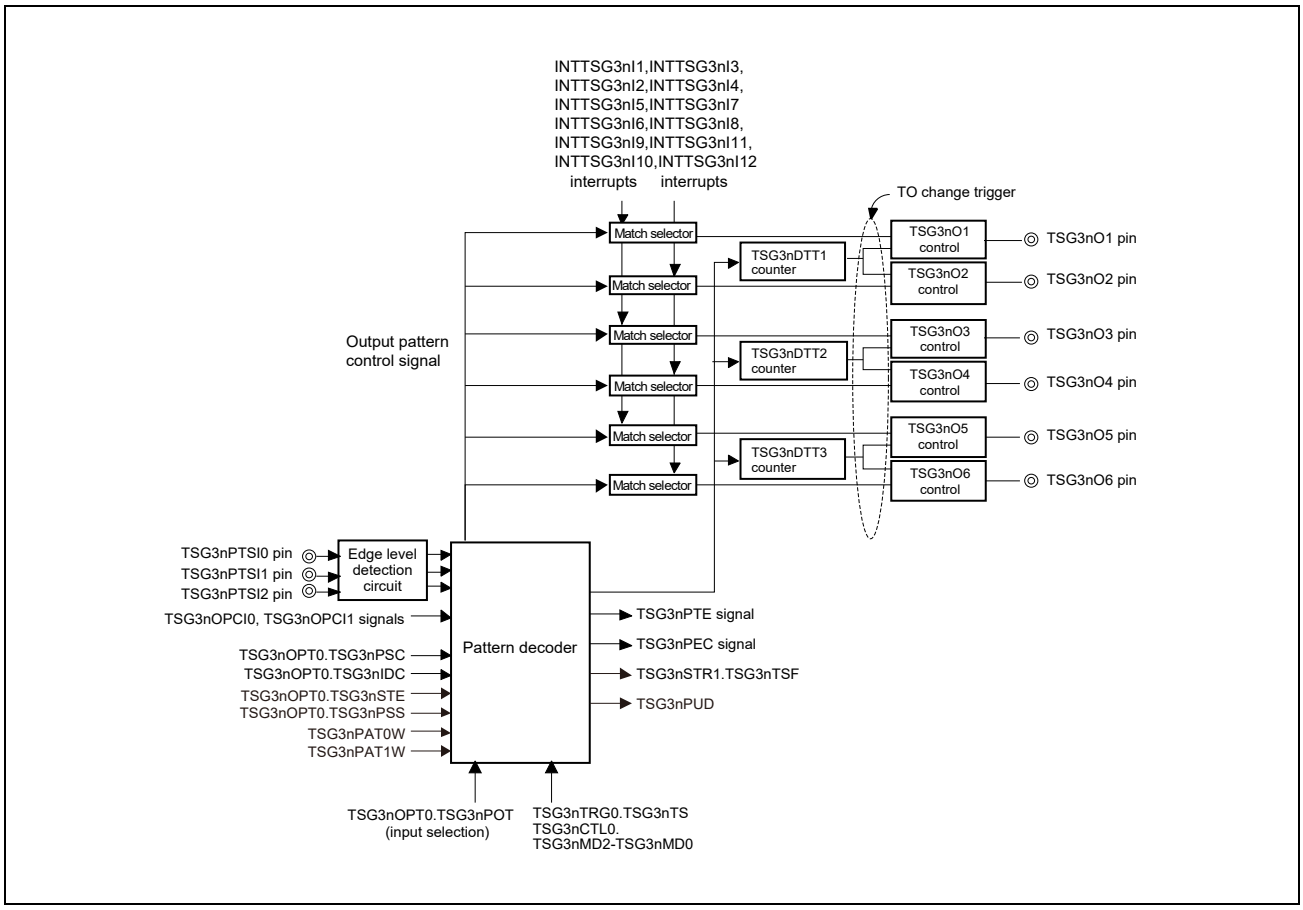
Set the PWM period, set the duty cycle to individual compare register, and set the pattern to be output to the pattern register. Setting TSG3nTRG0.TSG3nTS to 1 starts counting.

The 18-bit counter starts counting from 00000_H, and is cleared by the match with TSG3nCMP0E.

INTTSG3nI1 to INTTSG3nI12 interrupts are generated by a compare match of the 18-bit counter and TSG3nCMP1E to TSG3nCMP12E buffer registers, respectively.

NOTE

120-DC mode is valid when TSG3nCTL0.TSG3nMD2-TSG3nMD0 = 011_B.



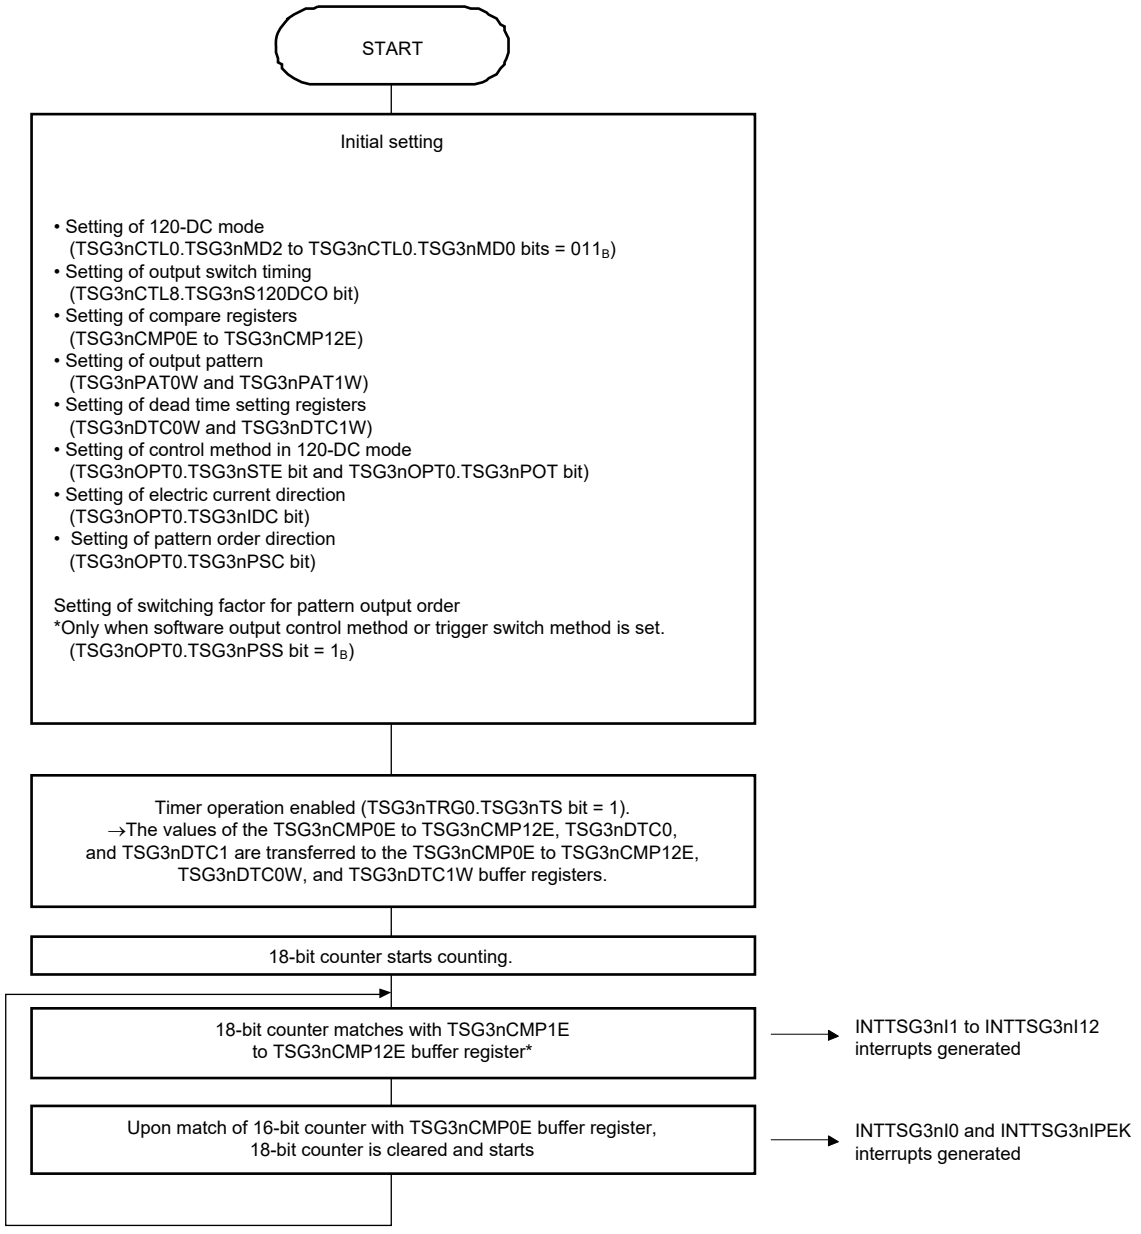


Figure 20.84 Block Diagram in 120-DC Mode

Note: The 18-bit counter is not cleared by match of the 18-bit counter with the TSG3nCMP1E to TSG3nCMP12E buffer registers

Figure 20.85 Basic Operation Flow in 120-DC Mode

(1) List of Operations in 120-DC Mode

Table 20.75 Counter Functions in 120-DC Mode

Operation		Setting Condition
18-bit counter	Start	TSG3nTRG0.TSG3nTS = 0 → 1 or simultaneous start trigger
	Clear	When TSG3nCTL8.TSG3nS120DCO is 0: timing of a match of TSG3nCMP0E value and 18-bit counter value or output pattern switch When TSG3nCTL8.TSG3nS120DCO is 1: timing of a match of TSG3nCMP0E value with 18-bit counter value
	Stop	TSG3nTRG1.TSG3nTT = 0 → 1

Table 20.76 Functions of Compare Registers and Dead Time Setting Registers in 120-DC Mode

Register	Rewrite Method	Rewrite during Operation	Function
TSG3nCMP0E	Reload	Possible	Setting period
TSG3nCMPmE (m = 1 to 12)	Reload	Possible	Setting PWM duty
TSG3nDCMP0E, TSG3nDCMP1E, TSG3nDCMP2E	Reload	Possible	Outputting diagnostic signal or setting A/D conversion trigger
TSG3nDTC0W, TSG3nDTC1W	Reload	Possible	Setting dead time

Table 20.77 Timer Input Function in 120-DC Mode

Pin/Signal	Function
TSG3nPTSI2-TSG3nPTSI0 pins	Pattern input (3 phases)
TSG3nOPCI0, TSG3nOPCI1 signals	Trigger input

Table 20.78 Timer Output Function in 120-DC Mode

Pin/Signal	Function
TSG3nO1 pin	PWM output (with dead time) according to a compare match of the TSG3nCMPmE buffer register (m = 1, 2, 5, 6, 9, 10) with the 18-bit counter and output pattern selected by TSG3nPAT0W setting.
TSG3nO2 pin	PWM output (with dead time) according to a compare match of the TSG3nCMPmE buffer register (m = 3, 4, 7, 8, 11, 12) with the 18-bit counter and output pattern selected by TSG3nPAT1W setting.
TSG3nO3 pin	PWM output (with dead time) according to a compare match of the TSG3nCMPmE buffer register (m = 1, 2, 5, 6, 9, 10) with the 18-bit counter and output pattern selected by TSG3nPAT0W setting.
TSG3nO4 pin	PWM output (with dead time) according to a compare match of the TSG3nCMPmE buffer register (m = 3, 4, 7, 8, 11, 12) with the 18-bit counter and output pattern selected by TSG3nPAT1W setting.
TSG3nO5 pin	PWM output (with dead time) according to a compare match of the TSG3nCMPmE buffer register (m = 1, 2, 5, 6, 9, 10) with the 18-bit counter and output pattern selected by TSG3nPAT0W setting.
TSG3nO6 pin	PWM output (with dead time) according to a compare match of the TSG3nCMPmE buffer register (m = 3, 4, 7, 8, 11, 12) with the 18-bit counter and output pattern selected by TSG3nPAT1W setting.
TSG3nO7 pin	Diagnostic signal output or pulse output by A/D conversion trigger
TSG3nPTE signal	Toggle signal by change in input pattern

Table 20.79 Interrupt Requests in 120-DC Mode

Interrupt	Function
INTTSG3nIm (m = 0 to 12)	Compare match of TSG3nCMPmE buffer register and 18-bit counter (m = 0 to 12)
INTTSG3nIER	Error
INTTSG3nIVLY	—
INTTSG3nIPEK	Peak interrupt (generated at the same timing as INTTSG3nI0)
INTTSG3nIWN	Warning interrupt

Table 20.80 Compare Match Timing in 120-DC Mode

Compare Match	Timing
TSG3nCMP0E	When 18-bit counter changes from TSG3nCMP0E to 00000_H
TSG3nCMPmE (m = 1 to 12)	After detecting the match of 18-bit counter and TSG3nCMPmE (m = 1 to 12)

Table 20.81 Example of Setting Each Timer Output Condition in 120-DC Mode

			Output Duty	
Pin	Item	Output Period	Output Condition	Setting Condition
TSG3nOm (m = 1 to 6)	PWM output	(TSG3nCMP0E + 1) × count clock	See **Section (6), List of Output Patterns in 120-DC Mode**.	—
TSG3nO7	Diagnostic signal output or pulse output by A/D conversion trigger	(TSG3nCMP0E + 1) × count clock	See **Section 20.4.5, A/D Conversion Trigger Function**.	—

(2) Various Settings of 120-DC Mode

Mode setting

120-DC mode is entered by setting TSG3nCTL0.TSG3nMD2-TSG3nMD0 to 011_B.

Setting timer output

The output pins TSG3nO1 to TSG3nO6 are controlled by setting TSG3nIOC0, TSG3nIOC2, and TSG3nIOC3.

The TSG3nO7 pin outputs pulses of the diagnostic output or the A/D conversion trigger. Please set it as required.

Enabling error interrupt generation

With TSG3nIOC1.TSG3nEOC = 1, the error interrupt (INTTSG3nIER) generation is enabled when the simultaneous active state of the positive phase and inverse phase is detected. For details, see **Section 20.4.6, Error/Warning Interrupt**.

Setting register rewrite timing

Reloading the registers with the reload function is activated with TSG3nCTL3.TSG3nRMC (simultaneous rewrite; default setting is 0 = reload). Set TSG3nCTL4.TSG3nPRE to 1 when reload is used.

The reload timing is not generated if TSG3nPRE is 0.

Setting A/D conversion trigger output

To set A/D conversion trigger 0 (TSG3nADTRG0 signal), use TSG3nCTL5.TSG3nAT09 to TSG3nAT00.

With TSG3nAT09 to TSG3nAT00, A/D conversion trigger output is enabled or disabled at the match of the 18-bit counter and TSG3nDCMP2E to TSG3nDCMP0E (during up count).

To set A/D conversion trigger 1 (TSG3nADTRG1 signal), use TSG3nCTL6.TSG3nAT19 to TSG3nAT10.

To set the match timing of the 18-bit counter and TSG3nDCMP2E to TSG3nDCMP0E, set the compare value to the pertinent register.

The skipping function can be used for TSG3nADTRG0 and TSG3nADTRG1 signals. Use TSG3nACC01, TSG3nACC00 of TSG3nCTL5 and TSG3nACC11, and TSG3nACC10 in TSG3nCTL6 to select the skipping rate among 1/1, 1/2, 1/4, and 1/8.

CAUTION

- Set TSG3nCTL5, TSG3nCTL6, and TSG3nDCMP2E to TSG3nDCMP0E correctly when using the TSG3nO7 output for the A/D conversion trigger timing pulse.
- In 120-DC mode, a trough interrupt (INTTSG3nIVLY) is not generated. Therefore, set TSG3nAT00 and TSG3nAT10 in TSG3nCTL5 and TSG3nCTL6 to 0.
- In 120-DC mode, the 18-bit sub-counter does not operate. Therefore, set TSG3nAT09, TSG3nAT08, TSG3nAT19, and TSG3nAT18 in TSG3nCTL5 and TSG3nCTL6 to 0.
- In 120-DC mode, the 18-bit counter does not decrement. Therefore, set TSG3nAT07, TSG3nAT05, TSG3nAT03, TSG3nAT17, TSG3nAT15, and TSG3nAT13 in TSG3nCTL5 and TSG3nCTL6 to 0.

Setting dead time

The dead time can be set with TSG3nDTC0 and TSG3nDTC1.

The dead time is calculated by the following expressions

- PCLK × TSG3nDTC0
- PCLK × TSG3nDTC1

TSG3nDTC0 can set the time between a change of TSG3nO2, TSG3nO4, and TSG3nO6 to the inactive state and a change of TSG3nO1, TSG3nO3, and TSG3nO5 to the active state, respectively.

TSG3nDTC1 can set the time between a change of TSG3nO1, TSG3nO3, and TSG3nO5 to the inactive state to a change of TSG3nO2, TSG3nO4, and TSG3nO6 to the active state.

Carrier period

Set the carrier period with TSG3nCMP0E according to the following expression:

- TSG3nCMP0E = (carrier period/count clock period) – 1

Duty (PWM width) setting

The duty of PWM output is set with TSG3nCMP1E to TSG3nCMP12E. The setting range of the compare registers is as follows:

- $00000_H \leq$ TSG3nCMPmE $\leq$ TSG3nCMP0E + 1

CAUTION

Do not set TSG3nCMPmE = TSG3nCMP0E + 1 (m = 1 to 12) only when TSG3nCMP0E + 1 < TSG3nCMPmE, and TSG3nCMP0E = $3FFFF_H$.

Output PWM setting

In 120-DC mode, the output pins TSG3nO1, TSG3nO3, and TSG3nO5 are controlled by TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, and TSG3nCMP10E, and the output pins TSG3nO2, TSG3nO4, TSG3nO6 are controlled by TSG3nCMP3E, TSG3nCMP4E, TSG3nCMP7E, TSG3nCMP8E, TSG3nCMP11E, and TSG3nCMP12E. The duty cycle of a PWM period (TSG3nCMP0E) can be set with TSG3nCMP1E to TSG3nCMP12E. Setting TSG3nCMP1E to TSG3nCMP12E to 00000_H sets the PWM duty cycle to 0%. Setting TSG3nCMP1E to TSG3nCMP12E to TSG3nCMP0E + 1 value sets the PWM duty cycle to 100%. This allows chopping output control and rectangular wave output control.

(3) Control Methods in 120-DC Mode

Control methods in 120-DC mode are listed below.

Table 20.82 Control Method in 120-DC Mode

Control Method	Function
Software output control method	Switches the output pattern according to the TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0 setting made by software.
Pattern switch method	Switches the output pattern by the pattern input signal of TSG3nPTSI0 to TSG3nPTSI2.
Trigger switch method	Switches the output pattern by the trigger switch method using the trigger input signals TSG3nOPCI0 and TSG3nOPCI1 or by the pattern input setting of TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0 in the constant order.

Switch timing of timer output when changing input pattern of 120-DC mode can be set by TSG3nCTL8.TSG3nS120DCO.

Table 20.83 Setting of TSG3nS120DCO and Operation in 120-DC Mode

TSG3nS120DCO	Function
0	When input patterns are changed, the main counter (TSG3nCNTE) is cleared and the change of patterns is immediately reflected to timer output.
1	When input patterns are changed, the change of input patterns is reflected to timer output from the next timer cycle (after a match of the main counter (TSG3nCNTE) with TSG3nCMP0E).

Setting software output control method

Setting TSG3nOPT0.TSG3nSTE = 0 switches the output pattern by software output control. The TSG3nO1 to TSG3nO6 pin output is switched according to TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0.

The pattern output order at the beginning of operation is set with TSG3nOPT0.TSG3nIDC and TSG3nOPT0.TSG3nPSC.

Operation of software output control method

The PWM output of TSG3nO1 to TSG3nO6 pins (PWM output defined by TSG3nCMP1E to TSG3nCMP12E) is selected by TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0 by software. To control the dead time, the dead time counter is activated at the falling edge of the signals in each phase and the dead time is inserted.

The 18-bit counter counts based on the carrier period set in TSG3nCMP0E. The 18-bit counter is cleared by match of the 18-bit counter and TSG3nCMP0E or by a write access to TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0 (when TSG3nS120DCO = 0).

In this method, the pattern is output, which is decoded using information on the output pattern (TSG3nSPC2 to TSG3nSPC0), the electric current direction control bit (TSG3nOPT0.TSG3nIDC), and order detection control bit (TSG3nOPT0.TSG3nPSC). **Figure 20.106** shows the timer output when the output pattern is changed by software output control.

Immediately after the operation starts (TSG3nTRG0.TSG3nTS = 1), the output pattern of TSG3nSPC2 to TSG3nSPC0 and the pattern set with TSG3nIDC and TSG3nPSC (TSG3nOPT0.TSG3nPSS = 1) are output.

Setting pattern switch method

Setting TSG3nOPT0.TSG3nSTE to 1 and TSG3nPOT to 0 selects the pattern switch method. The TSG3nO1 to TSG3nO6 pin output pattern is changed at the change timing of the TSG3nPTSI2 to TSG3nPTSI0 pins.

The output pattern at the beginning of operation is set with TSG3nOPT0.TSG3nIDC and with TSG3nOPT0.TSG3nPSC. However, after determining the rotation direction (after the value is set to TSG3nSTR1.TSG3nTSF), the setting of TSG3nPSC is disabled.

Operation of pattern switch method

After level detection is performed for the pins (three inputs from the hall sensor), the level-detected signals are decoded. From the decoding result, the PWM output of TSG3nO1 to TSG3nO6 pins (PWM output defined by TSG3nCMP1E to TSG3nCMP12E) is selected. To control the dead time, the dead time counter is activated at the falling timing of signals in each phase and the dead time is inserted.

The 18-bit counter is cleared by a match of the 18-bit counter value with the TSG3nCMP0E value or by a change of the input pattern (TSG3nPTSI2 to TSG3nPTSI0 pins) while TSG3nS120DCO is 0.

In this method, the pattern, which is decoded by using information on input pattern (TSG3nPTSI2 to TSG3nPTSI0), the electric current direction control bit (TSG3nOPT0.TSG3nIDC), and TSG3nPTSI2 to TSG3nPTSI0 pattern order detection flag (TSG3nSTR1.TSG3nTSF), is output. **Figure 20.88 to Figure 20.91** show the timer output when TSG3nPTSI2 to TSG3nPTSI0 pin inputs change.

Immediately after the operation starts (TSG3nTRG0.TSG3nTS = 1), the output pattern set by the levels input on the TSG3nPTSI2 to TSG3nPTSI0 pins and by the TSG3nIDC and TSG3nPSC bits is produced. If a level on any of the TSG3nPTSI2 to TSG3nPTSI0 pins is changed, TSG3nTSF is determined by the direction of the change to the sequence. After the TSG3nTSF value is determined, the pattern set by the TSG3nTSF bit replaces that set by the TSG3nPSC bit.

CAUTION

When connecting the three-phase pulse input signal to the TSG3nPTSI2 to TSG3nPTSI0 pins, confirm that the three-phase pulse input value and the patterns output from the TSG3nO1 to TSG3nO6 pins satisfy the expected conditions.

If the expected conditions are not satisfied, change the connection between the three-phase pulse input signal and the TSG3nPTSI2 to TSG3nPTSI0 pins.

Setting trigger switch method

Setting TSG3nOPT0.TSG3nSTE and TSG3nPOT to 1 selects the trigger switch method. The output patterns of the pins TSG3nO1 to TSG3nO6 are changed at a rising edge of an external input (TSG3nOPCI1 and TSG3nOPCI0 signals).

For pattern output order, see **Section 20.4.7.6(5), Operation in 120-DC Mode**.

The initial output pattern can be controlled with TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0.

When starting the TSG3n operation (TSG3nTRG0.TSG3nTS = 1) after setting TSG3nSPC2 to TSG3nSPC0, the initial pattern is output. For details, see **Section 20.4.7.6(6) List of Output Patterns in 120-DC Mode**.

Operation of trigger switch method

With the trigger input switch method, the rising edges of the TSG3nOPCI0 and TSG3nOPCI1 signals are detected and the output switch timing is generated. The initial timer output pattern is set with TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0. The subsequent output patterns are switched after rising of the TSG3nOPCI0 and TSG3nOPCI1 signals is detected. Furthermore, the output patterns can be switched by setting TSG3nOPT1.TSG3nSPC2 to TSG3nOPT1.TSG3nSPC0.

The 18-bit counter counts based on the carrier period set in TSG3nCMP0E. The 18-bit counter is cleared by match of the 18-bit counter and TSG3nCMP0E, by a write access to TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0, or by detecting a rising of TSG3nOPCI0 and TSG3nOPCI1 signals. (When TSG3nS120DCO = 0)

For examples of operation in 120-DC mode when trigger input switch method is used, see **Figure 20.88** to **Figure 20.91**.

CAUTION

The initial pattern should be set according to the read input level of the port to which TSG3nPTSI2 to TSG3nPTSI0 pins are connected.

(4) Timer Output in 120-DC Mode

In 120-DC mode, the PWM output is controlled with TSG3nPAT0W, TSG3nPAT1W, and TSG3nCMP1E to TSG3nCMP12E. TSG3nPAT0W, TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, and TSG3nCMP10E are set to control the output of TSG3nO1, TSG3nO3, and TSG3nO5 pins. TSG3nPAT1W, TSG3nCMP3E, TSG3nCMP4E, TSG3nCMP7E, TSG3nCMP8E, TSG3nCMP11E, and TSG3nCMP12E are set with the output of SG2nO2, TSG3nO4, and TSG3nO6 pins.

With PWM output control, eight types of output patterns can be selected for each of TSG3nO1, TSG3nO3, and TSG3nO5 pins and TSG3nO2, TSG3nO4, and TSG3nO6 pins.

Table 20.84 TSG3nPAT0W Set Value and Output Control

PATmT Value	Output Control
000	Fixed to low
001	PWM output set with TSG3nCMP1E
010	PWM output set with TSG3nCMP2E
011	PWM output set with TSG3nCMP5E
100	PWM output set with TSG3nCMP6E
101	PWM output set with TSG3nCMP9E
110	PWM output set with TSG3nCMP10E
111	Fixed to high

Note: m = 0, 1, 2, 3, 4, 5

(5) Operation in 120-DC Mode

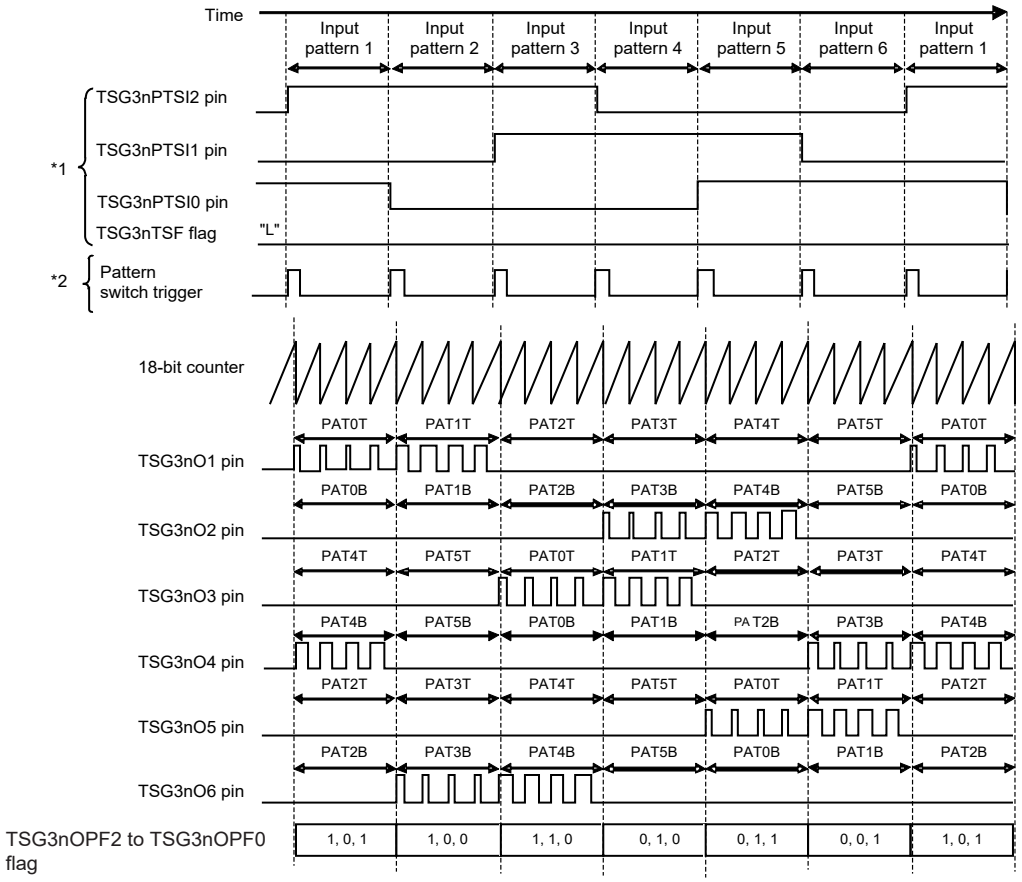

Figure 20.88 to **Figure 20.91** show examples of operation in 120-DC mode.

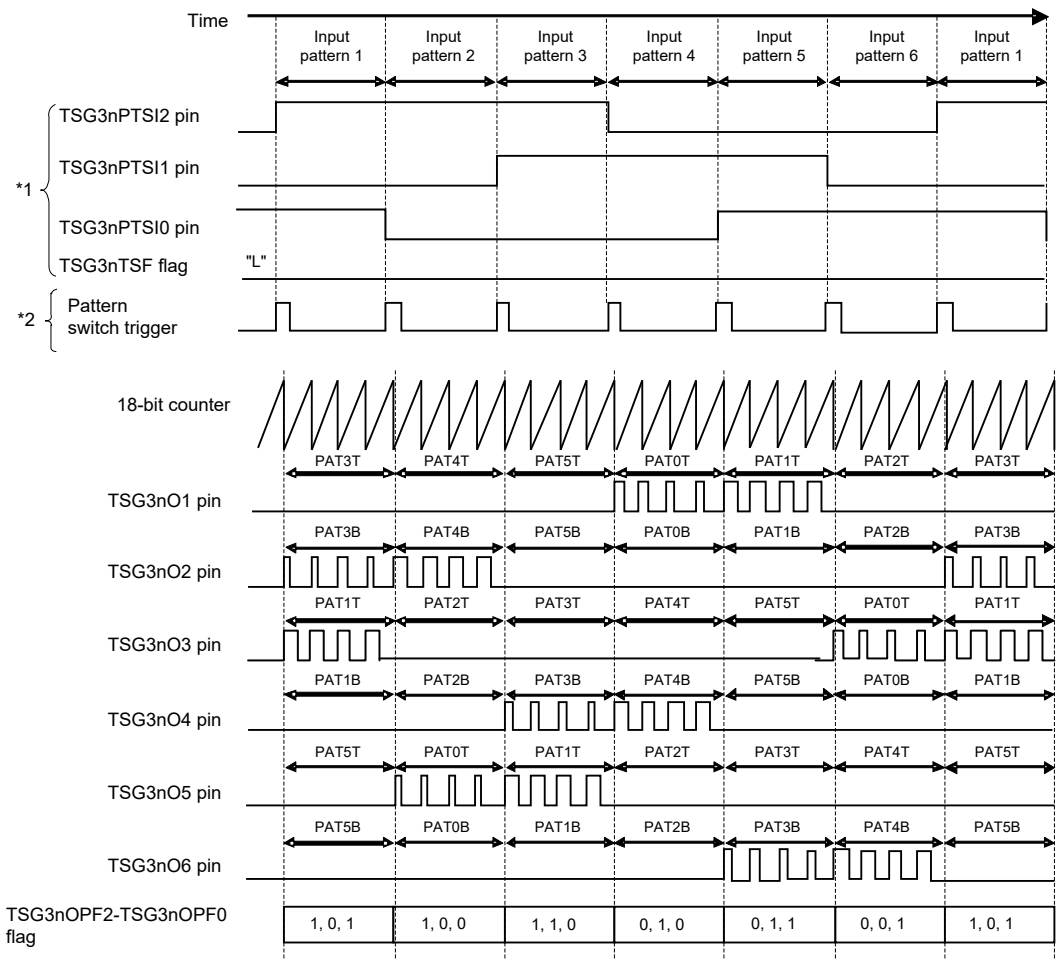
The TSG3nO1 to TSG3nO6 pins detect the input level change of the TSG3nPTSI2 to TSG3nPTSI0 pins, and then change the output pattern. The 18-bit counter produces sawtooth waveform and TSG3nCMP0E to TSG3nCMP12E output PWM signal. When TSG3nS120DCO = 0, the 18-bit counter is cleared to 00000_H each time the counter value matches with TSG3nCMP0E or a change in the TSG3nPTSI2 to TSG3nPTSI0 pins is detected. The timer output pattern is switched each time a change in the TSG3nPTSI2 to TSG3nPTSI0 pins is detected.

When TSG3nS120DCO = 1, the 18-bit counter is cleared to 00000_H when the counter value matches with TSG3nCMP0E but not cleared with a change in the TSG3nPTSI2 to TSG3nPTSI0 pins. The timer output pattern is switched to the one corresponding to the patterns of TSG3nPTSI2 to TSG3nPTSI0 pins at the next match timing of TSG3nCNTE and TSG3nCMP0E.

NOTE

PAT0T to PAT5T and PAT0B to PAT5B show PWM operation set by TSG3nCMP1E to TSG3nCMP12E, respectively.



Note 1. For pattern switch method (TSG3nOPT0.TSG3nSTE = 1, TSG3nOPT0.TSG3nPOT = 0)

Note 2. For trigger switch method (TSG3nOPT0.TSG3nSTE = 1, TSG3nOPT0.TSG3nPOT = 1)

Note: TSG3nOPT0.TSG3nSOC = 0

(6) List of Output Patterns in 120-DC Mode

In 120-DC mode, the output pattern is determined according to the electric current direction (TSG3nOPT0.TSG3nIDC) and the pattern order direction.

Table 20.86 Selection of Pattern Order Direction in 120-DC Mode

TSG3nOPT0			
TSG3nSTE	TSG3nPOT	TSG3nPSS	Pattern Order Direction
0	—	1	TSG3nPSC
1	0	—	TSG3nTSF (TSGnPSC only for initial setting at operation start)
1	1	1	TSG3nPSC

Table 20.87 List of Output Patterns in 120-DC Mode (1/4)

Electric current direction: normal (TSG3nIDC = 0)
Pattern order direction: normal (TSG3nTSF = 0 or TSG3nPSC = 0)

	TSG3nOPT1.TSG3nSPC2-TSG3nSPC0*1/TSG3nSTR1.TSG3nOPF2-TSG3nOPF0							
Output Pins	101	100	110	010	011	001	000	111
TSG3nO1	PAT0T	PAT1T	PAT2T	PAT3T	PAT4T	PAT5T	Low	Low

TSG3nO6	PAT5B	PAT0B	PAT1B	PAT2B	PAT3B	PAT4B	Low	Low

Note 1. When TSG3nSPC2 to TSG3nSPC0 are written to while the values of TSG3nSPC2 to TSG3nSPC0, TSG3nSTE, and TSG3nPOT are 1, the output pattern changes. Thereafter, when a pattern switch trigger is generated on rising of the TSG3nOPCI0 and TSG3nOPCI1 signals, the output is switched according to the order of pattern switching. When TSG3nS120DCO = 0, the output is switched immediately. When TSG3nS120DCO = 1, the output is switched when the main counter (TSG3nCNTE) is matched with TSG3nCMP0E (from the next timer cycle). TSG3nSPC2 to TSG3nSPC0 remain unchanged even if the output pattern is switched.

NOTES

1. PAT0T to PAT5T: PWM output set by TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, TSG3nCMP10E
2. PAT0B to PAT5B: PWM output set by TSG3nCMP3E, TSG3nCMP4E, TSG3nCMP7E, TSG3nCMP8E, TSG3nCMP11E, TSG3nCMP12E

Note 1. When TSG3nSPC2 to TSG3nSPC0 are written to while the values of TSG3nSPC2 to TSG3nSPC0, TSG3nSTE, and TSG3nPOT are 1, the output pattern changes. Thereafter, when a pattern switch trigger is generated on rising of the TSG3nOPCI0 and TSG3nOPCI1 signals, the output is switched according to the order of pattern switching. When TSG3nS120DCO = 0, the output is switched immediately.
When TSG3nS120DCO = 1, the output is switched when the main counter (TSG3nCNTE) is matched with TSG3nCMP0E (from the next timer cycle). TSG3nSPC2 to TSG3nSPC0 remain unchanged even if the output pattern is switched.

NOTES

1. PAT0T to PAT5T: PWM output set by TSG3nCMP1E, TSG3nCMP2E, TSG3nCMP5E, TSG3nCMP6E, TSG3nCMP9E, TSG3nCMP10E
2. PAT0B to PAT5B: PWM output set by TSG3nCMP3E, TSG3nCMP4E, TSG3nCMP7E, TSG3nCMP8E, TSG3nCMP11E, TSG3nCMP12E

(7) Operation Start Timing in 120-DC Mode

In 120-DC mode, when trigger switch control (TSG3nOPT0.TSG3nSTE = 1, TSG3nOPT0.TSG3nPOT = 1) is used, pattern set with TSG3nOPT1.TSG3nSPC2 to TSG3nOPT1.TSG3nSPC0, TSG3nOPT0.TSG3nPSC, and TSG3nOPT0.TSG3nIDC can be output. However, when pattern switch control (TSG3nOPT0.TSG3nSTE = 1, TSG3nOPT0.TSG3nPOT = 0) is used, the pattern of the TSG3nPTSI2 to TSG3nPTSI0 pins can be detected but the pattern order direction (TSG3nSTR1.TSG3nTSF) cannot be determined. Therefore, set the pattern order direction in TSG3nPSC when TSG3nTE is 0. The TSG3nPSC set value is loaded to TSG3nTSF, and the value can be used for the initial pattern setting.

- TSG3nOPT0.TSG3nSOC = 0, TSG3nPSC = 0, TSG3nPOT = 0, TSG3nIDC = 0, TSG3nSTE = 1

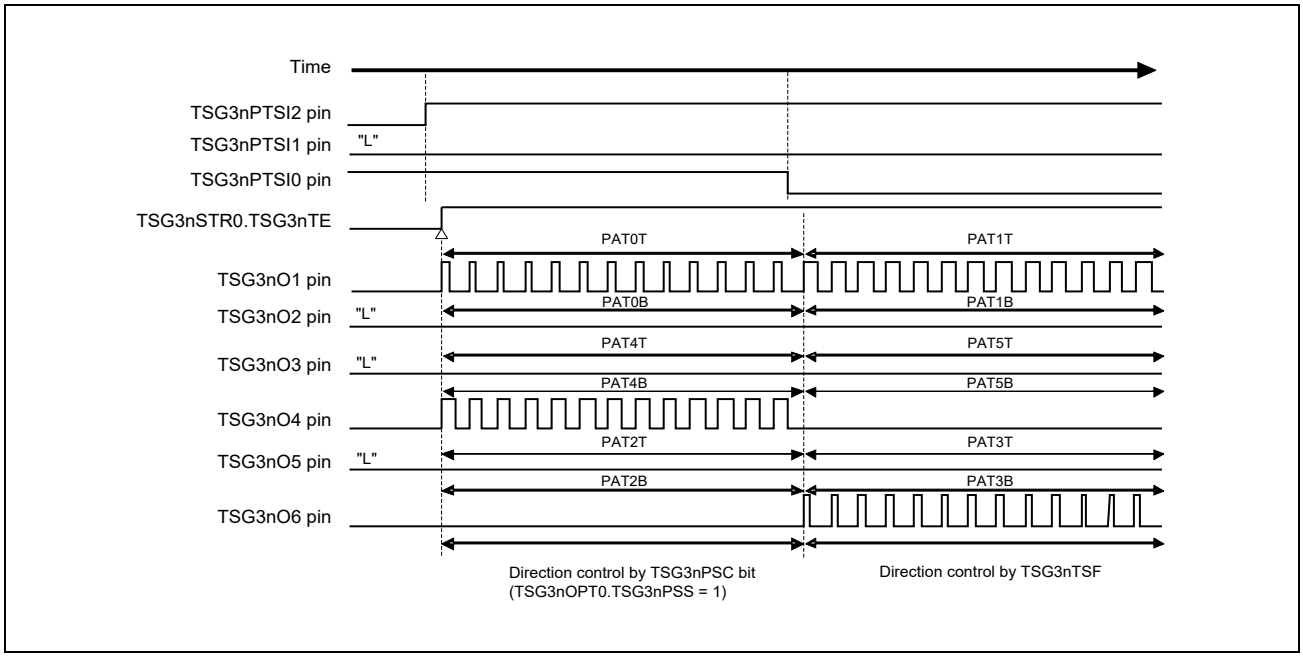

Figure 20.92 Control when Timer Output Starts in Normal Rotation (when Normal Pattern is Input)

- TSG3nOPT0.TSG3nSOC = 0, TSG3nPSC = 1, TSG3nPOT = 0, TSG3nIDC = 1, TSG3nSTE = 1

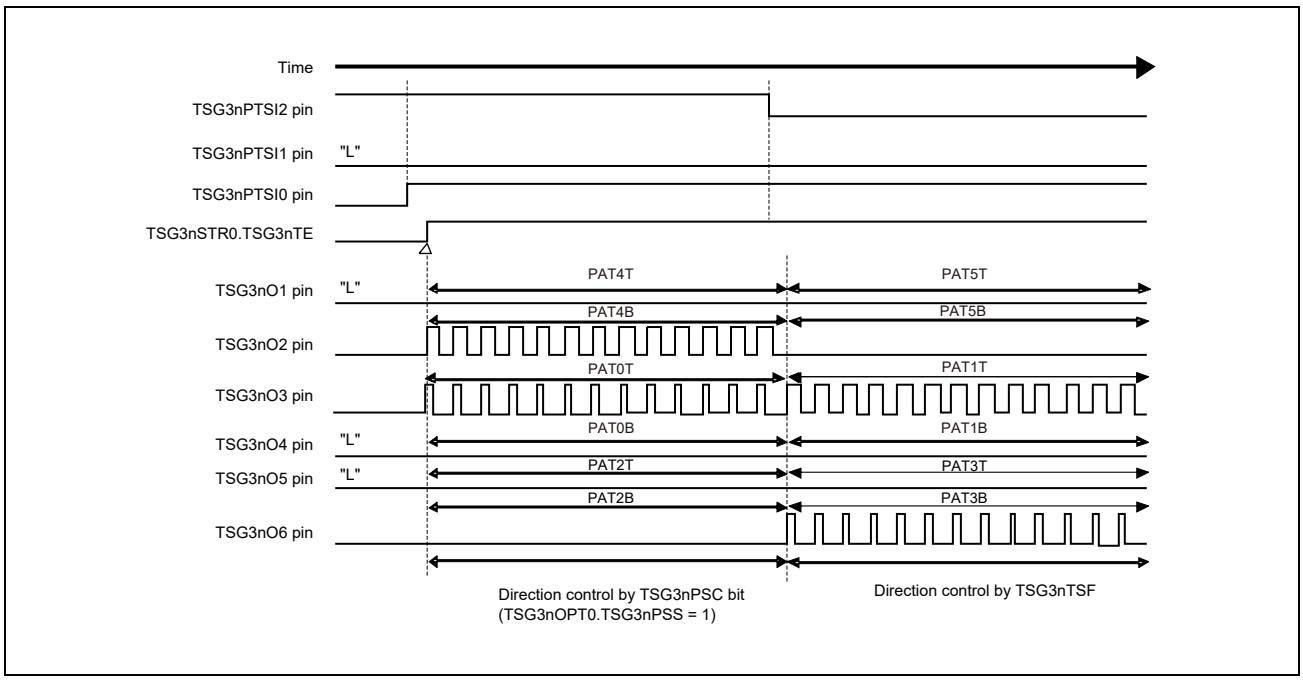

Figure 20.93 Control when Timer Output Starts in Reverse Rotation (when Normal Pattern is Input)

- TSG3nOPT0.TSG3nSOC = 0, TSG3nPSC = 0, TSG3nPOT = 0, TSG3nIDC = 0, TSG3nSTE = 1

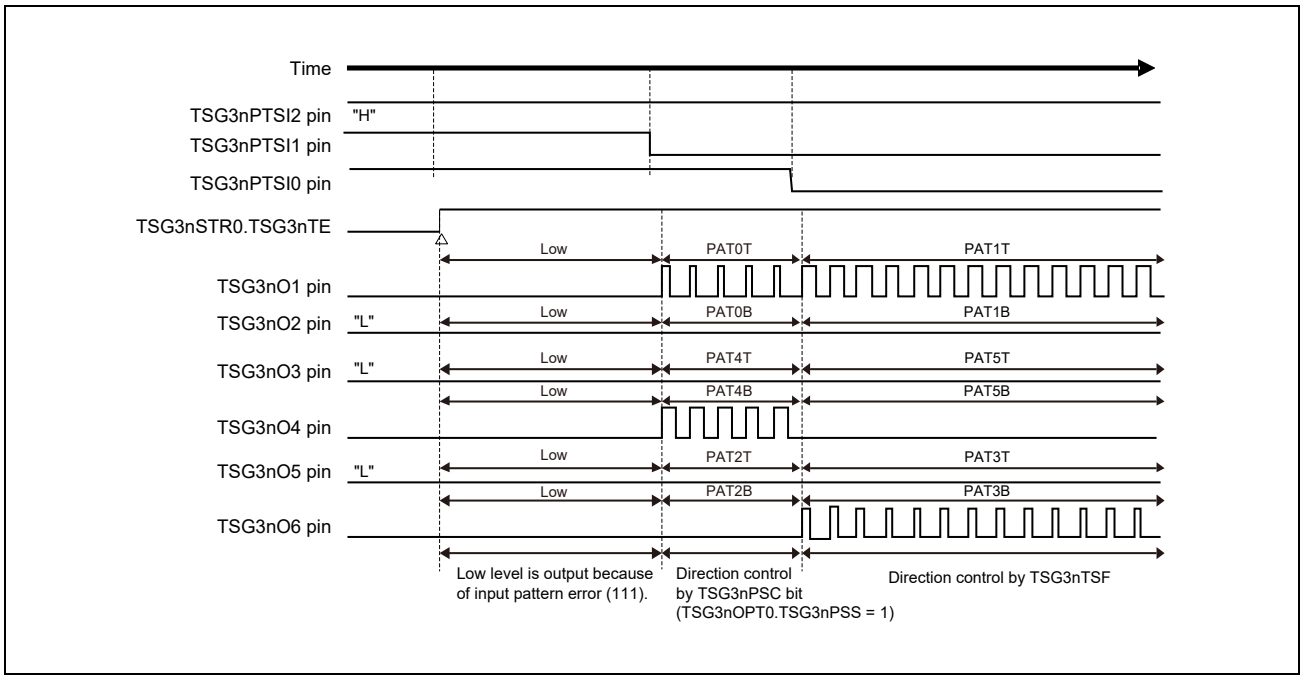

Figure 20.94 Control when Timer Output Starts in Normal Rotation (when Error Pattern is Input)

- TSG3nOPT0.TSG3nSOC = 0, TSG3nPSC = 1, TSG3nPOT = 0, TSG3nIDC = 1, TSG3nSTE = 1

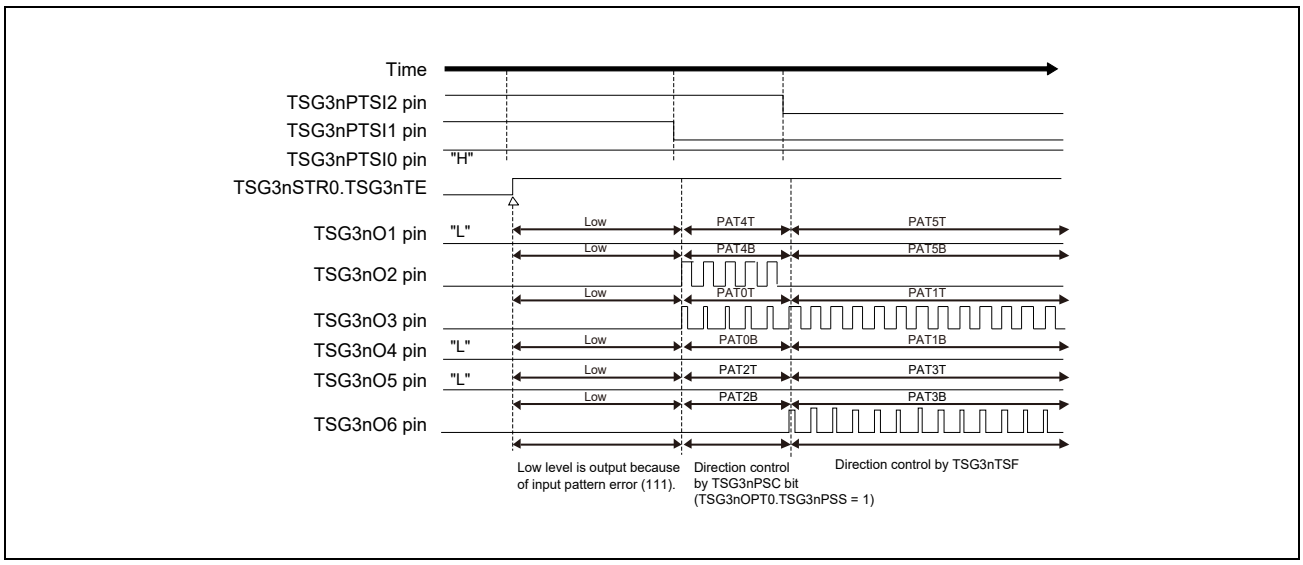

Figure 20.95 Control when Timer Output Starts in Reverse Rotation (when Error Pattern is Input)

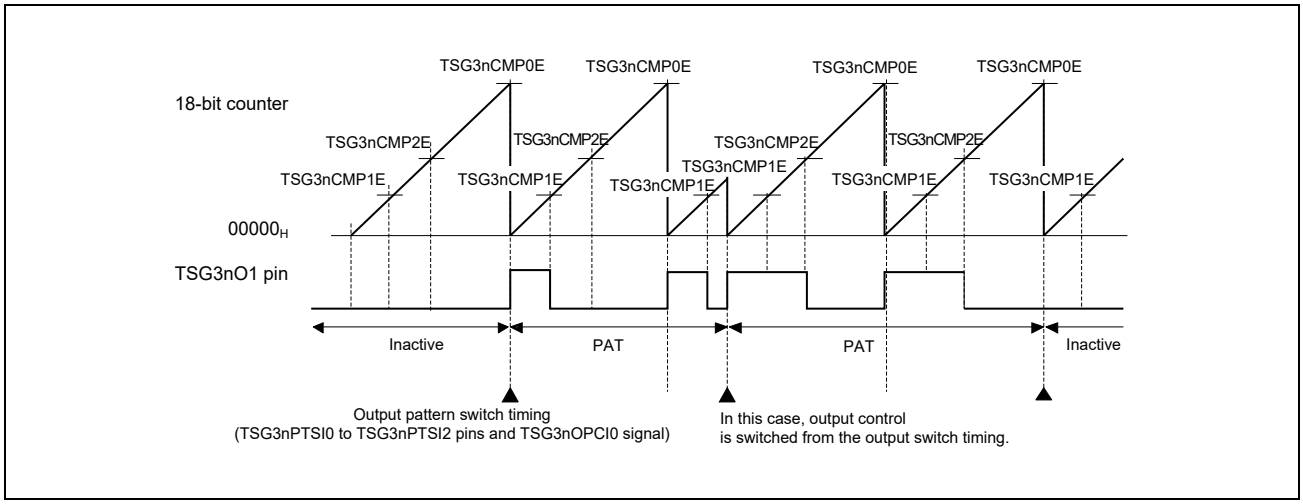
(8) Output Switch Timing in 120-DC Mode (TSG3nS120DCO = 0)

As shown in **Figure 20.96** to **Figure 20.99**, in 120-DC mode, the external switch timing for output pattern (TSG3nOPCI0 and TSG3nOPCI1 signals, and TSG3nPTSI2 to TSG3nPTSI0 pins) is input irrespective of the 18-bit counter operation. When TSG3nS120DCO is 0, the output is switched to the new pattern by clearing the 18-bit counter using the pattern switch timing signal applied from outside.

In the pattern switch method, if a change in TSG3nPTSI2 to TSG3nPTSI0 pins occurs several times within one period, the output pattern is switched by clearing the 18-bit counter at each change. In the trigger switch method, if TSG3nOPCI0 and TSG3nOPCI1 signal trigger is input for several times within one period, the output pattern is switched by clearing the 18-bit counter each time the trigger is accepted.

If TSG3nSPC2 to TSG3nSPC0 are rewritten several times within one period, the output pattern is switched by clearing the 18-bit counter each time TSG3nSPC2 to TSG3nSPC0 are rewritten.

In case of a conflict between a rewrite to TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0 and TSG3nOPCI0 and TSG3nOPCI1 trigger, rewriting of TSG3nSPC2 to TSG3nSPC0 takes precedence.



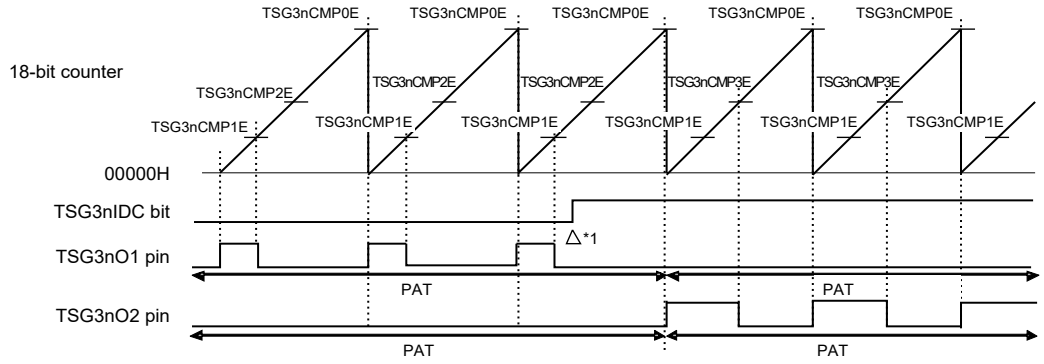


Figure 20.96 Output Switch Example (TSG3nPTSI2 to TSG3nPTSI0 Pins and TSG3nOPCI0 and TSG3nOPCI1 Signal Trigger Input)

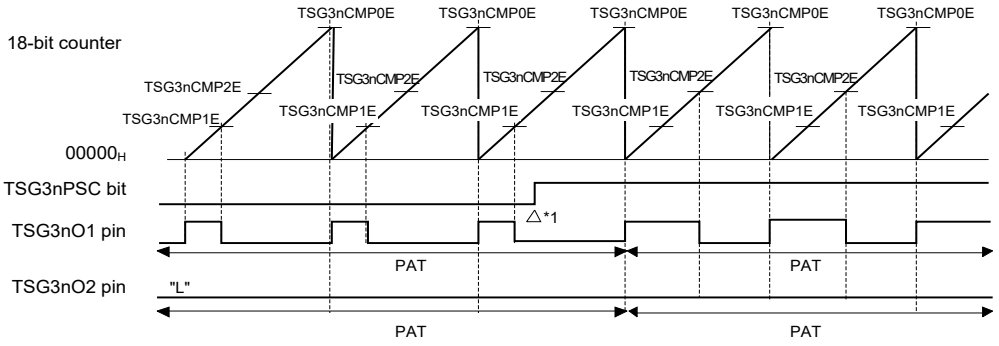
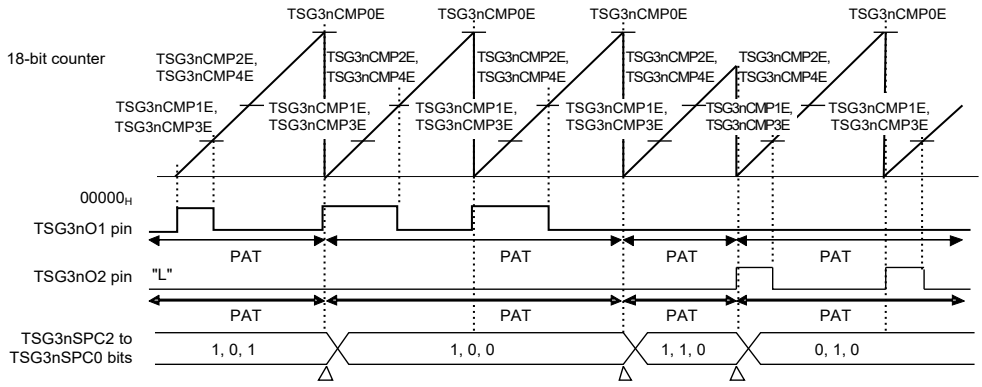


Note 1. When the pattern is switched here, output control is switched in the next period.

Note: If a change in the TSG3nPTSI2-0 pins occurs by the time next period when output control is switched by the TSG3nIDC bit, the 18-bit counter is cleared and output control is switched.

Figure 20.97 Output Switch Example (Switched by TSG3nOPT0.TSG3nIDC)

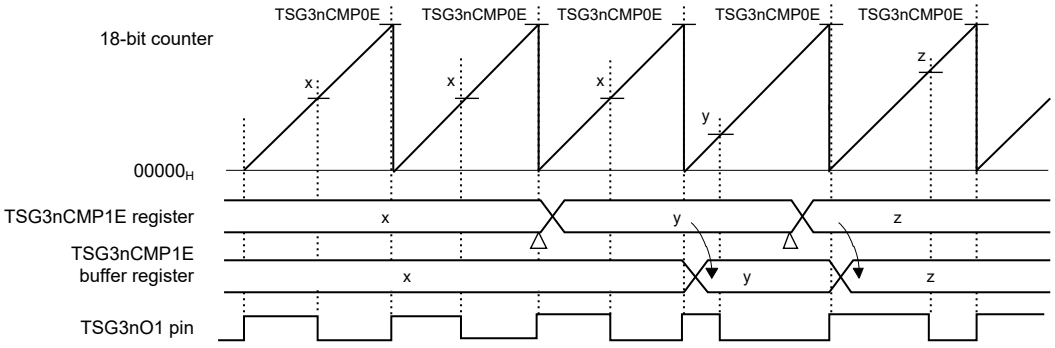


- TSG3nOPT0.TSG3nSTE = 1, TSG3nOPT0.TSG3nPOT = 1

Note 1. When the pattern is switched here, output control is switched from the next period.

Figure 20.98 Output Switch Example (Switched by TSG3nOPT0.TSG3nPSC)

- TSG3nOPT0.TSG3nSOC = 0, TSG3nOPT0.TSG3nSTE = 1, TSG3nOPT0.TSG3nPOT = 1



Note: Δ: Write access

Figure 20.99 Output Switch Example (Switched by TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0)

(9) Compare Register Rewrite Timing in 120-DC Mode

Example of operation when TSG3nCMP1E is reloaded (rewritten simultaneously) is shown below.

Figure 20.100 shows an output example when TSG3nCMP1E is rewritten. After TSG3nCMP1E is changed, data is not transferred to the TSG3nCMP1E buffer register (changed data is not valid) until the next reload timing; therefore, the specified output waveform can be obtained. However, do not write to TSG3nCMP1E again while the reload is suspended (period from when TSG3nCMP1E is changed to when simultaneous rewrite is executed). Be sure to read the reload request flag (TSG3nRSF) to confirm that the flag is 0, and write data to TSG3nCMP1E.

Note: Δ: Write access

Figure 20.100 Output Example when TSG3nCMP1E is Rewritten

(10) Dead Time Control in 120-DC Mode

In 120-DC mode, the dead time is controlled on falling of each phase, and the dead time is added.

The dead time set in TSG3nDTC1W is inserted on falling of the positive phase, and the dead time set in TSG3nDTC0W is inserted on falling of the inverse phase.

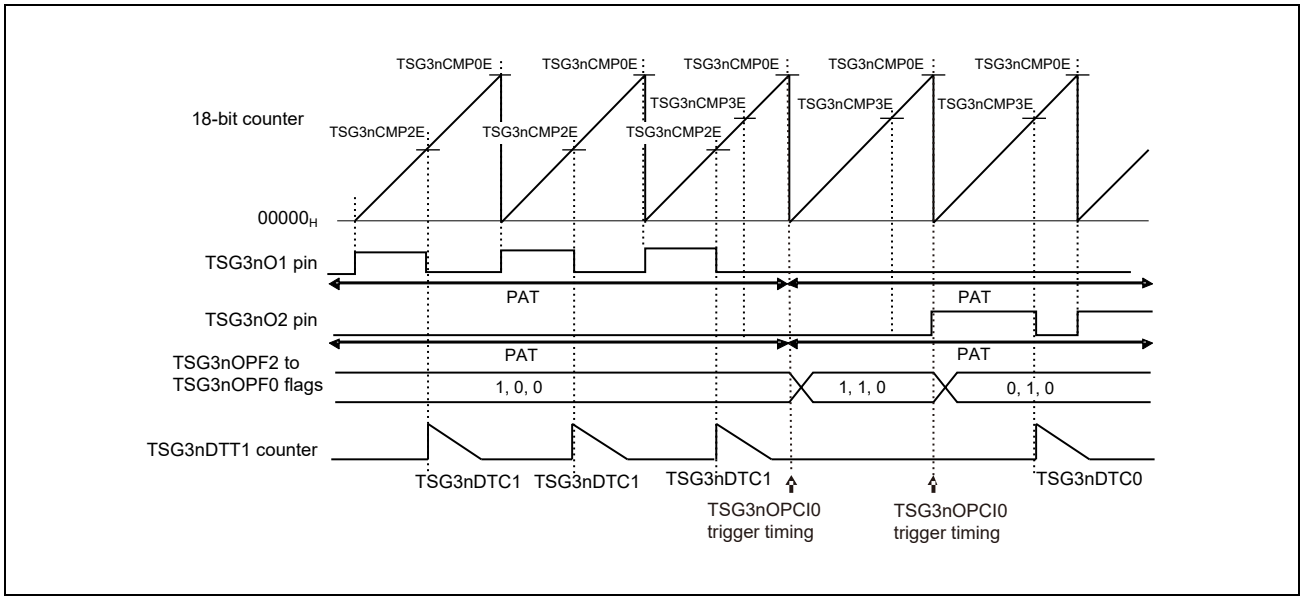


Figure 20.101 Output Switch Example

CAUTION

The dead time control method may affect the timer output. The timer output may not have the specified active level width due to the dead time control under the following conditions:

- When noise is generated on the input pattern in the pattern switch method
- When a change in the input pattern occurs earlier than the PWM period in the pattern switch method
- When TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0 are changed and the output pattern is forcibly changed in the trigger switch method
- When switch method is changed
- When the current direction control bit (TSG3nOPT0.TSG3nIDC) is changed
- When the software output control function is used

(11) Output Switch in 120-DC Mode

In 120-DC mode, the output pattern can be controlled by writing values to TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0 when the trigger switch method (TSG3nOPT0.TSG3nSTE = 1, and TSG3nPOT = 1) is used. The dead time is secured by hardware at the switch timing.

CAUTION

When 111_B or 000_B is written to TSG3nSPC2 to TSG3nSPC0, the TSG3nO1 to TSG3nO6 pins are driven low.

(12) Operation when Noise is Generated in TSG3nPTSI2 to TSG3nPTSI0 Pins in 120-DC Mode

Input to the TSG3nPTSI2 to TSG3nPTSI0 pins is assumed to be the hall sensor signals of the brushless DC motor. Depending on the system, a noise may be generated on the TSG3nPTSI2 to TSG3nPTSI0 pins. Operation when a noise is generated is described below.

For system product design, be sure to insert a noise filter circuit between the hall sensor and the TSG3nPTSI2 to TSG3nPTSI0 pins.

Figure 20.103 shows a case when a noise is generated on the TSG3nPTSI2 to TSG3nPTSI0 pins during operation with the pattern switch method used.

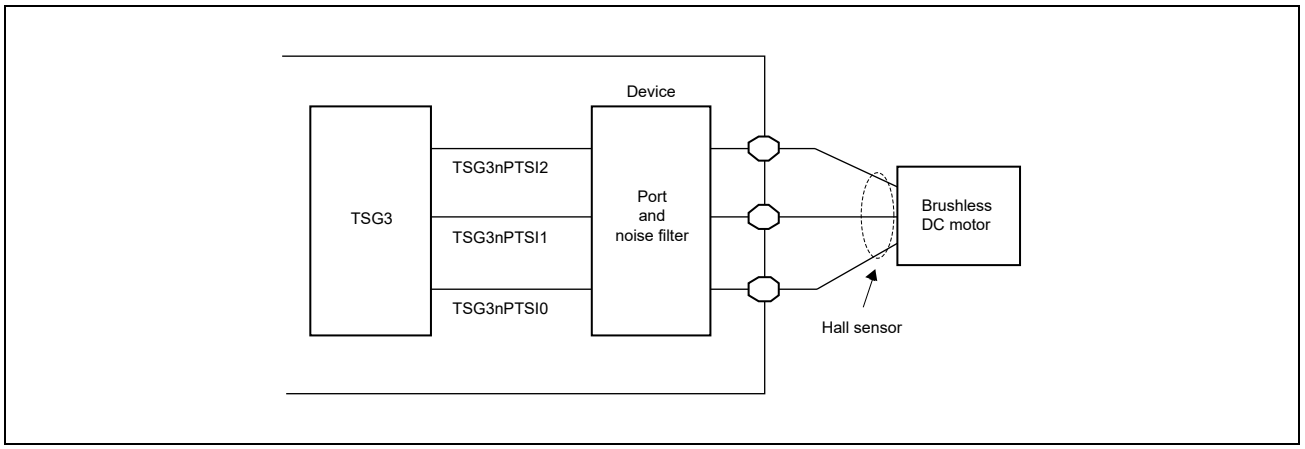

Figure 20.102 Example of Noise Filter Circuit Connection

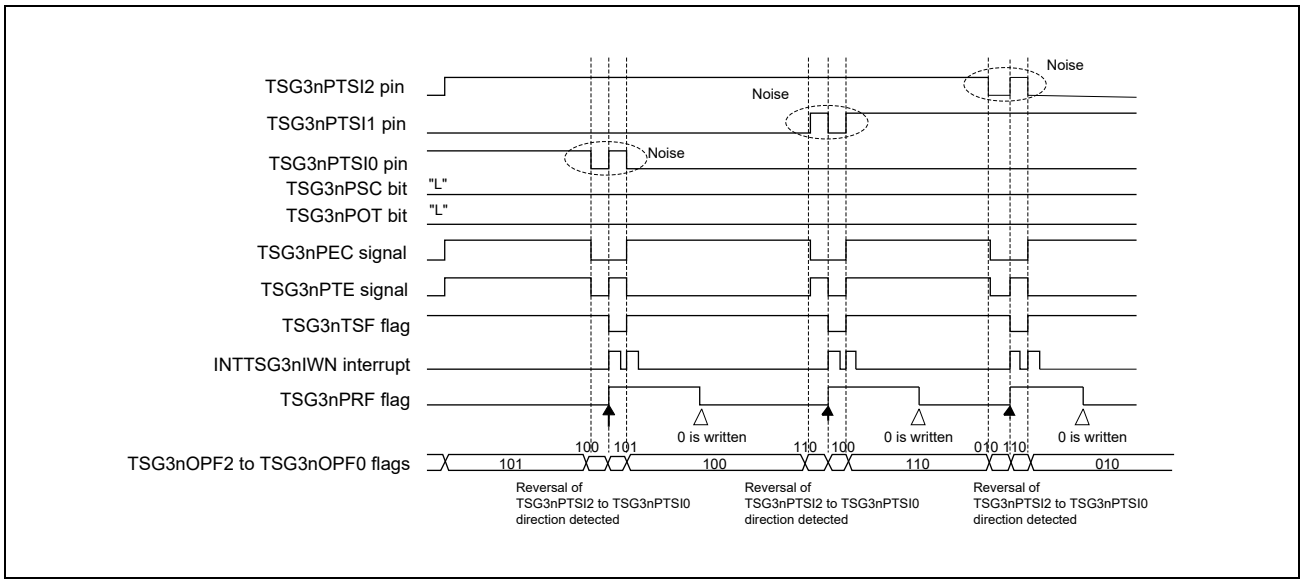

Figure 20.103 Example of Noise Generation at Level Change in TSG3nPTSI2 to TSG3nPTSI0 Pins (Pattern Switch Method)

(a) Change Timing of Input Pattern Change Detection Signal (TSG3nPTE)

The TSG3nPTE signal toggles when the input pattern (TSG3nPTSI2 to TSG3nPTSI0 pins) changes.

CAUTION

Be sure to specify the pattern order direction by the TSG3nPSC bit (when the TSG3nPSS bit in the TSG3nOPT0 register is 1) in the TSG3nOPT0 register.

- When TSG3nPSC = 0:

Table 20.88 TSG3nPTE Toggle Operation when TSG3nPSC is 0

		TSG3nPTSI2-TSG3nPTSI0 Pins After Change							
		000	111	101	100	110	010	011	001
Current TSG3nPTSI2 to TSG3nPTSI0 pins	000	—	—	—	—	—	—	—	—
	111	—	—	—	—	—	—	—	—

	001	—	—	Toggle	—	—	—	Toggle	—

(c) Change Timing of TSG3nO1 to TSG3nO6 Pins

- When the pattern switch method is used, the output pattern changes when the input signal of the TSG3nPTSI2 to TSG3nPTSI0 pins*[1] changes. The output is also switched when two or more pins change simultaneously.
- When the trigger switch method is used, the output pattern changes at the rising edge of the TSG3nOPCI0 and TSG3nOPCI1 signals. The output also changes when data is written to TSG3nSPC2 to TSG3nSPC0*[1] in TSG3nOPT0.

Note 1. When the input pattern changes to 000 or 111, the TSG3nO1-TSG3nO6 pins are driven low. The output pattern of TSG3nO1-TSG3nO6 changes immediately only when TSG3nS120DCO = 0. When TSG3nS120DCO = 1, the output pattern is switched when the main counter (TSG3nCNTE) is matched with TSG3nCMP0E (from the next timer cycle).

(d) Change Timing of TSG3nTSF Flag

The TSG3nTSF flag toggles when the input pattern (TSG3nPTSI2 to TSG3nPTSI0 pins) changes

Table 20.91 Setting and Clearing of TSG3nTSF

		TSG3nPTSI2-TSG3nPTSI0 Pins After Change							
		000	111	101	100	110	010	011	001
Current TSG3nPTSI2 to TSG3nPTSI0 Pins	000	—	—	—	—	—	—	—	—
	111	—	—	—	—	—	—	—	—
	101	—	—	—	0	—	—	—	1
	100	—	—	1	—	0	—	—	—
	110	—	—	—	1	—	0	—	—
	010	—	—	—	—	1	—	0	—
	011	—	—	—	—	—	1	—	0
	001	—	—	0	—	—	—	1	—

(e) Set Timing of TSG3nNDF Flag

This flag is set when two or more pins of the TSG3nPTSI2 to TSG3nPTSI0 pins change simultaneously, and cleared when 1 is written to the TSG3nNDR bit. The TSG3nNDF flag is valid when 1 is set to the TSG3nNDC bit.

(f) Set Timing of TSG3nPRF Flag

This flag is set when the TSG3nTSF flag changes, and cleared when 1 is written to the TSG3nPRR bit. The TSG3nPRF flag is valid when 1 is set to the TSG3nPRC bit.

(g) Set Timing of TSG3nPEF Flag

This flag is set when 000 or 111 is input to the TSG3nPTSI2 to TSG3nPTSI0 pins, and cleared when 1 is written to the TSG3nPER bit. The TSG3nPEF flag is valid when 1 is set to the TSG3nPEC bit.

(13) Basic Control Flow in 120-DC Mode

In 120-DC mode, there are eight control states as listed in **Table 20.92**.

When TSG3nOPT0.TSG3nSTE = 1 and TSG3nPOT = 0, the pattern switch method is used for 120-DC control.

This is defined as fixed phase control. The fixed phase control should be performed considering the factors such as delay from the hall sensor and delay from sensor level detection to timer output. However, acceleration or deceleration can be performed simply by changing the PWM duty.

When TSG3nOPT0.TSG3nSTE = 1 and TSG3nPOT = 1, the trigger switch method is selected for 120-DC control.

This is defined as variable phase control. With the variable phase control, the timer output pattern is set prior to the hall sensor; therefore, acceleration or deceleration control according to the phase difference can be performed. However, control is more complex than the fixed phase control because offset width with respect to the hall sensor and the predicted value with respect to the hall sensor should be considered. For details, **Section 24.2.3.11, Three-Phase Pulse Input Control Function**.

When TSG3nOPT0.TSG3nSTE = 1, TSG3nOPT0.TSG3nPOT = 1, and TSG3nPSS = 1, the pattern order direction of the motor can be set with the TSG3nPSC bit in the TSG3nOPT0 register. Set TSG3nPSC to 0 to set normal rotation, and 1 to set reverse rotation.

The TSG3nIDC bit in the TSG3nOPT0 register sets the electric current direction. If the same value as the rotation direction of the motor (TSG3nPSC set value) is set, acceleration control is set. If the different value from the rotation direction of the motor is set, deceleration control is set.

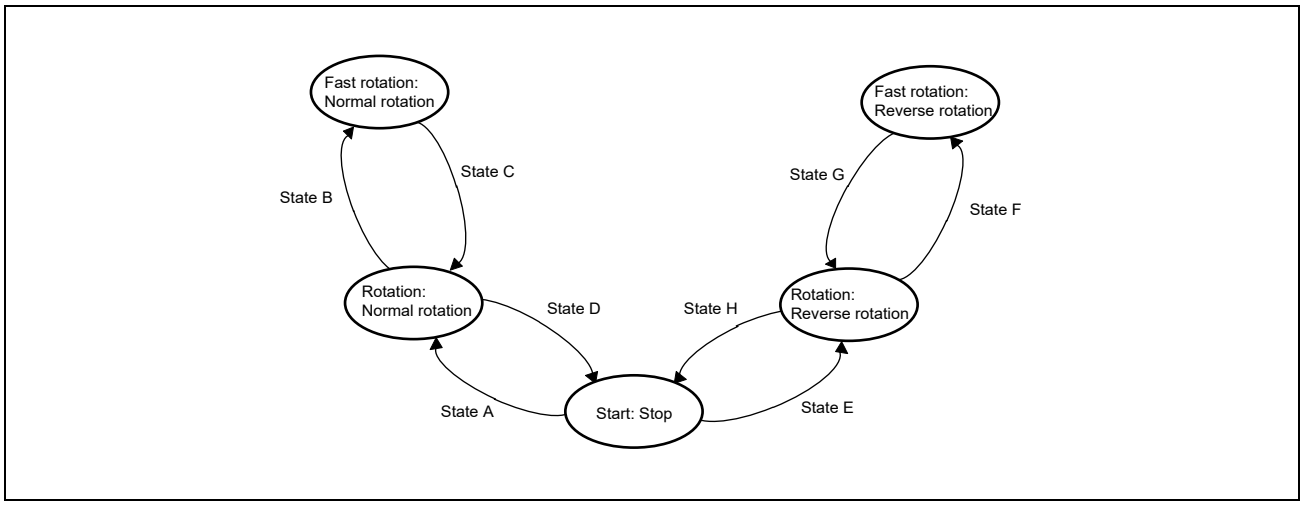
Table 20.92 Timer Control Status

Status	TSG3nPSC in TSG3nOPT0	TSG3nTSF in TSG3nSTR1	TSG3nIDC in TSG3nOPT0	TSG3nPOT in TSG3nOPT0	Control
A	—	0	0	0	Normal rotation, acceleration, and fixed phase
B	0	—	0	1	Normal rotation, acceleration, and variable phase
C	0	—	1	1	Normal rotation, deceleration, and variable phase
D	—	0	1	0	Normal rotation, deceleration, and fixed phase
E	—	1	1	0	Reverse rotation, acceleration, and fixed phase
F	1	—	1	1	Reverse rotation, acceleration, and variable phase
G	1	—	0	1	Reverse rotation, deceleration, and variable phase
H	—	1	0	0	Reverse rotation, deceleration, and fixed phase

Generally, the state, when the motor rotation stops, is assumed to be a state of the start and the control begins. First the fixed phase control is used to rotate the motor from the stopped state. Afterwards, to accelerate the motor speed to the fast rotation, the variable phase control is switched on. In combination with encoder timer (ENCA) and the variable phase control, the timer output is changed according to timing that is earlier than the change point of the hall sensors (leading).

To decelerate the motor speed from fast rotation, the direction of control is switched to deceleration control by rewriting only TSG3nIDC in TSG3nOPT0. When the rotation count can be reduced to low-speed rotation, the rotation can be placed in the stopped state by decreasing the PWM duty.

State transition is shown in **Figure 20.104** and **Figure 20.105**.



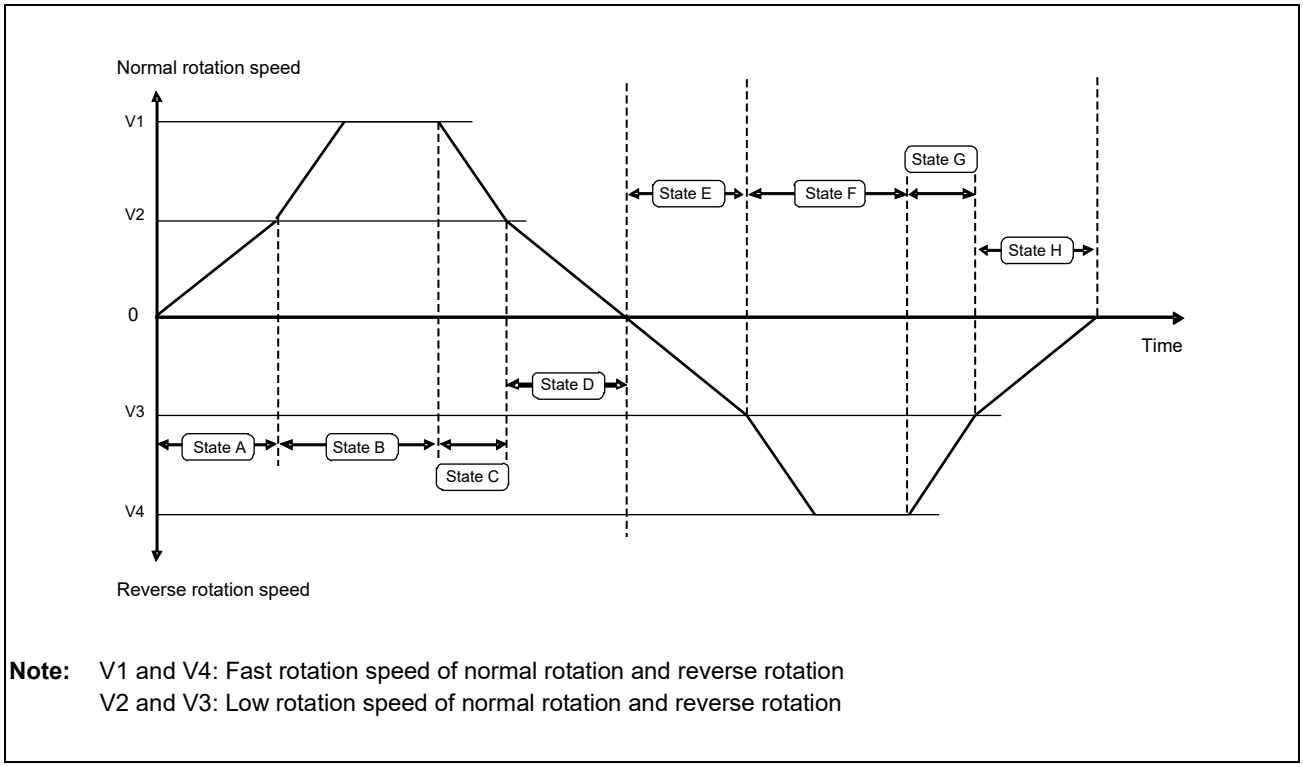


Figure 20.104 State Transition Diagram

Note: V1 and V4: Fast rotation speed of normal rotation and reverse rotation
V2 and V3: Low rotation speed of normal rotation and reverse rotation

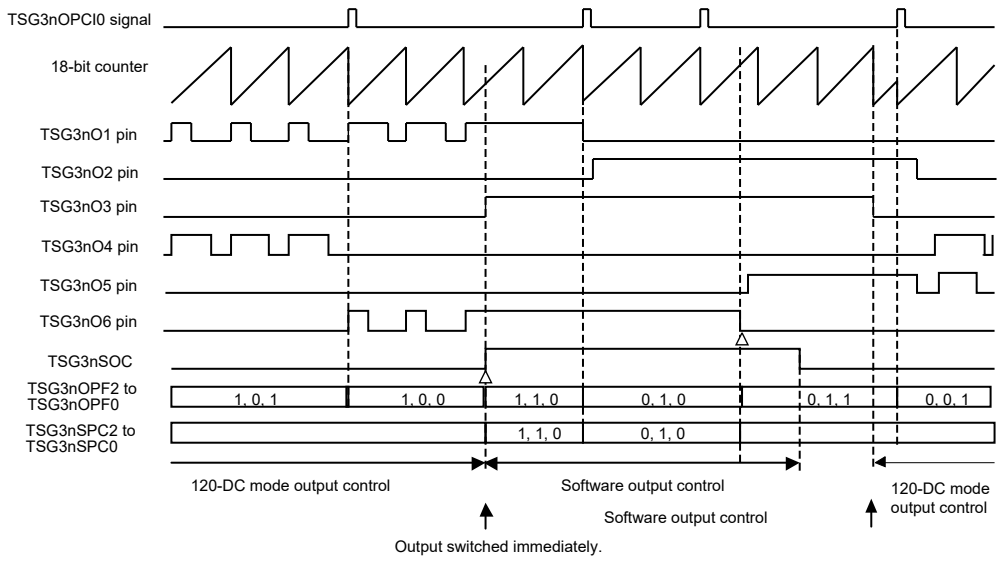

Figure 20.105 V1 and V4: Fast rotation speed of normal rotation and reverse rotation V2 and V3: Low rotation speed of normal rotation and reverse rotation

(14) Software Output Control Function in 120-DC Mode

TSG3nOPT0.TSG3nSOC and TSG3nIDC, and TSG3nOPT1.TSG3nSPC2 to TSG3nSPC0 are used in 120-DC mode for timer output control by software.

As shown in **Figure 20.106**, the output control is switched immediately when TSG3nSOC is set to 1. If the dead time is set, the period of the dead time period is guaranteed. After that, to switch the output control from software output control to 120-DC control, set TSG3nSOC to 0. At this timing, output control is retained. When the reload timing is generated, output control is switched to 120-DC mode.

For details on software output control function, see **20.4.7.10, Software** Output Control Function.

Note: Δ: Write access

Figure 20.106 Example of Switching from 120-DC Mode to Software Output Control Function

(a) Procedure for Software Output Control

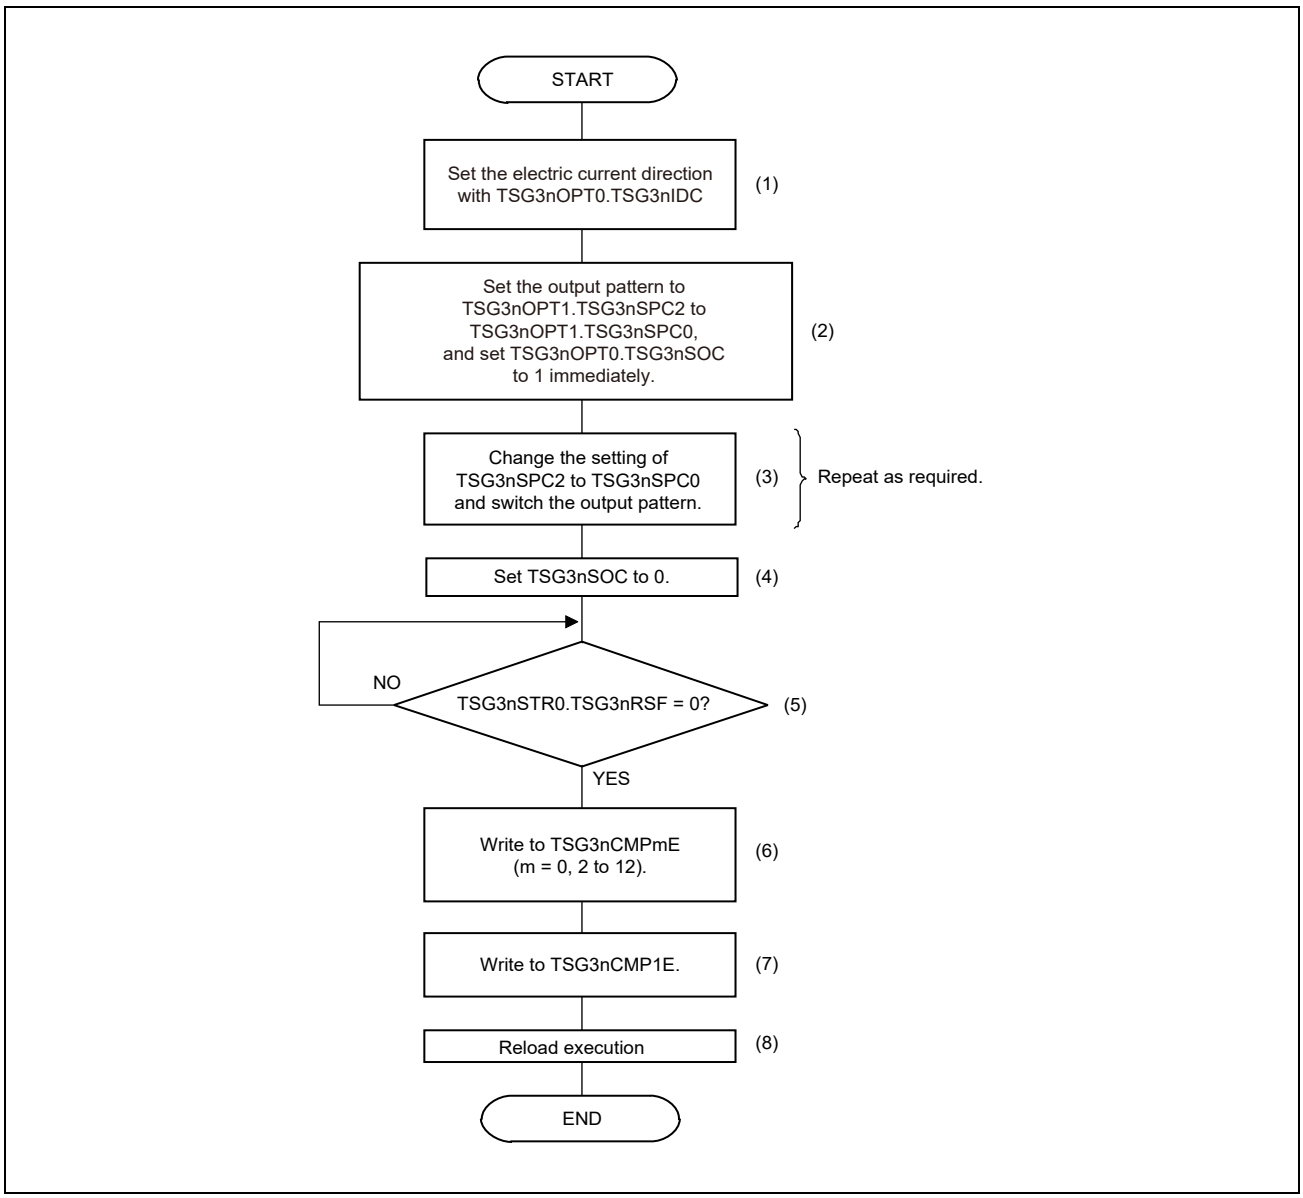

Figure 20.107 Process Flow of Software Output Control

The procedure for software output control is described below.

(1) Set the TSG3nIDC bit. The phase of the timer output with TSG3nIDC = 0 is different by 180 degrees from that with TSG3nIDC = 1. When this bit is rewritten with the software output control function, the output pattern will change according to the new setting at the next timer cycle. However, if the period match occurs before step (2), the output pattern of 120-DC control changes. So, schedule so as to prevent the period match from occurring before step (2).

(2) Set the output pattern to TSG3nSPC2 to TSG3nSPC0. To enable software output control, set TSG3nSOC to 1 simultaneously.

(3) Change the output pattern setting of TSG3nSPC2 to TSG3nSPC0 to change the timer output.

(4) Confirm that the reload request flag (TSG3nRSF) = 0. If TSG3nRFS = 1, do not proceed to the following step until TSG3nRSF = 0.

(5) Setting TSG3nSOC = 0 starts releasing of the software control (it is not released here yet).

(6) Make necessary settings of the compare registers that will be used after the software output control is released. Proceed to the following step when the register settings are not required. Here, change the registers with the reload function.

(7) Write to TSG3nCMP1E to start reloading.

(8) Reload is executed and software output is released.

CAUTION

Execute reload after executing steps (4) to (7). When reload cannot be executed, the software output cannot be released.

20.4.7.7 HSP-PWM Mode (High-Accuracy Shifted-Pulse - Pulse Width Modulation Mode)

Overview

In this mode, the 18-bit counter and the 18-bit compare register are used to generate a high accuracy sawtooth waveform PWM signal.

Prerequisites

Set the PWM period to TSG3nCMP0E.

Set PWM output width with the TSG3nHSPCMUE, TSG3nHSPCMVE, and TSG3nHSPCMWE registers. Set PWM shift width with the TSG3nHSPSHUE, TSG3nHSPSHVE, and TSG3nHSPSHWE registers. Set dead time with the TSG3nDTC0W and TSG3nDTC1W registers. The values set in these registers are immediately reflected in the corresponding TSG3nCMPmE (m = 1 to 12) based on the calculation described later.

Functional description

Set the PWM period, the duty cycle, and the PWM sift width. Then set the PWM output width. Counting up begins when TSG3nTRG0.TSG3nTS is set to 1.

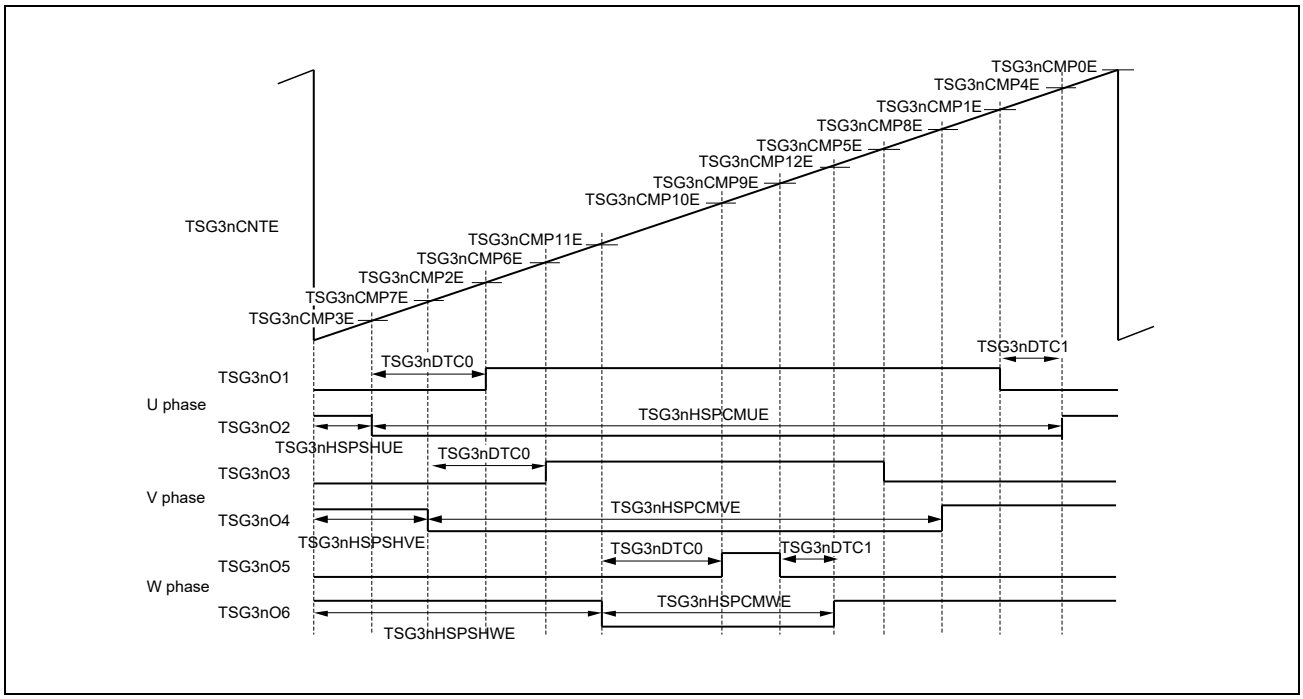
The 18-bit counter starts counting from 00000_H and is cleared by the match with TSG3nCMP0E.

During counting, a compare match interrupt (INTTSG3nI0 to INTTSG3nI12) is generated by the match of the buffer register TSG3nCMP0E to TSG3nCMP12E with the 18-bit counter.

NOTE

The HSP-PWM mode is set when TSG3nCTL0.TSG3nMD2-TSG3nMD0 = 100_B.

(1) Basic Timing Chart



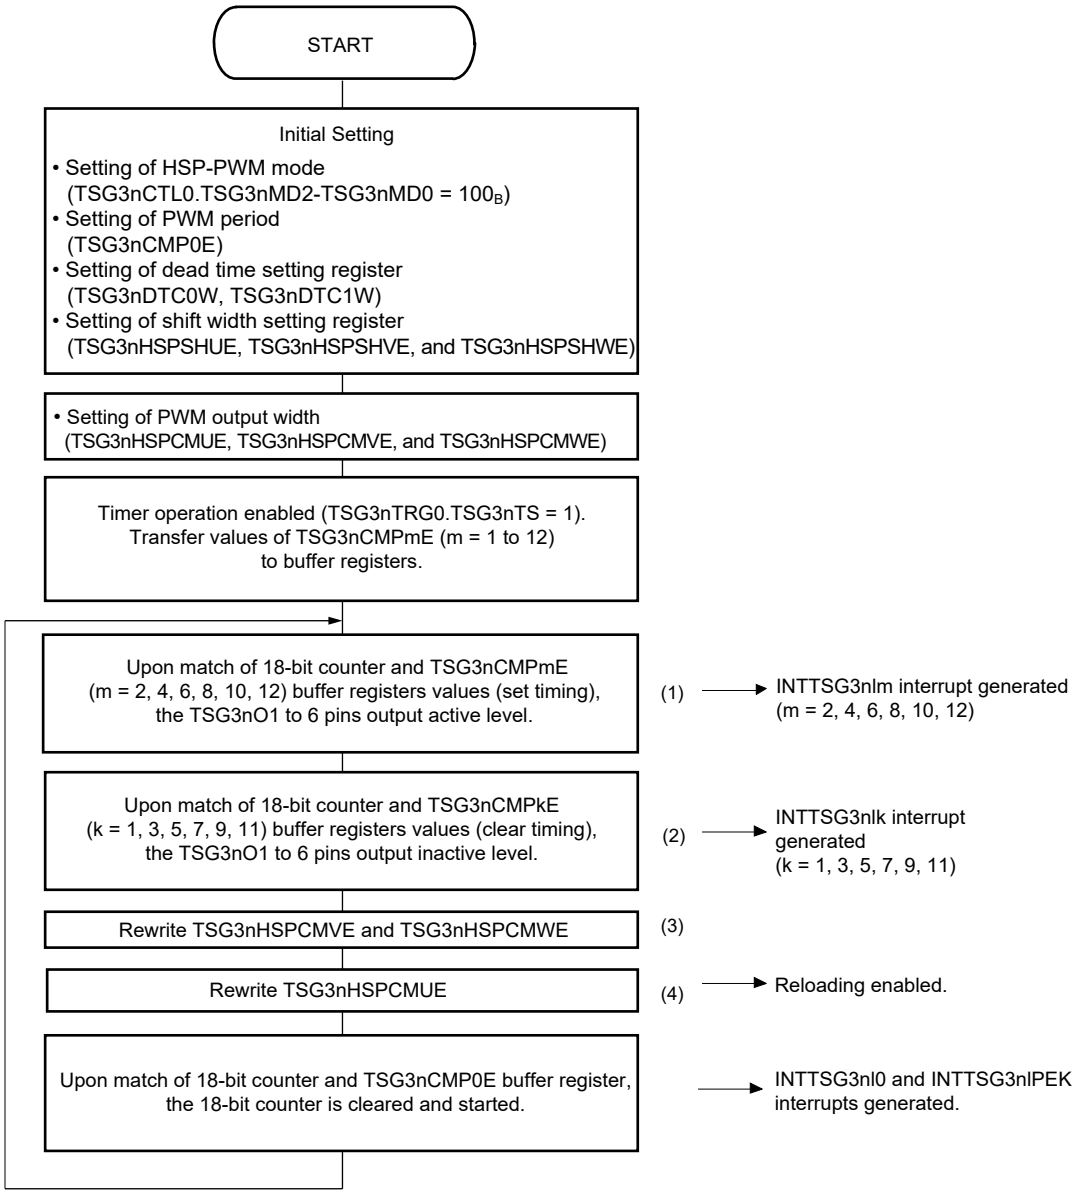


Figure 20.108 Basic Timing in HSP-PWM Mode

Note: The timing may be different from the orders described above but be sure to execute (4) after (3).

Figure 20.109 Basic Operation Flow in HSP-PWM Mode

CAUTIONS

1. When changing the settings for PWM output width in the TSG3nHSPCMUE, VE, and WE registers during operation, set the TSG3nHSPCMUE register last. When only the settings for the V phase and W phase are changed but the PWM output width in the U phase is not, the existing value should be written back to the TSG3nHSPCMUE register.
2. After changing the PWM cycle by using the TSG3nCMP0E register, the PWM output width settings in the TSG3nHSPCMUE, VE, and WE registers must be remade. Changing the settings for the PWM shift width in the TSG3nHSPSHUE, VE, and WE registers and for the PWM cycle in the TSG3nCMP0E register at the same time is not allowed.
3. Remake the settings for PWM output width in the TSG3nHSPCMUE, VE, and WE registers after changing the settings for PWM shift width in the TSG3nHSPSHUE, VE, and WE registers.

(2) List of Operation in HSP-PWM

Table 20.93 Counter Function in HSP-PWM

Operation		Setting Condition
18-bit counter	Start	TSG3nTRG0.TSG3nTS = 0 → 1 or simultaneous start trigger
	Clear	Compare match of TSG3nCMP0E buffer register and 18-bit counter
	Stop	TSG3nTRG1.TSG3nTT = 0 → 1

Table 20.94 Functions of Compare Registers, Sift Width Setting Register, and Dead Time Setting Register in HSP-PWM

Register	Rewriting Method	Rewrite During Operation	Function
TSG3nCMP0E	Reload	Possible	Setting period
TSG3nHSPCMUE	Reload	Possible	PWM control for U phase
TSG3nHSPSHUE			
TSG3nHSPCMVE	Reload	Possible	PWM control for V phase
TSG3nHSPSHVE			
TSG3nHSPCMWE	Reload	Possible	PWM control for W phase
TSG3nHSPSHWE			
TSG3nDCMP0E, TSG3nDCMP1E, TSG3nDCMP2E	Reload	Possible	Diagnostic output or A/D conversion trigger
TSG3nDTC0W, TSG3nDTC1W	Reload	Prohibited	Dead time

Table 20.95 Timer Output in HSP-PWM Mode

Pins	Function
TSG3nO1	PWM output by compare match of the TSG3nCMP1E buffer register (clear timing) or the TSG3nCMP2E buffer register (set timing) with the 18-bit counter.
TSG3nO2	PWM output by compare match of the TSG3nCMP3E buffer register (clear timing) or the TSG3nCMP4E buffer register (set timing) with the 18-bit counter.
TSG3nO3	PWM output by compare match of the TSG3nCMP5E buffer register (clear timing) or the TSG3nCMP6E buffer register (set timing) with the 18-bit counter.
TSG3nO4	PWM output by compare match of the TSG3nCMP7E buffer register (clear timing) or the TSG3nCMP8E buffer register (set timing) with the 18-bit counter.
TSG3nO5	PWM output by compare match of the TSG3nCMP9E buffer register (clear timing) or the TSG3nCMP10E buffer register (set timing) with the 18-bit counter.
TSG3nO6	PWM output by compare match of the TSG3nCMP11E buffer register (clear timing) or the TSG3nCMP12E buffer register (set timing) with the 18-bit counter.
TSG3nO7	Diagnostic signal output or pulse output by A/D conversion trigger

Table 20.96 Interrupt Request in HSP-PWM Mode

Interrupt	Function
INTTSG3nIm (m = 0 to 12)	Compare match of the TSG3nCMPmE buffer register with 18-bit counter
INTTSG3nIER	Error
INTTSG3nIVLY	—
INTTSG3nIPEK	Peak interrupt (generated at the same timing as INTTSG3nI0)
INTTSG3nIWN	Error

Table 20.97 Compare Match Timing in HSP-PWM Mode

Compare Match	Function
TSG3nCMP0E	When 18-bit counter changes from TSG3nCMP0E to 00000_H
TSG3nCMPmE (m = 1 to 12)	After match of 18-bit counter and TSG3nCMPmE

(3) Various Settings of HSP-PWM Mode

Mode setting

HSP-PWM mode is entered by setting TSG3nCTL0.TSG3nMD2-TSG3nMD0 to 100_B.

Setting timer output

The output pins TSG3nO1-6 are controlled by setting TSG3nIOC0, TSG3nIOC2, and TSG3nIOC3.

The TSG3nO7 pin provides output pulse as diagnostic output or A/D conversion trigger. The pin should be set as necessary.

Enabling error interrupt generation

Error interrupt (INTTSG3nIER) due to the detection of the simultaneous active state of positive and inverse phases is enabled by setting TSG3nIOC1.TSG3nEOC to 1. For details, see **Section 20.4.6 Error/Warning Interrupt**.

Setting rewriting timing of register with reload function

This function is only available in reload mode. Set TSG3nCTL3.TSG3nRMC to 0.

Setting A/D conversion trigger output

The A/D conversion trigger 0 (TSG3nADTRG0 signal) is set with TSG3nCTL5.TSG3nAT09-TSG3nAT00.

TSG3nAT09-TSG3n00 is used to enable or disable the A/D conversion trigger output on timing match of TSG3nDCMP2E-0E with 18-bit counter (up count).

TSG3nCTL6.TSG3nAT19-TSG3nAT10 is used to set the A/D conversion trigger 1 (TSG3nADTRG1 signal).

To set the match timing of the 18-bit counter and TSG3nDCMP2E-TSG3nDCMP0E, set the compare value to each register.

The skipping function can be used for TSG3nADTRG0, TSG3nADTRG1 signals. TSG3nACC01 and TSG3nACC00 of TSG3nCTL5, and TSG3nACC11 and TSG3nACC10 of TSG3nCTL6 can be used to select the skipping rate among 1/1, 1/2, 1/4, and 1/8.

CAUTIONS

1. Be sure to set TSG3nCTL5, TSG3nCTL6, and TSG3nDCMP2E-0E correctly when the timing pulse of A/D conversion trigger is output to TSG3nO7.
2. In HSP-PWM mode, no trough interrupt (INTTSG3nIVLY) is generated. Therefore, SG3nCTL5.TSG3nAT00 and TSG3nCTL6.TSG3nAT10 must be set to 0.
3. In HSP-PWM mode, the 18-bit sub-counter does not operate. Therefore, TSG3nCTL5.TSG3nAT09 and TSG3nAT08, and TSG3nCTL6.TSG3nAT19 and TSG3nAT18 must be set to 0.
4. In HSP-PWM mode, down counting by the 18-bit counter is not generated. Therefore, TSG3nCTL5.TSG3nAT07, TSG3nAT05, and TSG3nAT03, and TSG3nCTL6.TSG3nAT17, TSG3nAT15, and TSG3nAT13 should be set to 0.

Setting PWM period

Set the PWM period with TSG3nCMP0E according to the following expression:

PCLK × (TSG3nCMP0E + 1)

Setting PWM output width

The PWM output width is set with TSG3nHSPCMUE, TSG3nHSPCMVE, and TSG3nHSPCMWE (TSG3nCMP1E-12E).

Satisfy the following requirements when setting the TSG3nHSPCMUE, TSG3nHSPCMVE, and TSG3nHSPCMWE registers:

$0 \leq$ TSG3nHSPCMUE, TSG3nHSPCMVE, TSG3nHSPCMWE $\leq$ TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 + 1

Set the PWM output width after setting TSG3nCMP0E, TSG3nHSPSHUE, TSG3nHSPSHVE, TSG3nHSPSHWE, TSG3nDTC0, and TSG3nDTC1.

Setting of PWM sift width

PWM shift width is set with TSG3nHSPSHUE, TSG3nHSPSHVE, and TSG3nHSPSHWE.

Satisfy the following requirements when setting TSG3nHSPSHUE, TSG3nHSPSHVE, and TSG3nHSPSHWE.

TSG3nHSPSHUE, TSG3nHSPSHVE, TSG3nHSPSHWE $\leq$ TSG3nCMP0E

Setting dead time

The dead time can be set with TSG3nDTC0 and TSG3nDTC1.

PCLK × TSG3nDTC0

PCLK × TSG3nDTC1

TSG3nDTC0 can set the time between a change of TSG3nO2, TSG3nO4, and TSG3nO6 to the inactive state and a change of TSG3nO1, TSG3nO3, and TSG3nO5 to the active state.

TSG3nDTC1 can set the time between a change of TSG3nO1, TSG3nO3, and TSG3nO5 to the inactive state and a change of TSG3nO2, TSG3nO4, and TSG3nO6 to the active state.

Satisfy the following requirements when setting TSG3nDTC0 and TSG3nDTC 1.

(TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 + 1) < $3FFFF_H$

TSG3nCMP0E > 3 × TSG3nDTC0

TSG3nCMP0E > 3 × TSG3nDTC1

CAUTION

Do not modify the settings of TSG3nDTC0 and TSG3nDTC1 during timer operation in HSP-PWM (TSG3nTE = 1). Set TSG3nDTC0 and TSG3nDTC1 while TSG3nTE = 0. Set dead time in HSP-PWM mode. Do not set 0 to TSG3nDTC0 and TSG3nDTC1.

Settings for operation in HSP-PWM Mode

Use HSP-PWM mode with the following settings of control registers and bits.

Do not modify the settings during operation (TSG3nTE = 1).

Table 20.98 Setting Prohibited in HSP-PWM Mode

Bit Name	Setting Value	Description
TSG3nCTL3.TSG3nRMC	0	Available only in reload mode.
TSG3nIOC3.TSG3nTOL6-1	000000_B	Logical inverse of set/clear of PWM is prohibited (HSP-PWM mode limitation)
TSG3nOPT0.TSG3nSOC	0	Switching to software control function is prohibited.
TSG3nOPT0.TSG3nSTE	0	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nOPT0.TSG3nPOT	0	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nOPT0.TSG3nPSS	0	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nOPT0.TSG3nIDC	0	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nOPT0.TSG3nPSC	0	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nOPT1.TSG3nSPC2-0	000_B	Operation setting of 120-DC mode and software control function (value after reset).
TSG3nPAT0W	0000000_H	Operation setting of 120-DC mode (value after reset).
TSG3nPAT1W	0000000_H	Operation setting of 120-DC mode (value after reset).

CAUTION

In HSP-PWM mode, any setting should not be made directly to the TSG3nCMPmE register (m = 1 to 12).

The PWM output width and the PWM shift width should be set with TSG3nHSPCMUE, VE, and WE registers and TSG3nHSPSHUE, VE, and WE registers.

20.4.7.8 Compare Register Set Value in HSP-PWM Mode

In HSP-PWM mode, the PWM output width is set with TSG3nHSPCMUE, VE and WE.

With a write access to TSG3nHSPCMUE, VE, and WE, TSG3 calculates and sets the values to TSG3nCMP1E-12E based on the values written to the followings:

- TSG3nCMP0E (PWM period setting)
- TSG3nDTC0 (dead time setting 0)
- TSG3nDTC1 (dead time setting 1)
- TSG3nHSPSHUE/VE/WE (PWM shift width setting)
- TSG3nHSPCMUE/VE/WE (PWM output width setting)

The high accuracy PWM is realized by these values.

The algorithm to set compare register values are listed in the following table.

Table 20.99 Algorithm for Compare Setting in HSP-PWM Mode

Value Set in HSPCMUE					CMP4E	CMP3E	CMP2E	CMP1E
HSPCMUE = 0					if (HSPSHUE = 0) 0 else HSPCMUE – 1 + HSPSHUE	CMP0E + 1	0	0
0	<	HSPCMUE	≤	DTC0 + DTC1	HSPCMUE – 1 + HSPSHUE	if (HSPSHUE = 0) CMP0E else HSPSHUE – 1	0	0
DTC0 + DTC1	<	HSPCMUE	≤	CMP0E	HSPCMUE – 1 + HSPSHUE	if (HSPSHUE = 0) CMP0E else HSPSHUE – 1	DTC0 – 1 + HSPSHUE	HSPCMUE – DTC1 – 1 + HSPSHUE
CMP0E	<	HSPCMUE	≤	CMP0E + DTC1 + 1	0	0	DTC0 – 1 + HSPSHUE	HSPCMUE – DTC1 – 1 + HSPSHUE
CMP0E + DTC1 + 1	<	HSPCMUE	<	CMP0E + DTC0 + DTC1 + 1	0	0	DTC0 – 1 + HSPSHUE	HSPCMUE – CMP0E – DTC1 – 2 + HSPSHUE
HSPCMUE = CMP0E + DTC0 + DTC1 + 1					0	0	DTC0 – 1 + HSPSHUE	CMP0E + 1

: For the colored sells, subtract CMP0E + 1 when the calculated result is greater than CMP0E.

NOTE

"TSG3n" is omitted from the register names used in the calculation.

20.4.7.9 Timer Output Operation in HSP-PWM Mode

TSG3nO1-6 output is set by compare match of TSG3nCNTE with each TSG3nCMP2E, 4E, 6E, 8E, 10E, and 12E, and cleared by compare match of TSG3nCNTE with each TSG3nCMP1E, 3E, 5E, 7E, 9E, and 11E.

When PWM output width is set in TSG3nHSPCMUE, VE, and WE, the value is set in the TSG3nCMP1E-12E registers based on the calculation described in **Section 20.4.7.8, Compare Register Set Value in HSP-PWM Mode** that enables a high accuracy PWM output from 0% to 100%.

PWM output timing can be shifted by setting desired width to TSG3nHSPSHUE, VE, WE.

(1) When TSG3nHSPCMUE, VE, and WE (PWM output width setting) set value is 0

When 0 is set to TSG3nHSPCMUE (U phase PWM output width setting), 0 is set to TSG3nCMP1E, 2E, and 4E, and "TSG3nCMP0E+1" is set to TSG3nCMP3E.

Setting of TSG3nO1 by the match of TSG3nCNTE with TSG3nCMP2E and clearing by the match with TSG3nCMP1E occurs simultaneously. Here, clearing prevails on setting, therefore, TSG3nO1 is fixed to inactive.

Setting of TSG3nO2 by the match of TSG3nCNTE with TSG3nCMP4E occurs when TSG3nCNTE = 0.

"TSG3nCMP0E + 1" is set to TSG3nCMP3E. Here, with no match of TSG3nCNTE with TSG3nCMP3E occurs, TSG3nO2 is fixed to active.

The same condition applies to TSG3nO3-6, which are the output pins for V phase and W phase when 0 is set to TSG3nHSPCMVE (V phase PWM output width setting) and TSG3nHSPCMWE (W phase PWM output width setting).

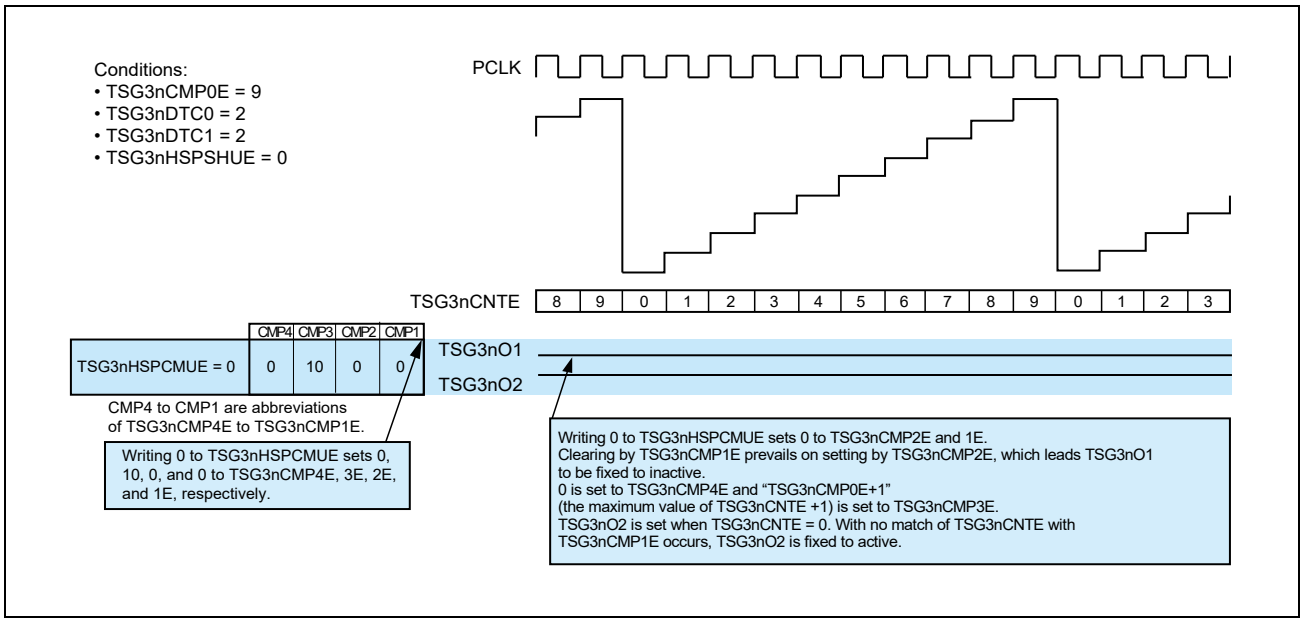

Figure 20.110 Waveform in HSP-PWM Mode (0 is set to TSG3nHSPCMUE)

(2) When TSG3nHSPCMUE/VE/WE (PWM output width setting) set value is 0 < TSG3nHSPCMUE ≤ TSG3nDTC0 + TSG3nDTC1

When the value within this range is set to TSG3nHSPCMUE (U phase PWM output width setting), 0 is set to TSG3nCMP1E and 2E, “the TSG3nHSPCMUE set value - 1” is set to TSG3nCMP4E, and the value same as TSG3nCMP0E is set to TSG3nCMP3E.

Setting of TSG3nO1 by the match of TSG3nCNTE with TSG3nCMP2E and clearing by the match with TSG3nCMP1E occurs simultaneously. Here, clearing prevails on setting, therefore, TSG3nO1 is fixed to inactive.

TSG3nO2 is cleared by the match of TSG3nCNTE with TSG3nCMP3E and set by the match with TSG3nCMP4E. Here, the output is shifted according to the set value in TSG3nHSPCMUE, that is, inactive for one cycle during PWM period when 1 is set, two cycles when 2 is set, and three cycles when 3 is set.

When the value other than 0 is set to TSG3nHSPSHUE (PWM shift width), set/clear timing of TSG3nO2 is shifted to the right for the number of cycles set in TSG3nHSPSHUE.

The same condition applies to TSG3nO3-6, which are the output pins for V phase and W phase when the value of above range is set to TSG3nHSPCMVE (V phase PWM output width setting) and TSG3nHSPCMWE (W phase PWM output width setting).

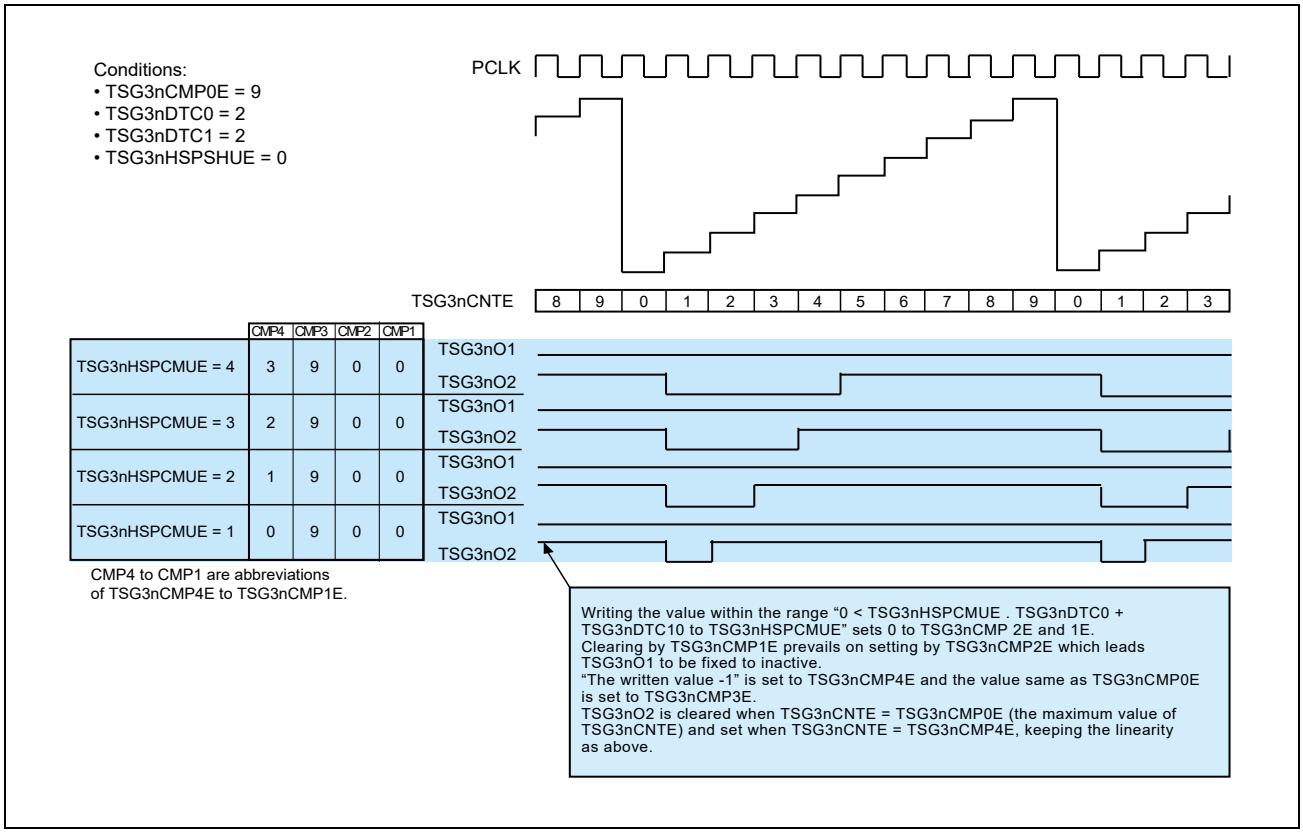

Figure 20.111 Waveform in HSP-PWM Mode (TSG3nHSPCMUE is set to 0 < TSG3nHSPCMUE ≤ TSG3nDTC0 + TSG3nDTC1)

(3) When TSG3nHSPCMUE/VE/WE (PWM Output Width Setting) set value is TSG3nDTC0 + TSG3nDTC1 <TSG3nHSPCMUE/VE/WE ≤ TSG3nCMP0E

When the value within this range is set to TSG3nHSPCMUE (U phase PWM output width setting), “TSG3nDTCD0 -1” is set to TSG3nCMP2E, “TSG3nHSPCMUE - TSG3nDTC1 - 1” is set to TSG3nCMP1E, “TSG3nHSPCMUE - 1” is set to TSG3nCMP4E, and the value same as TSG3nCMP0E is set to TSG3nCMP3E.

TTSG3nO1 is set by the match of TSG3nCNTE with TSG3nCMP2E and cleared by the match with TSG3nCMP1E while TSG3nO2 is set by the match of TSG3nCNTE with TSG3nCMP4E and cleared by the match with TSG3nCMP3E

Here, the outputs are shifted according to the set value in TSG3nHSPCMUE, that is, when

“TSG3nDTC0 + TSG3nDTC1 + 1” is set, TSG3nO1 is active for one cycle during PWM period and TSG3nO2 is inactive for the cycles of “TSG3nDTC0 + TSG3nDTC1+ 1” during PWM period. On the other hand, when “TSG3nDTC0 + TSG3nDTC1 + 2” is set, TSG3nO1 is active for two cycles during PWM period and TSG3nO2 is inactive for the cycles of “TSG3nDTC0 + TSG3nDTC1+ 2” during PWM period.

When the value other than 0 is set to TSG3nHSPSHUE (PWM shift width), set/clear timing of TSG3nO1 and TSG3nO2 are shifted for the number of cycles set in TSG3nHSPSHUE to the right.

The same condition applies to TSG3nO3-6, which are the output pins for V phase and W phase when the value of above range is set to TSG3nHSPCMVE (V phase PWM output width setting) and TSG3nHSPCMWE (W phase PWM output width setting).

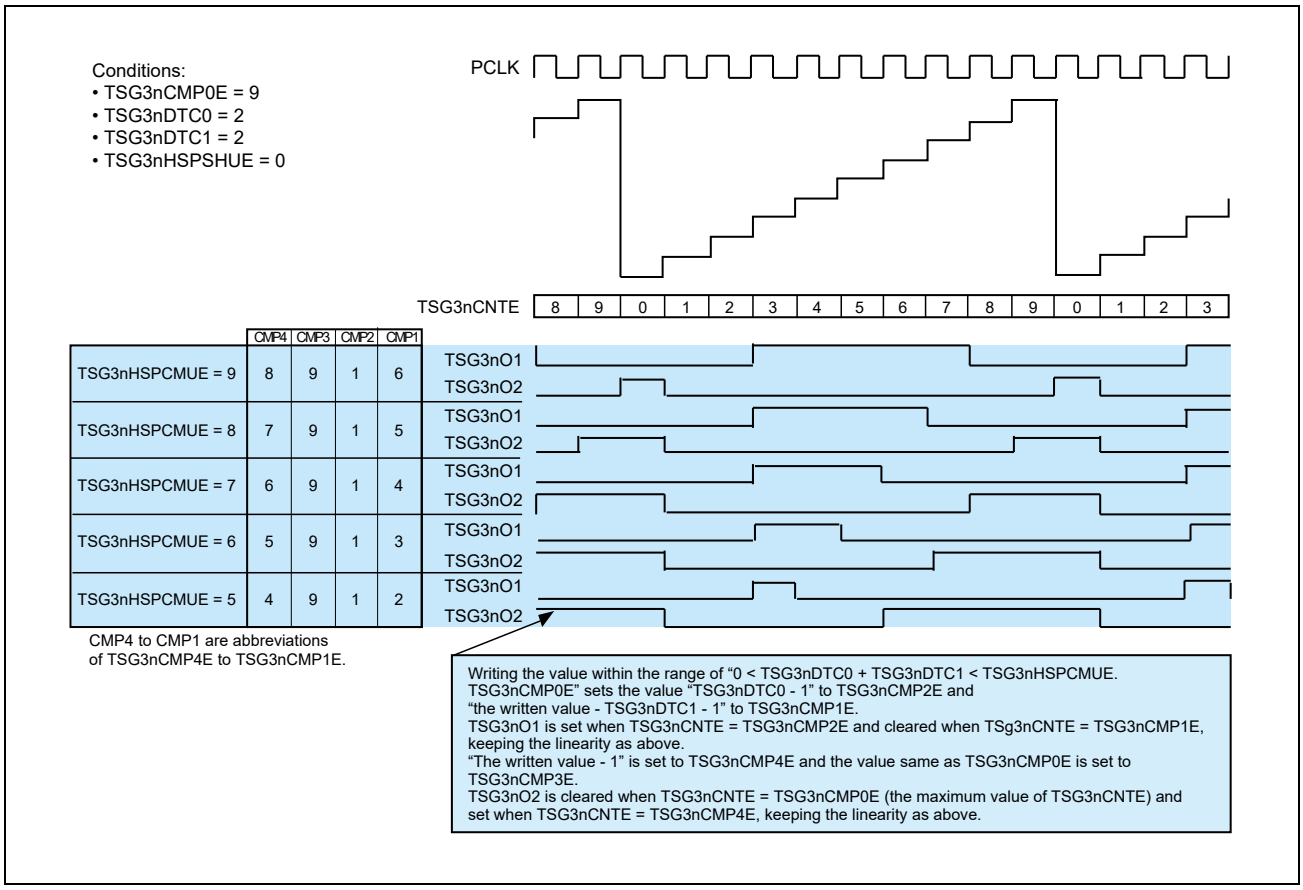

Figure 20.112 Waveform in HSP-PWM Mode (TSG3nHSPCMUE is set to TSG3nDTC0 + TSG3nDTC1 < TSG3nHSPCMUE ≤ TSG3nCMP0E)

(4) When TSG3nHSPCMUE/VE/WE (PWM Output Width Setting) set value is TSG3nCMP0E < TSG3nHSPCMUE/VE/ WE < TSG3nCMP0E + TSG3nDTC1 + 1

When the value within this range is set to TSG3nHSPCMUE (U phase PWM output width setting), “TSG3nDTC0 - 1” is set to TSG3nCMP2E, “TSG3nHSPCMU - TSG3nDTC1 - 1” is set to TSG3nCMP1E, and 0 is set to TSG3nCMP3E and 4E.

TSG3nO1 is cleared by the match of TSG3nCNTE with TSG3nCMP1E and set by the match with TSG3nCMP2E.

Here, the output is shifted according to the set value in TSG3nHSPCMUE, that is, inactive for the cycles of “TSG3nDTC0 + TSG3nDTC1” during PWM period when “TSG3nCMP0E + 1” is set, inactive for the cycles of “TSG3nDTC0 + TSG3nDTC1 - 1” during PWM period when “TSG3nCMP0E + 2” is set.

Setting of TSG3nO2 by the match of TSG3nCNTE with TSG3nCMP4E and clearing by the match with TSG3nCMP3E occurs simultaneously. Here, clearing prevails on setting, therefore, TSG3nO2 is fixed to inactive.

When the value other than 0 is set to TSG3nHSPSHUE (PWM shift width), set/clear timing of TSG3nO1 is shifted to the right for the number of cycles set in TSG3nHSPSHUE.

The same condition applies to TSG3nO3-6, which are the output pins for V phase and W phase when the value of above range is set to TSG3nHSPCMVE (V phase PWM output width setting) and TSG3nHSPCMWE (W phase PWM output width setting).

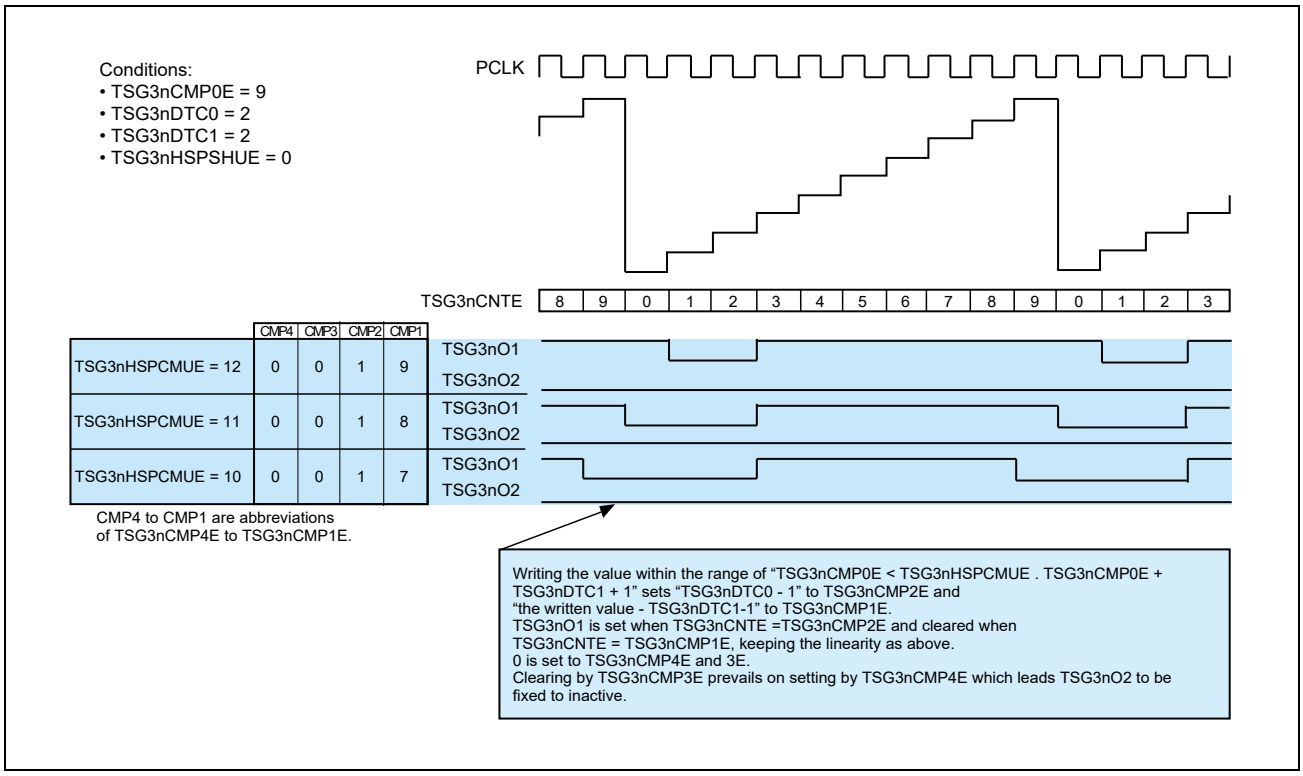

Figure 20.113 Waveform in HSP-PWM Mode (TSG3nHSPCMUE is set to TSG3nCMP0E < TSG3nHSPCMUE < TSG3nCMP0E + TSG3nDTC1 + 1)

(5) When TSG3nHSPCMUE/VE/WE (PWM Output Width Setting) set value is TSG3nCMP0E + TSG3nDTC1 + 1 < TSG3nHSPCMUE/VE/WE < TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 + 1

When the value within this range is set to TSG3nHSPCMUE (U phase PWM output width setting), “TSG3nDTC0 - 1” is set to TSG3nCMP2E, “TSG3nHSPCMUE - TSG3nCMP0E - TSG3nDTC1 - 2” is set to TSG3nCMP1E, and 0 is set to TSG3nCMP3E and 4E.

TSG3nO1 is cleared by the match of TSG3nCNTE with TSG3nCMP1E and set by the match with TSG3nCMP2E.

Here, the output is shifted according to the set value in TSG3nHSPCMUE, that is, inactive for one cycle during PWM period when “TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1” (the maximum value of PWM output width - 1) is set, inactive for two cycles during PWM period when “TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 - 1” (the maximum value of PWM output width - 2) is set.

Setting of TSG3nO2 by the match of TSG3nCNTE with TSG3nCMP4E and clearing by the match with TSG3nCMP3E occurs simultaneously. Here, clearing prevails on setting, therefore, TSG3nO2 is fixed to inactive.

When the value other than 0 is set to TSG3nHSPSHUE (PWM shift width), set/clear timing of TSG3nO1 is shifted to the right for the number of cycles set in TSG3nHSPSHUE.

The same condition applies to TSG3nO3-6, which are the output pins for V phase and W phase when the value of above range is set to TSG3nHSPCMVE (V phase PWM output width setting) and TSG3nHSPCMWE (W phase PWM output width setting).

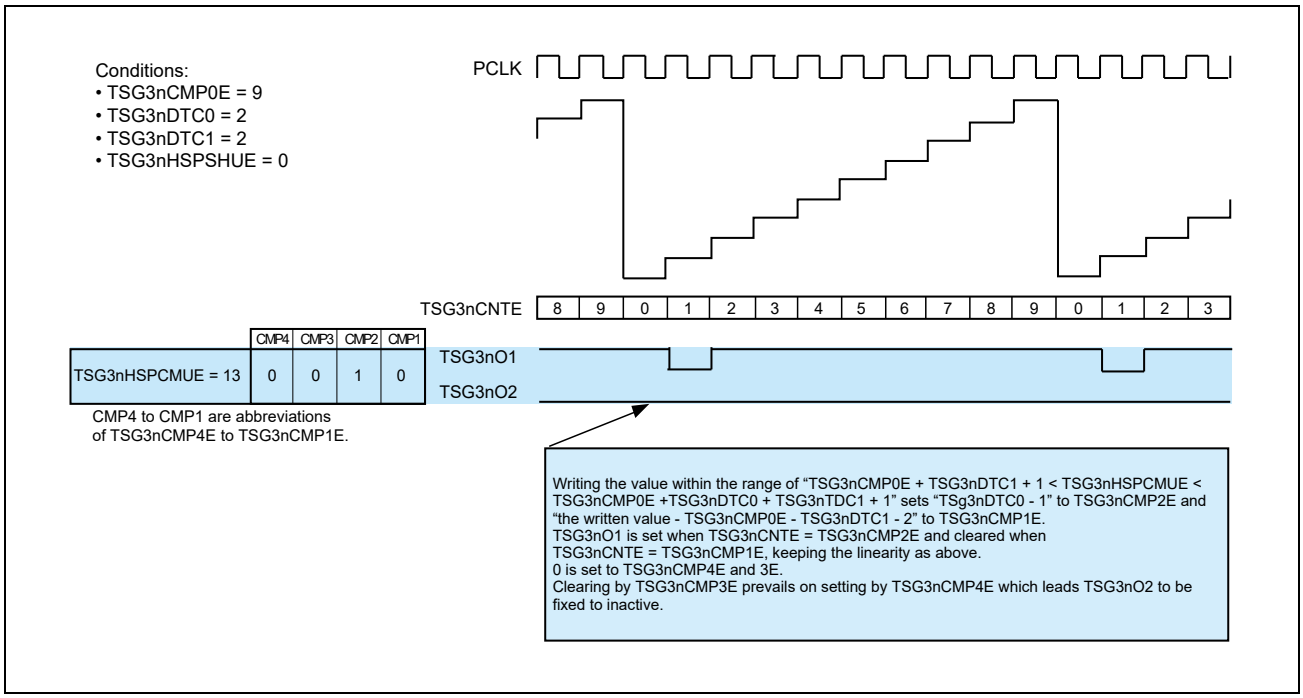

Figure 20.114 Waveform in HSP-PWM Mode (TSG3nHSPCMUE is set to TSG3nCMP0E + TSG3nDTC1 + 1 < TSG3nHSPCMUE < TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 + 1)

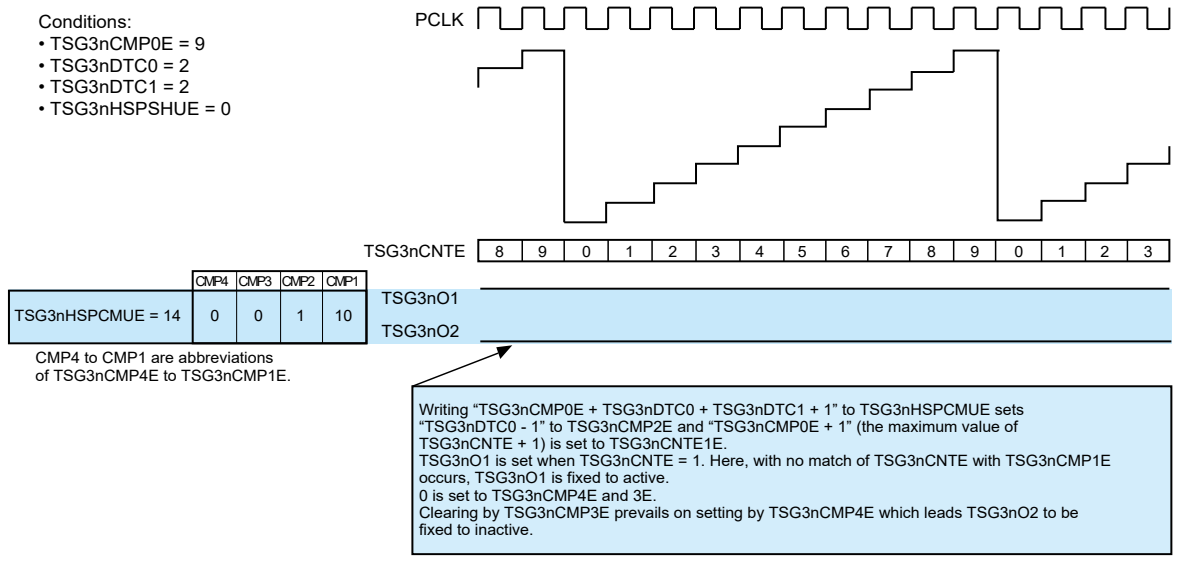
(6) When TSG3nHSPCMUE/VE/WE (PWM Output Width Setting) set value is TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 + 1

When “TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1” (the maximum value of PWM output width) is set to TSG3nHSPCMUE, “TSG3nDTC0 - 1” is set to TSG3nCMP2E, “TSG3nCMP0E + 1” is set to TSG3nCMP1E, and 0 is set to TSG3nCMP3E and 4E.



Setting of TSG3nO1 by the match of TSG3nCNTE with TSG3nCMP2E occurs when TSG3nCNTE = TSG3nDTC0 - 1.

“TSG3nCMP0E + 1” is set to TSG3nCMP3E. Here, with no match of TSG3nCNTE with TSG3nCMP3E occurs, TSG3nO1 is fixed to active.

Setting of TSG3nO2 by the match of TSG3nCNTE with TSG3nCMP4E and clearing by the match with TSG3nCMP3E occurs simultaneously. Here, clearing prevails on setting, therefore, TSG3nO2 is fixed to inactive.

When the value other than 0 is set to TSG3nHSPSHUE, set/clear timing of TSG3nO1 is shifted to the right for the number of cycles set in TSG3nHSPSHUE. Note that the set timing is shifted only at operation start (TSG3nTE = 0) because TSG3nO1 output is fixed to active. For the operation when operation start, see **Section (8) TO Operation at Operation Start in HT-PWM Mode**.

The same condition applies to TSG3nO3-6, which are the output pins for V phase and W phase when the value of above range is set to TSG3nHSPCMVE (V phase PWM output width setting) and TSG3nHSPCMWE (W phase PWM output width setting).

Note 1. In HSP-PWM mode, TSG3nO1 and TSG3nO2 can be set at the same timing by setting the same value to TSG3nCMP4E and 2E. In this case, both TSG3nO1 and TSG3nO2 go inactive.

Note 2. In HSP-PWM mode, dead time counter keeps operating even when TSG is stopped (TSG3nTE = 0) and the dead time set in TSG3nO1 and TSG3nO2 are always inserted.

Figure 20.115 Waveform in HSP-PWM (TSG3nHSPCMUE is set to TSG3nCMP0E + TSG3nDTC0 + TSG3nDTC1 + 1)

(7) PWM Adjustment at Reload Timing in HSP-PWM Mode

In HSP-PWM mode, PWM output width is adjusted when TSG3nHSPCMUE/VE/WE (PWM output width setting) is modified during operation. TSG3nO1-6 are set/cleared at reload timing and immediately switched to the output reflecting the new PWM output width.

TSG3nO1-6 are forcibly set/cleared according to the following formula. Even for adjustment, the dead time set to TSG3nDTC0 and 1 is always inserted to TSG3nO1-6. If values are directly written to TSG3nCMP1E-12E, output adjustment is not performed at reload timing.

Formula for reload adjustment operation

Table 20.100 Formula for Reload Adjustment Operation When TSG3nHSPSHUE/VE/WE is 0 (PWM sift width is set to 0)

Pin	Set	Clear
TSG3nO1/3/5	CMP0E + DTC1 + 1 < HSPCMUE/VE/WE	HSPCMUE/VE/WE ≤ CMP0E + DTC1 + 1
TSG3nO2/4/6	HSPCMUE/VE/WE = 0	0 < HSPCMUE/VE/WE

Table 20.101 Formula for Reload Adjustment Operation When TSG3nHSPSHUE/VE/WE is not 0 (PWM sift width is not set to 0)

Pin	Set	Clear
TSG3nO1/3/5	(i) CMP0E + DTC1 + 1 – HSPSHUE/VE/WE < HSPCMUE/VE/WE	HSPCMUE/VE/WE ≤ CMP0E + DTC1 + 1 – HSPSHUE/VE/WE
	(ii) (CMP0E + 1) × 2 + DTC1 – HSPSHUE/VE/WE < HSPCMUE/VE/WE	HSPCMUE/VE/WE ≤ (CMP0E + 1) × 2 + DTC1 – HSPSHUE/VE/WE
TSG3nO2/4/6	HSPCMUE/VE/WE ≤ CMP0E + 1 – HSPSHUE/VE/WE	CMP0E + 1 – HSPSHUE/VE/WE < HSPCMUE/VE/WE

If the value other than 0 is set as PWM shift width, set/clear condition for positive phase is determined whether the set shift width is greater than “CMP0E + DTC0 – 1” or not.

(i) HSPSHUE/VE/WE ≤ CMP0 – DTC0 + 1

(ii) HSPSHUE/VE/WE > CMP0 – DTC0 + 1

“TSG3n” is omitted from the register names used in the calculation.

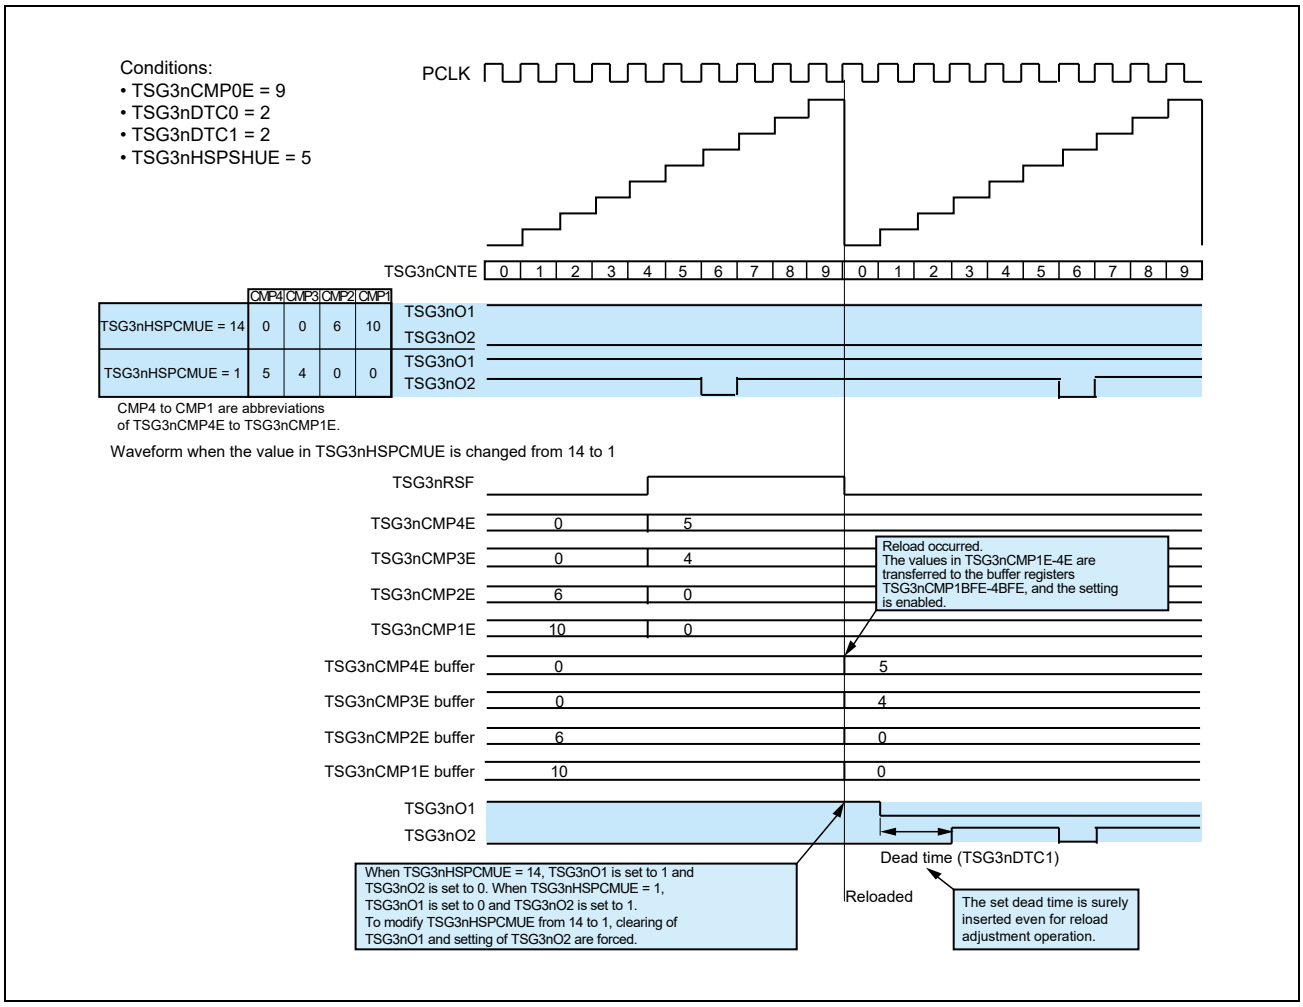


Figure 20.116 Detailed Timing Diagram of Reload Adjustment (Modification of TSG3nHSPCMUE from 14 to 1)

(8) TO Operation at Operation Start in HT-PWM Mode

In HSP-PWM mode, TSG3nO1-6 are cleared when operation starts.

Then, TSG3nO1-6 are set/cleared as TSG3nCNTE counts up depending on the values set in TSG3nHSPCMUE/VE/WE (TSG3nCMP1E to 12E).

Even if TSG3nO1-6 are set before operation start and cleared at operation start, and then set again, the set dead time is always inserted.

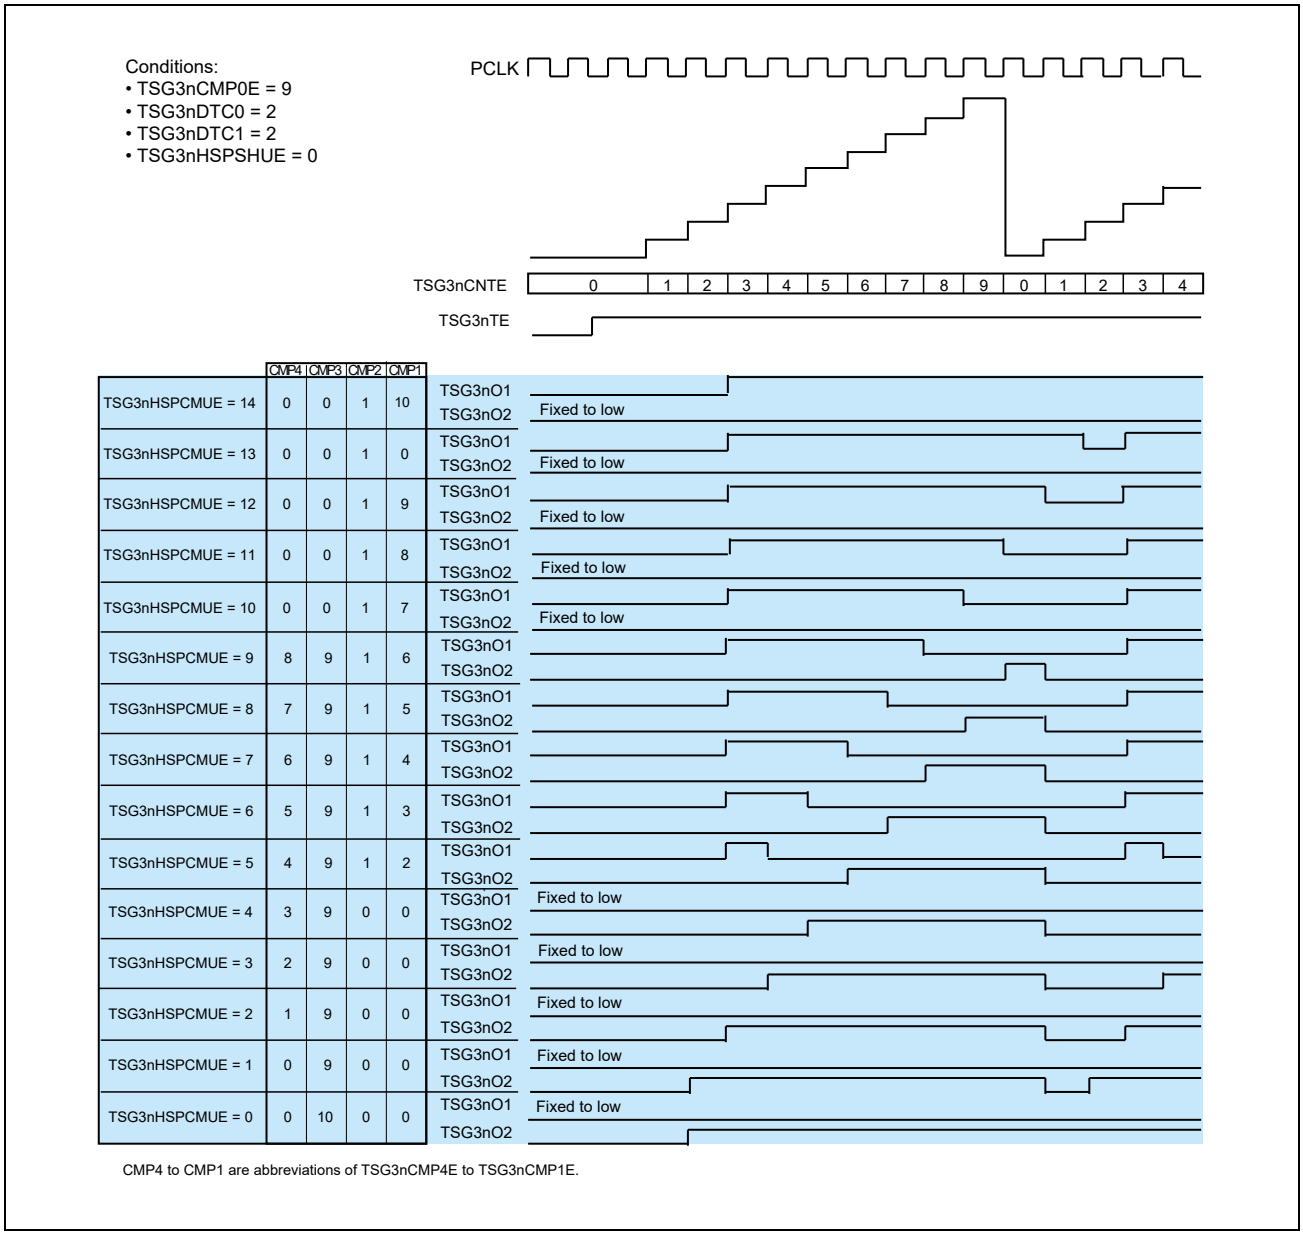

Figure 20.117 Timing Diagram of Operation Start in HSP-PWM Mode (TSG3nHSPSHUE = 0 (shift width is set to 0))

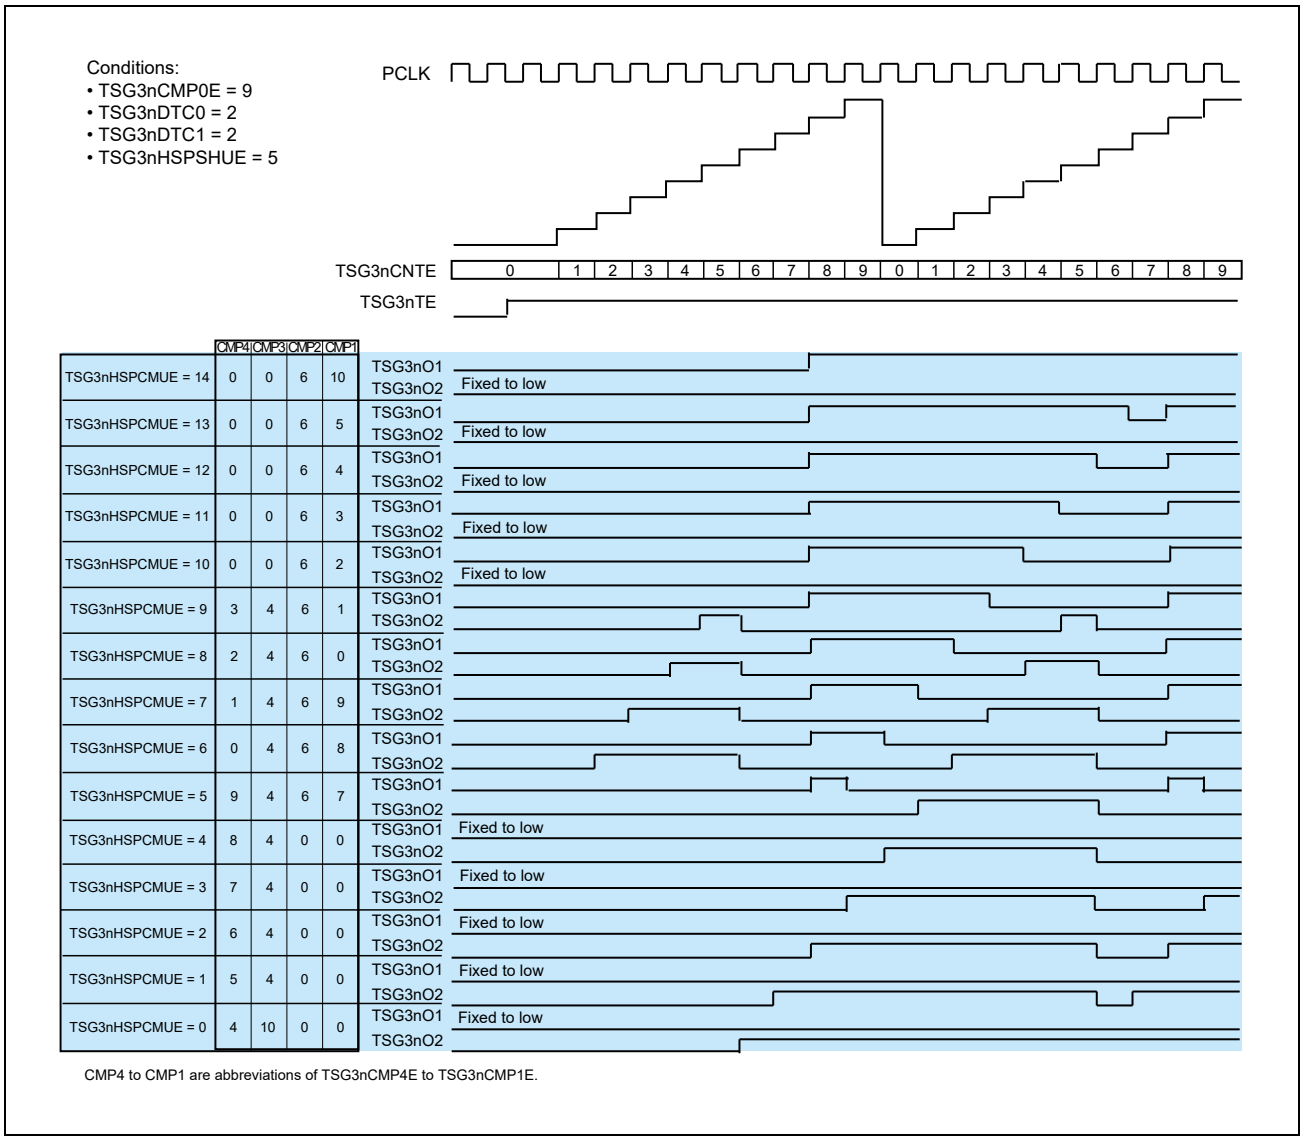

Figure 20.118 Timing Diagram of Operation Start in HSP-PWM Mode (TSG3nHSPSHUE = 5 (shift width is set to five clock cycles))

20.4.7.10 Software Output Control Function

Software output control function is available in any mode except HSP-PWM mode. This function can switch six output patterns for the TSG3nO1 to TSG3nO6 pins using TSG3nOPT0.TSG3nSOC, TSG3nIDC, and TSG3nOPT0.TSG3nSPC2-0.

When TSG3nSOC is switched from 0 to 1, the output control method of the TSG3nO1 to TSG3nO6 pins is switched to the software output control immediately. On the contrast, when TSG3nSOC is switched from 1 to 0, the software output control is released at the reload timing.

Table 20.102 Registers Associated with Software Output Control Function

Register	Operation
TSG3nOPT0.TSG3nSOC	TSG3nSOC = 1
TSG3nOPT0.TSG3nSTE	TSG3nSTE = 0
TSG3nOPT1.TSG3nSPC2-TSG3nSPC0	Sets output patterns listed in the following **Table 20.103** and **Table 20.104**.
TSG3nOPT0.TSG3nIDC	Sets output pattern (electric current direction).

Table 20.103 Output Patterns by Software Output Control (TSG3nOPT0.TSG3nIDC = 0) TSG3nOPT0.TSG3nSOC = 1, TSG3nSTE = 0, TSG3nIDC = 0

Section 21 Timer Option Module (TAPA)

This section contains a generic description of the timer option module (TAPA).

The first part of this section describes RH850/C1M-A specific properties, such as the number of units, register base addresses, etc. The remainder of this section describes TAPA functions and registers.

21.1 Features of RH850/C1M-A TAPA

21.1.1 Units

This LSI has the following number of TAPA units.

Table 21.1 Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of units	6	4
Name	TAPAn (n = 0 to 5)	TAPAn (n = 0, 1, 3, 4)

Table 21.2 Index

Index	Meaning
n	Throughout this section, the individual TAPA units are identified by the index “n” (n = 0 to 5); for example, TAPAnFLG is the TAPAn flag register.

21.1.2 Register Base Address

TAPA base addresses are listed in the table below.

TAPA register addresses are given as offsets from the base addresses in general.

Table 21.3 Register Base Address

Base Address Name	Base Address
<TAPA0_base>	FFE9 0000_H
<TAPA1_base>	FF89 1000_H
<TAPA2_base>	FFE9 2000_H
<TAPA3_base>	FFE9 3000_H
<TAPA4_base>	FF89 4000_H
<TAPA5_base>	FFE9 5000_H

21.1.3 Clock Supply

Clock supply by and to TAPA is listed in the following table.

Table 21.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
TAPAn	PCLK	CLKC_HSB (unmodulated high-speed peripheral clock)

21.1.4 Interrupt Requests

TAPA interrupt requests are listed in the following table.

Table 21.5 Interrupt Requests

Unit Interrupt Signal	Outline	Interrupt Number	DMA Trigger Number*1		DTS Trigger Number*1	
			1st	2nd	1st	2nd
TAPA0						
TAPA0TIPEK0	TAPA0 peak interrupt	176	—	89	—	89
TAPA0TIVLY0	TAPA0 trough interrupt	177	—	90	—	90
TAPA1						
TAPA1TIPEK0	TAPA1 peak interrupt	178	—	93	—	93
TAPA1TIVLY0	TAPA1 trough interrupt	179	—	94	—	94
TAPA2*2						
TAPA2TIPEK0	TAPA2 peak interrupt	180	—	97	—	97
TAPA2TIVLY0	TAPA2 trough interrupt	181	—	98	—	98

—: Not assigned

Note 1. 1st: Primary channel, 2nd: Secondary channel

Note 2. RH850/C1M-A1 does not have TAPA2.

21.1.5 Reset Source

TAPA reset sources are listed in the following table. TAPA is initialized by the reset sources below.

Table 21.6 Reset Source

Unit Name	Reset Source
TAPAn	Any reset source

21.1.6 Peripheral Configuration

The following figure shows the peripheral configuration of TAPA.

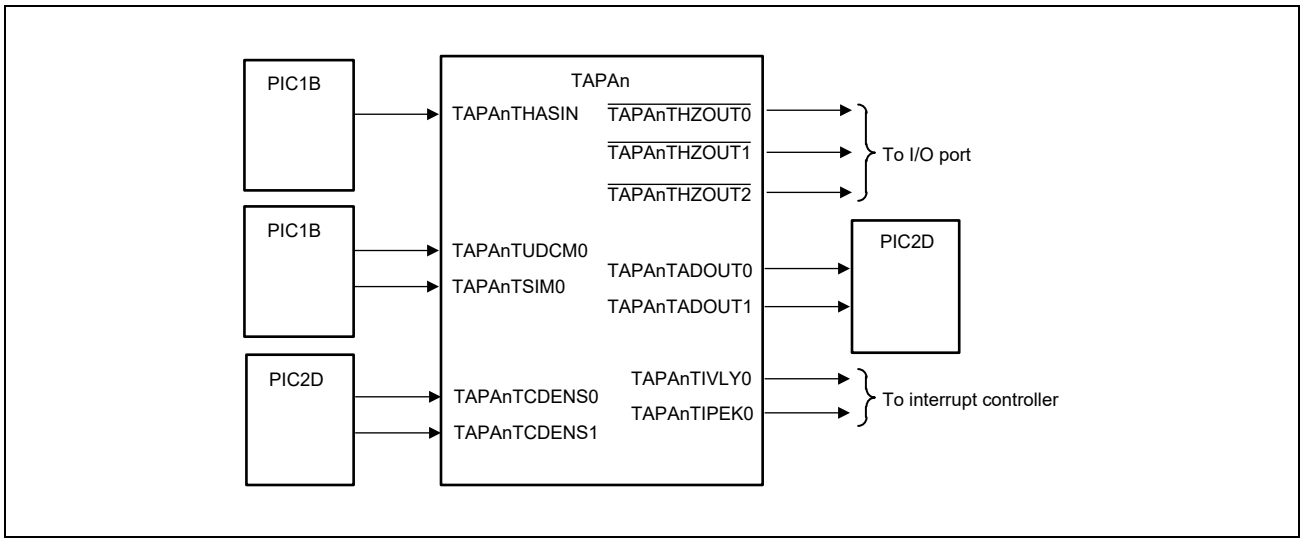

Figure 21.1 Peripheral Configuration of TAPA

The following describes the peripheral configuration of TAPA.

- TAPAnTHASIN: Hi-Z control asynchronous input signal
  This signal controls Hi-Z by the source selected in PIC1B.
  For the sources that can be selected in PIC1B, see **24.2.3.16, Hi-Z Control Function.**
- TAPAnTUDCM0: TAUD master channel up/down input
- TAPAnTSIM0: TAUD master channel INT input
  Peak and trough interrupts can be generated on TAUDn channels selected in PIC1B.
  For TAUDn channels that can be selected in PIC1B, see **24.2.2.34, PIC1BREG200 — Timer Input/Output Control Register 200**, **24.2.2.35, PIC1BREG210 — Timer Input/Output Control Register 210**.
  Only TAPA0, TAPA1, and TAPA2 have this connection.
- TAPAnTCDENS0, TAPAnTCDENS1: TAUD slave channel match detection input
  The TAUDn channel interrupts selected in PIC2D can be handled as AD conversion trigger outputs 0 and 1 (TAPAnTADOUT1 and TAPAnTADOUT0). For the TAUDn channel interrupts that can be selected in PIC, see **24.3.3.2, TAUD Trigger Output Function**.
  Only TAPA0, TAPA1, and TAPA2 have this connection.
- TAPAnTADOUT1-0: A/D conversion trigger outputs 1 and 0
  The A/D conversion trigger signals generated on TAPAn are output to PIC2D. The setting of the PIC2D can also be used to set these signals as triggers for A/D conversion. For the register specifications in the PIC2D, see **24.3.3.1, ADCC Trigger Select Function**.
  Only TAPA0, TAPA1, and TAPA2 have this connection.

21.2 Overview

21.2.1 Functional Overview

The timer option module (TAPA) is for use with the timer array unit D (TAUD) and TSG3 modules.

- Asynchronous Hi-Z control to each TAUD and TSG3 output is enabled by TAPA input signals.
- Output of the INTn signal from the TAUD as a peak or trough interrupt is selectable.
- The INTn signal output by the TAUD provides the basis for the output of two conversion-trigger signals for the A/D converter.

21.2.2 Terms

In this section, the following terms are used.

“Peak” and “Trough”, and “Peak Interrupt” and “Trough Interrupt”

In this document, the period from a TAUD down status (counting-down status) to generation of INT from the master channel is defined as a “trough” period, and this INT is defined as a “trough interrupt” (INT-VLY).

In contrast, the period from a TAUD up status (counting-up status) to generation of INT from the master channel is defined as a “peak” period, and this INT is defined as a “peak interrupt” (INT-PEK).

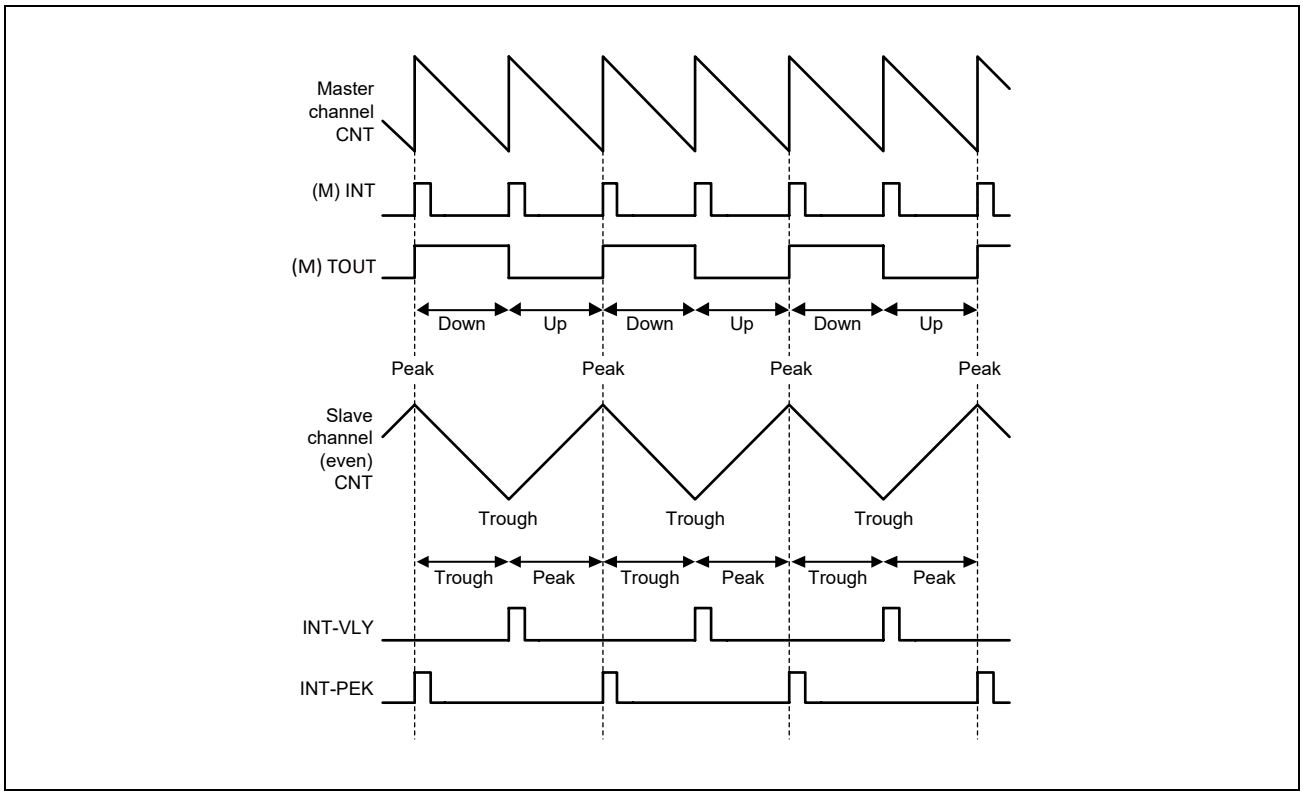

Figure 21.2 Peak and Trough of Timer Counter, and Peak and Trough Interrupts

21.2.3 Block Diagram

The major components of TAPA are shown in the block diagram below.

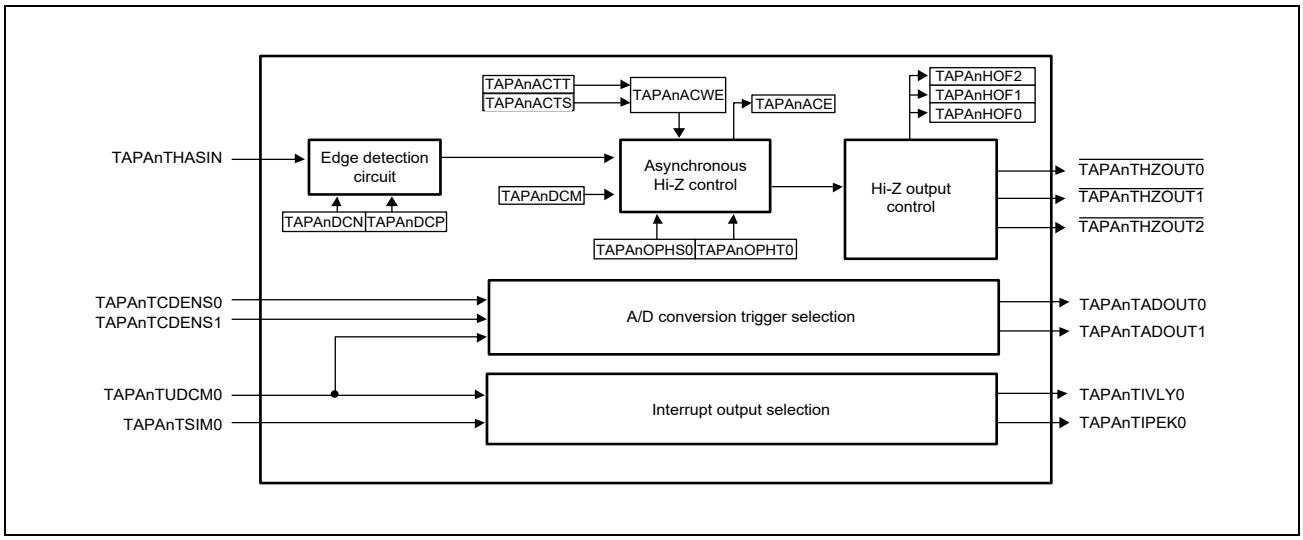

Figure 21.3 Block Diagram of TAPA

21.3 Registers

21.3.1 List of Registers

The following table lists the registers of TAPAn.

For information on <TAPAn_base>, see **Section 21.1.2, Register Base Address**.

Table 21.7 List of Registers

Module Name	Register Name	Symbol	Address
TAPAn	TAPAn control register 0	TAPAnCTL0	<TAPAn_base> + 20_H
TAPAn	TAPAn control register1*1	TAPAnCTL1	<TAPAn_base> + 24_H
TAPAn	TAPAn flag register	TAPAnFLG	<TAPAn_base> + 00_H
TAPAn	TAPAn asynchronous write enable register	TAPAnACWE	<TAPAn_base> + 04_H
TAPAn	TAPAn asynchronous control start trigger register	TAPAnACTS	<TAPAn_base> + 08_H
TAPAn	TAPAn asynchronous control stop trigger register	TAPAnACTT	<TAPAn_base> + $0C_H$
TAPAn	TAPAn Hi-Z start trigger register	TAPAnOPHS	<TAPAn_base> + 14_H
TAPAn	TAPAn Hi-Z stop trigger register	TAPAnOPHT	<TAPAn_base> + 18_H

Note 1. TAPAnCTL1 is valid only when TAPAn (n = 0, 1, 2).

21.3.2 TAPAnCTL0 ─ TAPAn Control Register0

Control register 0 is used to control Hi-Z.

A value in this register can only be rewritten in the following conditions.

- TAPAnFLG.TAPAnACE = 0 while TAPAn (n = 0, 1, 2) and TAUDnTEm = 0 (m = 10 to 15) at the corresponding TAUDn master channel.
- TAPAnFLG.TAPAnACE = 0 while TAPAn (n = 3, 4, 5).

Access: This register can be read/written in 16-bit units.

Address: <TAPAn_base> + 20_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TAPAn DCM	TAPAn DCN	TAPAn DCP	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R

Table 21.8 TAPAnCTL0 Register Contents

Bit Position	Bit Name	Function
15 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4	TAPAnDCM	Clearing Condition Specification This control bit specifies the condition for clearing of the Hi-Z control outputs. 0: Manipulation of TAPAnOPHT0 is enabled regardless of the TAPAnTHASIN signal input level. 1: Manipulation of TAPAnOPHT0 is disabled when the TAPAnTHASIN input signal is at the active level. Manipulation of TAPAnOPHT0 is enabled when the TAPAnTHASIN signal input is inactive.
3, 2	TAPAnDCN, TAPAnDCP	Hi-Z Input Edge Selection These control bits specify the effective edge of TAPAnTHASIN.

TAPAnDCN	TAPAnDCP	Description
0	0	Does not detect effective edges.
0	1	Detects a rising edge as the effective edge. (active level = high)
1	0	Detects a falling edge as the effective edge. (active level = low)
1	1	Setting is prohibited.

1, 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

21.3.3 TAPAnCTL1 ─ TAPAn Control Register 1

TAPAn control register 1 is only valid when n = 0, 1 or 2.

Access: This register can be read/written in 8-bit units.

Address: <TAPAn_base> + 24_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAPAnATS3	TAPAnATS2	TAPAnATS1	TAPAnATS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 21.9 TAPAnCTL1 Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3, 2	TAPAnATS3, TAPAnATS2	A/D Converter Trigger 1 Select These control bits specify the signal for output as A/D converter conversion trigger output 1 (TAPAnTADOUT1).

TAPA0ATS3	TAPA0ATS2	Description
0	0	Outputs INT while the master channel is in the down state.
0	1	Outputs INT while the master channel is in the up state.
1	0	Outputs INT while the master channel is in the up/down state.
1	1	Outputs INT and a trough interrupt of the master channel (TAPAnTIVLY0) while the master channel is in the up/down state.

Bit Position	Bit Name	Function
1, 0	TAPAnATS1, TAPAnATS0	AD Converter Trigger 0 Select These control bits specify the signal for output as A/D converter conversion trigger output 0 (TAPAnTADOUT0).

TAPA0ATS1	TAPA0ATS0	Description
0	0	Outputs INT while the master channel is in the down state.
0	1	Outputs INT while the master channel is in the up state.
1	0	Outputs INT while the master channel is in the up/down state.
1	1	Outputs INT and a trough interrupt of the master channel (TAPAnTIVLY0) while the master channel is in the up/down state.

21.3.4 TAPAnFLG ─ TAPAn Flag Register

Control register is used to control Hi-Z.

Access: This register can be read/written in 16-bit units.

Address: <TAPAn_base> + 00_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TAPAn HOF2	TAPAn HOF1	TAPAn HOF0	—	—	—	—	—	—	—	TAPAn ACE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.10 TAPAnFLG Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is read.
10 to 8	TAPAnHOFm	$\overline{\text{TAPAnTHZOUTm}}$ Output Monitor (m = 0, 1, 2) These bits monitor the $\overline{\text{TAPAnTHZOUTm}}$ output. 0: The $\overline{\text{TAPAnTHZOUTm}}$ output is at the high level. 1: The $\overline{\text{TAPAnTHZOUTm}}$ output is at the low level.*1
7 to 1	Reserved	When read, the value after reset is read.
0	TAPAnACE	Asynchronous Hi-Z Control Enable This bit indicates the state of asynchronous Hi-Z control. 0: Asynchronous Hi-Z control is stopped. 1: Asynchronous Hi-Z control is enabled. The conditions for setting and clearing this bit are as follows. Clearing condition: Writing 1 to TAPAnACTT while TAPAnACWE = 1. Setting condition: Writing 1 to TAPAnACTS while TAPAnACWE = 1.

Note 1. TAPAnHOFm (m = 1, 2) is valid only when TAPAn (n = 0, 1, 2).

21.3.5 TAPAnACWE — TAPAn Asynchronous Control Write Enable Register

This register enables writing for asynchronous Hi-Z control.

Access: This register can be read/written in 8-bit units.

Address: <TAPAn_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnACWE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 21.11 TAPAnACWE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	TAPAnACWE	Asynchronous Control Write Enable This is a write-enable bit for asynchronous Hi-Z control. After 1 has been written to this bit, it is automatically cleared to 0 by writing 1 to TAPAnACTS or TAPAnACTT. 0: Disables writing to TAPAnACTS and TAPAnACTT. 1: Enables writing to TAPAnACTS and TAPAnACTT.

21.3.6 TAPAnACTS — TAPAn Asynchronous Control Start Trigger Register

This register enables the start trigger for asynchronous Hi-Z control.

Access: This register can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnACTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 21.12 TAPAnACTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnACTS	Asynchronous Control Start Trigger This bit enables the start trigger for asynchronous Hi-Z control. The setting of this bit is only valid when TAPAnACWE = 1. 0: Writing 0 to this bit is ignored (no function). 1: Enables asynchronous Hi-Z control if TAPAnACWE = 1.

21.3.7 TAPAnACTT — TAPAn Asynchronous Control Stop Trigger Register

This register enables the stop trigger for asynchronous Hi-Z control.

Access: This register can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnACTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 21.13 TAPAnACTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnACTT	Asynchronous Control Stop Trigger This bit enables the stop trigger for asynchronous Hi-Z control. The setting of this bit is only valid when TAPAnACWE = 1. 0: Writing 0 to this bit is ignored (no function). 1: Stops asynchronous Hi-Z control if TAPAnACWE = 1.

21.3.8 TAPAnOPHS — TAPAn Hi-Z Start Trigger Register

This register sets the start trigger for a Hi-Z control signal ($\overline{\text{TAPAnTHZOUTm}}$ (m = 0 to 2*[1])).

Note 1. TAPAn (n = 3, 4, 5) are not available when m = 1, 2.

Access: This register can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnOPHS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 21.14 TAPAnOPHS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnOPHS0	Hi-Z Control Signal Start Trigger 0 This bit sets the start trigger for a Hi-Z control signal. 0: The read value is 0 and writing 0 to this bit is ignored (no function). 1: Sets the corresponding Hi-Z control signal ($\overline{\text{TAPAnTHZOUTm}}$ (m = 0 to 2*[1])) to the low level.

21.3.9 TAPAnOPHT ─ TAPAn Hi-Z Stop Trigger Register

This register sets the stop trigger for a Hi-Z control signal ($\overline{\text{TAPAnTHZOUTm}}$ (m = 0 to 2*[1])).

Note 1. TAPAn (n = 3, 4, 5) are not available when m = 1, 2.

Access: This register can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnOPHT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 21.15 TAPAnOPHT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnOPHT0	Hi-Z Control Signal Stop Trigger 0 This bit sets the stop trigger for a Hi-Z control signal. 0: The read value is 0 and writing 0 to this bit is ignored (no function). 1: Sets a Hi-Z control signal ($\overline{\text{TAPAnTHZOUTm}}$ (m = 0 to 2*[1])) to the high level.

21.4 Function

21.4.1 Asynchronous Hi-Z Control Function

Abnormal operation in timer motor-control under CPU control leads to rotation of the externally connected motor also becoming abnormal. In such a case, this function forcibly sets the motor control output to the Hi-Z state, independently of control by the CPU.

21.4.1.1 Overview

- The following method is available for controlling Hi-Z.
  - Asynchronous Hi-Z control for TAPA input signals (TAPAnTHASIN)
    Controls the Hi-Z control output signals $\overline{\text{TAPAnTHZOUT0}}$ (phase U), $\overline{\text{TAPAnTHZOUT1}}$ (phase V), $\overline{\text{TAPAnTHZOUT2}}$ (phase W) asynchronously at TAPAn (n = 0, 1, 2).
  - Controls the Hi-Z control output signals $\overline{\text{TAPAnTHZOUT0}}$ asynchronously at TAPAn (n = 3, 4, 5).

Table 21.16 Asynchronous Hi-Z Control and Its Operation

Hi-Z Control	Function and Operation
Asynchronous Hi-Z control for TAPA input signals (TAPAnTHASIN)	Asynchronous Hi-Z control This function forcibly places the output from the corresponding timer module (TAUD, TSG3) into Hi-Z. Device port outputs become Hi-Z while TAPAnTHASIN is active and until software sends a stop request (when TAPAnCTL0.TAPAnDCM = 0)

NOTE

The following timer output pins are controlled by this function:

- TAPAn (n = 0, 1, 2)
  - TAPAnTHZOUT0 (U phase): TAPAnUP, TAPAnUN
  - TAPAnTHZOUT1 (V phase): TAPAnVP, TAPAnVN
  - TAPAnTHZOUT2 (W phase): TAPAnWP, TAPAnWN
- TAPAn (n = 3)
  - TAPAnTHZOUT0: TSG30O1 to TSG30O6
- TAPAn (n = 4)
  - TAPAnTHZOUT0: TSG31O1 to TSG31O6
- TAPAn (n = 5)
  - TAPAnTHZOUT0: TSG32O1 to TSG32O6

CAUTION

There is no function that forcibly places the output from TAUD3 into Hi-Z. For the configuration, see **Section 24.2.3.16, Hi-Z Control Function**.

21.4.1.2 An Example of System Configuration

When effective edges of the external error detection signal are detected, an interrupt is generated and, at the same time, the motor-driving signal output is set to the Hi-Z state.

This module assumes that microcontroller operation may hang when an error occurs. To handle such situations, external error detection signals are continuously processed so that the motor-driving signal can be set to the Hi-Z state even if no clock signal is being supplied.

This module only detects an error as an edge of the error-detection signal. A fixed output level is not detected as an error (the signal has no edge).

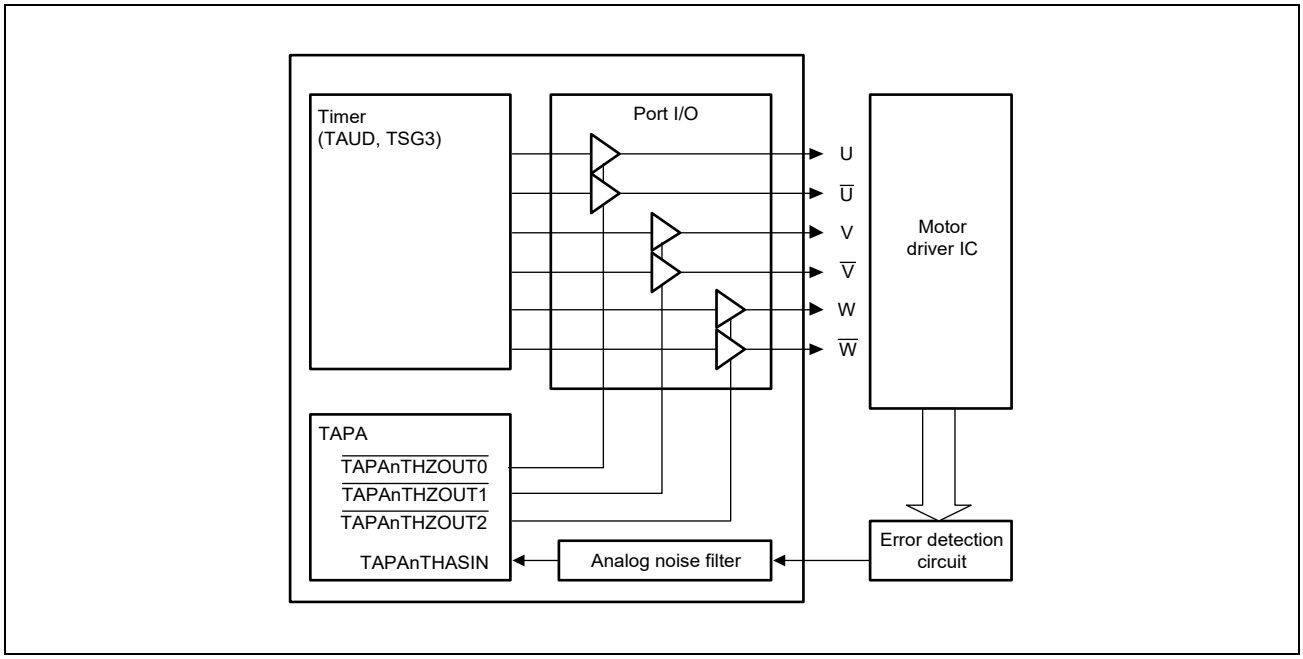

Figure 21.4 An Example of System Configuration of Asynchronous Hi-Z Control for Analog Inputs

21.4.1.3 Basic Operation

Setting examples are described as follows.

Hi-Z Control when TAPAnCTL0.TAPAnDCM = 0, TAPAnDCP = 1, and TAPAnDCN = 0

$\overline{\text{TAPAnTHZOUT0}}$ goes to the low level on detection of an effective edge of the asynchronous input (TAPAnTHASIN). Output is forcibly stopped (by port control for Hi-Z output) as long as the $\overline{\text{TAPAnTHZOUT0}}$ output is at the low level. $\overline{\text{TAPAnTHZOUT0}}$ goes to the high level in response to writing 1 to Hi-Z stop trigger 0 (TAPAnOPHT0), regardless of the level of TAPAnTHASIN.

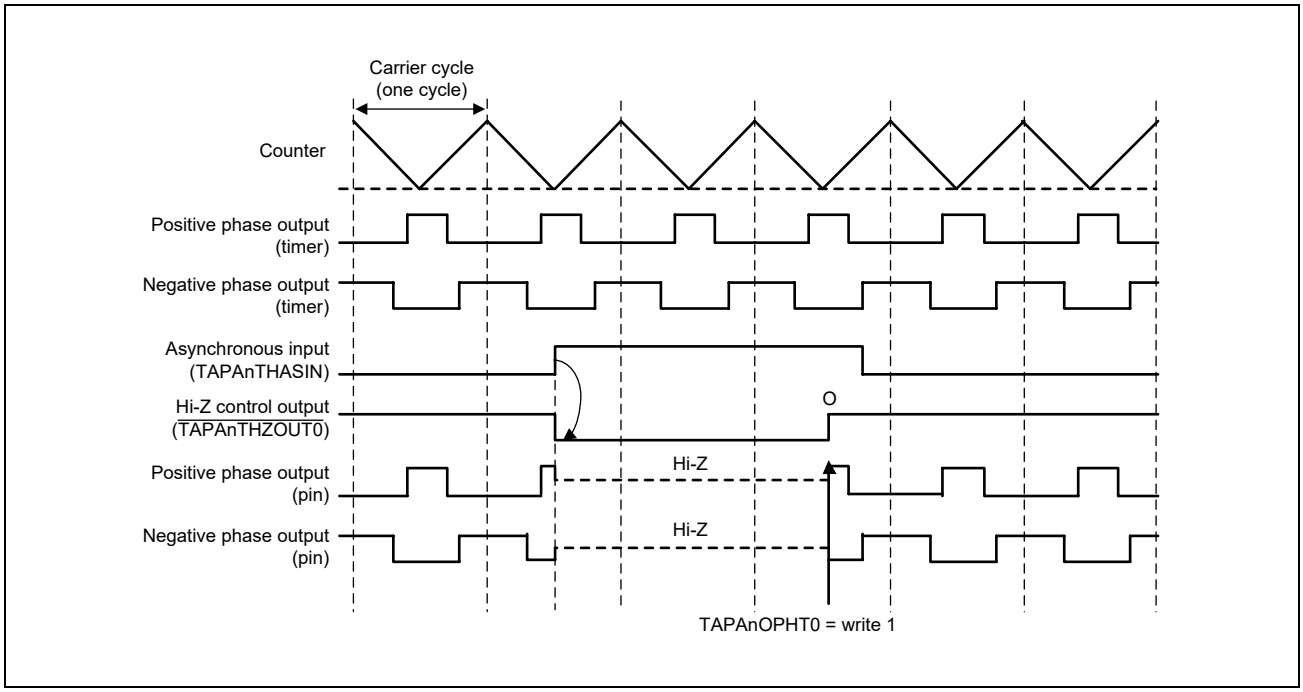

Figure 21.5 $\overline{\text{TAPAnTHZOUT0}}$ Operation when TAPAnDCM = 0, TAPAnDCP = 1, and TAPAnDCN = 0

Hi-Z Control when TAPAnCTL0.TAPAnDCM = 1, TAPAnDCP = 1, and TAPAnDCN = 0

$\overline{\text{TAPAnTHZOUT0}}$ goes to the low level in response to detection of an effective edge of the asynchronous input signal (TAPAnTHASIN). Output is forcibly stopped (by port control for Hi-Z output) as long as the $\overline{\text{TAPAnTHZOUT0}}$ output is at the low level. Writing of 1 to Hi-Z stop trigger 0 (TAPAnOPHT0) is ignored as long as the asynchronous input signal (TAPAnTHASIN) is at the active level (high because TAPAnDCP = 1).

After the asynchronous input signal (TAPAnTHASIN) is switched to the inactive level (low because TAPAnDCP = 1), $\overline{\text{TAPAnTHZOUT0}}$ goes to the high level when 1 is written to Hi-Z stop trigger 0 (TAPAnOPHT0).

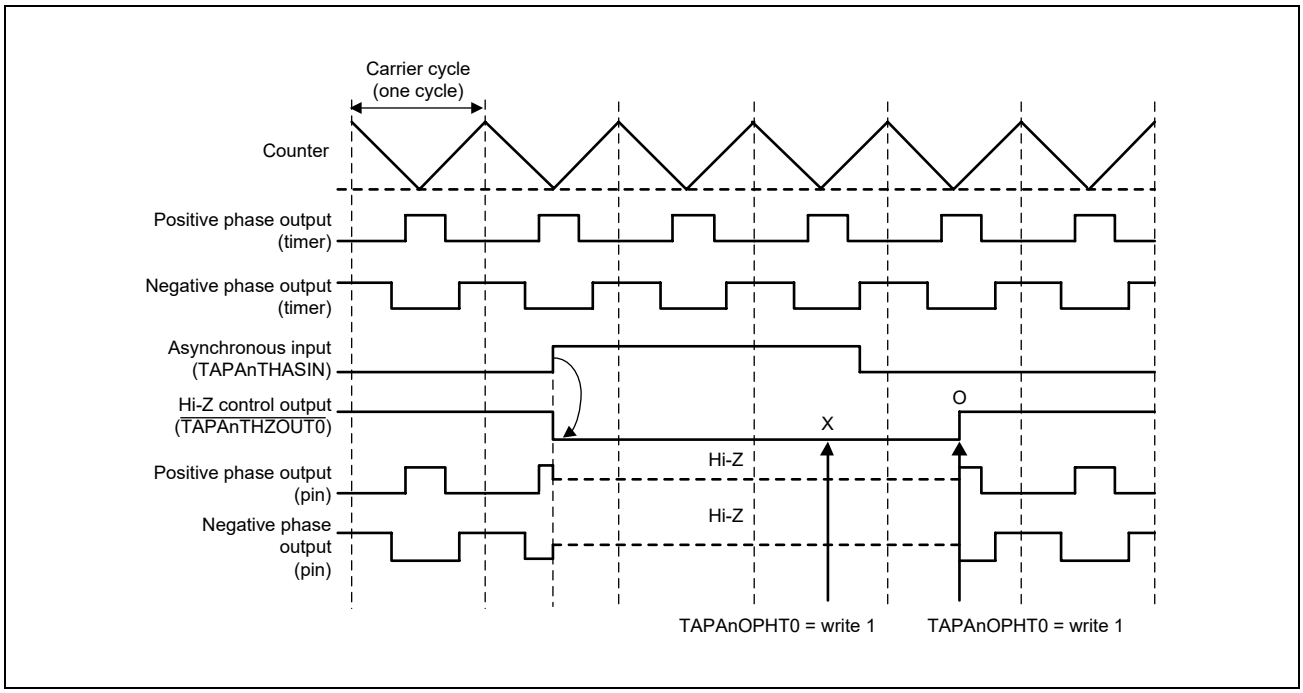

Figure 21.6 $\overline{\text{TAPAnTHZOUT0}}$ Operation when TAPAnDCM = 1, TAPAnDCP = 1, and TAPAnDCN = 0

21.4.1.4 Asynchronous Hi-Z Control Using Software Trigger

This module allows software control of the output of Hi-Z control signals.

Hi-Z start trigger 0 (TAPAnOPHS0) and Hi-Z stop trigger 0 (TAPAnOPHT0) are used to control $\overline{\text{TAPAnTHZOUT0}}$, $\overline{\text{TAPAnTHZOUT1}}$ *1, and $\overline{\text{TAPAnTHZOUT2}}$ *1.

Note 1. Not available when TAPAn (n = 3, 4, 5).

Table 21.17 Operation of the Hi-Z Start Trigger (TAPAnOPHS)

TAPAnOPHS	Operation
0/1	Writing 1 to the TAPAnOPHS0 bit places the $\overline{\text{TAPAnTHZOUT0}}$, $\overline{\text{TAPAnTHZOUT1}}$, and $\overline{\text{TAPAnTHZOUT2}}$ signals at the low level.

The Hi-Z stop trigger is enabled in the following conditions.

Table 21.18 Operation of the Hi-Z Stop Trigger (TAPAnOPHT) during Hi-Z Control in Response to Asynchronous Input

TAPAnOPHT	Operation
0	Writing 1 to the TAPAnOPHT0 bit places the $\overline{\text{TAPAnTHZOUT0}}$, $\overline{\text{TAPAnTHZOUT1}}$, and $\overline{\text{TAPAnTHZOUT2}}$ signals at the high level.
1	If $\overline{\text{TAPAnTHASIN}}$ is at the inactive level, writing 1 to the TAPAnOPHT0 bit places the $\overline{\text{TAPAnTHZOUT0}}$, $\overline{\text{TAPAnTHZOUT1}}$, and $\overline{\text{TAPAnTHZOUT2}}$ signals at the high level. If TAPAnTHASIN is at the active level, writing of 1 to the TAPAnOPHT0 bit is ignored.

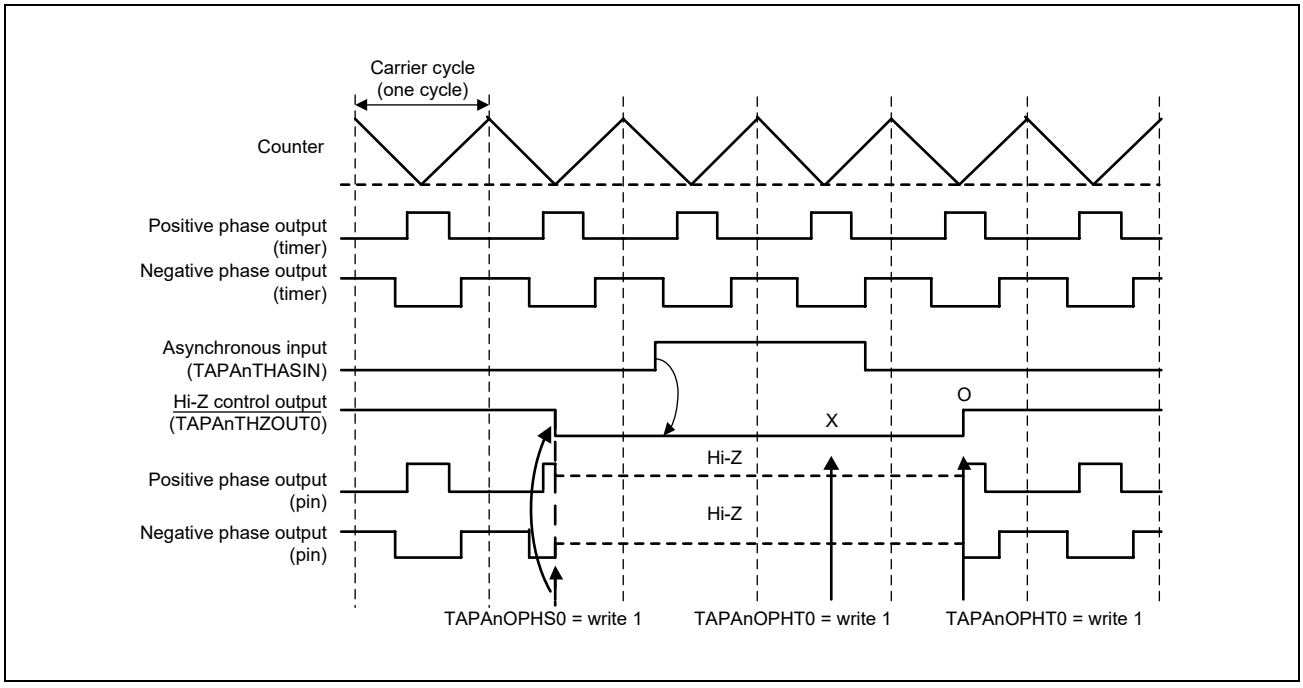

Figure 21.7 $\overline{\text{TAPAnTHZOUT0}}$ Operation when TAPAnDCM= 1, TAPAnDCP = 1, and TAPAnDCN = 0

21.4.1.5 Operating Procedure

An example of the operating procedure for Hi-Z control in response to asynchronous input is as follows (the table only covers settings for the timer option module because this operation does not depend on timer operations).

Table 21.19 Operating Procedure for Hi-Z Control in Response to Asynchronous Input

		Operation	State of TAPA
Restart operation	Initial settings	Setting in the TAPAnCTL0 register. Set TAPAnDCP and TAPAnDCN (input edge selection). Set TAPAnDCM (clearing mode selection).	Hi-Z control in response to asynchronous input is stopped (TAPAnFLG.TAPAnACE = 0).
	Starting operation	Setting in the TAPAnACWE register: Set the TAPAnACWE bit to 1. Setting in the TAPAnACTS register: Set the TAPAnACTS bit to 1.	Writing to the TAPAnACTS bit is enabled. TAPAnFLG.TAPAnACE = 1, enabling Hi-Z control in response to asynchronous input.
	During operation	To start Hi-Z control of an output from the timer: Control is by the TAPAnOPHS0 bit of TAPA Control is by the Hi-Z input signal (TAPAnTHASIN) for TAPA To stop Hi-Z control of output from the timer: Control is by the TAPAnOPHT0 bit of TAPA (if TAPAnDCM = 0) TAPAnOPHT0 is used if the Hi-Z input signal for TAPA (TAPAnTHASIN) is at the inactive level (if TAPAnDCM = 1) The state of TAPA operations can be read from the TAPAnFLG register at all times.	On detection of input of the starting edge of the Hi-Z input signal (TAPAnTHASIN) or setting of the start trigger bit (TAPAnOPHS0 = 1), the Hi-Z controller switches the $\overline{\text{TAPAnTHZOUT0}}$, $\overline{\text{TAPAnTHZOUT1}}$ *1, and $\overline{\text{TAPAnTHZOUT2}}$ *1 pins to low-level output. In accord with the operating mode settings in TAPAnDCM, the Hi-Z controller switches the $\overline{\text{TAPAnTHZOUT0}}$, $\overline{\text{TAPAnTHZOUT1}}$ *1, and $\overline{\text{TAPAnTHZOUT2}}$ *1 pins to high-level outputs in response to setting of the stop trigger bit (TAPAnOPHT0 = 1).
	Stopping operation	Setting in the TAPAnACWE register: Set the TAPAnACWE bit to 1. Setting in the TAPAnACTT register. Set the TAPAnACTT bit to 1.	Writing to the TAPAnACTT bit is enabled. TAPAnFLG.ACE = 0, stopping asynchronous Hi-Z control

Note 1. Not available when TAPAn (n = 3, 4, 5).

21.4.2 Selection of INT Signal Output

21.4.2.1 Configuration

This function outputs of peak or trough interrupts by using the INT and TAPAnTUDCMm signals output from the triangle-wave carrier-cycle generation channel (master) of the TAUD module.

Signals generated at cycle 0 and 1 of TAUD are used as input signals so that two sets of peak or trough interrupts are output.

21.4.2.2 Basic Operation

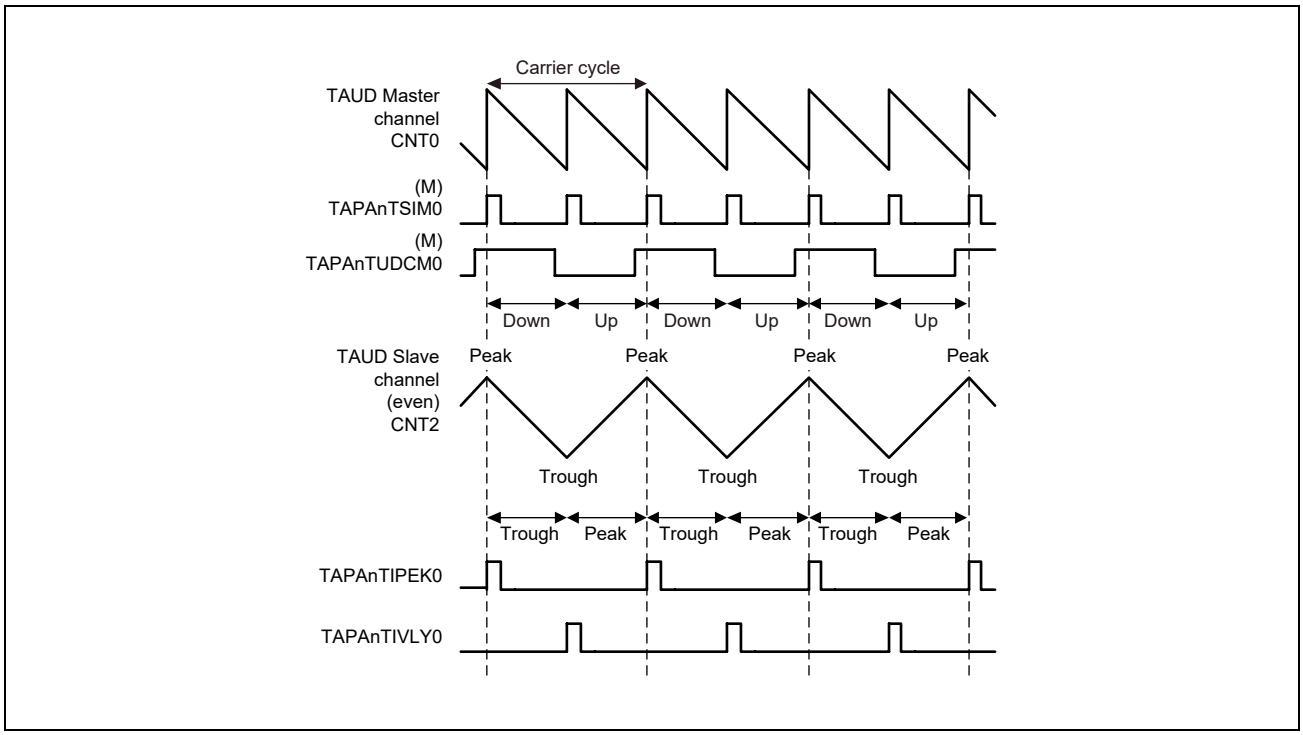

Figure 21.8 Example of Operations in Response to Master Channel 0 of TAUD

TAUD

The master channel of TAUD generates a triangle-wave carrier-cycle.

The TAUD module outputs an INT0 signal and toggles the up/down signal in accord with the setting of TAPAnTUDCM0 per half cycle of this carrier wave.

TAPA

- The TAPA module handles a TAPAnTSIM0 signal arriving while TAPAnTUDCM0 is high as a peak interrupt and outputs the TAPAnTIPEK0 signal in response.
- The TAPA module handles a TAPAnTSIM0 signal arriving while TAPAnTUDCM0 is low as a trough interrupt and outputs the TAPAnTIVLY0 signal in response.

CAUTION

Combined circuits handle output of the TAPAnTIPEK0/TAPAnTIVLY0 signals and operate regardless of the operating mode.

When the TAPAnTIPEK0/TAPAnTIVLY0 signals are not in use, they must be masked by using the registers described in **Section 6.2.3, EI Level Interrupt Mask Registers 0 to 11 (IMR0 to IMR11).**

21.4.2.3 Operating Procedure

The procedure for selecting interrupt output is as follows.

Table 21.20 Operating Procedure for Selecting Interrupt Output

	Operation	States of TAUD and TAPA
Initial settings	The TAPA module does not require initial settings.	TAUD and TAPA are stopped.
Starting operation	Start the TAUD module.	TAUD starts counting.
During operation	TAUD runs in accord with the settings for the various functions.	The interrupt output selector outputs a peak interrupt (TAPAnTIPEK0) or a trough interrupt (TAPAnTIVLY0) for control cycle 0. This is based on interrupt input (TAPAnTSIM0) and up/down input (TAPAnTUDCM0) from TAUD.
Stopping operation	Stop the TAUD module.	TAUD stops counting.

Restart operation

21.4.3 Selecting a Trigger to Start Conversion by the A/D Converter

The TAPA is capable of producing triggers to start conversion by the A/D converter (TAPAnTADOUT0 and TAPAnTADOUT1). A trigger signal is produced from the INT and TOUT signals output from the triangle-wave carrier-cycle generation channel (master) of the TAUD and the INT signal output from the channel selected for operation with the trigger to start conversion by the A/D converter.

21.4.3.1 Configuration

Table 21.21 Signals Used in Generating the TAPAnTADOUT Signals

Output Signal	Up/Down Input	Slave Match Detection Signal	Trough Interrupt Signal
TAPAnTADOUT0	TAPAnTUDCM0	TAPAnTCDENS0	TAPAnTIVLY0
TAPAnTADOUT1	TAPAnTUDCM0	TAPAnTCDENS1	TAPAnTIVLY0

Table 21.22 Operation of TAPAnCTL1.TAPAnATS[1:0] and TAPAnTADOUT0

TAPAnATS1	TAPAnATS0	Description
0	0	The INT signal from slave 0 is output as TAPATADOUT0 while master 0 of the TAUD module is in the down state.
0	1	The INT signal from slave 0 is output as TAPATADOUT0 while master 0 of the TAUD module is in the up state.
1	0	The INT signal from slave 0 of TAUD is output as TAPATADOUT0.
1	1	The INT and TAPATIVLY0 (trough interrupt signal 0) signals from slave 0 of TAUD are output as TAPAnTADOUT0.

Table 21.23 Operation of TAPAnCTL1.TAPAnATS[3:2] and TAPAnTADOUT1

TAPAnATS3	TAPAnATS2	Description
0	0	The INT signal from slave 1 is output as TAPAnTADOUT1 while master 0 of the TAUD module is in the down state.
0	1	The INT signal from slave 1 is output as TAPAnTADOUT1 while master 0 of the TAUD module is in the up state.
1	0	The INT signal from slave 1 of TAUD is output as TAPAnTADOUT1.
1	1	The INT and TAPAnTIVLY0 (trough interrupt signal 0) signals from slave 1 of TAUD are output as TAPAnTADOUT1.

21.4.3.2 Basic Operation

The following figure shows waveforms in control of A/D converter trigger output in triangle-wave PWM mode.

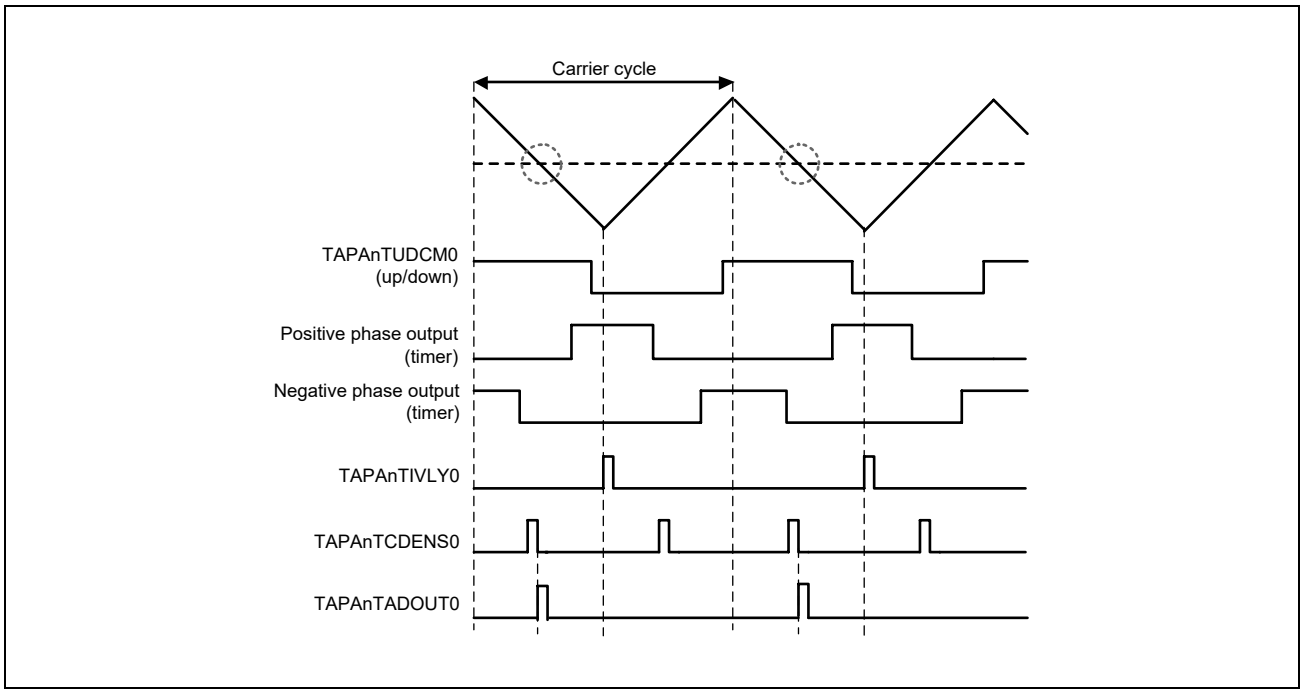

Figure 21.9 TAPAnATS = {0, 0}: INT Output while Master Channel is in the Down State

An INT signal from the slave while the master is in the down state is output as a trigger to start conversion by the A/D converter.

An INT signal from the slave while the master is in the up state is not output.

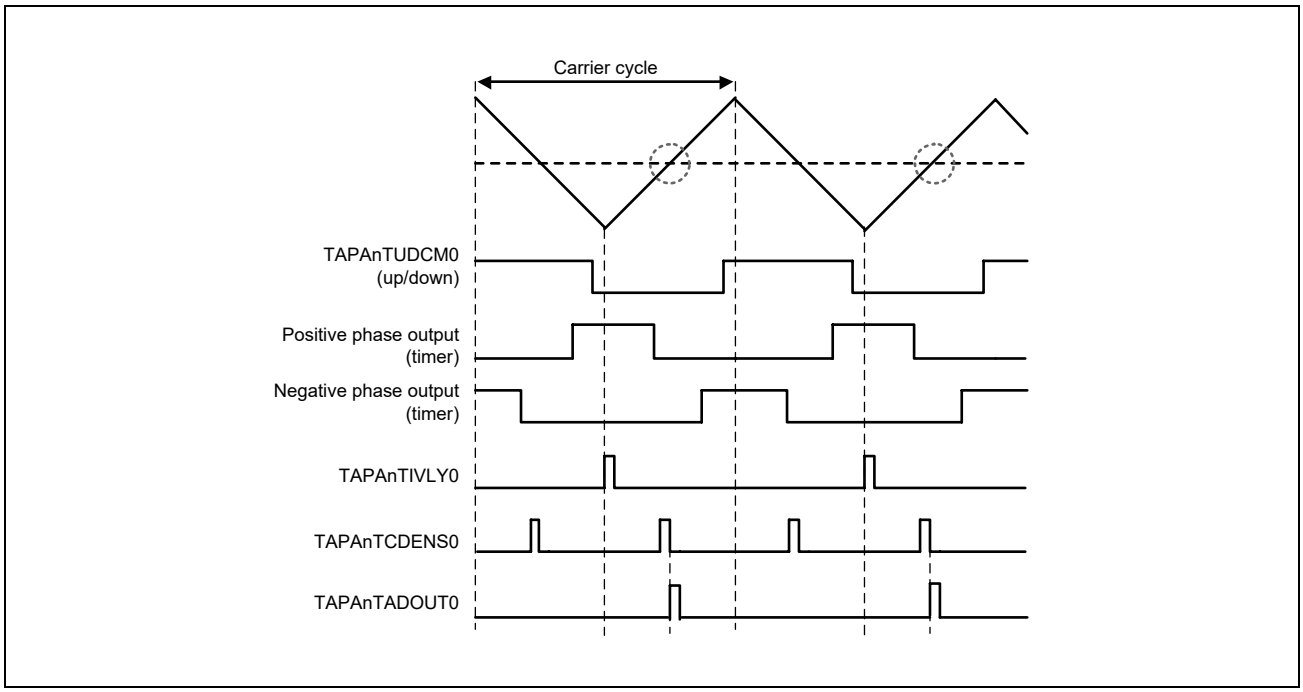

Figure 21.10 TAPAnATS = {0, 1}: INT Output while the Master Channel is in the Up State

An INT signal from the slave while the master is in the up state is output as a trigger to start conversion by the A/D converter.

An INT signal from the slave while the master is in the down state is not output.

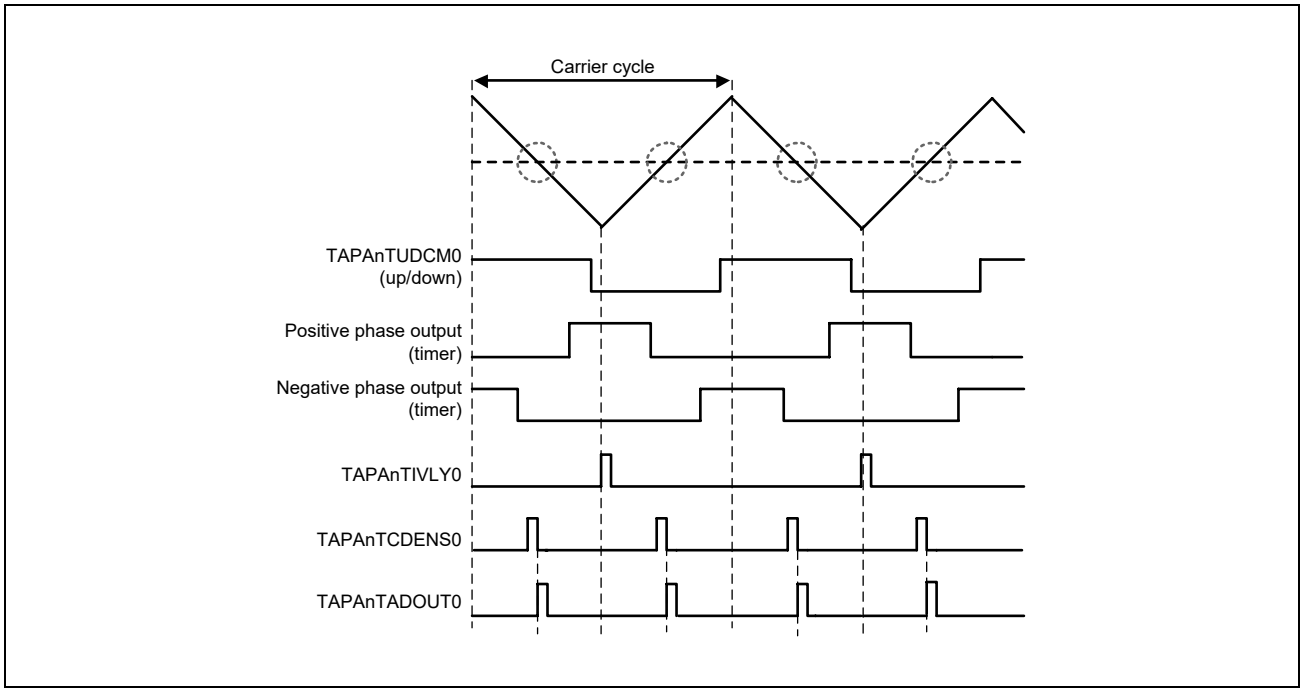

Figure 21.11 TAPAnATS = {1, 0}: INT Output while the Master Channel is in the Down or Up State

An INT signal from the slave at any time is output as a trigger to start conversion by the A/D converter.

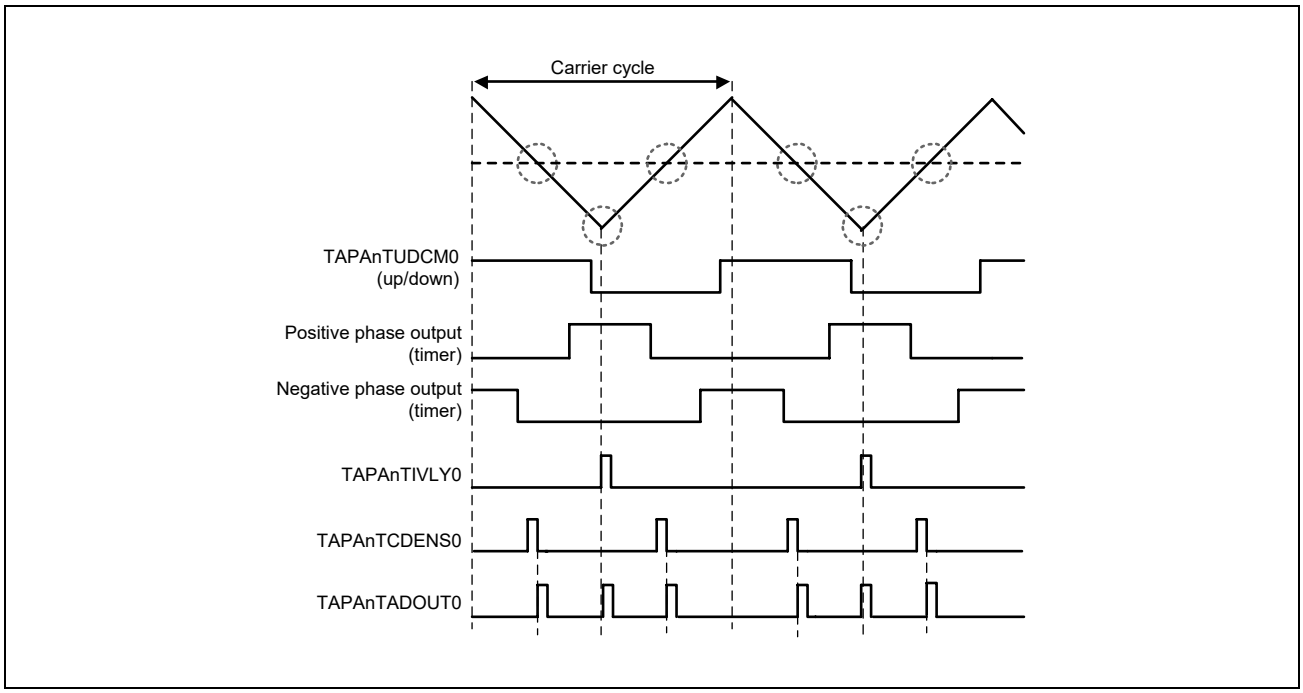

Figure 21.12 TAPAnATS = {1, 1}: INT Output and Trough Interrupt while Master Channel is in the Down or Up State

An INT signal or trough interrupt signal from the slave is output as a trigger to start conversion by the A/D converter.

21.4.3.3 Operating Procedure

The operating procedure for setting a trigger to start conversion by the A/D converter is as follows.

Table 21.24 Operation Procedure for Setting a Trigger to Start Conversion by the A/D Converter

		Operation	States of TAUD and TAPA
	Initial settings	Initialize TAUD. Determine the timer's operating mode.	TAUD and TAPA are stopped.
		Setting in the TAPAnCTL1 register. Set TAPAnATS[1:0] bits (for TAPAnTADOUT0). Set TAPAnATS[3:2] (for TAPAnTADOUT1).	
Restart operation	Starting operation	Start the TAUD module.	TAUD starts counting.
	During operation	TAUD runs in accord with the settings for the various functions.	The A/D converter conversion trigger selector outputs TAPAnTADOUT0 in accord with the settings of TAPAnATS[1:0] or TAPAnTADOUT1 in accord with the settings of TAPAnATS[3:2], based on the interrupt input (TAPAnTCDENS1 or TAPAnTCDENS0) and up/down input (TAPAnTUDCM1 or TAPAnTUDCM0) from the TAUD and the trough interrupt signal (TAPAnTIVLY1 or TAPAnTIVLY0) generated by TAPA.
	Stopping operation	TAUD is stopped.	TAUD stops counting

Section 22 Timer Pattern Buffer (TPBA)

This section contains a generic description of the Timer Pattern Buffer (TPBA).

The first part of this section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of TPBA.

22.1 Features of RH850/C1M-A TPBA

22.1.1 Units

This LSI has the following number of TPBA units.

Each TPBA unit has one channel interface.

Table 22.1 Number of Units

Product Name	RH850/C1M-A2	RH850/C1M-A1
Number of units	2	1
Name	TPBAn (n = 0, 1)	TPBAn (n = 0)

Table 22.2 Indices

Index	Meaning
n	Throughout this section, the individual TPBA units are identified by the index “n” (n = 0, 1) (n = 0, 1 for C1M-A2; n = 0 for C1M-A1); for example, TPBAnCTL is the TPBAn control register.
m	The number of buffers are indicated by the index “m” (m = 00 to 63).

22.1.2 Register Base Address

TPBA base addresses are listed in the following table.

TPBA register addresses are given as offsets from the base addresses in general.

Table 22.3 Register Base Address

Base Address Name	Base Address
<TPBA0_base>	FFEA 0000$_H$
<TPBA1_base>	FF8A 1000$_H$*1

Note 1. Not supported for C1M-A1.

22.1.3 Clock Supply

Clock supply by and to TPBA is listed in the following table.

Table 22.4 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
TPBAn	PCLK	CLKC_HSB (non-modulated high-speed peripheral clock)

22.1.4 Interrupt Request

TPBA interrupt requests are listed in the following table.

Table 22.5 Interrupt Requests

Unit Interrupt Signal	Outline	Interrupt Number	DMA Trigger Number*1		DTS Trigger Number*1	
			1st	2nd	1st	2nd
TPBA0						
INTTPBA0IPRD	Period matched detection interrupt	184	—	61	—	61
INTTPBA0IDTY	Duty-cycle-matched detection interrupt	185	—	62	—	62
INTTPBA0IPAT	Number-of-patterns matched detection interrupt	186	—	63	—	63
TPBA1*2						
INTTPBA1IPRD	Period matched detection interrupt	187	—	64	—	64
INTTPBA1IDTY	Duty-cycle-matched detection interrupt	188	—	65	—	65
INTTPBA1IPAT	Number-of-patterns matched detection interrupt	189	—	66	—	66

—: No number is assigned.

Note 1. 1st: Primary channel, 2nd: Secondary channel

Note 2. Not supported for C1M-A1.

22.1.5 Reset Sources

TPBA is initialized by these reset sources.

Table 22.6 Reset Sources

Unit Name	Reset Sources
TPBAn	All reset sources

22.1.6 External Input/Output Signals

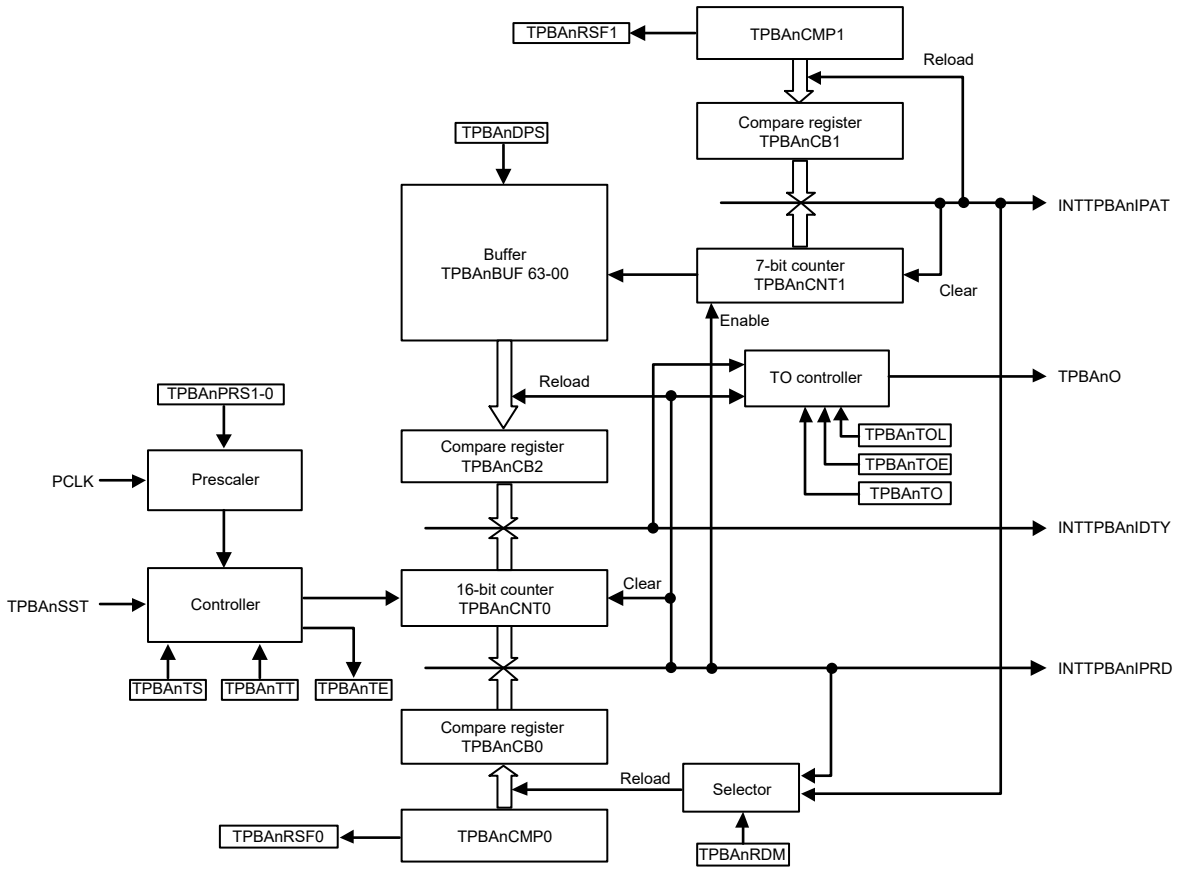
External input/output signals of TPBA are listed in the following table.

Table 22.7 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
TPBA0		
TPBA0O	Timer output	TPBA0O
TPBA1*1		
TPBA1O	Timer output	TPBA1O

Note 1. Not supported for C1M-A1.

22.2 Overview



22.2.1 Functional Overview

TPBAn is a 16-bit PWM timer with the duty setting buffer.

- Count clock resolution: Min. 12.5 ns (count clock: 80 MHz)
- 16-bit counter
- 16-bit duty register
- 16-bit period setting register
- 7-bit address counter register
- 7-bit pattern number setting register
- Interrupt request signals
  - Period-matched detection interrupt
  - Duty-cycle-matched detection interrupt
  - Number-of-patterns matched detection interrupt
- Number of duty patterns
  - 64 patterns (16 bits) or 128 patterns (8 bits)
- Automatic duty generation according to the number of patterns
- Output control by software
- The count clock can be selected from PCLK, PCLK/2, PCLK/4, and PCLK/8 according to the prescaler set value.
- Synchronous start with another timer

22.2.2 Block Diagram

The following block diagram shows the main components of TPBA.

Note: TPBAnSST: Simultaneous start trigger (input from PIC1B)

Figure 22.1 Block Diagram of TPBA

22.3 Registers

22.3.1 TPBAn Registers

TPBA registers are listed in the following table.

For information on <TPBAn_base>, see **Section 22.1.2, Register Base Address**.

Table 22.8 List of Registers

Module Name	Register Name	Symbol	Address
TPBAn	TPBAn control register	TPBAnCTL	<TPBAn_base> + 200_H
TPBAn	TPBAn reload data mode register	TPBAnRDM	<TPBAn_base> + 118_H
TPBAn	TPBAn reload status register	TPBAnRSF	<TPBAn_base> + 110_H
TPBAn	TPBAn reload data trigger register	TPBAnRDT	<TPBAn_base> + 114_H
TPBAn	TPBAn timer output enable register	TPBAnTOE	<TPBAn_base> + 120_H
TPBAn	TPBAn timer output register	TPBAnTO	<TPBAn_base> + $11C_H$
TPBAn	TPBAn timer output level register	TPBAnTOL	<TPBAn_base> + 124_H
TPBAn	TPBAn period setting register	TPBAnCMP0	<TPBAn_base> + 100_H
TPBAn	TPBAn duty setting register	TPBAnBUFm	<TPBAn_base> + m × 4_H
TPBAn	TPBAn pattern number setting register	TPBAnCMP1	<TPBAn_base> + 104_H
TPBAn	TPBAn timer counter register	TPBAnCNT0	<TPBAn_base> + 108_H
TPBAn	TPBAn address counter register	TPBAnCNT1	<TPBAn_base> + $10C_H$
TPBAn	TPBAn enable status register	TPBAnTE	<TPBAn_base> + 128_H
TPBAn	TPBAn start trigger register	TPBAnTS	<TPBAn_base> + $12C_H$
TPBAn	TPBAn stop trigger register	TPBAnTT	<TPBAn_base> + 130_H

22.3.2 TPBAnCTL — TPBAn Control Register

This register specifies the operation of the TPBAn.

Access: This register can be read/written in 8-bit units.

Address: <TPBAn_base> + 200_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	TPBAnPRS[1:0]		—	—	—	TPBAnDPS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R/W

Table 22.9 TPBAnCTL Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4, 5	TPBAnPRS[1:0]	Selects the count clock.
3 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	TPBAnDPS	Selects the duty setting pattern mode. 0: 16 bits × 64 patterns mode 1: 8 bits × 128 patterns mode

TPBAnPRS1	TPBAnPRS0	Description
0	0	PCLK is selected.
0	1	PCLK/2 is selected.
1	0	PCLK/4 is selected.
1	1	PCLK/8 is selected.

CAUTION

This register should be set when the timer is stopped (TPBAnTE = 0). If this register is erroneously rewritten, set the register again after stopping the timer.

22.3.3 TPBAnRDM — TPBAn Reload Data Mode Register

This register controls the reload timing of the TPBAn period setting register and TPBAn timer output level register values.

Access: This register can be read/written in 8-bit units.

Address: <TPBAn_base> + 118_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TPBAnRDM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 22.10 TPBAnRDM Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	TPBAnRDM0	Controls the reload timing of the TPBAn period setting register (TPBAnCMP0) and TPBAn timer output level register (TPBAnTOL) values. 0: Reloads the values synchronously with a number-of-patterns matched detection interrupt (INTTPBAnIPAT). 1: Reloads the values synchronously with a period-matched detection interrupt (INTTPBAnIPRD).

CAUTION

Although this register can be rewritten during operation, the rewritten value is reflected at any time. Accordingly, during operation, this register should be rewritten when the reload request flag (TPBAnRSF) is 0.

22.3.4 TPBAnRSF — TPBAn Reload Status Register

This register indicates whether or not reload requests from the corresponding registers have been generated.

Access: This register can be read in 8-bit units.

Address: <TPBAn_base> + 110_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TPBAnRSF1	TPBAnRSF0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.11 TPBAnRFS Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read.
1	TPBAnRSF1	Indicates whether or not a reload request from TPBAnCMP1 has been generated. 0: No reload request generated or reload completed. 1: Reload request has been generated. This bit is set to 1 when 1 is written to the TPBAnRDT1 bit in the TPBAnRDT register. This bit is cleared at the timing when reload is performed.
0	TPBAnRSF0	Indicates whether or not a reload request from TPBAnCMP0 and TPBAnTOL has been generated. 0: No reload request generated or reload completed. 1: Reload request has been generated. This bit is set to 1 when 1 is written to the TPBAnRDT0 bit in the TPBAnRDT register. This bit is cleared at the timing when reload is performed.

22.3.5 TPBAnRDT — TPBAn Reload Data Trigger Register

This register enables reload of the register values.

Access: This register can be written in 8-bit units. It is always read as 0.

Address: <TPBAn_base> + 114_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TPBAnRDT1	TPBAnRDT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 22.12 TPBAnRDT Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	TPBAnRDT1	Enables reload of the TPBAnCMP1 values. 0: Write access is ignored. 1: Reload is enabled (TPBAnRSF1 is set to 1). The values are updated simultaneously at the next reload timing (reload).
0	TPBAnRDT0	Enables reload of the TPBAnCMP0 and TPBAnTOL values. 0: Write access is ignored. 1: Reload is enabled (TPBAnRSF0 is set to 1). The values are updated simultaneously at the next reload timing (reload).

22.3.6 TPBAnTOE — TPBAn Timer Output Enable Register

This register enables or disables the timer output.

Access: This register can be read/written in 8-bit units.

Address: <TPBAn_base> + 120_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TPBAnTOE0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 22.13 TPBAnTOE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	TPBAnTOE0	Enables or disables the timer output (TPBAnO). 0: Disables the timer output based on counter operation. 1: Enables the timer output based on counter operation. • When the timer output is disabled, the level specified in TPBAnTO is output from the TPBAnO pin, and can be controlled by software. • When the timer output is enabled, TPBAnTO is set or cleared by the timer operation, and a PWM signal is output. Write access is prohibited (ignored).

22.3.7 TPBAnTO — TPBAn Timer Output Register

This register controls or reads timer output level.

Access: This register can be read/written in 8-bit units.

Address: <TPBAn_base> + $11C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TPBAnTO0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 22.14 TPBAnTO Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	TPBAnTO0	Sets or indicates the output level of TPBAnO pin • When the timer output is disabled (TPBAnTOE.TPBAnTOE0 = 0) 0: Outputs low level. 1: Outputs high level. The output level can be controlled by rewriting this register during stopping of the timer output. • When the timer output is enabled (TPBAnTOE.TPBAnTOE0 = 1) 0: Low level is being output by the timer output. 1: High level is being output by the timer output. When the timer output is enabled, rewrite to this register is ignored.

22.3.8 TPBAnTOL — TPBAn Timer Output Level Register

This register controls the timer output level.

Access: This register can be read/written in 8-bit units.

Address: <TPBAn_base> + 124_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TPBAnTOL0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 22.15 TPBAnTOL Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	TPBAnTOL0	Specifies the active level of the timer output. 0: High 1: Low • Setting of this bit is enabled when the timer output is enabled (TPBAnTOE.TPBAnTOE0 = 1). • Setting of this bit is reflected when the timer output is started, and change of the output level is reflected at the next reload timing.

CAUTION

This register is a register to be reloaded. Rewrite during timer operation is reflected at the next reload timing. For details on reload, see **Section 22.4.2, Compare Register Rewrite Operation**.

22.3.9 TPBAnCMP0 — TPBAn Period Setting Register

This is a 16-bit compare register for setting the PWM period.

Access: This register can be read/written in 16-bit units.

Address: <TPBAn_base> + 100_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TPBAnCMP0															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.16 TPBAnCMP0 Register Setting

Operating Mode	PWM Period	Minimum Value (Period)	Maximum Value (Period)
8 bits	TPBAnCMP0 + 1	1	100_H
16 bits	TPBAnCMP0 + 1	1	10000_H

CAUTION

- The PWM period is (TPBAnCMP0 + 1) count clock periods. Accordingly, for PWM output with 100% duty cycle, the maximum settable value is $FFFE_H$ (FE_H).
- This register is a register to be reloaded. Rewrite during timer operation is reflected at the next reload timing. For details on reload, see **Section 22.4.2, Compare Register Rewrite Operation**.

22.3.10 TPBAnBUFm — TPBAn Duty Setting Register

This register is a 16 × 64 buffer register for duty setting.

Access: This register can be read/written in 16-bit units.

Address: <TPBAn_base> + 000_H to $0FC_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TPBAnBUFm															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.17 TPBAnBUFm Register Contents

Bit Position	Bit Name	Function
15 to 0	TPBAnBUFm15 to TPBAnBUFm0	Sets the duty value. This register can set the duty value either in 16 bits × 64 patterns mode (TPBAnDPS = 0) or 8 bits × 128 patterns mode (TPBAnDPS = 1) by setting the TPBAnDPS bit. In either mode, this register is accessed in 16-bit units by the CPU. For details, see **Section 22.4.3, Duty Rewrite Operation.**

CAUTION

The value set to this register is transferred to the duty setting buffer register (TPBAnCB2) synchronously with a period-matched detection interrupt (INTTPBAnIPRD). Rewrite during timer operation is reflected at any time. For details, see **Section 22.4.3, Duty Rewrite Operation**.

- When duty setting register with 8 bits × 128 patterns is used, the duty is set in the range from 00_H to FF_H.
  The formula to output a waveform of duty 100% is: TPBAnBUFm = TPBAnCMP0 + 1 ≤ $00FF_H$. Therefore, when PWM output of duty 100% is required, the maximum value of TPBAnCMP0 is $00FE_H$. When TPBAnBUFm is greater than TPBAnCMP0 + 1, duty value exceeds 100%, but the output becomes 100% in total.
- When duty setting register with 16 bits × 64 patterns is used, the duty is set in the range from 0000_H to $FFFF_H$.
  The formula to output a waveform of duty 100% is: TPBAnBUFm = TPBAnCMP0 + 1 ≤ $FFFF_H$. Therefore, when PWM output of duty 100% is required, the maximum value of TPBAnCMP0 is $FFFE_H$. When TPBAnBUFm is greater than TPBAnCMP0 + 1, the duty value exceeds 100%, but the output becomes 100% in total.

22.3.11 TPBAnCMP1 — TPBAn Pattern Number Setting Register

This register sets the number of PWM output patterns.

Access: This register can be read/written in 8-bit units.

Address: <TPBAn_base> + 104_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	TPBAnCMP1						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.18 TPBAnCMP1 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 0	TPBAnCMP1 [6:0]	Sets the number of patterns within the following range. TPBAnDPS = 0: 0 to 63 TPBAnDPS = 1: 0 to 127

CAUTION

- This register is a register to be reloaded. Rewrite during timer operation is reflected at the next reload timing. For details on reload, see **Section 22.4.2, Compare Register Rewrite Operation**.
- If 64 or a greater number is set as the number of patterns when the duty setting pattern is in 16 bits × 64 patterns mode (TPBAnDPS = 0), the address pointer changes from 63 to 00, and the duty value is transferred from 00 again. A number-of-patterns matched detection interrupt signal (INTTPBAnIPAT) is output by the match of the specified number of patterns and the lower 7-bit values of TPBAnCNT1.

22.3.12 TPBAnCNT0 — TPBAn Timer Counter Register

This is a timer counter register that generates PWM output.

Access: This register can be read in 16-bit units.

Address: <TPBAn_base> + 108_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TPBAnCNT0															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

16-bit counter

This register is a counter register through which the 16-bit counter value can be read.

22.3.13 TPBAnCNT1 — TPBAn Address Counter Register

This register is a counter register that indicates the address pointer to the duty setting register.

Access: This register can only be read in 8-bit units.

Address: <TPBAn_base> + $10C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	TPBAnCNT1						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

7-bit counter

This register is a counter register that indicates the address of the TPBAnBUFm register.

22.3.14 TPBAnTE — TPBAn Enable Status Register

This register indicates whether the timer counter is operating or stopped.

Access: This register can only be read in 8-bit units.

Address: <TPBAn_base> + 128_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TPBAnTE0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.19 TPBAnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read.
0	TPBAnTE0	Indicates whether the timer counter is operating or stopped. 0: The timer counter is stopped. 1: The timer counter is operating. • The TPBAnTE0 bit is set to 1 when 1 is written to the TPBAnTS bit or when a synchronous start trigger is input. • The TPBAnTE0 bit is cleared to 0 when 1 is written to the TPBAnTT bit.

22.3.15 TPBAnTS — TPBAn Start Trigger Register

This register controls the timer counter start trigger.

Access: This register can only be written in 8-bit units. It is always read as 0.

Address: <TPBAn_base> + $12C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TPBAnTS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 22.20 TPBAnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TPBAnTS0	This bit is a trigger bit that enables the timer counter. 0: Write access is ignored. 1: Starts counting (TPBAnTE = 1).

CAUTION

Write access to this register during counting (TPBAnTE = 1) is ignored.

22.3.16 TPBAnTT — TPBAn Stop Trigger Register

This register controls the timer counter stop trigger.

Access: This register can only be written in 8-bit units. It is always read as 0.

Address: <TPBAn_base> + 130_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TPBAnTT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 22.21 TPBAnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TPBAnTT0	This bit is a trigger bit that disables the timer counter. 0: Write access is ignored. 1: Disables counting (TPBAnTE = 0).

22.4 Function

22.4.1 Basic Operation

22.4.1.1 Basic Operation of 16-Bit Counter (TPBAnCNT0)

Counting start

The 16-bit counter (TPBAnCNT0) starts counting from the value after reset $FFFF_H$.

Counter clear

The 16-bit counter is cleared by the match of the counter value and the buffer register (TPBAnCB0) set value of TPBAnCMP0.

Counter read during counting

The 16-bit counter value during counting can be read through TPBAnCNT0.

22.4.1.2 Basic Operation of 7-Bit Counter (TPBAnCNT1)

Counting start

The 7-bit counter (TPBAnCNT1) is initialized to 00_H and starts counting. Subsequently, the counter value is incremented synchronously with a period-matched detection interrupt (INTTPBAnIPRD).

Counter clear

The 7-bit counter is cleared by the match of the counter value and the buffer register (TPBAnCB1) set value of TPBAnCPM1.

Counter read during counting

The 7-bit counter value during counting can be read through TPBAnCNT1. The read value indicates TPBAnBUFm in which the duty value to be transferred next is stored.

22.4.2 Compare Register Rewrite Operation

The following registers are rewritten by reload.

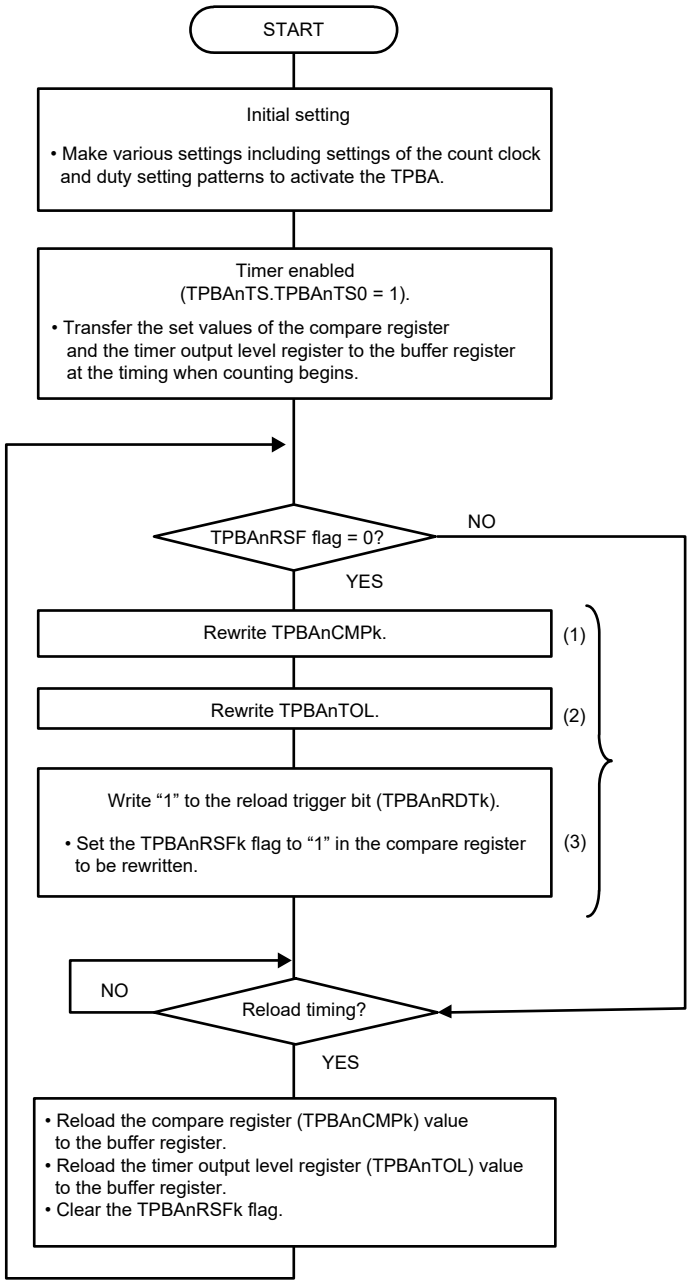
- TPBAnCMP0
- TPBAnCMP1
- TPBAnTOL

Reload mode (simultaneous rewrite function)

Writing to TPBAnRDT enables reload of the registers corresponding to the set bits (sets the reload request flag (TPBAnRSF.TPBAnRSFk)), and the values of all the pertinent registers are updated simultaneously at the next reload timing (reload).

The reload timing of TPBAnCMP0 and TPBAnTOL is set by TPBAnRDM.

The reload timing of TPBAnCMP1 is the match timing (INTTPBAnIPAT) of the 7-bit counter (TPBAnCNT1) and the buffer register (TPBAnCB1) of TPBAnCMP1.



The registers to be reloaded should be rewritten when the reload request flag (TPBAnRFS.TPBAnRSFk) is 0.

NOTE

k = 0, 1

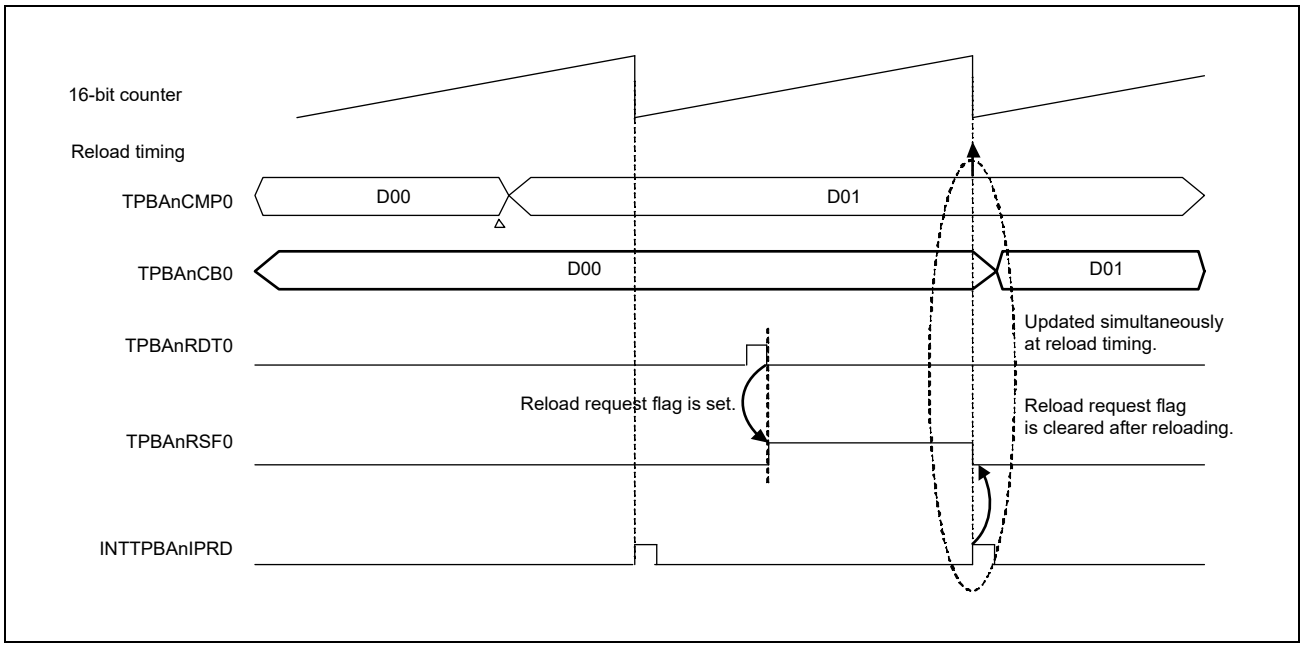
Setting Flow for Registers to Be Reloaded

The rewritten values of the registers to be reloaded (TPBAnCMP0, TPBAnCMP1, and TPBAnTOL) can be transferred to the respective buffer registers simultaneously at the reload timing.

Remark: k = 0, 1

Note: Setting the TPBAnRDTk bit to 1 enables reload. Accordingly, the TPBAnRDTk bit should be rewritten after the registers to be reloaded have been rewritten.

Figure 22.2 Basic Operation Flow of Reload (Simultaneous Rewrite Function)



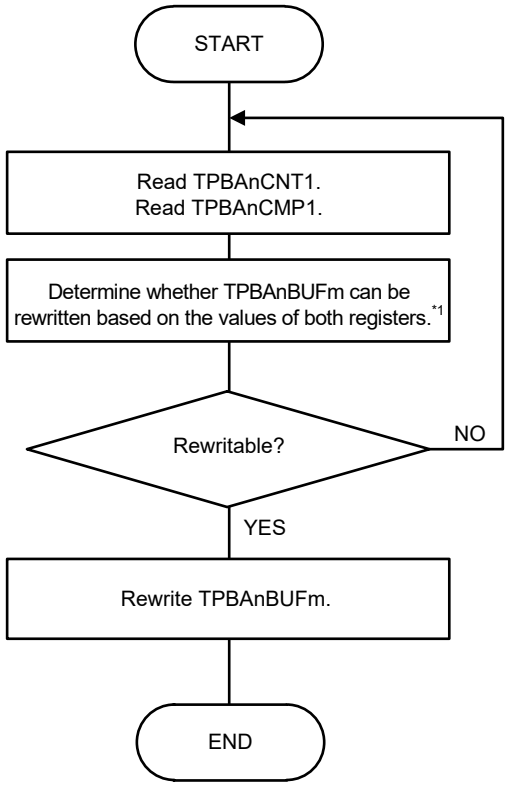


Figure 22.3 Simultaneous Rewrite Timing (TPBAnDPS = 0, TPBAnRDM = 0, and TPBAnTOL = 0)

22.4.3 Duty Rewrite Operation

TPBAnBUFm can be rewritten during operation.

The rewritten setting is reflected immediately.

22.4.3.1 TPBAnBUFm Setting Flow

Note 1. Since TPBAnBUFm can be written at any time, it is recommended that this register is rewritten during last duty cycle output (TPBAnCNT1 = 00_H) of the pattern period (the number of patterns specified by TPBAnCMP1).

Figure 22.4 Basic Rewrite Flow of TPBAnBUFm

22.4.3.2 Access to TPBAnBUFm

TPBAnBUFm is accessed in 16 bit units.

The following shows the access in 16 bits × 64 patterns mode and the access in 8 bits × 128 patterns mode.

- In 16 bits × 64 patterns mode (TPBAnDPS = 0)
  This register is accessed by the CPU in units of one 16-bit pattern.

15 0	
Pattern 64	$00FC_H$
Pattern 63	$00F8_H$
:	:
Pattern 3	0008_H
Pattern 2	0004_H
Pattern 1	0000_H

- In 8 bits × 128 patterns mode (TPBAnDPS = 1)
  This register is accessed by the CPU in units of two 8-bit patterns.

15 8	7 0	
Pattern 128	Pattern127	$00FC_H$
Pattern 126	Pattern125	$00F8_H$
:	:	:
Pattern 6	Pattern 5	0008_H
Pattern 4	Pattern 3	0004_H
Pattern 2	Pattern 1	0000_H

22.4.3.3 Relationship between TPBAnCNT1 Read Value and TPBAnBUFm

The duty value of the currently output PWM waveform can be obtained by reading the TPBAnCNT1 count value during operation. TPBAnBUFm in which the currently output duty value is stored can be found by one of the following formulas.

	Formula		
TPBAnDPS Bit	TPBAnCNT1 ≠ 00_H		TPBAnCNT1 = 00_H
0: 16 bits × 64 patterns mode	TPBAnCNT1 – 01_H*1		TPBAnCMP1*2
1: 8 bits × 128 patterns mode	TPBAnCNT1 value is an odd number	TPBAnCNT1 / 2*3	TPBAnCMP1 / 2*5
	TPBAnCNT1 value is an even number	(TPBAnCNT1 / 2) – 01_H*4	

Note 1. When TPBAnDPS = 0 and the TPBAnCNT1 ≠ 00_H
The applicable register is found by the formula TPBAnCNT1 – 01_H.
(Example) When TPBAnCNT1 = 08_H: 08_H – 01_H = 07_H → TPBA0BUF07

Note 2. When TPBAnDPS = 0 and the TPBAnCNT1 = 00_H
The applicable register is found by the TPBAnCMP1 value.
(Example) When TPBAnCMP1 = 08_H: TPBAnBUF08

Note 3. When TPBAnDPS = 1 and the TPBAnCNT1 = an odd number
The applicable register is found by the formula TPBAnCNT1 / 2
(Example) When TPBAnCNT1 = 07_H: 07_H / 02_H = 03_H → TPBAnBUF03 (lower 8 bits)

Note 4. When TPBAnDPS = 1 and the TPBAnCNT1 = an even number
The applicable register is found by the formula (TPBAnCNT1 / 2) – 01_H.
(Example) When TPBAnCNT1 = 08_H: (08_H / 02_H) – 01_H = 03_H → TPBAnBUF03 (upper 8 bits)

Note 5. When TPBAnDPS = 1 and the TPBAnCNT1 = 00_H
The applicable register is found by the formula TPBAnCMP1 / 2.
(Example) When TPBAnCMP1 = 08_H: 08_H / 2 = 04_H → TPBAnBUF04 (lower 8 bits)

22.4.4 Basic Operation Example

Overview

A PWM signal is output from the TPBAnO pin according to the PWM period set in the TPBAnCMP0 register and duty cycle set in the TPBAnBUF00 to TPBAnBUF63 registers.

Prerequisites

- Select 16 bits × 64 patterns mode or 8 bits × 128 patterns mode by setting TPBAnDPS.
- Set the duty cycle to TPBAnBUF00 to TPBAnBUF63.
- Set the number of patterns to TPBAnCMP1.

Functional description

Set the PWM period, the number of patterns, duty cycle, and level to be output. Set TPBAnTS.TPBAnTS0 = 1 (or input a synchronous start trigger) to start incrementing the timer counter value.

The TPBAnO output is set to the active level at the same time the counting begins. TPBAnCNT1 is incremented, and points to the address of the buffer in which the subsequent duty value is stored.

The output is set to the inactive level by the match of the 16-bit counter and the TPBAnBUFm buffer register (TPBAnCB2).

The duty value is then transferred from TPBAnBUFm to the buffer register (TPBAnCB2) by the match of the 16-bit counter and the TPBAnCMP0 buffer register (TPBAnCB0). Then, TPBAnCNT1 is incremented, and a period-matched detection interrupt (INTTPBAnIPRD) is generated. The TPBAnO output is set to the active level after one count clock.

During counting, a duty-cycle-matched detection interrupt (INTTPBAnIDTY) is generated by the match of the 16-bit counter and the buffer register (TPBAnCB2) of TPBAnBUFm.

A number-of-patterns matched detection interrupt (INTTPBAnIPAT) is generated by the match of the 7-bit counter and the TPBAnCMP1 buffer register (TPBAnCB1).

22.4.4.1 List of Operations

Table 22.22 16-Bit Counter Function

Operation		Setting Condition
16-bit counter	Start	Writing 1 to TPBAnTS or set 1 to simultaneous start trigger.
	Clear	Compare match of TPBAnCMP0 buffer register and 16-bit counter
	Stop	Writing 1 to TPBAnTT

Table 22.23 7-Bit Counter Function

Operation		Setting Condition
7-bit counter	Start	Writing 1 to TPBAnTS or set 1 to simultaneous start trigger.
	Clear	Compare match of TPBAnCMP1 buffer register and 7-bit counter
	Stop	Writing 1 to TPBAnTT

Table 22.24 Functions of Compare Registers and Buffer Registers

Register (Data)	Buffer Register	Rewrite Method	Rewrite During Operation	Function
TPBAnCMP0	TPBAnCB0	Reload	Possible	Setting period
TPBAnCMP1	TPBAnCB1	Reload	Possible	Setting number of patterns
TPBAnBUFm	TPBAnCB2	Rewrite at any time	Possible	Setting duty
TPBAnTOL	TPBAnTOLB	Reload	Possible	Setting output level

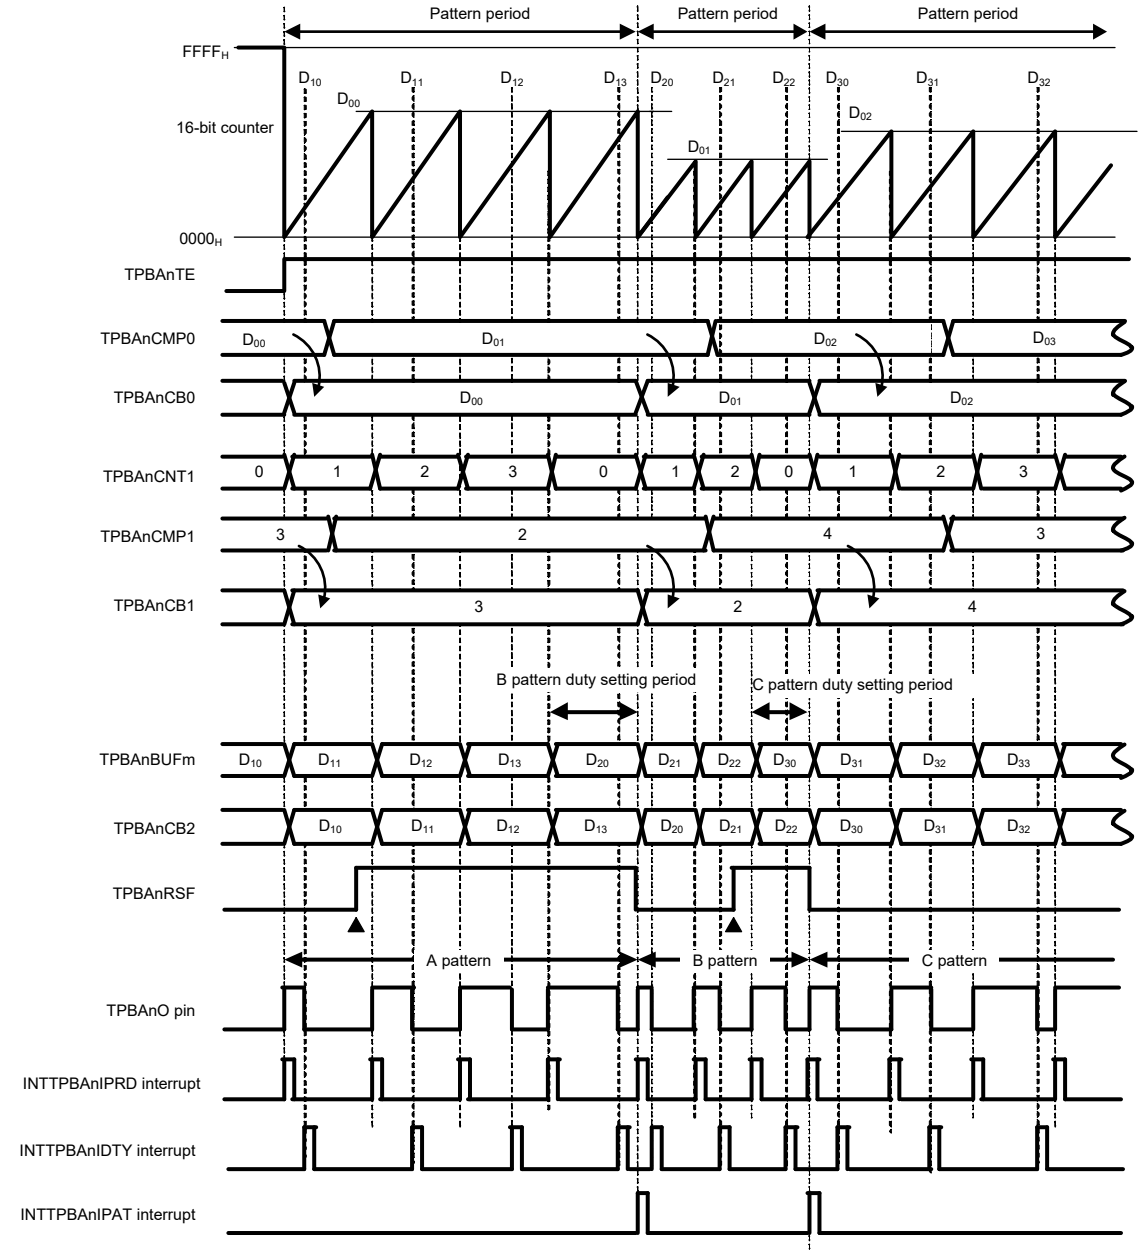
Buffer Registers

The registers that specify period, the number of patterns, duty, and timer output level consist of data registers that a user can directly set and buffer registers that a user cannot directly set.

Table 22.25 Timer Output Function

Pin	Function
TPBAnO	• When output is enabled (TPBAnTOE = 01_H) PWM output by compare match of the TPBAnBUFm buffer register (TPBAnCB2) and the 16-bit counter • When output is disabled (TPBAnTOE = 00_H) TPBAnTO set value

Table 22.26 Interrupt Requests



Interrupt	Function
INTTPBAnIPRD	Period-matched detection interrupt
INTTPBAnIDTY	Duty-cycle-matched detection interrupt
INTTPBAnIPAT	Number-of-patterns matched detection interrupt

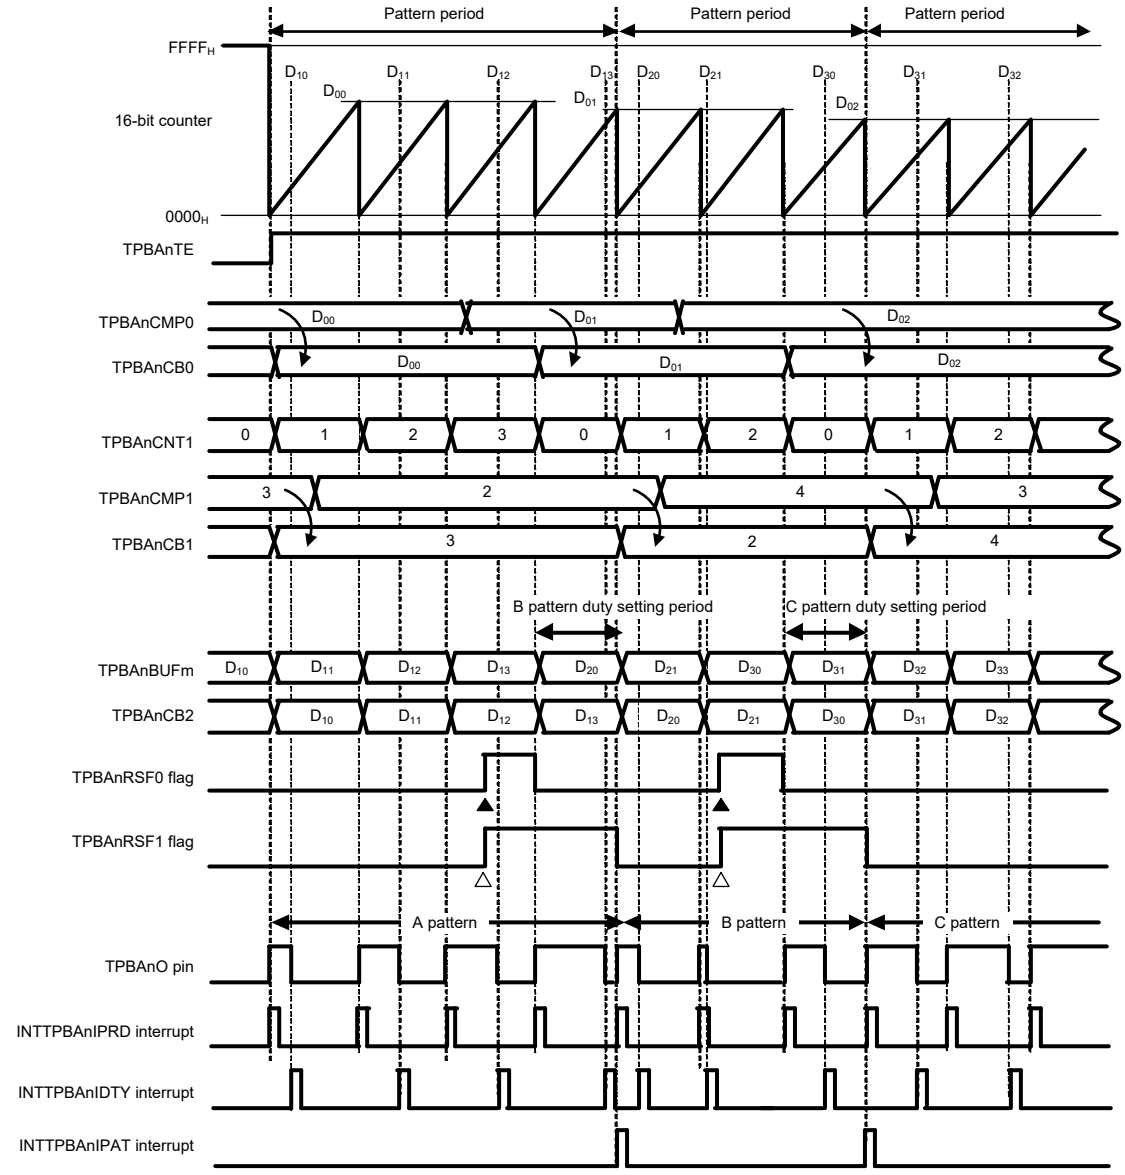
Table 22.27 Compare Match Timing

Compare Match	Timing
TPBAnCMP0	When the value in the 16-bit counter matches with the value in TPBAnCMP0 and changed to 0000_H.
TPBAnCMP1	When the value in the 7-bit counter matches with the value in TPBAnCMP1 and changed to 01_H.
TPBAnBUFm	When the value in the 16-bit counter matches with the value in the buffer register (TPBAnCB2).

Table 22.28 Example of Setting Each Timer Output Condition

Pin	Item	Output Period	Output Duty	
			Output Condition	Setting Condition
TPBAnO	PWM output	(TPBAnCMP0 + 1) × count clock	Outputs an inactive level throughout one period (duty cycle 0%).	TPBAnBUFm = 0000_H
			Outputs an active level of one count clock in one period.	TPBAnBUFm = 0001_H
			Outputs an inactive level of one count clock in one period	TPBAnBUFm = TPBAnCMP0
			Outputs an active level throughout one period (duty cycle 100%).	TPBAnBUFm ≥ TPBAnCMP0 + 1

Note 1. PPWM duty cycle = (TPBAnBUFm) / (TPBAnCMP0 set value + 1)
PWM period = (TPBAnCMP0 set value + 1) × (count clock period)



Note 2. ▲: Writing 1 to TPBAnRDT

Figure 22.5 Example of Basic Timing (1/2)

CAUTION

TPBAnO outputs active level 1 count clock after output of INTTPBAnIPRD and outputs inactive level at INTTPBAnIDTY output timing.

When a number-of-patterns matched detection interrupt is used as a trigger of the TPBAnCMP0 and TPBAnTOL reload timing (TPBAnIRDM.TPBAnRDM0 = 0 and TPBAnTOL = 0)

Note 3. PWM duty cycle = (TPBAnBUFm) / (TPBAnCMP0 set value + 1)
PWM period = (TPBAnCMP0 set value + 1) × (count clock period)

Note 4. ▲: Writing 1 to TPBAnRDT

Note 5. △: Writing 1 to TPBAnRDT1

Figure 22.5 Example of Basic Timing (2/2)

CAUTION

TPBAnO outputs active level 1 count clock after output of INTTPBAnIPRD and outputs inactive level at INTTPBAnIDTY output timing.

When a period-matched detection interrupt is used as a trigger of the TPBAnCMP0 and TPBAnTOL reload timing (TPBAnIRDM.TPBAnRDM0 = 1 and TPBAnTOL = 0)

Section 23 Encoder Timer (ENCA)

This section contains a generic description of the encoder timer (ENCA).

The first part of this section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the ENCA.

23.1 Features of RH850/C1M-A ENCA

23.1.1 Number of Units

This microcontroller has the following number of ENCA units.

Table 23.1 Number of Units

Product Name	RH850/C1M-A
Number of Units	2
Name	ENCAn (n = 0, 1)

Table 23.2 Index

Index	Meaning
n	Throughout this section, the individual ENCA units are identified by the index “n” (n = 0, 1); for example, ENCAnCTL is the ENCAn control register.

23.1.2 Register Base Address

ENCA base addresses are listed in the following table.

ENCA register addresses are given as offsets from the base addresses in general.

Table 23.3 Register Base Address

Base Address Name	Base Address
<ENCA0_base>	FFE8 0000_H
<ENCA1_base>	FF88 1000_H

23.1.3 Clock Supply

The ENCA clock supply is shown in following table.

Table 23.4 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
ENCAn	PCLK	CLKC_HSB (non-modulated high-speed peripheral clock)

23.1.4 Interrupts and DMA / DTS

ENCA interrupt requests are listed in the following table.

Table 23.5 Interrupt Requests

Unit Interrupt Name	Outline	Interrupt Number	DMA Trigger Number*1		DTS Trigger Number*1	
			1st	2nd	1st	2nd
ENCA0						
INTENCA0IOV	Overflow interrupt	166	53	—	53	—

Note 1. 1st: Primary channel, 2nd: Secondary channel

— : No number is assigned.

23.1.5 Reset Sources

ENCA reset sources are listed in the following table. ENCA is initialized by these reset sources.

Table 23.6 Reset Sources

Unit Name	Reset Source
ENCAn	All reset sources

23.1.6 External Input/Output Signals

External input/output signals of ENCA are listed in the following table.

Table 23.7 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
ENCA0		
ENCA0I0	ENCA0 capture trigger input 0	ENCA0TIN0
ENCA0I1	ENCA0 capture trigger input 1*1	ENCA0TIN1
ENCA0E0	ENCA0 encoder input 0*1	ENCA0E0
ENCA0E1	ENCA0 encoder input 1*1	ENCA0E1
ENCA0EC	ENCA0 encoder clear input*1	ENCA0EC
ENCA1		
ENCA1I0	ENCA1 capture trigger input 0	ENCA1TIN0
ENCA1I1	ENCA1 capture trigger input 1*1	ENCA1TIN1
ENCA1E0	ENCA1 encoder input 0*1	ENCA1E0
ENCA1E1	ENCA1 encoder input 1*1	ENCA1E1
ENCA1EC	ENCA1 encoder clear input*1	ENCA1EC

Note 1. These signals are input via the PIC.

23.2 Overview

23.2.1 Functional Overview

- Generation of the counter control signal from the encoder input signal, and counter operation in synchronization with PCLK.
- Capture function for capturing the counter value with an external trigger signal
- Compare function for compare match judgment with the counter value
- Two capture compare registers that can be set separately for capture operation and for compare operation
- Interrupt mask function for masking the interrupt request signal output as a result of compare match judgment during compare operation
- Function for loading the value of the capture compare register to the counter upon underflow occurrence
- Encoder input signal can be applied to the timer counter clearing condition
- Edge or level for clearing the encoder input signal of the timer counter clearing condition can be selected
- Detection of counter overflow and underflow and output of error flags and error interrupts
- Five interrupts: two capture compare interrupts, one counter clear interrupt, one overflow interrupt, and one underflow interrupt.

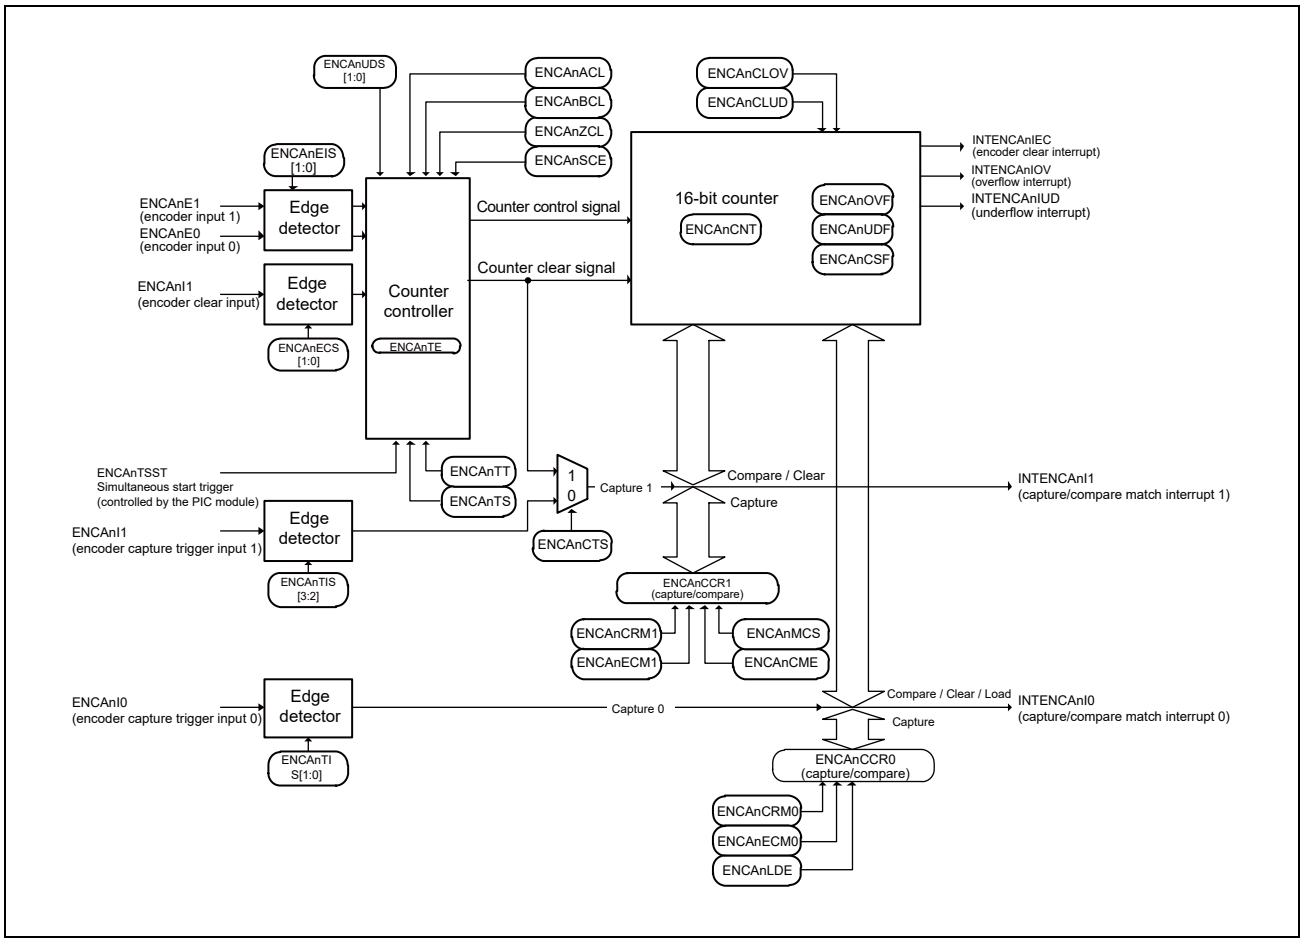

Figure 23.1 Block Diagram of ENCA

23.3 Registers

23.3.1 List of Registers

ENCA registers are listed in the following table.

For details about <ENCAn_base>, see Section **23.1.2, Register Base Address**.

Table 23.8 List of Registers

Module Name	Register Name	Symbol	Address
ENCAn	ENCAn capture compare register 0	ENCAnCCR0	<ENCAn_base>
ENCAn	ENCAn capture compare register 1	ENCAnCCR1	<ENCAn_base> + 04_H
ENCAn	ENCAn counter register	ENCAnCNT	<ENCAn_base> + 08_H
ENCAn	ENCAn status flag register	ENCAnFLG	<ENCAn_base> + $0C_H$
ENCAn	ENCAn status flag clear register	ENCAnFGC	<ENCAn_base> + 10_H
ENCAn	ENCAn timer enable status register	ENCAnTE	<ENCAn_base> + 14_H
ENCAn	ENCAn timer start trigger register	ENCAnTS	<ENCAn_base> + 18_H
ENCAn	ENCAn timer stop trigger register	ENCAnTT	<ENCAn_base> + $1C_H$
ENCAn	ENCAn I/O control register 0	ENCAnIOC0	<ENCAn_base> + 20_H
ENCAn	ENCAn control register	ENCAnCTL	<ENCAn_base> + 40_H
ENCAn	ENCAn I/O control register 1	ENCAnIOC1	<ENCAn_base> + 44_H

23.3.2 ENCAnCTL — ENCAn Control Register

This register is used to configure various operation settings for ENCAn.

Access: This register can be read/written in 16-bit units.

Writing to this register during operation is prohibited.

Address: <ENCAn_base> + 40_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAn CME	ENCAn MCS	—	—	—	—	ENCAn CRM1	ENCAn CRM0	ENCAn CTS	—	—	ENCAn LDE	ENCAn ECM1	ENCAn ECM0	ENCAnUDS[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Table 23.9 ENCAnCTL Register Contents (1/2)

Bit Position	Bit Name	Function
15	ENCAnCME	Encoder Clear Mask Enable This bit is used to enable/disable masking of compare match interrupt detection when the compare function is used. 0: Disables the compare match interrupt (INTENCAnI1) mask function for the ENCAnCCR1 register 1: Enables the compare match interrupt (INTENCAnI1) mask function for the ENCAnCCR1 register. This bit is valid only when ENCAnCRM1 = 0. When this bit is set to 1, setting ENCAnECM1 to 1 is prohibited.
14	ENCAnMCS	Encoder Mask Clear Select This bit is used to select the trigger for cancelling masking of compare match interrupt detection when the compare function is used. This bit is valid only when ENCAnCRM1 = 0. 0: Masking of compare match interrupt detection is cancelled when the ENCAnCCR1 register is written. 1: Masking of compare match interrupt detection is cancelled when one of the following three operations is performed. – Timer counter clearing by encoder clear input – Timer counter clearing upon compare match between ENCAnCNT and ENCAnCCR0 when ENCAnECM0 = 1 – Loading from ENCAnCCR0 to timer counter upon underflow detection when ENCAnLDE = 1
13 to 10	Reserved	When read, the value after reset is read. When writing, write the value after reset.
9	ENCAnCRM1	ENCAnCCR1 Register Mode 0: ENCAnCCR1 used as compare register. 1: ENCAnCCR1 used as capture register.
8	ENCAnCRM0	ENCAnCCR0 Register Mode 0: ENCAnCCR0 used as compare register. 1: ENCAnCCR0 used as capture register.

Table 23.9 ENCAnCTL Register Contents (2/2)

Bit Position	Bit Name	Function
7	ENCAnCTS	ENCAnCCR1 Capture Trigger Select This is a trigger selection bit for the capture operation to the ENCAnCCR1 register. This bit is valid only when ENCAnCRM1 = 1. 0: Uses ENCAnI1 of capture trigger 1 signal as the trigger for capturing to the ENCAnCCR1 register. 1: Uses the counter clear signal selected with ENCAnSCE as the trigger for capturing to the ENCAnCCR1 register.
6, 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4	ENCAnLDE	ENCAn Counter Load Enable This bit is used to enable/disable loading of the setting value to the counter upon underflow occurrence. This bit is valid only when ENCAnCRM0 = 0. When ENCAnCRM0 = 1, loading of the ENCAnCCR0 register setting value to the counter upon occurrence of an underflow is not performed, regardless of the value of this bit. 0: Disable loading of ENCAnCCR0 register setting value to counter upon occurrence of a counter underflow. 1: Enable loading of ENCAnCCR0 register setting value to counter upon occurrence of a counter underflow.
3	ENCAnECM1	Encoder Clear Mode 1 This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR1 setting value. This bit is valid only when ENCAnCRM1 = 0. 0: Does not clear the counter to 0000_H upon match of timer counter value and ENCAnCCR1 setting value. 1: Clears the counter to 0000_H upon match of timer counter value and ENCAnCCR1 setting value if the next counting operation is down-counting.
2	ENCAnECM0	Encoder Clear Mode 0 This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR0 setting value. This bit is valid only when ENCAnCRM0 = 0. 0: Does not clear the counter to 0000_H upon match of timer counter value and 0: Does not clear the counter to 0000_H upon match of timer counter value and ENCAnCCR0 setting value. 1: Clears the counter to 0000_H upon match of timer counter value and ENCAnCCR0 setting value if the next counting operation is up-counting.
1, 0	ENCAnUDS[1:0]	Up/Down Count Selection 1 and 0 These bits are the counter up/down control bits using ENCAnE0 and ENCAnE1. 00: Upon detection of effective edge of ENCAnE0, – down-count when ENCAnE1 = H, – up-count when ENCAnE1 = L 01: Upon detection of effective edge of ENCAnE0, up-count, Upon detection of effective edge of ENCAnE1, down-count 10: At rising edge of ENCAnE0, down-count At falling edge of ENCAnE0, up-count However, counting is performed only when ENCAnE1 = L. 11: Detection of both edges of ENCAnE0, ENCAnE1. Judgment of counter operation combining both detected edge and level.

23.3.3 ENCAnIOC0 — ENCAn I/O Control Register 0

This register is used to select the input edge of capture triggers 0 and 1 (ENCAnI0, ENCAnI1).

Access: This register can be read/written in 8-bit units.

Address: <ENCAn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	ENCAnTIS[3:2]		ENCAnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 23.10 ENCAnIOC0 Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3, 2	ENCAnTIS[3:2]	Input Edge Selection for Capture Trigger 1 These bits are valid only when the ENCAnCTL register's ENCAnCRM1 = 1 and ENCAnCTS = 0. All other settings of ENCAnCRM1 and ENCAnCTS are invalid. 00: No edge detection 01: Detection of the rising edge 10: Detection of the falling edge 11: Detection of both edges
1, 0	ENCAnTIS[1:0]	Input Edge Selection for Capture Trigger 0 These bits are valid only when ENCAnCTL.ENCAnCRM0 = 1. 00: No edge detection 01: Detection of the rising edge 10: Detection of the falling edge 11: Detection of both edges

23.3.4 ENCAnIOC1 — ENCAn I/O Control Register 1

This register is used to perform the clear condition setting and edge selection upon encoder input.

Access: This register can be read/written in 8-bit units.
Writing to this register during operation is prohibited.

Address: <ENCAn_base> + 44_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ENCAnSCE	ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnECS[1:0]		ENCAnEIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.11 ENCAnIOC1 Register Contents (1/2)

Bit Position	Bit Name	Function
7	ENCAnSCE	Encoder Special-Clear Enable When setting this bit to 1, set both ENCAnUDS1 and ENCAnUDS0 to either 10_B or 11_B. The operation is not guaranteed if this bit is set to 1 with ENCAnUDS1 and ENCAnUDS0 set to 00_B or 01_B. 0: Clears the counter upon detection of ENCAnEC effective edge (set with ENCAnECS1 and ENCAnECS0). 1: Clears the counter upon detection of input level condition of ENCAnEC, ENCAnE1 and ENCAnE0 (set with ENCAnZCL bit, ENCAnBCL bit, and ENCAnACL bit).
6	ENCAnZCL	Input-Z Clear Condition Selection This bit is used to set the condition for clearing by encoder clear input (ENCAnEC) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
5	ENCAnBCL	Input-B Clear Condition Selection This bit is used to set the condition for clearing by encoder input 1 (ENCAnE1) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
4	ENCAnACL	Input-A Clear Condition Selection This bit is used to set the condition for clearing by encoder input 0 (ENCAnE0) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level

Table 23.11 ENCAnIOC1 Register Contents (2/2)

Bit Position	Bit Name	Function
3, 2	ENCAnECS[1:0]	Encoder Clear Input Edge Selection 1 and 0 These are the encoder clear input edge selection bits. These bits are valid only when ENCAnSCE = 0; they are invalid when ENCAnSCE = 1. 00: No edge detection 01: Detection of the rising edge 10: Detection of the falling edge 11: Detection of both edges
1, 0	ENCAnEIS[1:0]	Encoder Edge Input Selection 1 and 0 These are the encoder input edge selection bits. These bits are valid when ENCAnUDS1 and ENCAnUDS0 = 00_B or 01_B, and are invalid when ENCAnUDS1 and ENCAnUDS0 = 10_B or 11_B. 00: No edge detection 01: Detection of the rising edge 10: Detection of the falling edge 11: Detection of both edges

23.3.5 ENCAnFLG — ENCAn Status Flag Register

This register holds the status flags of the timer counter of ENCAn.

Access: This register can only be read in 8-bit units.

Address: <ENCAn_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENCAnCSF	ENCAnUDF	ENCAnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 23.12 ENCAnFLG Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is read.
2	ENCAnCSF	Counter Status Flag This bit reflects the current timer counter operation. 0: Timer counter is in up-count status 1: Timer counter is in down-count status
1	ENCAnUDF	Underflow Flag This bit reflects the occurrence of an underflow during the timer counter operation. This bit is cleared at the start of counting. 0: This flag is cleared upon any of the following events: – 1 is written to ENCAnFGC.ENCAnCLUD – The flag is cleared to 0 by setting the ENCAnTS bit to 1 when ENCAnTE = 0 or by setting the simultaneous start trigger input (ENCAnTSST signal) to “High”. 1: This flag is set to 1 upon occurrence of an underflow during the encoder timer counting.
0	ENCAnOVF	Overflow Flag This bit reflects the occurrence of an overflow during the timer counter operation. This bit is cleared at the start of counting. 0: This flag is cleared upon any of the following events: – 1 is written to ENCAnFGC.ENCAnCLOV – The flag is cleared to 0 by setting the ENCAnTS bit to 1 when ENCAnTE = 0 or by setting the simultaneous start trigger input (ENCAnTSST signal) to “High”. 1: This flag is set to 1 upon occurrence of an overflow during the encoder timer counting.

23.3.6 ENCAnFGC — ENCAn Status Flag Clear Register

This register is used to clear the timer counter status flags of ENCAnFLG.

Access: This register can only be written in 8-bit units.
This register is always read as 00_H.

Address: <ENCAn_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ENCAnCLUD	ENCAnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 23.13 ENCAnFGC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	ENCAnCLUD	Underflow Flag Clear This bit clears the underflow flag. 0: Writing is ignored. 1: Clears ENCAnUDF of the ENCAnFLG register (clears underflow detection).
0	ENCAnCLOV	Overflow Flag Clear This bit clears the overflow flag. 0: Writing is ignored. 1: Clears ENCAnOVF of the ENCAnFLG register (clears overflow detection).

23.3.7 ENCAnCCR0 — ENCAn Capture Compare Register 0

This register is a 16-bit capture compare register 0.

Access: This register can be read/written in 16-bit units.
When used as a capture register, this register is only readable. Writing to this register is ignored.
When used as a compare register, this register is readable/writable.

Address: <ENCAn_base> + 00_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCCR0[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.14 ENCAnCCR0 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCCR0 [15:0]	Capture Compare Register 0 Upon occurrence of an underflow, the setting value of this register may be loaded to the counter according to the ENCAnCTL.ENCAnLDE setting. See the description of the ENCAnLDE bit in ENCA control register ENCAnCTL for details. • If ENCAnCTL.ENCAnCRM0 = 0: ENCAnCCR0 is compare register. Set the value to be compared with the timer counter value. • If ENCAnCTL.ENCAnCRM0 = 1: ENCAnCCR0 is capture register. The captured timer counter value is stored.

23.3.8 ENCAnCCR1 — ENCAn Capture Compare Register 1

This register is a 16-bit capture compare register 1.

Access: This register can be read/written in 16-bit units.
When used as a capture register, this register is only readable. Writing to this register is ignored.
When used as a compare register, this register is readable/writable.

Address: <ENCAn_base> + 04_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCCR1[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.15 ENCAnCCR1 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCCR1 [15:0]	Capture Compare Register 1 During capture operation, the trigger for capturing to this register differs according to the ENCAnCTL.ENCAnCTS setting. See the description of the ENCAnCTS bit in ENCA control register ENCAnCTL for details. • If ENCAnCTL.ENCAnCRM1 = 0: ENCAnCCR1 is compare register. Set the value to be compared with the timer counter value. • If ENCAnCTL.ENCAnCRM1 = 1: ENCAnCCR1 is capture register. The captured timer counter value is stored.

23.3.9 ENCAnCNT — ENCAn Counter Register

This register is the 16-bit timer counter register.

Access: This register can be read/written in 16-bit units.
This register can be written only when the operation is stopped.

Address: <ENCAn_base> + 08_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCNT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.16 ENCAnCNT Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCNT [15:0]	Counter Register • ENCAnTE.ENCAnTE status: 0 (initial setting): Counting stops. An arbitrary value can be set to timer counter. • ENCAnTE.ENCAnTE status: 0 → 1 (operation start)): Counting starts. Counting up or down is started with the set arbitrary value. • ENCAnTE.ENCAnTE status: 1 (operating): Counting Counting up or down is performed. • ENCAnTE.ENCAnTE status: 1 → 0 (stopped): Counting stops. The counter value immediately before the operation was stopped is held, and counting is stopped.

23.3.10 ENCAnTE — ENCAn Timer Enable Status Register

This register indicates the operating status of ENCAn.

Access: This register can only be read in 8-bit units.

Address: <ENCAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 23.17 ENCAnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read.
0	ENCAnTE	Timer Status Enable This is a status bit that indicates the operation enabled/stopped status of ENCAn. This bit is cleared to 0 when 1 is written to ENCAnTT.ENCAnTT. This bit is set to 1 when 1 is written to ENCAnTS.ENCAnTS or when the input signal of ENCAnTSST is set to the high level. 0: Operation stopped status 1: Operation enabled status

23.3.11 ENCAnTS — ENCAn Timer Start Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation enabled state.

Access: This register can only be written in 8-bit units.
This register is always read as 00_H. This register can be written only when ENCAnTE.ENCAnTE is 0.

Address: <ENCAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 23.18 ENCAnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ENCAnTS	Timer Start Trigger This is the trigger bit that sets the ENCAn to the operation enabled state. 0: Writing is ignored. 1: The ENCAn is set to the operation enabled state by setting ENCAnTE.ENCAnTE = 1.

23.3.12 ENCAnTT — ENCAn Timer Stop Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation stopped state.

Access: This register can only be written in 8-bit units.
This register is always read as 00_H.

Address: <ENCAn_base> + $1C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 23.19 ENCAnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ENCAnTT	Timer Stop Trigger This is the trigger bit that sets the ENCAn to the operation stopped state. 0: Writing is ignored. 1: Clears ENCAnTE.ENCAnTE to 0 to set the ENCAn to the counter operation stopped state.

23.4 Functions

The ENCAn operates the timer counter with counter up/down control and clear control by encoder inputs. The ENCAnCCR0 and ENCAnCCR1 registers can be used as dedicated compare registers or as dedicated capture registers.

23.4.1 Timer Counter Operation

The timer counter operations of the ENCAn are described below.

The figure below shows the operation phases. See the corresponding section with the section number for detailed descriptions on each operation.

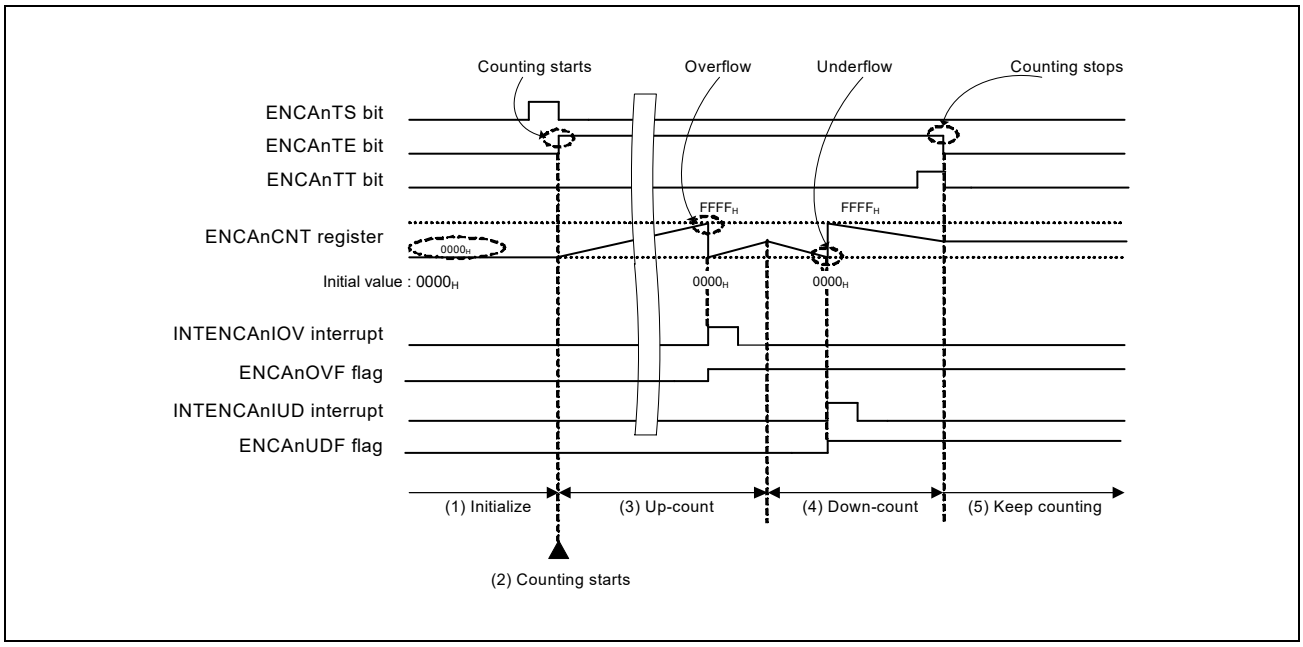

Figure 23.2 Timer Counter Initial Value Setting/Start/Stop

(1) Timer counter initial value setting

The initial value of the ENCAn counter register (ENCAnCNT) can be set in the counter operation stopped status (ENCAnTE = 0).

(2) Timer counter startup

By writing 1 to the timer start trigger bit (ENCAnTS), the timer status enable bit (ENCAnTE) is set to 1, the counter operation is enabled, and counting operation is performed upon detection of the effective edge of the encoder input.

(3) Overflow operation

An overflow occurs when up-counting is performed when the counter value is $FFFF_H$. If the counter value changes from $FFFF_H$ to 0000_H, an overflow interrupt (INTENCAnIOV) is generated, and the overflow flag (ENCAnOVF) is set to 1. The overflow flag (ENCAnOVF) is cleared to 0 when 1 is set to the overflow flag clear bit (ENCAnCLOV). For details about the operation, see **Section 23.6.6, Overflow Occurrence and Overflow Flag Clear Operation**.

(4) Underflow operation

An underflow occurs when down-counting is performed when the counter value is 0000_H. If the counter value changes from 0000_H to $FFFF_H$, an underflow interrupt (INTENCAnIUD) is generated, and the underflow flag (ENCAnUDF) is set to 1. The underflow flag (ENCAnUDF) is cleared to 0 when 1 is set to the underflow flag clear bit (ENCAnCLUD). For details about the operation, see **Section 23.6.7, Underflow Occurrence and Underflow Flag Clear Operation**.

(5) Timer counter stop

By writing 1 to the timer stop trigger bit (ENCAnTT), the timer status enable bit (ENCAnTE) is cleared to 0, and counting is stopped. At this time, the timer counter is not reset to 0000_H and holds the value before counting stops.

23.4.2 Up/Down Control of Timer Counter

Up/down control is performed by judging the phase of the encoder inputs (ENCAnE0, ENCAnE1) according to the settings of the ENCAnUDS1 and ENCAnUDS0 bits.

23.4.2.1 When ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 00_B

Table 23.20 When ENCAnUDS1 and ENCAnUDS0 Bits = 00_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 Pin	ENCAnE1 Pin	Counting Operation
0	0	Rising edge	High level	Down
		Falling edge		
		Both edges		
		Rising edge	Low level	Up
		Falling edge		
		Both edges		

The effective edge of the signal on the ENCAnE0 pin is specified by setting the ENCAnEIS1 and ENCAnEIS0 bits.

The timer starts counting up/down according to the condition of the edges and levels of the ENCAnE0 and ENCAnE1 pins.

The following timing chart shows the counter operation when the ENCAnUDS1 and ENCAnUDS0 bits = 00_B.

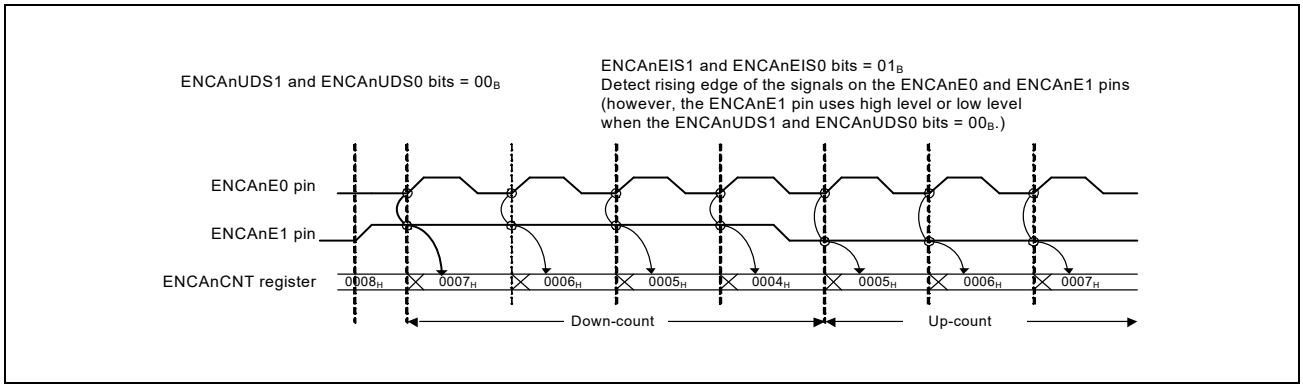

Figure 23.3 Counter Operation when ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 00_B

23.4.2.2 When ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 01_B

Table 23.21 When ENCAnUDS1 and ENCAnUDS0 Bits = 01_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 Pin	ENCAnE1 Pin	Counting operation
0	1	Low level	Rising edge	Down
			Falling edge	
			Both edges	
		High level	Rising edge	
			Falling edge	
			Both edges	
		Rising edge	Low level	Up
		Falling edge		
		Both edges		
		Rising edge	High level	
		Falling edge		
		Both edges		
		Simultaneous input		Hold

The effective edges of the signals on the ENCAnE0 and ENCAnE1 pins are specified by setting the ENCAnEIS1 and ENCAnEIS0 bits.

The timer starts counting up/down according to the condition of the edges and levels of the ENCAnE0 and ENCAnE1 pins. When effective edges coincide, the counter keeps counting.

The following timing chart shows the counter operation when the ENCAnUDS1 and ENCAnUDS0 bits = 01_B.

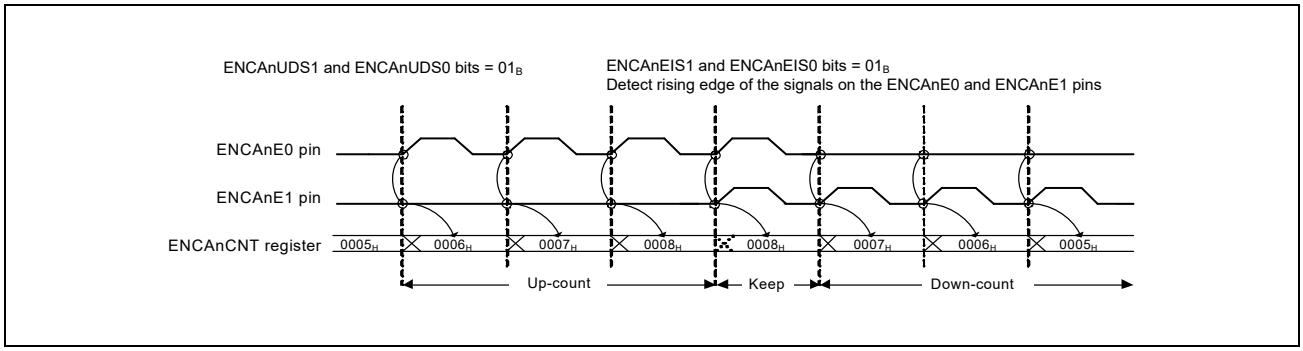

Figure 23.4 Counter Operation when ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 01_B

23.4.2.3 When ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 10_B

Table 23.22 When ENCAnUDS1 and ENCAnUDS0 Bits = 10_B

		Operation Description		
ENCAnUDS1	ENCAnUDS0	ENCAnE0 Pin	ENCAnE1 Pin	Counting Operation
1	0	Rising edge	Low level	Down
		Rising edge	Falling edge	
		Falling edge	Low level	Up
		Falling edge	Falling edge	
		Low level	Rising edge	Hold
		Rising edge	Rising edge	
		High level	Rising edge	
		Falling edge	Rising edge	
		Low level	Falling edge	
		Rising edge	High level	
		High level	Falling edge	
		Falling edge	High level	

Specifying effective edges of the signals on the ENCAnE0 and ENCAnE1 pins (by setting the ENCAnEIS1 and ENCAnEIS0 bits) is invalid.

The following timing chart shows the counter operation when the ENCAnUDS1 and ENCAnUDS0 bits = 10_B.

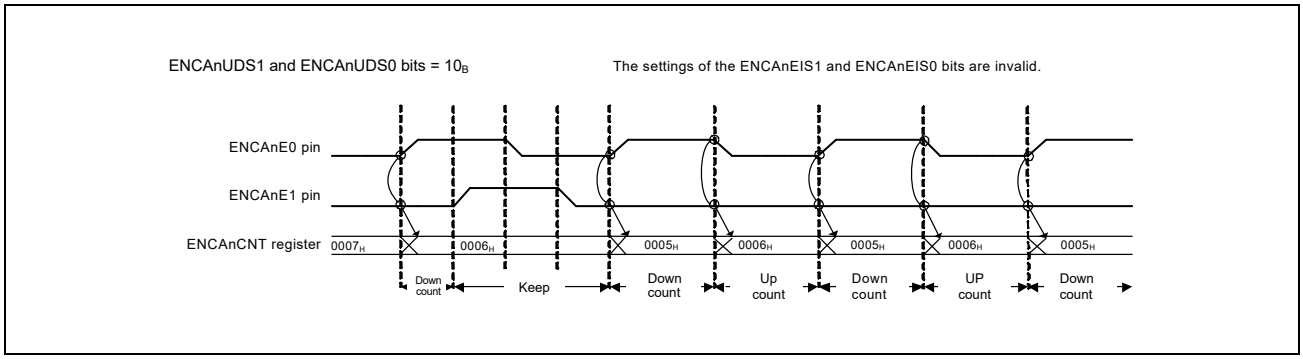

Figure 23.5 Counter Operation when ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 10_B

23.4.2.4 When ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 11_B

Table 23.23 When ENCAnUDS1 and ENCAnUDS0 Bits = 11_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 Pin	ENCAnE1 Pin	Counter Operation
1	1	Low level	Falling edge	Down
		Rising edge	Low level	
		High level	Rising edge	
		Falling edge	High level	
		Rising edge	High level	Up
		High level	Falling edge	
		Falling edge	Low level	
		Low level	Rising edge	
		Simultaneous input		Hold

Specifying effective edges of the signals on the ENCAnE0 and ENCAnE1 pins (by setting the ENCAnEIS1 and ENCAnEIS0 bits) is invalid. The counter value is held when the effective edges of the signals on the ENCAnE0 and ENCAnE1 pins coincide.

The following timing chart shows the counter operation when the ENCAnUDS1 and ENCAnUDS0 bits = 11_B.

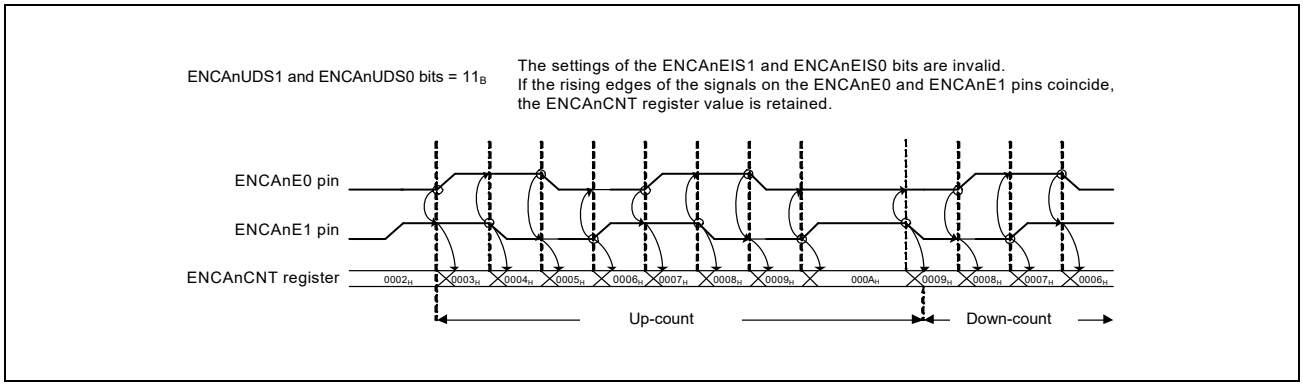

Figure 23.6 Counter Operation when ENCAnUDS1 and ENCAnUDS0 Bits in ENCAnCTL = 11_B

23.4.3 Timer Counter Clear Control by Encoder Input

The timer counter is cleared to 0000_H by the encoder clearing input signal (signal on ENCAnEC).
Two types of clearing methods can be selected by controlling the ENCAnSCE, ENCAnZCL, ENCAnBCL, ENCAnACL, ENCAnECS1, and ENCAnECS0 bits of the ENCAnIOC1 register.

Table 23.24 Timer Counter Clear Control by Encoder Input

Clearing Method	ENCAnSCE	ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnECS1, ENCAnECS0
See **23.4.3.1**	0	Invalid	Invalid	Invalid	Valid
See **23.4.3.2**	1	Valid	Valid	Valid	Invalid

23.4.3.1 Clearing Method when ENCAnSCE = 0

- Upon detection of the effective edge of ENCAnEC, the timer counter is cleared to 0000_H in synchronization with the operation clock.
- The effective edge of ENCAnEC is specified by the setting of the ENCAnECS1 and ENCAnECS0 bits.
- The settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits are invalid.
- An encoder clear interrupt request signal (INTENCAnIEC) is output simultaneously with timer counter clearing.

For details about clear operation when ENCAnSCE = 0, see the timing chart in **Section 23.6.24, Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0**.

23.4.3.2 Clearing Method when ENCAnSCE = 1

- When the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs are detected, the timer counter is cleared to 0000_H in synchronization with the operating clock.
- Specify the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs by setting the ENCAnZCL, ENCAnBCL, and ENCAnACL bits.
- The settings of the ENCAnECS1 and ENCAnECS0 bits are invalid.
- An encoder clear interrupt request signal (INTENCAnIEC) is output simultaneously with timer counter clearing.
- For details about the clear operation when ENCAnSCE = 1, see the timing charts from **Section23.6.23.2, When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count** to **Section 23.6.23.5, When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count**.

The clearing conditions of the timer counter according to the ENCAnZCL, ENCAnBCL, and ENCAnACL settings are listed in the table below.

Table 23.25 Clearing Conditions of the Timer Counter

Counter Clearing Condition Setting			Encoder Pin Input Level		
ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnEC	ENCAnE1	ENCAnE0
0	0	0	Low	Low	Low
0	0	1	Low	Low	High
0	1	0	Low	High	Low
0	1	1	Low	High	High
1	0	0	High	Low	Low
1	0	1	High	Low	High
1	1	0	High	High	Low
1	1	1	High	High	High

23.4.4 Functions of ENCAnCCR0

23.4.4.1 Compare Function

- When ENCAnCRM0 = 0, the ENCAnCCR0 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR0 setting value, a compare 0 match interrupt (INTENCAnI0) is output.
- When ENCAnECM0 = 1, the timer counter is cleared to 0000_H in synchronization with the operating clock upon compare match if the next counting operation is up-count.

Table 23.26 Compare Function of ENCAnCCR0

ENCAnCCR0 Function	Compare Match Clear Control		Timer Counter Clearing Upon Compare Match with ENCAnCCR0
ENCAnCRM0	ENCAnECM0	Next Counting Operation	
0 (Compare)	0	Up-count	Does not clear (continues counter operation).
		Down-count	
	1	Up-count	Clears timer counter to 0000_H.
		Down-count	Does not clear (continues counter operation).

When ENCAnLDE = 1

- Upon occurrence of an underflow, the setting value of the ENCAnCCR0 register is loaded to the timer counter.
- An underflow interrupt (INTENCAnIUD) is output.

NOTE

For details about the timing chart when ENCAnLDE = 1, see the description from **Section 23.6.13, Using the ENCAnLDE Function Immediately after Startup** to **Section 23.6.17, Up-counting after Conflict between ENCAnLDE Function (loading counter value) and Clear Operation by Encoder Clear Input**.

23.4.4.2 Capture Function

- When ENCAnCRM0 = 1, the ENCAnCCR0 register functions as a dedicated capture register.
- Upon effective edge detection of the capture trigger input 0 (ENCAnI0), the value of the timer counter is stored into ENCAnCCR0.
- A capture 0 interrupt (INTENCAnI0) is output during capture operation.

NOTE

For details about capture operation for ENCAnCCR0, see the timing charts in **Section 23.6.19, Capture Operation between Counter Clocks (ENCAnCCR0)** and **Section 23.6.22, Encoder Operation when Compare Match Clear Control is Disabled**.

23.4.5 Functions of ENCAnCCR1

23.4.5.1 Compare Function

- When ENCAnCRM1 = 0, the ENCAnCCR1 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR1 setting value, a compare 1 match interrupt (INTENCAnI1) is output.
- When ENCAnECM1 = 1, the timer counter is cleared to 0000_H in synchronization with the operating clock upon compare match if the next counting operation is down-count.

Table 23.27 Compare Function of ENCAnCCR1

ENCAnCCR1 Function	Compare Match Clear Control		Timer Counter Clearing upon Compare Match with ENCAnCCR1
ENCAnCRM1	ENCAnECM1	Next Counting Operation	
0 (Compare)	0	Up-count	Does not clear (continues counting).
		Down-count	
	1	Up-count	Does not clear (continues counting).
		Down-count	Clears timer count to 0000_H.

Compare match interrupt mask function

- When ENCAnCME = 1, the compare 1 match interrupt mask function is enabled. In this state, the compare 1 match interrupt is output upon the first match of the value of the timer counter and the ENCAnCCR1 setting value, and interrupts are then masked for the second and subsequent compare matches.
- When ENCAnCME = 1 and ENCAnMCS = 0, a compare 1 match interrupt is output once upon the first compare match by writing to the ENCAnCCR1 register (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCAnCME = 1 and ENCAnMCS = 1, a compare 1 match interrupt is output once upon the first compare match by a timer counter clear operation by the encoder clearing input signal or by a timer counter clear operation upon match between the ENCAnCCR0 register value and the timer counter value (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCAnCME = 1, ENCAnMCS = 1 and ENCAnLDE = 1, a compare 1 match interrupt is output once upon the first compare match by a loading operation of the ENCAnCCR0 register to the timer counter upon underflow detection (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- Setting ENCAnECM1 to 1 is prohibited when enabling the compare 1 match interrupt mask function.

Table 23.28 Compare Match Interrupt Mask Function

ENCAnCCR1 Function	Compare 1 Match Interrupt Mask	Interrupt Mask Cancel Trigger	Compare 1 Match Interrupt Output upon Compare Match with ENCAnCCR1
ENCAnCRM1	ENCAnCME	ENCAnMCS	
0 (Compare)	0 (Mask function disabled)	— (Setting invalid)	Outputs compare 1 match interrupt upon each compare match.
	1 (Mask function enabled)	0 (Write operation to ENCAnCCR1)	Outputs compare 1 match interrupt once upon the first compare match. (Interrupts are masked for the second and subsequent matches until the cancel trigger occurs.)
		1 (Timer counter clear operation) (Loading from ENCAnCCR0 to timer counter upon underflow when ENCAnLDE = 1)	

23.4.5.2 Capture Function

When ENCAnCRM1 = 1, the ENCAnCCR1 register functions as a dedicated capture register.

NOTE

For details about capture operation to ENCAnCCR1, see the timing chart in **Section 23.6.18, Capture Operation between Counter Clocks (ENCAnCCR1)**.

The operations for each of the ENCAnCTS settings are shown in the table below.

Table 23.29 Capture Function of ENCAnCTS

ENCAnCCR1 Function	Capture Trigger Selection	Capture Trigger Signal	Timer Counter Clearing	Interrupt Occurrence
ENCAnCRM1	ENCAnCTS			
1 (Capture)	0	Capture trigger 1 input (ENCAnI1)	Does not clear timer counter.	(1) Capture 1 interrupt (INTENCAnI1)
	1	Encoder clear input (set with ENCAnSCE)	Clears timer counter.	(1) Capture 1 interrupt (INTENCAnI1) (2) Encoder clear interrupt (INTENCAnIEC)

NOTE

For details about the timing chart when ENCAnCTS = 0 or ENCAnCTS = 1, see the following:

Section 23.6.8, Counter Clearing and Capture Operation by Encoder Clear Input (ENCAnEC pin), **Section 23.6.9,** Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin), **Section 23.6.10,** Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin), **Section 23.6.16,** Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC pin), and **Section 23.6.17, Up-counting after Conflict between ENCAnLDE Function (loading counter value) and Clear Operation by Encoder Clear Input**.

23.4.5.3 Timer Counter Clearing upon Compare Register Match

Clearing of the timer counter upon compare match between the value of the timer counter and the setting of ENCAnCCR0 or ENCAnCCR1, according to the settings of the ENCAnECM1 and ENCAnECM0 bits in ENCAnCTL, is detailed in the following table.

Table 23.30 Timer Counter Clearing Operation upon Compare Register Match

ENCAnECM1 and ENCAnECM0	Next Counting Operation	Timer Counter Clearing upon Compare Match with ENCAnCCR1	Timer Counter Clearing upon Compare Match with ENCAnCCR0
00	Up-count	Does not clear (continues counting).	Does not clear (continues counting).
	Down-count	Does not clear (continues counting).	Does not clear (continues counting).
01	Up-count	Does not clear (continues counting).	Clears timer counter to 0000_H.
	Down-count	Does not clear (continues counting).	Does not clear (continues counting).
10	Up-count	Does not clear (continues counting).	Does not clear (continues counting).
	Down-count	Clears timer counter to 0000_H.	Does not clear (continues counting).
11	Up-count	Does not clear (continues counting).	Clears timer counter to 0000_H.
	Down-count	Clears timer counter to 0000_H.	Does not clear (continues counting).

23.4.6 Starting and Stopping the Timer Counter

23.4.6.1 Starting the Timers

This product has two encoder timers, for which independent or synchronized operation is selectable.

In the case of independent operation, operation is started by setting the ENCAnTS bits in the respective ENCAnTS registers to 1.

Synchronous operation and simultaneous start with other timers are possible by setting the PIC. For details, see **Section 24.2.3.1, Simultaneous Start Trigger Function**.

23.4.6.2 Stopping the Timers

Setting the ENCAnTT bit in the ENCAnTT register of a given encoder timer to 1 causes the ENCAnTE bit in the ENCAnTE register to be set to 0.

Writing to the ENCAnTT bits in the ENCAnTT registers of the individual encoder timers will lead to each encoder timer stopping with different timing, creating a possible margin of error in the held counter values. Therefore, when resuming operation after it has been stopped, the value in the counter must be re-set or corrected as in the examples below.

Example 1: Remaking the Counter Setting Prior to Restarting Operation

Condition:	Input on the ENCAnEC pin while two encoder timers are operating with common ENCAnE0 and ENCAnE1 pins.
Restart procedure:	Execute simultaneous restarting by setting the encoder timers to the same value. Setting the timers to the same value eliminates errors in the counted value due to operation being stopped and allows restarting of the operation.

Example 2: Correcting the Counter Setting Prior to Restarting Operation

Condition:	Input on the ENCAnEC pin while two encoder timers are operating with separate ENCAnE0 and ENCAnE1 pins.
Restart procedure:	Execute simultaneous restarting by calculating the difference between the values of the counters in the respective encoder timers and compensate for the difference in setting the counters for simultaneous restarting. Since the information of the CPU includes the information on the differences between the values of the counters of the encoder timers, operation can be restarted by correcting the error in the counter value that arose when operation was stopped, i.e. by calculating the difference and setting corrected values.

23.4.6.3 Example of Connection when Two ENCAn Units are Used

To simultaneously operate the counters of the two ENCAn units, make the same settings in the ENCAnUDS[1:0] bits in the ENCAnIOC1 register and the ENCAnCTL register.

When using ENCAnCCR0 as the comparison register for the two ENCAn units, set the same value in the ENCAnCCR0 registers and the ENCAnECM0 and ENCAnLDE bits of the two ENCAn units.

When using ENCAnCCR1 as the comparison register for the two ENCAn units, set the same value in the ENCAnECM1 registers of the two ENCAn units.

Without the settings described above, different counter values will be used and synchronous operation of two ENCAn units is not possible.

An example where two units of ENCAn are installed is shown below.

This setting example assumes the use of the ENCAnCCR0 register as a comparison register, and the ENCAnCCR1 register as a capture register.

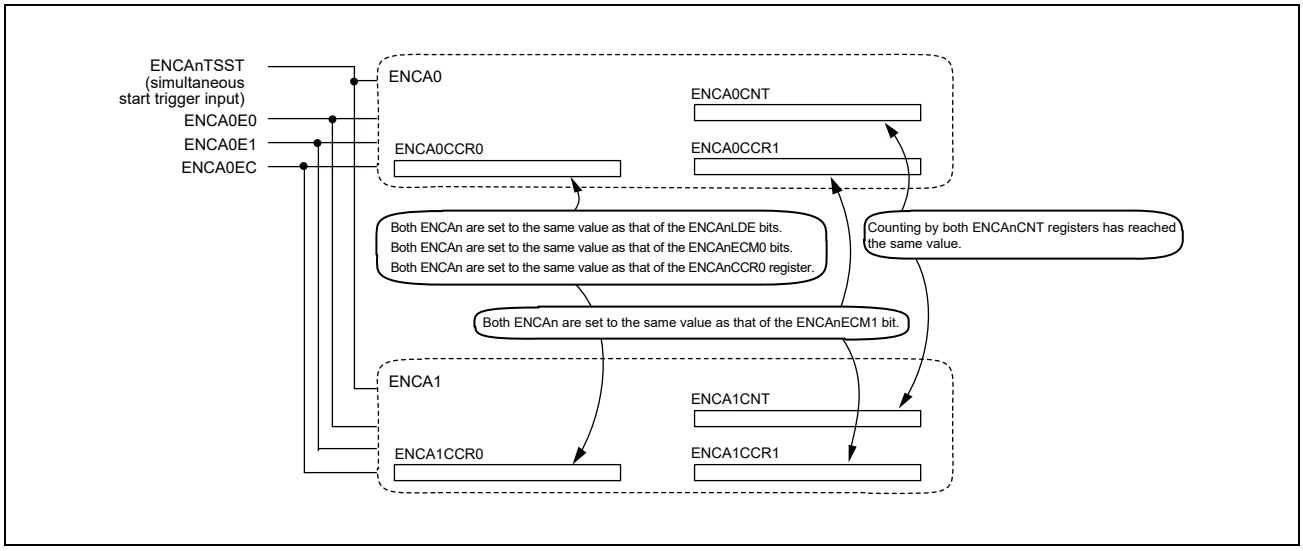

Figure 23.7 Example of Connection when Two ENCAn Units are Used

23.5 Procedure

23.5.1 ENCAn Setting Procedure

The setting procedure for ENCAn is described below.

Table 23.31 ENCAn Setting Procedure

Stage	Operation	State
Initial Setting	Release the module from the reset state	The power for the module is on and the operation is stopped. Writing to registers is enabled.
Initial Settings for ENCAn	Perform the following initial settings. • Settings for the counter • Settings for clearing the counter • Setting for ENCAnCCR0 register • Setting for ENCAnCCR1 register	The counter is not operating in this state. The ENCAnTE bit which indicates the operating state is 0.
	Make initial settings for the counter. • Set any 16-bit value to the ENCAnCNT register. (After setting this register, writing 1 to the ENCAnTS bit starts counting by the counter from the specified value.)	The value set at this stage is used as the initial value of the counter register.
Starting Operation	Make the setting to start the counter. • Set the ENCAnTS bit to 1.	The counter starts in this state. The value of the ENCAnTE bit indicating the operating state is 1, and the counter clock is supplied to the internal circuit.
During operation	Only those registers whose setting can be changed during operation can be rewritten. • Setting of the ENCAnCCR0 register • Setting of the ENCAnCCR1 register • Setting of the ENCAnIOC0 register	The counting operation set in the initial settings is performed. Counting up or down proceeds according to the settings of the ENCAnE0 and ENCAnE1 pins.
Stopping operation	Perform the setting to stop counter operation while the counter is running. • Set the ENCAnTT bit to 1.	The counter is stopped. The value of the ENCAnTE bit indicating the operating state is 0.
Stopping ENCAn	Perform reset	Settings of the registers are initialized.

23.5.1.1 Initial Setting Procedure for the Counter

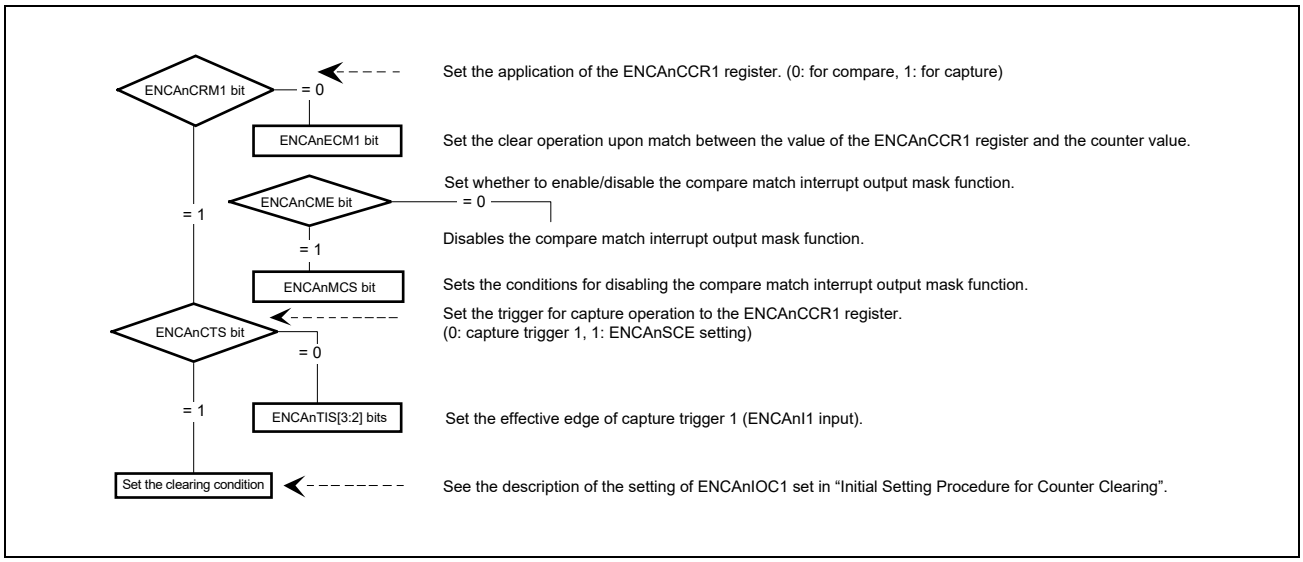

Figure 23.11 Setting Procedure for the ENCAnCCR1 Register

23.6 Timing Charts for Encoder Operations

23.6.1 Timing of Basic Encoder Operation 1 (Encoder Comparison Mode 1)

<Setting conditions>

- ENCAnCTL.ENCAnCRM[1:0] = 00_B:
  Comparison is selected as the function of the ENCAnCCR0 and ENCAnCCR1 registers.
- ENCAnCTL.ENCAnECM[1:0] = 01_B:
  If the next counting after a match between the values in the counter and the ENCAnCCR0 register is up-counting, the counter is cleared.
- ENCAnCTL.ENCAnLDE = 1:
  When the counter underflows, it is loaded with the value from the ENCAnCCR0 register.

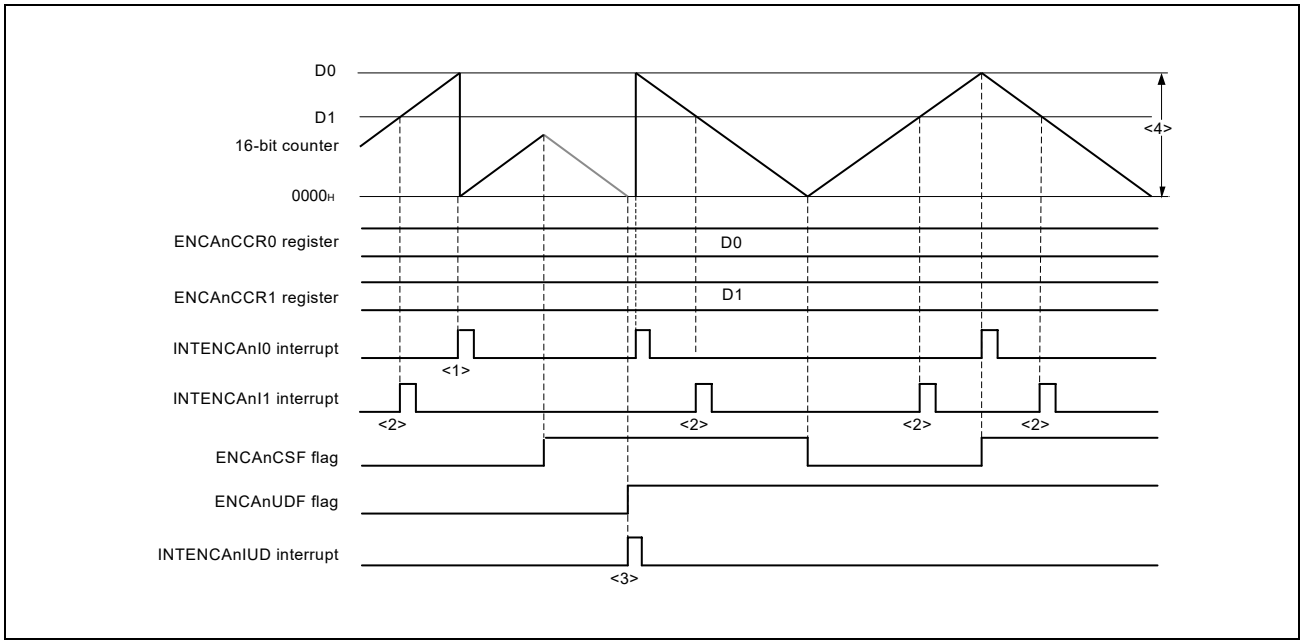

Figure 23.12 Timing of Basic Encoder Operation 1 (Encoder Comparison Mode 1)

1. A compare match interrupt (INTENCAnI0) is generated when the counter value and the ENCAnCCR0 register setting (D0) match.
   If the next counting is up-counting, the counter is cleared to 0000_H because ENCAnECM0 = 1.
2. A compare match interrupt (INTENCAnI1) is generated when the counter value and the ENCAnCCR1 register setting (D1) match.
   Counter clearing due to a match with ENCAnCCR1 does not proceed because ENCAnECM1 = 0.
3. An underflow interrupt (INTENCAnIUD) is generated when the counter underflows. ENCAnLDE = 1, so the counter is loaded with the value from the ENCAnCCR0 register (D0) when the counter underflows.
4. ENCAnLDE = 1 and ENCAnECM[1:0] = 01_B, so counting is from 0000_H to the setting of the ENCAnCCR0 register.

23.6.2 Timing of Basic Encoder Operation 2 (Encoder Comparison Mode 2)

<Setting conditions>

- ENCAnCTL.ENCAnCRM[1:0] = 00_B:
  Comparison is selected as the function of the ENCAnCCR0 and ENCAnCCR1 registers.
- ENCAnCTL.ENCAnECM[1:0] = 00_B:
  The counter is not cleared on a match between its value and that of the ENCAnCCR0 register.
- ENCAnCTL.ENCAnLDE = 0:
  The counter is not loaded with the value from the ENCAnCCR0 register.

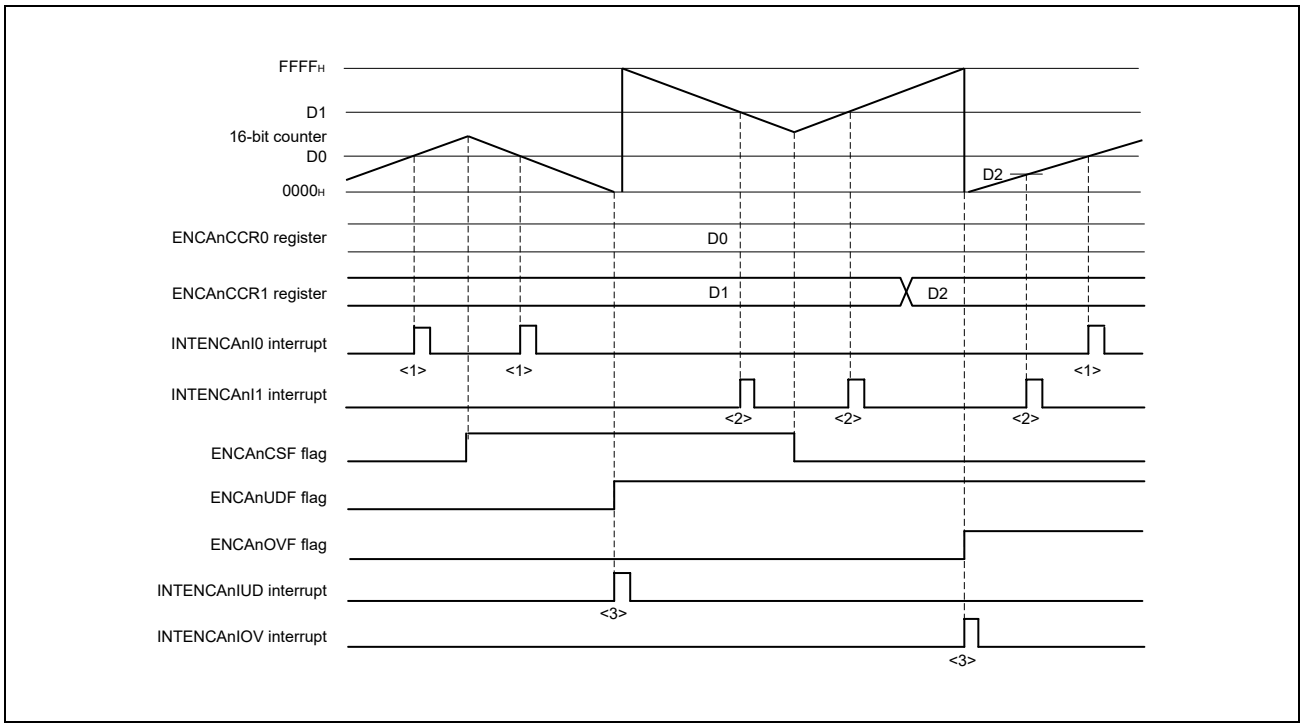

Figure 23.13 Timing of Basic Encoder Operation 2 (Encoder Comparison Mode 2)

1. A compare match interrupt (INTENCAnI0) is generated when the counter value and the ENCAnCCR0 register setting (D0) match.
   Counter clearing due to matching with ENCAnCCR0 does not proceed because ENCAnECM0 = 0.
2. A compare match interrupt (INTENCAnI1) is generated when the counter value and the ENCAnCCR1 register setting (D1, D2) match.
   Counter clearing due to matching with ENCAnCCR1 does not proceed because ENCAnECM1 = 0.
3. Overflow interrupts (INTENCAnIOV) or underflow interrupts (INTENCAnIUD) are generated in response to an overflow or underflow of the counter.

23.6.3 Timing of Basic Encoder Operation 3 (Encoder Comparison Mode 3)

<Setting conditions>

- ENCAnCTL.ENCAnCRM[1:0] = 00_B:
  Comparison is selected as the function of the ENCAnCCR0 and ENCAnCCR1 registers.
- ENCAnCTL.ENCAnECM[1:0] = 11_B:
  If the next counting after a match between the values in the counter and the ENCAnCCR0 register is up-counting, the counter is cleared.
  If the next counting after a match between the values in the counter and the ENCAnCCR1 register is down-counting, the counter is cleared.
- ENCAnCTL.ENCAnLDE = 0
  The counter is not loaded with the value from the ENCAnCCR0 register.

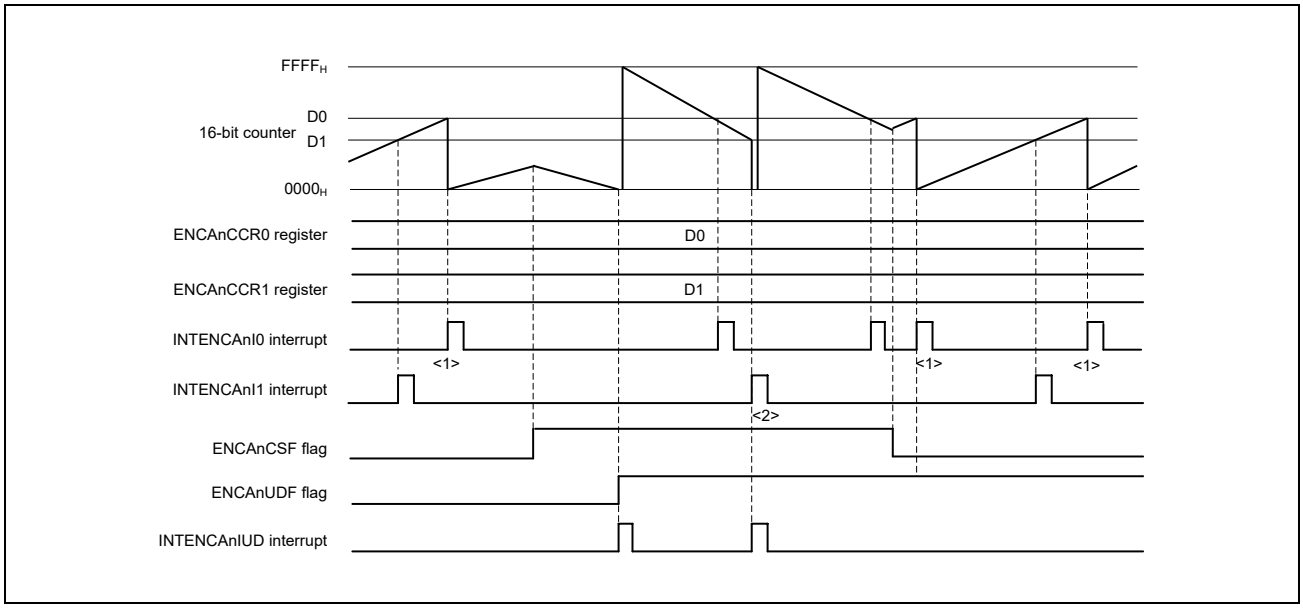

Figure 23.14 Timing of Basic Encoder Operation 3 (Encoder Comparison Mode 3)

1. A compare match interrupt (INTENCAnI0) is generated when the counter value and the ENCAnCCR0 register setting (D0) match.
   If the next counting is up-counting, the counter is cleared to 0000_H because ENCAnECM0 = 1.
2. A compare match interrupt (INTENCAnI1) is generated when the counter value and the ENCAnCCR1 register setting (D1) match.
   If the next counting is down-counting, the counter is cleared to 0000_H because ENCAnECM1 = 1.

23.6.4 Timing of Basic Encoder Operation 4 (Encoder Capture Mode)

<Setting conditions>

- ENCAnCTL.ENCAnCRM[1:0] = 11_B:
  Capture is selected as the function of the ENCAnCCR0 and ENCAnCCR1 registers.
- ENCAnCTL.ENCAnECM[1:0] = 00_B:
  The counter is not cleared on a match between its value and that of the ENCAnCCR0 register.
- ENCAnCTL.ENCAnLDE = 0:
  The setting from the ENCAnCCR0 register is not loaded to the counter.
- ENCAnIOC1.ENCAnSCE = 0, ENCAnECS[1:0] = 00_B:
  Input on the ENCAnEC pin does not lead to edge detection.
- ENCAnIOC0.ENCAnTIS[3:2] = 01_B:
  Selects detection of rising edges of the signal on the ENCAnI1 pin.
- ENCAnIOC0.ENCAnTIS[1:0] = 01_B:
  Selects detection of rising edges of the signal on the ENCAnI0 pin.

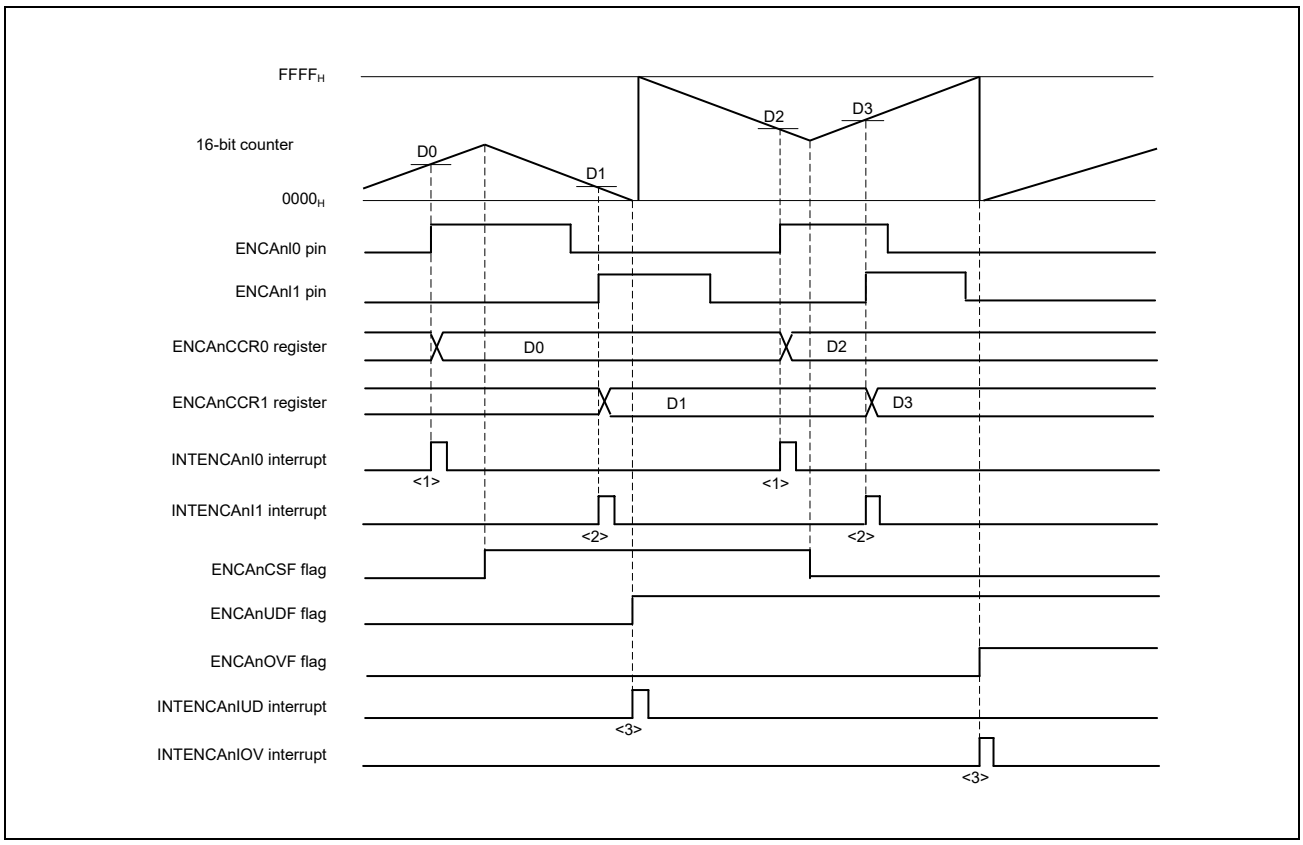

Figure 23.15 Timing of Basic Encoder Operation 4 (Encoder Capture Mode)

1. Detection of a rising edge on the ENCAnI0 pin leads to storage of the counter value (D0, D2) in the capture register (ENCAnCCR0) and the generation of a capture interrupt (INTENCAnI0).
2. Detection of a rising edge on the ENCAnI1 pin leads to storage of the counter value (D1, D3) in the capture register (ENCAnCCR1) and the generation of a capture interrupt (INTENCAnI1).
3. Overflow interrupts (INTENCAnIOV) or underflow interrupts (INTENCAnIUD) are generated in response to an overflow or underflow of the counter.

23.6.5 Timing of Basic Encoder Operation 5 (Encoder Capture and Comparison Mode)

<Setting conditions>

- ENCAnCTL.ENCAnCRM[1:0] = 10_B:
  Select the comparison function for the ENCAnCCR0 register and the capture function for the ENCAnCCR1 register.
- ENCAnCTL.ENCAnECM[1:0] = 01_B:
  The counter is cleared when its value matches that of the ENCAnCCR0 register.
- ENCAnCTL.ENCAnLDE = 1:
  When the counter underflows, it is loaded with the value from the ENCAnCCR0 register.
- ENCAnIOC1.ENCAnSCE = 0, ENCAnECS[1:0] = 00_B
- ENCAnIOC0.ENCAnTIS[3:2] = 11_B
  Selects detection of both edges of the signal on the ENCAnI1 pin.

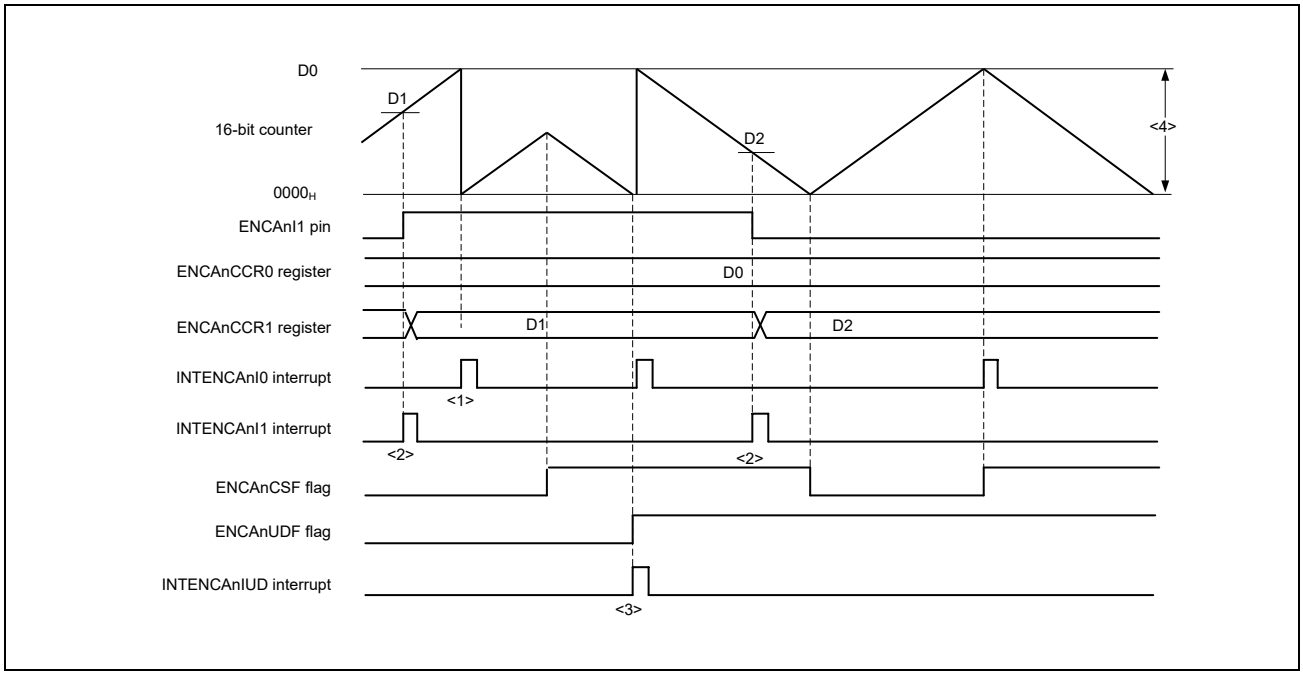

Figure 23.16 Timing of Basic Encoder Operation 5 (Encoder Capture and Comparison Mode)

1. A compare match interrupt (INTENCAnI0) is generated when the counter value and the ENCAnCCR0 register setting (D0) match.
   If the next counting is up-counting, the counter is cleared to 0000_H because ENCAnECM0 = 1.
2. Detection of both edges on the ENCAnI1 pin leads to storage of the counter value (D1) in the capture register (ENCAnCCR1) and the generation of a capture interrupt (INTENCAnI1).
3. An underflow interrupt (INTENCAnIUD) is generated when the counter underflows. ENCAnLDE = 1, so the counter is loaded with the value from the ENCAnCCR0 register (D0) when the counter underflows.
4. ENCAnLDE = 1 and ENCAnECM[1:0] = 01_B, so counting is from 0000_H to the setting of the ENCAnCCR0 register.

23.6.6 Overflow Occurrence and Overflow Flag Clear Operation

When up-counting is performed while the counter value is $FFFF_H$, an overflow occurs. If an overflow occurs, an overflow interrupt (INTENCAnIOV) is output and the overflow flag (ENCAnOVF) is set to 1. When the overflow flag clear bit (ENCAnCLOV) is set to 1, the overflow flag (ENCAnOVF) is cleared to 0.

The overflow occurrence and overflow flag clear operation are described as follows.

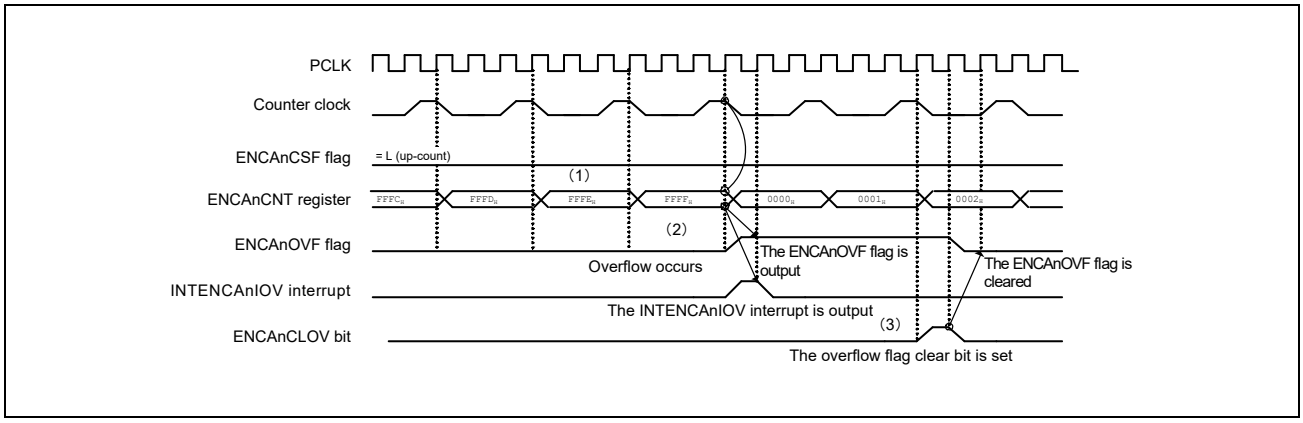

Figure 23.17 Overflow Occurrence and Setting for Clearing of the Overflow Flag

1. The counter value is counted up from $FFFE_H$ to $FFFF_H$.
2. When the counter value changes from $FFFF_H$ to 0000_H, an overflow occurs. At the same time, an overflow interrupt is output, and the overflow flag is set to 1.
3. An overflow flag is cleared to 0 by setting 1 to the ENCAnCLOV bit in the ENCAnFGC register according to the clearing procedure. In addition, an overflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 while ENCAnTE.ENCAnTE is 0, or by setting an input signal of the ENCAnTSST (simultaneous start trigger input) to high.

23.6.7 Underflow Occurrence and Underflow Flag Clear Operation

When down-counting is performed while the counter value is 0000_H, an underflow occurs. If an underflow occurs, an underflow interrupt (INTENCAnIUD) is output and the underflow flag (ENCAnUDF) is set to 1. When the underflow flag clear bit (ENCAnCLUD) is set to 1, the underflow flag (ENCAnUDF) is cleared to 0.

The underflow occurrence and underflow flag clear operation are described as follows.

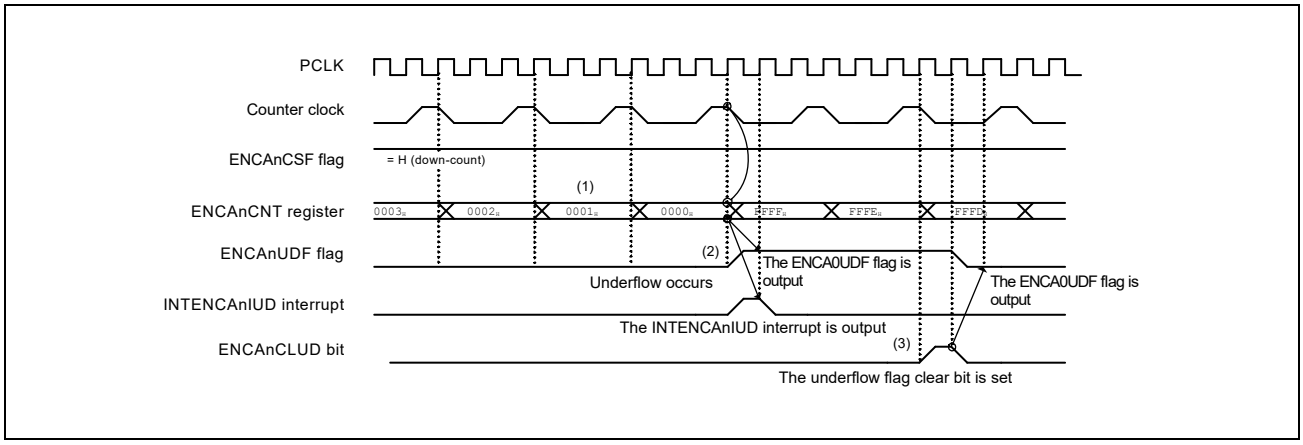

Figure 23.18 Underflow Occurrence and Setting for Clearing of the Underflow Flag

1. The counter value is decremented from 0001_H to 0000_H.
2. When the counter value changes from 0000_H to $FFFF_H$, an underflow occurs. At the same time, an underflow interrupt is output, and the underflow flag is set to 1.
3. An underflow flag is cleared to 0 by setting 1 to the ENCAnCLUD bit in the ENCAnFGC register according to the clearing procedure. In addition, an underflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 while the ENCAnTE bit in the ENCAnTE register is 0, or by setting an input signal of the ENCAnTSST (simultaneous start trigger input) to high.

23.6.8 Counter Clearing and Capture Operation by Encoder Clear Input (ENCAnEC pin)

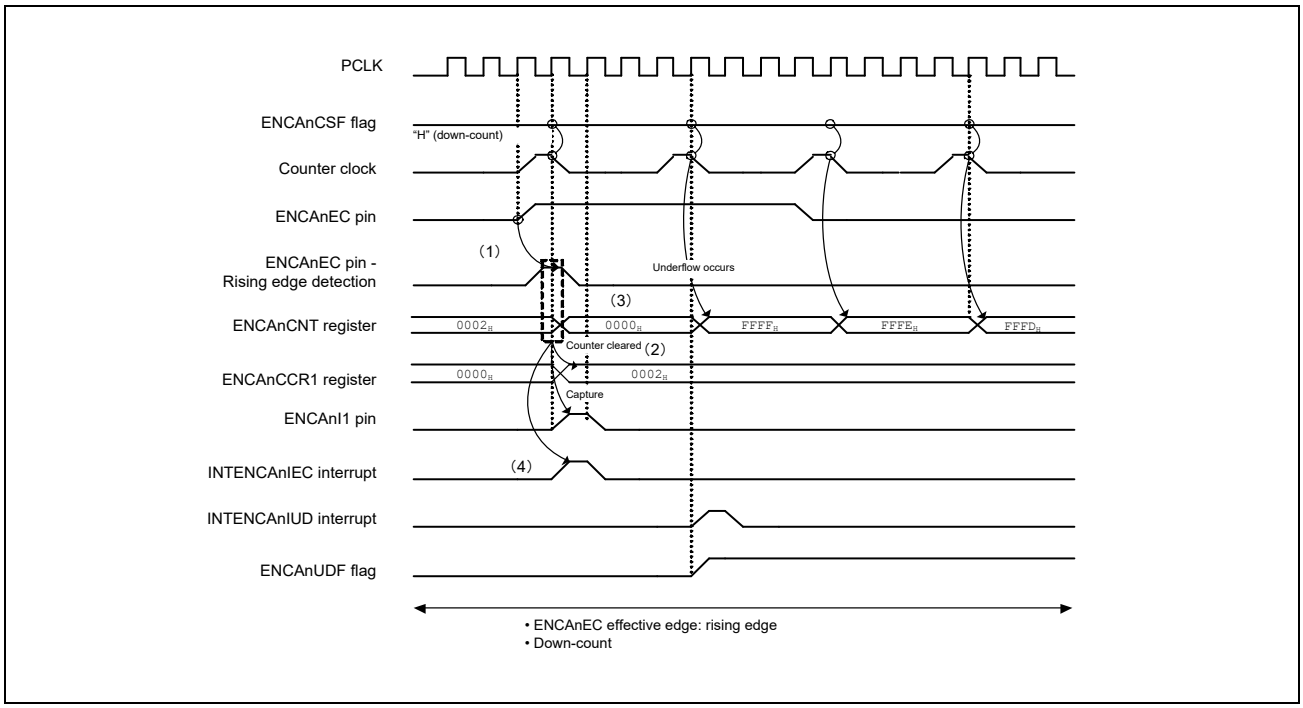

Figure 23.19 Timing Chart of Counter Clearing and Capture Operation by Encoder Clear Input (ENCAnEC pin)

<Setting Conditions>

- ENCAnCTL.ENCAnCRM1 = 1
  (ENCAnCCR1 is selected as the capture register)
- ENCAnCTL.ENCAnCTS = 1
  (ENCAnEC pin input is selected as a capture trigger input)
- ENCAnIOC1.ENCAnECS1 and ENCAnECS0 bits = 01_B
  (A rising edge is selected as the effective edge to be detected for the ENCAnEC pin input)

1. Capture operation is performed at the rising edge of the ENCAnEC pin input trigger.
2. The counter value (0002_H) is captured at the rising edge of the ENCAnEC pin input, and it is stored in the ENCAnCCR1 register.
3. Clear operation is performed by the input through the ENCAnEC pin, and the counter value is reset to 0000_H.
4. At the same time, by the input through the ENCAnEC pin, an encoder clear interrupt (INTENCAnIEC) and capture interrupt 1 (INTENCAnI1) are output.

23.6.9 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)

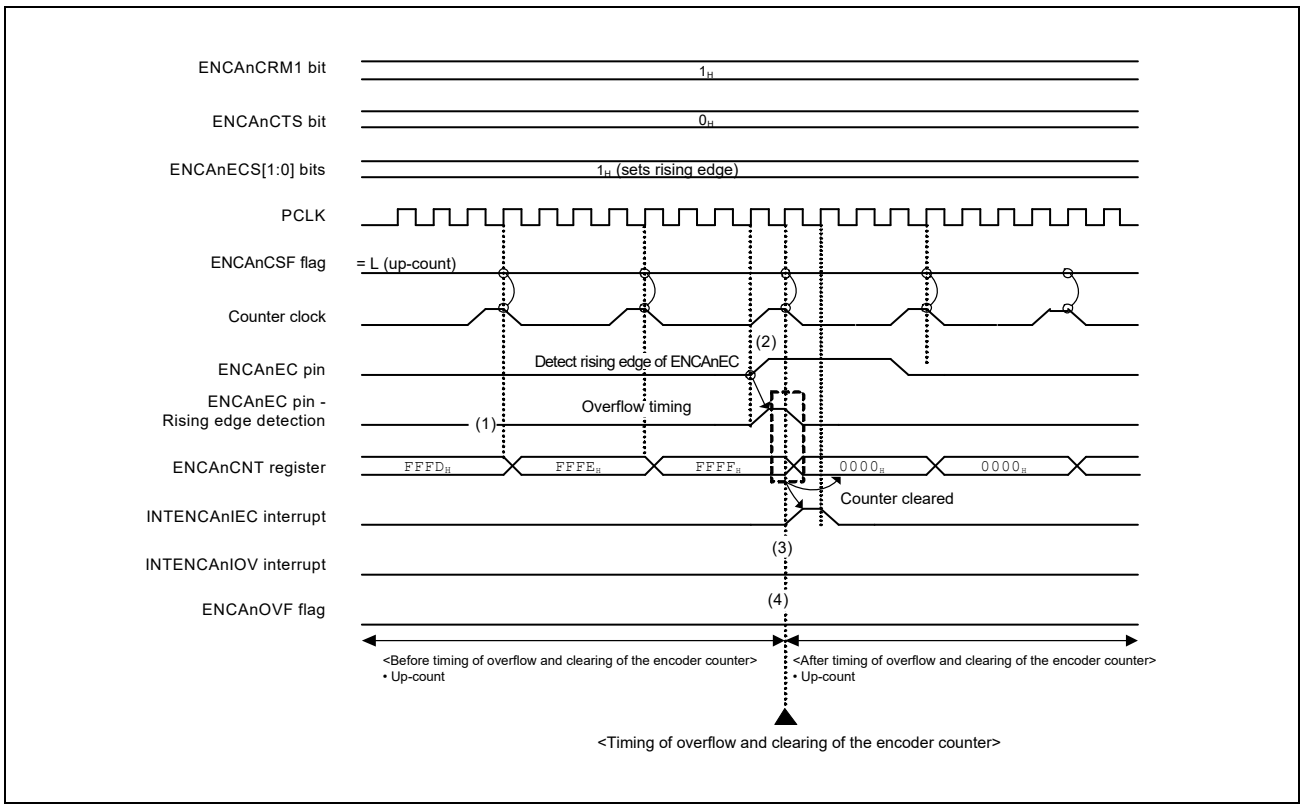

Figure 23.20 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)

1. Up-counting from $FFFD_H$ is continuously performed.
2. If an overflow occurs due to the counter value reaching $FFFF_H$, and the rising edge of ENCAnEC is detected at the same time, clearing by the encoder clear input is performed. Then, the counter value is cleared to 0000_H.
3. The encoder clear input clears the counter value and outputs a clear interrupt (INTENCAnIEC) at the same time. Here, an overflow is deemed to not have occurred and an overflow interrupt is not output. The counter has been cleared.
4. An overflow has not occurred as described in step 3, the overflow flag is not set.

23.6.10 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)

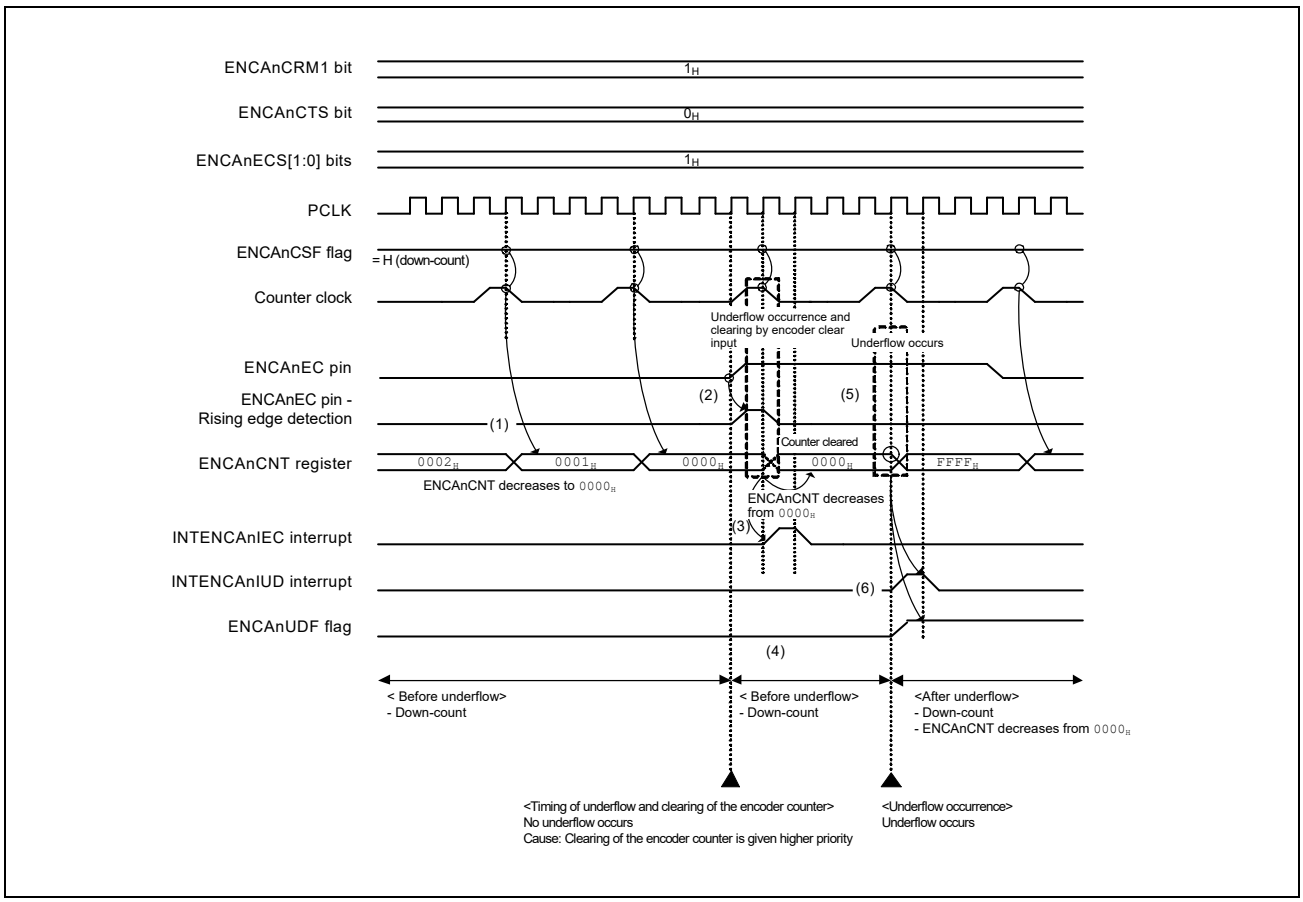

Figure 23.21 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)

1. Down-counting from 0002_H is continuously performed.
2. If an underflow occurs due to the counter value reaching 0000_H, and the rising edge of ENCAnEC is detected at the same time, clearing by the encoder clear input is performed. Even if the next clock signal is input during clear operation, the counter value remains at 0000_H.
3. When the counter value is cleared by the encoder clear input, an encoder clear interrupt (INTENCAnIEC) is output simultaneously. Here, an underflow is deemed to not have occurred and an underflow interrupt is not output. The counter has been cleared.
4. An underflow has not occurred as described in step 3, the underflow flag is not set.
5. When down-counting is further performed after the counter value has reached 0000_H by clear operation by the encoder clear input, the counter value changes from 0000_H to $FFFF_H$, and another underflow occurs.
6. When an underflow occurs, an underflow interrupt (INTENCAnIUD) is output, and the underflow flag (ENCAnUDF) is set.

23.6.11 Overflow Operation Immediately after Startup

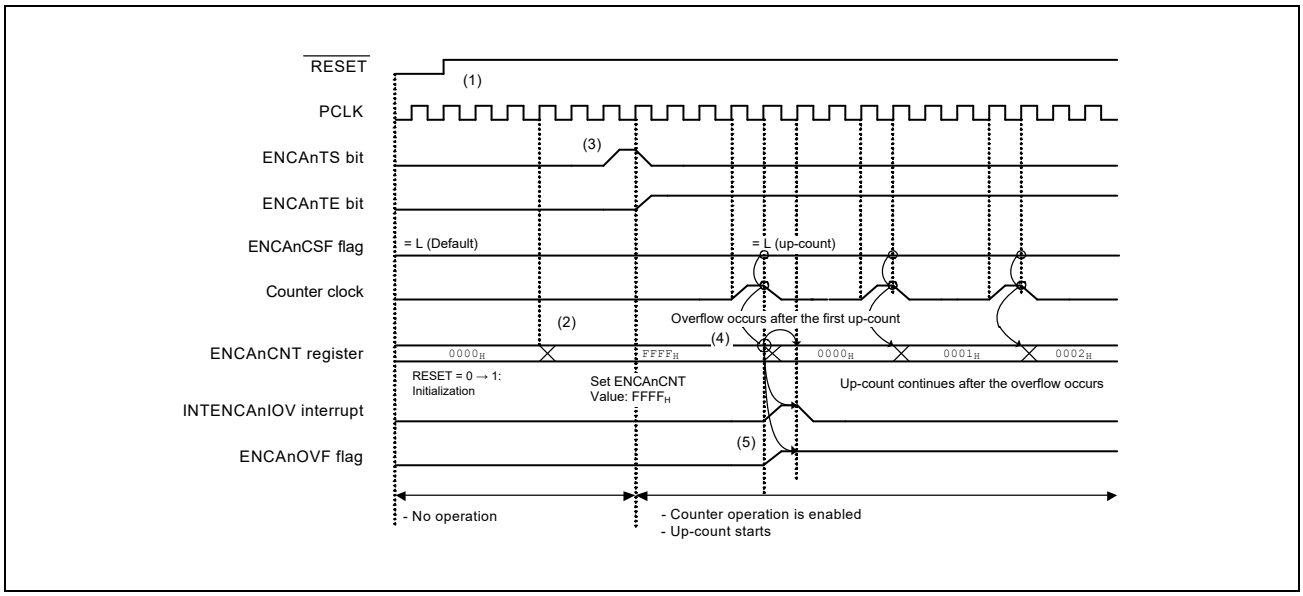

Figure 23.22 Overflow Operation Immediately after Startup

1. When the $\overline{\text{RESET}}$ value changes from 0 to 1, the state of the counter changes from “reset” to “reset release”.
2. The timer counter is set to $FFFF_H$ as the initial value.
3. ENCAnTS is set to 1, and operation starts. ENCAnTE changes to 1, which indicates that operation is enabled.
4. When up-counting is performed from $FFFF_H$ which is the initially set counter value, the counter value changes from $FFFF_H$ to 0000_H, and an overflow occurs immediately after operation starts.
5. At the same time, by an overflow occurrence immediately after operation starts, an overflow interrupt (INTENCAnIOV) is output, and the overflow flag (ENCAnOVF) is set.

23.6.12 Underflow Operation Immediately after Startup

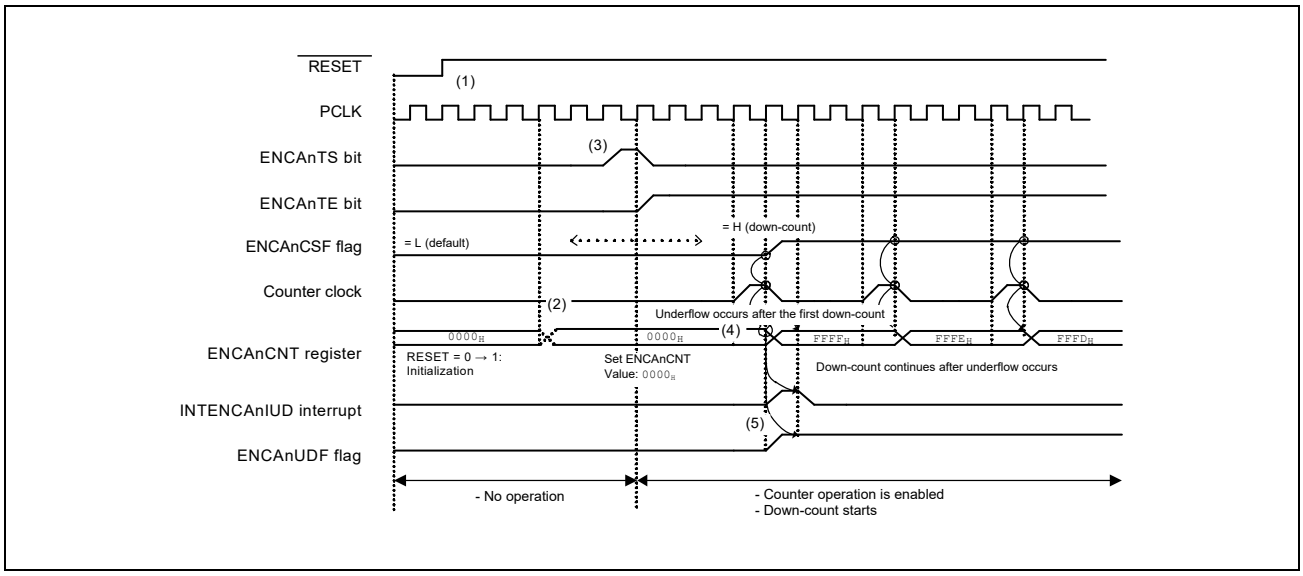

Figure 23.23 Underflow Operation Immediately after Startup

1. When the $\overline{\text{RESET}}$ value changes from 0 to 1, the state of the counter changes from “reset” to “reset release”.
2. The timer counter is set to 0000_H as the initial value.
3. ENCAnTS is set to 1, and operation starts. ENCAnTE changes to 1, which indicates that operation is enabled.
4. When down-counting is performed from 0000_H which is the initially set counter value, the counter value changes from 0000_H to $FFFF_H$, and an underflow occurs immediately after operation starts.
5. At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (INTENCAnIUD) is output, and the underflow flag (ENCAnUDF) is set.

23.6.13 Using the ENCAnLDE Function Immediately after Startup

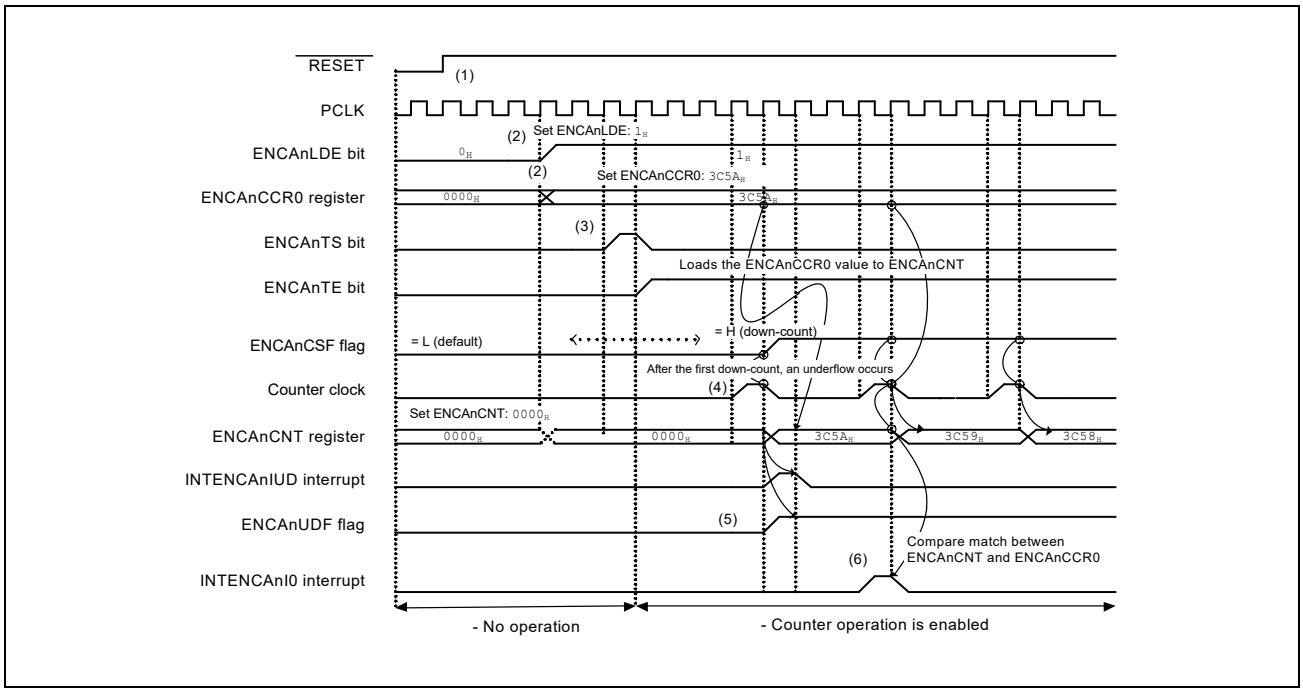

Figure 23.24 Using the ENCAnLDE Function Immediately after Startup

1. When the $\overline{\text{RESET}}$ value changes from 0 to 1, the status is changes from “reset” to “reset release”.
2. The load enable bit (ENCAnLDE) is set to 1, capture compare register 0 (ENCAnCCR0) is set to $3C5A_H$, and the timer counter is set to the initial value 0000_H.
3. ENCAnTS is set to 1, and operation starts. ENCAnTE changes to 1, which indicates that operation is enabled.
4. When down-counting is performed from 0000_H which is the initially set counter value, an underflow occurs immediately after operation starts. Because ENCAnLDE is set to 1, the ENCAnCCR0 value, $3C5A_H$, is loaded to the timer counter (INTENCAnI0 is not output during loading).
5. At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (INTENCAnIUD) is output, and the underflow flag (ENCAnUDF) is set (after an underflow occurs, down-counting from the loaded value ($3C5A_H$) continues).
6. After the ENCAnCCR0 value is loaded to ENCAnCNT, a match with ENCAnCCR0 is detected, and INTENCAnI0 is output.

23.6.14 ENCAnLDE Function (Loading Counter Value)

(1) <When ENCAnLDE = 0>

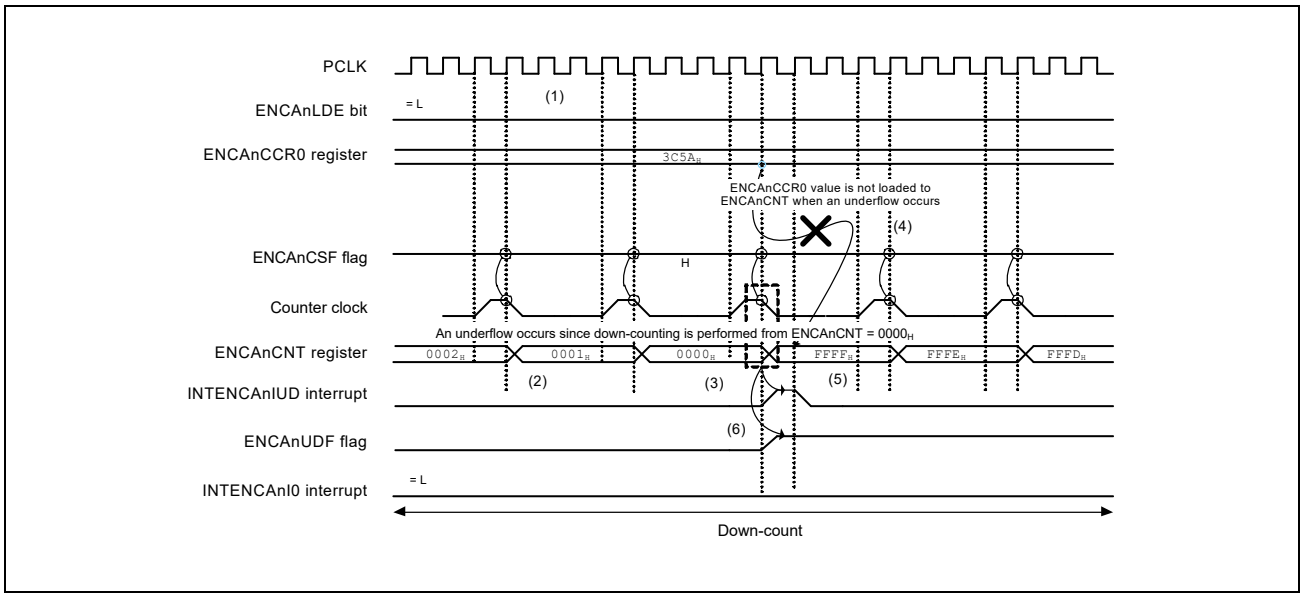

Figure 23.25 ENCAnLDE Function (when ENCAnLDE = 0)

1. ENCAnLDE is set to 0 (even if an underflow occurs, the ENCAnCCR0 value is not loaded).
2. Down-counting is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$
3. When down-counting is further performed after the counter value changes to 0000_H, an underflow occurs.
4. Because ENCAnLDE is set to 0, the setting value of the ENCAnCCR0 register is not loaded to the counter even if an underflow occurs.
5. Operation changes to underflow operation (counter value: $0000_H \rightarrow FFFF_H$).
6. An underflow interrupt (INTENCAnIUD) is output, and the underflow flag (ENCAnUDF) is set.

(2) <When ENCAnLDE = 1>

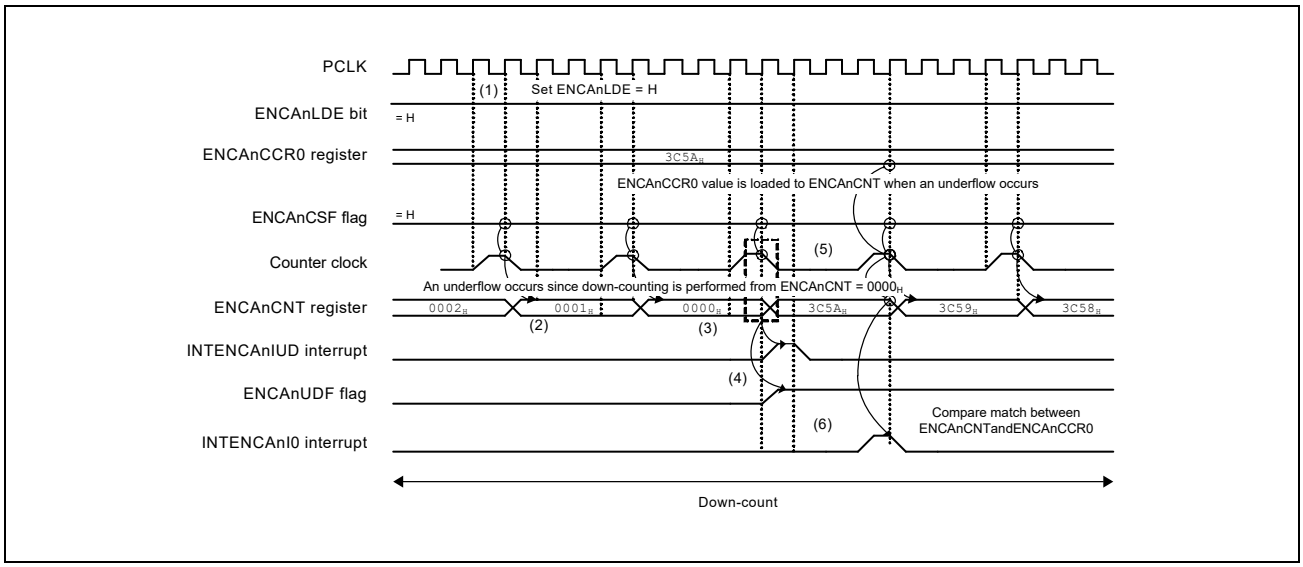

Figure 23.26 ENCAnLDE Function (when ENCAnLDE = 1)

1. ENCAnLDE is set to 1 (if an underflow occurs, the ENCAnCCR0 value is loaded to the counter).
2. Down-counting is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$
3. When down-counting is further performed after the counter value changes to 0000_H, an underflow occurs.
4. An underflow interrupt is output, and the underflow flag is set.
5. Because ENCAnLDE is set to 1, the setting value of the ENCAnCCR0 register is loaded to the counter if an underflow occurs. ENCAnCNT is set to $3C5A_H$.
6. After the ENCAnCCR0 value is set to ENCAnCNT, if the ENCAnCNT value matches with the ENCAnCCR0 value on a counter clock, a compare match interrupt (INTENCAnI0) is output.

23.6.15 Conflict between ENCAnLDE Function (Loading Counter Value) and Rewriting of ENCAnCCR0 Register

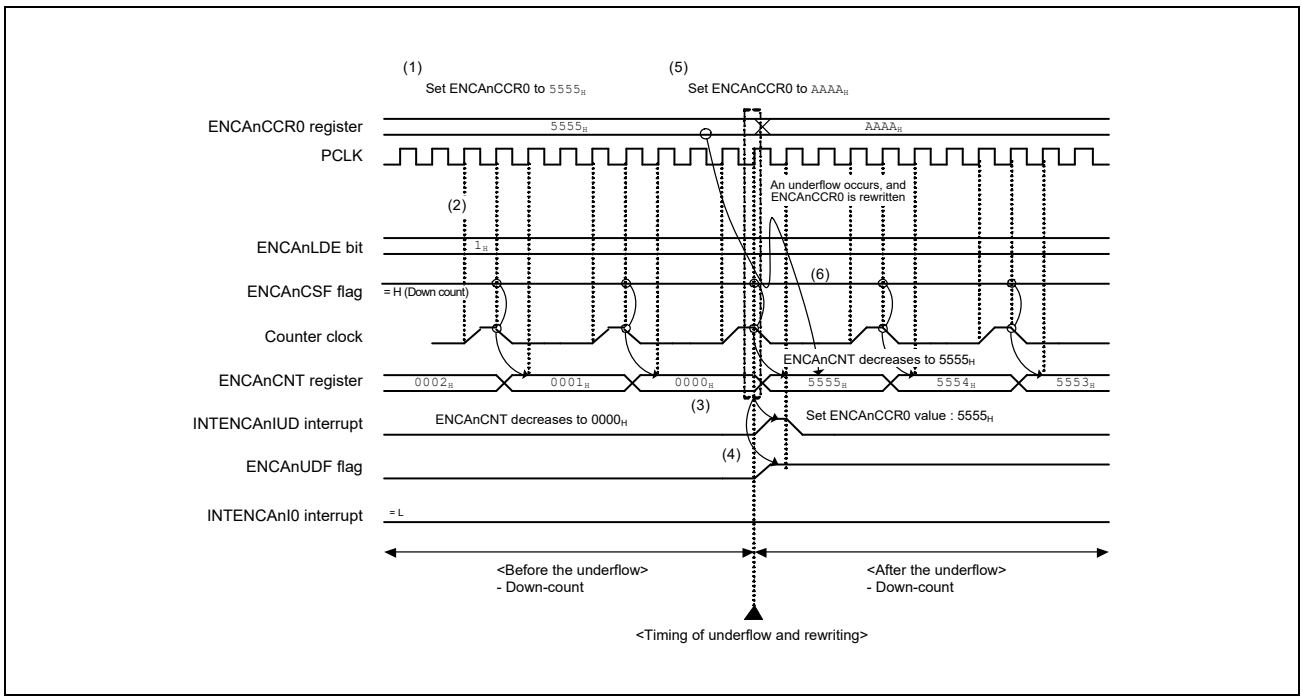

Figure 23.27 Conflict between ENCAnLDE Function and Rewriting of ENCAnCCR0 Register

1. The ENCAnCCR0 register is currently set to 5555_H.
2. ENCAnLDE is currently set to 1.
3. Down-counting is performed ($0002_H \rightarrow 0001_H \rightarrow 0000_H$), and an underflow occurs.
4. An underflow interrupt (INTENCAnIUD) is output, and the underflow flag (ENCAnUDF) is set.
5. When an underflow occurs, the ENCAnCCR0 register value is changed from 5555_H to $AAAA_H$.
6. Additionally, when an underflow occurs, the ENCAnCCR0 value before the rewrite was performed (5555_H) is set in ENCAnCNT.

23.6.16 Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC pin)

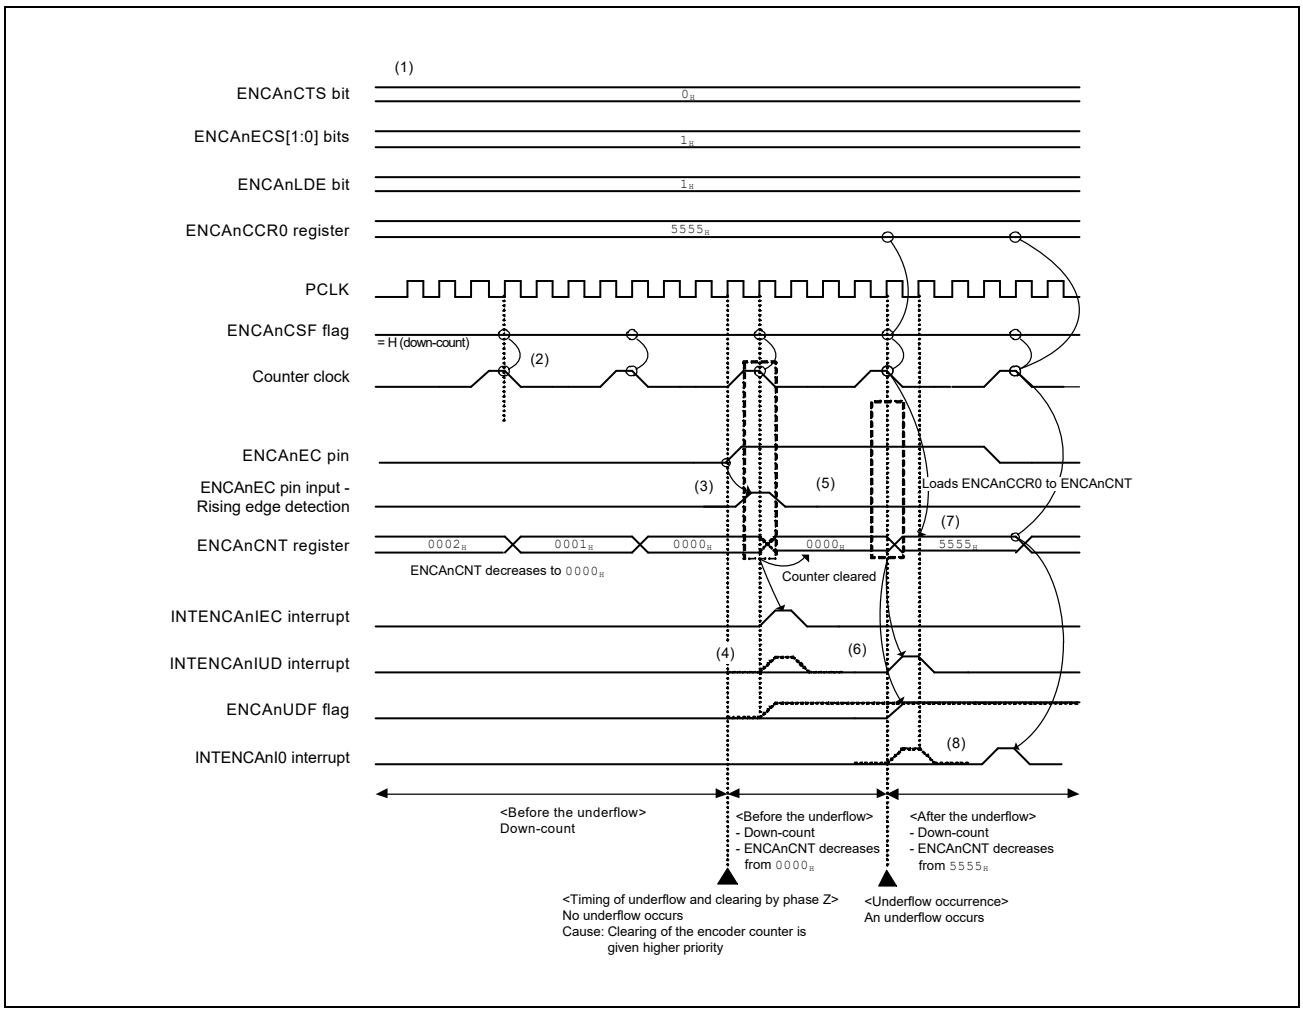

Figure 23.28 Conflict between ENCAnLDE Function and Clear Operation by Encoder Clear Input

1. The values are set as follows: ENCAnCTS = 0, ENCAnECS[1:0] = 01_B, ENCAnLDE = 1, and ENCAnCCR0 = 5555_H.
2. Down-counting is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$
3. When the counter value becomes 0000_H, the rising edge of the ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.
4. Because a count clear is performed when the counter value reaches 0000_H, a counter clear interrupt (INTENCAnIEC) by the encoder clear input is output. An underflow does not occur because down-counting is not performed when the counter value is 0000_H. Therefore, an underflow interrupt (INTENCAnIUD) is not output, and the underflow flag (ENCAnUDF) is not set.
5. After the counter value is cleared to 0000_H by clear operation by the encoder clear input, down-counting is performed and an underflow occurs.
6. An underflow interrupt (INTENCAnIUD) is output, and the underflow flag (ENCAnUDF) is set.
7. Because ENCAnLDE = 1, if an underflow occurs, the ENCAnCCR0 value is loaded to ENCAnCNT.
8. After the ENCAnCCR0 value is set to ENCAnCNT, a compare match is detected according to the counter clock. If the ENCAnCNT value matches with the ENCAnCCR0 value, a compare match interrupt (INTENCAnI0) is output.

23.6.17 Up-counting after Conflict between ENCAnLDE Function (loading counter value) and Clear Operation by Encoder Clear Input

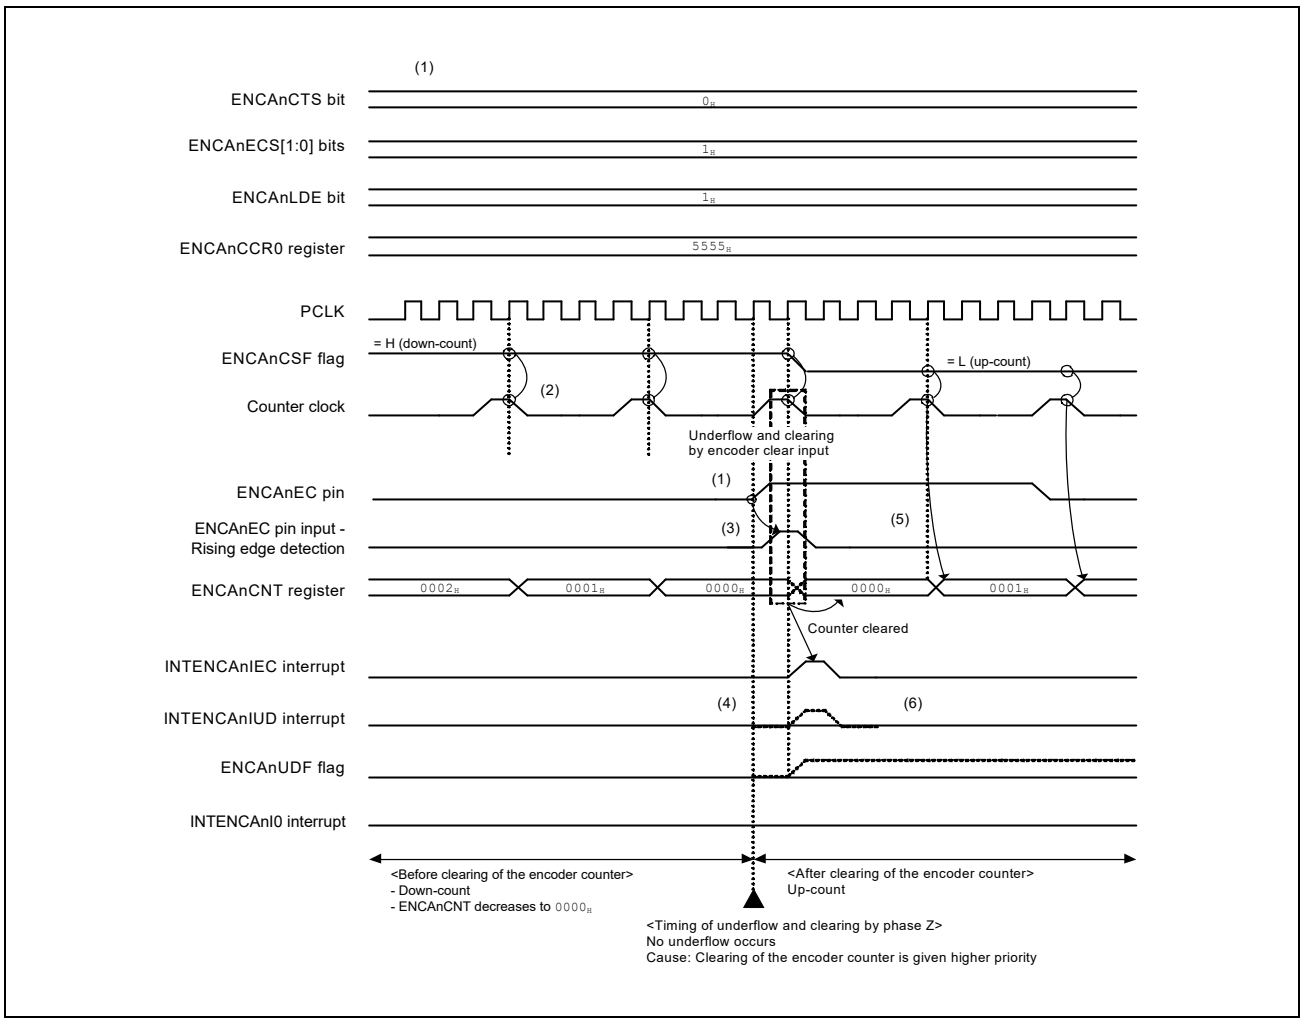

Figure 23.29 Up-counting after Conflict between ENCAnLDE Function and Clearing of the Encoder Counter

1. The values are set as follows: ENCAnCTS = 0, ENCAnECS[1:0] = 01_B, ENCAnLDE = 1, and ENCAnCCR0 = 5555_H.
2. Down-counting is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$
3. When the counter value reaches 0000_H, the rising edge of ENCAnEC is detected, and clear operation by the encoder clear input is performed.
4. Upon clearing of the counter, a counter clear interrupt (INTENCAnIEC) triggered by the encoder clear input is output. Here, an underflow will not occur because further down-counting was not performed when the counter value was 0000_H. This means that neither an underflow interrupt (INTENCAnIUD) is output nor the underflow flag (ENCAnUDF) is set.
5. After the counter value has been cleared to 0000_H, up-counting is performed.
6. An underflow interrupt (INTENCAnIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

23.6.18 Capture Operation between Counter Clocks (ENCAnCCR1)

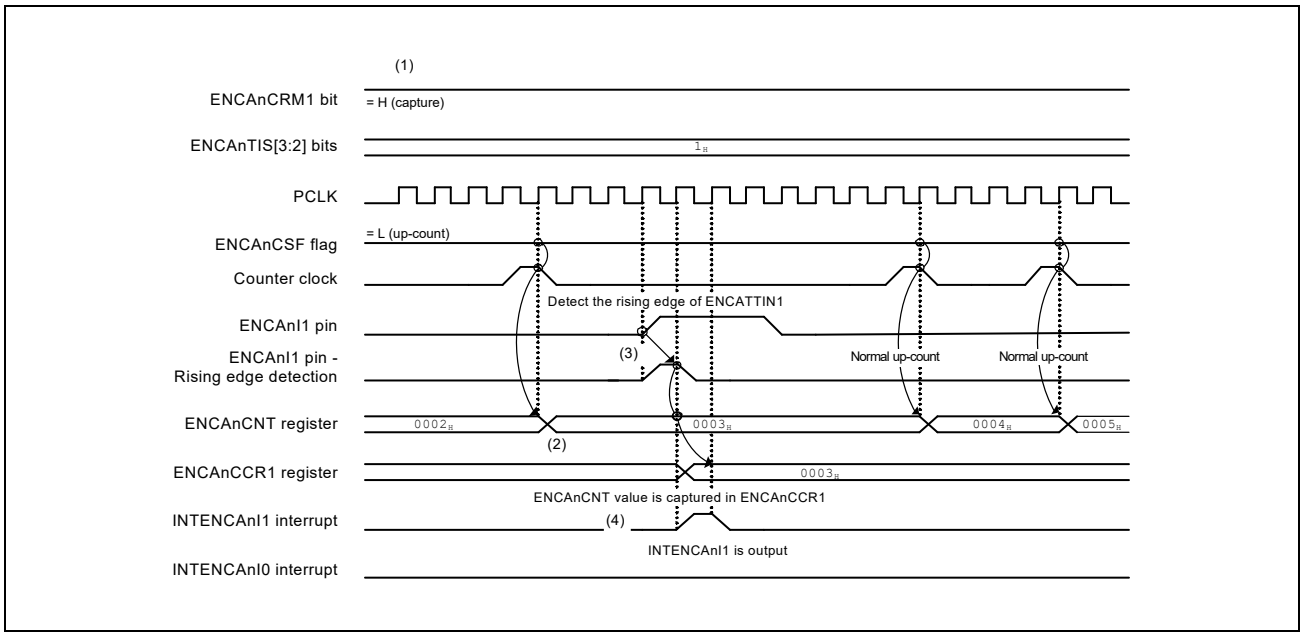

Figure 23.30 Capture Operation between Counter Clocks (ENCAnCCR1)

1. The values are set as follows: ENCAnCRM1 = 1 and ENCAnTIS[3:2] = 01_B.
2. Up-counting is performed.
3. The rising edge of the ENCAnI1 input is detected, and the counter value is captured in ENCAnCCR1.
4. An interrupt (INTENCAnI1) corresponding to the capture into the ENCAnCCR1 register is output.

23.6.19 Capture Operation between Counter Clocks (ENCAnCCR0)

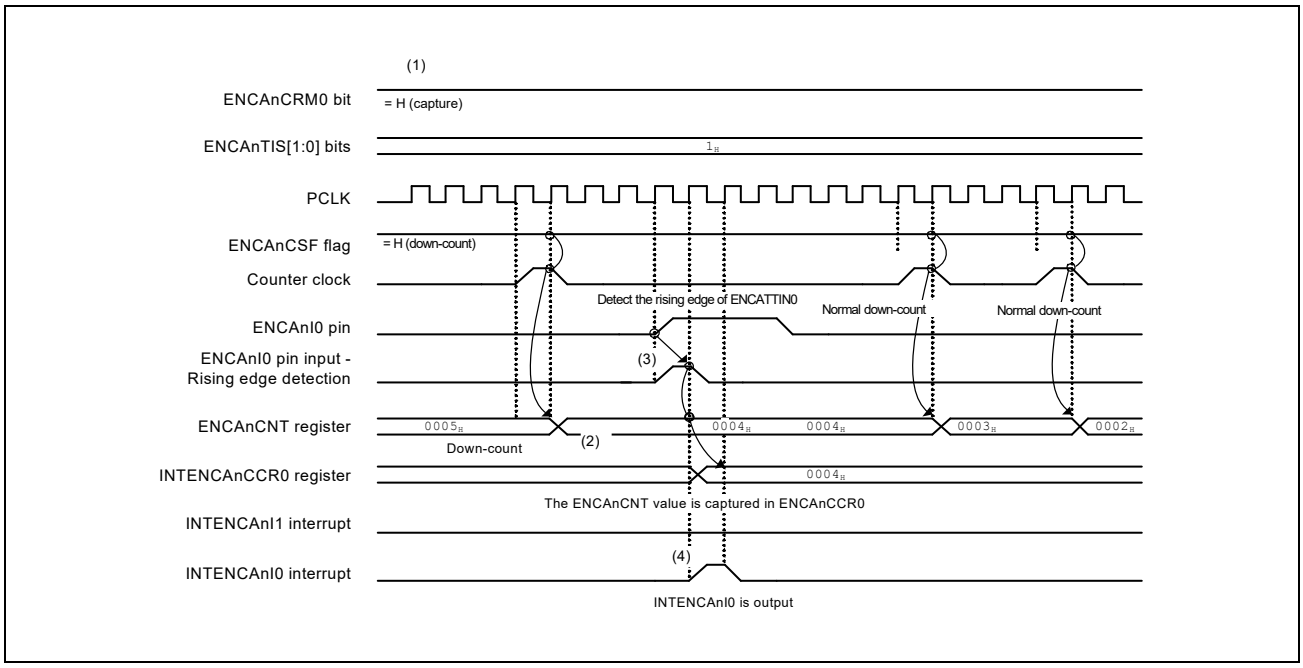

Figure 23.31 Capture Operation between Counter Clocks (ENCAnCCR0)

1. The values are set as follows: ENCAnCRM0 = 1 and ENCAnTIS[1:0] = 01_B.
2. Down-counting is performed.
3. The rising edge of the ENCAnI0 input is detected, and the counter value is captured in ENCAnCCR0.
4. An interrupt (INTENCAnI0) corresponding to the capture into the ENCAnCCR0 register is output.

23.6.20 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0

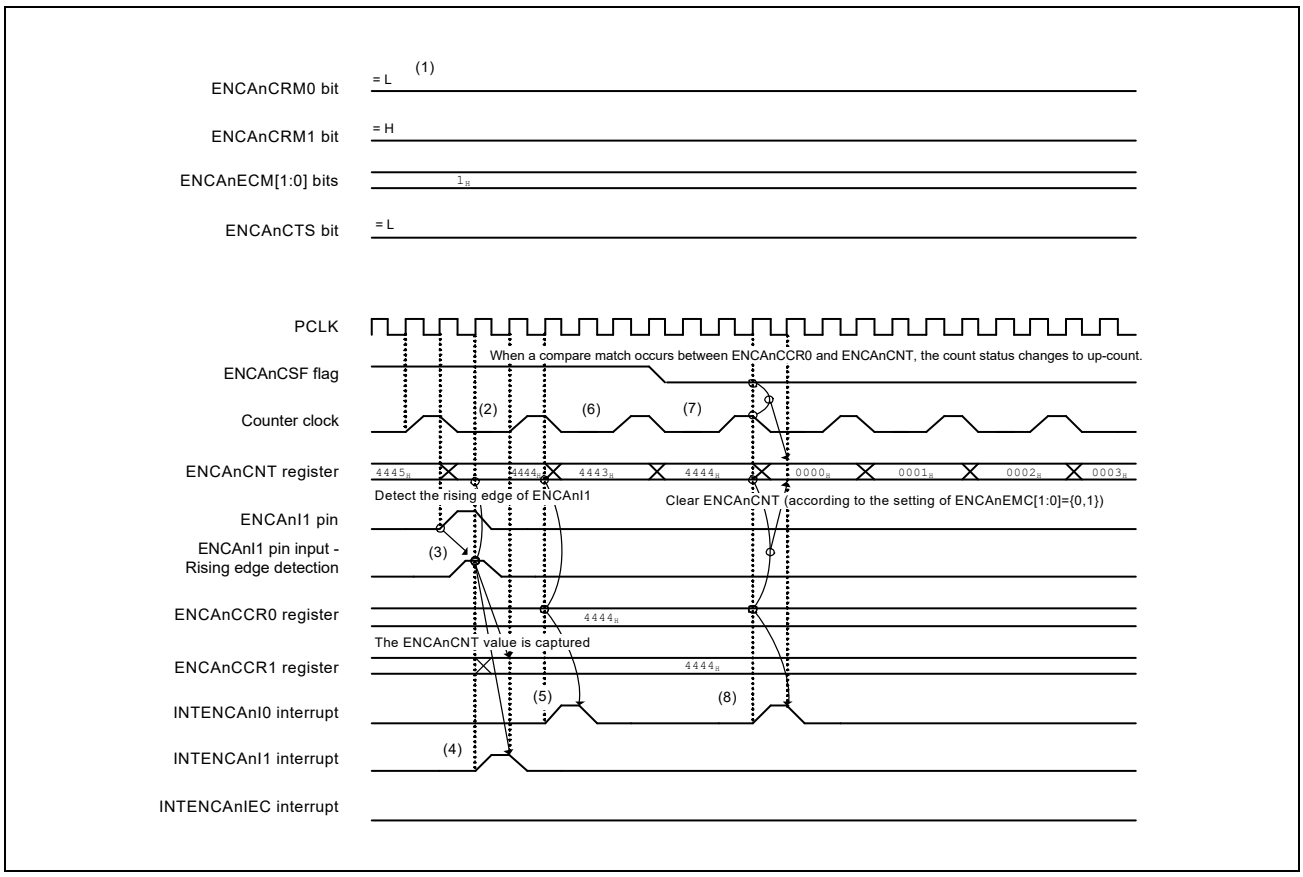

Figure 23.32 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0

1. The values are set as follows: ENCAnCCR0 = 4444_H, ENCAnCRM0 = 0, ENCAnCRM1 = 1, ENCAnECM[1:0] = 01_B, and ENCAnCTS = 0.
2. Down-counting is performed.
3. The rising edge of the ENCAnI1 input is detected, and the ENCAnCNT value (4444_H) is captured in the ENCAnCCR1 register.
4. An interrupt signal (INTENCAnI1) corresponding to the capture into the ENCAnCCR1 register is output.
5. When a compare match occurs between ENCAnCNT (counted down from 4445_H to 4444_H) and ENCAnCCR0 (4444_H), a compare match interrupt (INTENCAnI0) with ENCAnCCR0 is output.
6. The counter operation changes to up-counting.
7. When ENCAnCNT is counted up from 4443_H to 4444_H, a compare match with ENCAnCCR0 occurs again. Because the counter operation is up-counting when the compare match occurs, the counter value is cleared according to the setting of ENCAnECM[1:0] (01_B), and the ENCAnCNT value changes to 0000_H.
8. When ENCAnCNT changes to 4444_H, a compare match interrupt (INTENCAnI0) with ENCAnCCR0 is output.

23.6.21 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1

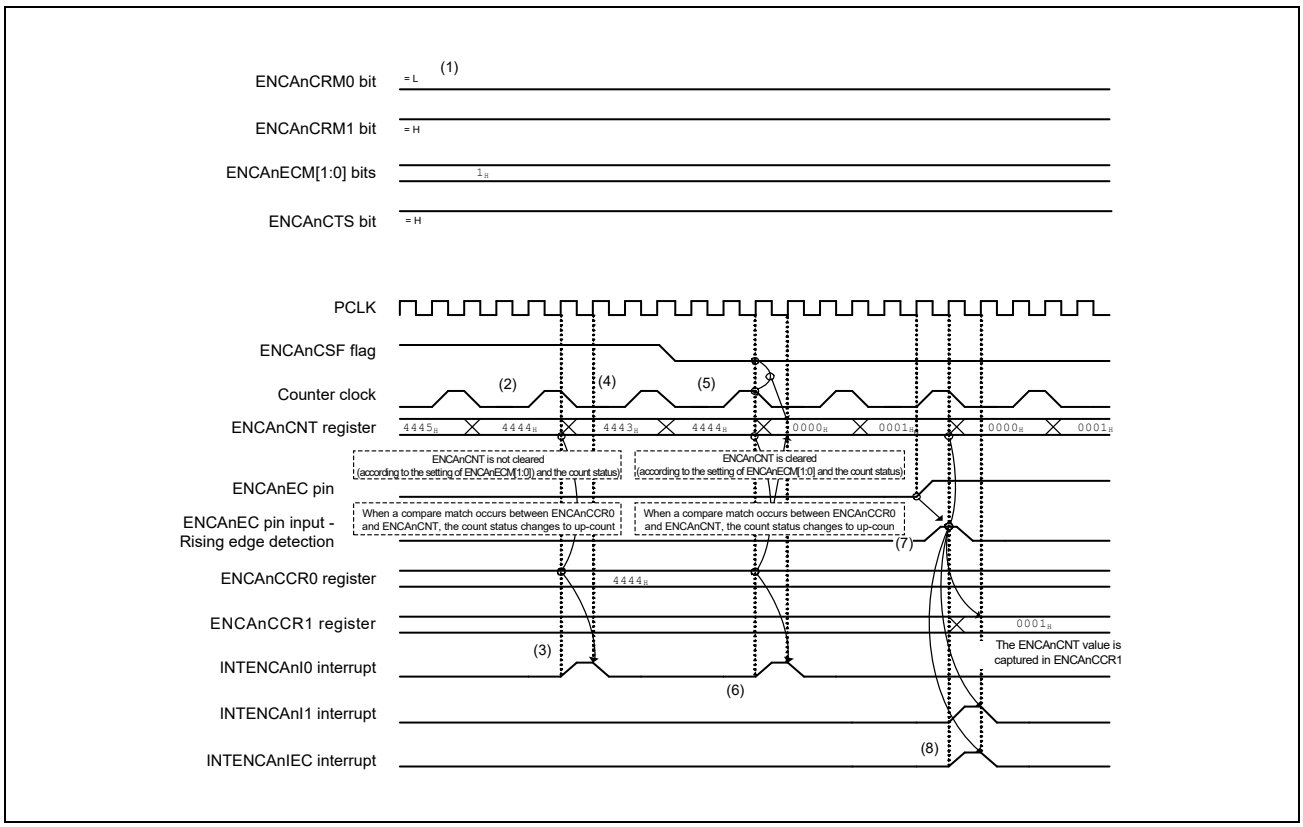

Figure 23.33 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1

1. The values are set as follows: ENCAnCCR0 = 4444_H, ENCAnCRM0 = 0, ENCAnCRM1 = 1, ENCAnECM[1:0] = 01_B, and ENCAnCTS = 1.
2. Down-counting is performed.
3. When a compare match occurs between ENCAnCNT (counted down from 4445_H to 4444_H) and ENCAnCCR0 (4444_H), a compare/capture interrupt 0 (INTENCAnI0) is output.
4. The counter operation changes to up-counting.
5. When ENCAnCNT is counted up from 4443_H to 4444_H, a compare match with ENCAnCCR0 occurs again. Because the counter operation is up-counting when the compare match occurs, the counter value is cleared according to the setting of ENCAnECM[1:0] (01_B), and the ENCAnCNT value changes to 0000_H.
6. When ENCAnCNT changes to 4444_H, a compare match interrupt (INTENCAnI0) with ENCAnCCR0 is output.
7. After the counter value is cleared, up-counting is performed, and the counter value changes to 0001_H. At this point, the ENCAnCNT value (0001_H) is captured in ENCAnCCR1 by detecting the rising edge of the ENCAnEC signal, and the counter is cleared to 0000_H.
8. An interrupt (INTENCAnI1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (INTENCAnIEC) by ENCAnEC are output.

23.6.22 Encoder Operation when Compare Match Clear Control is Disabled

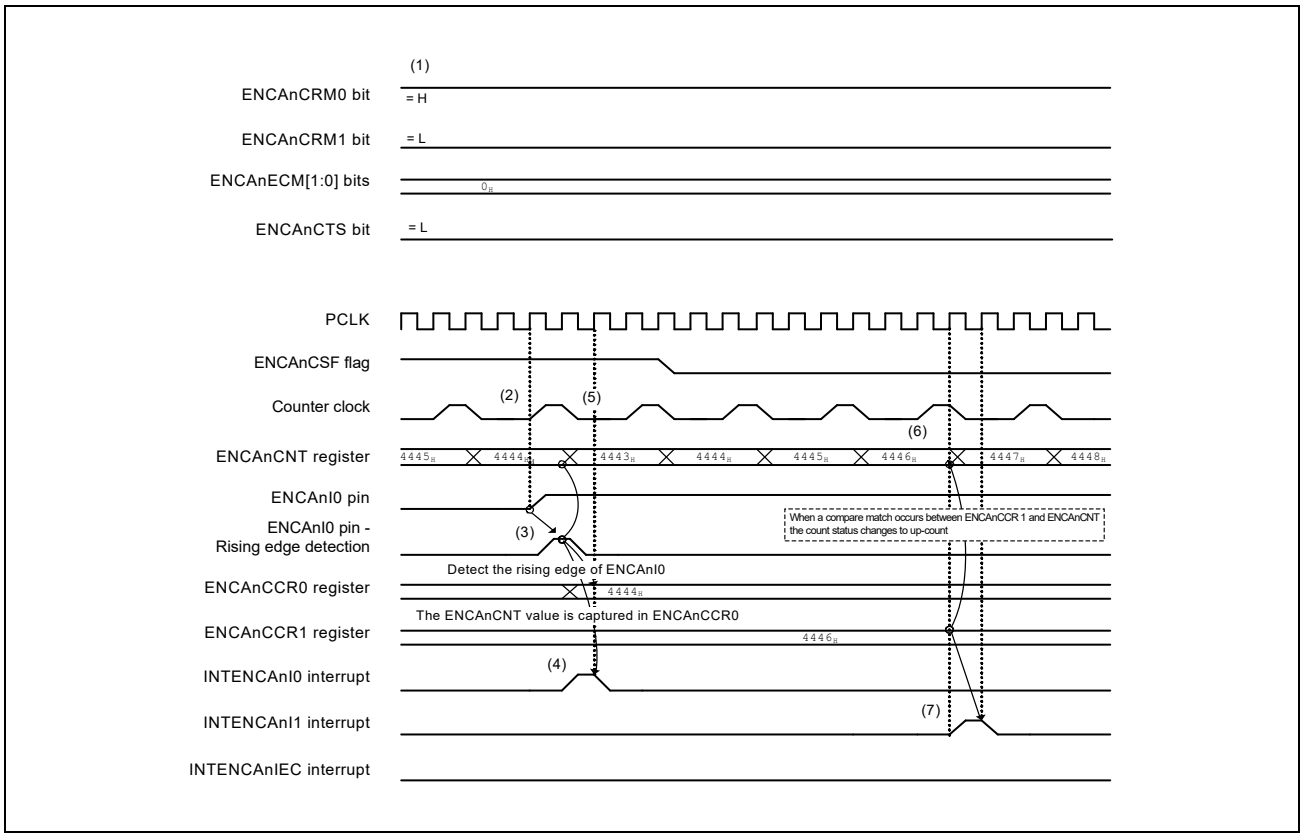

Figure 23.34 Encoder Operation when Compare Match Clear Control is Disabled

1. The values are set as follows: ENCAnCCR1 = 4446_H, ENCAnCRM0 = 1, ENCAnCRM1 = 0, ENCAnECM[1:0] = 00_B, and ENCAnCTS = 0.
2. Down-counting is performed.
3. When the rising edge of ENCAnI0 is detected, the ENCAnCNT value (4444_H) is captured in ENCAnCCR0.
4. An interrupt signal (INTENCAnI0) corresponding to the capture to the ENCAnCCR0 register is output
5. The counter operation changes to up-count.
6. When ENCAnCNT changes to 4446_H, a compare match with ENCAnCCR1 is detected.
7. A compare match interrupt (INTENCAnI1) with ENCAnCCR1 is output.

23.6.23 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, and ENCAnE1 when ENCAnSCE = 1

23.6.23.1 Accompanying Capture Operation

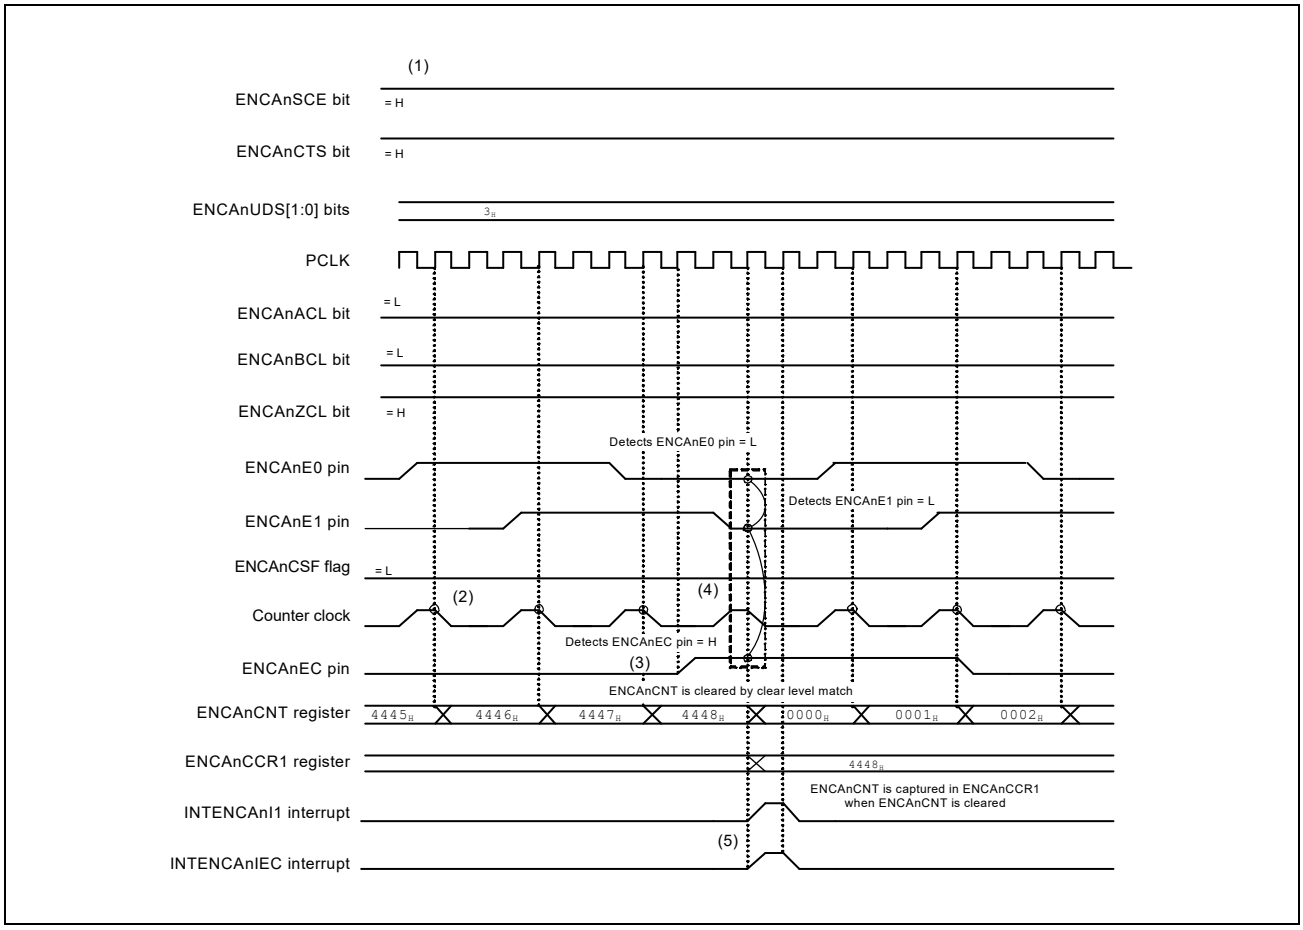

Figure 23.35 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, and ENCAnE1 when ENCAnSCE = 1

1. The values are set as follows: ENCAnSCE = 1, ENCAnCTS = 1, ENCAnUDS[1:0] = 11_B, ENCAnACL = 0, ENCAnBCL = 0, and ENCAnZCL = 1.
2. Up-counting is performed.
3. The counter value is not cleared upon the rising edge of ENCAnEC.
4. When ENCAnE0, ENCAnE1, and ENCAnEC reach the set clear level, the counter value is cleared. The counter value is captured in ENCAnCCR1 at the time of the clearing.
5. At the time of the clearing, an interrupt (INTENCAnI1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (INTENCAnIEC) by ENCAnEC are output.

23.6.23.2 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count

(When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

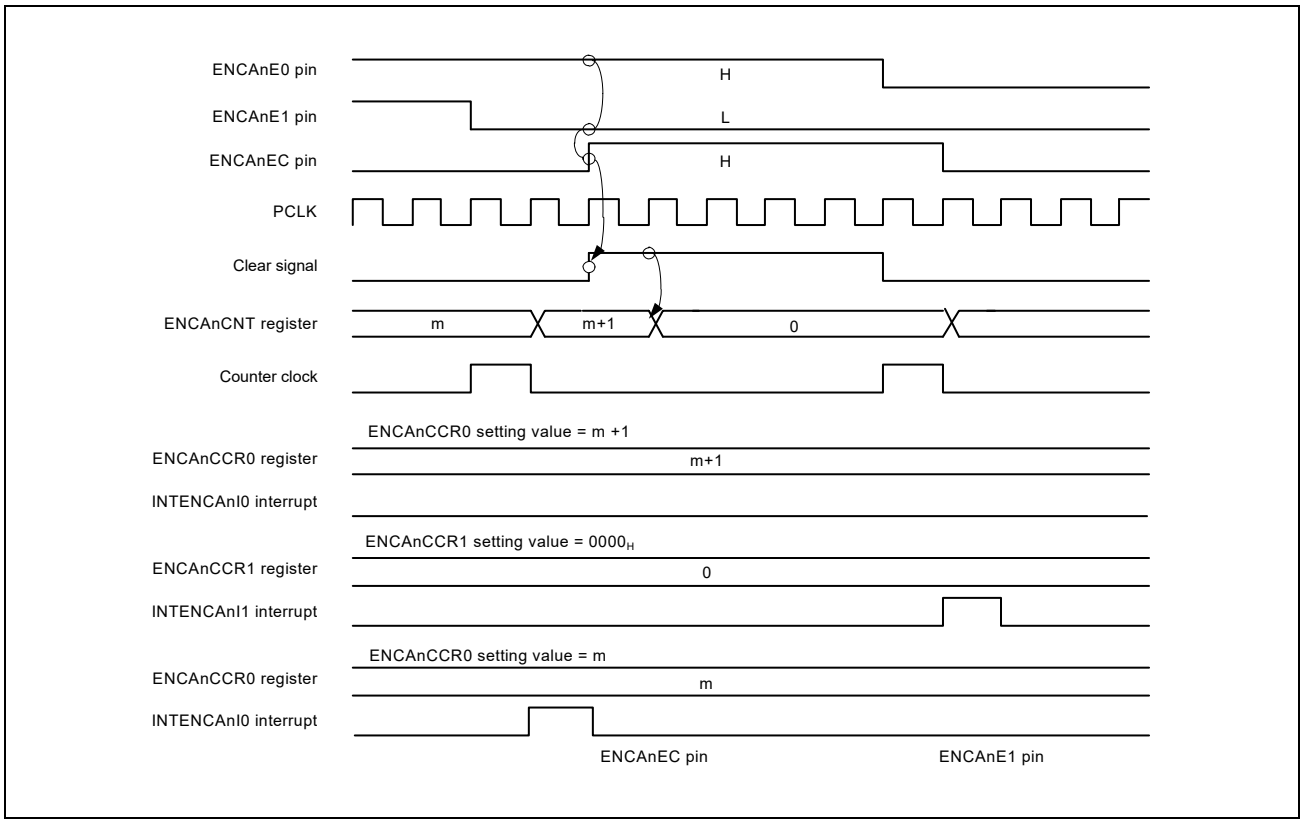

Figure 23.36 Clearing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input During Up-Count

23.6.23.3 When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count

(When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

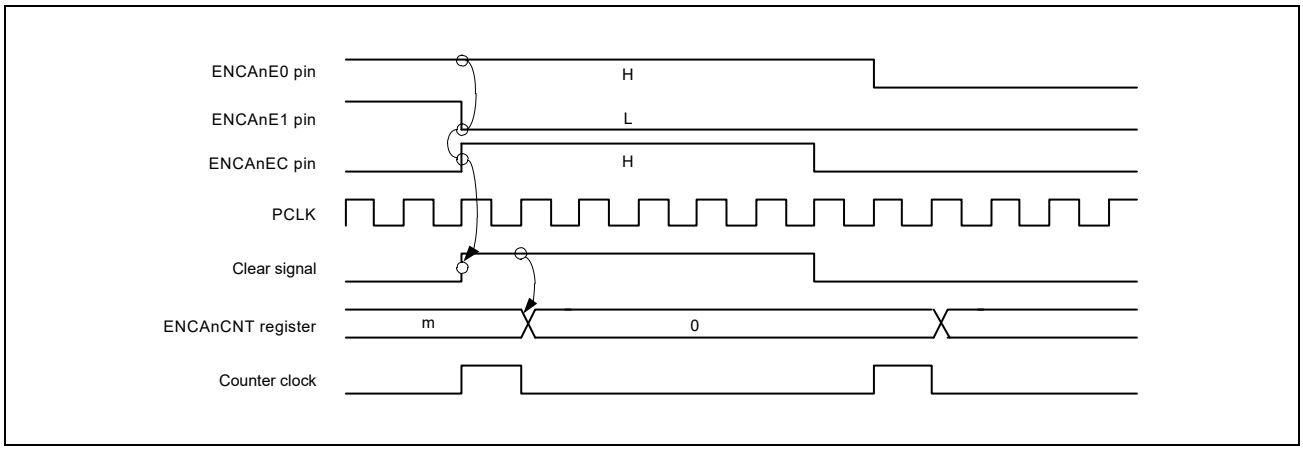

Figure 23.37 Clearing for when the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input During Up-Count

23.6.23.4 When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count

(When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

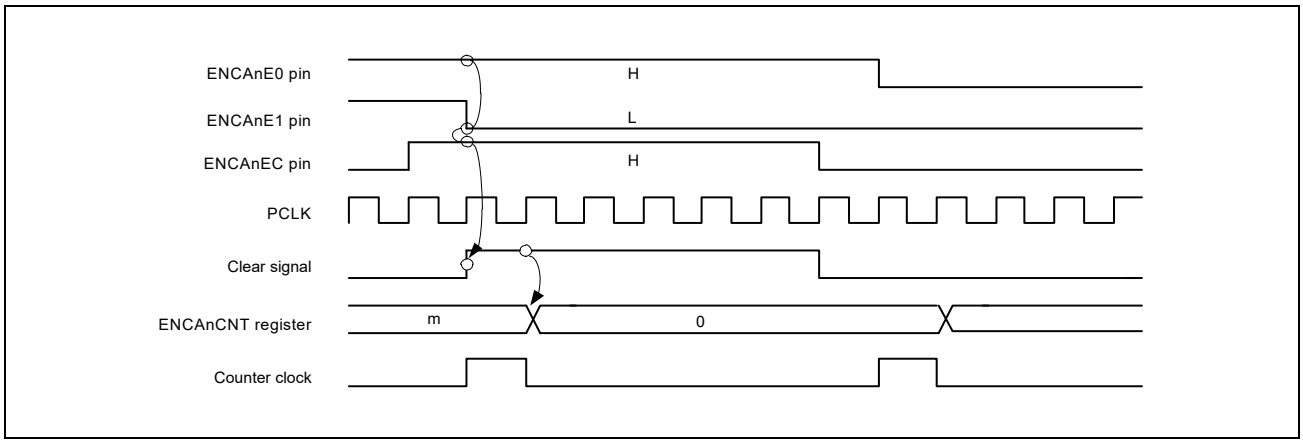

Figure 23.38 Clearing for when the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input During Up-Count

23.6.23.5 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count

(When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

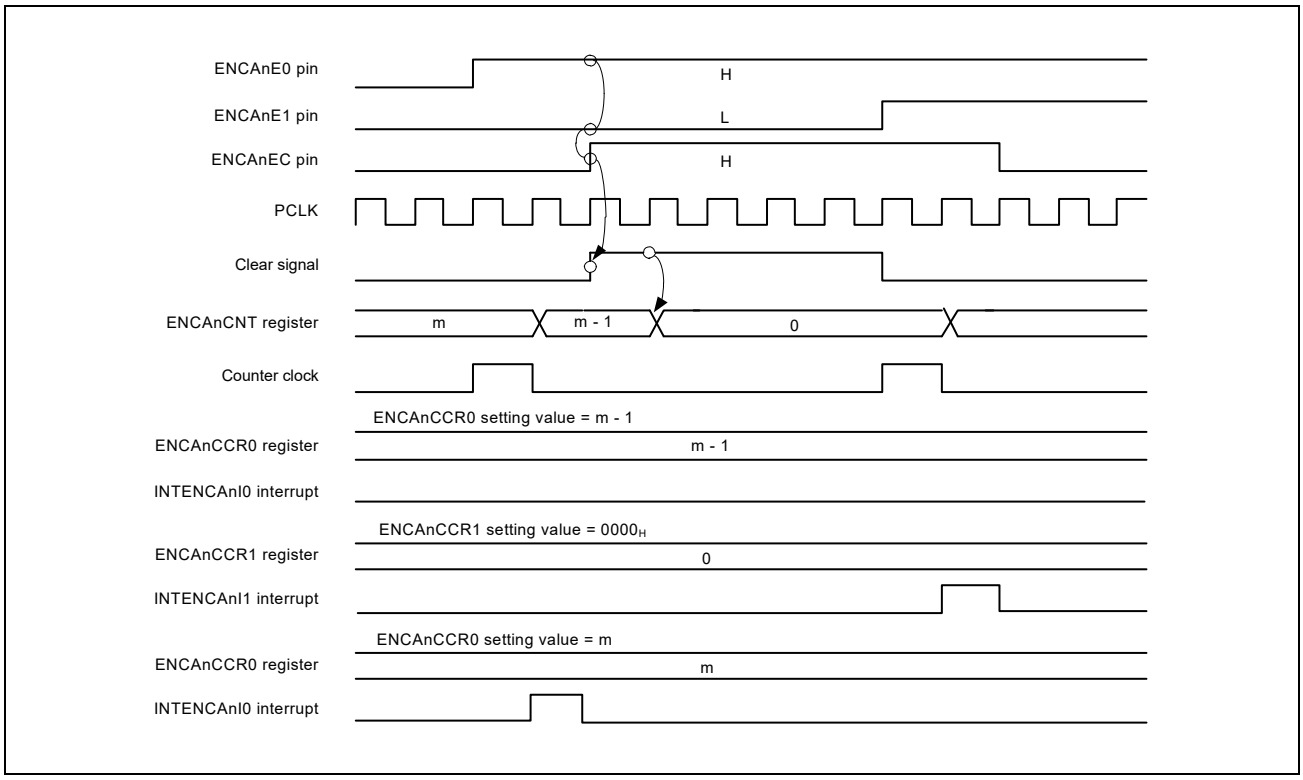

Figure 23.39 Clearing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input During Down-count

23.6.24 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0

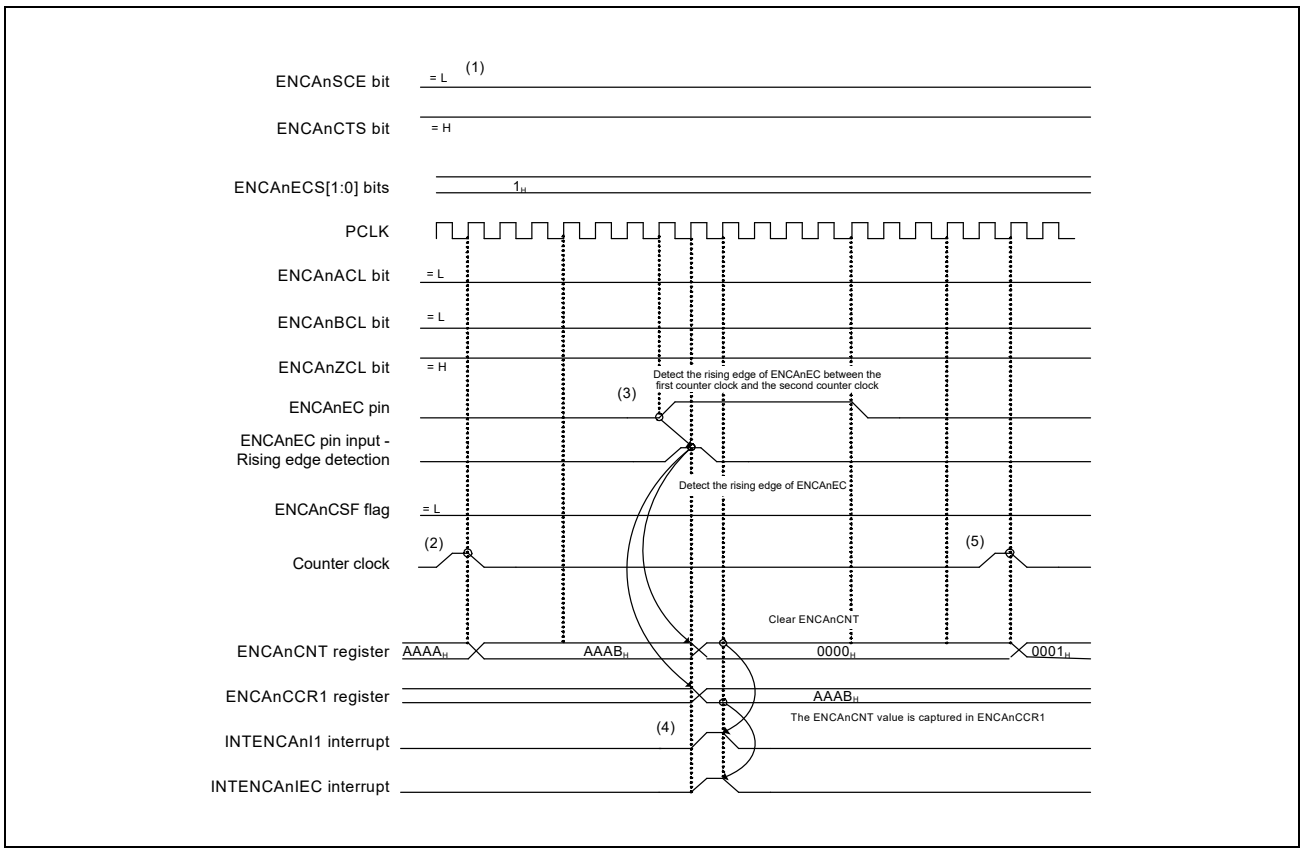

Figure 23.40 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0

1. The values are set as follows: ENCAnSCE = 0, ENCAnCTS = 1, and ENCAnECS[1:0] = 01_B.
2. Up-counting is performed.
3. The rising edge of the ENCAnEC input is detected, and the ENCAnCNT value ($AAAB_H$) is captured in the ENCAnCCR1 register. Concurrently, clear operation by ENCAnEC is performed, and ENCAnCNT is cleared to 0000_H.
4. A capture interrupt 1 (INTENCAnI1) to the ENCAnCCR1 register and an encoder clear interrupt (INTENCAnIEC) by ENCAnEC are output.
5. After the counter value is cleared, up-counting is performed, and the counter value changes to 0001_H.

Section 24 Peripheral Interconnection (PIC)

24.1 Features of RH850/C1M-A PIC

This section contains a generic description of the peripheral interconnection (PIC).

The first part of this section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the PIC (PIC1B, PIC2D).

24.1.1 Number of Units

This microcontroller has the following number of units of the PIC.

Table 24.1 Number of Units (PIC1B)

Product Name	RH850/C1M-A2	RH850/C1M-A1
Number of Units	2	1
Name	PIC1Bk (k = 0, 1)	PIC1Bk (k = 0)

Table 24.2 Number of Units (PIC2D)

Product Name	RH850/C1M-A2	RH850/C1M-A1
Number of Units	1	
Name	PIC2D	

Table 24.3 Indices

Index	Meaning
k	The individual unit of PIC1B is identified by the index “k”.
n	The individual unit of each timer and A/D converter is identified by the index “n”.
m	The individual channel of each timer and A/D converter is identified by the index “m”.
x	The individual scan group of A/D converter is identified by the index “x”.
i	The variable used for descriptions is indicated by the index “i”.

24.1.2 Register Base Address

PIC base addresses are listed in the following table.

PIC register addresses are given as offsets from the base addresses in general.

Table 24.4 Register Base Address

Base Address Name	Base Address
<PIC1B0_base>	FFDD 0000_H
<PIC1B1_base>	FF7D 2000_H
<PIC2D_base>	FFDD 1000_H

24.1.3 Clock Supply

PIC clocks are listed in the following table.

Table 24.5 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
PIC1Bk	PCLK	CLKC_HSB (non-modulated high-speed peripheral clock)
PIC2D	PCLK	CLKC_HSB (non-modulated high-speed peripheral clock)

24.1.4 Reset Sources

PIC reset sources are listed in the following table. PIC is initialized by these reset sources.

Table 24.6 Reset Sources

Unit Name	Reset Source
PIC1Bk	Reset by all reset sources.
PIC2D	Reset by all reset sources.

24.1.5 External Input/Output Signals

External input/output signals of PIC are listed in the following table.

Table 24.7 PIC1B External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal Name
ENCAnI1	ENCAn capture trigger input 1	ENCAnTIN1
ENCAnE0	ENCAn encoder input (count pulse 0)	ENCAnE0
ENCAnE1	ENCAn encoder input (count pulse 1)	ENCAnE1
ENCAnEC	ENCAn encoder input (clear pulse)	ENCAnEC
TAUDnTINm	TAUDn channel m	TAUDnIm
ESOn	Hi-Z control	TAPAnESO
TSG3nO1-6	TSG3n channel output 1 to 6	TSG3nO1-6
TOPnU	Motor control output U phase	TAPAnUP
TOPnUB	Motor control output UB phase	TAPAnUN
TOPnV	Motor control output V phase	TAPAnVP
TOPnVB	Motor control output VB phase	TAPAnVN
TOPnW	Motor control output W phase	TAPAnWP
TOPnWB	Motor control output WB phase	TAPAnWN
TSGTSST	TSG external simultaneous start trigger input	TSGTRG

Table 24.8 PIC2D External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal Name
ADTRGnZ	ADCCn trigger	ADCCnTRG

24.2 Peripheral Interconnection 1 (PIC1B)

24.2.1 Overview

24.2.1.1 Functional Overview

The peripheral interconnection 1 (PIC1B) handles synchronous operation using multiple timers and by connecting the timer internal I/O signals between the timers.

CAUTIONS

- The signal names used in the following descriptions are abbreviations. The actual signal names corresponding to each abbreviation are as follows:
  INTm → TAUDnTINTm
  TINm → TAUDnTTINm
  TOUTm → TAUDnTTOUTm
  CDRm → TAUDnCDRm
  CNTm → TAUDnCNTm
  TSGTSST → TSGTRG
- The functions of the ENCA internal signals used in the following descriptions are as follows:
  ENCATnEQ0 : Internal signals to be output one PCLK cycle before INTENCAnI0 interrupt request signals
  ENCATnEQ1 : Internal signals to be output one PCLK cycle before INTENCAnI1 interrupt request signals
  ENCATnIEC : Internal signals of INTENCAnIEC interrupt request signals

The PIC1B has the following functions.

- Simultaneous start trigger function
- TSG simultaneous start trigger function (external trigger)
- PWM output function with dead time
- High accuracy triangle wave PWM output function with dead time
- Delay pulse output function with dead time
- Trigger and pulse width measurement function
- Encoder capture trigger select function
- Two-phase encoder control function (control method 1)
- Two-phase encoder control function (control method 2)
- Two-phase encoder control function (control method 3)
- Three-phase pulse input control function
- Three-phase encoder control function
- ENCA input select function
- TAUD input select function
- Switch function between TSG output and low/high level output
- Hi-Z control function

Table 24.9 lists the related modules by functionality.

Table 24.9 Related Modules by Functionality

Section Number	Function Name	Related Module*2 / Input Pin*2		
		PIC1B0	PIC1B1*1	Two Units Coupled*1
24.2.3.1	**Simultaneous Start Trigger Function**	TAUD0, TAUD1 TAUJ0 TSG30, TSG31 TPBA0, TPBA1 ENCA0, ENCA1 OSTM0, OSTM1, OSTM2	TAUD2, TAUD3 TAUJ1 TSG32 — — OSTM3	TAUD0, TAUD1, TAUD2, TAUD3 TAUJ0, TAUJ1 TSG30, TSG31, TSG32 TPBA0, TPBA1 ENCA0, ENCA1 OSTM0, OSTM1, OSTM2, OSTM3
24.2.3.2	**TSG Simultaneous Start Function (External Trigger)**	TSG30, TSG31	TSG32	TSG30, TSG31, TSG32
24.2.3.3	**PWM Output Function with Dead Time**	TAUD0, TAUD1	TAUD2, TAUD3	—
24.2.3.4	**High Accuracy Triangle Wave PWM Output Function with Dead Time**	TAUD0, TAUD1	TAUD2, TAUD3	—
24.2.3.5	**Delay Pulse Output Function with Dead Time**	TADU0, TAUD1	TAUD2, TAUD3	—
24.2.3.6	**Trigger and Pulse Width Measurement Function**	TADU0, TAUD1 TAUJ0 ENCA0, ENCA1	—	—
24.2.3.7	**Encoder Capture Trigger Select Function**	TAUD0, TAUD1, ENCA0, ENCA1 PIC2D	—	—
24.2.3.8	**Two-Phase Encoder Control Function (Control Method 1)**	TSG30, TSG31 ENCA0, ENCA1	—	—

24.2.3.14	**TAUD Input Select Function**	TAUD0, TAUD1	TAUD2, TAUD3	—
24.2.3.15	**Switch Function between TSG Output and Low/High Level Output**	TSG30, TSG31	TSG32	—
24.2.3.16	**Hi-Z Control Function**	TAUD0, TAUD1 TSG30, TSG31 TAPA0, TAPA1, TAPA3, TAPA4 ECM ES00, ES01, ES03, ES04 (pin)	TAUD2 TSG32 TAPA2, TAPA5 ECM ES02, ES05 (pin)	—

Note 1. PIC1B1 is not provided for the C1M-A1 and thus coupled operation of the two units are not possible.

Note 2. TSG32, TAPA5, TAPA2, TAUD3, TAUD2, TAUJ1, TPBA1, OSTM3, RDC3A1, ESO5, and ESO2 are not provided for the C1M-A1.

24.2.2 Registers

24.2.2.1 List of Registers

The registers are listed in the following table.

The bits can be accessed only in 32-bit units. Access in 16-bits or 8-bits is operated as 32-bit access.

See **Section 24.1.2, Register Base Address** for <PIC1Bk_base>.

Table 24.10 Registers (1/2)

Module Name	Register	Symbol	Address
PIC1B0	Simultaneous start trigger control register 0	PIC1BSST0	<PIC1B0_base> + 04_H
PIC1B0	TSG3 simultaneous start trigger select register 0	PIC1BSSTSGSEL0	<PIC1B0_base> + 08_H
PIC1B0	Simultaneous start trigger output control register 0*1	PIC1BSSTOUTEN0	<PIC1B0_base> + $0C_H$
PIC1B0	Simultaneous start control register 00	PIC1BSSER00	<PIC1B0_base> + 10_H

24.2.2.2 PIC1BSST0 ─ Simultaneous Start Trigger Control Register 0

PIC1BSST0 is an 8-bit register that selects a simultaneous start trigger.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PIC1BSYNCTRG
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 24.12 PIC1BSST0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BSYNCTRG	Generates a start trigger for the timer of PIC1B0 whose simultaneous start trigger is enabled. 0: Disabled 1: Simultaneous start trigger (a pulse with a width of 1 cycle of PCLK is output.)

Note: PIC1BSYNCTRG is always read as 0.

24.2.2.3 PIC1BSST1 ─ Simultaneous Start Trigger Control Register 1*1

PIC1BSST1 is an 8-bit register that selects a simultaneous start trigger.

Access: Readable/writable in 8-bit units.

Address: <PIC1B1_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PIC1BSYNCTRG
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 24.13 PIC1BSST1 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BSYNCTRG	Generates a start trigger for the timer of PIC1B1 whose simultaneous start trigger is enabled. 0: Disabled 1: Simultaneous start trigger (a pulse with a width of 1 cycle of PCLK is output.)

Note: PIC1BSYNCTRG is always read as 0.

Note 1. C1M-A1 is not provided with the PIC1BSST1 register.

24.2.2.4 PIC1BSSTSGSEL0 ─ TSG3 Simultaneous Start Trigger Select Register 0

PIC1BSSTSGSEL0 is an 8-bit register that selects a simultaneous start trigger for each of TSG31 and TSG30.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PIC1BSS TSGSEL01	PIC1BSS TSGSEL00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 24.14 PIC1BSSTSGSEL0 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	PIC1BSSTSGSEL01	Selects a start trigger for TSG31. 0: Selects PIC1BSYNCTRG of the PIC1BSST0 register. 1: Selects an external trigger (TSGTSST).
0	PIC1BSSTSGSEL00	Selects a start trigger for TSG30. 0: Selects PIC1BSYNCTRG of the PIC1BSST0 register. 1: Selects an external trigger (TSGTSST).

24.2.2.5 PIC1BSSTSGSEL1 ─ TSG3 Simultaneous Start Trigger Select Register 1*1

PIC1BSSTSGSEL1 is an 8-bit register that selects a simultaneous start trigger for TSG32.

Access: Readable/writable in 8-bit units.

Address: <PIC1B1_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PIC1BSS TSGSEL10
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 24.15 PIC1BSSTSGSEL1 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BSSTSGSEL10	Selects a start trigger for TSG32. 0: Selects PIC1BSYNCTRG of the PIC1BSST1 register. 1: Selects an external trigger (TSGTSST).

Note 1. C1M-A1 is not provided with the PIC1BSSTSGSEL1 register.

24.2.2.6 PIC1BSSTOUTENk – Simultaneous Start Trigger Output Control Register k*1

The PIC1BSSTOUTENk registers enables or disables the output of simultaneous start triggers from one PIC1B unit to the other. Setting PIC1BSSTOUTEN00 of the PIC1BSSTOUTEN0 register and then PIC1BSYNCTRG0 of the PIC1BSST0 register to 1 sends a simultaneous start trigger to the PIC1B1 unit. Making the equivalent settings in the PIC1BSSTOUTEN1 and PIC1BSST1 registers sends a simultaneous start trigger to the PIC1B0 unit.

Access: Readable/writable in 8-bit units.

Address: <PIC1Bk_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PIC1BSSTOUTENk0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 24.16 PIC1BSSTOUTENk Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BSSTOUTENk0	Enables or disables output of simultaneous start triggers from the corresponding PIC1B unit to the other. 0: Disables the output of a simultaneous start trigger to the other PIC1B unit. 1: Enables the output of a simultaneous start trigger to the other PIC1B unit.

Note 1. This register is not provided for the C1M-A.

24.2.2.7 PIC1BSSERk0 – Simultaneous Start Control Register k0

PIC1BSSER00 enables a start trigger for each channel of TAUD0.
PIC1BSSER10 enables a start trigger for each channel of TAUD2.*[1]

Access: Readable/writable in 16-bit units.

Address: <PIC1Bk_base> + 10_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIC1BSSERk015	PIC1BSSERk014	PIC1BSSERk013	PIC1BSSERk012	PIC1BSSERk011	PIC1BSSERk010	PIC1BSSERk009	PIC1BSSERk008	PIC1BSSERk007	PIC1BSSERk006	PIC1BSSERk005	PIC1BSSERk004	PIC1BSSERk003	PIC1BSSERk002	PIC1BSSERk001	PIC1BSSERk000
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.17 PIC1BSSERk0 Register Contents

Bit Position	Bit Name	Function
15 to 0	PIC1BSSERk015 to PIC1BSSERk000	Enable or disable a simultaneous start trigger for CHm in the TAUDn. 0: Disabled 1: Enabled

Note 1. The PIC1BSSER10 register is not provided for the C1M-A1.

24.2.2.8 PIC1BSSERk1 ─ Simultaneous Start Control Register k1

PIC1BSSER01 enables a start trigger for each channel of TAUD1.
PIC1BSSER11 enables a start trigger for each channel of TAUD3.*[1]

Access: Readable/writable in 16-bit units.

Address: <PIC1Bk_base> + 14_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIC1BSSERk115	PIC1BSSERk114	PIC1BSSERk113	PIC1BSSERk112	PIC1BSSERk111	PIC1BSSERk110	PIC1BSSERk109	PIC1BSSERk108	PIC1BSSERk107	PIC1BSSERk106	PIC1BSSERk105	PIC1BSSERk104	PIC1BSSERk103	PIC1BSSERk102	PIC1BSSERk101	PIC1BSSERk100
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 24.18 PIC1BSSERk1 Register Contents

Bit Position	Bit Name	Function
15 to 0	PIC1BSSERk115 to PIC1BSSERk100	Enable or disable a simultaneous start trigger for CHm in the TAUDn. 0: Disabled 1: Enabled

Note 1. The PIC1BSSER11 register is not provided for the C1M-A1.

24.2.2.9 PIC1BSSER02 ─ Simultaneous Start Control Register 02

PIC1BSSER02 enables a start trigger for TAUJ0, TSG30, TSG31, TPBA0, TPBA1*[1], ENCA0, and ENCA1.

Access: Readable/writable in 16-bit units.

Address: <PIC1B0_base> + 18_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	PIC1BSSER0213	PIC1BSSER0212	PIC1BSSER0211	PIC1BSSER0210	PIC1BSSER0209	PIC1BSSER0208	—	—	—	—	PIC1BSSER0203	PIC1BSSER0202	PIC1BSSER0201	PIC1BSSER0200

Table 24.19 PIC1BSSER02 Register Contents (1/2)

Bit Position	Bit Name	Function
15, 14	Reserved	When read, the value after reset is read. When writing, write the value after reset.
13	PIC1BSSER0213	Enables or disables a simultaneous start trigger for the ENCA1. 0: Disabled 1: Enabled
12	PIC1BSSER0212	Enables or disables a simultaneous start trigger for the ENCA0. 0: Disabled 1: Enabled
11	PIC1BSSER0211	Enables or disables a simultaneous start trigger for the TPBA1.*[1] 0: Disabled 1: Enabled
10	PIC1BSSER0210	Enables or disables a simultaneous start trigger for the TPBA0. 0: Disabled 1: Enabled
9	PIC1BSSER0209	Enables or disables a simultaneous start trigger for the TSG31. 0: Disabled 1: Enabled
8	PIC1BSSER0208	Enables or disables a simultaneous start trigger for the TSG30. 0: Disabled 1: Enabled
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	PIC1BSSER0203	Enables or disables a simultaneous start trigger for the TAUJ0 CH03. 0: Disabled 1: Enabled
2	PIC1BSSER0202	Enables or disables a simultaneous start trigger for the TAUJ0 CH02. 0: Disabled 1: Enabled
1	PIC1BSSER0201	Enables or disables a simultaneous start trigger for the TAUJ0 CH01. 0: Disabled 1: Enabled

Table 24.19 PIC1BSSER02 Register Contents (2/2)

Bit Position	Bit Name	Function
0	PIC1BSSER0200	Enables or disables a simultaneous start trigger for the TAUJ0 CH00. 0: Disabled 1: Enabled

Note 1. This module is not provided for the C1M-A1.

24.2.2.10 PIC1BSSER12 – Simultaneous Start Control Register 12*1

PIC1BSSER12 enables a start trigger for TAUJ1 and TSG32.

Access: Readable/writable in 16-bit units.

Address: <PIC1B1_base> + 18_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 24.20 PIC1BSSER12 Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8	PIC1BSSER1208	Enables or disables a simultaneous start trigger for TSG32. 0: Disabled 1: Enabled
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	PIC1BSSER1203	Enables or disables a simultaneous start trigger for TAUJ1 CH03. 0: Disabled 1: Enabled
2	PIC1BSSER1202	Enables or disables a simultaneous start trigger for TAUJ1 CH02. 0: Disabled 1: Enabled
1	PIC1BSSER1201	Enables or disables a simultaneous start trigger for TAUJ1 CH01. 0: Disabled 1: Enabled
0	PIC1BSSER1200	Enables or disables a simultaneous start trigger for TAUJ1 CH00. 0: Disabled 1: Enabled

Note 1. This register is not provided for the C1M-A1.

24.2.2.11 PIC1BSSER03 ─ Simultaneous Start Control Register 03

The PIC1BSSER03 register enables a start trigger for each channel of OSTM0 to OSTM2.

Access: Readable/writable in 16-bit units.

Address: <PIC1B0_base> + $1C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PIC1BSSER0302	PIC1BSSER0301	PIC1BSSER0300
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 24.21 PIC1BSSER03 Register Contents

Bit Position	Bit Name	Function
15 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2	PIC1BSSER0302	Enables or disables a simultaneous start trigger for OSTM2. 0: Disabled 1: Enabled
1	PIC1BSSER0301	Enables or disables a simultaneous start trigger for OSTM1. 0: Disabled 1: Enabled
0	PIC1BSSER0300	Enables or disables a simultaneous start trigger for OSTM0. 0: Disabled 1: Enabled

24.2.2.12 PIC1BSSER13 ─ Simultaneous Start Control Register 13*1

The PIC1BSSER13 register enables a start trigger for each channel of OSTM3.

Access: Readable/writable in 16-bit units.

Address: <PIC1B1_base> + $1C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PIC1BSSER1300
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 24.22 PIC1BSSER13 Register Contents

Bit Position	Bit Name	Function
15 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BSSER1300	Enables or disables a simultaneous start trigger for OSTM3. 0: Disabled 1: Enabled

Note 1. This register is not provided for the C1M-A1.

24.2.2.13 PIC1BINIn0 ─ RS Flip-Flop Circuit Initialization Register n0*1

The PIC1BINIn0 register enables initialization of the RS flip-flop circuits 4 to 2 (RSn4 to 2)

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 20_H (n = 0), <PIC1B0_base> + $2C_H$ (n = 1),
<PIC1B1_base> + 20_H (n = 2), <PIC1B1_base> + $2C_H$ (n = 3)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	PIC1BINIn04	PIC1BINIn03	PIC1BINIn02	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	W	W	W	R	R

Table 24.23 PIC1BINIn0 Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 2	PIC1BINIn0[4:2]	Enables or disables initialization of the RS flip-flop circuits 4 to 2 (RSn4 to RSn2) used for the PWM output function with dead time. These bits are always read as 0. 0: Disabled 1: Initialized
1, 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Note 1. TAUD2 (n = 2) and TAUD3 (n = 3) are not provided for the C1M-A1.

24.2.2.14 PIC1BINIn1 — DT Initialization Register n1

The PIC1BINIn1 register enables initialization of the latch & toggle (DT) circuit.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 24_H (n = 0), <PIC1B0_base> + 30_H (n = 1)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	PIC1BINIn12	PIC1BINIn11	PIC1BINIn10
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	W	W	W

Table 24.24 PIC1BINIn1 Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2 to 0	PIC1BINIn1[2:0]	Enables or disables initialization of the DT circuit to be used for the trigger and pulse width measurement function. These bits are always read as 0. 0: Disabled 1: Initialized

24.2.2.15 PIC1BLHSEL0 — TSG30 Output Low/High Level Select Register

The PIC1BLHSEL0 register selects low/high level output of the TSG30 output.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 60_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	PIC1BLHSEL 06	PIC1BLHSEL 05	PIC1BLHSEL 04	PIC1BLHSEL 03	PIC1BLHSEL 02	PIC1BLHSEL 01	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 24.25 PIC1BLHSEL0 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 1	PIC1BLHSEL0m	These bits are applied to TSG30 output [6:1] and PIC1BLHSEL0 [6:1]. 0: Low level output 1: High level output
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

24.2.2.16 PIC1BTSGOUTCTR0 ─ TSG30 Output Control Register

The PIC1BTSGOUTCTR0 register selects the output type of TSG30 output signal.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 64_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	PIC1BSEL06	PIC1BSEL05	PIC1BSEL04	PIC1BSEL03	PIC1BSEL02	PIC1BSEL01	PIC1BSEL00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.26 PIC1BTSGOUTCTR0 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 1	PIC1BSEL0m	Select the output signal from either TSG30 output or low/high level output. 0: TSG30 output 1: Low/high level output
0	PIC1BSEL00	Switches on/off of the function to output low/high level. 0: Off (only TSG30 output is available) 1: On (TSG30 output and low/high level output can be switched)*1

Note 1. When low/high level output function of TSG30 output is turned on, a delay of one cycle of the clock (CLKC_HSB) is generated from the output when the function is turned off.

24.2.2.17 PIC1BLHSEL1 ─ TSG31 Output Low/High Level Select Register

The PIC1BLHSEL1 register selects low/high level output of the TSG31 output.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 68_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	PIC1BLHSEL 16	PIC1BLHSEL 15	PIC1BLHSEL 14	PIC1BLHSEL 13	PIC1BLHSEL 12	PIC1BLHSEL 11	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 24.27 PIC1BLHSEL1 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 1	PIC1BLHSEL1m	These bits are applied to TSG31 output [6:1] and PIC1BLHSEL1[6:1]. 0: Low level output 1: High level output
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

24.2.2.18 PIC1BTSGOUTCTR1 ─ TSG31 Output Control Register

The PIC1BTSGOUTCTR1 register selects the output type of TSG31 output.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + $6C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	PIC1BSEL16	PIC1BSEL15	PIC1BSEL14	PIC1BSEL13	PIC1BSEL12	PIC1BSEL11	PIC1BSEL10
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.28 PIC1BTSGOUTCTR1 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 1	PIC1BSEL1m	Select the output signal between TSG31 output and low/high-level output. 0: TSG31 output 1: Low/high level output
0	PIC1BSEL10	Switches on/off the function to output low/high level. 0: Off (only TSG31 output is available) 1: On (TSG31 output and low/high level output can be switched)*1

Note 1. When low/high level output function of TSG31 output is turned on, a delay of one cycle of the clock (CLKC_HSB) is generated from the output when the function is turned off.

24.2.2.19 PIC1BLHSEL2 ─ TSG32 Output Low/High Level Select Register*1

The PIC1BLHSEL2 register selects the output level (low/high) of the TSG32 output.

Access: Readable/writable in 8-bit units.

Address: <PIC1B1_base> + 60_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	PIC1BLHSEL 26	PIC1BLHSEL 25	PIC1BLHSEL 24	PIC1BLHSEL 23	PIC1BLHSEL 22	PIC1BLHSEL 21	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 24.29 PIC1BLHSEL2 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 1	PIC1BLHSEL2m	These bits are applied to TSG32 output[6:1] and PIC1BLHSEL2[6:1]. 0: Low level output 1: High level output
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Note 1. C1M-A1 is not provided with the PIC1BLHSEL2 register.

24.2.2.20 PIC1BTSGOUTCTR2 ─ TSG32 Output Control Register*1

The PIC1BTSGOUTCTR2 register selects the type of the signal for output from the TSG32 pin.

Access: Readable/writable in 8-bit units.

Address: <PIC1B1_base> + 64_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	PIC1BSEL26	PIC1BSEL25	PIC1BSEL24	PIC1BSEL23	PIC1BSEL22	PIC1BSEL21	PIC1BSEL20
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.30 PIC1BTSGOUTCTR2 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 1	PIC1BSEL2m	Select the output signal between TSG32 output and low/high-level output. 0: TSG32 output 1: Low/high level output
0	PIC1BSEL20	Switches on/off of the function to output low/high level. 0: Off (only TSG32 output is available) 1: On (TSG32 output and low/high level output can be switched)*2

Note 1. PIC1BTSGOUTCTR2 is not provided for the C1M-A1.

Note 2. When the low or high level output function of the TSG32 output pins is turned on and then off, operation as a TSG output only starts after a delay of one cycle of the clock (CLKC_HSB).

24.2.2.21 PIC1BTSGHALLSEL ─ Hall Sensor Input Select Register

The PIC1BTSGHALLSEL register sets the pin conditions to input the external hall sensor signal.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 74_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PIC1BTSG1 HALLSEL	PIC1BTSG0 HALLSEL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 24.31 PIC1BTSGHALLSEL Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	PIC1B TSG1HALLSEL	Sets pin condition to input the external hall sensor signal.*1 0: Separate input 1: Alternative input with ENCA
0	PIC1B TSG0HALLSEL	Sets pin condition to input the external hall sensor signal.*1 0: Separate input 1: Alternative input with ENCA

Note 1. For the products of C1M-A series, set this register to 1 because the external hall sensor input pins are also used as ENCA input pins. Set the bit 0 of the PIC1BREG50 register and the PIC1BREG51 register as the following tables.

Table 24.32 Settings of PIC1BTSGHALLSEL and PIC1BREG51 Register Bit 0 (PIC1BREG5100)

PIC1BTSG1HALLSEL	PIC1BREG5100	Function
1	1	Selects input pin ENCA1E0, ENCA1E1, and ENCA1EC.
Other than above		Setting prohibited.

Table 24.33 Settings of PIC1BTSGHALLSEL and PIC1BREG5000 Register Bit 0 (PIC1BREG5000)

PIC1BTSG0HALLSEL	PIC1BREG5000	Function
1	0	Selects input pin ENCA0E0, ENCA0E1, and ENCA0EC.
Other than above		Setting prohibited.

24.2.2.22 PIC1BTAUD0SEL ─ TAUD0 Input Select Register

The PIC1BTAUD0SEL register is a 32-bit register that selects TAUDTIN input signals.

Access: Readable/writable in 32-bit units.

Address: <PIC1B0_base> + 78_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.36 PIC1BTAUD2SEL Register Contents

Bit Position	Bit Name	Function
2m + 3	PIC1BTAUD2INm3	Selects the signal for output from the TAUD2TIN (m + 1) output pin. 00: TAUD2TIN (m + 1) is selected. 01: TAUD2TIN (m) is selected. 10: TAUD3TIN (m + 1) is selected. 11: TAUD3TIN (m) is selected. Settings other than above are prohibited.
2m + 2	PIC1BTAUD2INm2	
2m + 1	PIC1BTAUD2INm1	Selects the signal for output from the TAUD2TIN (m) output pin. 00: TAUD2TIN (m) is selected. 01: TAUD2TIN (m + 1) is selected. 10: TAUD3TIN (m) is selected. 11: TAUD3TIN (m + 1) is selected. Settings other than above are prohibited.
2m	PIC1BTAUD2INm0	

Note: m is an even channel number of TAUD2 (CHm_even).

Note 1. This register is not provided for the C1M-A1.

24.2.2.25 PIC1BTAUD3SEL ─ TAUD3 Input Select Register*1

PIC1BTAUD3SEL is a 32-bit register that selects TAUDTIN input signals.

Access: Readable/writable in 32-bit units.

Address: <PIC1B1_base> + $7C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.37 PIC1BTAUD3SEL Register Contents

Bit Position	Bit Name	Function
2m + 3	PIC1BTAUD3INm3	Selects the signal for output from the TAUD3TIN (m + 1) output pin. 00: TAUD3TIN (m + 1) is selected. 01: TAUD3TIN (m) is selected. 10: TAUD2TIN (m + 1) is selected. 11: TAUD2TIN (m) is selected.
2m + 2	PIC1BTAUD3INm2	
2m + 1	PIC1BTAUD3INm1	Selects the signal for output from the TAUD3TIN (m) output pin. 00: TAUD3TIN (m) is selected. 01: TAUD3TIN (m + 1) is selected. 10: TAUD2TIN (m) is selected. 11: TAUD2TIN (m + 1) is selected.
2m	PIC1BTAUD3INm0	

Note: m is an even channel number of TAUD3 (CHm_even).

Note 1. This register is not provided for the C1M-A1.

24.2.2.26 PIC1BHIZCEN00 ─ Hi-Z Control Register 00

The PIC1BHIZCEN00 register selects Hi-Z control input signals of TAUD0.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 80_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	PIC1BHIZCEN005	—	—	—	—	PIC1BHIZCEN000
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R	R	R/W

Table 24.38 PIC1BHIZCEN00 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	PIC1BHIZCEN005	Enables or disables Hi-Z control by ERROROUTZ signal. 0: Disabled 1: Enabled
4 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BHIZCEN000	Enables or disables Hi-Z control by ESO0 pin input. 0: Disabled 1: Enabled

CAUTION

Set this register before starting U/V/W outputs or UB/VB/WB outputs of TAUD0.

Set TAPA0CTL0.TAPA0DCN = 0 and TAPA0CTL0.TAPA0DCP = 1 when performing Hi-Z control by ERROROUTZ signal.

24.2.2.27 PIC1BHIZCEN01 ─ Hi-Z Control Register 01

The PIC1BHIZCEN01 register selects Hi-Z control input signals of TAUD1.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 84_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	PIC1BHIZCEN015	—	—	—	—	PIC1BHIZCEN010
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R	R	R/W

Table 24.39 PIC1BHIZCEN01 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	PIC1BHIZCEN015	Enables or disables Hi-Z control by ERROROUTZ signal. 0: Disabled 1: Enabled
4 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BHIZCEN010	Enables or disables Hi-Z control by ESO1 pin input. 0: Disabled 1: Enabled

CAUTION

Set this register before starting U/V/W outputs or UB/VB/WB outputs of TAUD1.

Set TAPA1CTL0.TAPA1DCN = 0 and TAPA1CTL0.TAPA1DCP = 1 when performing Hi-Z control by ERROROUTZ signal.

24.2.2.28 PIC1BHIZCEN02 ─ Hi-Z Control Register 02

The PIC1BHIZCEN02 register selects Hi-Z control input signals of TSG30.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + 88_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	PIC1BHIZCEN025	—	PIC1BHIZCEN023	—	—	PIC1BHIZCEN020
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R	R	R/W

Table 24.40 PIC1BHIZCEN2 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	PIC1BHIZCEN025	Enables or disables Hi-Z control by ERROROUTZ signal. 0: Disabled 1: Enabled
4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	PIC1BHIZCEN023	Enables or disables Hi-Z control by INTTSG30IER interrupt request signal. 0: Disabled 1: Enabled
2, 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BHIZCEN020	Enables or disables Hi-Z control by ESO3 pin input. 0: Disabled 1: Enabled

CAUTION

Set this register before starting TSG30 output.

Set TAPA3CTL0.TAPA3DCN = 0 and TAPA3CTL0.TAPA3DCP = 1 when performing Hi-Z control by ERROROUTZ signal.

24.2.2.29 PIC1BHIZCEN03 ─ Hi-Z Control Register 03

The PIC1BHIZCEN03 register selects Hi-Z control input signals of TSG31.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + $8C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	PIC1BHIZCEN035	PIC1BHIZCEN034	—	—	—	PIC1BHIZCEN030
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R/W

Table 24.41 PIC1BHIZCEN3 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	PIC1BHIZCEN035	Enables or disables Hi-Z control by ERROROUTZ signal. 0: Disabled 1: Enabled
4	PIC1BHIZCEN034	Enables or disables Hi-Z control by INTTSG31IER interrupt request signal. 0: Disabled 1: Enabled
3 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BHIZCEN030	Enables or disables Hi-Z control by ESO4 pin input. 0: Disabled 1: Enabled

CAUTION

Set this register before starting TSG31 output.

Set TAPA4CTL0.TAPA4DCN = 0 and TAPA4CTL0.TAPA4DCP = 1 when performing Hi-Z control by ERROROUTZ signal.

24.2.2.30 PIC1BHIZCEN10 ─ Hi-Z Control Register 10*1

The PIC1BHIZCEN10 register selects Hi-Z control input signals of TAUD2.

Access: Readable/writable in 8-bit units.

Address: <PIC1B1_base> + 80_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	PIC1BHIZCEN 105	—	—	—	—	PIC1B1HIZCEN 100
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R	R	R/W

Table 24.42 PIC1BHIZCEN10 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	PIC1BHIZCEN 105	Enables or disables Hi-Z control by ERROROUTZ signal. 0: Disabled 1: Enabled
4 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BHIZCEN 100	Enables or disables Hi-Z control by ESO2 pin input. 0: Disabled 1: Enabled

CAUTION

Set this register before starting U/V/W outputs or UB/VB/WB outputs of TAUD2.

Set TAPA2CTL0.TAPA2DCN = 0 and TAPA2CTL0.TAPA2DCP = 1 when performing Hi-Z control by ERROROUTZ signal.

Note 1. This register is not provided for the C1M-A1.

24.2.2.31 PIC1BHIZCEN12 ─ Hi-Z Control Register 12*1

The PIC1BHIZCEN12 register selects Hi-Z control input signals of TSG32.

Access: Readable/writable in 8-bit units.

Address: <PIC1B1_base> + 88_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	PIC1BHIZCEN 125	—	PIC1BHIZCEN 123	—	—	PIC1BHIZCEN 120
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R	R	R/W

Table 24.43 PIC1BHIZCEN12 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	PIC1BHIZCEN 125	Enables or disables Hi-Z control by ERROROUTZ signal. 0: Disabled 1: Enabled
4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	PIC1BHIZCEN 123	Enables or disables Hi-Z control by INTTSG32IER interrupt request signal. 0: Disabled 1: Enabled
2, 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BHIZCEN 120	Enables or disables Hi-Z control by ESO5 pin input. 0: Disabled 1: Enabled

CAUTION

Set this register before starting TSG32 output.

Set TAPA5CTL0.TAPA5DCN = 0 and TAPA5CTL0.TAPA5DCP = 1 when performing Hi-Z control by ERROROUTZ signal.

Note 1. This register is not provided for the C1M-A1.

24.2.2.32 PIC1BENCSEL400 ─ ENCATIN1 Input Select Register 400

The PIC1BENCSEL400 register is used for encoder capture trigger function.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + $B8_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PIC1BENCSEL 4007	—	—	—	PIC1BENCSEL 4003	PIC1BENCSEL 4002	PIC1BENCSEL 4001	PIC1BENCSEL 4000
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 24.44 PIC1BENCSEL400 Register Contents

Bit Position	Bit Name	Function
7	PIC1BENCSEL 4007	Enables or disables output of INTTAUD0Im signal selected by PIC1BENCSEL400[3:0]. 0: Disabled 1: Enabled
6 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	PIC1BENCSEL 400[3:0]	Select TAUD0TINTm to be used as a capture trigger signal for ENCA0 and ENCA1. 0: INTTAUD0I0 is selected. 1: INTTAUD0I1 is selected. 2: INTTAUD0I2 is selected. 3: INTTAUD0I3 is selected. 4: INTTAUD0I4 is selected. 5: INTTAUD0I5 is selected. 6: INTTAUD0I6 is selected. 7: INTTAUD0I7 is selected. 8: INTTAUD0I8 is selected. 9: INTTAUD0I9 is selected. 10: INTTAUD0I10 is selected. 11: INTTAUD0I11 is selected. 12: INTTAUD0I12 is selected. 13: INTTAUD0I13 is selected. 14: INTTAUD0I14 is selected. 15: INTTAUD0I15 is selected.

24.2.2.33 PIC1BENCSEL410 ─ ENCATIN1 Input Select Register 410

The PIC1BENCSEL410 register is used for encoder capture trigger function.

Access: Readable/writable in 8-bit units.

Address: <PIC1B0_base> + BC_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PIC1BENCSEL 4107	—	—	—	PIC1BENCSEL 4103	PIC1BENCSEL 4102	PIC1BENCSEL 4101	PIC1BENCSEL 4100
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 24.45 PIC1BENCSEL410 Register Contents

Bit Position	Bit Name	Function
7	PIC1BENCSEL 4107	Enables or disables output of INTTAUD1Im signal selected by PIC1BENCSEL410[3:0]. 0: Disabled 1: Enabled
6 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	PIC1BENCSEL 410[3:0]	Selects TAUD1TINTm to be used as a capture trigger signal for ENCA0 and ENCA1. 0: INTTAUD1I0 is selected. 1: INTTAUD1I1 is selected. 2: INTTAUD1I2 is selected. 3: INTTAUD1I3 is selected. 4: INTTAUD1I4 is selected. 5: INTTAUD1I5 is selected. 6: INTTAUD1I6 is selected. 7: INTTAUD1I7 is selected. 8: INTTAUD1I8 is selected. 9: INTTAUD1I9 is selected. 10: INTTAUD1I10 is selected. 11: INTTAUD1I11 is selected. 12: INTTAUD1I12 is selected. 13: INTTAUD1I13 is selected. 14: INTTAUD1I14 is selected. 15: INTTAUD1I15 is selected.

24.2.2.34 PIC1BREG200 ─ Timer Input/Output Control Register 200

The PIC1BREG200 register selects TAUD0 input signals.

Access: Readable/writable in 32-bit units.

Address: <PIC1B0_base> + $C0_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PIC1BREG20025	PIC1BREG20024	—	—	—	—	—	PIC1BREG20018	—	—

Table 24.46 PIC1BREG200 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is read. When writing, write the value after reset.
25, 24	PIC1BREG20025, PIC1BREG20024	Select TAUD channel to use for TAPA0TSIM0 and TAPA0TUDCM0. 00: No channel selected. 01: TAUD0 channel 0 is selected. 10: TAUD0 channel 2 is selected. 11: TAUD0 channel 8 is selected.
23 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	PIC1BREG20018	Selects the signal for input as TAUD0TIN10, TAUD0TIN12, and TAUD0TIN14 signals of TAUD0. 1: TOUT from TAUD0 CH02 Settings other than above are prohibited.*1
17 to 12	Reserved	When read, the value after reset is read. When writing, write the value after reset.
11, 10	PIC1BREG20011, PIC1BREG20010	Select the signal for input as TAUD0TIN6 and TAUD0TIN7 signals of TAUD0. 10: TS0PTE signal of TSG30. Settings other than above are prohibited.*1
9, 8	PIC1BREG20009, PIC1BREG20008	Select the signal for input as TAUD0TIN4 and TAUD0TIN5 signals of TAUD0. 10: TS0PTE signal of TSG30. Settings other than above are prohibited.*1
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	PIC1BREG20003	Selects the signal for input as TAUD0TIN7 signal of TAUD0. 0: TIN pin input 1: Input signal selected by PIC1BREG20011 and PIC1BREG20010 bits (TS0PTE signal).
2	PIC1BREG20002	Selects the signal for input as TAUD0TIN6 signal of TAUD0. 0: TIN pin input 1: Input signal selected by PIC1BREG20011 and PIC1BREG20010 bits (TS0PTE signal).

Table 24.46 PIC1BREG200 Register Contents (2/2)

Bit Position	Bit Name	Function
1	PIC1BREG20001	Selects the signal for input as TAUD0TIN5 signal of TAUD0. 0: TIN pin input 1: Input signal selected by PIC1BREG20009 and PIC1BREG20008 bits (TS0PTE signal).
0	PIC1BREG20000	Selects the signal for input as TAUD0TIN4 signal of TAUD0. 0: TIN pin input 1: Input signal selected by PIC1BREG20009 and PIC1BREG20008 bits (TS0PTE signal).

Note 1. Set any appropriate value because the value after reset is “setting prohibited”.

24.2.2.35 PIC1BREG210 ─ Timer Input/Output Control Register 210

The PIC1BREG210 register selects TAUD1 input signals.

Access: Readable/writable in 32-bit units.

Address: <PIC1B0_base> + $D4_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.47 PIC1BREG210 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is read. When writing, write the value after reset.
25, 24	PIC1BREG21025, PIC1BREG21024	Select the TAUD channel to use for TAPA1TSIM0 and TAPA1TUDCM0. 00: No channel selected. 01: TAUD1 channel 0 is selected. 10: TAUD1 channel 2 is selected. 11: TAUD1 channel 8 is selected.
23 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	PIC1BREG21018	Selects the signal for input as TAUD1TIN10, TAUD1TIN12, and TAUD1TIN14 signals of TAUD1. 1: TOUT from TAUD1 CH02 Settings other than above are prohibited.*1
17 to 12	Reserved	When read, the value after reset is read. When writing, write the value after reset.
11, 10	PIC1BREG21011, PIC1BREG21010	Select the signal for input as TAUD1TIN6 and TAUD1TIN7 signals of TAUD1. 10: TS0PTE signal of TSG31 Settings other than above are prohibited.*1
9, 8	PIC1BREG21009, PIC1BREG21008	Select the signal for input as TAUD1TIN4 and TAUD1TIN5 signals of TAUD1. 10: TS0PTE signal of TSG31 Settings other than above are prohibited.*1
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	PIC1BREG21003	Selects the signal for input as TAUD1TIN7 signal of TAUD1. 0: TIN pin input 1: Input signal selected by PIC1BREG21011 and PIC1BREG21010 bits (TS0PTE signal).
2	PIC1BREG21002	Selects the signal for input as TAUD1TIN6 signal of TAUD1. 0: TIN pin input 1: Input signal selected by PIC1BREG21011 and PIC1BREG21010 bits (TS0PTE signal).

Table 24.47 PIC1BREG210 Register Contents (2/2)

Bit Position	Bit Name	Function
1	PIC1BREG21001	Selects the signal for input as TAUD1TIN5 signal of TAUD1. 0: TIN pin input 1: Input signal selected by PIC1BREG21009 and PIC1BREG21008 bits (TS0PTE signal).
0	PIC1BREG21000	Selects the signal for input as TAUD1TIN4 signal of TAUD1. 0: TIN pin input 1: Input signal selected by PIC1BREG21009 and PIC1BREG21008 bits (TS0PTE signal).

Note 1. Set any appropriate value because the value after reset is “setting prohibited”.

24.2.2.36 PIC1BREG220 ─ Timer Input/Output Control Register*1

The PIC1BREG220 register selects TAUD2 input signals.

Access: Readable/writable in 32-bit units.

Address: <PIC1B1_base> + $C0_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PIC1BREG22025	PIC1BREG22024	—	—	—	—	—	PIC1BREG22018	—	—

Table 24.48 PIC1BREG220 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is read. When writing, write the value after reset.
25, 24	PIC1BREG22025, PIC1BREG22024	Select TAUD channel to use for TAPA2TSIM0 and TAPA2TUDCM0. 00: No channel selected. 01: TAUD2 channel 0 is selected. 10: TAUD2 channel 2 is selected. 11: TAUD2 channel 8 is selected.
23 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	PIC1BREG22018	Selects the signal for input as TAUD2TIN10, TAUD2TIN12, and TAUD2TIN14 signals of TAUD2. 1: TOUT from TAUD2 CH02 Settings other than above are prohibited.*2
17 to 12	Reserved	When read, the value after reset is read. When writing, write the value after reset.
11, 10	PIC1BREG22011, PIC1BREG22010	Selects the signal for input as TAUD2TIN6 and TAUD2TIN7 signals of TAUD2. 10: TS0PTE signal of TSG32 Settings other than above are prohibited.*2
9, 8	PIC1BREG22009, PIC1BREG22008	Selects the signal for input as TAUD2TIN4 and TAUD2TIN5 signals of TAUD2. 10: TS0PTE signal of TSG32 Settings other than above are prohibited.*2
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	PIC1BREG22003	Selects the signal for input as TAUD2TIN7 signal of TAUD2. 0: TIN pin input 1: Input signal selected by PIC1BREG22011 and PIC1BREG22010 bits (TS0PTE signal).

Table 24.48 PIC1BREG220 Register Contents (2/2)

Bit Position	Bit Name	Function
2	PIC1BREG22002	Selects the signal for input as TAUD2TIN6 signal of TAUD2. 0: TIN pin input 1: Input signal selected by PIC1BREG22011 and PIC1BREG22010 bits (TS0PTE signal).
1	PIC1BREG22001	Selects the signal for input as TAUD2TIN5 signal of TAUD2. 0: TIN pin input 1: Input signal selected by PIC1BREG22009 and PIC1BREG22008 bits (TS0PTE signal).
0	PIC1BREG22000	Selects the signal for input as TAUD2TIN4 signal of TAUD2. 0: TIN pin input 1: Input signal selected by PIC1BREG22009 and PIC1BREG22008 bits (TS0PTE signal).

Note 1. This register is not provided for the C1M-A1.

Note 2. Set any appropriate value because the value after reset is “setting prohibited”.

24.2.2.37 PIC1BREG230 ─ Timer Input/Output Control Register 230*1

The PIC1BREG230 register selects TAUD3 input signals.

Access: Readable/writable in 32-bit units.

Address: <PIC1B1_base> + $D4_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.49 PIC1BREG230 Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	PIC1BREG23018	Selects the signal for input as TAUD3TIN10, TAUD3TIN12, and TAUD3TIN14 signals of TAUD3. 1: TOUT from TAUD3 CH02 Settings other than above are prohibited.*2
17 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	PIC1BREG23003	Selects the signal for input as TAUD3TIN7 signal of TAUD3. 0: TIN pin input Settings other than above are prohibited.
2	PIC1BREG23002	Selects the signal for input as TAUD3TIN6 signal of TAUD3. 0: TIN pin input Settings other than above are prohibited.
1	PIC1BREG23001	Selects the signal for input as TAUD3TIN5 signal of TAUD3. 0: TIN pin input Settings other than above are prohibited.
0	PIC1BREG23000	Selects the signal for input as TAUD3TIN4 signal of TAUD3. 0: TIN pin input Settings other than above are prohibited.

Note 1. This register is not provided for the C1M-A1.

Note 2. Set any appropriate value because the value after reset is “setting prohibited”.

24.2.2.38 PIC1BREG2n1 ─ Timer Input/Output Control Register 2n1*1

The PICBREG2n1 register selects logical operation for the combination circuit PFN0xx.

Access: Readable/writable in 32-bit units.

Address: <PIC1B0_base> + $C4_H$ (n = 0), <PIC1B0_base> + $D8_H$ (n = 1),
<PIC1B1_base> + $C4_H$ (n = 2), <PIC1B1_base> + $D8_H$ (n = 3)

Value after reset: 0000 0000_H

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is read. When writing, write the value after reset.
27, 26	PIC1BREG2n127, PIC1BREG2n126	Select PFN045 WO2 output.*2 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*3
25, 24	PIC1BREG2n125, PIC1BREG2n124	Select PFN045 WO1 output.*2 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*3
23, 22	PIC1BREG2n123, PIC1BREG2n122	Select PFC023 VO2 output.*2 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*3
21, 20	PIC1BREG2n121, PIC1BREG2n120	Select PFC023 VO1 output.*2 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*3
19, 18	PIC1BREG2n119, PIC1BREG2n118	Select PFN001 UO2 output.*2 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*3
17, 16	PIC1BREG2n117, PIC1BREG2n116	Select PFN001 UO1 output.*2 10: Combination circuit output. 11: Inverted combination circuit output. Settings other than above are prohibited.*3

Table 24.50 PIC1BREG2n1 Register Contents (2/2)

Bit Position	Bit Name	Function
15 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Note 1. TAUD2 (n = 2) and TAUD3 (n = 3) are not provided for the C1M-A1.

Note 2. The register value for some functions needs to be set depending on the value of TAUD. For the setting values, see **Section 24.2.3, Function**.

Note 3. Set any appropriate value because the value after reset is “setting prohibited”.

Block diagram of PFN001 is shown in the following figure.

PFN023 and PFN045 are operated under the same logic with different input signals and registers.

For connection of PFN0xx with peripheral circuits, see **Figure 24.15**.

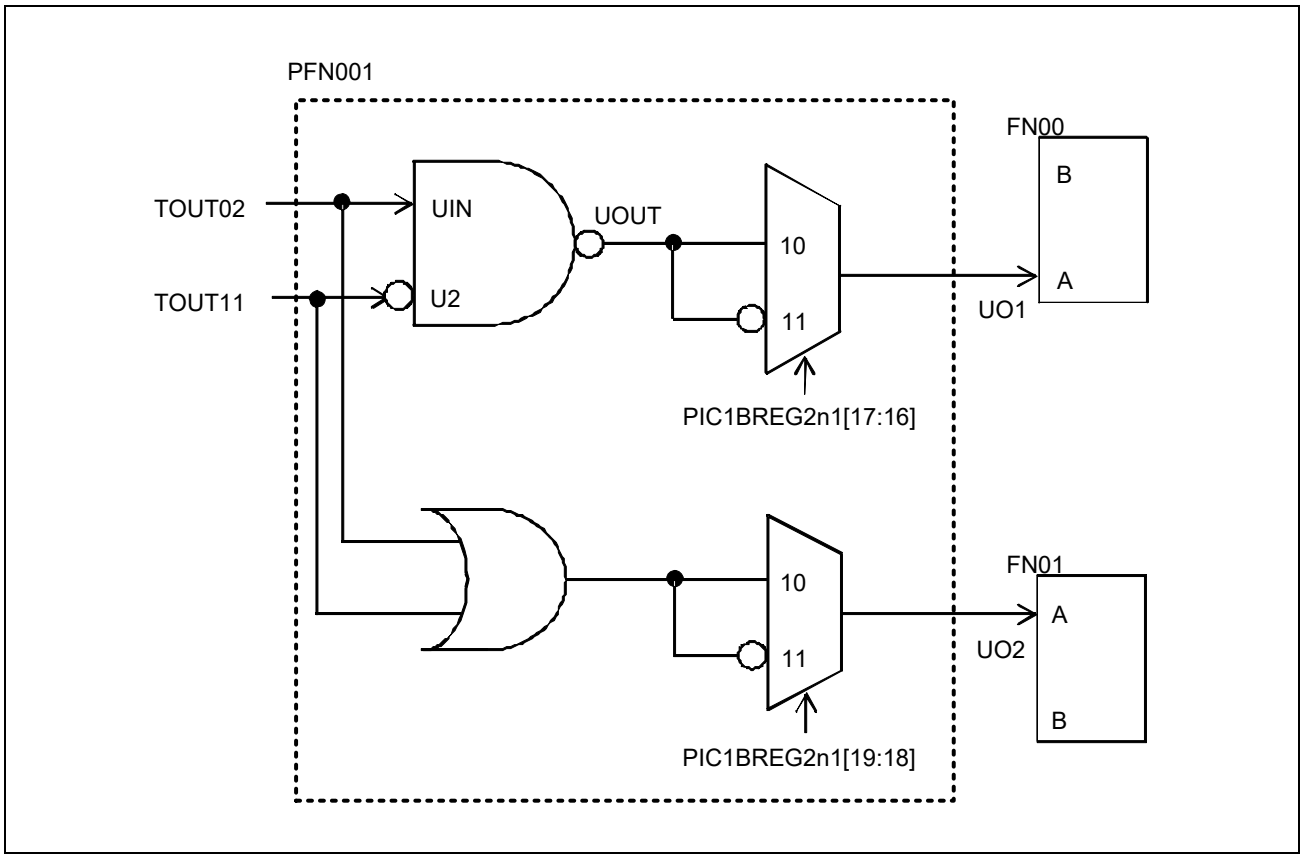

Figure 24.1 Block Diagram of PFN001

24.2.2.39 PIC1BREG2n2 ─ Timer Input/Output Control Register 2n2*1

The PIC1BREG2n2 register selects input signals of TAUDn CHm.

Access: Readable/writable in 32-bit units.

Address: <PIC1B0_base> + $C8_H$ (n = 0), <PIC1B0_base> + DC_H (n = 1),
<PIC1B1_base> + $C8_H$ (n = 2), <PIC1B1_base> + DC_H (n = 3)

Value after reset: 0000 0000_H

Table 24.51 PIC1BREG2n2 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is read. When writing, write the value after reset.
27, 26	PIC1BREG2n227, PIC1BREG2n226	Selects TIN input signal of TAUDn CH15. 00: TIN pin input. 10: Signal selected by PIC1BREG2n204 bit (TOUT of TAUDn CH09). Settings other than above are prohibited.
25, 24	PIC1BREG2n225, PIC1BREG2n224	Selects TIN input signal of TAUDn CH14. 00: TIN pin input. 10: Signal selected by PIC1BREG2n018 bit (TOUT of TAUDn CH02). Settings other than above are prohibited.
23, 22	PIC1BREG2n223, PIC1BREG2n222	Selects TIN input signal of TAUDn CH13. 00: TIN pin input. 10: Signal selected by PIC1BREG2n203 bit (TOUT of TAUDn CH07). Settings other than above are prohibited.
21, 20	PIC1BREG2n221, PIC1BREG2n220	Select TIN input signal of TAUDn CH12. 00: TIN pin input. 10: Signal selected by PIC1BREG2n018 bit (TOUT of TAUDn CH02). Settings other than above are prohibited.
19, 18	PIC1BREG2n219, PIC1BREG2n218	Select TIN input signal of TAUDn CH11. 00: TIN pin input. 10: Signal selected by PIC1BREG2n202 bit (TOUT of TAUDn CH05). Settings other than above are prohibited.
17, 16	PIC1BREG2n217, PIC1BREG2n216	Select TIN input signal of TAUDn CH10. 00: TIN pin input. 10: Signal selected by PIC1BREG2n018 bit (TOUT of TAUDn CH02). Settings other than above are prohibited.
15 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Table 24.51 PIC1BREG2n2 Register Contents (2/2)

Bit Position	Bit Name	Function
4	PIC1BREG2n204	Selects the signal to be supplied to TIN of TAUDn CH15. 0: TOUT of TAUDnCH09. 1: Set or clear output by TAUDnINT08 and TAUDnINT09.
3	PIC1BREG2n203	Selects the signal to be supplied to TIN of TAUDn CH13. 0: TOUT of TAUDnCH07. 1: Set or clear output by TAUDnINT06 and TAUDnINT07.
2	PIC1BREG2n202	Selects the signal to be supplied to TIN of TAUDn CH11. 0: TOUT of TAUDnCH05. 1: Set or clear output by TAUDnINT04 and TAUDnINT05.
1, 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Note 1. TAUD2 (n = 2) and TAUD3 (n = 3) are not provided for the C1M-A1.

24.2.2.40 PIC1BREG2n3 ─ Timer Input/Output Control Register 2n3*1

The PIC1BREG2n3 register selects logical operation for the combination circuit FN0i.

Access: Readable/writable in 32-bit units.

Address: <PIC1B0_base> + CC_H (n = 0), <PIC1B0_base> + $E0_H$ (n = 1),
<PIC1B1_base> + CC_H (n = 2), <PIC1B0_base> + $E0_H$ (n = 3)

Value after reset: 0000 0000_H

Table 24.52 PIC1BREG2n3 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22 to 20	PIC1BREG2n322, PIC1BREG2n321, PIC1BREG2n320	Select a logical operation to be performed on input signals A and B. 000: A 100: A and B 101: A or B Settings other than above are prohibited.
19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18 to 16	PIC1BREG2n318, PIC1BREG2n317, PIC1BREG2n316	Select a logical operation to be performed on input signals A and B. The register value for some functions needs to be set depending on the value of TAUD. 000: A 100: A and B 101: A or B Settings other than above are prohibited.
15	Reserved	When read, the value after reset is read. When writing, write the value after reset.
14 to 12	PIC1BREG2n314, PIC1BREG2n313, PIC1BREG2n312	Select a logical operation to be performed on input signals A and B. The register value for some functions needs to be set depending on the value of TAUD. 000: A 100: A and B 101: A or B Settings other than above are prohibited.
11	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Table 24.52 PIC1BREG2n3 Register Contents (2/2)

Bit Position	Bit Name	Function
10 to 8	PIC1BREG2n310, PIC1BREG2n309, PIC1BREG2n308	Select a logical operation to be performed on input signals A and B. The register value for some functions needs to be set depending on the value of TAUD. 000: A 100: A and B 101: A or B Settings other than above are prohibited.
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 4	PIC1BREG2n306, PIC1BREG2n305, PIC1BREG2n304	Select a logical operation to be performed on input signals A and B. The register value for some functions needs to be set depending on the value of TAUD. 000: A 100: A and B 101: A or B Settings other than above are prohibited.
3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2 to 0	PIC1BREG2n302, PIC1BREG2n301, PIC1BREG2n300	Select a logical operation to be performed on input signals A and B.*2 000: A 100: A and B 101: A or B Settings other than above are prohibited.

Note 1. TAUD2 (n = 2) and TAUD3 (n = 3) are not provided for the C1M-A1.

Note 2. The register value for some functions needs to be set depending on the value of TAUD. For the setting values, see **Section 24.2.3, Function**.

Block diagram of FN00 is shown in the following figure.

FN01 to FN05 are operated under the same logical with different input signals and registers.

For connection of FN0i with peripheral circuits, see **Figure 24.15**.

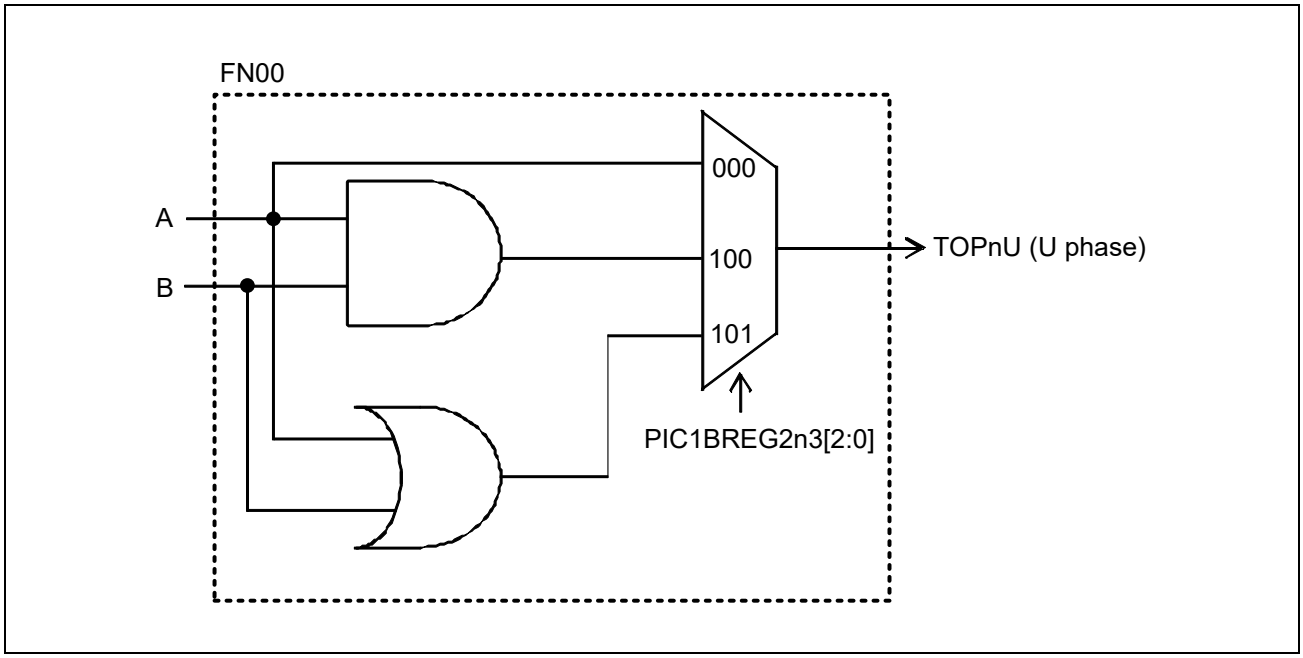

Figure 24.2 Block Diagram of FN00

24.2.2.41 PIC1BREG30 ─ Timer Input/Output Control Register 30

PIC1BREG30 selects ENCAn input signals.

Access: Readable/writable in 32-bit units.

Address: <PIC1B0_base> + $E8_H$

Value after reset: 0000 0000_H

Table 24.53 PIC1BREG30 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22	PIC1BREG3022	Selects the input signals (to the ENCA0E0, ENCA0E1, ENCA0EC internal input pins) for the ENCA0 timer. 0: The signals selected by the PIC1BREG3000 bit (ENCA0E0 internal input), the PIC1BREG3001 bit (ENCA0E1 internal input), and the PIC1BREG3017 and PIC1BREG3016 bits (ENCA0EC internal input) 1: The signals selected by the PIC1BREG3020 and PIC1BREG3019 bits.
21	PIC1BREG3021	Selects the signals to be supplied to bits 12 to 14 of the PIC1BREG30. 0: ENCA1I1 (signal 1 of the ENCA1 external pin) 1: Signal selected with the PIC1BENCSEL4107 bit of the PIC1BENCSEL410 register.
20, 19	PIC1BREG3020, PIC1BREG3019	Selects the input signals (to the ENCA1E0, ENCA1E1, ENCA1EC internal input pins) for the ENCA1 timer. 00: ENCA1E0, ENCA1E1, ENCA1EC input pins (for the ENCA1 timer). 01: RDC1BOUT, RDC1AOUT, RDC1ZOUT input pins (for RDC3A1).*1 10: RDC0BOUT, RDC0AOUT, RDC0ZOUT input pins (for RDC3A0). Settings other than above are prohibited.
18	PIC1BREG3018	Selects the signal to be supplied to bits 2 to 4 of PIC1BREG30. 0: ENCA0I1 (signal 1 of the ENCA0 external pin) 1: The signal selected by the PIC1BENCSEL4007 bit of the PIC1BENCSEL400 register.
17, 16	PIC1BREG3017, PIC1BREG3016	Selects the input signals (to the ENCA0E0, ENCA0E1, ENCA0EC internal input pins) for the ENCA0 timer. 00: ENCA0E0, ENCA0E1, ENCA0EC input pins (for the ENCA0 timer). 01: RDC0BOUT, RDC0AOUT, RDC0ZOUT input pins (for RDC3A0). 10: RDC1BOUT, RDC1AOUT, RDC1ZOUT input pins (for RDC3A1).*1 Settings other than above are prohibited.

Table 24.53 PIC1BREG30 Register Contents (2/2)

Bit Position	Bit Name	Function
15 to 12	PIC1BREG30[15:12]	Select the signal for input as the ENCAT1TIN1 signal. 0: The signal selected by PIC1BREG3021. 1: The signal selected by PIC1BREG3018. 2: ADCC0TRG4 3: ADCC0TRG3 4: ADCC0TRG2 5: ADCC0TRG1 6: ADCC0TRG0 7: ADCC1TRG4 8: ADCC1TRG3 9: ADCC1TRG2 10: ADCC1TRG1 11: ADCC1TRG0 Settings other than above are prohibited.
11, 10	PIC1BREG3011, PIC1BREG3010	Select the ENCA1EC pin input of timer ENCA1. 00: The signal selected by the PIC1BREG3019 and PIC1BREG3020 bits. 10: The signal selected by the PIC1BREG3016 and PIC1BREG3017 bits. 11: ENCA0EQ1 signal (ENCA0 timer) Settings other than above are prohibited.
9, 8	PIC1BREG3009, PIC1BREG3008	Select the ENCA1E1 pin input of timer ENCA1. 00: Signal selected by the PIC1BREG3019 and PIC1BREG3020 bits. 01: The signal selected by the PIC1BREG3016 and PIC1BREG3017 bits. 10: TS1PUD signal of TSG31. Settings other than above are prohibited.
7, 6	PIC1BREG3007, PIC1BREG3006	Select the ENCA1E0 pin input of timer ENCA1. 00: The signal selected by the PIC1BREG3019 and PIC1BREG3020 bits. 01: The signal selected by the PIC1BREG3016 and PIC1BREG3017 bits. 10: TS1PEC signal of TSG31. Settings other than above are prohibited.
5 to 2	PIC1BREG30[05:02]	Select the signal for input as the ENCAT0TIN1 signal. 0: The signal selected by the PIC1BREG3018 bit. 1: The signal selected by the PIC1BREG3021 bit. 2: ADCC0TRG4 3: ADCC0TRG3 4: ADCC0TRG2 5: ADCC0TRG1 6: ADCC0TRG0 7: ADCC1TRG4 8: ADCC1TRG3 9: ADCC1TRG2 10: ADCC1TRG1 11: ADCC1TRG0 Settings other than above are prohibited.
1	PIC1BREG3001	Selects the signal to input to the ENCA0E1 internal signal. 0: Signal selected by PIC1BREG3017 and PIC1BREG3016. 1: TS0PUD signal of TSG30.
0	PIC1BREG3000	Selects the signal to input to the ENCA0E0 internal signal. 0: Signal selected by PIC1BREG3017 and PIC1BREG3016. 1: TS0PEC signal of TSG30.

Note 1. This setting is prohibited for the C1M-A1.

24.2.2.42 PIC1BREG31 ─ Timer Input/Output Control Register 31

The PIC1BREG31 register selects TAUD0, TAUD1, and TAUJ0 input signals.

Access: Readable/writable in 32-bit units.

Address: <PIC1B0_base> + EC_H

Value after reset: 0000 0000_H

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is read. When writing, write the value after reset.
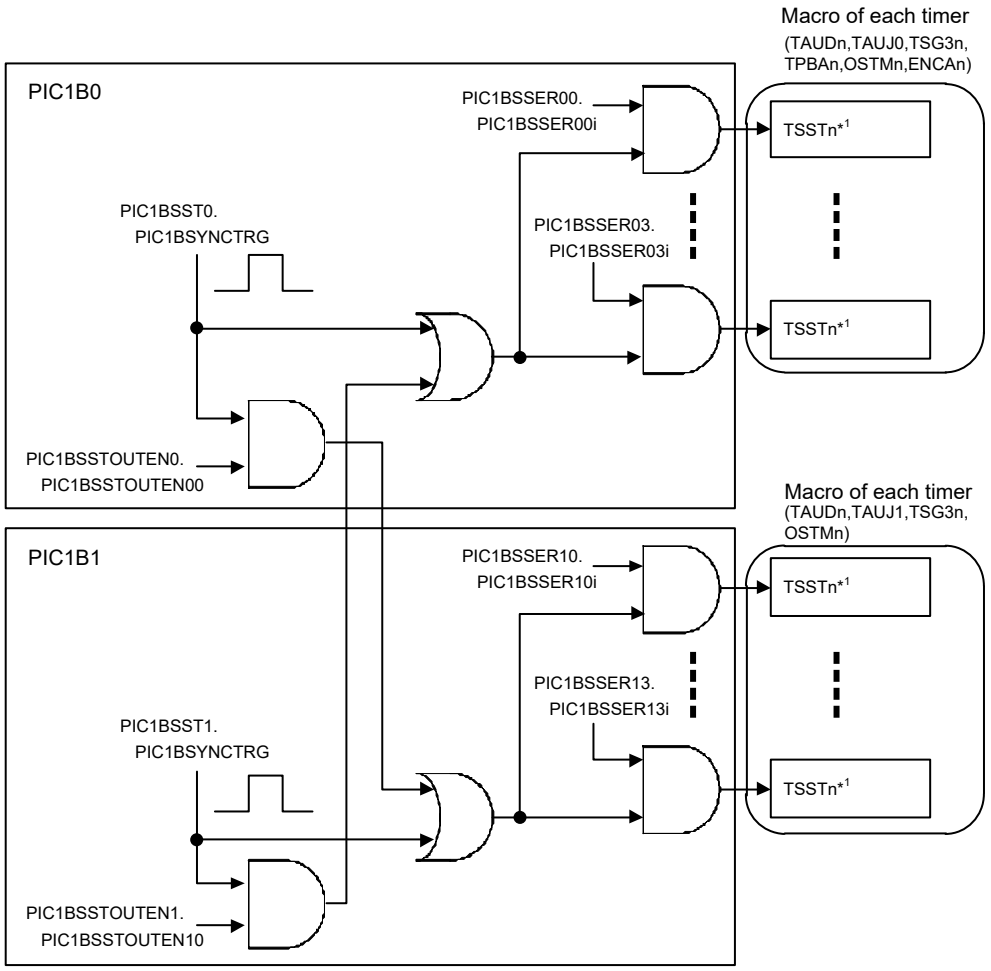
10	PIC1BREG5110	Selects the signal for input as the TSG31TSTOPC0 signal from the TSG31 timer. 0: INTENCA1I1 input signal of the ENCA1 timer 1: Setting prohibited.
9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8	PIC1BREG5108	Selects the signal for input as the TSG31TSTOPC0 signal from TSG31 timer. 0: INTENCA0I1 input signal of the ENCA0 timer 1: Setting prohibited.
7	PIC1BREG5107	Selects the signal for input as the TS1OPCI1 signal from TSG31 timer. 0: The INTTAUD1I7 signal input of the TAUD1 timer. 1: Setting prohibited.
6, 5	PIC1BREG5106, PIC1BREG5105	Select the signal for input as the TSG31TSTOPC0 (TS1OPCI0) signal from TSG31 timer. 01: The signal selected by the PIC1BREG5108 bit. 10: The signal selected by the PIC1BREG5110 bit. 11: Select input of the INTTAUD1I5 signal of TAUD1. Settings other than above are prohibited.*1
4 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	PIC1BREG5100	Switches the ENCA signal and external hall sensor signal. For the note on selection of the signals, see **Note 1** of **Section 24.2.2.21, PIC1BTSGHALLSEL ─ Hall Sensor Input Select Register**. 1: Select the pin input ENCA1E0, ENCA1E1, ENCA1EC. Settings other than above are prohibited.*1

Note 1. Set any appropriate value because the value after reset is “setting prohibited”.

24.2.3 Function

24.2.3.1 Simultaneous Start Trigger Function

(1) Overview

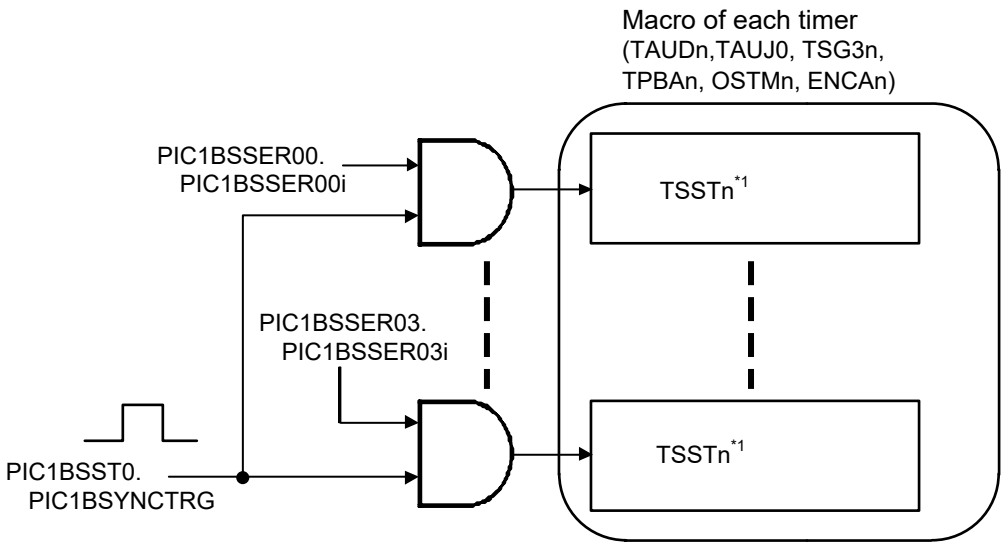


The function allows any combination of timers (TAUDn, TAUJn, TSG3n, TPBAn, OSTMn, and ENCAn) to be started simultaneously.

(2) Configuration

The timers which support simultaneous start trigger function are listed as follows.

- TAUDn
- TAUJn
- TSG3n
- TPBAn
- OSTMn
- ENCAn



Note: The block diagram with two PIC1B units applies to the C1M-A2 and that with one PIC1B unit applies to the C1M-A1.

Note 1. Simultaneous start trigger signal for each timer

i: The applicable bit

Figure 24.3 Block Diagram of Simultaneous Start Trigger Function with Two PIC1B Units

Note 1. Simultaneous start trigger signal for each timer

i: The applicable bit

Figure 24.4 Block Diagram of Simultaneous Start Trigger Function with One PIC1B Unit

Setting the PIC1BSYNCTRG bits in the simultaneous start trigger control registers (PIC1BSSTk) to 1 after removing the trigger masks for the target timers activates input of the start triggers for each of the timers, and operation of the given timers starts.

In C1M-A2, the timers connected to the PIC1B0 unit can be simultaneously started by setting the PIC1BSSTOUTEN1 register of the PIC1B1 unit. Similarly, the timers connected to the PIC1B1 unit can be simultaneously started by setting the register of the PIC1B0 unit.

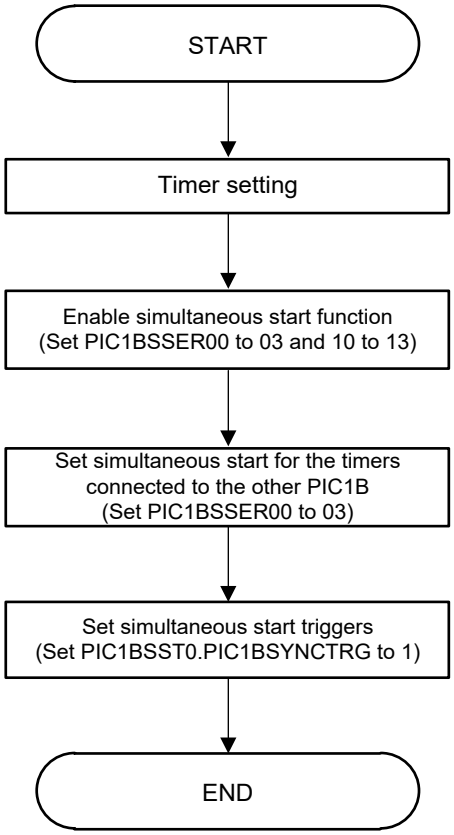
(3) Registers

The PIC1B registers set by this function is listed as follows. For setting value of the registers, see **Sections 24.2.2.2 to 24.2.2.12**.

- PIC1B registers to be set
  PIC1BSSTk
  PIC1BSSER00
  PIC1BSSER01
  PIC1BSSER02
  PIC1BSSER03
  PIC1BSSER10*[1]
  PIC1BSSER11*[1]
  PIC1BSSER12*[1]
  PIC1BSSER13*[1]
  PIC1BSSTOUTEN0*[1]
  PIC1BSSTOUTEN1*[1]

Note 1. This register is not provided for the C1M-A1.

(4) Function



The function allows any combination of timers (TAUDn, TAUJn, TSG3n, TPBAn, OSTMn, and ENCAn) to be started simultaneously.

(5) Flow chart

The following figure shows the setting flow of this function.

Note: The flowchart with two PIC1B units applies to the C1M-A2 and that with one PIC1B unit applies to the C1M-A1.

For two PIC1B units

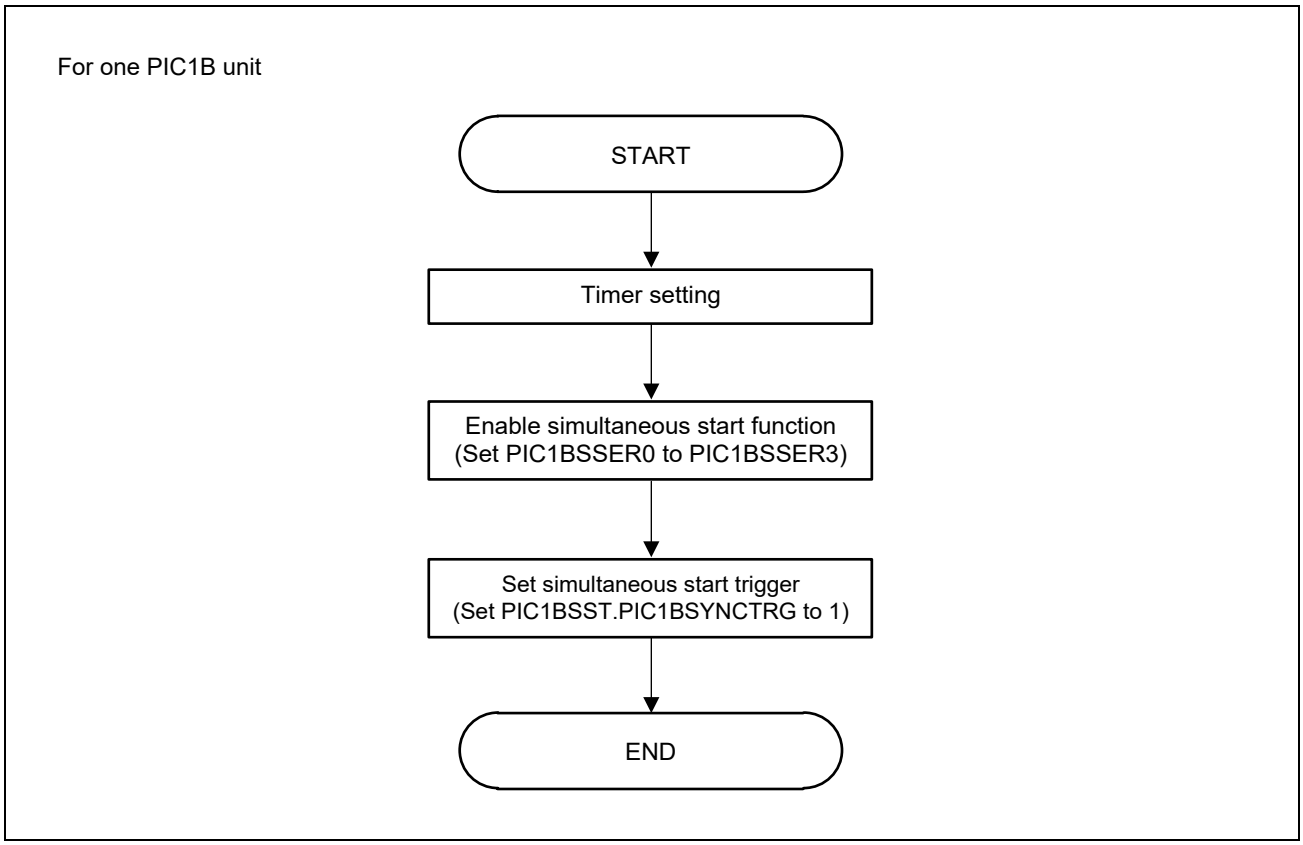


Figure 24.5 Setting Flow

Setting procedures are described as follows.

- Timer setting
  Set the timers to start simultaneously.
- Enable simultaneous start function
  Set 1 to the applicable bits of the PIC1BSSER00, PIC1BSSER01, PIC1BSSER02, and PIC1BSSER03 registers to enable simultaneous start of timers.
  In C1M-A2, enable the timers of the PIC1B1 unit by setting the applicable bits of the PIC1BSSER10, PIC1BSSER11, PIC1BSSER12, and PIC1BSSER13 registers.
- Set simultaneous start for the timers connected to the other PIC1B unit in C1M-A2
  In C1M-A2, set 1 to the PIC1BSSTOUTEN00 bit of the PIC1BSSTOUT0 register to enable simultaneous start of the timers connected to the PIC1B1 unit. Similarly, set 1 to the PIC1BSSTOUTEN10 bit of the PIC1BSSTOUT1 register to enable simultaneous start of the timers connected to the PIC1B0 unit.
- Setting simultaneous start triggers
  Setting the PIC1BSYNCTRG bits in simultaneous start trigger control registers (PIC1BSSTk) to 1 simultaneously starts the corresponding timers. In the C1M-A2, if the PIC1BSSTOUTk register of one PIC1B unit is set to enable simultaneous starting of the timers connected to the other PIC1B, setting of the PIC1BSSTk register of the other PIC1B is not required.

24.2.3.2 TSG Simultaneous Start Function (External Trigger)

(1) Overview

This function allows any combination of TSG3 timers to be started simultaneously by the trigger input from outside (TSGTSST).

(2) Configuration

The timer which supports this function is below.

- TSG3n

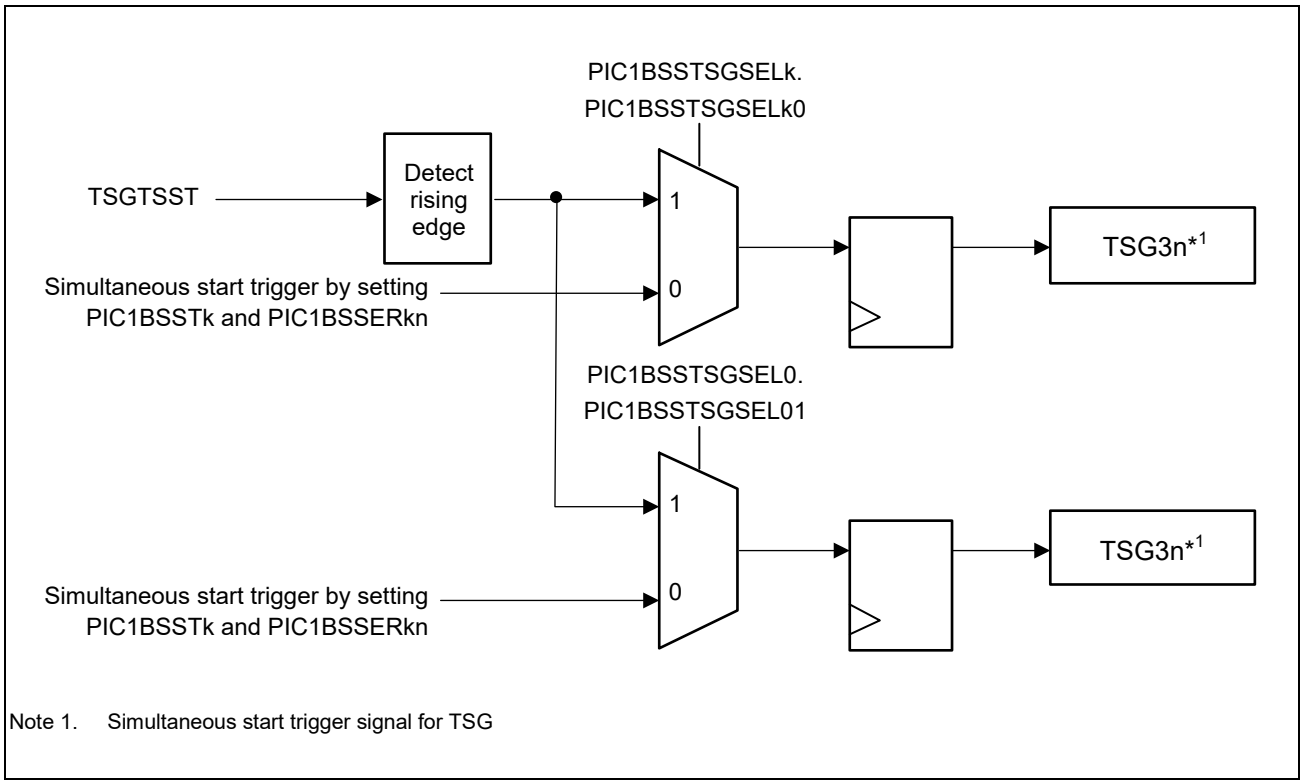

Figure 24.6 Block Diagram of TSG Simultaneous Start Function

(3) Registers

The PIC1B registers set by this function are listed as follows. For setting value of the registers, see **Sections 24.2.2.4 and 24.2.2.5**.

- PIC1B registers to be set
  PIC1BSSTSGSEL0
  PIC1BSSTSGSEL1*1

Note 1. This register is not provided for the C1M-A1.

(4) Function

Start the TSG3 timers are started by the trigger input from outside (TSGTSST).

(5) Flow chart

The following figure shows the setting flow of this function.

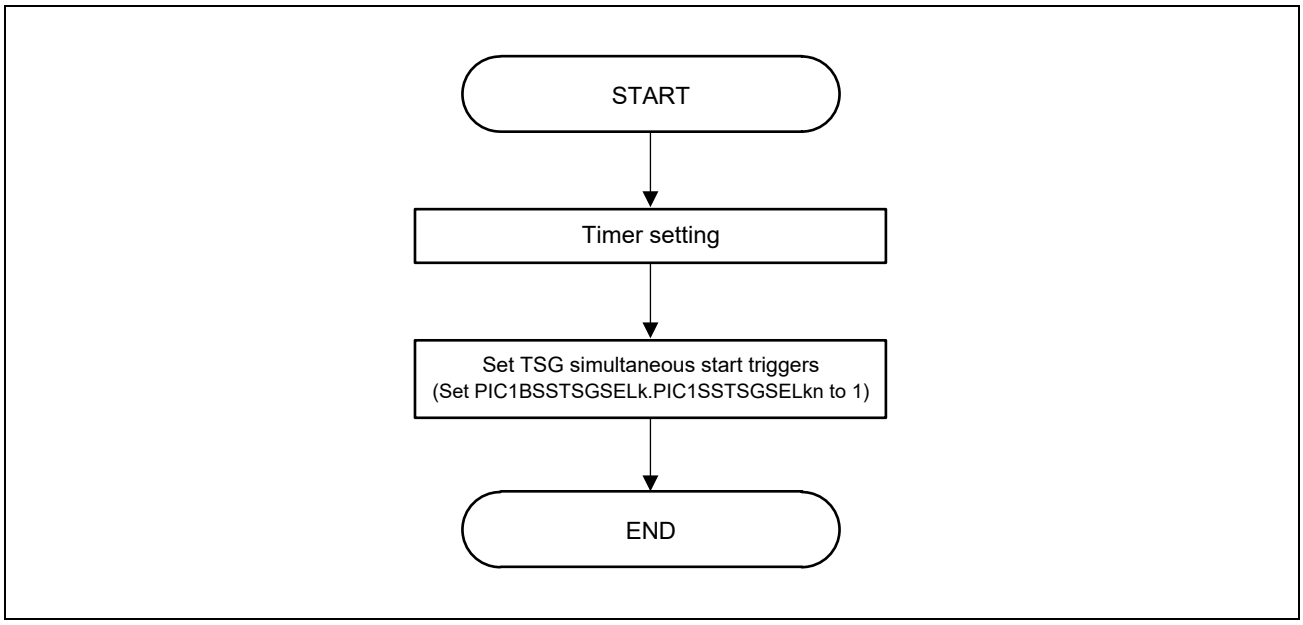

Figure 24.7 Setting Flow

Setting procedure is described as follows.

- Timer setting
  Set the TSG3 timers to start simultaneously.
- Set TSG simultaneous start trigger
  Set the PIC1BSSTSGSELkn bits to 1 in the selected TSG3 simultaneously start trigger select registers k (PIC1BSSTSGSELk). Input of a trigger on the external pin (TSGTSST) then starts the selected TSG3 timers.

24.2.3.3 PWM Output Function with Dead Time

(1) Overview

This function generates and outputs PWM waveforms with the dead time from one phase to three phases using TAUDn.

The PWM output function of TAUD sets only the clear timing in a period under the duty ratio specification. On the other hand, this function can specify the set timing in addition to the clear timing to output more flexible PWM waveforms with the dead time.

The following table lists the number of channels used.

Table 24.57 Number of TAUDn Channels for Use in PWM Output with Dead Time

PWM Output with Dead Time	Number of TAUDn Channels
One-phase PWM output (U phase/UB phase)	5 channels (master channel: 1, slave channel: 4)
Two-phase PWM output (U phase/UB phase, V phase/VB phase)	9 channels (master channel: 1, slave channel: 8)
Three-phase PWM output (U phase/UB phase, V phase/VB phase, W phase/WB phase)	13 channels (master channel: 1, slave channel: 12)

Note: Above are examples of combination.

Usages of each channel of TAUDn are listed in the following table. CH2 is used as the master channel.

Table 24.58 Usage of TAUDn Channels

TAUDn Channel	U phase/ UB phase	V phase/ VB phase	W phase/ WB phase	Usage
CH0	—	—	—	Not used.
CH1	—	—	—	Not used.
CH2	√	√	√	Carrier period (common to each phase)
CH3	—	—	—	Not used.
CH4	√	—	—	Duty (U phase setting)
CH5	√	—	—	Duty (U phase clearing)
CH6	—	√	—	Duty (V phase setting)
CH7	—	√	—	Duty (V phase clearing)
CH8	—	—	√	Duty (W phase setting)
CH9	—	—	√	Duty (W phase clearing)
CH10	√	—	—	U phase output (TOUT10)
CH11	√	—	—	UB phase output (TOUT11)
CH12	—	√	—	V phase output (TOUT12)
CH13	—	√	—	VB phase output (TOUT13)
CH14	—	—	√	W phase output (TOUT14)
CH15	—	—	√	WB phase output (TOUT15)

Note: √: Used; — : Not used

(2) Configuration

The PWM output function with the dead time is realized by using the PWM output function/one-phase output PWM function of TAUDn and PIC1B in combination. The following figure shows the block diagram of the PWM output function with the dead time.

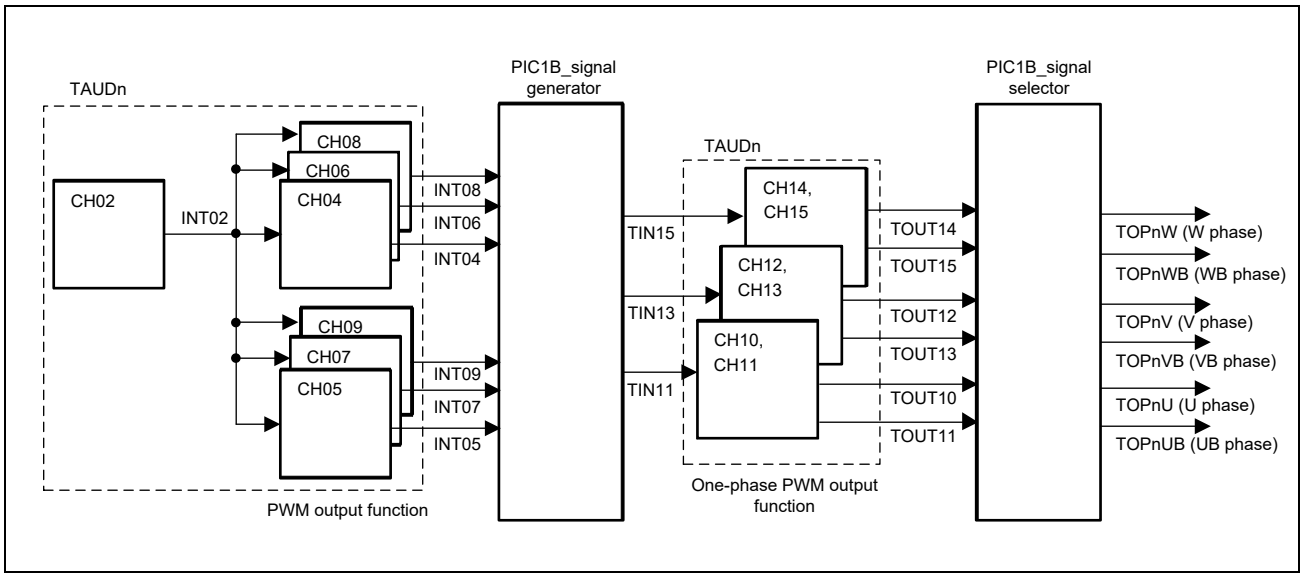

Figure 24.8 Block Diagram of PWM Output Function with Dead Time

The configuration of this function is described as follows using the PWM output of U phase/UB phase as an example.

- [TAUDn] PWM output function
  CH02, CH04, and CH05 are used in combination. Setting the period, U phase set value, and U phase clear value to CDR02, CDR04, and CDR05, respectively generates the set and clear signals (INT04 and INT05).
- [PIC1B_signal generator] RS flip-flop circuit (RSn2)
  Selecting the INT04 and INT05 inputs allows TIN11 (PWM signal) to be generated.
- [TAUDn] One-phase PWM output function
  CH10 and CH11 are used in combination. Setting the dead time value to CDR11, and inserting dead time into the PWM signal to be input to TIN11 allows TOUT10 (U phase PWM signal) and TOUT11 (UB phase PWM signal) to be output.
- [PIC1B_signal selector]
  TOUT10 and TOUT11 inputs are selected and output to TOPnU and TOPnUB pins, respectively.

Similar configuration is applied to V phase/VB phase and W phase/WB phase.

(3) Registers

The block diagram of PIC1B is shown in the following figure.

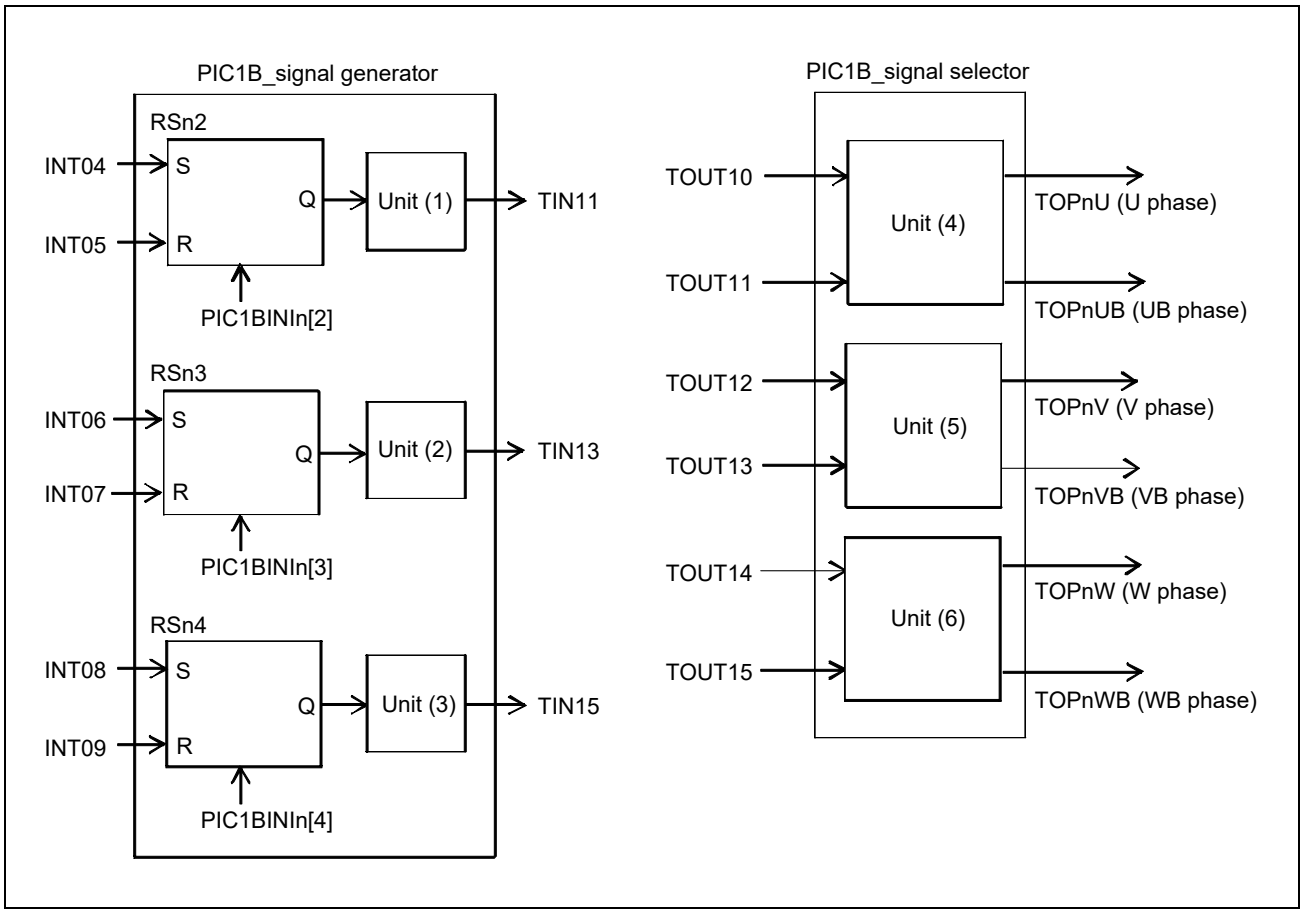

Figure 24.9 Block Diagram of PIC1B

The values of PIC1B registers used in this function are as follows.

U phase/UB phase

The values to output the signal Q from RSn2 as TIN11. (**Figure 24.9**, unit (1))

PIC1BREG2n2[19:18] = 10_B

PIC1BREG2n2[2] = 1_B

PIC1BTAUDnSEL[23:22] = 00_B

The values to output TOUT10 and TOUT11 as TOPnU and TOPnUB, respectively (**Figure 24.9**, unit (4))

PIC1BREG2n1[19:16] = 0000_B

PIC1BREG2n3[2:0] = 000_B

PIC1BREG2n3[6:4] = 000_B

V phase/VB phase

The values to output the signal Q from RSn3 as TIN13. (**Figure 24.9**, unit (2))

PIC1BREG2n2[23:22] = 10_B

PIC1BREG2n2[3] = 1_B

PIC1BTAUDnSEL[27:26] = 00_B

The values to output TOUT12 and TOUT13 as TOPnV and TOPnVB, respectively (**Figure 24.9**, unit (5))

PIC1BREG2n1[23:20] = 0000_B

PIC1BREG2n3[10:8] = 000_B

PIC1BREG2n3[14:12] = 000_B

W phase/WB phase

The values to output the signal Q from RSn4 as TIN15. (**Figure 24.9**, unit (3))

PIC1BREG2n2[27:26] = 10_B

PIC1BREG2n2[4] = 1_B

PIC1BTAUDnSEL[31:30] = 00_B

The values to output TOUT14 and TOUT15 as TOPnW and TOPnWB, respectively (**Figure 24.9**, unit (6))

PIC1BREG2n1[27:24] = 0000_B

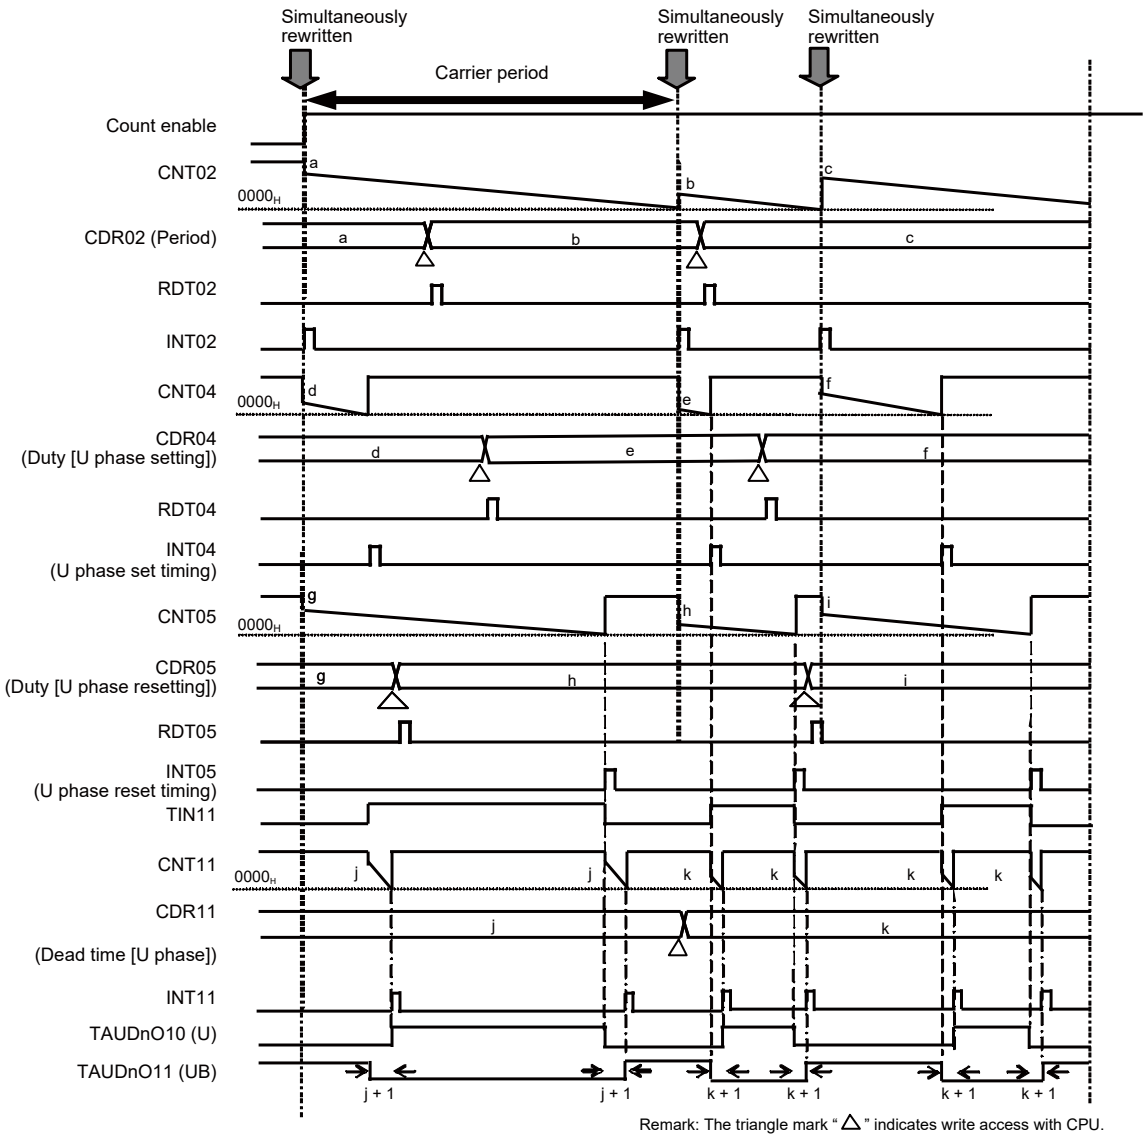
PIC1BREG2n3[18:16] = 000_B

PIC1BREG2n3[22:20] = 000_B

Enables initialization of RSn2 to RSn4

The values to enable initialization of RSn2 to RSn4

PIC1BINIn0[4] = 1_B (initialized)



PIC1BINIn0[3] = 1_B (initialized)

PIC1BINIn0[2] = 1_B (initialized)

(4) Function

Detail of the function is described using the one-phase PWM output (U phase/UB phase) with dead time as an example.

The following figure shows the timing diagram.

Note: For the detail of TAUD function including operation timing, see **Section 18, Timer Array Unit D (TAUD)**.

Figure 24.10 Timing Diagram of One-Phase PWM Output with Dead Time (U phase/UB phase)

(1) Using the simultaneous start trigger function, the timers to be used are started simultaneously.*1

(2) For CH04 and CH05, CH02 underflow allows the set values in CDR04 and CDR05 to be reloaded to CNT04 and CNT05, respectively.

(3) CH04 underflow allows the INT04 to be generated and TIN11 to become high level. CH05 underflow allows the INT05 to be generated and TIN11 to become low level, and the PWM waveform to be generated.

(4) Both edges of TIN11 allows the set values to be reloaded to CNT11.*2

(5) CH11 underflow allows the INT11to be generated and TAUDnO10 to become high level. CH05 underflow allows the INT05 to be generated and TAUDnO10 to become low level. The PWM waveform of U phase is generated and output to TOPnU.

(6) The rising edge of TIN11 allows TAUDnO11 to become low level. CH11 underflow allows the INT11to be generated and TAUDnO11 to become high level. The PWM waveform of UB phase is generated and output to TOPnUB.

Similar configuration is applied to V phase/VB phase and W phase/WB phase.

Note 1. Select the count clock signal of the same clock for TAUDn.

Note 2. Set the effective edge to be detected by TIN11 of TAUDn as both edges (rising edge and falling edge) for this function.

Detail of the function when setting the longer clear timing than the carrier period is described using V phase/VB phase as an example.

The following figure shows the timing diagram.

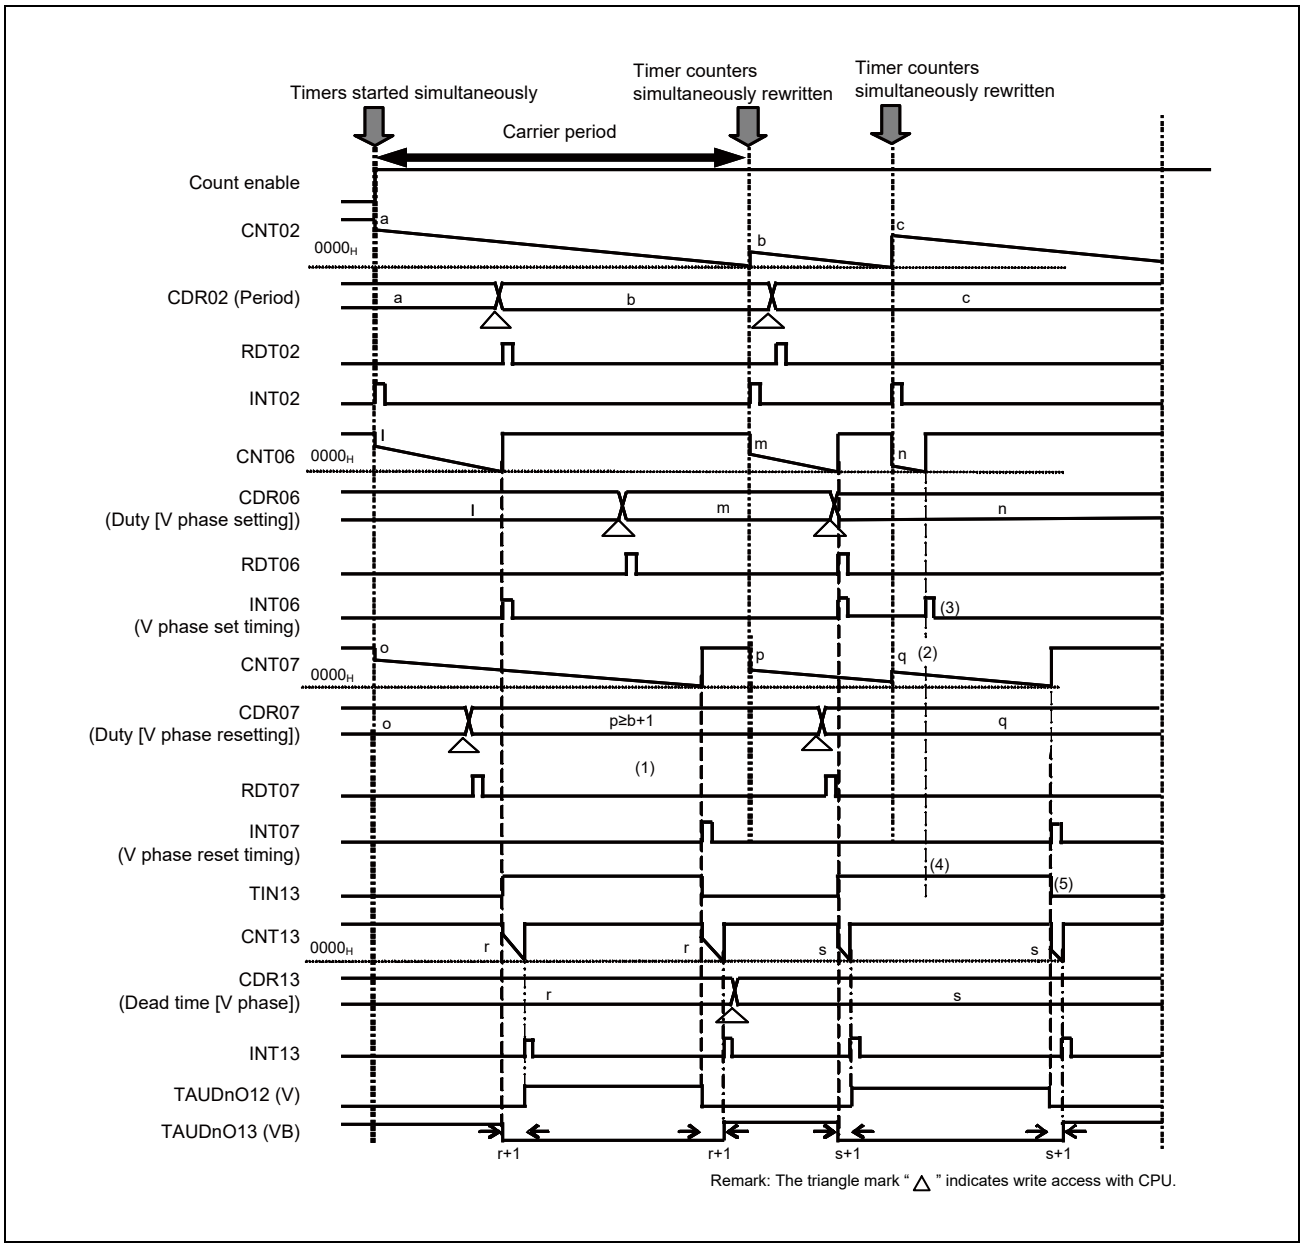


Figure 24.11 Clear Timing Value > Carrier Period Value (V Phase/VB Phase)

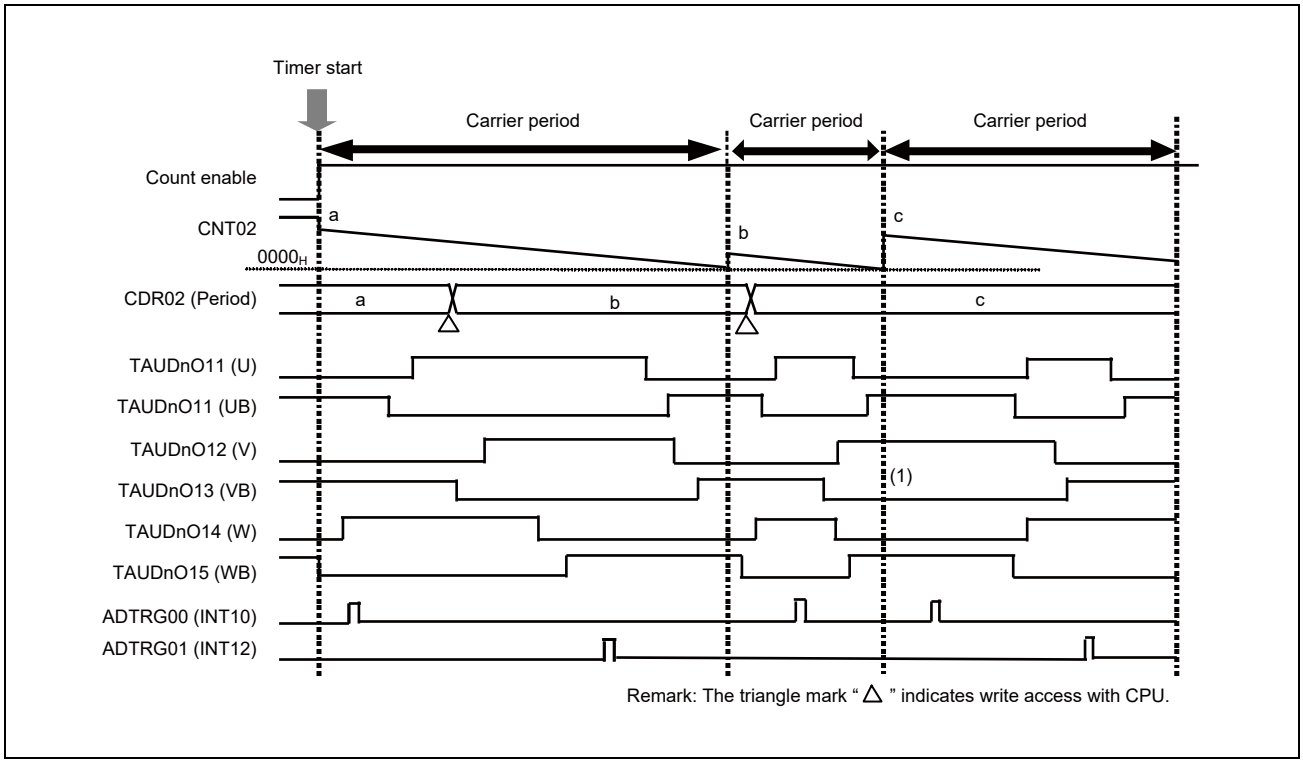
Setting the longer clear time than the carrier period allows the waveform output to be extended over the carrier period.

An operation example of one-phase PWM output (V phase/VB phase) is shown as follows. The operation flow from timer operation start to one-phase PWM output by one-phase PWM output function, refer to the description for one-phase PWM output with dead time (U phase/UB phase).

When the value set in CH07 is longer than the value set in CH02 (**Figure 24.11** (1)), underflow of the carrier period timer is generated before generation of V phase clearing timing signal (INT07), and the value is reloaded (**Figure 24.11** (2)).
This causes generation of the V phase set timing signal (INT06) to precede, thus preventing generation of the V phase clear timing signal (INT07) (**Figure 24.11** (3)).
Then, the PWM waveform is not influenced because V phase set timing signal is ignored in the PIC circuit (**Figure 24.11** (4)). Therefore, the PWM waveform is output extended over the carrier period (**Figure 24.11** (5)).

The following figure shows the timing diagram of three-phase PWM output with the dead time.



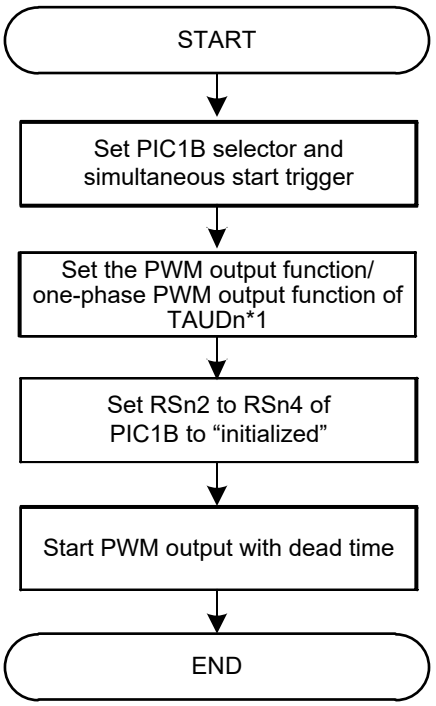


Figure 24.12 Timing Diagram of Three-Phase PWM Output with Dead Time

(5) Flow chart

The following flow chart shows the PMW output function with the dead time.

Note 1. For the setting of PWM output function of TAUDn, see **Section 18.4.12.1, PWM Output Function**. For the setting of one-phase PWM output function, see **Section 18.4.12.11, One-Phase PWM Output Function**.

Figure 24.13 Setting Flow

24.2.3.4 High Accuracy Triangle Wave PWM Output Function with Dead Time

(1) Overview

This function generates triangle wave PWM output with dead time from one-phase to three-phases. Compared to the triangle wave PWM output function with dead time of TAUDn, this function enables a control of the variable dead time range, where duty cycle is close to 100% and 0%.

The TAUDn channels used in this function are listed in the following table.

Table 24.59 Number of TAUDn Channels for Use in Triangle Wave PWM Output with Dead Time

High Accuracy Triangle Wave PWM Output with Dead Time	Number of TAUDn Channels
One-phase PWM output (U phase/UB phase)	5 channels (master channel: 1, slave channel: 4)
Two-phase PWM output (U phase/UB phase, V phase/VB phase)	9 channels (master channel: 1, slave channel: 8)
Three-phase PWM output (U phase/UB phase, V phase/VB phase, W phase/WB phase)	13 channels (master channel: 1, slave channel: 12)

Note: Above are examples of combination.

Usages of each channel of TAUDn are listed in the following table. CH2 is used as the master channel of CH3 to 9.

CHm is used as the master channel of CHm+1 (m = 10, 12, 14).

Table 24.60 Usage of TAUDn Channels

TAUDn Channel	U phase/ UB phase	V phase/ VB phase	W phase/ WB phase	Usage
CH0	—	—	—	Not used.
CH1	—	—	—	Not used.
CH2	√	√	√	Carrier period (common to each phase)
CH3	—	—	—	Not used.
CH4	√	—	—	Triangle PWM output with dead time (U phase/UB phase)
CH5	√	—	—	
CH6	—	√	—	Triangle PWM output with dead time (V phase/VB phase)
CH7	—	√	—	
CH8	—	—	√	Triangle PWM output with dead time (W phase/WB phase)
CH9	—	—	√	
CH10	√	—	—	Reduced dead time pulse (U phase/UB phase)
CH11	√	—	—	
CH12	—	√	—	Reduced dead time pulse (V phase/VB phase)
CH13	—	√	—	
CH14	—	—	√	Reduced dead time pulse (W phase/WB phase)
CH15	—	—	√	

Note: √: Used; — : Not used

(2) Configuration

The high accuracy triangle wave PWM output function with the dead time is realized by using the triangle wave PWM output function/one-shot pulse output function of TAUDn and PIC1B in combination. The following figure shows the block diagram of the high accuracy triangle wave PWM output function with the dead time.

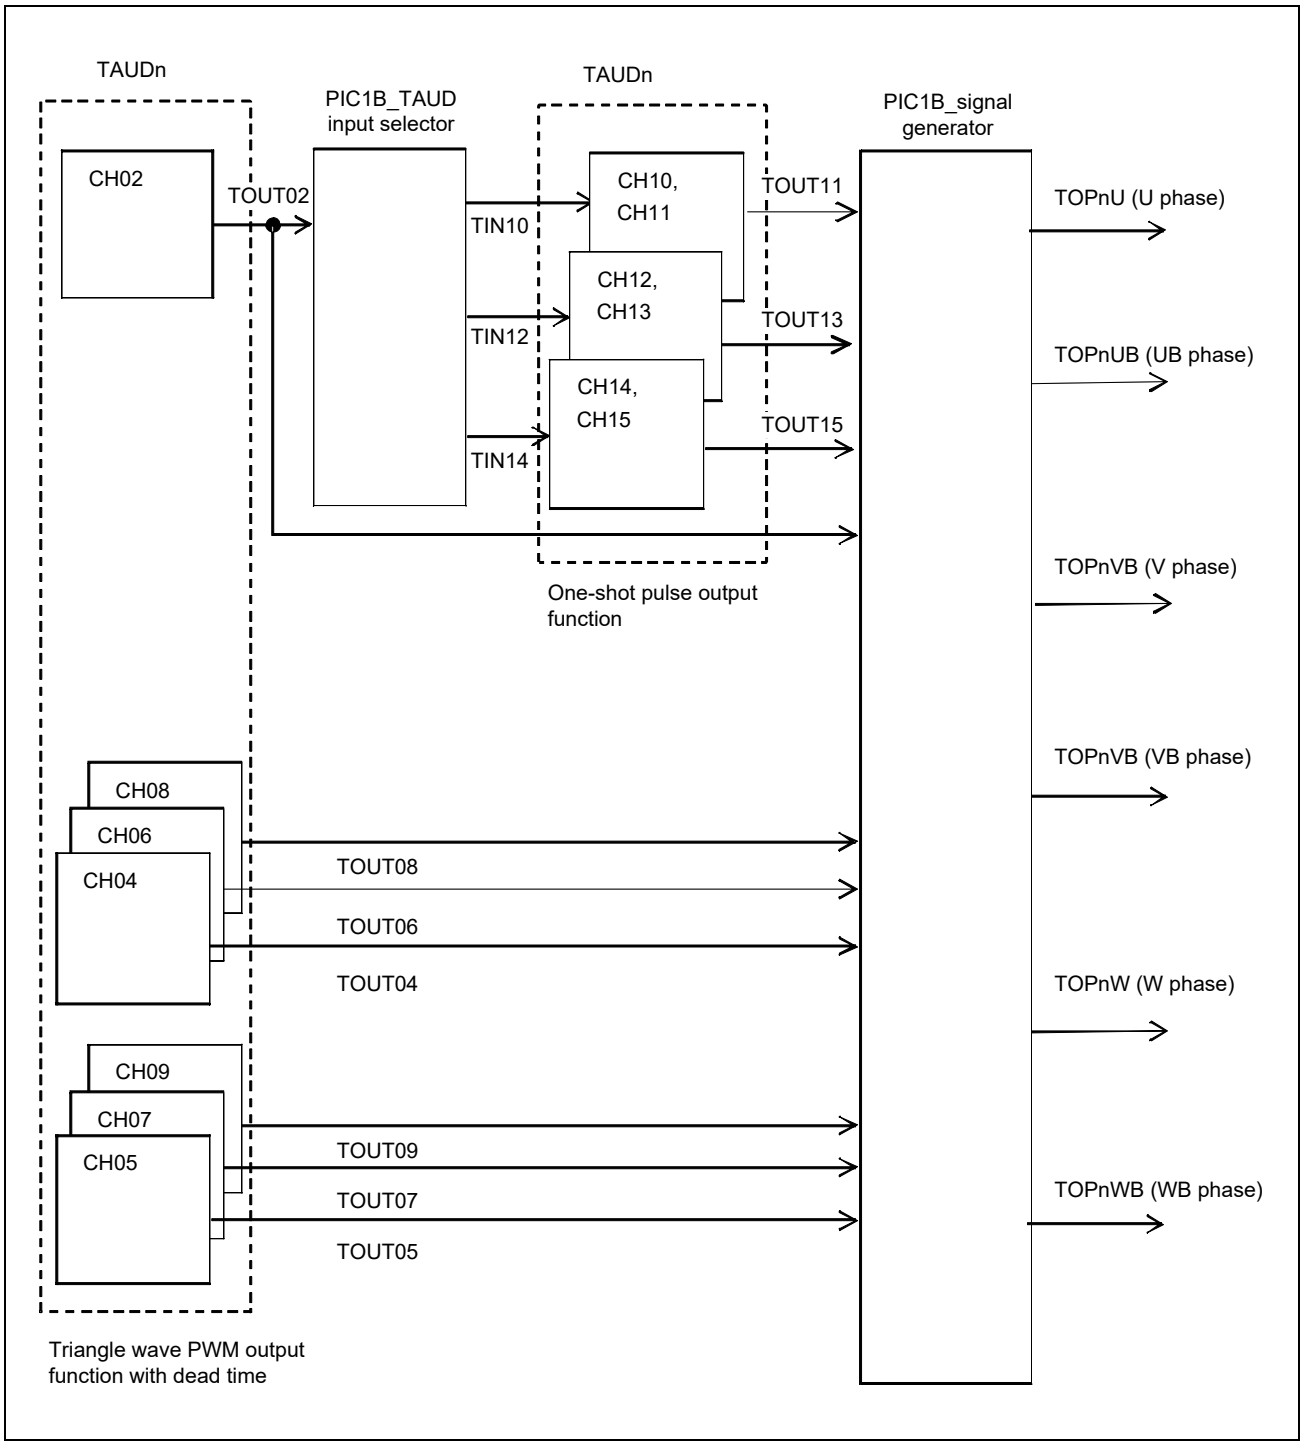

Figure 24.14 Block Diagram of High Accuracy Triangle Wave Three-Phase PWM Output with Dead Time

The configuration of this function is described as follows using the PWM output of U phase/UB phase as an example.

- [PIC1B_TAUD input selector]
  TOUT02 is selected and output to TIN10.
- [TAUDn] One-shot pulse output function
  CH10 and CH11 are used in combination. Setting the delay value and the pulse width to CDR10 and CDR11, respectively allows the one-shot pulse output signal (TOUT11) to be generated.
- [TAUDn] Triangle wave PWM output function with dead time
  CH02, CH04, and CH05 are used in combination. Setting the period, duty, and dead time to CDR02, CDR04, and CDR05, respectively generates the triangle wave PWM output signal with dead time (TOUT04 and TOUT05).
- [PIC1B_signal generator]
  The reduced dead time pulses (UO1 and UO2) are generated at PFN001 from the one-shot pulse output signal. UO1 and UO2 are synthesized with TOUT04 and TOUT05 at FN00 and FN01, respectively, added dead time variable range pulse, and TOPnU (U phase PWM signal) and TOPnUB (UB phase PWM signal) are generated.

Similar configuration is applied to V phase/VB phase and W phase/WB phase.

(3) Registers

The following figure shows the block diagram of PIC1B.

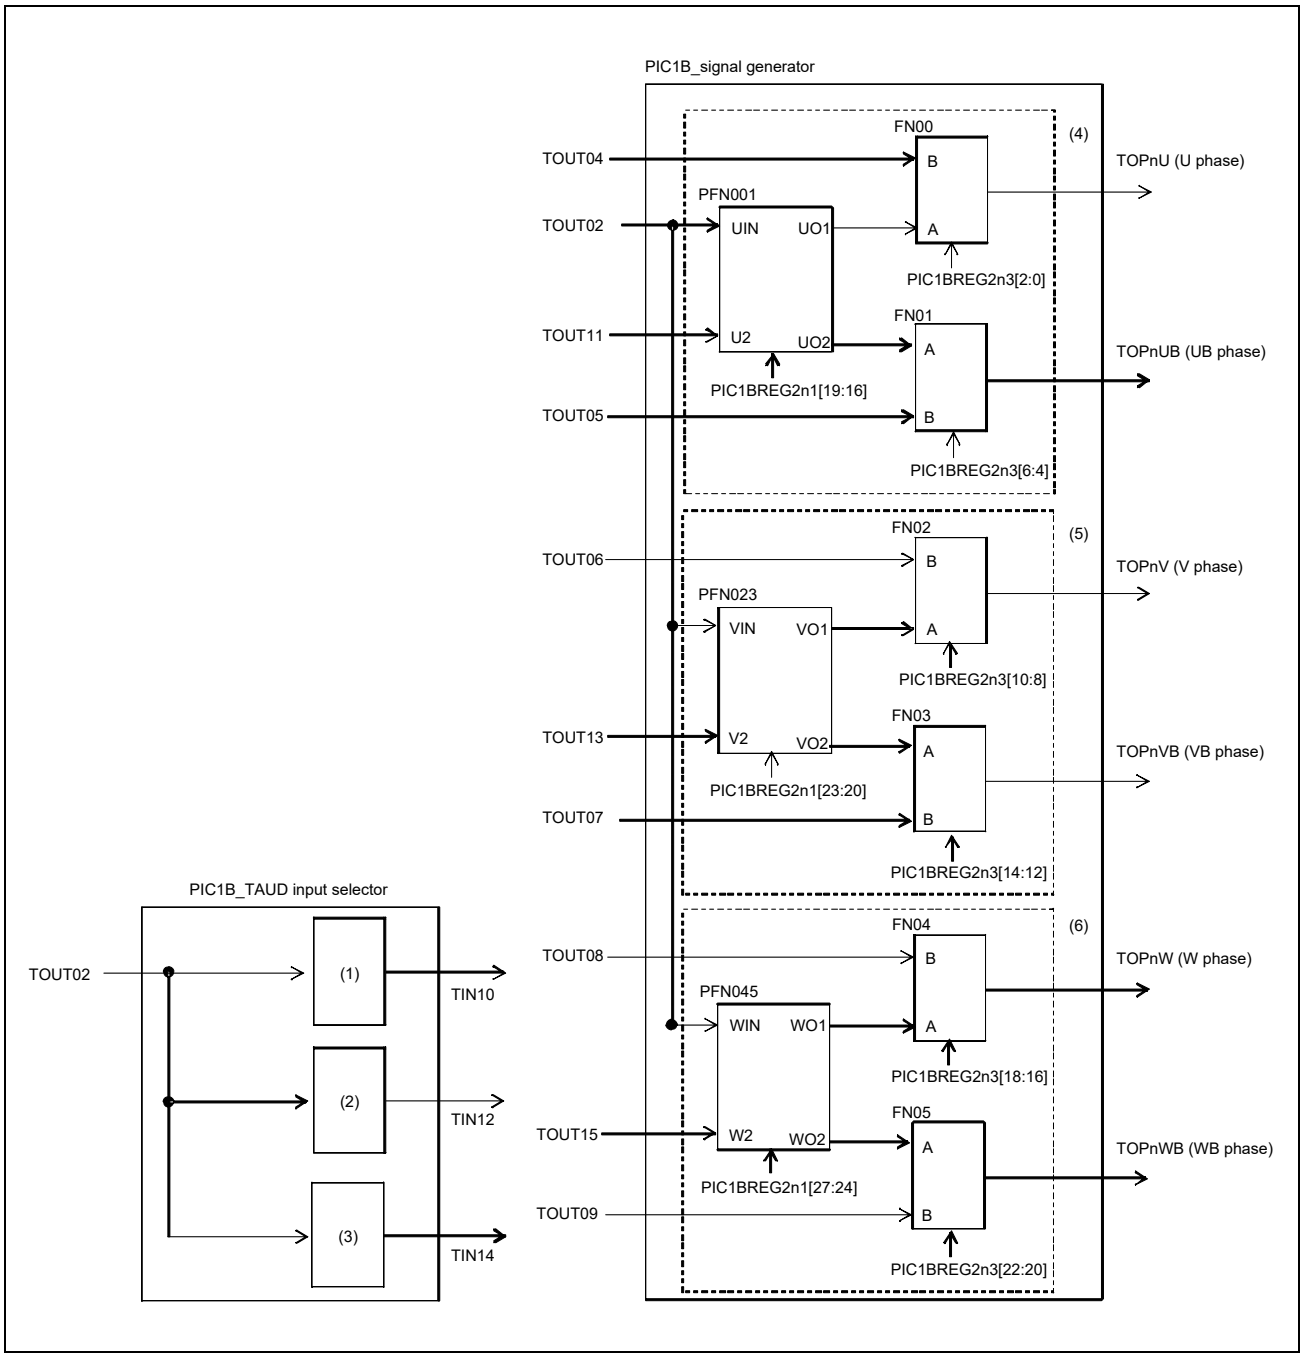

Figure 24.15 Block Diagram of PIC1B

The values of PIC1B registers used in this function are as follows.

Unit (1): PIC1B_TAUD input selector (U phase/UB phase)

The values to output TOUT02 as TIN10 (common to active high/low)

PIC1BREG2n0[18] = 1_B

PIC1BREG2n2[17:16] = 10_B

PIC1BTAUDnSEL[21:20] = 00_B

Unit (2): PIC1B_TAUD input selector (V phase/VB phase)

The values to output TOUT02 as TIN12 (common to active high/low)

PIC1BREG2n0[18] = 1_B

PIC1BREG2n2[21:20] = 10_B

PIC1BTAUDnSEL[25:24] = 00_B

Unit (3): PIC1B_TAUD input selector (W phase/WB phase)

The values to output TOUT02 as TIN14 (common to active high/low)

PIC1BREG2n0[18] = 1_B

PIC1BREG2n2[25:24] = 10_B

PIC1BTAUDnSEL[29:28] = 00_B

Unit (4): PIC1B_signal generator (U phase/UB phase)

The values to output one-phase PWM (active high/low) from TAUDnO10 and TAUDnO11

PIC1BREG2n1[19:16] = 1010_B (active high), 1111_B (active low)

PIC1BREG2n3[06:04] = 100_B (active high), 101_B (active low)

PIC1BREG2n3[02:00] = 100_B (active high), 101_B (active low)

Unit (5): PIC1B_signal generator (V phase/VB phase)

The values to output one-phase PWM (active high/low) from TAUDnO12 and TAUDnO13

PIC1BREG2n1[23:20] = 1010_B (active high), 1111_B (active low)

PIC1BREG2n3[14:12] = 100_B (active high), 101_B (active low)

PIC1BREG2n3[10:08] = 100_B (active high), 101_B (active low)

Unit (6): PIC1B_signal generator (W phase/WB phase)

The values to output one-phase PWM (active high/low) from TAUDnO14 and TAUDnO15

PIC1BREG2n1[27:24] = 1010_B (active high), 1111_B (active low)

PIC1BREG2n3[22:20] = 100_B (active high), 101_B (active low)

PIC1BREG2n3[18:16] = 100_B (active high), 101_B (active low)

(4) Function

Detail of the function is described using U phase/UB phase as an example. The function with V phase/VB phase and W phase/WB phase are operated under the same logic as that of U phase/UB phase with different input signals and register settings.

- U phase combination circuit (PFN001)
  This circuit generates reduced dead time pulses*1 (FN00A and FN01A) that are used to insert the dead time pulse generated by the one-shot pulse output function into the triangle wave PWM generated by the triangle wave PWM output function with the dead time. For the block diagram, see **Figure 24.1, Block Diagram of PFN001**.

Note 1. Reduced dead time pulses are the pseudo pulses that are inserted into the PWM output provided by the triangle wave PWM output function with dead time of TAUDn and that are modeled on the dead time pulses that are generated in the range where duty cycle is close to 100% or 0% in PWM output in HT-PWM mode of TSG3n.

- Logical operation circuits (FN0i (i = 0, 1))
  This circuit synthesizes the triangle wave PWM output (TOUT04 and TOUT05) from the triangle wave PWM output function with the dead time and the outputs from the combinational circuit PFN001 (UO0 and UO1) to generate PWM with reduced dead time pulses inserted. The synthesizing logic of this circuit is selected with PIC1BREG2n3k (k = 00 to 02, 04 to 06). For the block diagram, see **Figure 24.2, Block Diagram of FN00**.

Detail of the function is described using high accuracy triangle wave PWM output function (U phase/UB phase) as an example.

The following figure shows the timing diagram when U phase duty cycle = 0% and UB phase duty cycle = 100% at active high.

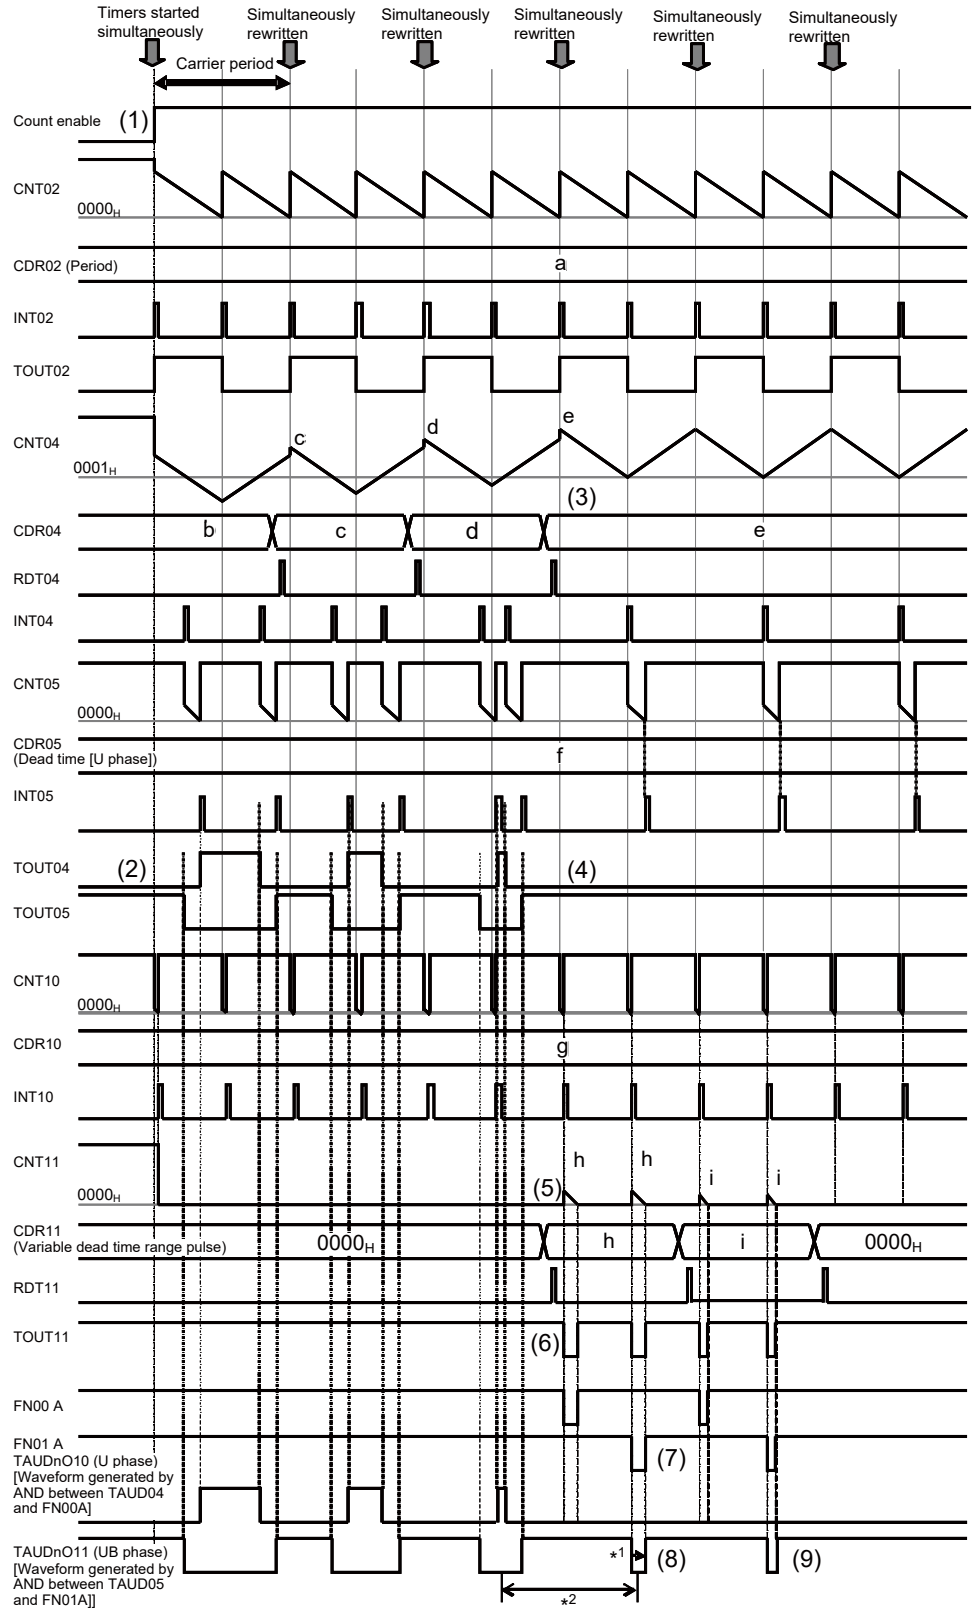

Figure 24.16 Timing Diagram of High Accuracy Triangle Wave PWM (U phase duty cycle = 0%, UB phase duty cycle = 100%) Output with Dead Time (Active High)

(1) With the simultaneous timer start function, the timers to be used are started simultaneously.

(2) TOUT04 and TOUT05 are generated by the triangle wave PWM output function with dead time.

(3) A 0% duty cycle value is set in CDR04 for U phase output.

(4) The setting described in step (3) sets the TOUT04 output to the inactive level and the TOUT05 output to the active level.

(5) To generate the reduced dead time pulse, a value for the reduced dead time pulse width is set in CDR11 when a 0% duty cycle value for U phase output is set in step (3).

(6) CH10 count starts with the effective edge of TOUT02 and INT10 is generated when the counter underflows. CH11 count starts by generation of INT10 and the reduced dead time pulse (TOUT11) of the width set in CDR11 is output.

(7) The reduced dead time pulse (UO1 and UO2) are generated from TOUT02 and TOUT11 in PFN001.

(8) UO1 and UO2 are synthesized with TOUT04 and TOUT05 in FN00 and FN01, and are output as TOPnU (U phase PWM signal) and TOPnUB (UB phase PWM signal).

CAUTION

Since the reduced dead time pulses are sawtooth waves, they expand and contract on one side, unlike the triangle wave pulses, which expand and contract on both sides. Since one-side expansion and contraction applies to the reduced dead time pulses, a one-phase PWM output period in the reduced dead time range is longer by half the width of an inserted reduced dead time pulse.

The following figure shows the timing diagram when U phase duty cycle = 100% and UB phase duty cycle = 0% at active high.

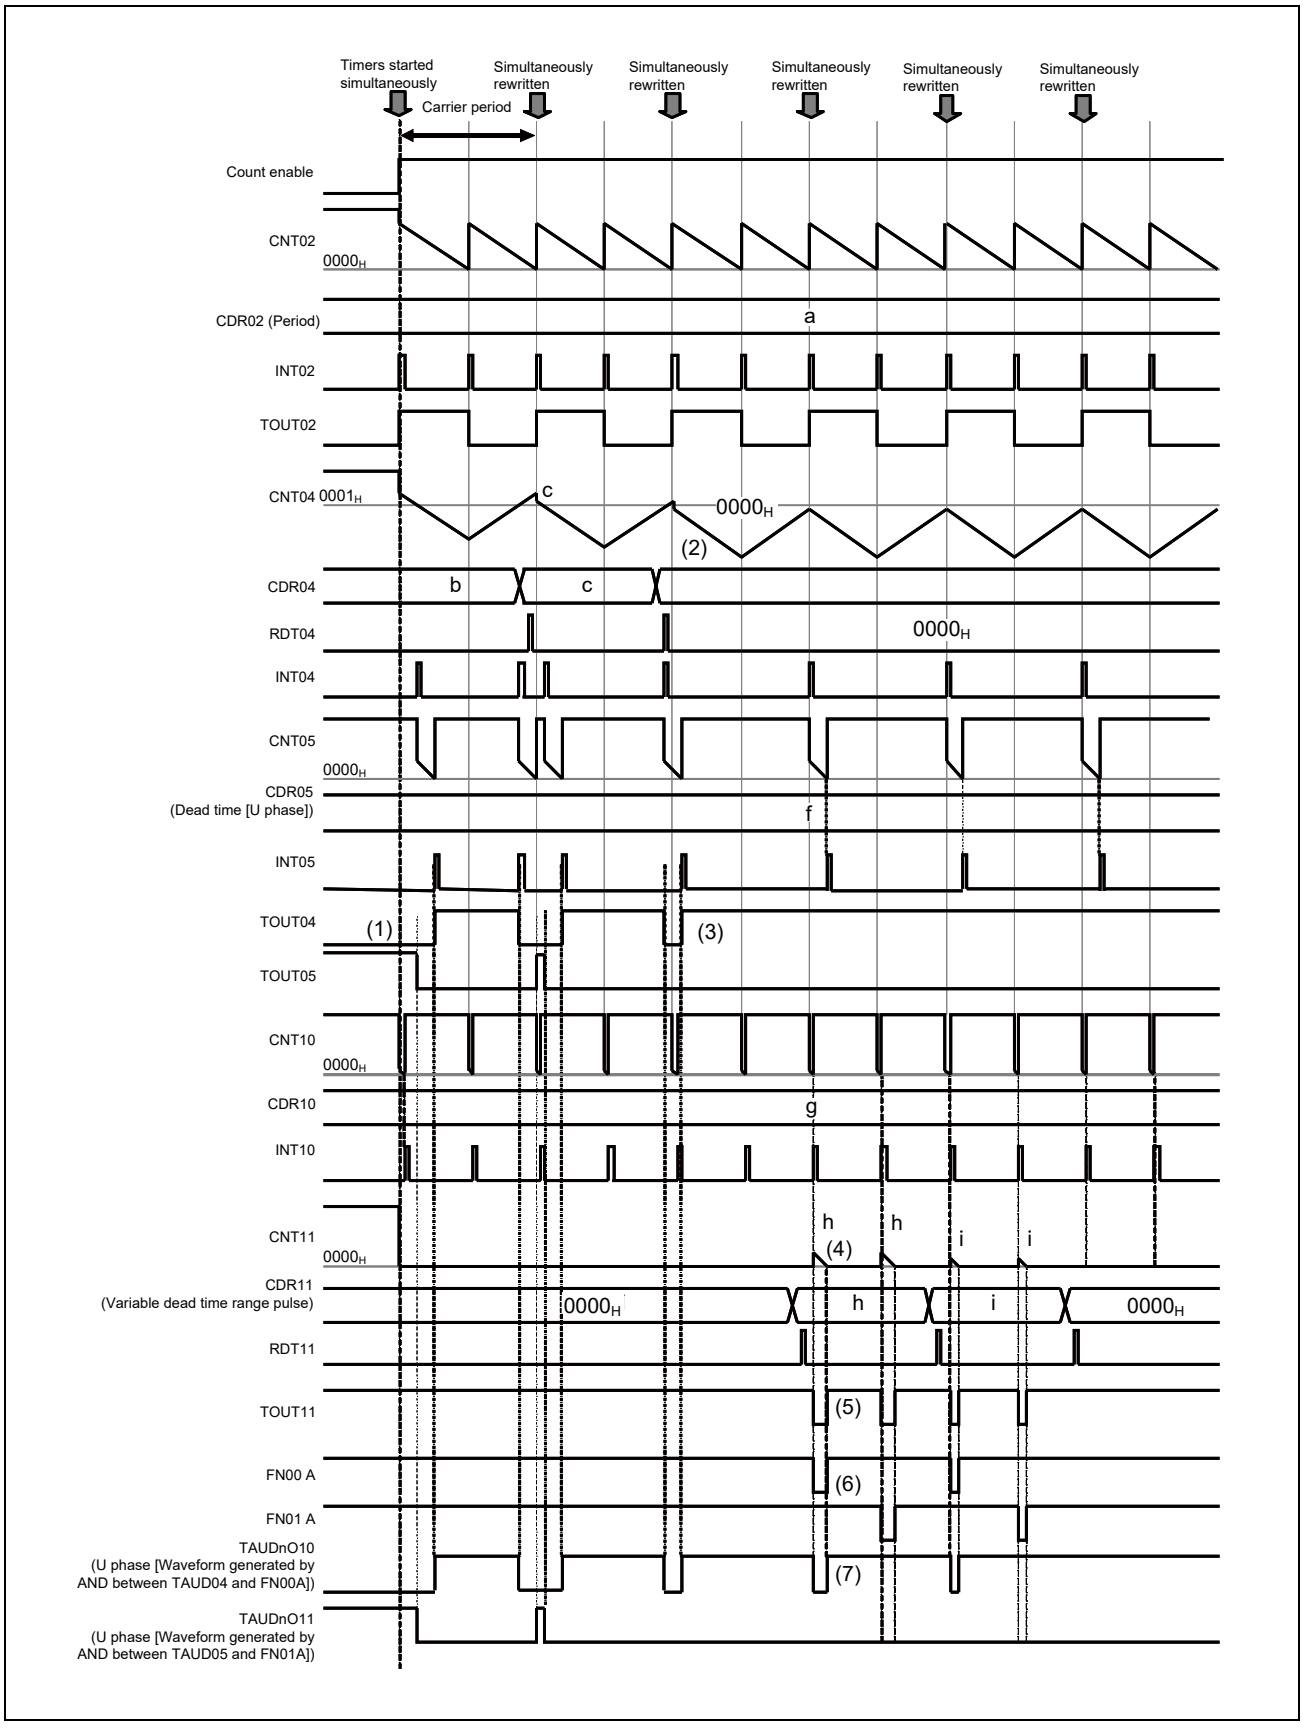

Figure 24.17 Timing Diagram of High Accuracy Triangle Wave PWM (U phase duty cycle = 100%, UB phase duty cycle = 0%) Output with Dead Time (Active High)

(1) With the simultaneous timer start function, the timers to be used are started simultaneously.

(2) TOUT04 and TOUT05 are generated by the triangle wave PWM output function with dead time.

(3) A 100% duty cycle value (CDR04 = 0000_H) is set in CDR04 for U phase output.

(4) TOUT04 outputs the active level and TOUT05 outputs the inactive level.

(5) A value for the reduced dead time pulse width is set in CDR11 one period after setting 100% duty cycle for U phase output.

(6) CH10 count starts with the effective edge of TOUT02 and INT10 is generated when the counter underflows. CH11 count starts by generation of INT10 and the reduced dead time pulse (TOUT11) of the width set in CDR11 is output.

(7) The reduced dead time pulse (UO1 and UO2) are generated from TOUT02 and TOUT11 in PFN001.

(8) UO1 and UO2 are synthesized with TOUT04 and TOU05 in FN00 and FN01, and are output as TOPnU (U phase PWM signal) and TOPnUB (UB phase PWM signal).

CAUTION

As shown in **Figure 24.18**, if a value is set for the variable dead time range pulse width in CDR11 at the same time as a 100% duty cycle value is set for U phase output in CDR04, the variable dead time range pulse affects the last PWM output from TOUT04 (indicated by **Figure 24.18**, (1)) by the amount of time indicated by **Figure 24.18**, (2), which is due to the functional specification. To eliminate this influence, CDR11 must be set one period after setting CDR04.

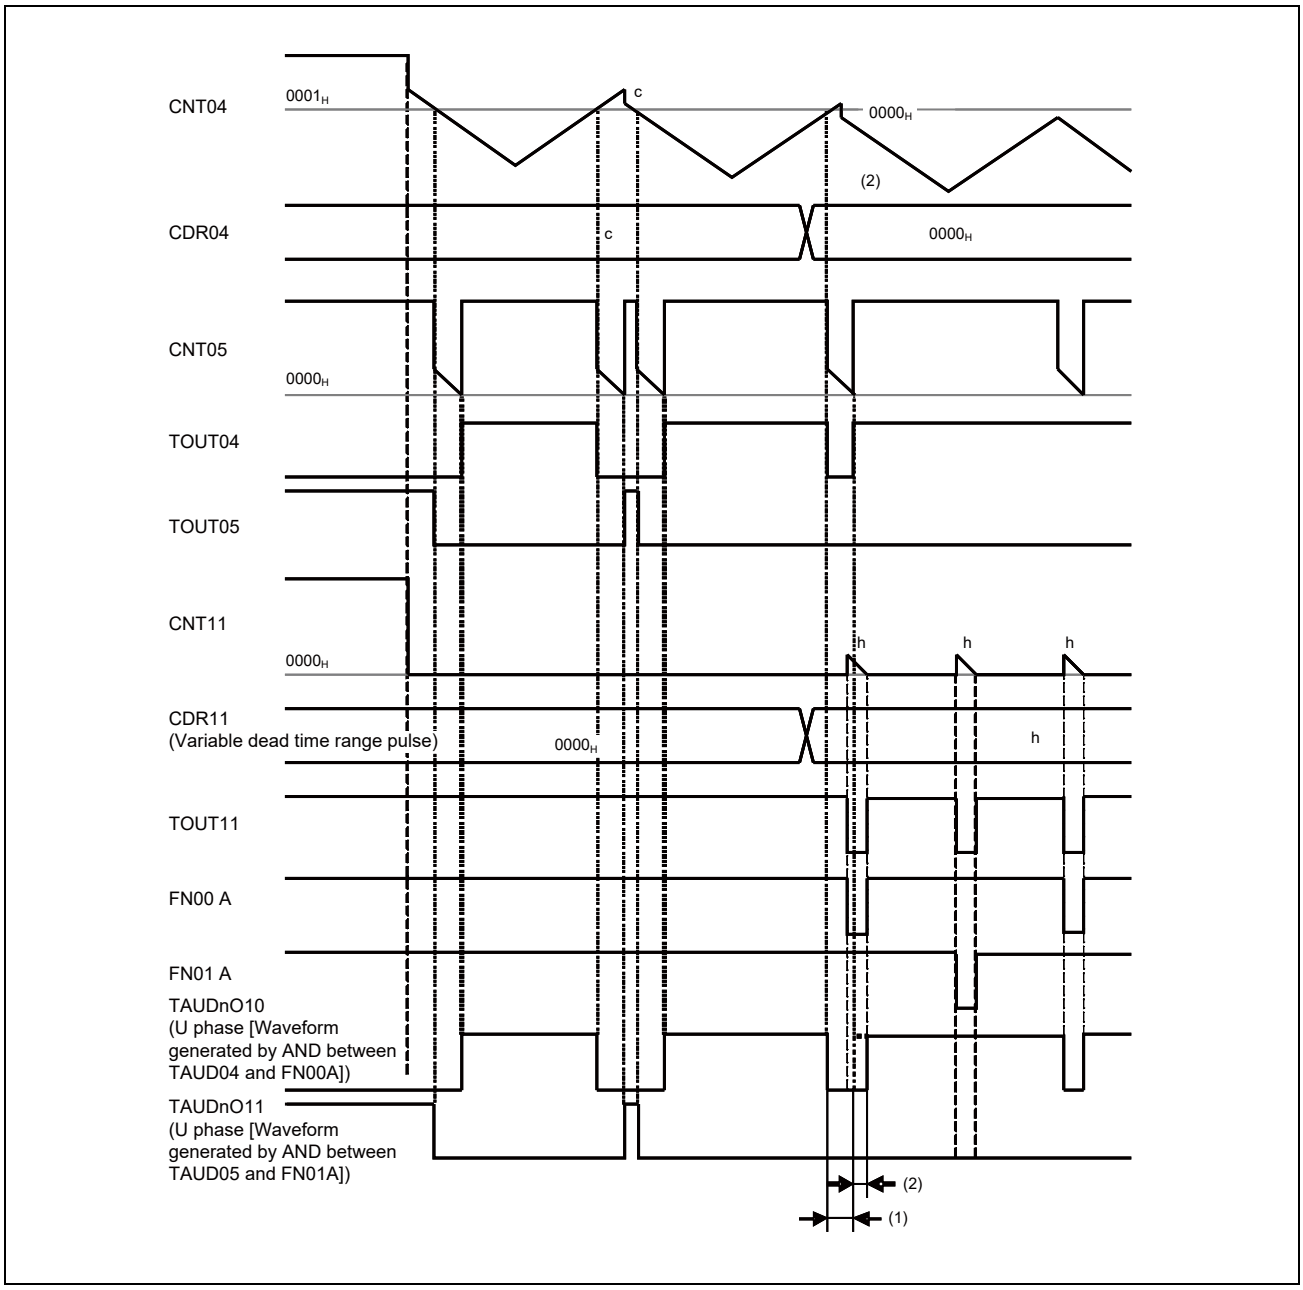

Figure 24.18 Timing Diagram of an Example of Reduced Dead Time Pulse Giving Influence on Triangle Wave PWM Output with Dead Time

The following figure shows the timing diagram when U phase duty cycle = 100% and UB phase duty cycle = 0% at active low.

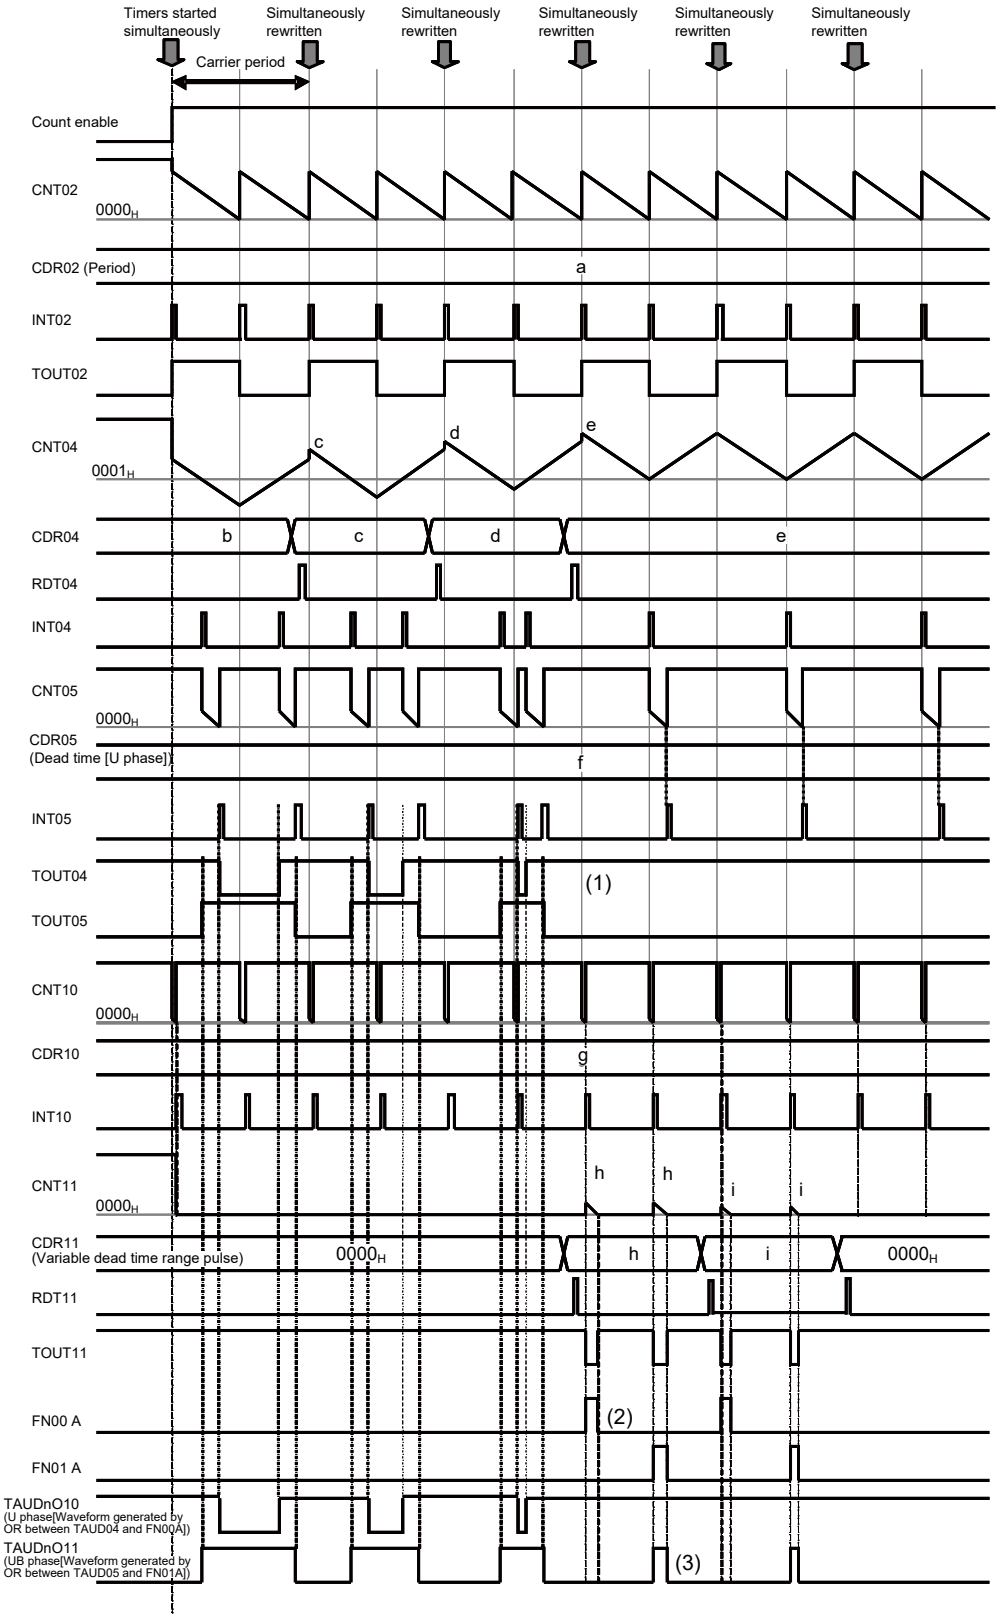

Figure 24.19 Timing Diagram of High Accuracy Triangle Wave PWM (U phase duty cycle = 100%, UB phase duty cycle = 0%) Output with Dead Time (Active Low)

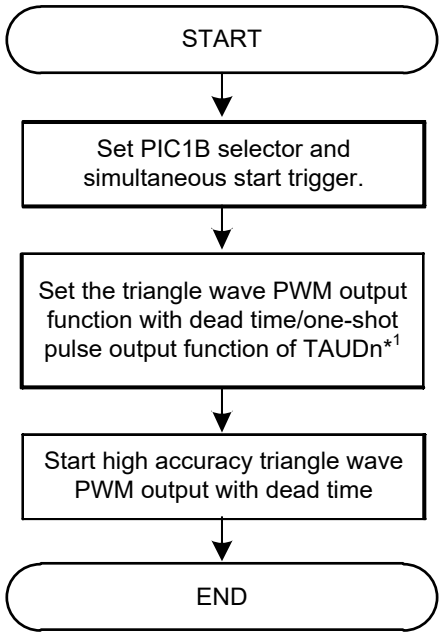
The operation flow from timer operation start to triangle wave PWM output with dead time is same as **Figure 24.19, Timing Diagram of High Accuracy Triangle Wave PWM (U phase duty cycle = 100%, UB phase duty cycle = 0%) Output with Dead Time (Active Low)**, with the difference of the PWM output signal from TOUT04 and TOUT05 are active low.

CAUTION

Set each CDR for the one-shot pulse output function so that the following condition is satisfied.

CDR05 ≥ (CDR10 + CDR11)

If the condition above is not satisfied, the output waveform may be influenced. To minimize the influence, satisfy the condition above, and also fix the value of CDR11 to 0000_H until the reduced dead time pulse is required.



Set the both edges to be detected of TIN10 (TOUT02) as effective, and set TAUDnTOL11 to 1 (active low).

Select the count clock signal (CK0 to 3) of the same clock for TAUDn.

After high accuracy triangle wave PWM output with dead time is started, do not set the value of variable dead time pulse width at the same time as setting a 100% duty cycle value for U phase, V phase, and W phase.

(5) Flow chart

The flow chart of this function is shown in the following figure.

Note 1. For the setting of triangle wave PWM output function with dead time of TAUDn, see **Section 18.4.12.8, Triangle PWM Output Function with Dead Time**, for the setting of one-shot pulse output function, see **Section 18.4.12.2, One-Shot Pulse Output Function**.

Figure 24.20 Setting Flow

24.2.3.5 Delay Pulse Output Function with Dead Time

(1) Overview

This function allows generation of PWM output with the dead time, that is, delayed as specified from the period timing using TAUDn.

With this function, PWM output can be reset in the next period unlike with the function described in **24.2.3.3, PWM Output Function with Dead Time**.

The following table lists the number of channels used.

Table 24.61 Number of TAUDn Channels for Use in Delay Pulse Output with Dead Time

PWM Output with Dead Time	Number of TAUDn Channels
One-phase PWM output (U phase/UB phase)	5 channels (master channel: 1, slave channel: 4)
Two-phase PWM output (U phase/UB phase, V phase/VB phase)	9 channels (master channel: 1, slave channel: 8)
Three-phase PWM output (U phase/UB phase, V phase/VB phase, W phase/WB phase)	13 channels (master channel: 1, slave channel: 12)

Note: Above are examples of combination.

Usages of each channel of TAUDn are listed in the following table. CH2 is used as the master channel of CH3 to 9.

Table 24.62 Usage of TAUDn Channels

TAUDn Channel	U phase/ UB phase	V phase/ VB phase	W phase/ WB phase	Usage
CH0	—	—	—	Not used.
CH1	—	—	—	Not used.
CH2	√	√	√	Carrier period (common to each phase)
CH3	√	√	√	Reserved
CH4	√	—	—	Delay pulse input (U phase/UB phase)
CH5	√	—	—	
CH6	—	√	—	Delay pulse input (V phase/VB phase)
CH7	—	√	—	
CH8	—	—	√	Delay pulse input (W phase/WB phase)
CH9	—	—	√	
CH10	√	—	—	U phase output (TOUT10)
CH11	√	—	—	UB phase output (TOUT11)
CH12	—	√	—	V phase output (TOUT12)
CH13	—	√	—	VB phase output (TOUT13)
CH14	—	—	√	W phase output (TOUT14)
CH15	—	—	√	WB phase output (TOUT15)

Note: √: Used; — : Not used

(2) Configuration

The delay pulse output function with the dead time is realized by using the delay pulse output function/one-phase PWM output function of TAUDn and PIC1B in combination. The following figure shows the block diagram of the delay pulse output function with the dead time.

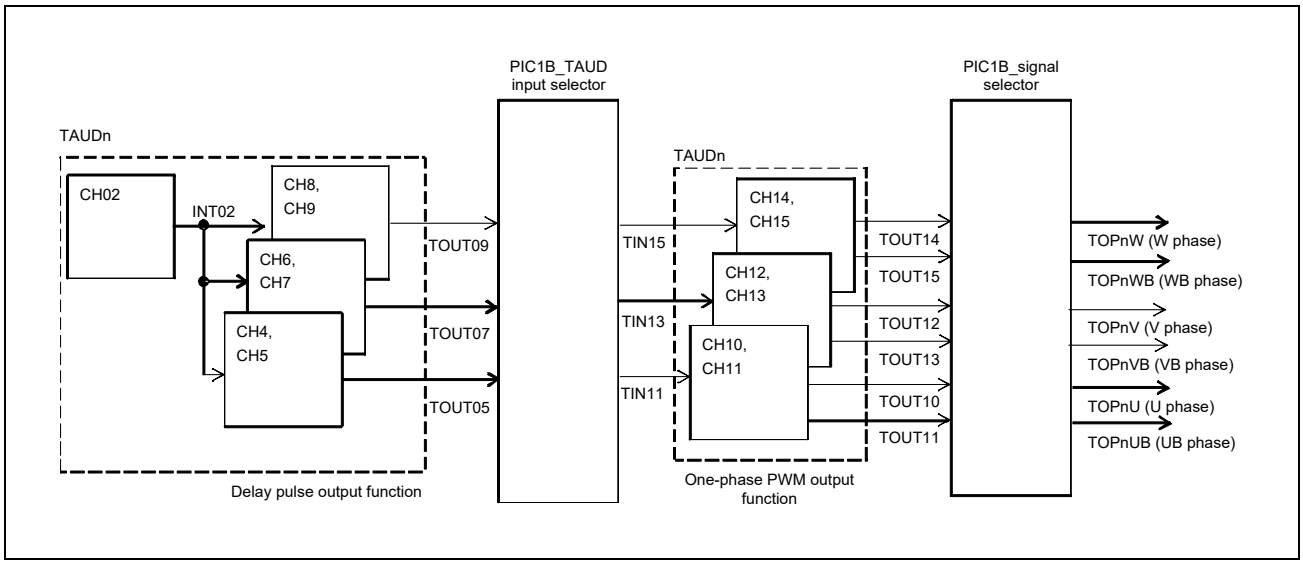


Figure 24.21 Block Diagram of Delay Pulse Output Function with Dead Time

The configuration of this function is described as follows using the PWM output of U phase/UB phase as an example.

- [TAUDn] Delay pulse output function
  CH02, CH04, and CH05 are used in combination. Setting the period, delay value, and the pulse width to CDR02, CDR04, and CDR05, respectively generates the delay pulse output signal (TOUT05).
- [PIC1B_TAUD input selector]
  TOUT05 is selected for output as TIN11.
- [TAUDn] One-phase PWM output function
  CH10 and CH11 are used in combination. Setting the dead time value to CDR11, and inserting dead time into the PWM signal to be input to TIN11 allows TOUT10 (U phase PWM signal) and TOUT11 (UB phase PWM signal) to be output.
- [PIC1B_signal selector]
  TOUT10 and TOUT11 inputs are selected and output to TOPnU and TOPnUB pins, respectively.

Similar configuration is applied to V phase/VB phase and W phase/WB phase.

(3) Registers

Block diagram of PIC1B is shown in the following figure.

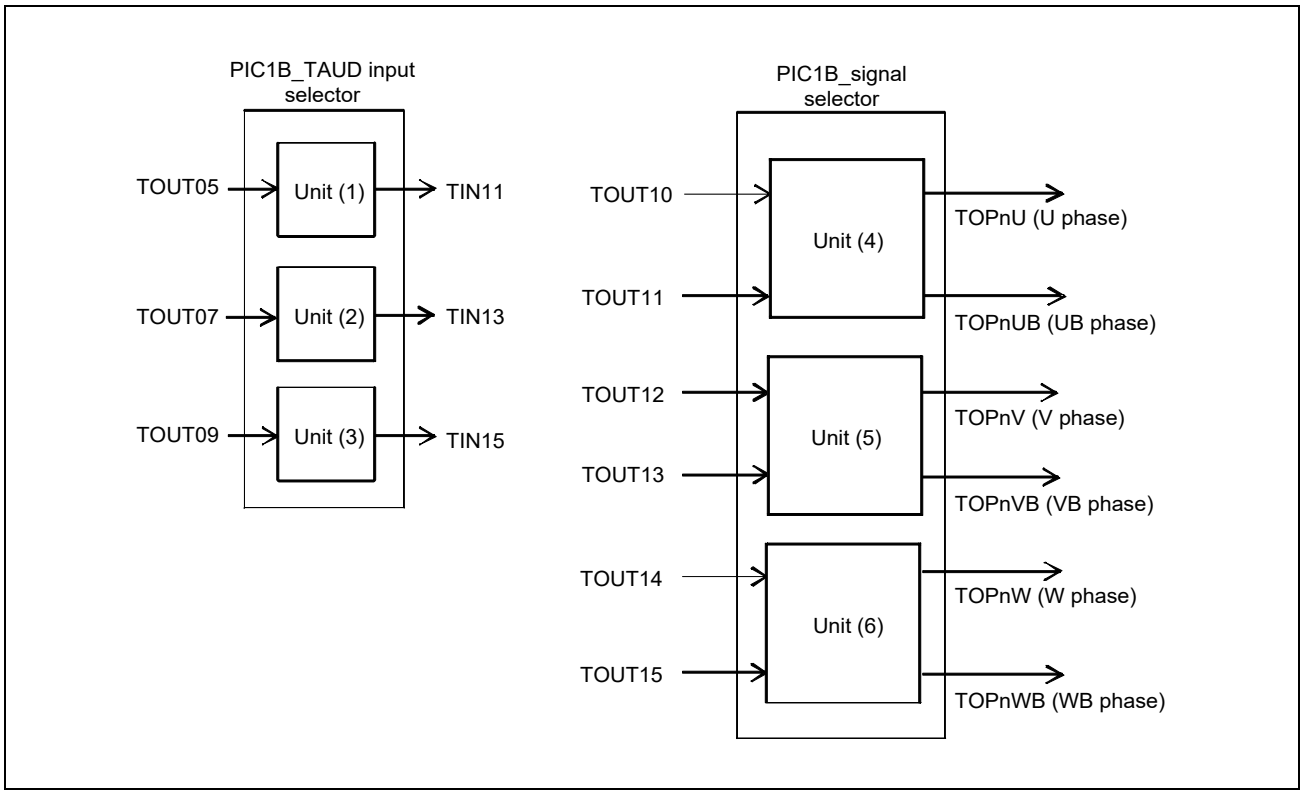

Figure 24.22 Block Diagram of PIC1B

The values of PIC1B registers used in this function are as follows.

U phase/UB phase

The values to output TOUT05 as TIN11 (**Figure 24.22**, unit (1))

PIC1BREG2n2[19:18] = 10_B

PIC1BREG2n2[2] = 0_B

PIC1BTAUDnSEL[23:22] = 00_B

The values to output the TOUT10 and TOUT11 as TOPnU and TOPnUB, respectively (**Figure 24.22**, unit (4))

PIC1BREG2n1[19:16] = 0000_B

PIC1BREG2n3[2:0] = 000_B

PIC1BREG2n3[6:4] = 000_B

V phase/VB phase

The values to output TOUT07 as TIN13 (**Figure 24.22**, unit (2))

PIC1BREG2n2[23:22] = 10_B

PIC1BREG2n2[3] = 0_B

PIC1BTAUDnSEL[27:26] = 00_B

The values to output TOUT12 and TOUT13 as TOPnV and TOPnVB, respectively (**Figure 24.22**, unit (5))

PIC1BREG2n1[23:20] = 0000_B

PIC1BREG2n3[10:8] = 000_B

PIC1BREG2n3[14:12] = 000_B

W phase/WB phase

The values to output TOUT09 as TIN15 (**Figure 24.22**, unit (3))

PIC1BREG2n2[27:26] = 10_B

PIC1BREG2n2[4] = 0_B

PIC1BTAUDnSEL[31:30] = 00_B

The values to output TOUT14 and TOUT15 as TOPnW and TOPnWB, respectively (**Figure 24.22**, unit (6))

PIC1BREG2n1[27:24] = 0000_B

PIC1BREG2n3[18:16] = 000_B

PIC1BREG2n3[22:20] = 000_B

(4) Function

Detail of the function is described using the delay pulse output (U phase/UB phase) as an example.

The following figure shows the timing diagram.

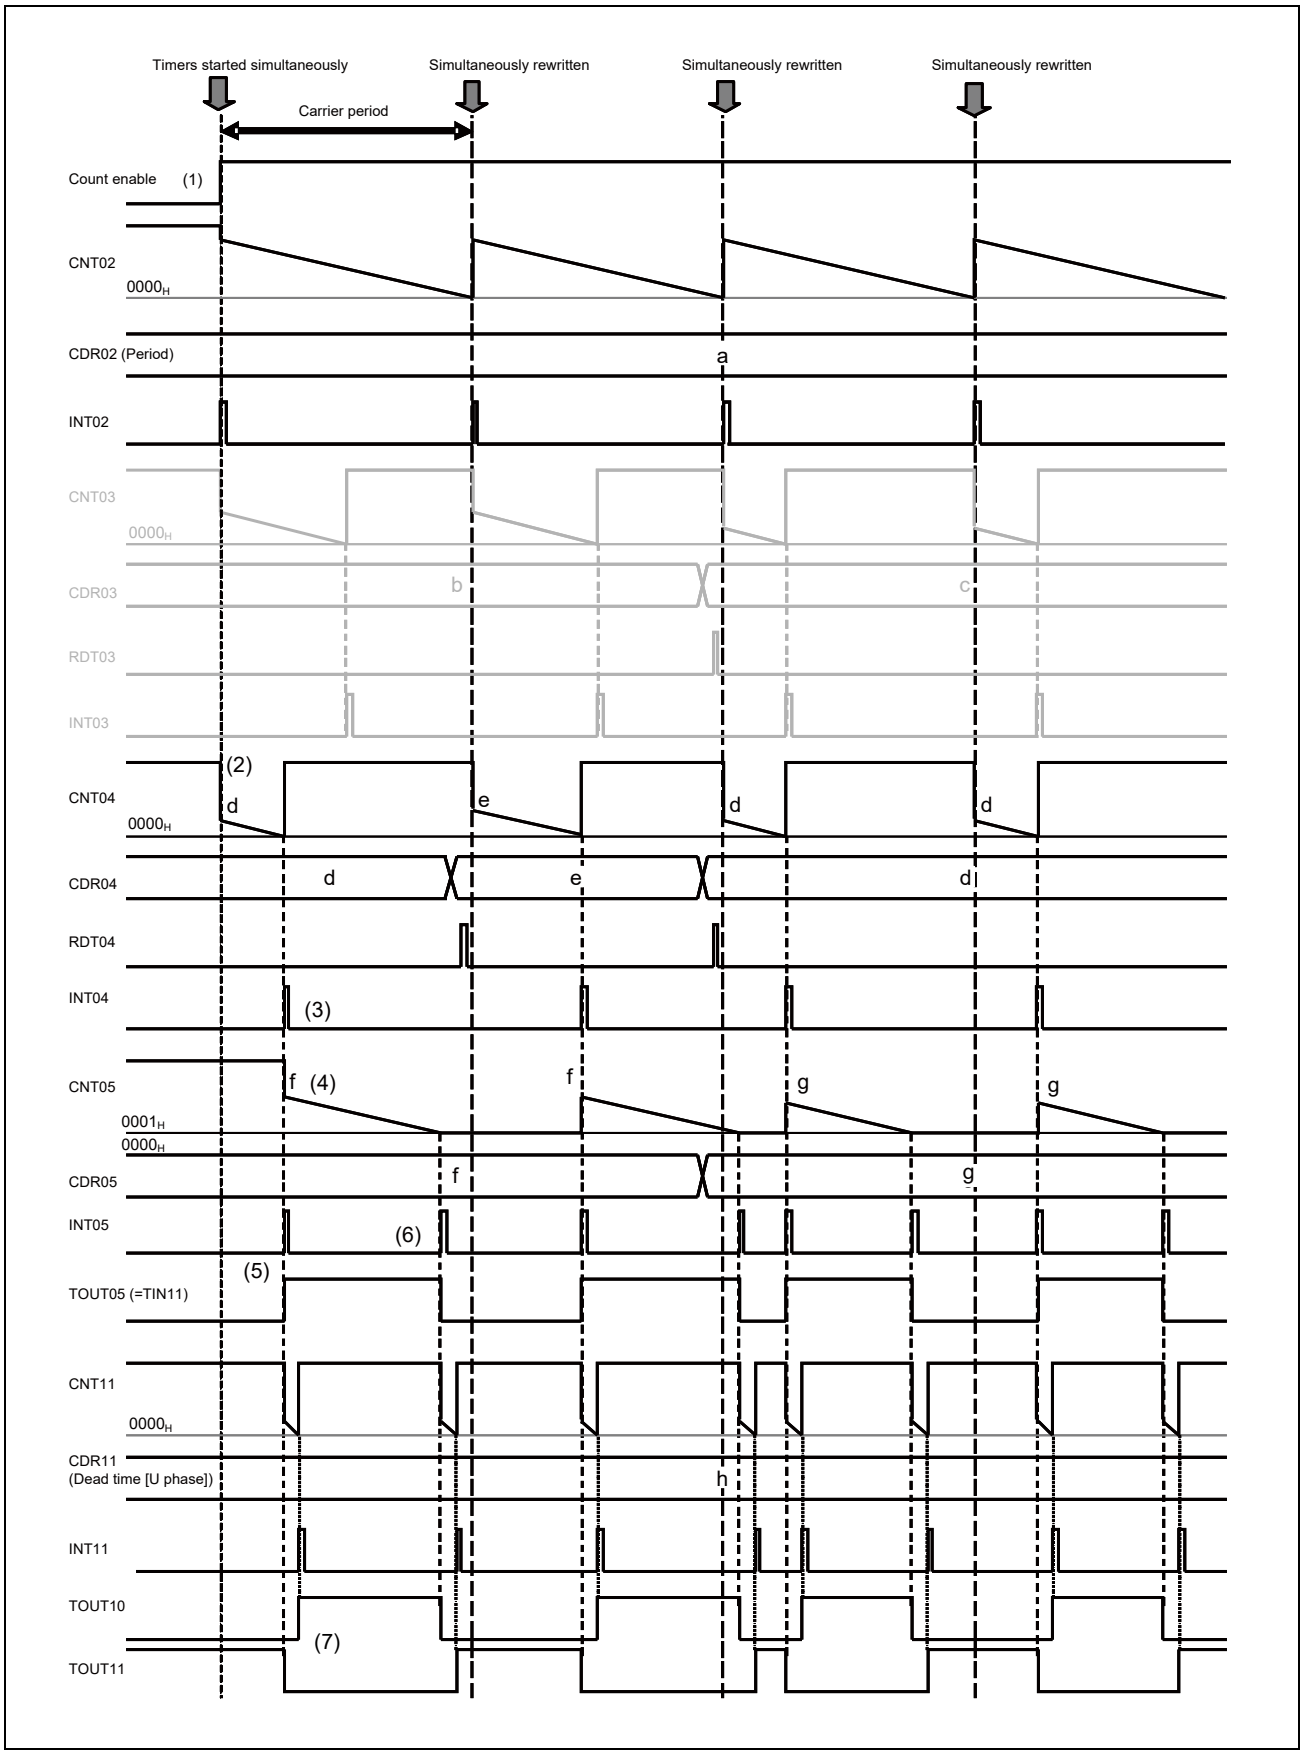

Figure 24.23 Timing Diagram of Delay Pulse Output with Dead Time (U phase/UB phase)

(1) Using the simultaneous start trigger function, the timers to be used are started simultaneously.

(2) For CH04, CH02 underflow allows the set value in CDR04 to be reloaded to CNT04.

(3) CH04 underflow allows the delay timing signal (INT04) to be generated.

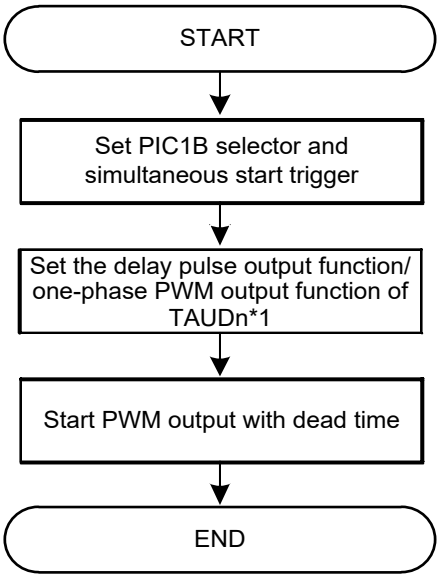
(4) INT04 generation allows the set value to be reloaded from CDR05 to CNT05, thus starting the count operation of CH05.

(5) Here, INT05 is generated and the TOUT05 output level changes to the active level.

(6) Upon CH05 underflow, INT05 is generated again and the TOUT05 output level changes to the inactive level. TOUT05 is supplied to TIN11.

(7) The U phase PWM signal (TOUT10) and UB phase PWM signal (TOUT11) with the dead time is generated and output according to the TIN11 edges detected, and output to TOPnU and TOPnUB.

Similar configuration is applied to V phase/VB phase and W phase/WB phase.



CAUTION

Do not set the delay value which extends over carrier period.

Select the count clock signal of the same clock for TAUDn.

(5) Flow chart

The following flow chart shows the PMW output function with the dead time.

Note 1. For the setting of delay pulse output function of TAUDn, see **Section 18.4.12.4, Delay Pulse Output Function**, for the setting of one-phase PWM output function, see **Section 18.4.12.11, One-Phase PWM Output Function**.

Figure 24.24 Setting Flow

24.2.3.6 Trigger and Pulse Width Measurement Function

(1) Overview

This function allows measurement of trigger periods by inputting the trigger signal output from ENCAn to TAUJ0 and TAUDn.

The following table lists the ENCAn interrupt trigger signals to be measured by each timer and channel.

Table 24.63 Combinations of Measurement Timers and Trigger Signals to be Measured

Timer	Channel	Interrupt Trigger Signal to be Measured
TAUJ0	CH0	ENCAT0IEC
	CH1	ENCAT0IEC
	CH2	ENCAT1IEC
	CH3	ENCAT1IEC
TAUD0	CH0	ENCAT0EQ0 or ENCAT0EQ1
	CH1	ENCAT0EQ1
	CH2	ENCAT0EQ0
TAUD1	CH0	ENCAT1EQ0 or ENCAT1EQ1
	CH1	ENCAT1EQ1
	CH2	ENCAT1EQ0

(2) Configuration

The trigger and pulse width measurement function is realized by using the TAUJ0 and TINm input pulse of TAUDn, and PIC1B in combination. The following figure shows the block diagram of the trigger and pulse width measurement function.

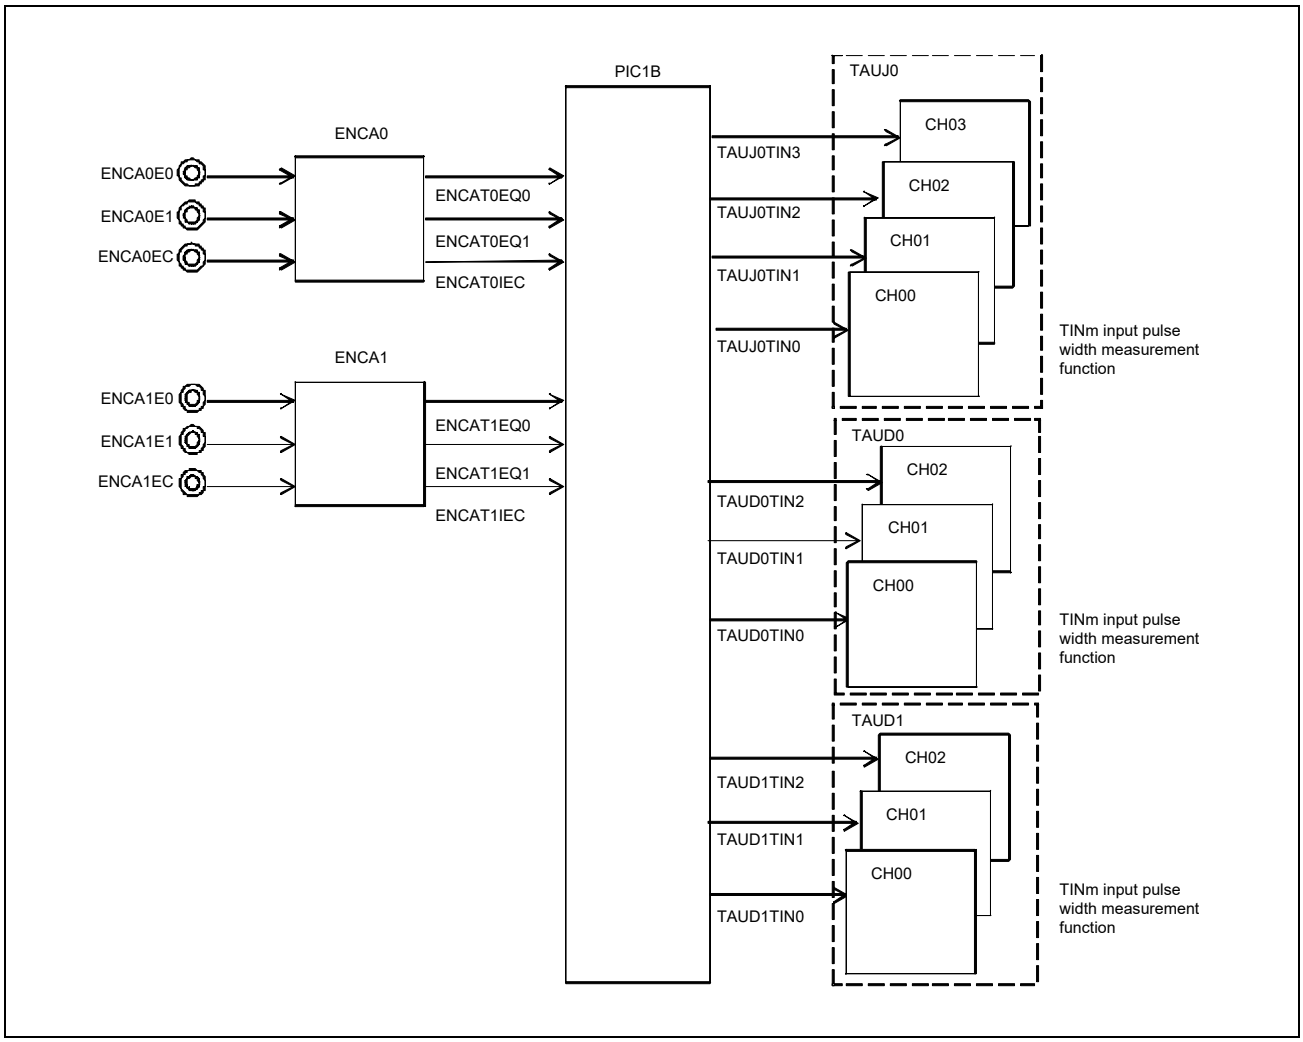


Figure 24.25 Block Diagram of Trigger and Pulse Width Measurement Function

The configuration of this function is described as follows using TAUJ0 CH0 as an example.

- [ENCA0]
  ENCAT0IEC interrupt trigger signal is generated each time ENCA0 timer counter is cleared by input from ENCA0EC pin.
- [PIC1B] Latch and toggle output (DT) circuit
  ENCA0IEC interrupt trigger signal selected by the DT circuit is converted into a level-sensitive toggle signal and output to TAUJ0TIN0.
- [TAUJ0] TINm input pulse width measurement function
  TAUJ0 CH0 is used. TAUJ0CNT0 is captured each time input signal is toggled. The counter is cleared and restarted.

Similar configuration is applied for trigger and pulse width measurement of TAUD0 and TAUD1.

(3) Registers

Block diagram of PIC1B is shown in the following figure.

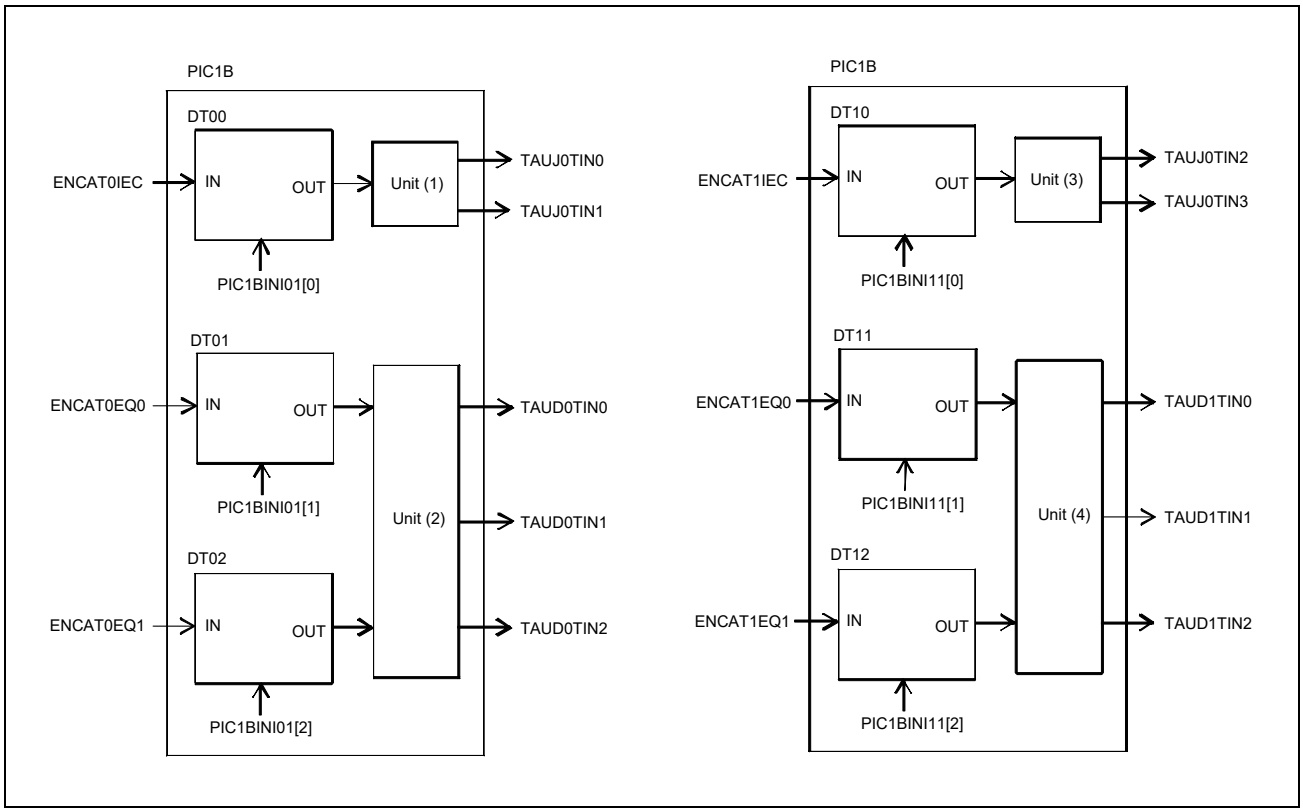

Figure 24.26 Block Diagram of PIC1B

The values of PIC1B registers used in this function are as follows.

ENCA0

- ENCAT0EC trigger and pulse width measurement
  The register values to select the timer which performs ENCAT0EC trigger and pulse width measurement. (**Figure 24.26**, unit (1))

Table 24.64 Setting Values

Register Value			
PIC1BREG31			
1	0	TAUJ0.TIN00	TAUJ0.TIN01
0	0	Not selected	
0	1	ENCAT0IEC	—
1	0	—	ENCAT0IEC
1	1	ENCAT0IEC	ENCAT0IEC

Note: Write 0 (value after reset) to PIC1BREG30[22,17:16].

- ENCAT0EQ0 and ENCAT0EQ1 trigger and pulse width measurement
  The register values to select the timer which performs ENCAT0EQ0 and ENCAT0EQ1 trigger and pulse width measurement. (**Figure 24.26**, unit (2))

Table 24.65 Setting Values

Register Value										
PIC1BREG31										
13	12	11	10	9	8	7	6	TAUD0.TIN00	TAUD0.TIN01	TAUD0.TIN02

0	1	1	1	0	0	0	1	ENCAT1EQ0	ENCAT1EQ1	ENCAT1EQ0

Note: Do not set the values other than the settings listed above for this function.
Write 0 (value after reset) to PIC1BTAUD1SEL[5:0] and PIC1BREG30[20:19, 9:6].

- Enable initialization of DT12 to DT10 circuits
  The register values to enable initialization of the DT12 to DT10 circuits.
  PIC1BINI11 [2:0] = 111_B (initialized)

(4) Function

Detail of the function is described here.

The following figure shows the timing diagram.

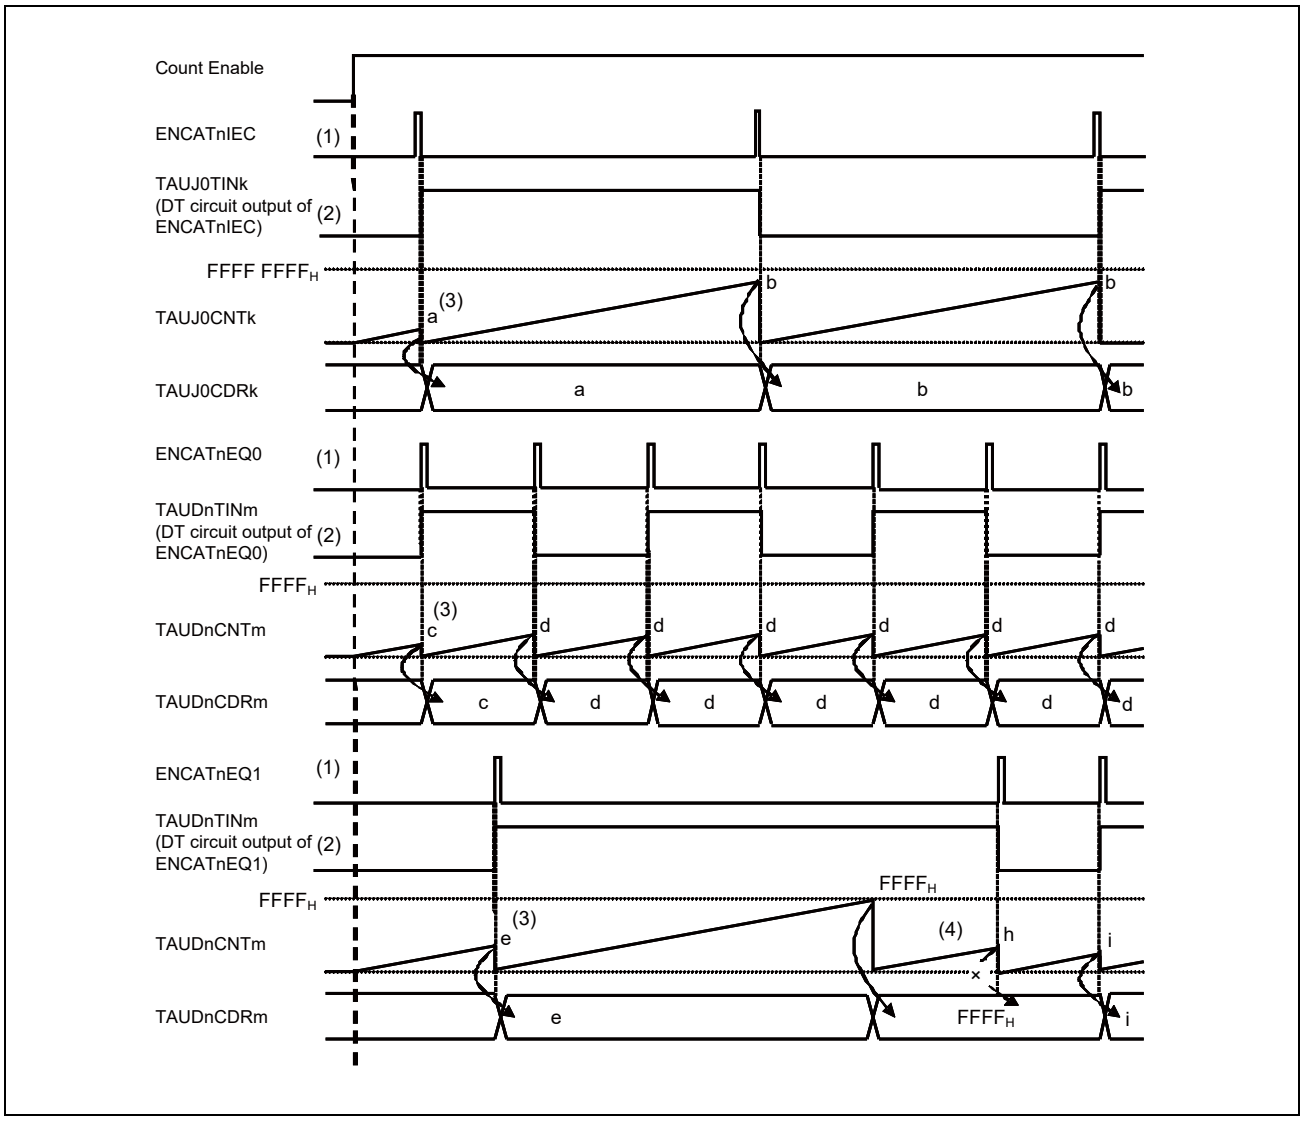

Figure 24.27 Timing Diagram of Trigger and Pulse Width Measurement

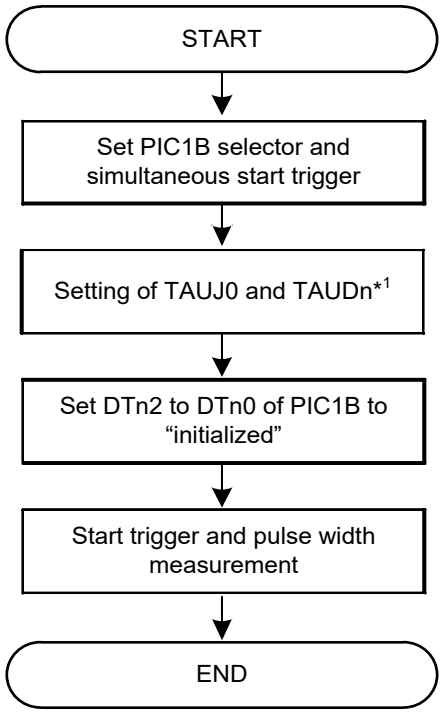
(1) Using the simultaneous start trigger function, the timers to be used are started simultaneously.

(2) The interrupt trigger signal output from ENCAn is converted to the level-sensitive toggle signal by the DT circuit and is output to TINm of TAUJ0 and TINm of TAUDn.

(3) The CNTm value is captured into CDRm on the TINm toggle timing and cleared.

(4) When an overflow occurs, the greatest count value ($FFFF_H$ for TAUDn and FFFF $FFFF_H$ for TAUJ0) is captured and the counter is cleared at the same time. The count value is not captured on the first trigger after the overflow. (When TAUDnCMORm.TAUDnCOS[1] = 1_B)



CAUTION

Operation at an overflow varies depending on the setting of TAUJ and TAUD. For the detail of the TAUJ setting, see **Section 19.4.9.3, TAUJTTINm Input Pulse Interval Measurement Function**, for the detail of the TAUD setting, see **Section 18.4.9.7, TAUDTTINm Input Pulse Interval Measurement Function**. In this function, set the effective edge to be detected by TAUJ0 and TINm of TAUDn as both (rising edge and falling edge).

(5) Flow chart

The following figure shows the setting flow of this function.

This flow chart can be set at both during ENCAn operation and while waiting for simultaneous start trigger.

Note 1. For the setting of TAUDn, see **Section 18.4.9.7, TAUDTTINm Input Pulse Interval Measurement Function**, for the setting of TAUJ0, see **Section 19.4.9.3, TAUJTTINm Input Pulse Interval Measurement Function**.

Figure 24.28 Setting Flow

The ENCAn registers to use this function are as follows.

ENCAnCTL[15:0] = xx00_0000_x00x_xxxx$_B$

ENCAnIOC0[7:0] = 0000_0000$_B$

ENCAnIOC1[7:0] = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 23, Encoder Timer (ENCA)**.

24.2.3.7 Encoder Capture Trigger Select Function

(1) Overview

The function selects any of the ADCCnTRGm (ADCCn conversion start trigger m), TAUDnTINTm (TAUDn-CHm interrupt request signal), and ENCAnI1 (signal 1 of the ENCAn external pin input).

(2) Configuration

The encoder capture trigger select function is realized by using ADCCnTRGm (ADCCn conversion start trigger m), TAUDnTINTm (TAUDn CHm interrupt request signal), ENCAnI1 (ENCAn external pin input 1 signal), and PIC1B.

Block diagram of this function is shown in the following figure.

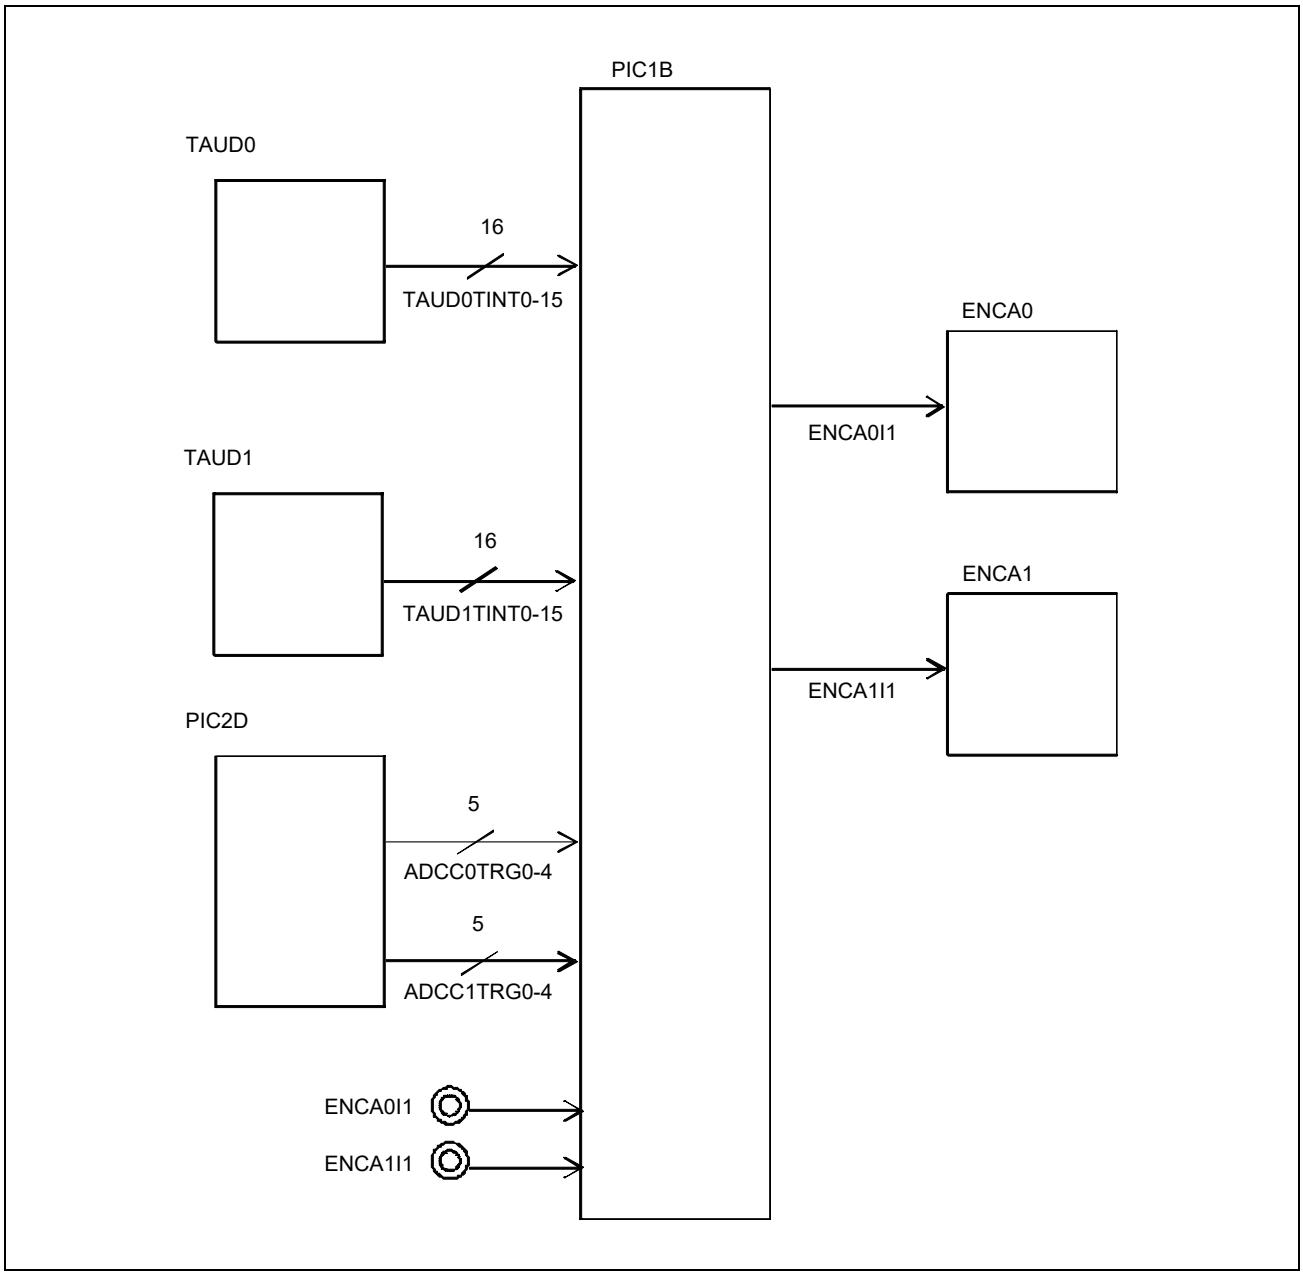


Figure 24.29 Block Diagram of Encoder Capture Trigger Select Function

An example of selecting CH0 of TAUD0 as a capture trigger input of ENCA0 is described as follows.

PIC1BENCSEL400[7] = 1_B

PIC1BENCSEL400[3:0] = 0000_B

PIC1BREG30[18] = 1_B

PIC1BREG30[5:2] = 0000_B

(3) Registers

Block diagram of PIC1B is shown in the following figure.

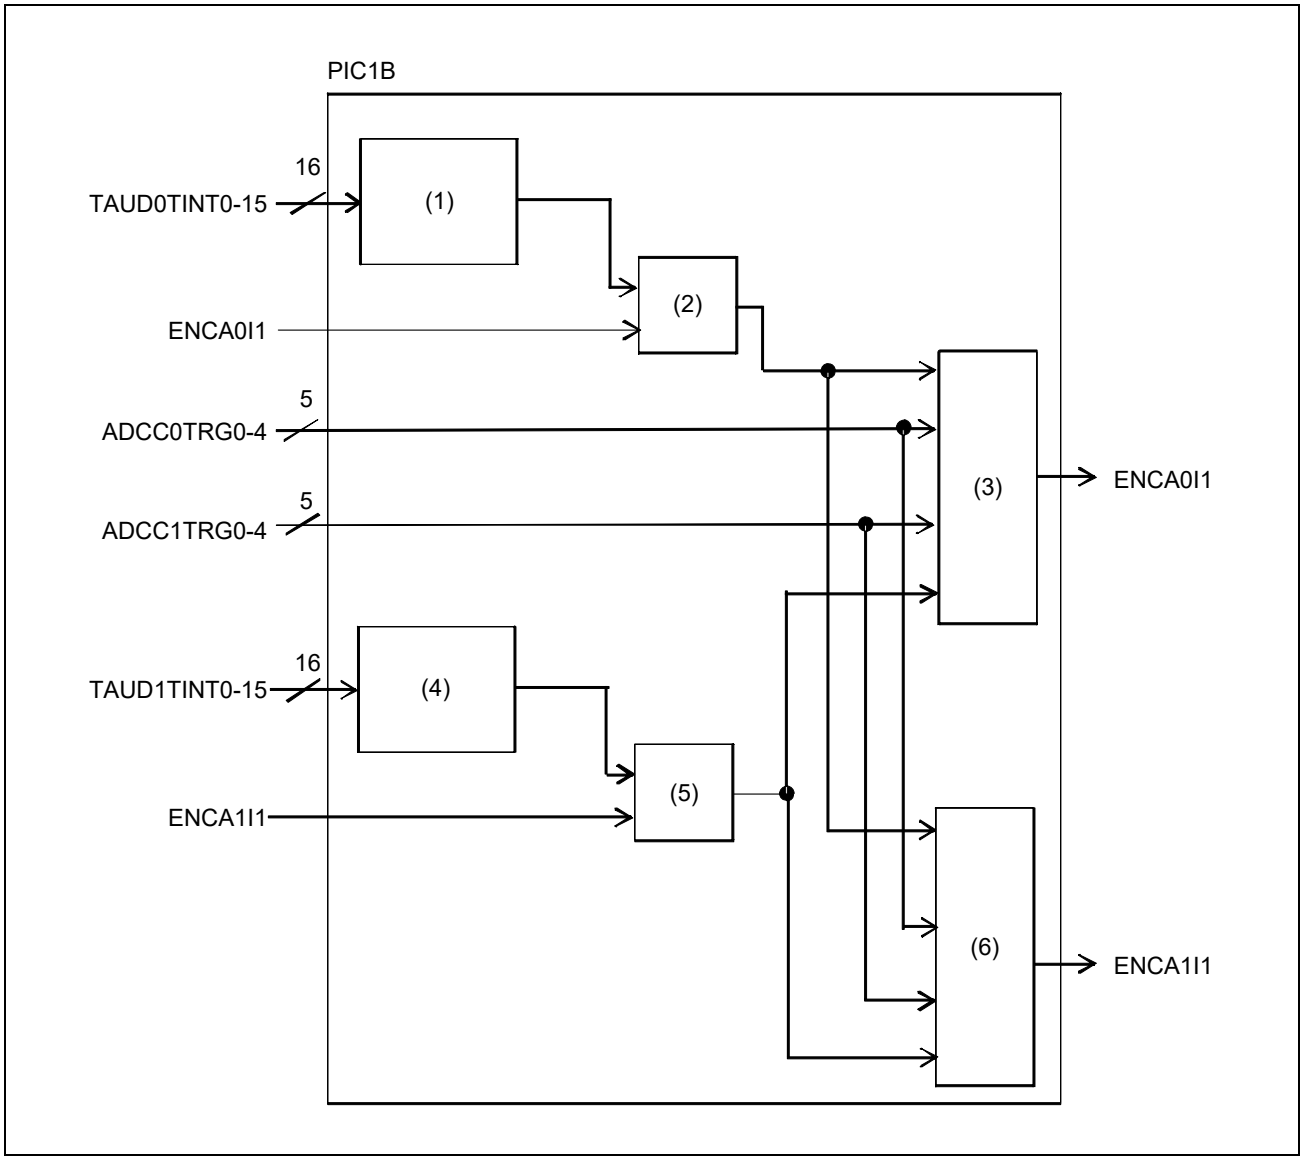

Figure 24.30 Block Diagram of PIC1B

The values of PIC1B registers used in this function are as follows.

ENCA0

- (1) TAUD0TINTm selection
  The register values to select TAUD0TINTm. Set 1 to the PIC1BENCSEL400[7] to select TAUD0TINTm.

Table 24.68 Setting Values

Register Value					
PIC1BENCSEL400					
7	3	2	1	0	Output
1	0	0	0	0	INTTAUD0I0
1	0	0	0	1	INTTAUD0I1
1	0	0	1	0	INTTAUD0I2
1	0	0	1	1	INTTAUD0I3

Register Value	
PIC1BREG30	
21	Output
1	Output (4)
0	ENCA1I1

- (6) ENCA1I1 selection
  The register values to select any of the output (2), output (5), ADCC0TRG0 to 4, and ADCC1TRG0 to 4.

Table 24.73 Setting Values

Register Value				
PIC1BREG30				
15	14	13	12	ENCA1I1
0	0	0	0	Output (5)
0	0	0	1	Output (2)
0	0	1	0	ADCC0TRG4
0	0	1	1	ADCC0TRG3
0	1	0	0	ADCC0TRG2
0	1	0	1	ADCC0TRG1
0	1	1	0	ADCC0TRG0
0	1	1	1	ADCC1TRG4
1	0	0	0	ADCC1TRG3
1	0	0	1	ADCC1TRG2
1	0	1	0	ADCC1TRG1
1	0	1	1	ADCC1TRG0

Note: Do not set the values other than the settings listed above for this function.

(4) Function

Detail of the function is described with an example of selecting TAUDnTINTm as a capture trigger signal.

The following figure shows the timing diagram.

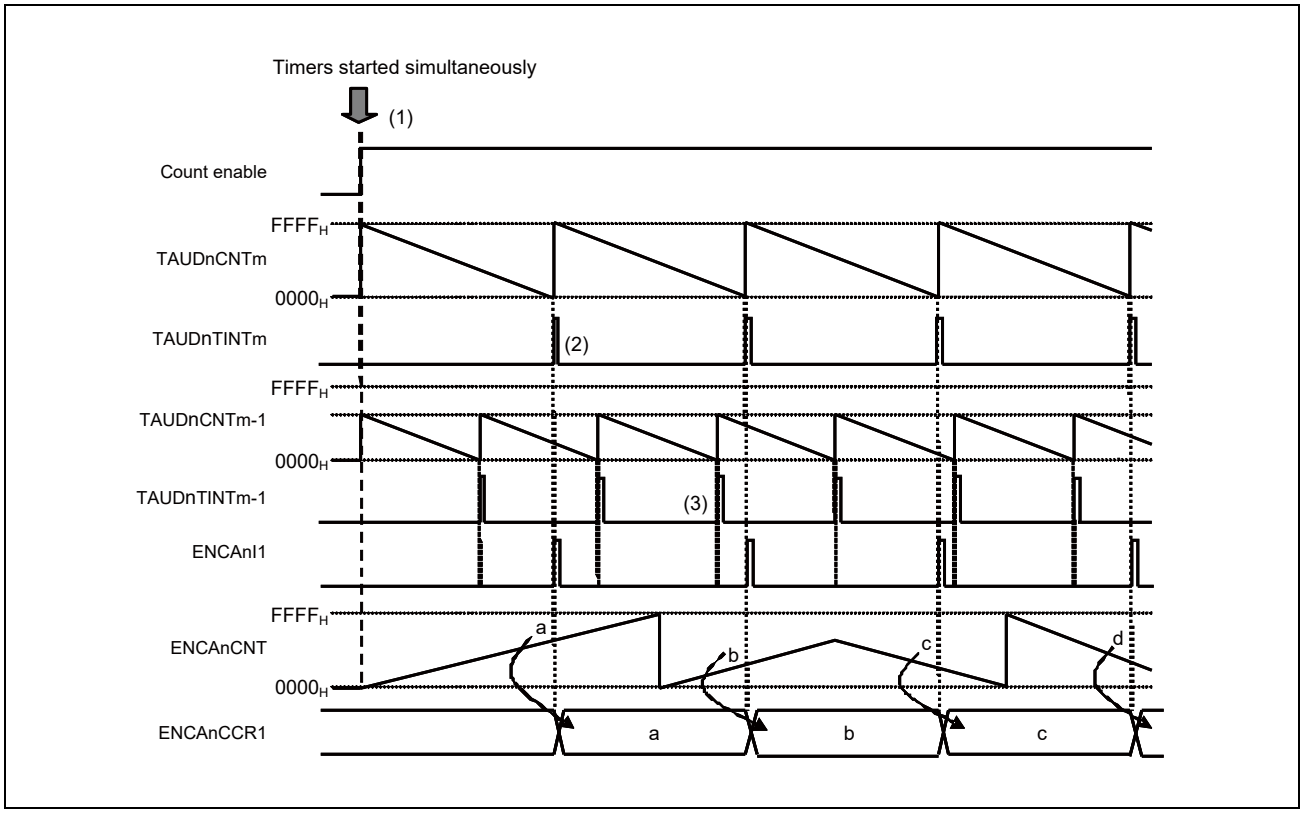

Figure 24.31 Timing Diagram of Encoder Capture Trigger Select Function (TAUDnTINTm)

(1) Using the simultaneous start trigger function, the timers to be used are started simultaneously.

On generation of an effective edge of TAUDnTINTm, ENCAn captures ENCAnCNT.

Do not select ENCAn interrupt trigger signal (INTENCATnI1) as the ADCCn trigger described in **Section 24.3.3.1, ADCC Trigger Select Function**, the correct operation cannot be performed because the following loop occurs: ADCCnTRG1 generation → ENCAn capture operation → INTENCAnI1 generation by capture operation → ADCCnTRG1 generation.

The following figure shows a timing chart of the loop paths of PIC1B, PIC2D, and ENCAn.

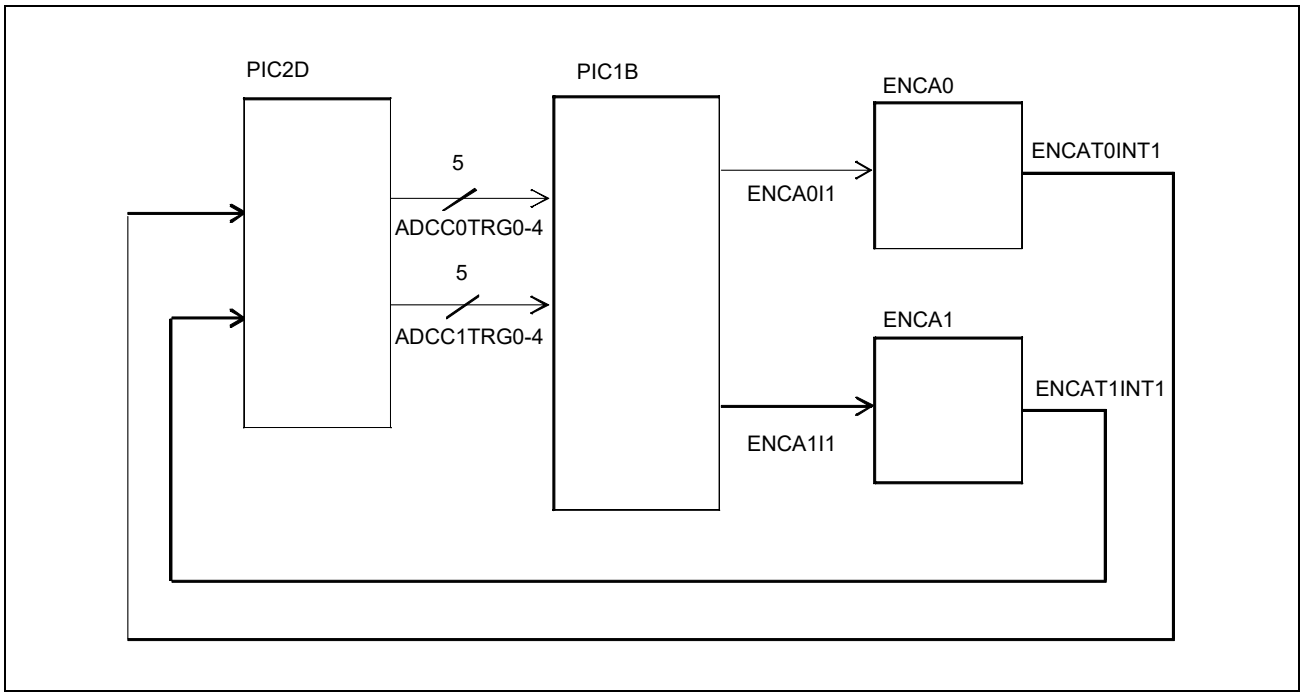

Figure 24.32 Timing Chart of Loop Paths of PIC1B, PIC2D, and ENCAn

(5) Flow chart

Select the encoder capture trigger before starting the encoder timer.

ENCAn settings to use this function are described as follows.

ENCAnCTL[15:0] = 0000_001x_0 00x_xxxx$_B$

ENCAnIOC0[7:0] = 0000_01xx$_B$

ENCAnIOC1[7:0] = (set any value)

“x” can be set arbitrarily. For the registers specifications, see **Section 23, Encoder Timer (ENCA)**.

24.2.3.8 Two-Phase Encoder Control Function (Control Method 1)

(1) Overview

This function allows switching of the output patterns of the motor control function (TSG3n) using the two-phase encoder control function (ENCAn).

(2) Configuration

Switching of output pattern in 120-DC mode by encoder result is realized by using ENCAn and TSG3n, and PIC1B in combination. The following figure describes the block diagram of two-phase encoder control function (control method 1).

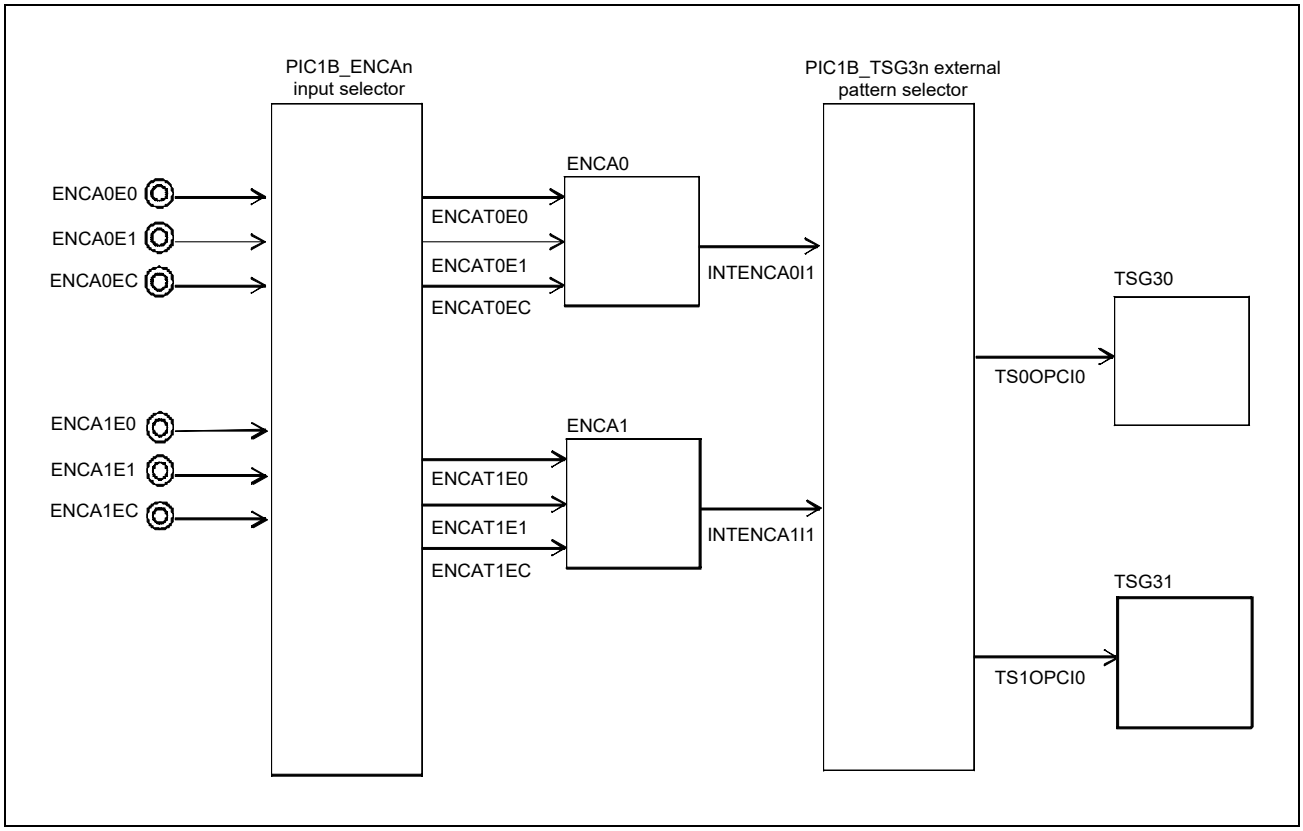

Figure 24.33 Block Diagram of Two-Phase Encoder Control Function (Control Method 1)

The configuration of two-phase encoder control function (control method 1) is described as follows.

- [PIC1B_ENCAn input selector]
  ENCAnE0, ENCAnE1, and ENCAnEC pin inputs are selected and output as ENCATnE0, ENCATnE1, and ENCATnEC.
- [ENCAn]
  INTENCAnI1 is output by two-phase encoder processing.
- [PIC1B_TSG3n external pattern selector]
  INTENCAnI1 is selected and output to TS0OPCI0 or TS1OPCI0.
- [TSG3n]
  Output pattern in 120-DC mode is switched by TSG3nOPCI0.

(3) Registers

The values of PIC1B registers used in this function are as follows.

PIC1B_ENCAn input selector

The register values to output ENCAn pin inputs (ENCAnE0, ENCAnE1, and ENCAnEC) as ENCATnE0, ENCATnE1, and ENCATnEC.

PIC1BREG30[22] = 0_B

PIC1BREG30[20:19] = 00_B

PIC1BREG30[17:16] = 00_B

PIC1BREG30[11:6] = 000000_B

PIC1BREG30[1:0] = 00_B

PIC1B_TSG3n external pattern selection

The register values to select the interrupt request signal to be input as TSG30 external pattern.

Table 24.74 Setting Values

Register Value				
PIC1BREG50				
10	8	6	5	TS0OPCI0
X	0	0	1	INTENCA0I1
0	X	1	0	INTENCA1I1

Note: Do not set the values other than the settings listed above for this function.

The register values to select the interrupt request signal to be input as TSG31 external pattern.

Table 24.75 Setting Values

Register Value				
PIC1BREG51				
10	8	6	5	TS1OPCI0
X	0	0	1	INTENCA0I1
0	X	1	0	INTENCA1I1

Note: Do not set the values other than the settings listed above for this function.

(4) Function

Detail of the function is described using the two-phase encoder control function (method 1) at up count (normal rotation) as an example.

The following figure shows the timing diagram.

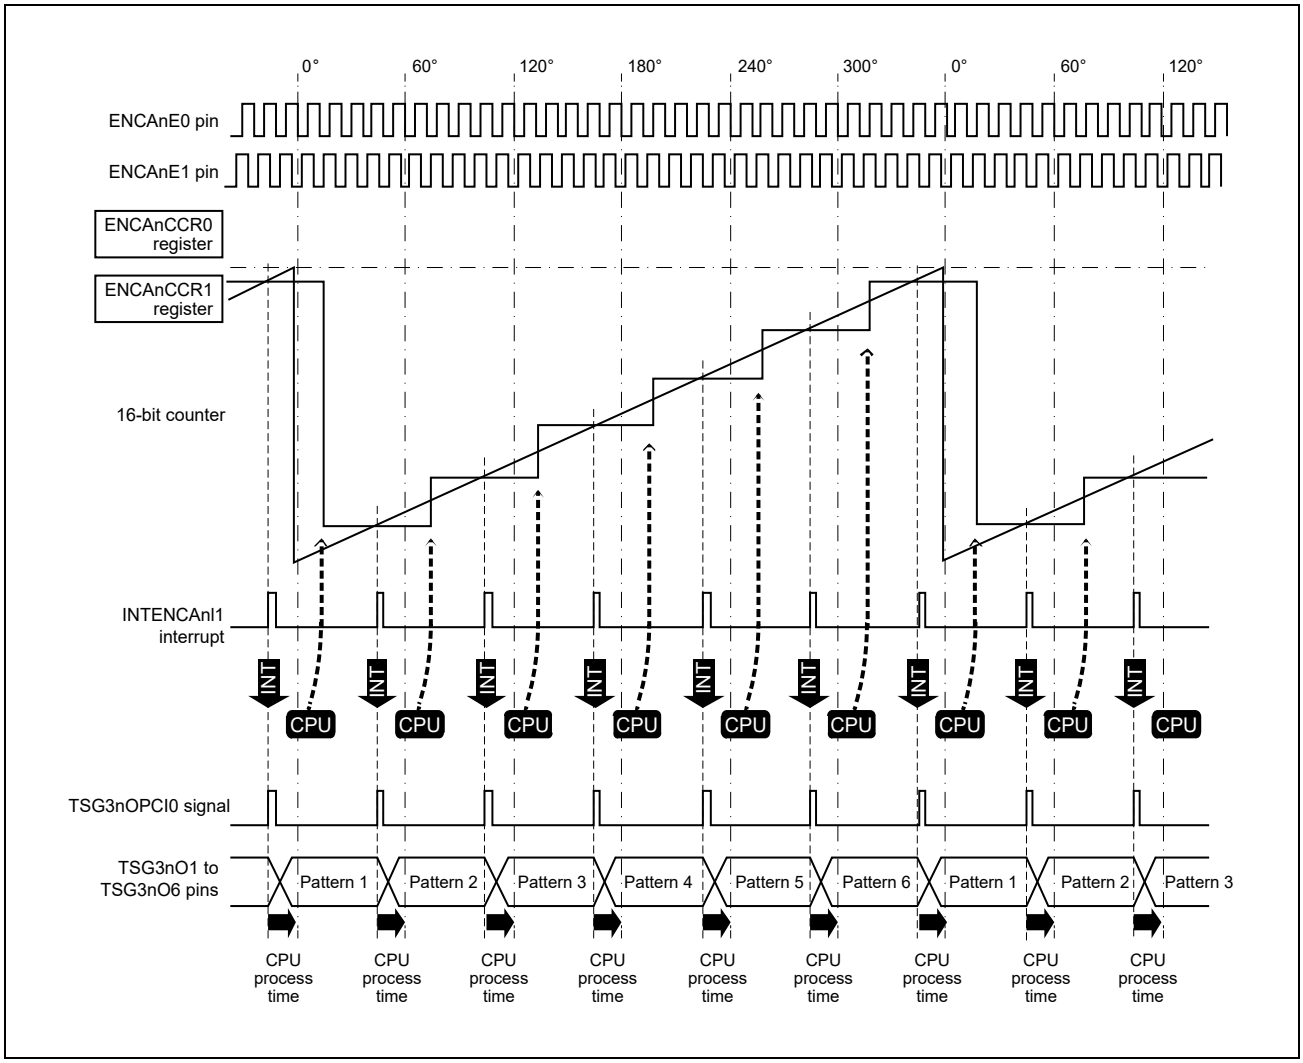

Figure 24.34 Timing Diagram of Two-Phase Encoder Control Function (Control Method 1) at Up Count (Normal Rotation)

(1) A match of the value of the encoder counter and ENCAnCCR1 allows INTENCAnI1 to be generated, and the pattern is output from the TSG3nO1 to TSG3nO6 pins.

(2) CPU calculates the next timing to switch output patterns by an interrupt processing and set the value to ENCAnCCR1.

(3) With a match of the value of the encoder counter and ENCAnCCR0 the encoder counter is cleared.

CAUTION

It is necessary to set ENCAnCCR1 at each pattern switch (each INTENCAnI1 interrupt). It is necessary to match the initial output pattern of timer TSG3n to the set value of ENCAnCCR1 before start.

Switching between normal and reverse rotations of output patterns should be set with the TSG3nPSC bit of the TSG3nOPT0 register.

The following figure shows the timing diagram.

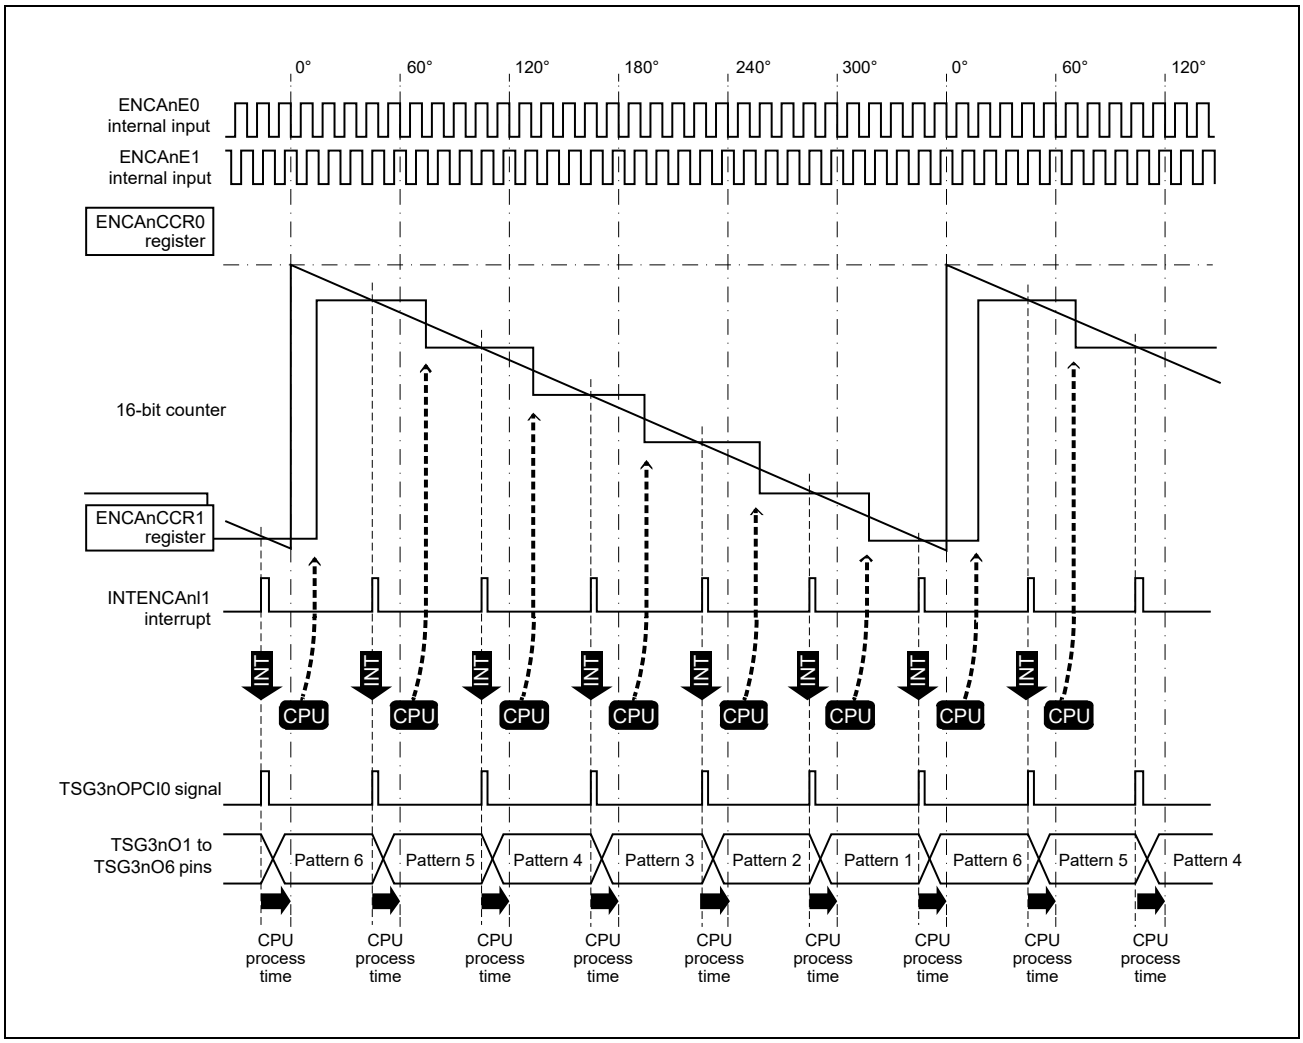

Figure 24.35 Timing Diagram of Two-Phase Encoder Control Function (Control Method 1) at Down Count (Reverse Rotation)

(5) Flow chart

The following figure shows the setting flow of this function.

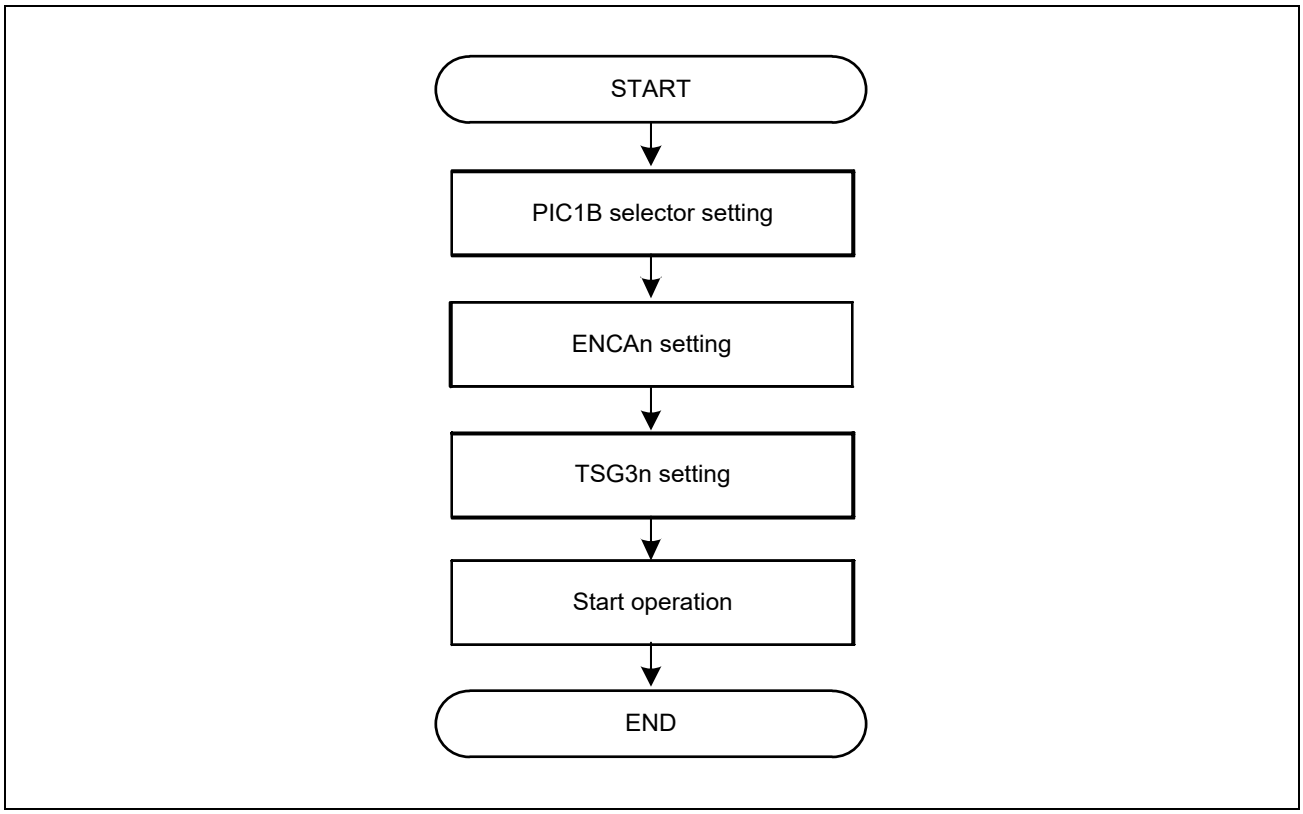

Figure 24.36 Setting Flow

The following figure shows the flow chart after interrupt processing.

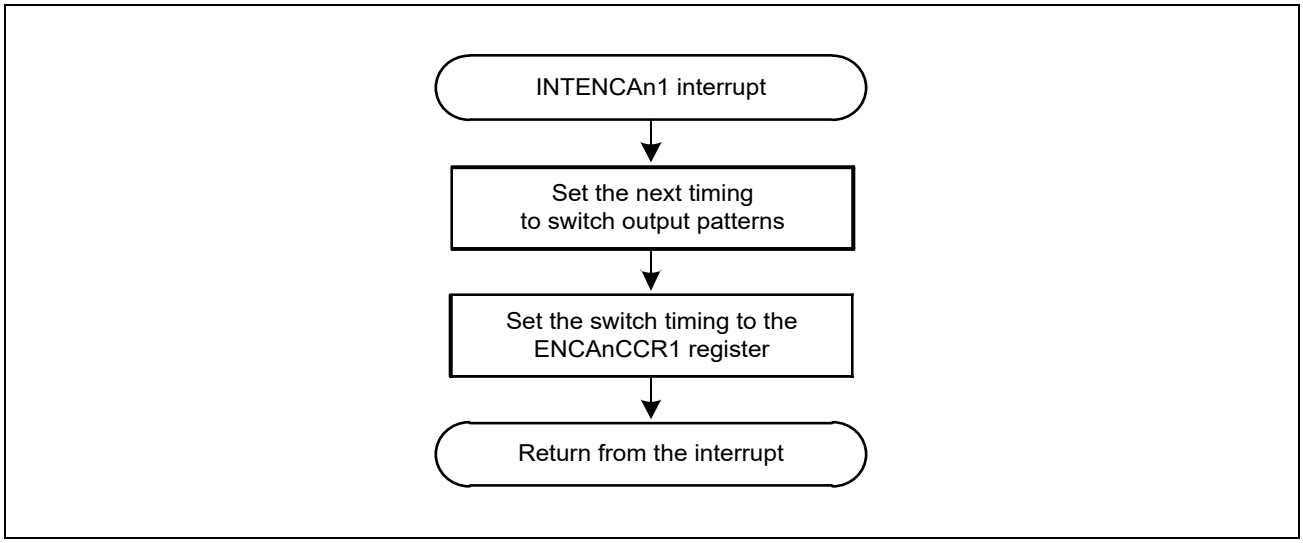

Figure 24.37 Flow after Interrupt Processing

The values of ENCAn registers used in this function are as follows.

ENCAnCTL[15:0] = $1000_0000_000x_01xx_B$

ENCAnIOC1[7:0] = 0000_00xx_B

ENCAnCCR0 = (set any value)

ENCAnCCR1 = (set any value)

ENCAnCNT = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 23, Encoder Timer (ENCA)**.

The values of TSG3n registers used in this function are as follows.

TSG3nCTL0[7:0] = $000x_0011_B$

TSG3nCTL3[7:0] = 0000_00xx_B

TSG3nCTL4[15:0] = $0000_0001_xxx0_0000_B$

TSG3nIOC0[7:0] = 0111_1110_B

TSG3nIOC2[15:0] = $0xxx_xxx0_0000_0000_B$

TSG3nOPT0[7:0] = 0011_1xx0_B

TSG3nOPT1[7:0] = 0000_0xxx_B

TSG3nCMP0 = (set any value)

TSG3nCMP1W, 5W, 9W = (set any value)

TSG3nCMP1, 5, 9 = (set any value)

TSG3nPAT0W, 1W = (set any value)

TSG3nDTC0W, 1W = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 20, Motor Control Timer (TSG3)**.

24.2.3.9 Two-Phase Encoder Control Function (Control Method 2)

(1) Overview

This function allows switching the advance and retard control of the motor control function (TSG3n) output patterns in 120-DC mode using the two-phase encoder control function (ENCAn).

(2) Configuration

The similar configuration as the **Section 24.2.3.8, Two-Phase Encoder Control Function (Control Method 1)** is applied this function. See **(2)Configuration** of **Section 24.2.3.8, Two-Phase Encoder Control Function (Control Method 1)**.

(3) Registers

The similar configuration as the **Section 24.2.3.8, Two-Phase Encoder Control Function (Control Method 1)** is applied this function. See **(3)Registers** of **Section 24.2.3.8, Two-Phase Encoder Control Function (Control Method 1)**.

(4) Function

Detail of the function is described using the two-phase encoder control function (method 2) at advance control (normal rotation) as an example.

The following figure shows the timing diagram.

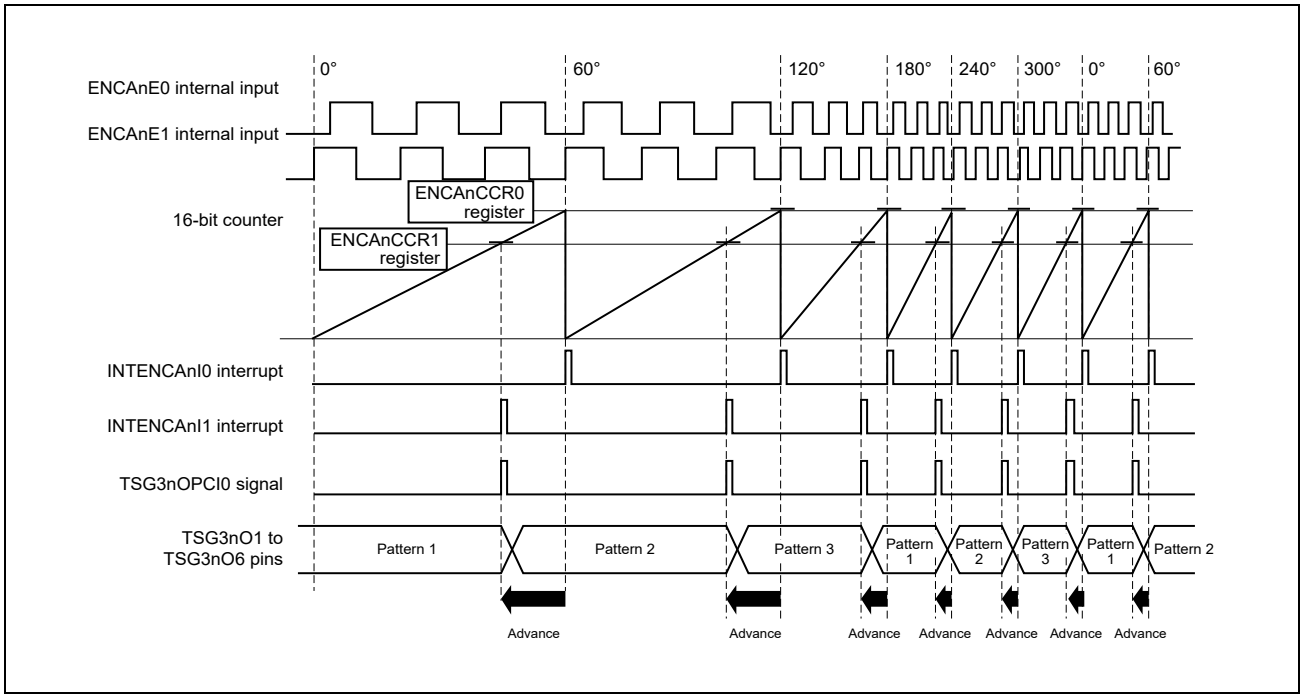

Figure 24.38 Timing Diagram of Two-Phase Encoder Control Function (Method 2) at Advance Control (Normal Rotation)

(1) A match of the value of the encoder counter and ENCAnCCR1 (corresponds to the output pattern switch position for TSG3n) allows INTENCAnI1 to be generated, and the pattern is output from the TSG3nO1 to 6 pins.

(2) With a match of the value of the encoder counter and ENCAnCCR0 (corresponds to the phase advance and retard of the switch position), INTENCAnI0 is generated and the encoder counter is cleared.

CAUTION

It is necessary to set ENCAnCCR1 at each pattern switch (each INTENCAnI1 interrupt). It is necessary to match the initial output pattern of timer TSG3n to the set value of ENCAnCCR0 before start.

Switching between normal and reverse rotations of output patterns should be set with the TSG3nPSC bit of the TSG3nOPT0 register.

The following figure shows the timing diagram at retard control (normal rotation).

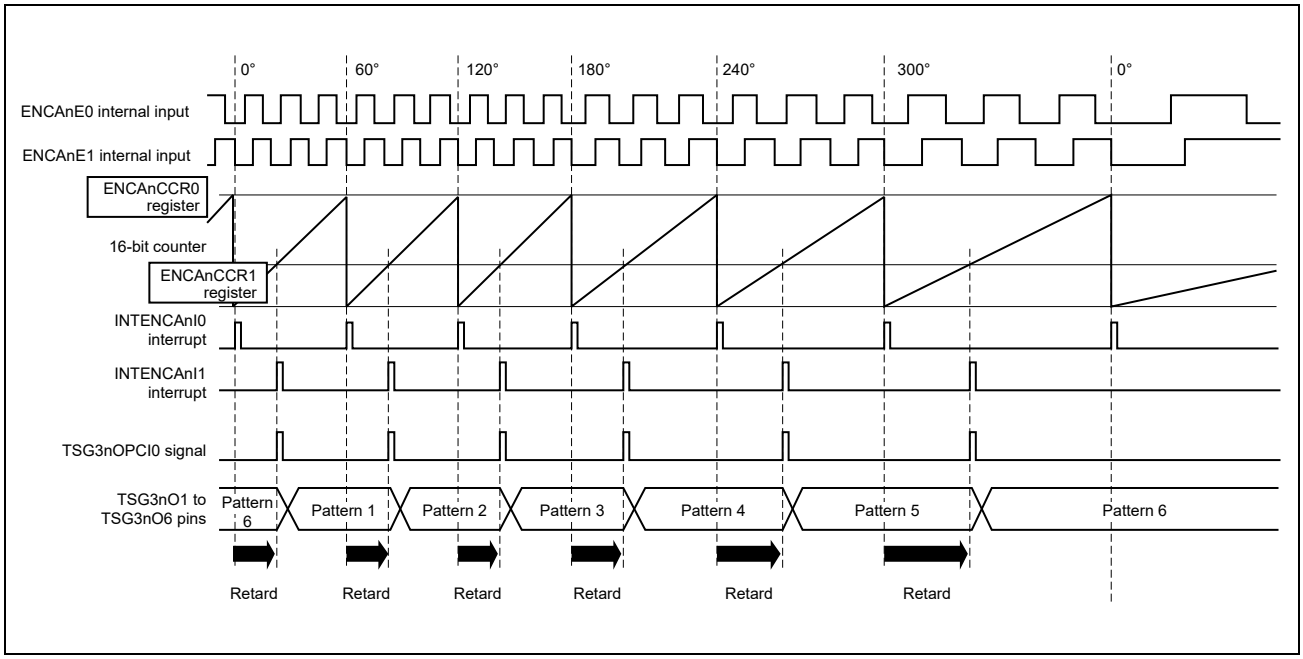

Figure 24.39 Timing Diagram of Two-Phase Encoder Control Function (Method 2) at Retard Control (Normal Rotation)

By setting greater value to ENCAnCCR1 than that of ENCAnCCR0, TSG3n output pattern phase can be retarded.

NOTE

This function can be used for advance control and retard control both at up count and down count.

(5) Flow chart

The flow charts for this function are shown as follows.

Flow chart of main routine

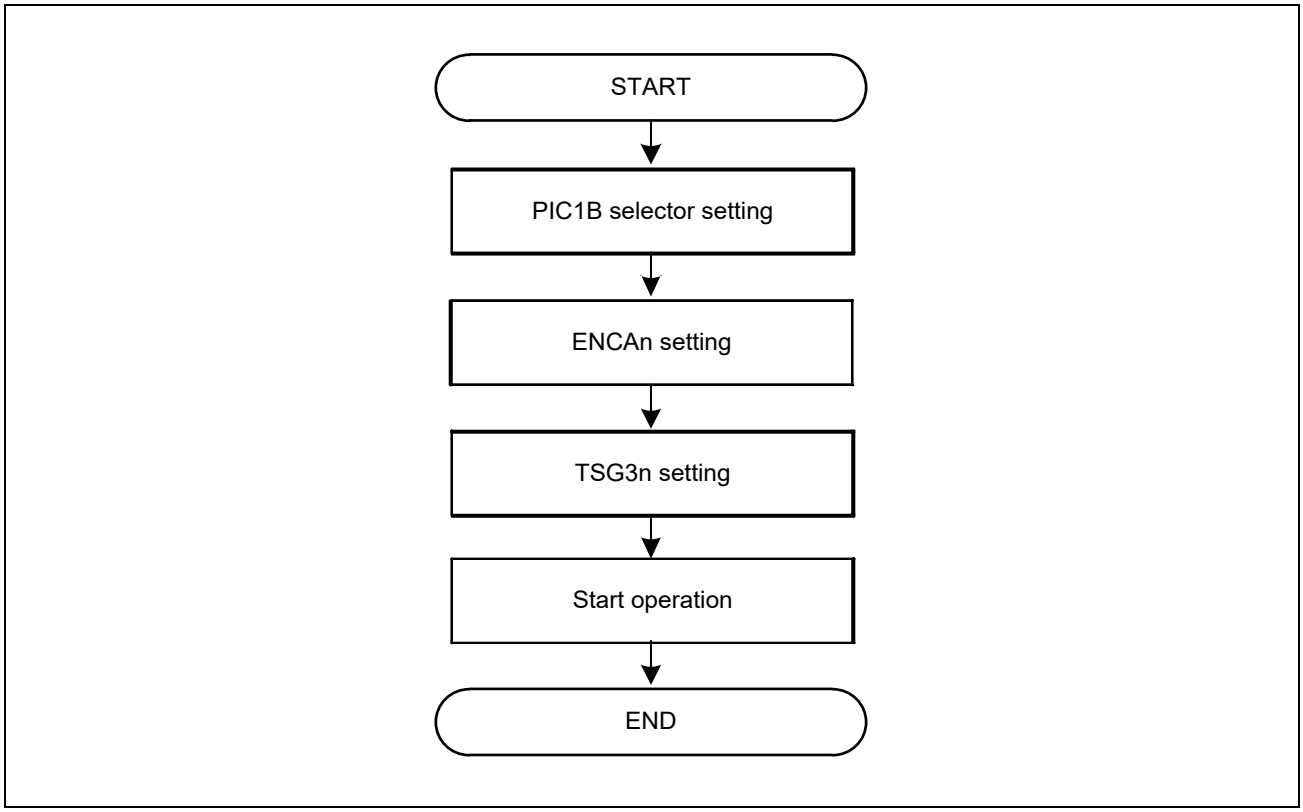

Figure 24.40 Setting Flow

Flow chart of ENCAnCCR1 rewrite processing at advance control

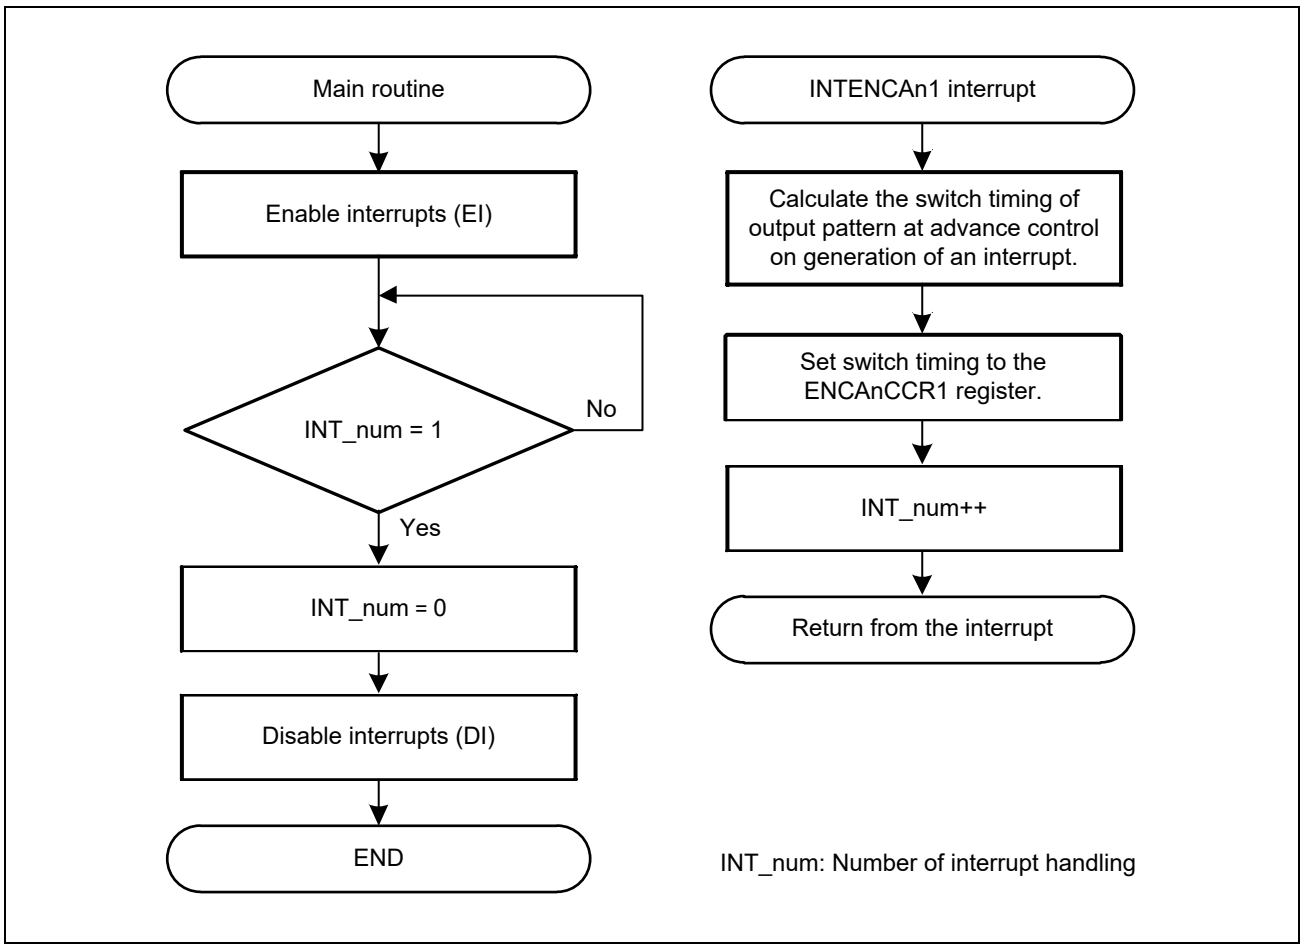

Figure 24.41 ENCAnCCR1 Rewrite Processing at Advance Control (Setting Flow)

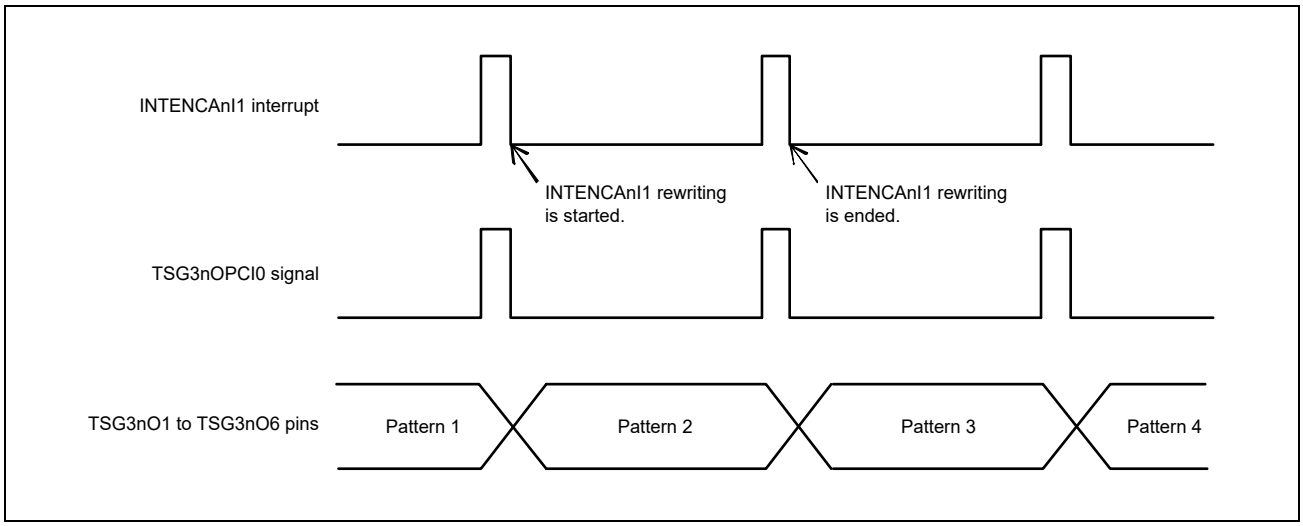

Figure 24.42 ENCAnCCR1 Rewrite Processing at Advance Control (Timing)

Flow chart of ENCAnCCR1 rewrite processing at retard control

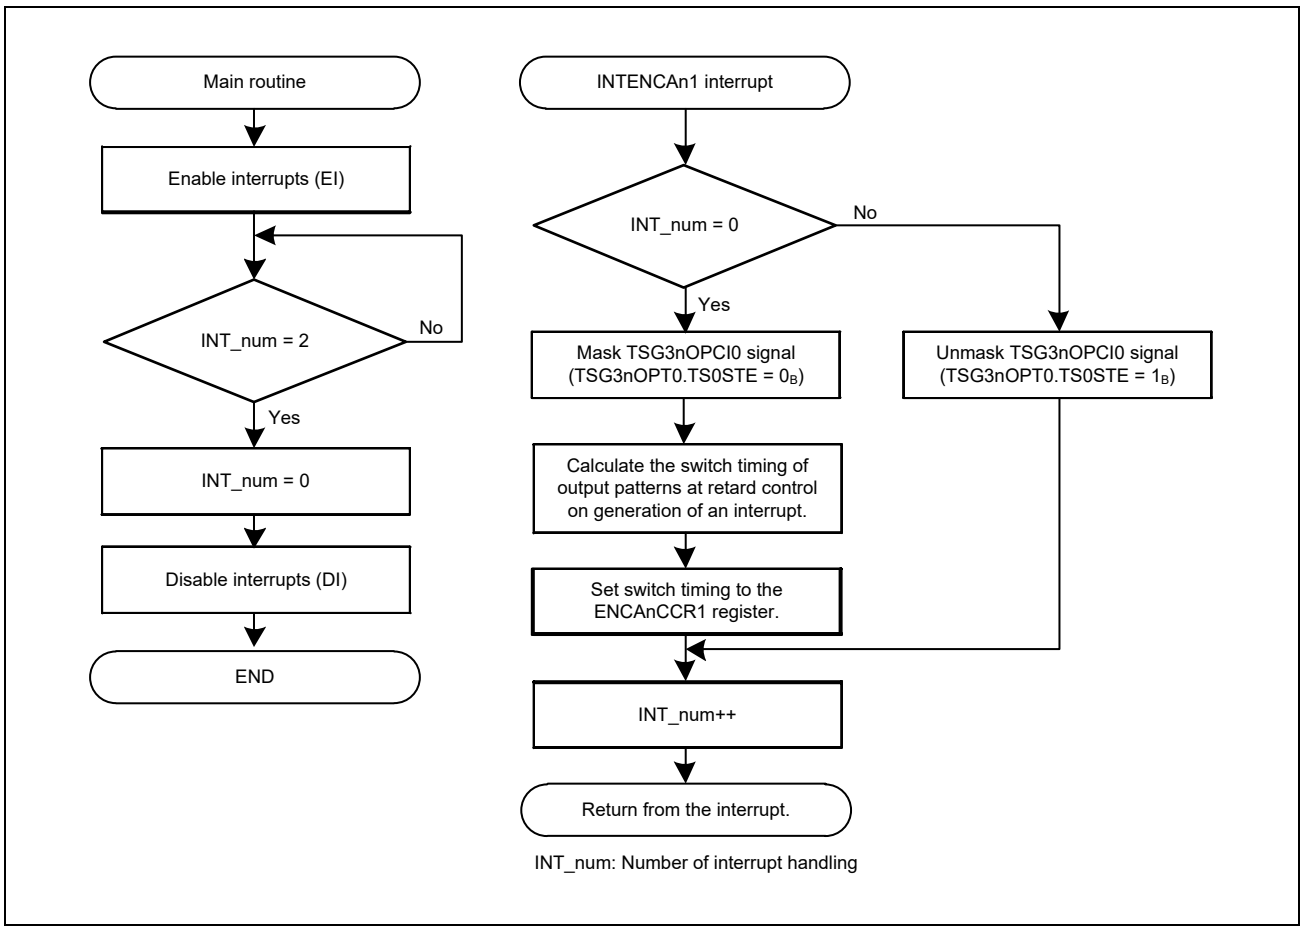

Figure 24.43 ENCAnCCR1 Rewrite Processing at Retard Control (Setting Flow)

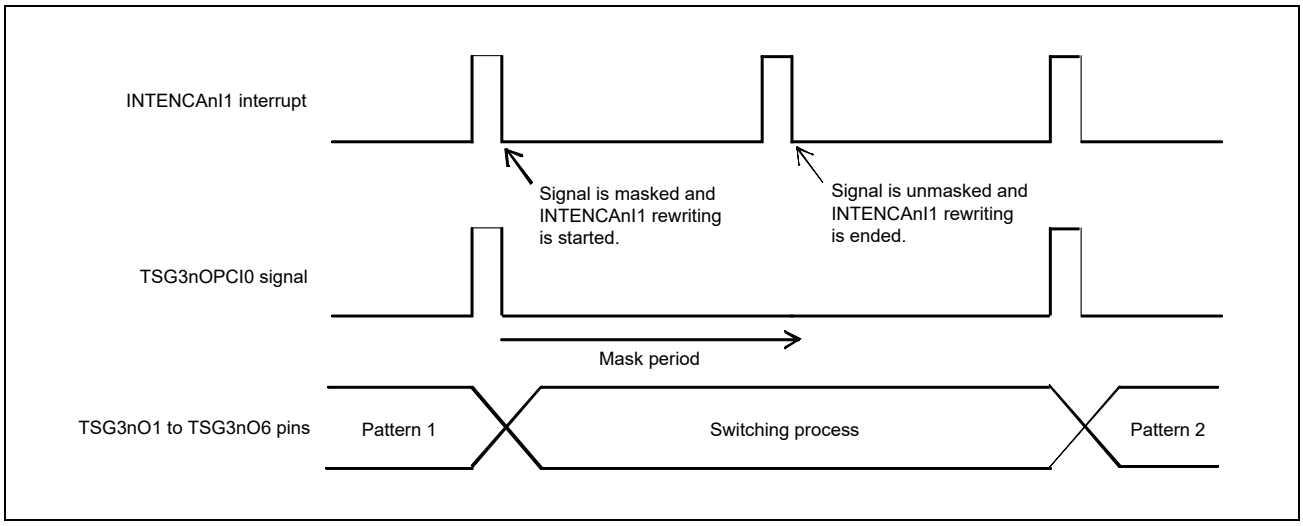

Figure 24.44 ENCAnCCR1 Rewrite Processing at Retard Control (Timing)

The register settings for ENCAn to use this function are described as follows.

ENCAnCTL[15:0] = $1000_0000_000x_01xx_B$

ENCAnIOC1[7:0] = 0000_00xx_B

ENCAnCCR0 = (set any value)

ENCAnCCR1 = (set any value)

ENCAnCNT = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 23, Encoder Timer (ENCA)**.

The register settings for TSG3n to use this function are described as follows.

TSG3nCTL0[7:0] = $000x_0011_B$

TSG3nCTL3[7:0] = 0000_00xx_B

TSG3nCTL4[15:0] = $0000_0001_xxx0_0000_B$

TSG3nIOC0[7:0] = 0111_1110_B

TSG3nIOC2[15:0] = $0xxx_xxx0_0000_0000_B$

TSG3nOPT0[7:0] = 0011_1xx0_B

TSG3nOPT1[7:0] = 0000_0xxx_B

TSG3nCMP0 = (set any value)

TSG3nCMP1W, 5W, 9W = (set any value)

TSG3nCMP1, 5, 9 = (set any value)

TSG3nPAT0W, 1W = (set any value)

TSG3nDTC0W, 1W = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 20, Motor Control Timer (TSG3)**.

24.2.3.10 Two-Phase Encoder Control Function (Control Method 3)

(1) Overview

Using the two-phase encoder control function (ENCAn), variation of the desired angle and phase (up to ±60°) by pattern output control is available regarding the angle of motor rotation indicated by the ENCA0 and ENCA1 timers.

(2) Configuration

Variation of desired angle and phase control by output pattern in 120-DC mode is realized by using ENCAn and TSG3n, and PIC1B in combination.

The following figure describes the block diagram of two-phase encoder control function (control method 3).

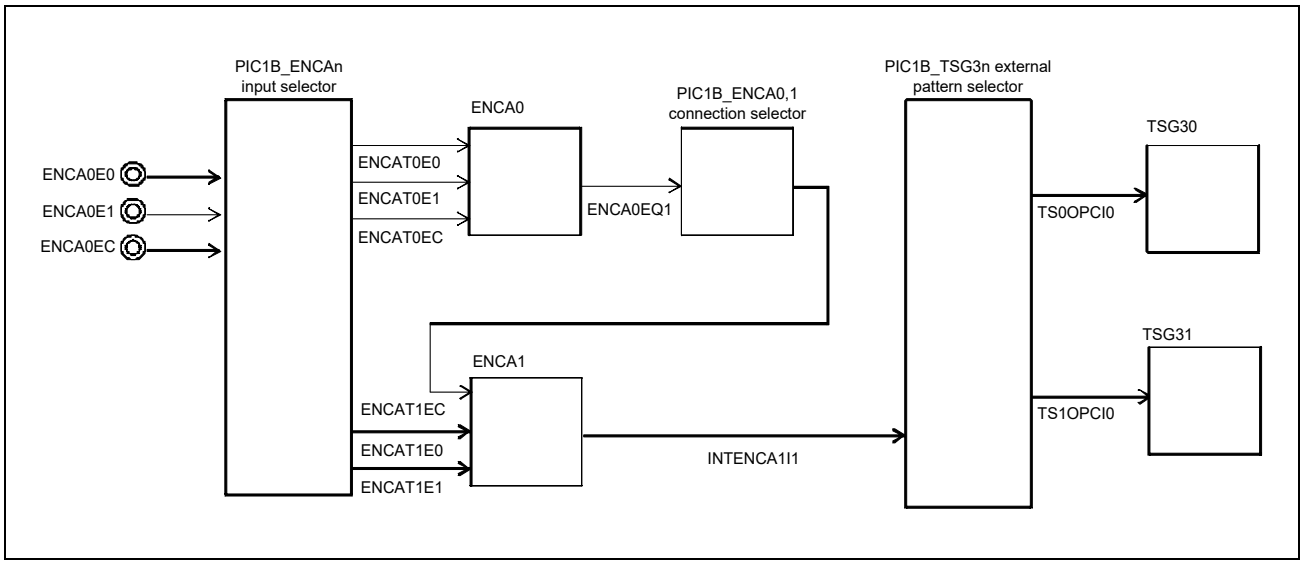

Figure 24.45 Block Diagram of Two-Phase Encoder Control Function (Control Method 3)

The configuration of this function is described as follows.

- [PIC1B_ENCAn input selector]
  ENCA0E0, ENCA0E1, and ENCA0EC pin inputs are selected and output to ENCATnE0, ENCATnE1, and ENCATnEC.
- [ENCA0]
  ENCA0EQ1 is output by two-phase encoder processing.
- [PIC1B_ENCA0, 1 connection selector]
  ENCA0EQ1 is selected and output to ENCAT1EC.
- [ENCA1]
  INTENCA1I1 is output by two-phase encoder processing. If an active level signal is input to ENCAT1EC, the timer count value is cleared.
- [PIC1B_TSG3n external pattern selector]
  INTENCA1I1 is selected and output to TSG3nOPCI0.
- [TSG3n]
  Output patterns in 120-DC mode are switched by TSG3nOPCI0.

(3) Registers

Block diagram of PIC1B is shown in the following figure.

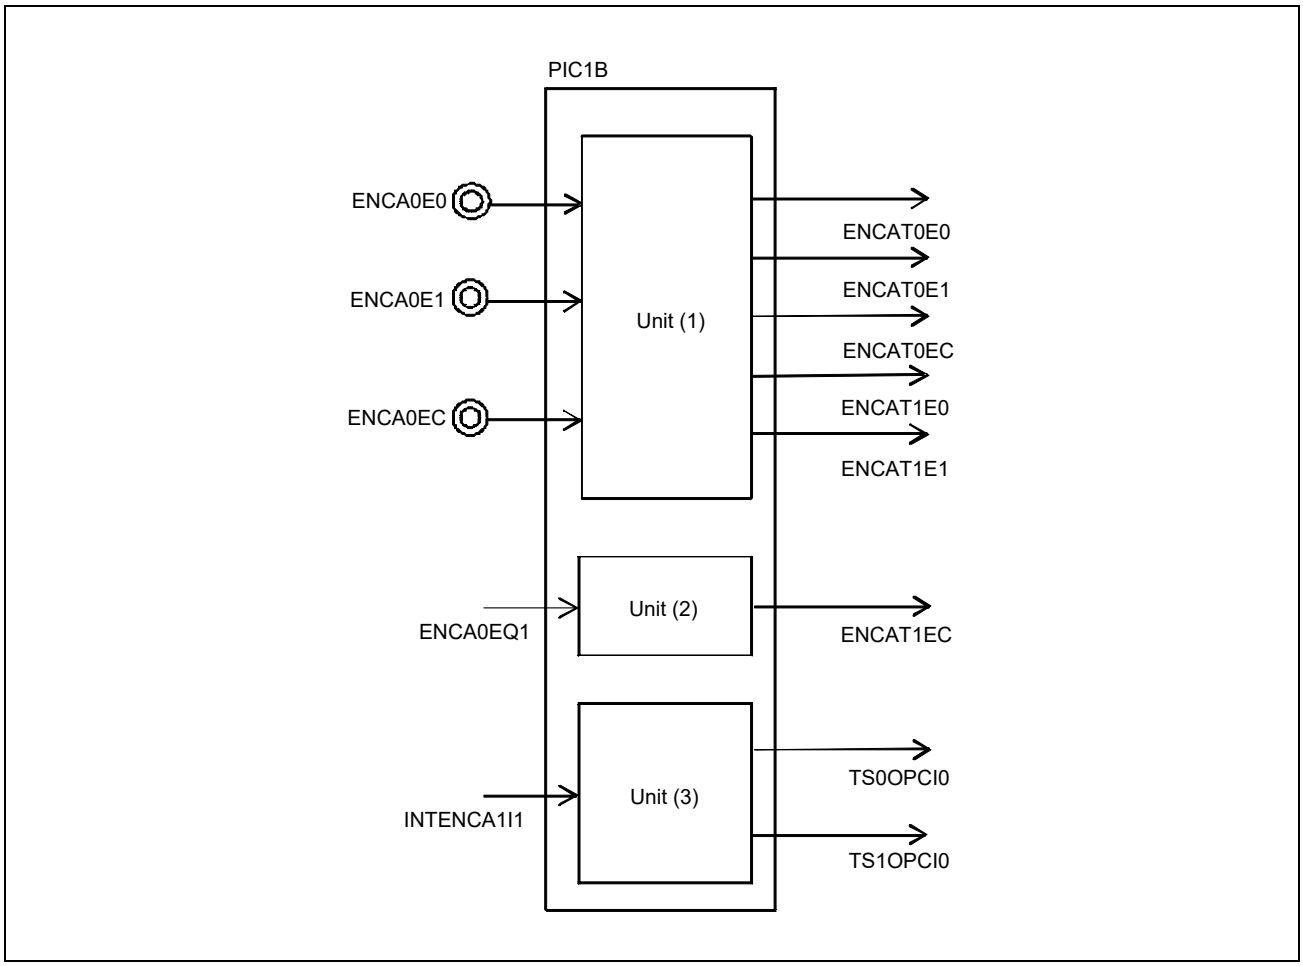

Figure 24.46 Block Diagram of PIC1B

The register settings for PIC1B to use this function are described as follows.

Unit (1): PIC1B_ENCAn input selector

PIC1BREG30[22] = 0_B

PIC1BREG30[17:16] = 00_B

PIC1BREG30[9:6] = 0101_B

PIC1BREG30[1:0] = 00_B

Unit (2): PIC1B_ENCA0, 1 connection selector

PIC1BREG30[11:10] = 11_B

Unit (3): PIC1B_TSG3n external pattern selector

PIC1BREG5n[10] = 0_B

PIC1BREG5n[6:5] = 10_B

(n = 0 when TSG30 is selected and n = 1 when TSG31 is selected.)

(4) Function

Detail of the function is described using the two-phase encoder control function (control method 3) at advance control (normal rotation) as an example.

The following figure shows the timing diagram.

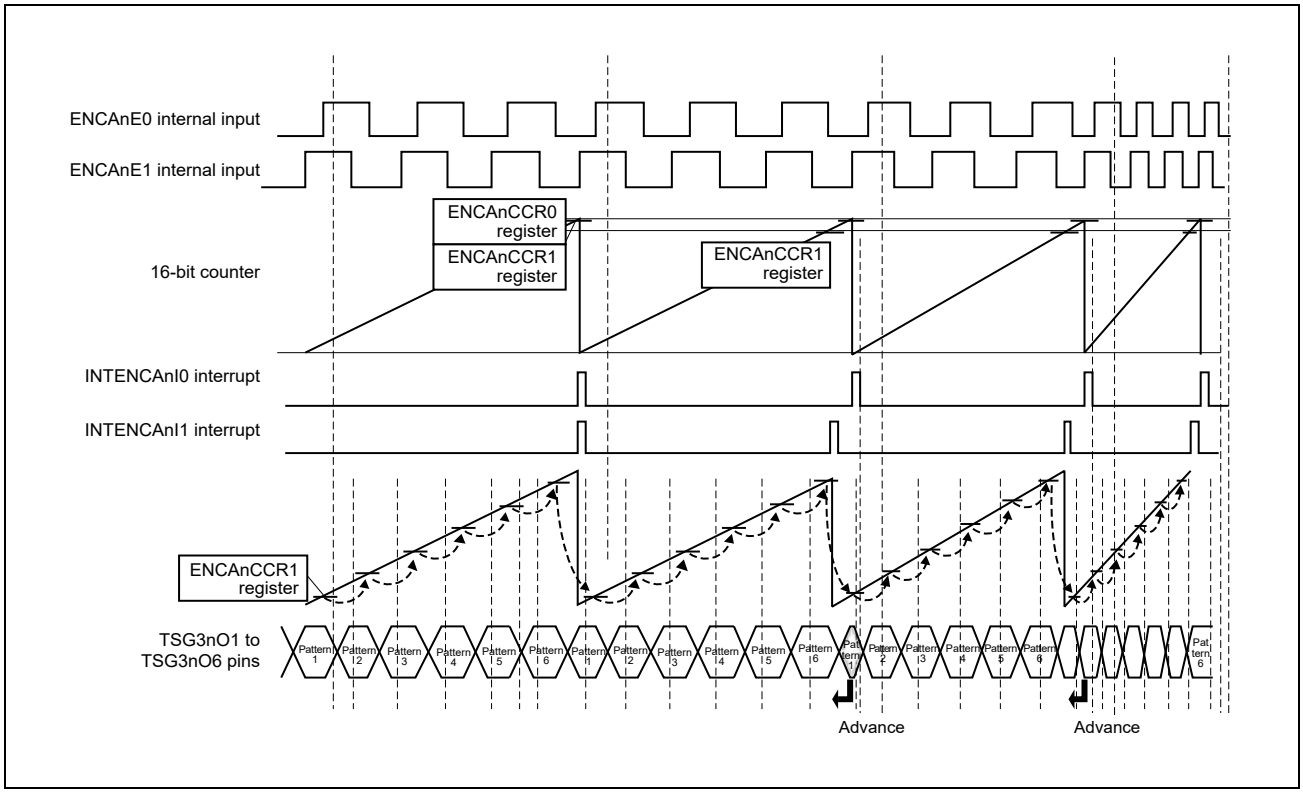

Figure 24.47 Timing Diagram of Two-Phase Encoder Control Function (Control Method 3) at Advance Control (Normal Rotation)

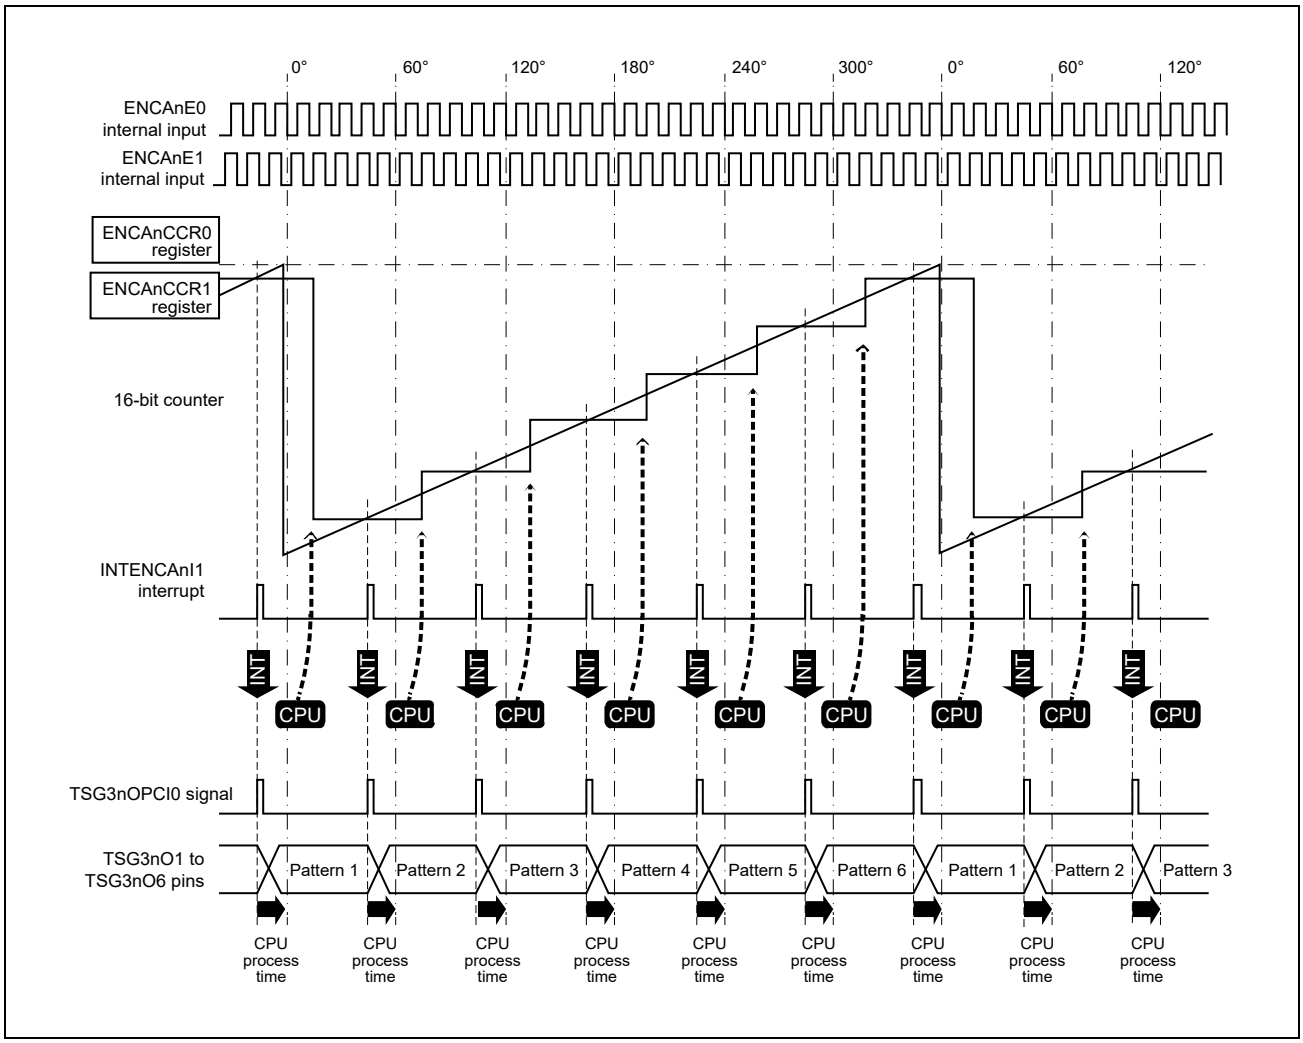

Figure 24.48 Timing Diagram of TSG3n Output Pattern Control (ENCA1) (Normal Rotation)

(1) A match of the value of the ENCA0 encoder counter and ENCA0CCR1 allows INTENCA0I1 to be generated and ENCA1 encoder counter is cleared.

(2) A match of the value of the ENCA1 encoder counter and ENCA1CCR1 allows INTENCA1I1 to be generated, and the pattern is output from the TSG3nO1 to 6 pins.

(3) With a match of the value of the ENCA0 encoder counter and ENCA0CCR0, INTENCA0I0 is generated and the encoder counter is cleared.

(5) Flow chart

The flow charts for this function are shown as follows.

Flow chart of main routine

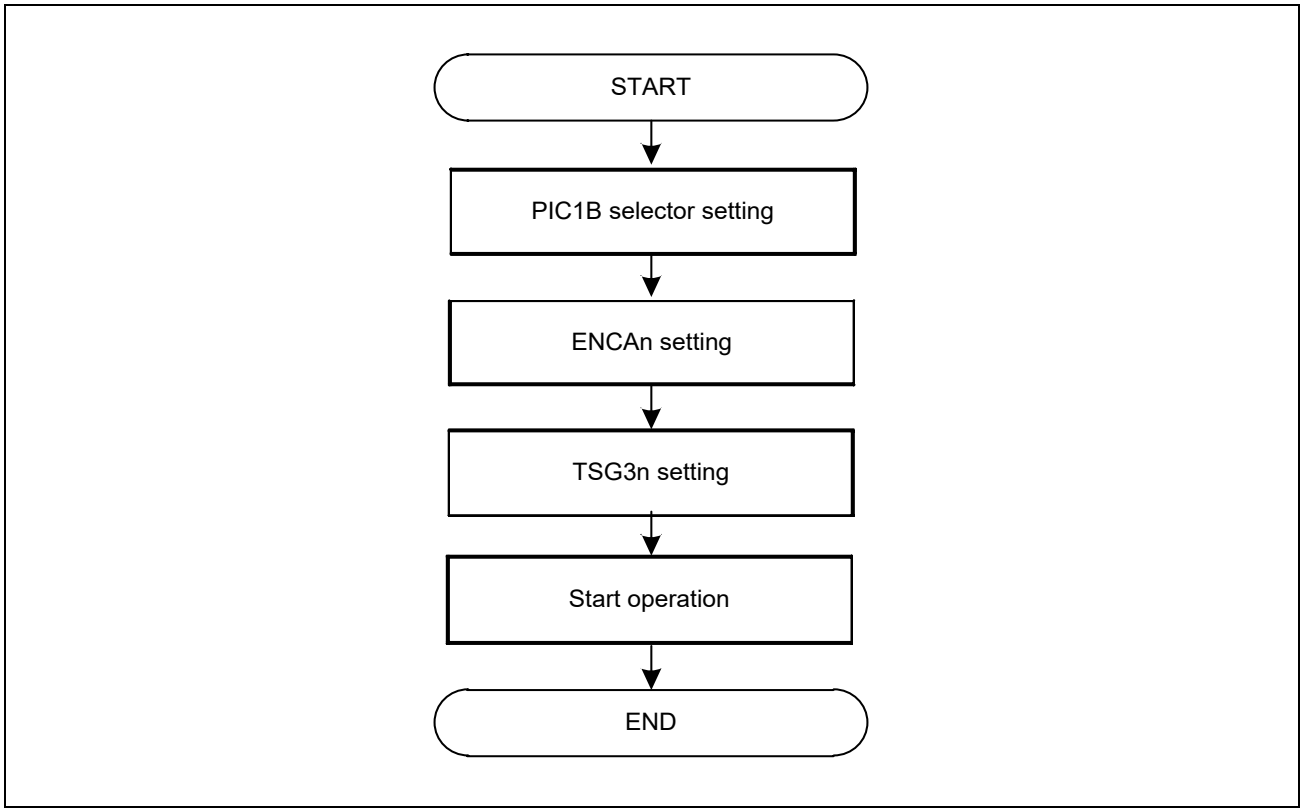

Figure 24.49 Setting Flow

Flow chart of ENCAnCCR1 rewrite processing at advance control

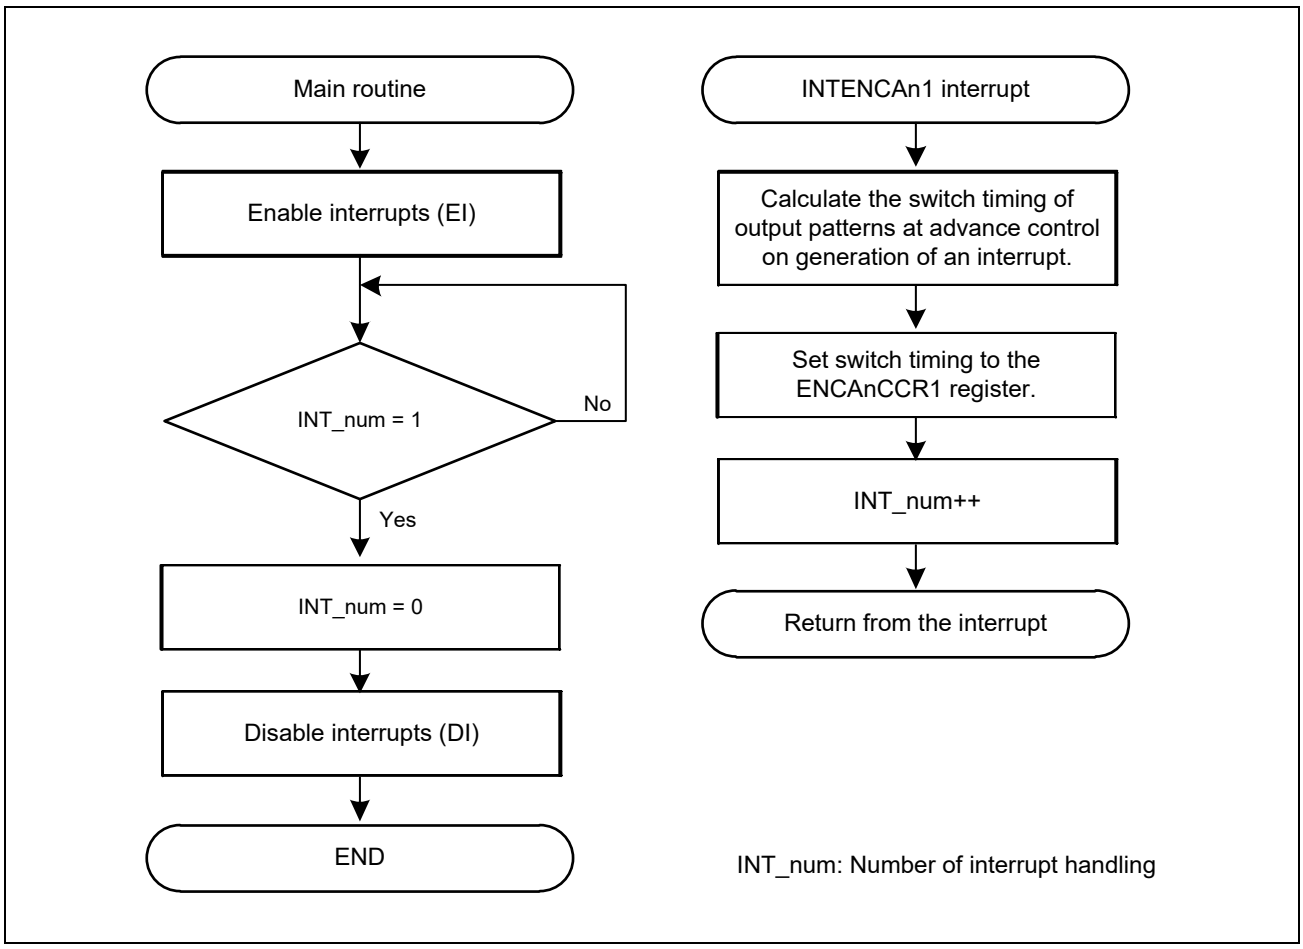

Figure 24.50 ENCAnCCR1 Rewrite Processing at Advance Control

Flow chart of ENCAnCCR1 rewrite processing at retard control

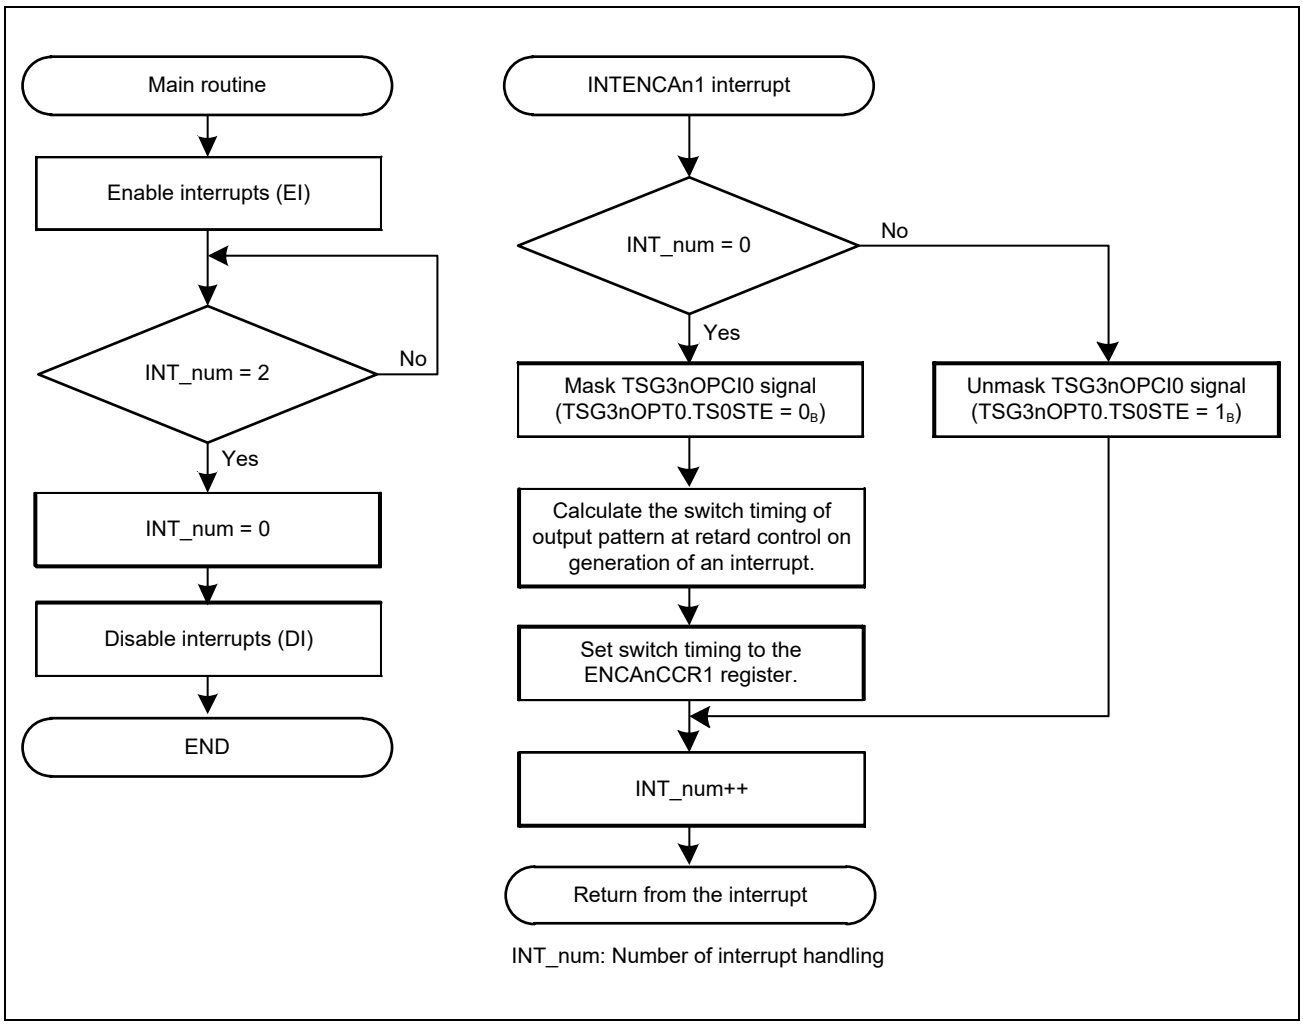

Figure 24.51 ENCAnCCR1 Rewrite Processing at Retard Control (Setting Flow)

The register settings for ENCAn to use this function are described as follows.

ENCAnCTL[15:0] = $1000_0000_000x_01xx_B$

ENCAnIOC1[7:0] = 0000_00xx_B

ENCAnCCR0 = (set any value)

ENCAnCCR1 = (set any value)

ENCAnCNT = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 23, Encoder Timer (ENCA)**.

The register settings for TSG3n to use this function are described as follows.

TSG3nCTL0[7:0] = $000x_0011_B$

TSG3nCTL3[7:0] = 0000_00xx_B

TSG3nCTL4[15:0] = $0000_0001_xxx0_0000_B$

TSG3nIOC0[7:0] = 0111_1110_B

TSG3nIOC2[15:0] = 0xxx_xxx0_0000_0000$_B$

TSG3nOPT0[7:0] = 0011_1xx0$_B$

TSG3nOPT1[7:0] = 0000_0xxx$_B$

TSG3nCMP0 = (set any value)

TSG3nCMP1W, 5W, 9W = (set any value)

TSG3nCMP1, 5, 9 = (set any value)

TSG3nPAT0W, 1W = (set any value)

TSG3nDTC0W, 1W = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 20, Motor Control Timer (TSG3)**.

24.2.3.11 Three-Phase Pulse Input Control Function

(1) Overview

This function allows variable phase control of TSG3n pattern output in 120-DC mode using TSG3n and TAUDn.

The following diagram shows the method of three-phase pulse input control.

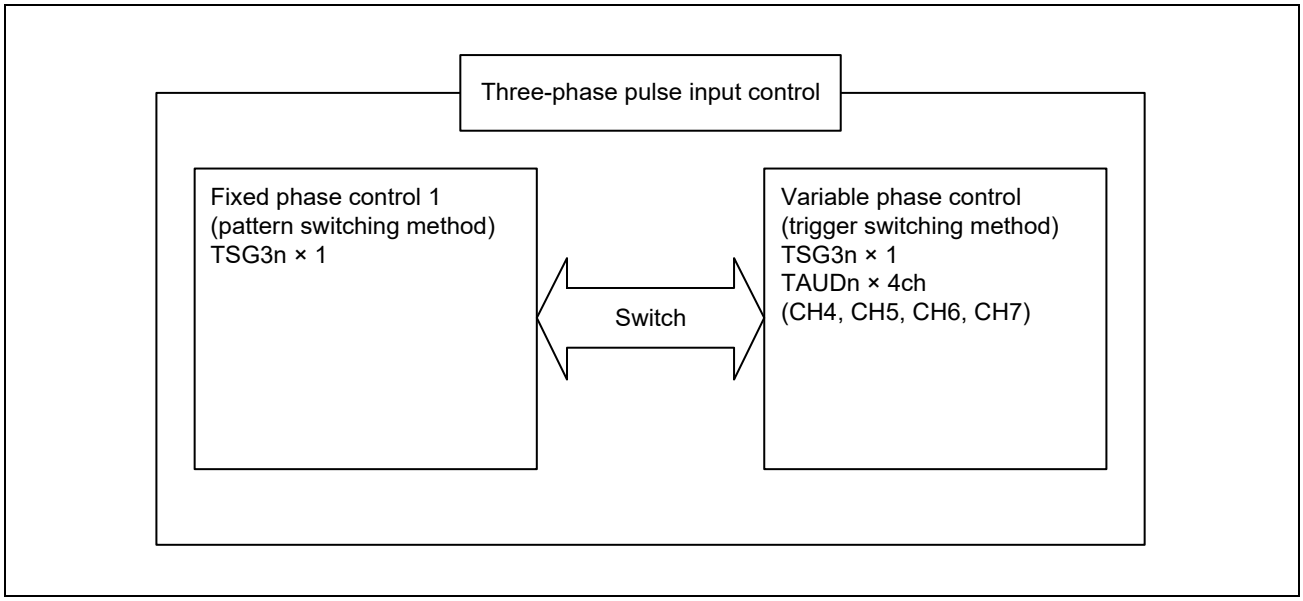

Figure 24.52 Control Method of Three-Phase Pulse Input Control Function

Table 24.76 Control Method of Three-Phase Pulse Input Function

Control Method	Function
Fixed phase control 1 (pattern switching method)	Outputs a fixed pattern at constant rotation angle.
Variable phase control (trigger switching method)	Varies the phase by arbitrary angle (or time) up to ±60 degrees with reference to the rotation angle and outputs the pattern.

(2) Configuration

Three-phase pulse input control function is realized by using three-phase pulse input and TAUDn offset trigger mode, and PIC1B in combination.

The following figure shows the block diagram of three-phase pulse input control function.

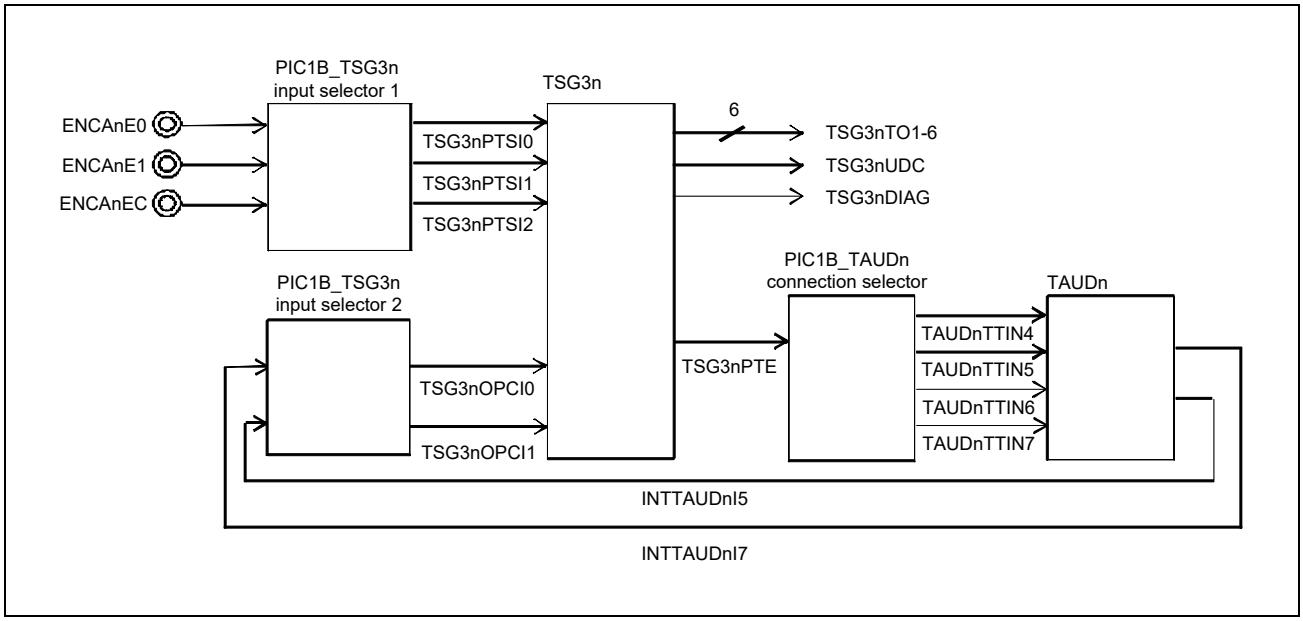

Figure 24.53 Block Diagram of Three-Phase Pulse Input Control

The configuration of this function is described as follows.

- [PIC1B_TSG3n input selector 1]
  ENCAnE0, ENCAnE1, and ENCAnEC pin inputs are selected and output to TSG3nPTSI0 to TSG3nPTSI2.
- [TSG3n]
  Patterns set in TSG3nTO1 to TSG3nTO6 are output in response to the input of TSG3nPTSI0 to TSG3nPTSI2 signals. TSG3nPTE is toggled each time the output patterns are switched.
- [PIC1B_TAUDn connection selector]
  TSG3nPTE input is selected and output to TAUDnTTIN4 to TAUDnTTIN7.
- [TAUDn]
  Interrupt signals INTTAUDnI5 and INTTAUDnI7 for output pattern phase generation are output with the offset trigger mode.
- [PIC1B_TSG3n input selector 2]
  INTTAUDnI5 and INTTAUDnI7 inputs are selected and output as TSG3nOPCI0 and TSG3nOPCI1.

(3) Registers

Block diagram of PIC1B is shown in the following figure.

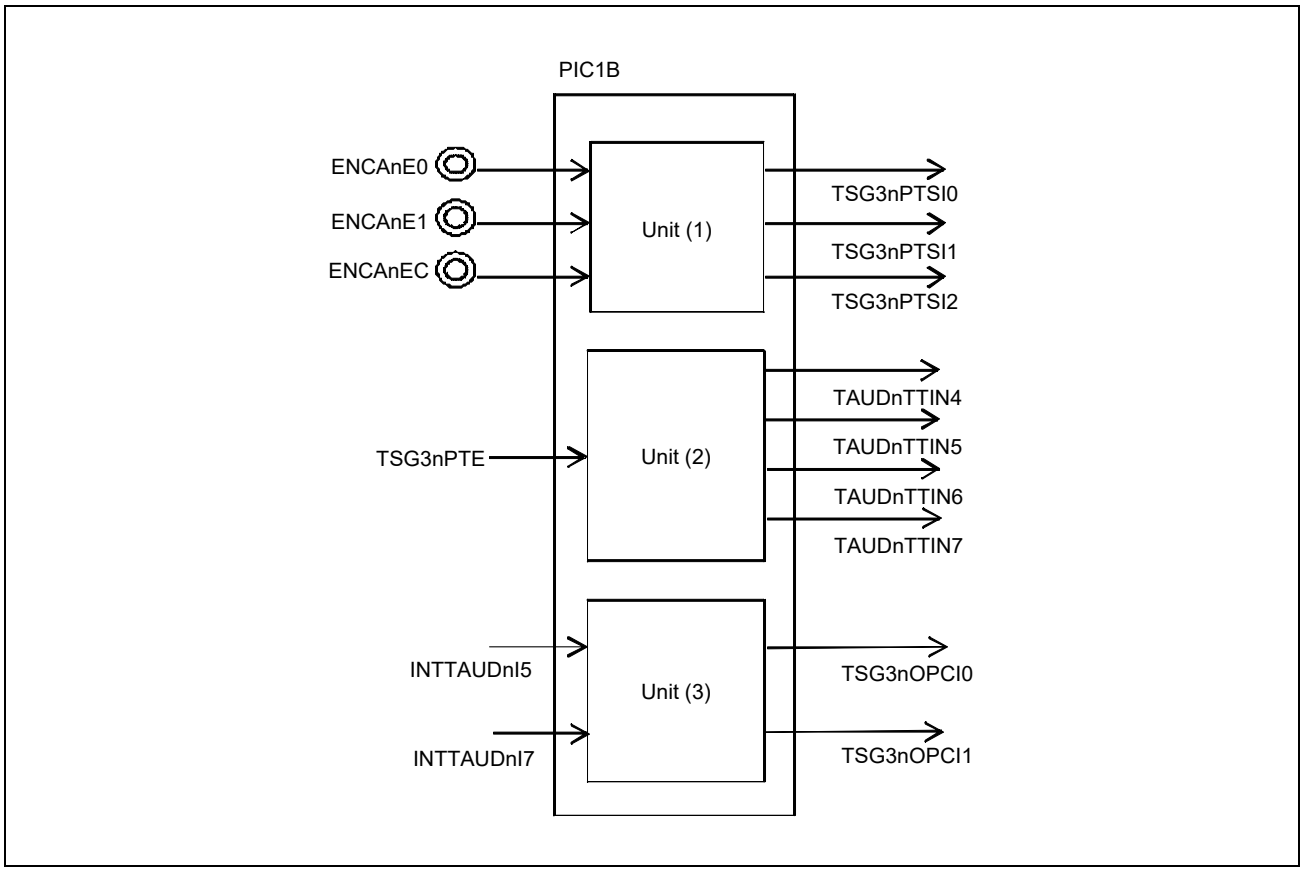

Figure 24.54 Block Diagram of PIC1B

The values of PIC1B registers used in this function are as follows.

Unit (1): PIC1B_TSG3n input selector 1

The values to output ENCA0E0, ENCA0E1, and ENCA0EC as TSG30PTSI0 to TSG30PTSI2
PIC1BTSGHALLSEL[0] = 1_B
PIC1BREG50[0] = 0_B

The values to output ENCA1E0, ENCA1E1, and ENCA1EC as TSG31PTSI0 to TSG31PTSI2
PIC1BTSGHALLSEL[1] = 1_B
PIC1BREG51[0] = 1_B

Unit (2): PIC1B_TAUDn connection selector

The values to output TSG3nPTE to TAUDnTTIN4 to TAUDnTTIN7.
PIC1BREG2n0[11:8] = 1010_B
PIC1BREG2n0[3:0] = 1111_B
PIC1BTAUDnSEL[15:8] = 00_H

Unit (3): PIC1B_ENCAn input selector 2

The values to output INTTAUDnI5 and INTTAUDnI7 to TSG3nOPCI0 and TSG3nOPCI1.
PIC1BREG5n[7:5] = 011_B

(4) Function

Detail of the three-phase pulse input control function is described here.

The following figure shows the timing diagram.

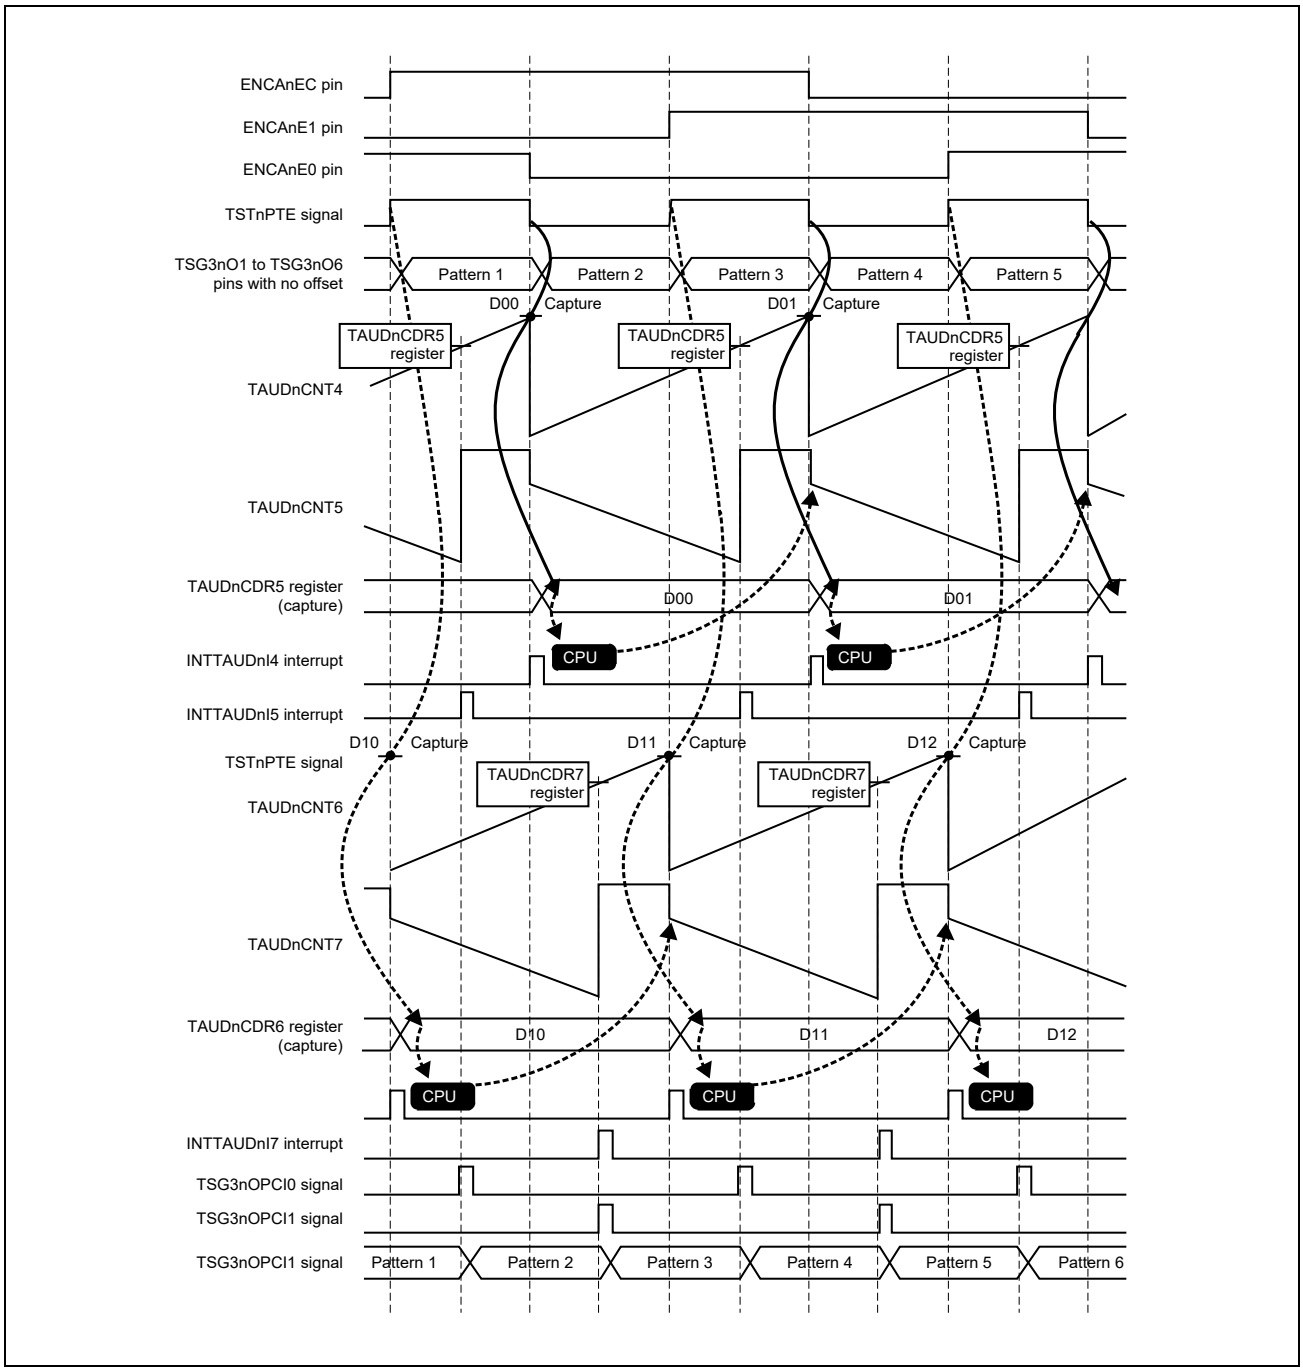

Figure 24.55 Three-Phase Pulse Input Control Function

(1) The output patterns are switched by the TSG pattern switching method on detection of ENCAn pin signal. The TSTnPTE signal toggles each time the patterns are switched.

(2) TAUDnCNT6 and TAUDnCNT4 are captured at the rising edge and falling edge of the TSTnPTE signal. The interval to switch patterns is calculated according to the captured value.

(3) CPU calculates the phase of the next output pattern and set the values to TAUDnCNT5 and TAUDnCNT7. The signals corresponding to the values are output as TSG3nOPCI0 and TSG3nOPCI1. At this time, the patterns delayed for the set phase are output by switching the output patterns by the trigger switching method.

The following table lists the relation between the value set to TAUDnCNTm and the captured value in TAUDnCDR (m-1) (m = 5, 7).

Table 24.77 Setting Value and Captured Value of TAUDnCNTm

TAUDnCNTm Register Setting	TSG3n Pattern Output Switch Timing
TAUDnCNTm = 0000_H	The patterns switched on detection of an edge of TSTnPTE signal with a delay of up to one cycle of the clock signal being counted by TAUDn is generated.
TAUDnCNTm = captured value	The patterns are switched on detection of an edge of TSTnPTE signal.
TAUDnCNTm < captured value	The patterns are switched on the timing after the phase delayed from detection of an edge of TSTnPTE signal.
TAUDnCNTm > captured value	Setting prohibited

An example of switch operation from fixed phase control 1 to variable phase control

The following figure shows an example of switch operation from fixed phase control 1 to variable phase control.

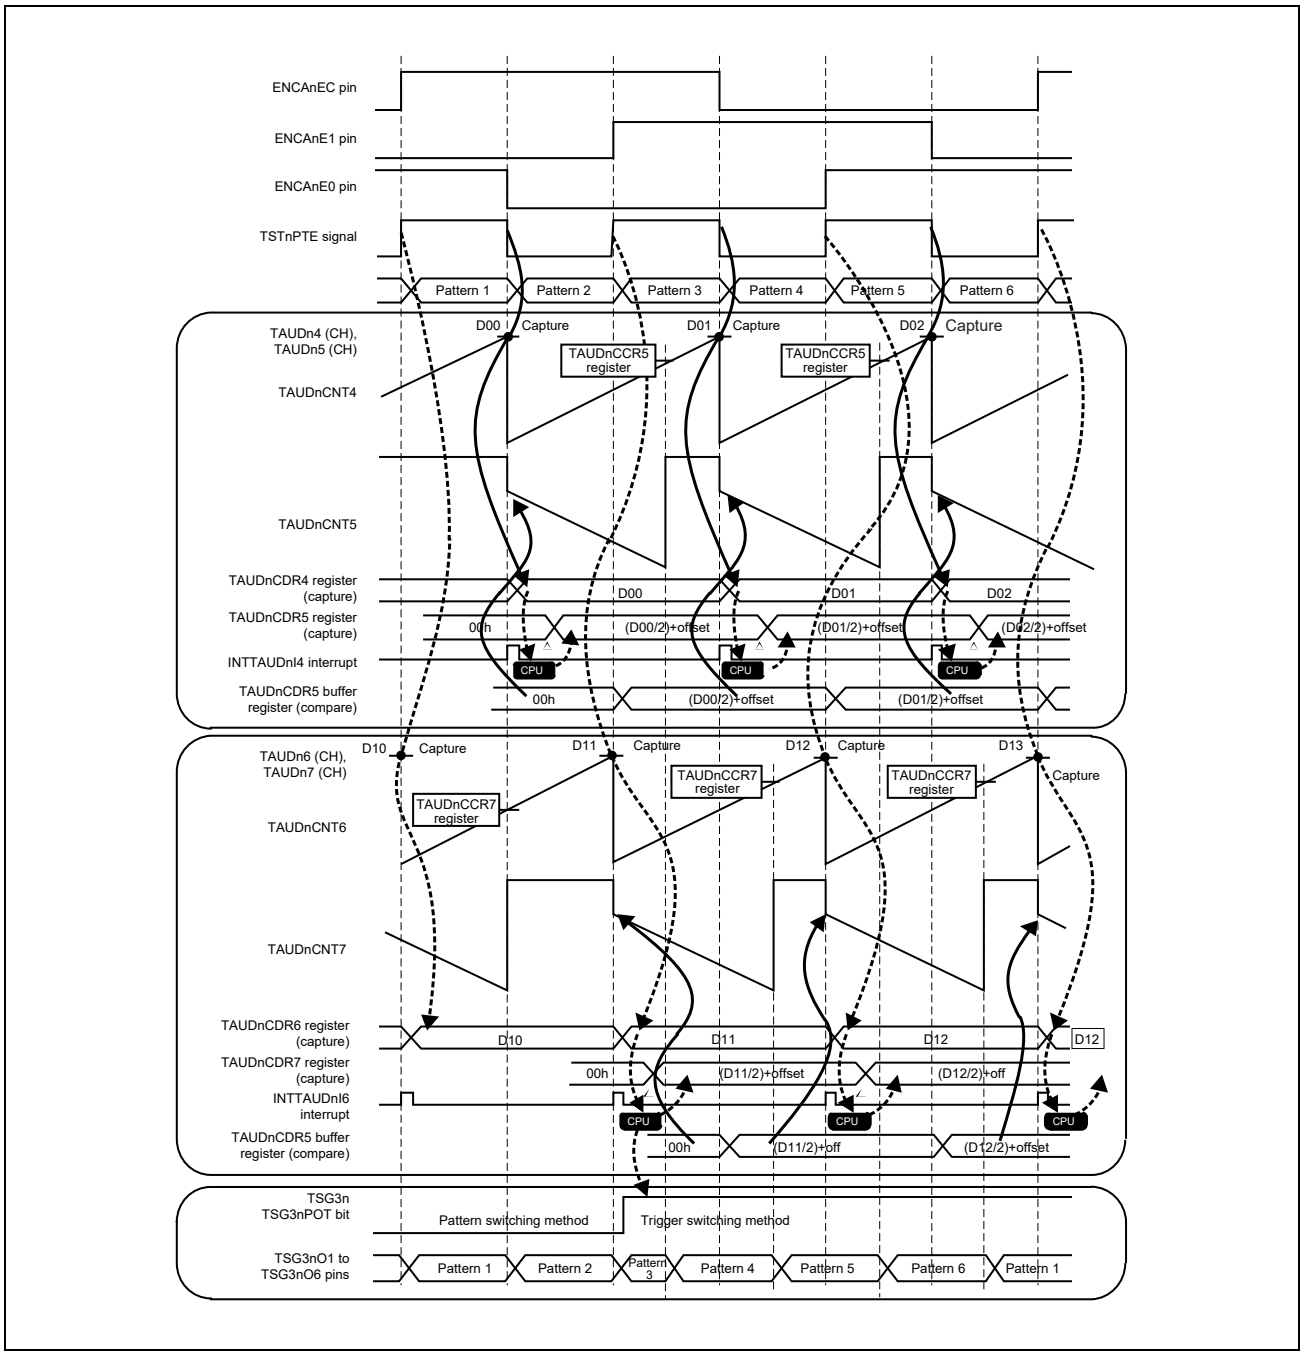

Figure 24.56 An Example of Switch Operation from Fixed Phase Control 1 to Variable Phase Control

The output pattern is changed to the trigger switching method by changing the TSG3nPOT bit from low level to high level, and the variable phase control is enabled.

An example of switch operation from variable phase control to fixed phase control 1

The following figure shows an example of switch operation from variable phase control to fixed phase control 1.

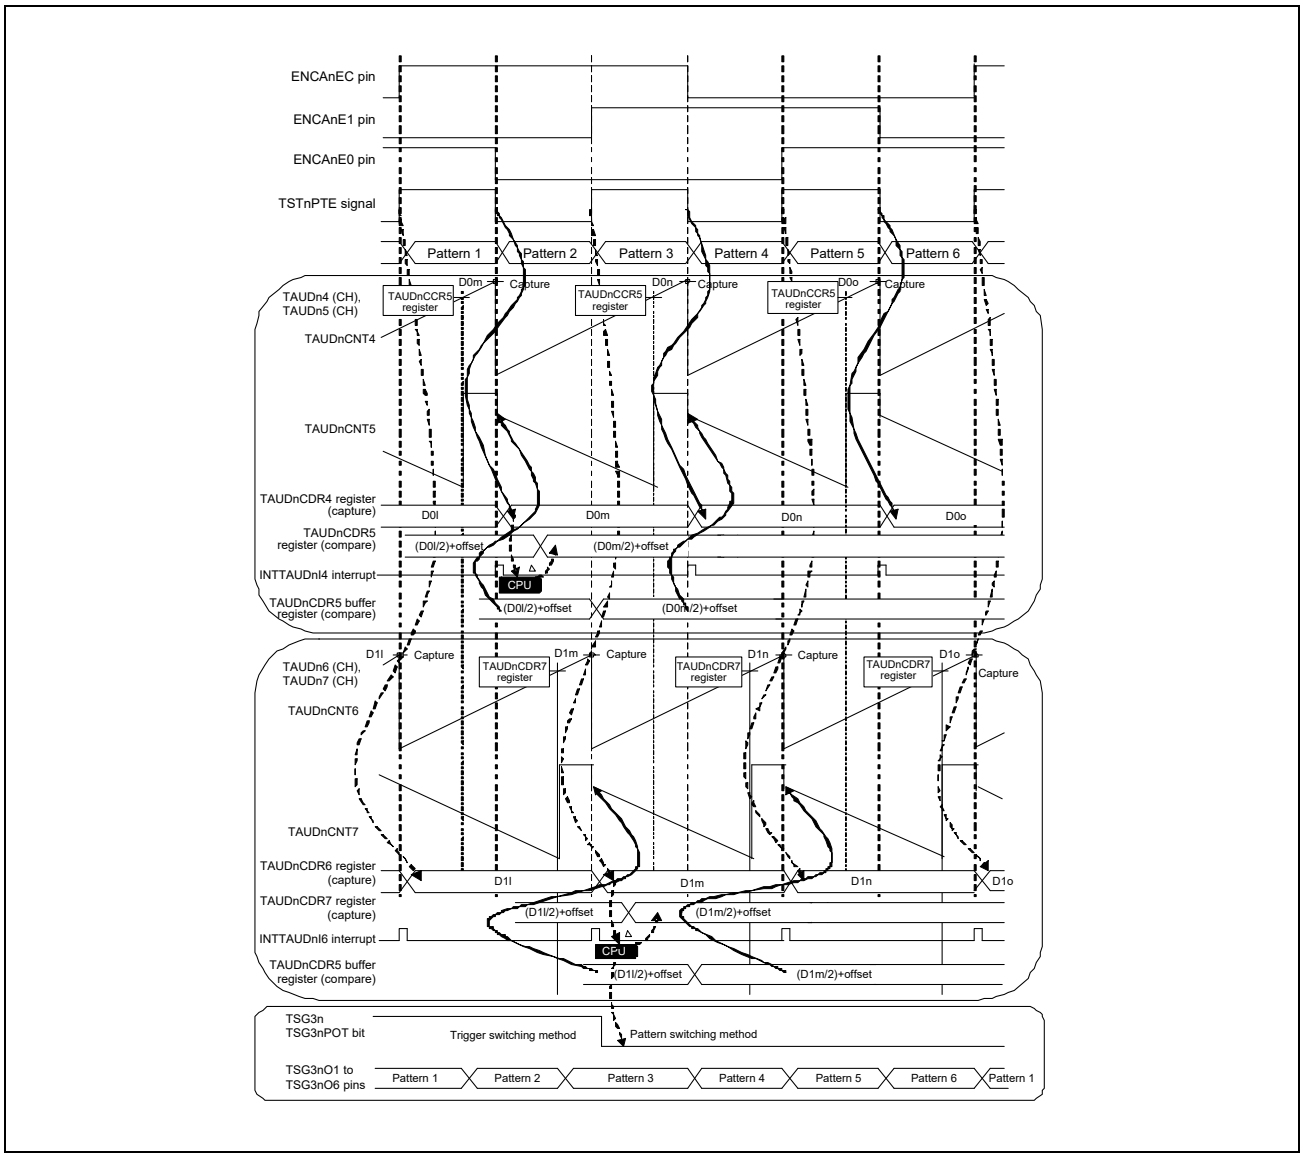

Figure 24.57 An Example of Switch Operation from Variable Phase Control to Fixed Phase Control 1

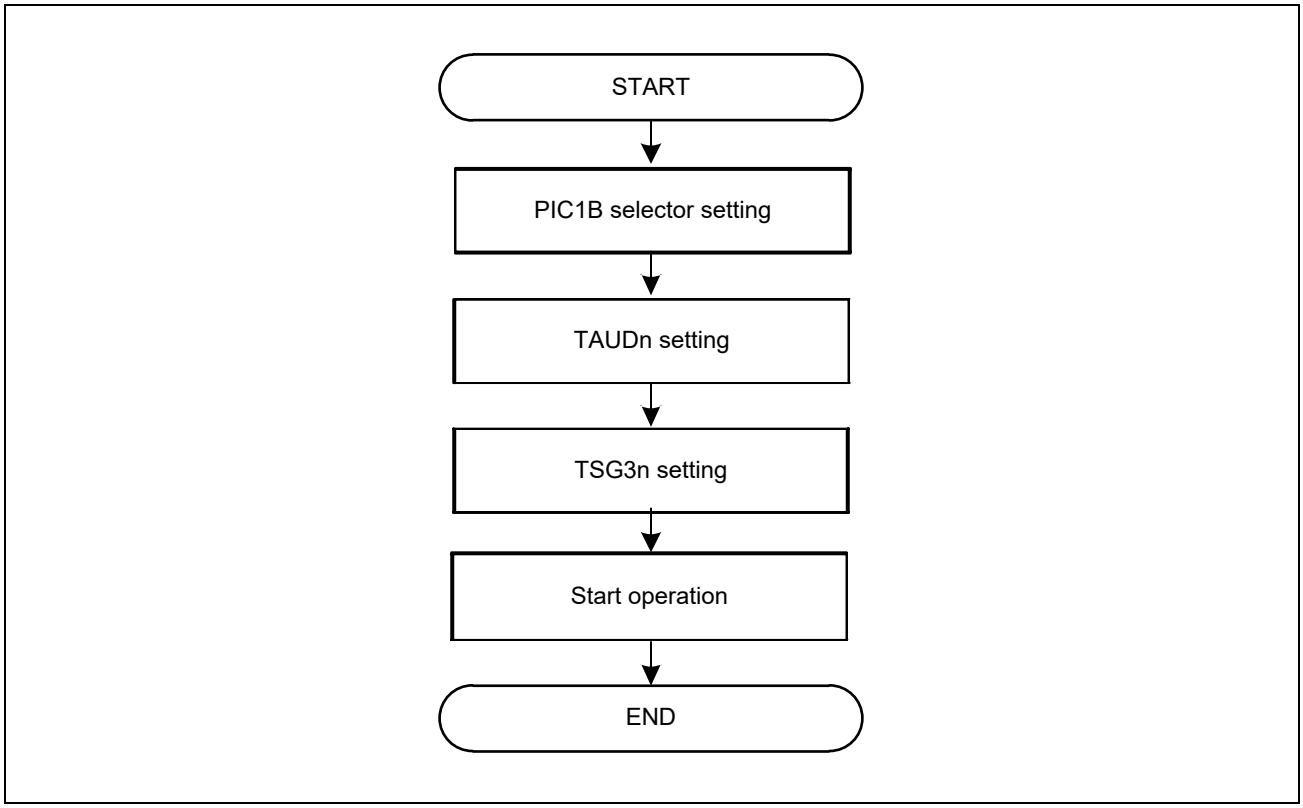
The output pattern is changed to the pattern switching method by changing the TSG3nPOT from high level to low level, and the fixed phase control 1 is enabled.

(5) Flow chart

The flow charts for this function are shown as follows.

Flow chart of main routine



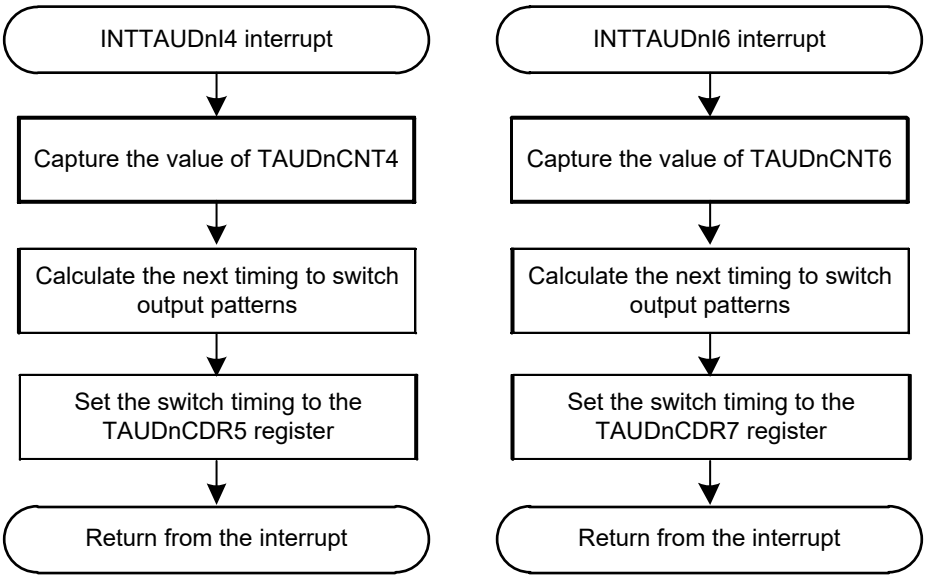


Figure 24.58 Setting Flow

Flow chart of rewriting of TAUDnCDR5 and TAUDnCDR7 during operation

Note: For the TAUDn settings, see **Section 18.4.12.5, Offset Trigger Output Function**.

Figure 24.59 TAUDnCDR5 and TAUDnCDR7 Rewrite Processing

The values of TSG3n registers used in this function are as follows.

TSG3nCTL0[7:0] = 0000_0011_B

TSG3nCTL3[7:0] = 0000_00xx_B

TSG3nCTL4[15:0] = $0000_0001_xxx0_0000_B$

TSG3nIOC0[7:0] = 0111_1110_B

TSG3nIOC1[7:0] = 0001_xxxx_B

TSG3nIOC2[15:0] = $0xxx_xxx0_0000_0000_B$

TSG3nOPT0[7:0] = 0011_1xx0_B

TSG3nOPT1[7:0] = 0000_0xxx_B

TSG3nCMP0 = (set any value)

TSG3nCMP1W, 5W, 9W = (set any value)

TSG3nCMP1, 5, 9 = (set any value)

TSG3nPAT0W, 1W = (set any value)

TSG3nDTC0W, 1W = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 20, Motor Control Timer (TSG3)**.

24.2.3.12 Three-Phase Encoder Function

(1) Overview

The function allows three-phase external pattern inputs (TSG3nPTSI0 to TSG3nPTSI2) using ENCAn.

(2) Configuration

The three-phase encoder control function is realized by using TSG3n, ENCAn, and PIC1B in combination.

The following figure shows the block diagram of three-phase encoder control function.

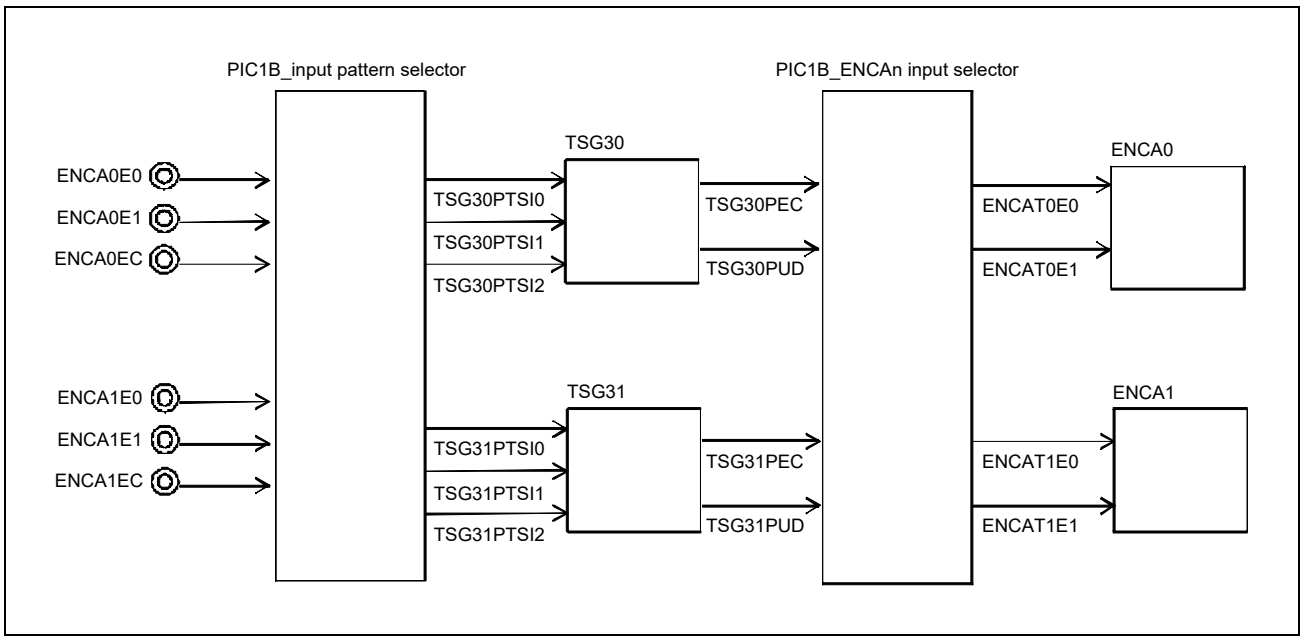

Figure 24.60 Block Diagram of Three-Phase Encoder Control Function

The configuration of this function is described as follows.

- [PIC1B_input pattern selector]
  ENCAnE0, ENCAnE1, and ENCAnEC pin inputs are selected and output to TSG3nPTSI0 to TSG3nPTSI2.
- [TSG3n]
  Patterns set in TSG3nPEC are output in response to the input of the TSG3nPTSI0 to TSG3nPTSI2 signals.
  TSG3nPUD is output depending on rotation in normal or reverse.
- [PIC1B_ENCAn input selector]
  TSG3nPEC is selected and output to ENCATnE0. TSG3nPUD is selected and output to ENCATnE1.
- [ENCAn]
  ENCATnE0 and ENCATnE1 are encoded.

(3) Registers

Block diagram of PIC1B is shown in the following figure.

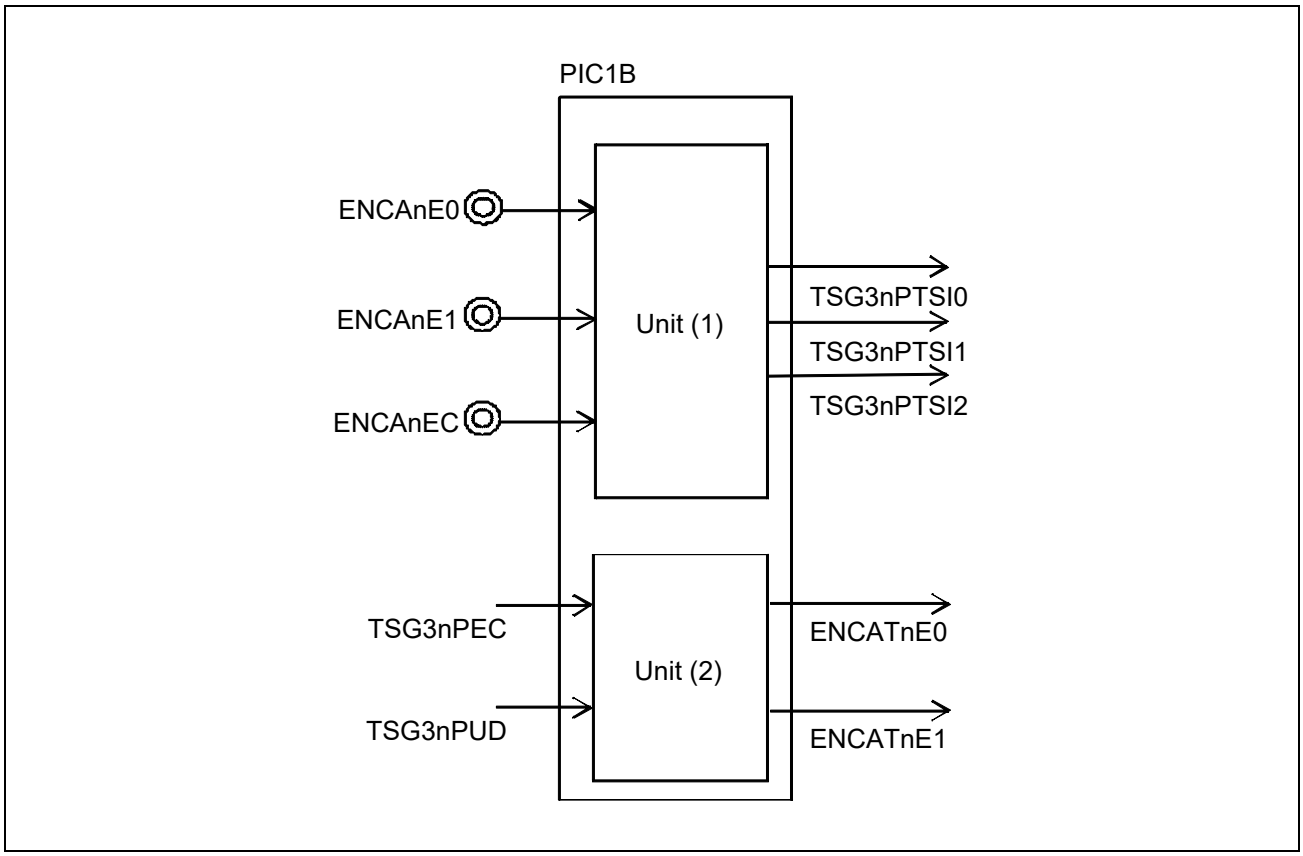

Figure 24.61 Block Diagram of PIC1B

The register settings for PIC1B to use this function are described as follows.

Unit (1): PIC1B_input pattern selector

The values to output ENCA0E0, ENCA0E1, and ENCA0EC as TSG30PTSI0 to TSG30PTSI2
PIC1BTSGHALLSEL[0] = 1_B
PIC1BREG50[0] = 0_B

The value to output ENCA1E0, ENCA1E1, and ENCA1EC as TSG31PTSI0 to TSG31PTSI2
PIC1BTSGHALLSEL[1] = 1_B
PIC1BREG51[0] = 1_B

Unit (2): PIC1B_ENCAn input selector

The values to output TSG30PEC and TSG30PUD as ENCAT0E0 and ENCAT0E1, respectively
PIC1BREG30[22] = 0_B
PIC1BREG30[1:0] = 11_B

The values to output TSG31PEC and TSG31PUD as ENCAT1E0 and ENCAT1E1, respectively
PIC1BREG30[9:8] = 10_B
PIC1BREG30[7:6] = 10_B

(4) Function

Detail of the three-phase encoder function is described as follows.

The following figure shows the timing diagram.

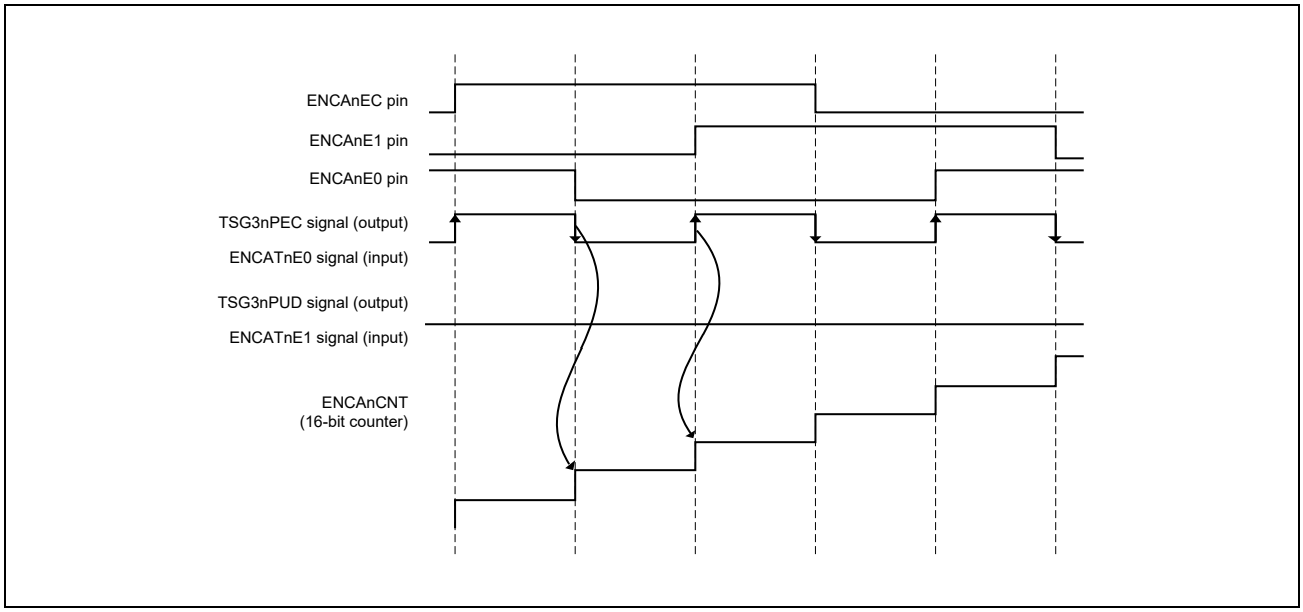

Figure 24.62 Timing Diagram of Three-Phase Encoder Function_ENCAnUDS1 and ENCAnUDS0 = 00_B

(1) When the low level is input to ENCAnE1, the count is incremented each time an active edge is input to ENCAnE0.

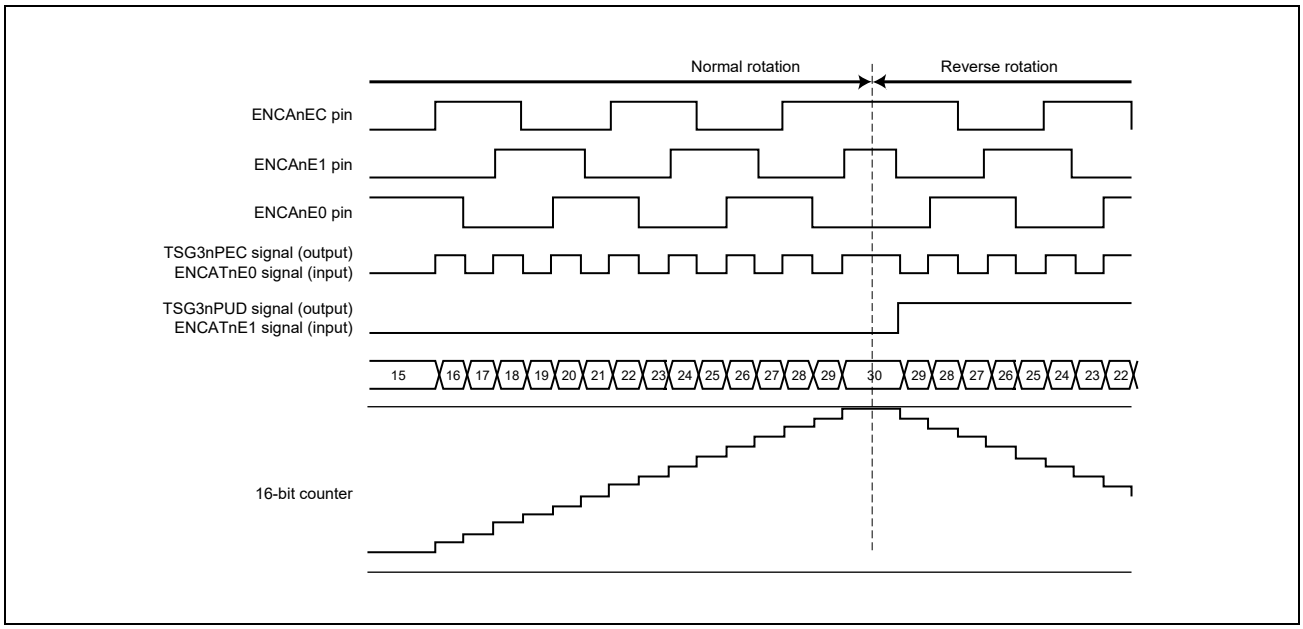

Figure 24.63 Timing Diagram of Three-Phase Encoder Function (Normal Rotation/Reverse Rotation)

(5) Flow chart

Set PIC before using the three-phase encoder control function.

The values of ENCAn registers used in this function are as follows.

ENCAnCTL[15:0] = $xx00_00xx_000x_xx00_B$

ENCAnIOC1[7:0] = 0000_00xx_B*1

ENCAnCCR0 = (set any value)

ENCAnCCR1 = (set any value)

ENCAnCNT = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 23, Encoder Timer (ENCA)**.

Note 1. Except for 00_B (no edge detected) for ENCAnIOC1[1:0] because edge detection is necessary.

The values of TSG3n registers used in this function are as follows.

TSG3nCTL0[7:0] = 0000_0001_B

TSG3nCTL3[7:0] = 0000_00xx_B

TSG3nCTL4[15:0] = $0000_000x_xxxx_xxxx_B$

TSG3nIOC0[7:0] = $0xxx_xxx0_B$

TSG3nIOC1[7:0] = 0001_xxxx_B

TSG3nIOC2[15:0] = $0xxx_xxx0_0000_0000_B$

TSG3nOPT0[7:0] = $0xxx_xxx0_B$

TSG3nOPT1[7:0] = 0000_0xxx_B

TSG3nCMP0 = (set any value)

TSG3nCMP1W, 5W, 9W = (set any value)

TSG3nCMP1, 5, 9 = (set any value)

TSG3nPAT0W, 1W = (set any value)

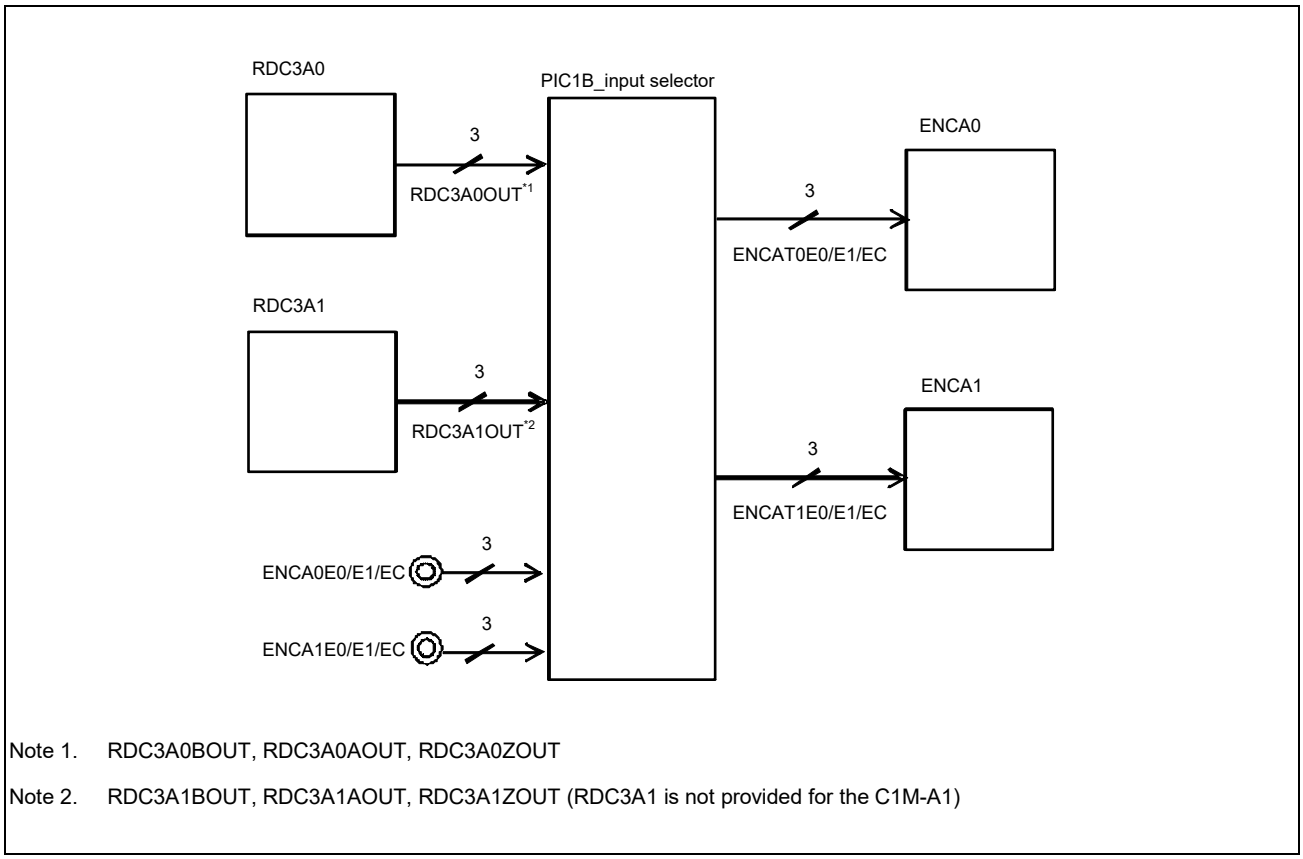
TSG3nDTC0W, 1W = (set any value)

"x" can be set arbitrarily. For the registers specifications, see **Section 20, Motor Control Timer (TSG3)**.

24.2.3.13 ENCA Input Select Function

(1) Overview

This function selects ENCAn input signals from among RDC3A1*[1], RDC3A0, encoder signal group 0 pin, and encoder signal group 1 pin.



Connecting the same encoder signals to both ENCAn modules so that operation of the two is synchronized virtually increases the number of registers available for comparison and capture.

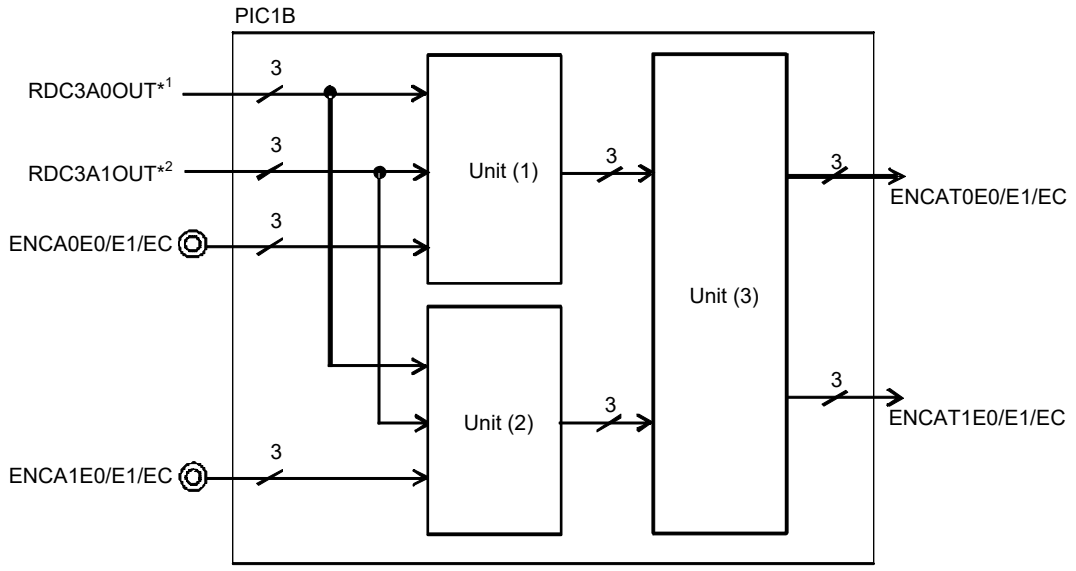
Note 1. RDC3A1 is not provided for the C1M-A1.

(2) Configuration

The ENCA input select function is realized by using RDC3An output signal and ENCAn input pin signal, and PIC1B in combination.

The following figure shows the block diagram of ENCA input select function.

Note 1. RDC3A0BOUT, RDC3A0AOUT, RDC3A0ZOUT



Note 2. RDC3A1BOUT, RDC3A1AOUT, RDC3A1ZOUT (RDC3A1 is not provided for the C1M-A1)

Figure 24.64 Block Diagram of ENCA Input Select Function

The signals to be output to ENCA0 and ENCA1 can be selected from the signals input to PIC1B.

(3) Registers

Block diagram of PIC1B is shown in the following figure.

Note 1. RDC3A0BOUT, RDC3A0AOUT, RDC3A0ZOUT

Note 2. RDC3A1BOUT, RDC3A1AOUT, RDC3A1ZOUT (RDC3A1 is not provided for the C1M-A1)

Figure 24.65 Block Diagram of PIC1B

The values of PIC1B registers used in this function are as follows.

PIC1B_input selector

- ENCA0 connection selector

  The value to select the signal to input to ENCAT0E0, ENCAT0E1, and ENCAT0EC in unit (3) via unit (1)

Table 24.78 Setting Value

Register Setting					
PIC1BREG30					
22	[17:16]	[1:0]	ENCAT0E0	ENCAT0E1	ENCAT0EC
0	01	00	RDC3A0BOUT	RDC3A0AOUT	RDC3A0ZOUT
0	10	00	RDC3A1BOUT*1	RDC3A1AOUT*1	RDC3A1ZOUT*1
0	00	00	ENCA0E0 pin input	ENCA0E1 pin input	ENCA0EC pin input

Note: Do not set the values other than the settings listed above for this function.

Note 1. Not supported in the C1M-A1.

The value to select the signal to input to ENCAT0E0, ENCAT0E1, and ENCAT0EC in unit (3) via unit (2)

Table 24.79 Setting Value

Register Setting				
PIC1BREG30				
22	[20:19]	ENCAT0E0	ENCAT0E1	ENCAT0EC
1	10	RDC3A0BOUT	RDC3A0AOUT	RDC3A0ZOUT
1	01	RDC3A1BOUT*1	RDC3A1AOUT*1	RDC3A1ZOUT*1
1	00	ENCA1E0 pin input	ENCA1E1 pin input	ENCA1EC pin input

Note: Do not set the values other than the settings listed above for this function.

Note 1. Not supported in the C1M-A1.

- ENCA1 connection selector

The value to select the signal to input to ENCAT1E0, ENCAT1E1, and ENCAT1EC in unit (3) via unit (1)

Table 24.80 Setting Value

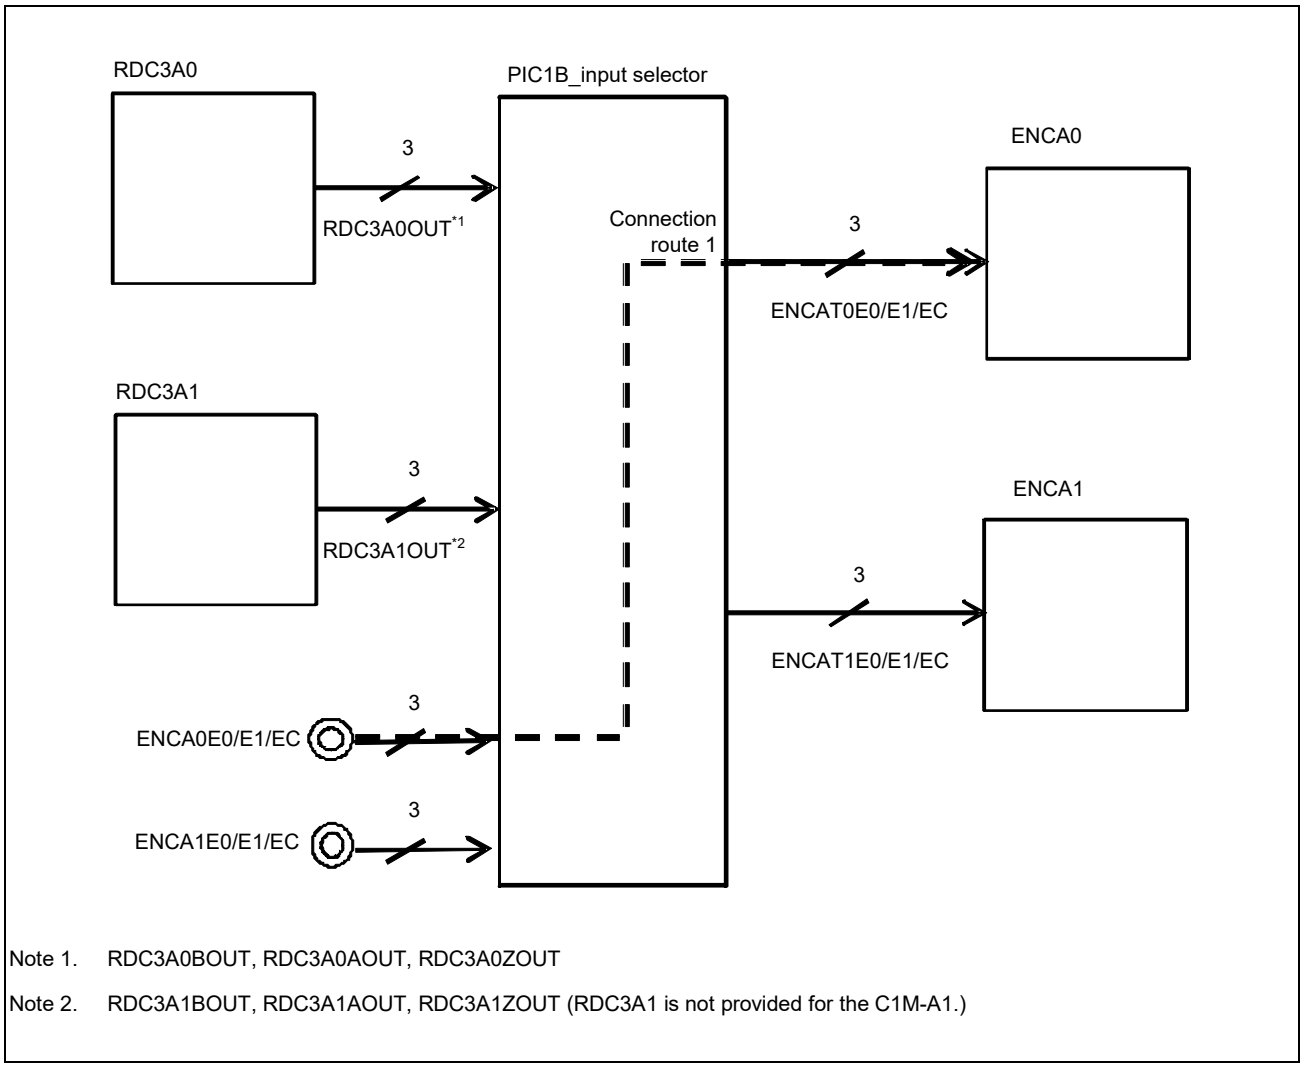
Register Setting				
PIC1BREG30				
[17:16]	[11:6]	ENCAT1E0	ENCAT1E1	ENCAT1EC
10	100101	RDC3A0BOUT	RDC3A0AOUT	RDC3A0ZOUT
01	100101	RDC3A1BOUT*1	RDC3A1AOUT*1	RDC3A1ZOUT*1
00	100101	ENCA0E0 pin input	ENCA0E1 pin input	ENCA0EC pin input

Note: Do not set the values other than the settings listed above for this function.

Note 1. Not supported in the C1M-A1.

The value to select the signal to input to ENCAT1E0, ENCAT1E1, and ENCAT1EC in unit (3) via unit (2)

Table 24.81 Setting Value

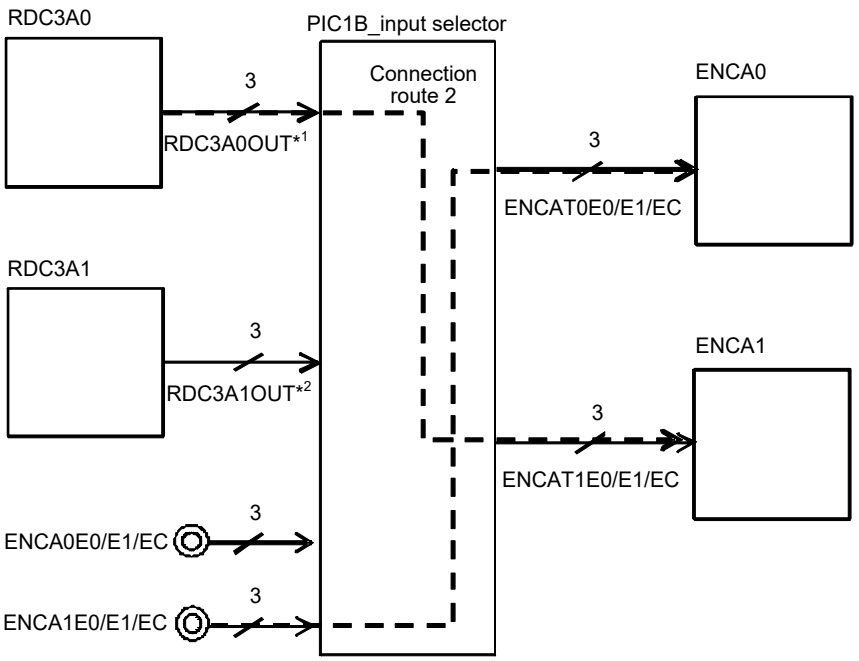


Register Setting				
PIC1BREG30				
[20:19]	[11:6]	ENCAT1E0	ENCAT1E1	ENCAT1EC
10	000000	RDC3A0BOUT	RDC3A0AOUT	RDC3A0ZOUT
01	000000	RDC3A1BOUT*1	RDC3A1AOUT*1	RDC3A1ZOUT*1
00	000000	ENCA1E0 pin input	ENCA1E1 pin input	ENCA1EC pin input

Note: Do not set the values other than the settings listed above for this function.

Note 1. Not supported in the C1M-A1.

(4) Function



This function allows the connection route 1 and the connection route 2 as shown in the flowing figures.
Each connection route counts the selected input signal.

Note 1. RDC3A0BOUT, RDC3A0AOUT, RDC3A0ZOUT

Note 2. RDC3A1BOUT, RDC3A1AOUT, RDC3A1ZOUT (RDC3A1 is not provided for the C1M-A1.)

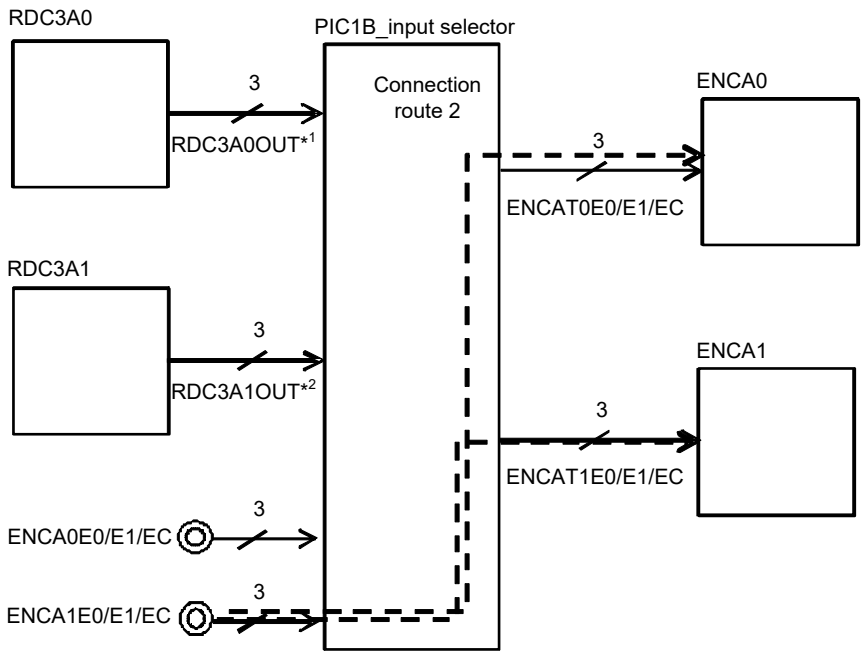


Figure 24.66 Example of Connection Route 1 (ENCA0 Pin Connected to ENCA0 Timer)

Note 1. RDC3A0BOUT, RDC3A0AOUT, RDC3A0ZOUT

Note 2. RDC3A1BOUT, RDC3A1AOUT, RDC3A1ZOUT (RDC3A1 is not provided for the C1M-A1.)

Figure 24.67 Example of Connection Route 2 (ENCA1 Pin and RDC3A0 Connected to ENCA0 and ENCA1, Respectively)

Note 1. RDC3A0BOUT, RDC3A0AOUT, RDC3A0ZOUT

Note 2. RDC3A1BOUT, RDC3A1AOUT, RDC3A1ZOUT (RDC3A1 is not provided for the C1M-A1.)

Figure 24.68 Example of Connection Route 2 (ENCA1 Pin Connected to ENCA0 and ENCA1)

(5) Flow chart

Set PIC before starting the encoder timer.

The values of ENCAn registers when selecting different signals for input to ENCA0 and ENCA1 are as follows.

ENCAnCTL[15:0] = $1000_0000_000x_0101_B$ (ENCA pin input), $1000_0000_000x_0111_B$ (RDC3A input)

ENCAnIOC0[7:0] = 0000_xxxx_B

ENCAnIOC1[7:0] = $xxxx_xxxx_B$*1

"x" can be set arbitrarily. For the registers specifications, see **Section 23, Encoder Timer (ENCA)**.

Note 1. Except for 00_B (no edge detected) for ENCAnIOC1[3:2] and [1:0] because edge detection is necessary.

The values of ENCAn registers when selecting same signals for input to ENCA0 and ENCA1 are as follows.

ENCAnCTL[15:0] = $0x00_000x_x00x_0xxx_B$ (ENCA pin input), $0x00_000x_x00x_0x11_B$ (RDC3A input)

ENCAnIOC0[7:0] = 0000_xxxx_B

ENCAnIOC1[7:0] = $xxxx_xxxx_B$*1

"x" can be set arbitrarily. For the registers specifications, see **Section 23, Encoder Timer (ENCA)**.

Note 1. Except for 00_B (no edge detected) for ENCAnIOC1[3:2] and [1:0] because edge detection is necessary.

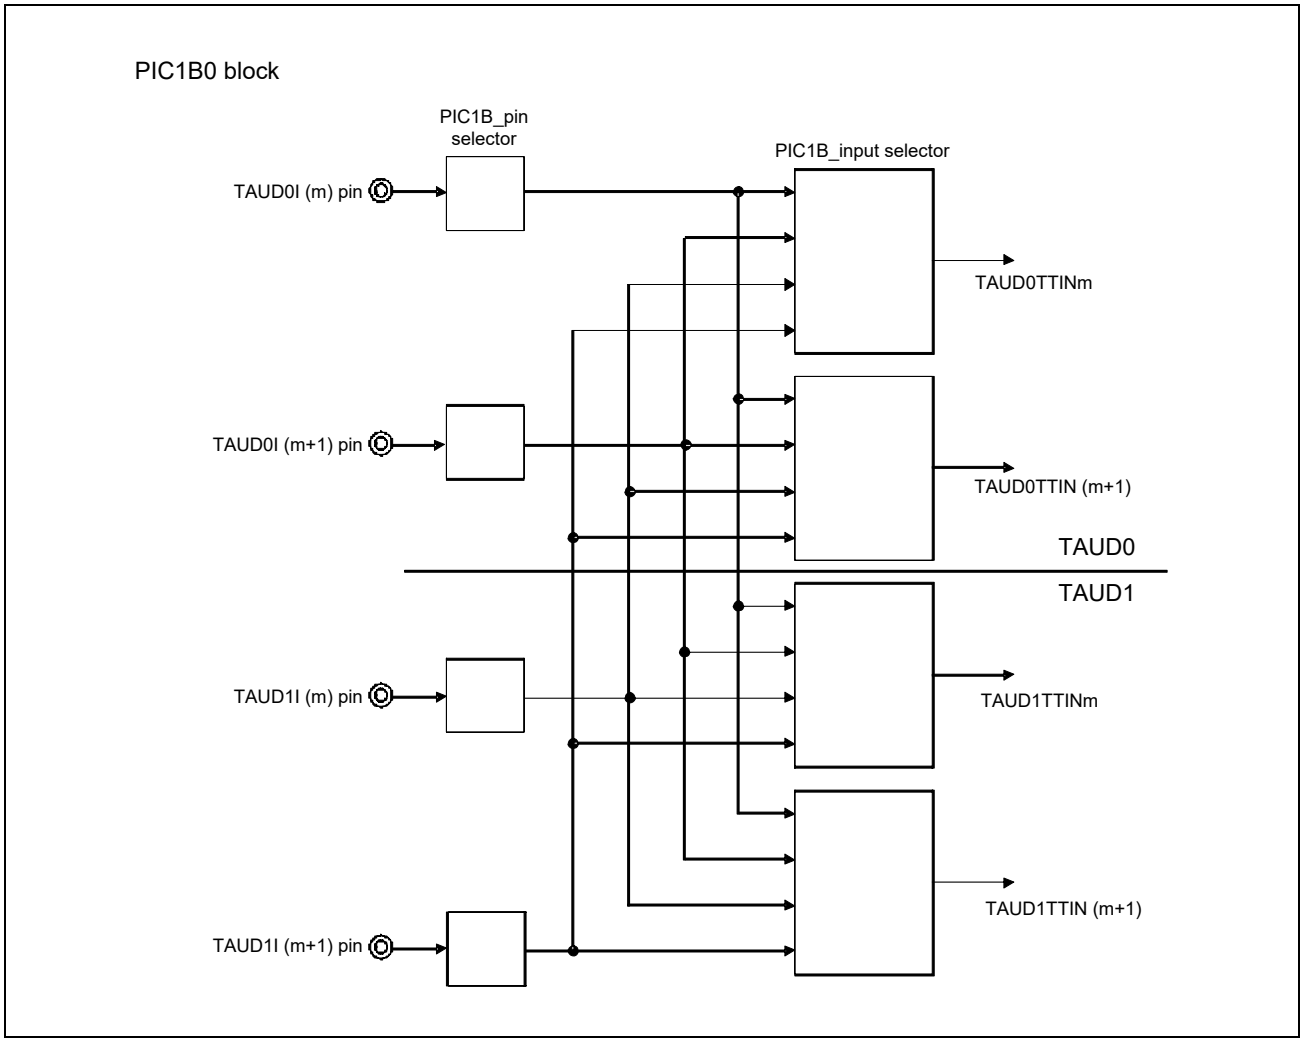
24.2.3.14 TAUD Input Select Function

(1) Overview

The function selects TAUDn input signal to be input as TAUDnTTINm/m+1 signal from either TAUD0Im/m+1 signal or TAUD1Im/m+1 signal (m is an even number between 0 and 14).

(2) Configuration

The TAUD input select function is realized by using TAUDn input signals and PIC1B in combination.



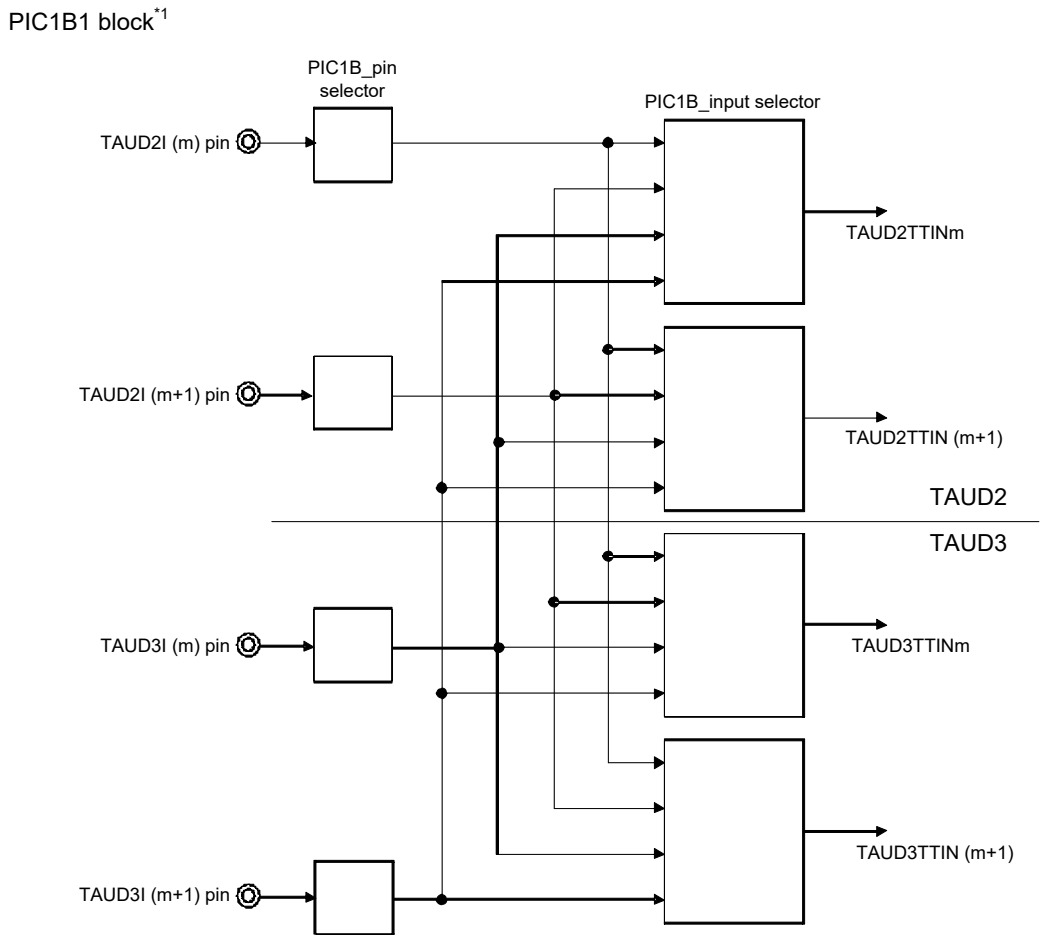


Figure 24.69 Block Diagram of TAUD Input Select Function

Note 1. The PIC1B1 blocks are not provided for the C1M-A1.

Figure 24.70 Block Diagram of TAUD Input Select Function

(3) Registers

The register settings for PIC1B to use this function are described as follows.

PIC1B_pin selector

Select TAUDn external channel input pin for output from PIC1B pin selector.

PIC1B_input selector

Select by the registers listed as follows.

PIC1BTAUD0SEL

PIC1BTAUD1SEL

PIC1BTAUD2SEL*[1]

PIC1BTAUD3SEL*[1]

PIC1BREG2n0

PIC1BREG2n2

PIC1BREG31

Note 1. This register is not provided for the C1M-A1.

For the details of the register settings, see **Sections 24.2.2.22 to 24.2.2.25, 24.2.2.34 to 24.2.2.37, 24.2.2.39, and 24.2.2.42**.

(4) Function

Detail of the function is described using selection of the TAUD0TTIN[1:0] signal as an example.

The following table lists an example of selection of the TAUD0TTIN[1:0] signals. Setting 000000 to PIC1BREG31[11:6], and setting 01 to PIC1BTAUD0SEL[3:2] and PIC1BTAUD0SEL[1:0] allows TAUD0I0 and TAUD0I1 signals to be input to TAUD0TTIN1 and TAUD0TTIN0 input pins of the TAUD0 timer. Setting 1 to PIC1BTAUD0SEL[3] and PIC1BTAUD0SEL[1] selects TIN pin signal of TAUD1.

Table 24.82 Example of Selection of the TAUD0TTIN0 Signals

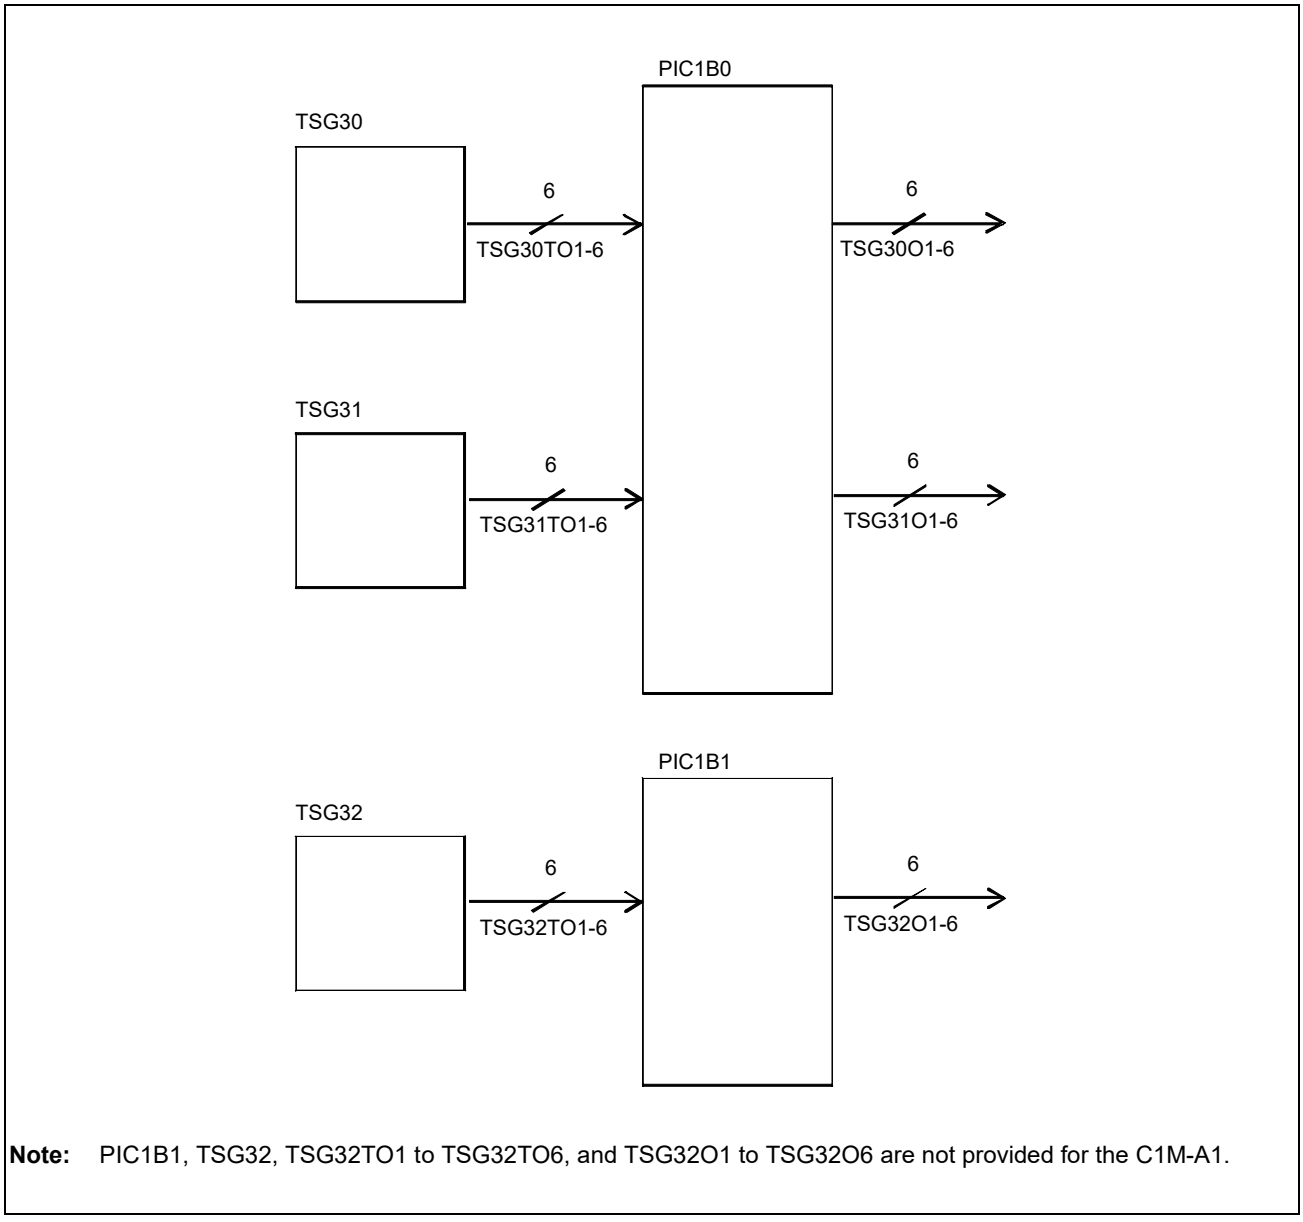
Register Setting	
PIC1BTAUD0SEL	
[1:0]	TAUD0TTIN0
00_B	TAUD0I0 pin
01_B	TAUD0I1 pin
10_B	TAUD1I0 pin
11_B	TAUD1I1 pin

Table 24.83 Example of Selection of the TAUD0TTIN1 Signals

Register Setting	
PIC1BTAUD0SEL	
[3:2]	TAUD0TTIN1
00_B	TAUD0I1 pin
01_B	TAUD0I0 pin
10_B	TAUD1I1 pin
11_B	TAUD1I0 pin

(5) Flow chart

Set PIC1B before starting the TAUDn timer.



24.2.3.15 Switch Function between TSG Output and Low/High Level Output

(1) Overview

The function allows switching of outputs between TSG output and low/high level output at desired timing.

(2) Configuration

TSG is output via PIC1B. With this function, the TSG output is delayed for one cycle of the clock (CLKC_HSB).

Note: PIC1B1, TSG32, TSG32TO1 to TSG32TO6, and TSG32O1 to TSG32O6 are not provided for the C1M-A1.

Figure 24.71 Block Diagram of Switch Function between TSG Output and Low/High-Level Output

(3) Registers

The block diagram of PIC1B is shown in the following figure.

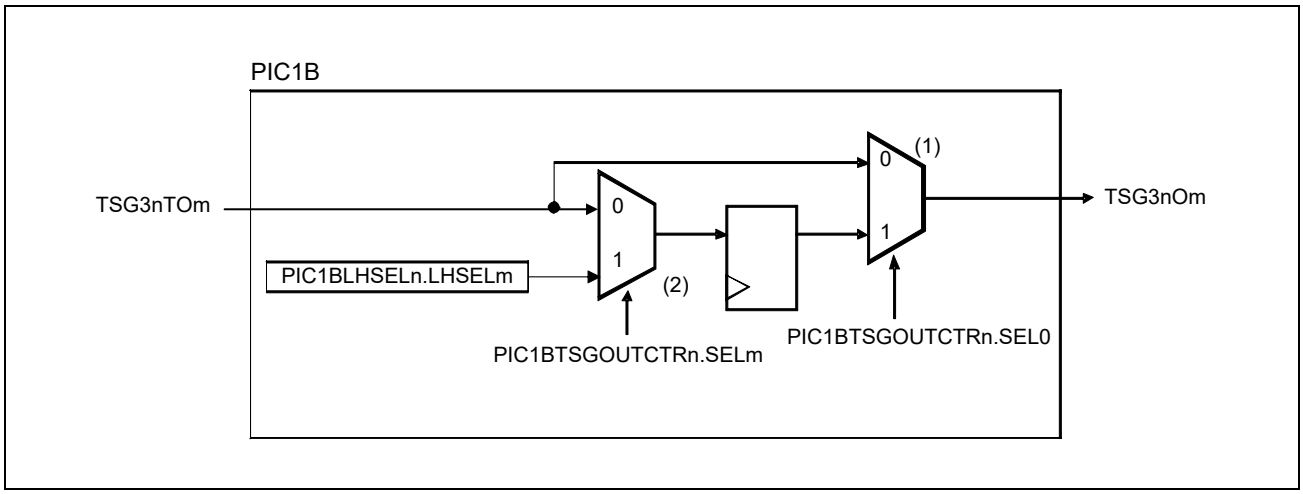


Figure 24.72 Block Diagram of PIC1B

The values of PIC1B registers used in this function are as follows.

(1) Switch on and off the function

PIC1BTSGOUTCTRn[0] = 0_B (turned off), 1_B (turned on)

(2) Switch between low level output and high level output

PIC1BLHSELn[m] = 0_B (output of low level), 1_B (output of high level)

PIC1BTSGOUTCTRn.SELm = 0_B (TSG3n output), 1_B (output of low/high level)

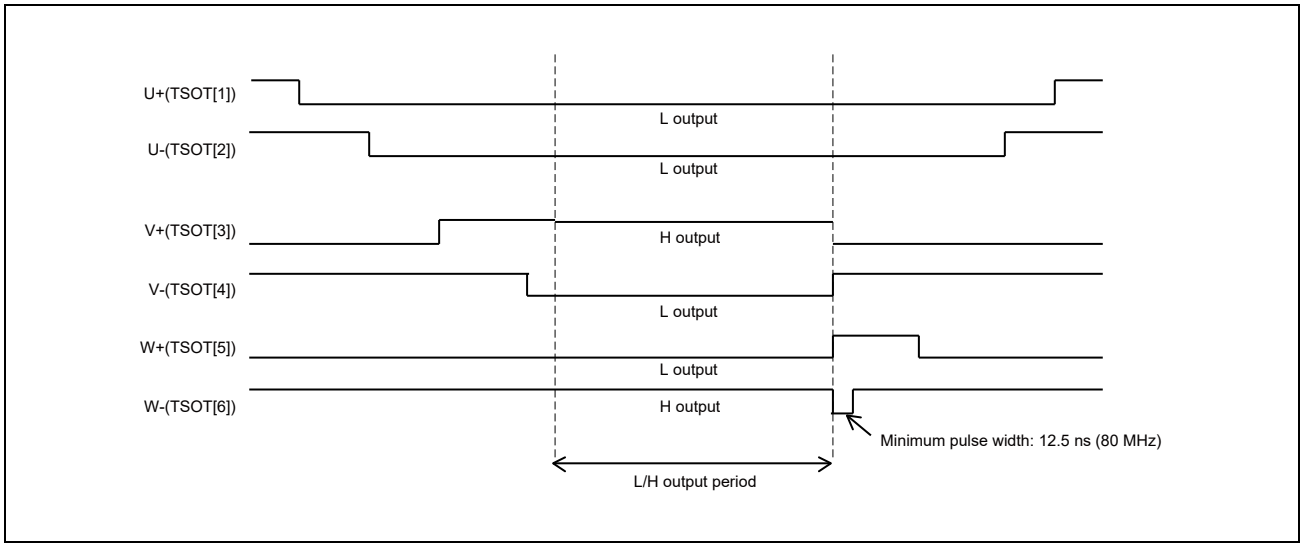
CAUTION

Set (1) before starting TSG3n. Changing at operation is prohibited.

(4) Function

Detail of the function is described using an example timing of switch function.

The following figure shows the timing diagram.



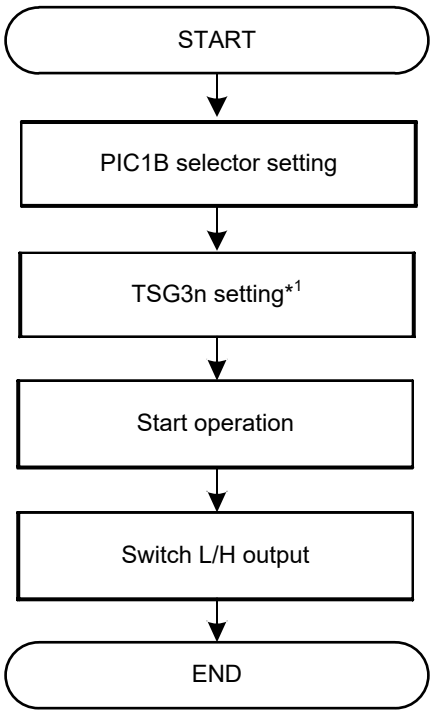


Figure 24.73 TSG Output Switching Timing

The function allows switching of outputs between TSG output and low/high level output at desired timing. The six output phases can be switched between high level and low level both individually and simultaneously. The minimum pulse (internal pulse) of CLKC_HSB may be generated depending on the switch timing.

(5) Flow chart

The flow charts for this function are shown as follows.

Note 1. For the TSG3n settings, see **Section 20, Motor Control Timer (TSG3)**.

Figure 24.74 Setting Flow

24.2.3.16 Hi-Z Control Function

(1) Overview

The function disconnects three-phase output signal and changes to Hi-Z state.

For the detail of the purpose and operation of the Hi-Z control function, see **Section 21.4.1, Asynchronous Hi-Z Control Function**.

(2) Configuration

The ESOn, ERROROUTZ, and INTTSG3nIER signals are masked and OR'ed in PIC1B, and output to TAPAn as the signal for Hi-Z control.

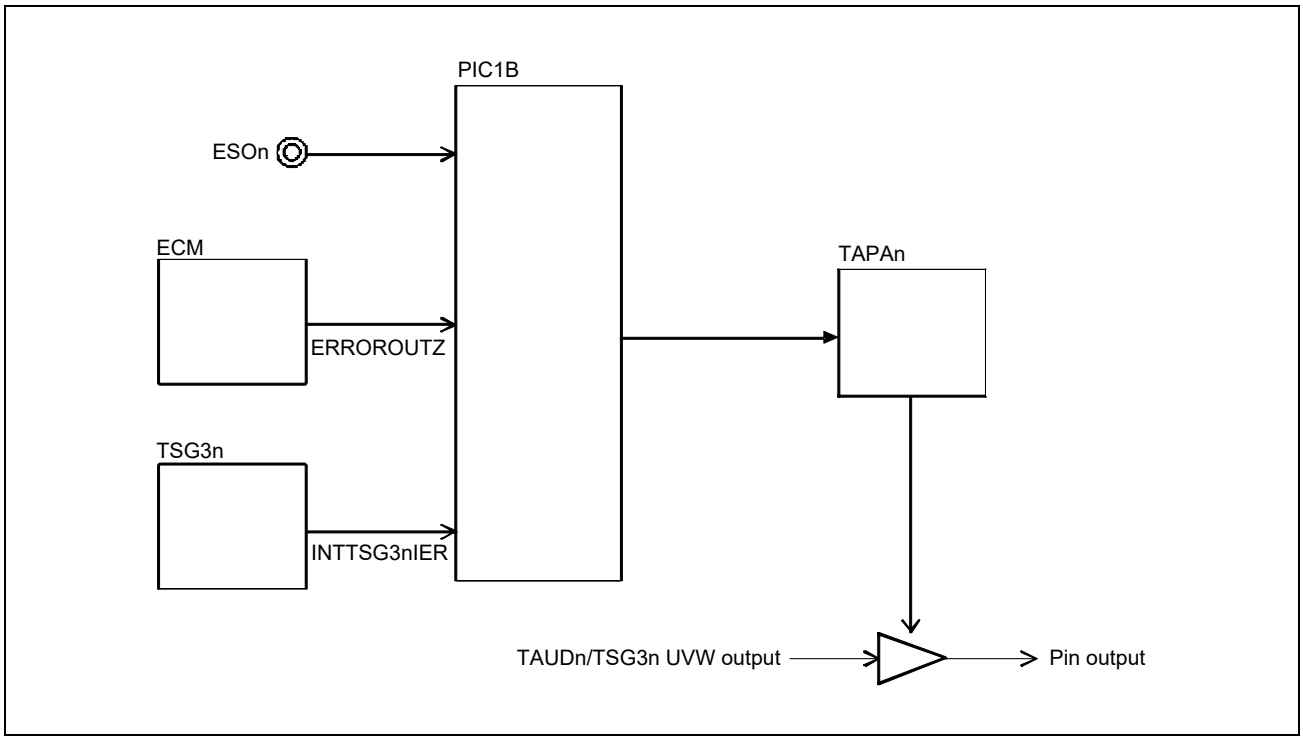

Figure 24.75 Block Diagram of Hi-Z Control

(3) Registers

The block diagram of PIC1B is shown in the following figure.

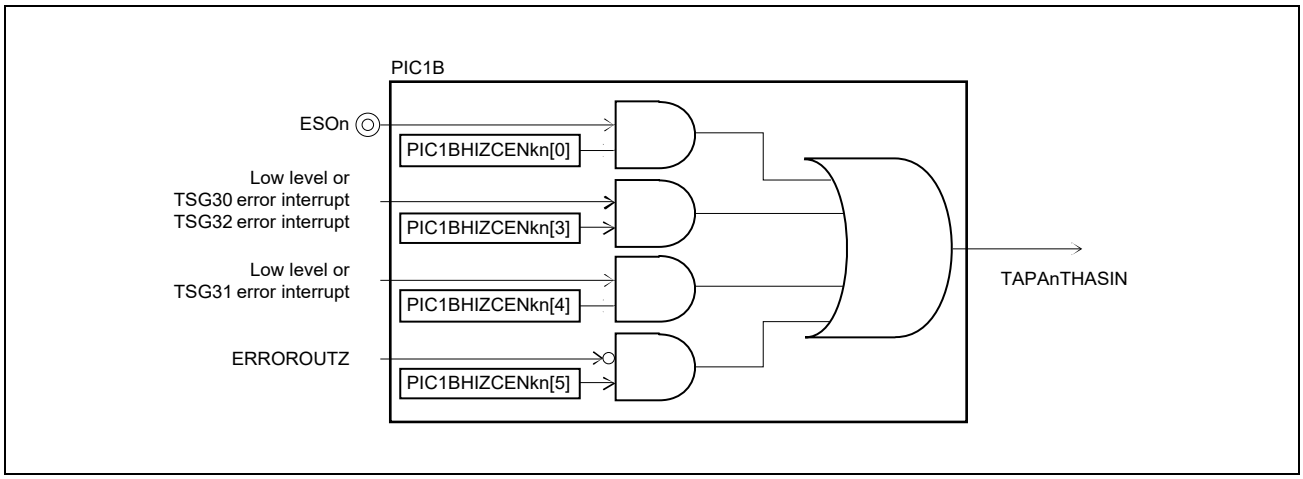

Figure 24.76 Block Diagram of PIC1B

The register settings for PIC1B to be used with this function are described as follows.

Table 24.84 Setting Value

Register Name	Bit 5	Bit 4	Bit 3	Bit 0	Register to be Controlled	TAPA to be Connected
PIC1BHIZCEN00	ERROROUTZ	—	—	ESO0	TAUD0	TAPA0
PIC1BHIZCEN01	ERROROUTZ	—	—	ESO1	TAUD1	TAPA1
PIC1BHIZCEN02	ERROROUTZ	—	INTTSG30IER	ESO3	TSG30	TAPA3
PIC1BHIZCEN03	ERROROUTZ	INTTSG31IER	—	ESO4	TSG31	TAPA4
PIC1BHIZCEN10*1	ERROROUTZ	—	—	ESO2	TAUD2	TAPA2
PIC1BHIZCEN12*1	ERROROUTZ	—	INTTSG32IER	ESO5	TSG32	TAPA5

Bit 5 = 1_B (enabled), 0_B (disabled): ERROROUTZ
Bit 4 = 1_B (enabled), 0_B (disabled): INTTSG31IER
Bit 3 = 1_B (enabled), 0_B (disabled): INTTSG30IER or INTTSG32IER
Bit 0 = 1_B (enabled), 0_B (disabled): ESOm

Note 1. PIC1BHIZCEN10, PIC1BHIZCEN12, ESO2, ESO5, TAUD2, TSG32, TAPA2, TAPA5 are not provided for the C1M-A1.

(4) Function

The signals ESOn pin, ERROROUTZ, and INTTSG3nIER are masked and OR'ed in PIC1B, and output to TAPAn.

For Hi-Z control by TAPA, see **Section 21.4.2.2, Basic Operation**.

(5) Flow chart

Set PIC1B before starting Hi-Z control.

For the operation flow of TAPA, see **Section 21.4.2.3, Operating Procedure**.

24.3 Peripheral Interconnection 2 (PIC2D)

24.3.1 Overview

24.3.1.1 Functional Overview

The peripheral interconnection 2 (PIC2D) allows ADCC hardware trigger signal to be generated using the internal and external trigger signals output from individual IPs.

24.3.2 Registers

24.3.2.1 List of Registers

PIC2D registers are listed in the following table.

See **Section 24.1.2, Register Base Address** for <PIC2D_base>.

Table 24.85 List of Registers (1/2)

Module Name	Register Name	Symbol	Address
PIC2D	A/D converter 0 trigger select control register 0	PIC2DADCC0TSEL0	<PIC2D_base> + 00_H
PIC2D	A/D converter 0 trigger select control register 1	PIC2DADCC0TSEL1	<PIC2D_base> + 04_H
PIC2D	A/D converter 0 trigger select control register 2	PIC2DADCC0TSEL2	<PIC2D_base> + 08_H
PIC2D	A/D converter 0 trigger select control register 3	PIC2DADCC0TSEL3	<PIC2D_base> + $0C_H$
PIC2D	A/D converter 0 trigger select control register 4	PIC2DADCC0TSEL4	<PIC2D_base> + 10_H
PIC2D	A/D converter 0 trigger edge select control register	PIC2DADCC0EDGSEL	<PIC2D_base> + $1C_H$
PIC2D	A/D converter 1 trigger select control register 0	PIC2DADCC1TSEL0	<PIC2D_base> + 20_H
PIC2D	A/D converter 1 trigger select control register 1	PIC2DADCC1TSEL1	<PIC2D_base> + 24_H
PIC2D	A/D converter 1 trigger select control register 2	PIC2DADCC1TSEL2	<PIC2D_base> + 28_H
PIC2D	A/D converter 1 trigger select control register 3	PIC2DADCC1TSEL3	<PIC2D_base> + $2C_H$
PIC2D	A/D converter 1 trigger select control register 4	PIC2DADCC1TSEL4	<PIC2D_base> + 30_H
PIC2D	A/D converter 1 trigger edge select control register	PIC2DADCC1EDGSEL	<PIC2D_base> + $3C_H$
PIC2D	A/D converter 2 trigger select control register 0	PIC2DADCC2TSEL0	<PIC2D_base> + 40_H
PIC2D	A/D converter 2 trigger select control register 1	PIC2DADCC2TSEL1	<PIC2D_base> + 44_H
PIC2D	A/D converter 2 trigger select control register 2	PIC2DADCC2TSEL2	<PIC2D_base> + 48_H
PIC2D	A/D converter 2 trigger select control register 3	PIC2DADCC2TSEL3	<PIC2D_base> + $4C_H$
PIC2D	A/D converter 2 trigger select control register 4	PIC2DADCC2TSEL4	<PIC2D_base> + 50_H
PIC2D	A/D converter 2 trigger edge select control register	PIC2DADCC2EDGSEL	<PIC2D_base> + $5C_H$
PIC2D	Common to ADCC0 to ADCC2		
PIC2D	A/D converter trigger output control register 400	PIC2DADTEN400	<PIC2D_base> + 80_H
PIC2D	A/D converter trigger output control register 401	PIC2DADTEN401	<PIC2D_base> + 84_H
PIC2D	A/D converter trigger output control register 402	PIC2DADTEN402	<PIC2D_base> + 88_H
PIC2D	A/D converter trigger output control register 403	PIC2DADTEN403	<PIC2D_base> + $8C_H$
PIC2D	A/D converter trigger output control register 404	PIC2DADTEN404	<PIC2D_base> + 90_H
PIC2D	A/D converter trigger output control register 410	PIC2DADTEN410	<PIC2D_base> + $A0_H$
PIC2D	A/D converter trigger output control register 411	PIC2DADTEN411	<PIC2D_base> + $A4_H$
PIC2D	A/D converter trigger output control register 412	PIC2DADTEN412	<PIC2D_base> + $A8_H$
PIC2D	A/D converter trigger output control register 413	PIC2DADTEN413	<PIC2D_base> + AC_H
PIC2D	A/D converter trigger output control register 414	PIC2DADTEN414	<PIC2D_base> + $B0_H$
PIC2D	A/D converter trigger output control register 420*1	PIC2DADTEN420	<PIC2D_base> + $C0_H$

Table 24.85 List of Registers (2/2)

Module Name	Register Name	Symbol	Address
PIC2D	A/D converter trigger output control register 421*1	PIC2DADTEN421	<PIC2D_base> + $C4_H$
PIC2D	A/D converter trigger output control register 422*1	PIC2DADTEN422	<PIC2D_base> + $C8_H$
PIC2D	A/D converter trigger output control register 423*1	PIC2DADTEN423	<PIC2D_base> + CC_H
PIC2D	A/D converter trigger output control register 424*1	PIC2DADTEN424	<PIC2D_base> + $D0_H$
PIC2D	A/D converter trigger output control register 430*1	PIC2DADTEN430	<PIC2D_base> + $E0_H$
PIC2D	A/D converter trigger output control register 431*1	PIC2DADTEN431	<PIC2D_base> + $E4_H$
PIC2D	A/D converter trigger output control register 432*1	PIC2DADTEN432	<PIC2D_base> + $E8_H$
PIC2D	A/D converter trigger output control register 433*1	PIC2DADTEN433	<PIC2D_base> + EC_H
PIC2D	A/D converter trigger output control register 434*1	PIC2DADTEN434	<PIC2D_base> + $F0_H$

Note 1. This register is not provided for the C1M-A1.

24.3.2.2 PIC2DADCCnTSELx ─ A/D Converter n Trigger Select Control Register x

The PIC2DADCCnTSELx register selects triggers for ADCCn scan group x (n = 0 to 2; x = 0 to 4).

Access: Readable/writable in 32-bit units.

Address: <PIC2D_base> + 00_H (n = 0, x = 0), <PIC2D_base> + 04_H (n = 0, x = 1), <PIC2D_base> + 08_H (n = 0, x = 2), <PIC2D_base> + $0C_H$ (n = 0, x = 3), <PIC2D_base> + 10_H (n = 0, x = 4), <PIC2D_base> + 20_H (n = 1, x = 0), <PIC2D_base> + 24_H (n = 1, x = 1), <PIC2D_base> + 28_H (n = 1, x = 2), <PIC2D_base> + $2C_H$ (n = 1, x = 3), <PIC2D_base> + 30_H (n = 1, x = 4) <PIC2D_base> + 40_H (n = 2, x = 0), <PIC2D_base> + 44_H (n = 2, x = 1), <PIC2D_base> + 48_H (n = 2, x = 2), <PIC2D_base> + $4C_H$ (n = 2, x = 3), <PIC2D_base> + 50_H (n = 2, x = 4)

Value after reset: 0000 0000_H

24.3.2.3 PIC2DADCCnEDGSEL ─ A/D Converter n Trigger Edge Control Register

The PIC2DADCCnEDGSEL register selects an effective edge for the one-shot pulse generation circuit which generates an ADCC trigger.

The ADC external pin trigger is input in negative logic, but it is converted to positive logic for trigger source selection. Since edge detection is made for a trigger source after selection, note that the definition of an edge is reversed for an ADC external pin signal. (Setting 00 enables selection of a falling edge of ADC external pin triggers ADTRG0Z, ADTRG1Z, and ADTRG2Z).

Access: Readable/writable in 16-bit units.

Address: <PIC2D_base> + $1C_H$ (n = 0), <PIC2D_base> + $3C_H$ (n = 1), <PIC2D_base> + $5C_H$ (n = 2)

Value after reset: 0000_H

24.3.2.4 PIC2DADTEN4nx ─ A/D Converter Trigger Output Select Control Register*1

The PIC2DADTEN4nx register enables selecting a trigger source from TAUDn channel m as the ADCC trigger (n = 0 to 3; x = 0 to 4). This register is common to ADCC0 to ADCC2.

Access: Readable/writable in 16-bit units.

Address: <PIC2D_base> + 80_H (n = 0, x = 0), <PIC2D_base> + 84_H (n = 0, x = 1), <PIC2D_base> + 88_H (n = 0, x = 2), <PIC2D_base> + $8C_H$ (n = 0, x = 3), <PIC2D_base> + 90_H (n = 0, x = 4), <PIC2D_base> + $A0_H$ (n = 1, x = 0), <PIC2D_base> + $A4_H$ (n = 1, x = 1), <PIC2D_base> + $A8_H$ (n = 1, x = 2), <PIC2D_base> + AC_H (n = 1, x = 3), <PIC2D_base> + $B0_H$ (n = 1, x = 4), <PIC2D_base> + $C0_H$ (n = 2, x = 0), <PIC2D_base> + $C4_H$ (n = 2, x = 1), <PIC2D_base> + $C8_H$ (n = 2, x = 2), <PIC2D_base> + CC_H (n = 2, x = 3), <PIC2D_base> + $D0_H$ (n = 2, x = 4), <PIC2D_base> + $E0_H$ (n = 3, x = 0), <PIC2D_base> + $E4_H$ (n = 3, x = 1), <PIC2D_base> + $E8_H$ (n = 3, x = 2), <PIC2D_base> + EC_H (n = 3, x = 3), <PIC2D_base> + $F0_H$ (n = 3, x = 4)

Table 24.88 PIC2DADTEN4nx Register Contents

Bit Position	Bit Name	Function
15 to 0	PIC2DADTEN4nxm (m = 0 to 15)	Set a trigger source from TAUDn channel m. 0: Trigger source of TAUDn channel m cannot be selected as the ADCC trigger. 1: Trigger source of TAUDn channel m can be selected as the ADCC trigger.

Note 1. The PIC2DADTEN42x registers (TAUD2) and the PIC2DADTEN43x registers (TAUD3) are not provided for the C1M-A1.

24.3.3 Function

24.3.3.1 ADCC Trigger Select Function

(1) Overview

The function allows generation of ADCC hardware trigger signal for individual channel groups by the signals from each IP. The IPs can be selected from among TAUD0, TAUD1, TAUD2*[1], TAUD3*[1], ENCA0, ENCA1, TSG30, TSG31, TSG32*[1], TAPA0, TAPA1, TAPA2, EMU3, RDC3A0, and RDC3A1*[1].

The external trigger signal (ADTRG) is active low and it is converted by PIC2D.

Note 1. This IP is not provided for the C1M-A1.

(2) Configuration

The ADCC trigger select function is realized by using individual IPs and PIC2D in combination. The following figure shows the block diagram of ADCC trigger select function.

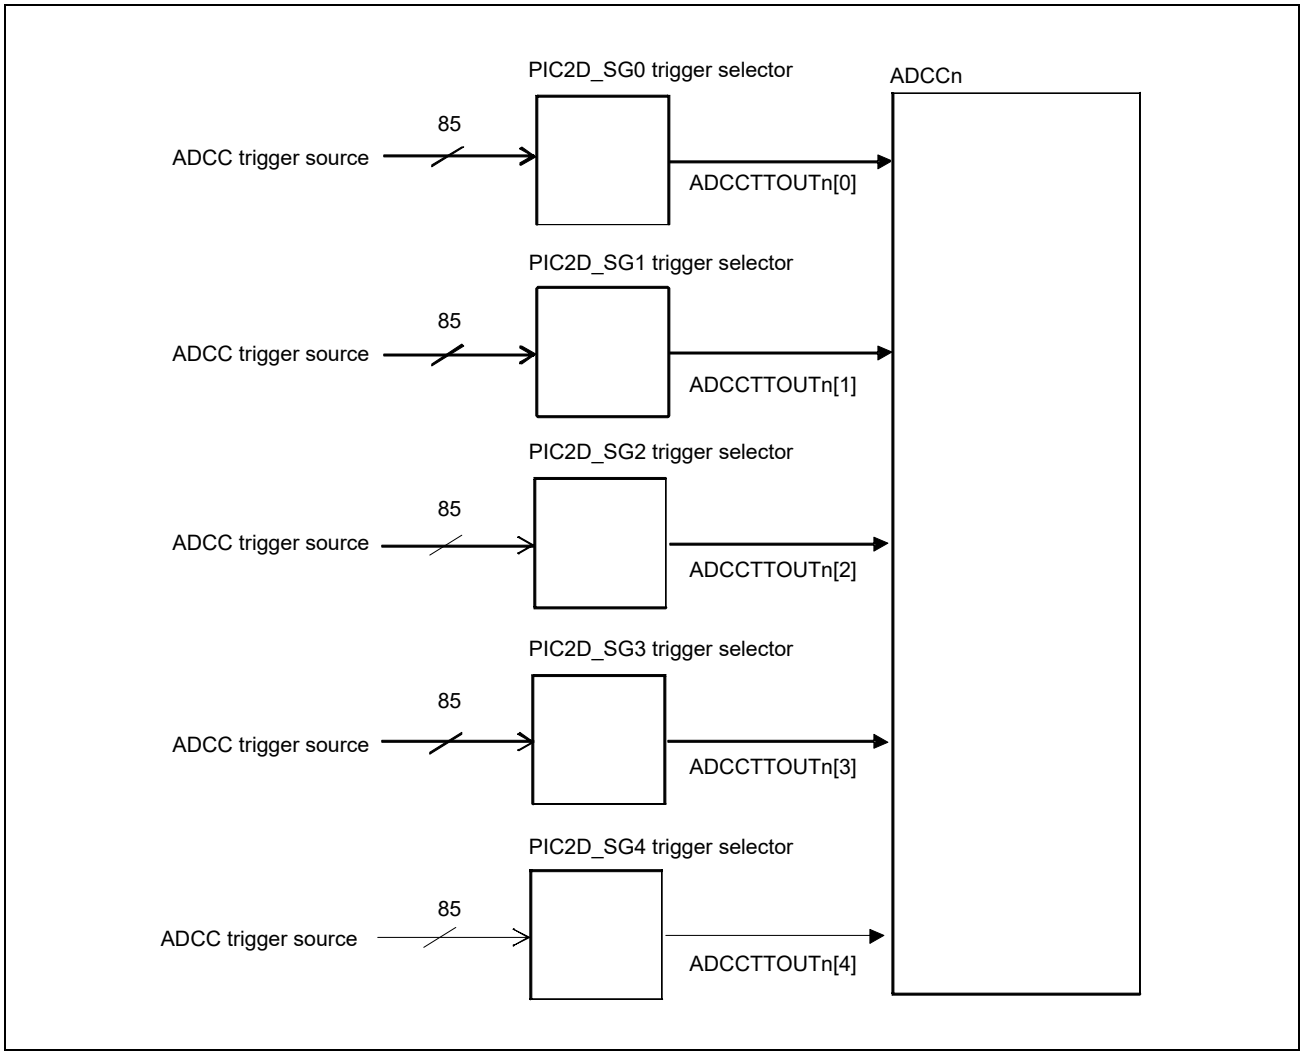

Figure 24.77 Block Diagram of ADCC Trigger Select Function

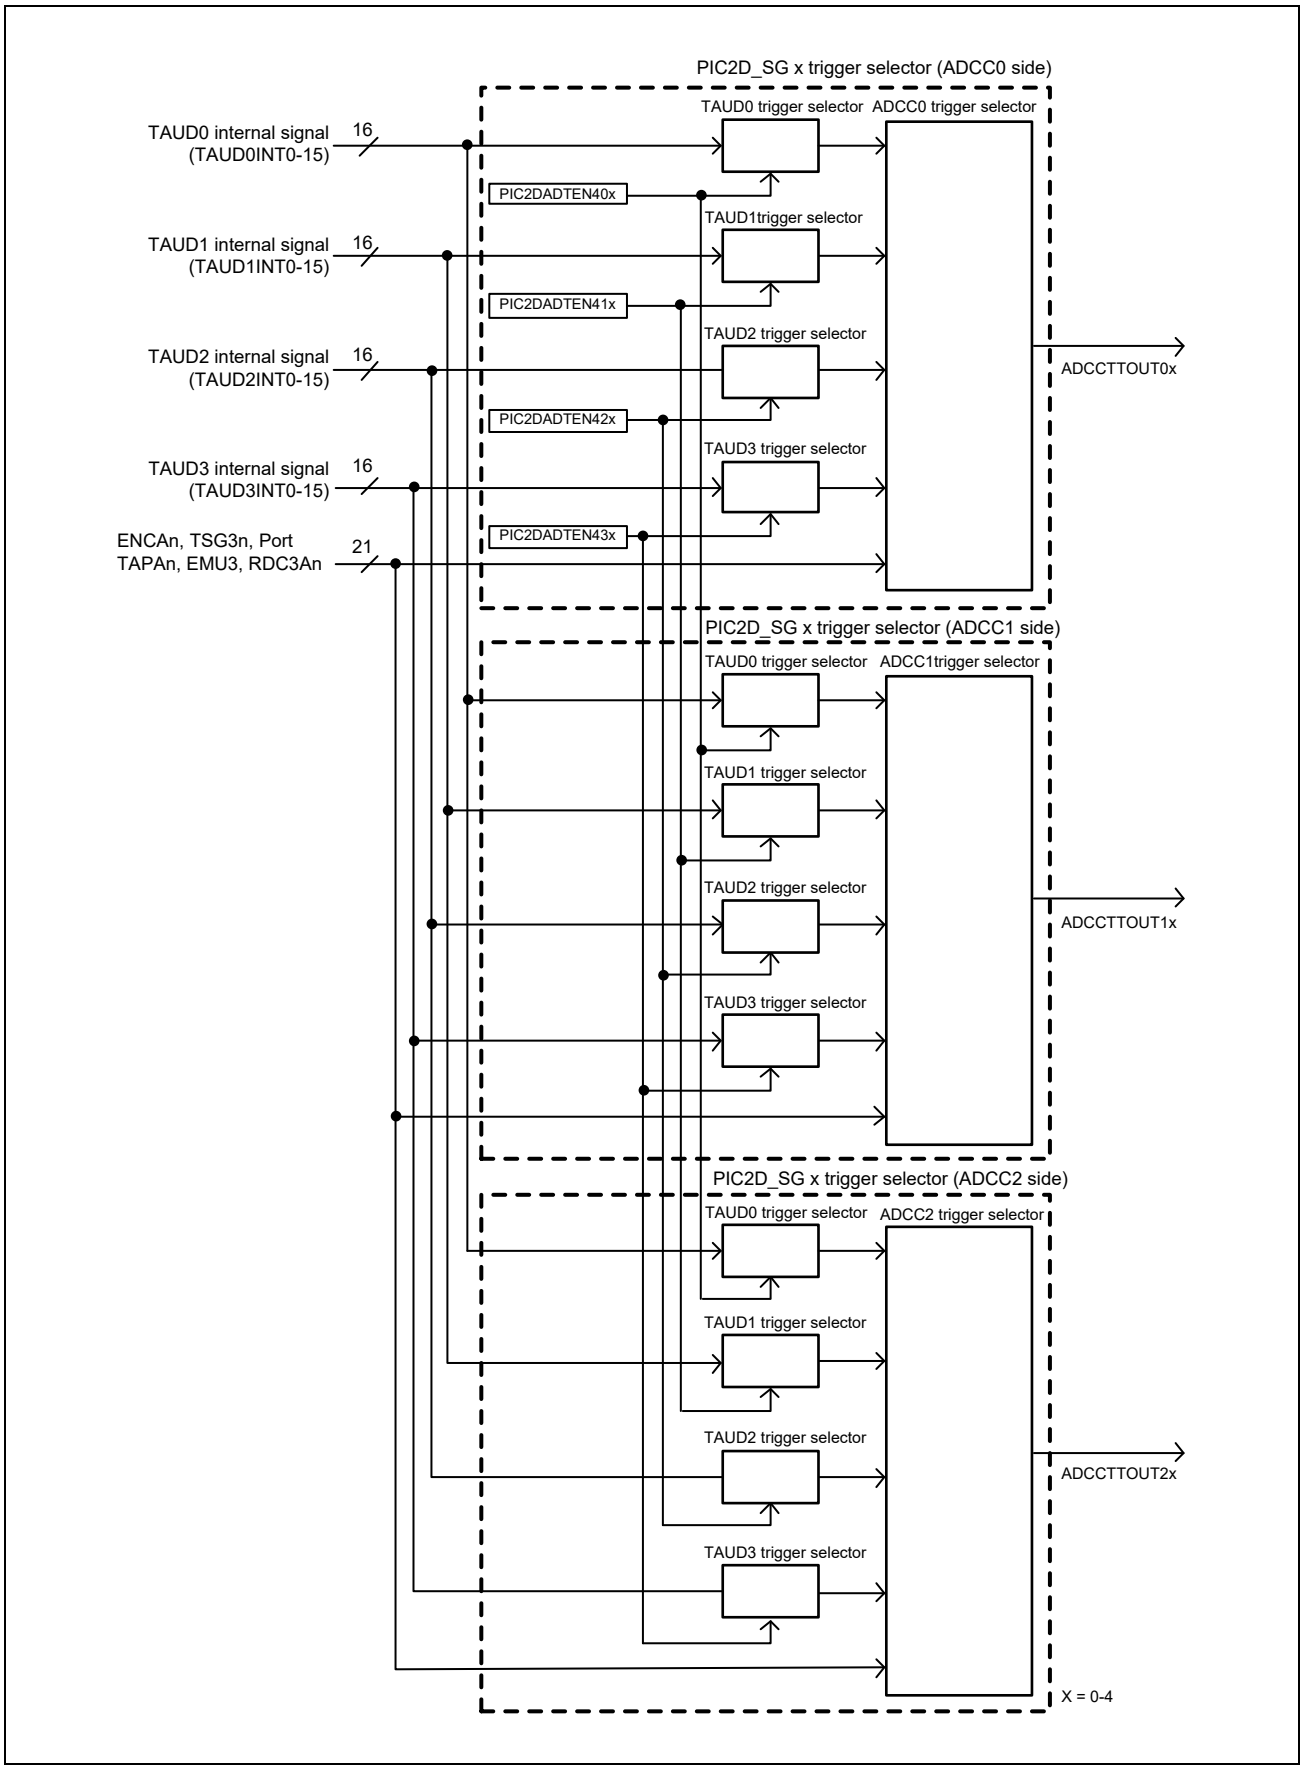

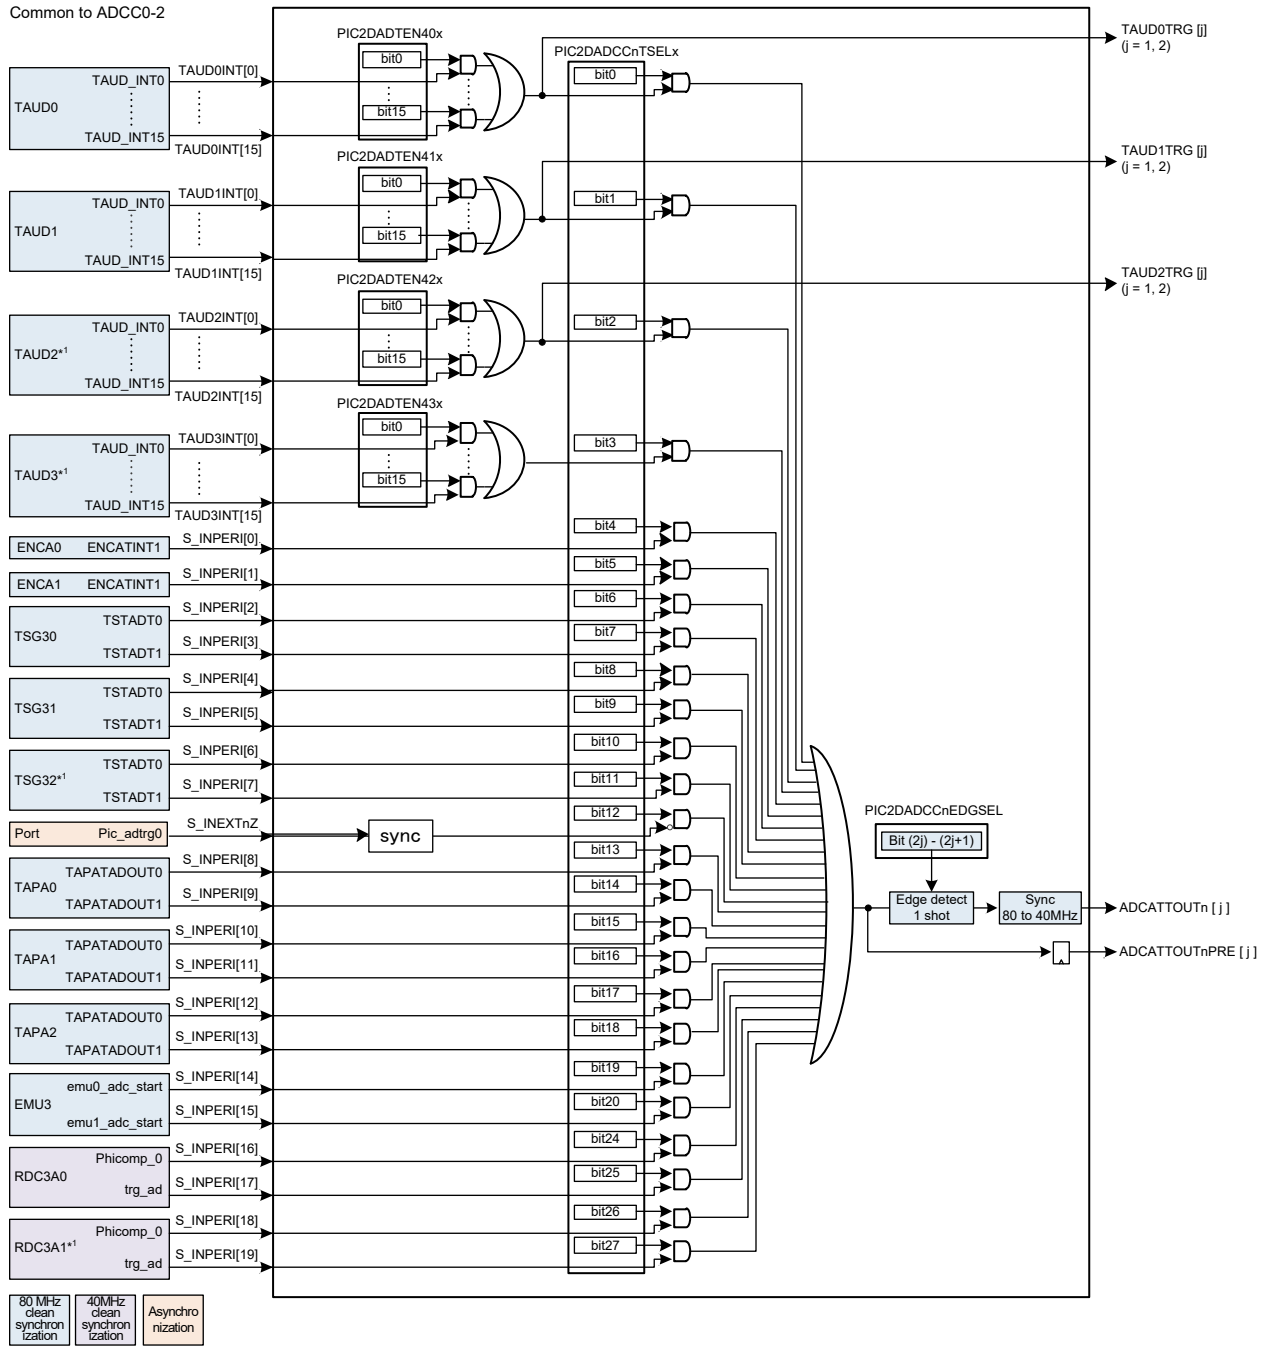

Figure 24.78 Block Diagram of PIC2D_SGx

Note 1. RDC3A1, TSG32, TAUD2, TAUD3, and TAUD2/TAUD3 related signals are not provided for the C1M-A1.

(3) Registers

For the settings of the registers used in this function, see **Figure 24.79, Block Diagram of PIC2D**, and **Sections from 24.3.2.2 to 24.3.2.4**.

Note 1. This is not provided for the C1M-A1.

Note 2. For external trigger signal, a delay of maximum two cycles of the clock (12.5 ns (80 MHz) @1clk) is generated because of the synchronization circuit (Sync) which needs to be considered when selecting an external trigger signal as the ADCC trigger.

Figure 24.79 Block Diagram of PIC2D

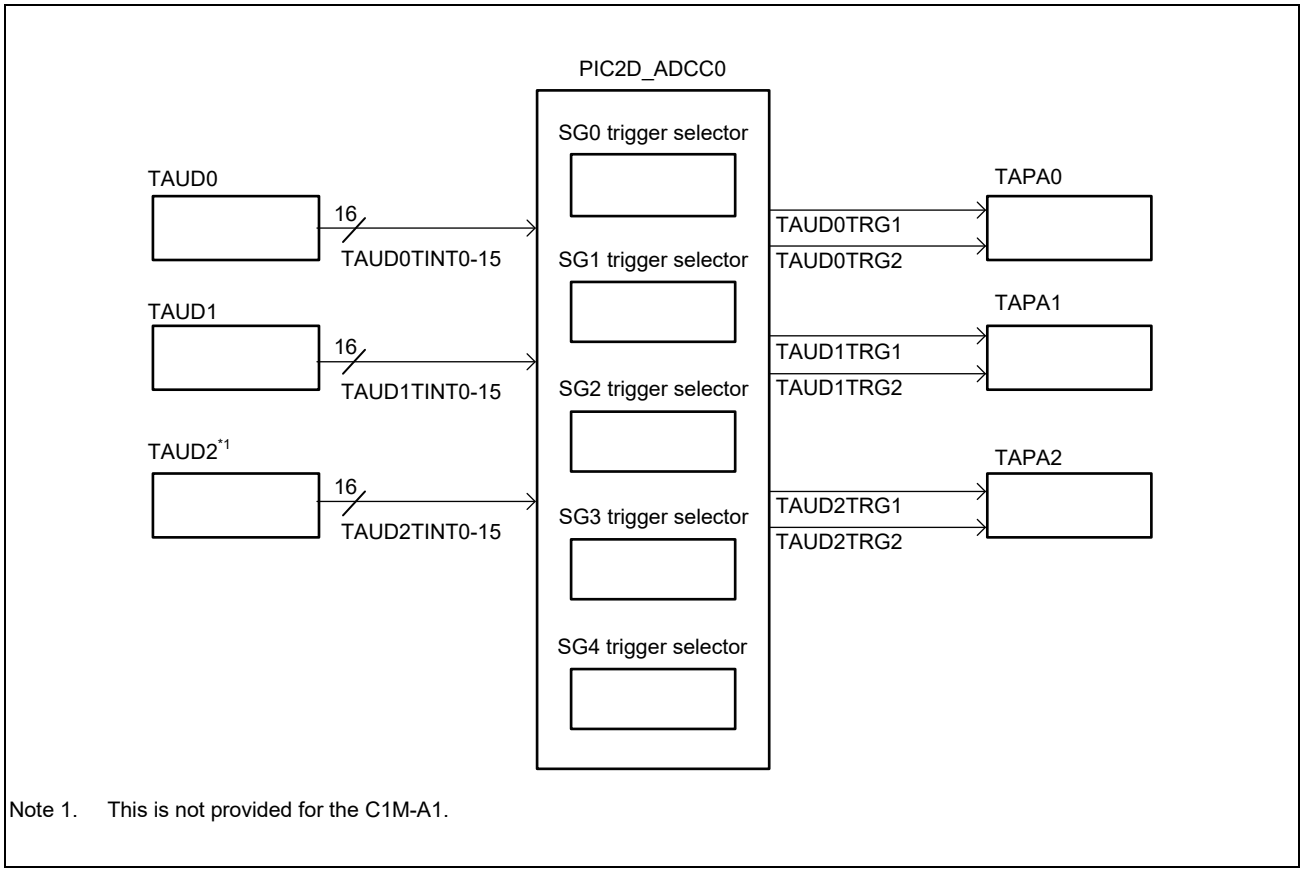
(4) Function

AD trigger signal can be selected for individual ADCCn channel groups and output can be selected from rising edge, falling edge, and both edges. TAUD trigger for the scan group with the same number is shared among ADCC0, ADCC1, and ADCC2.

(5) Flow chart

Set this function before starting A/D converter.

24.3.3.2 TAUD Trigger Output Function



(1) Overview

The interrupt request signal of each channel of TAUD is masked and OR'ed, and output to TAPA as the TAUD trigger signal. This function is available only for the scan groups 1 and 2.

The TAUD trigger signal is used as the trigger source for A/D converter conversion trigger signal for TAPA. For the detail, see **Section 21.4.3, Selecting a Trigger to Start Conversion by the A/D Converter**.

(2) Configuration

The TAUD trigger output function is realized by PIC2D. The following figure shows the block diagram of the TAUD trigger output function.

Note 1. This is not provided for the C1M-A1.

Figure 24.80 Block Diagram of TAUD Trigger Output Function

(3) Registers

For the settings of the registers used in this function, see **Figure 24.79, Block Diagram of PIC2D**, and **Section 24.3.2.4, PIC2DADTEN4nx — A/D Converter Trigger Output Select Control Register**.

The values of PIC2D registers used in this function are as follows.

PIC2DADTEN40x = (set any value)

PIC2DADTEN41x = (set any value)

PIC2DADTEN42x = (set any value)

PIC2DADTEN43x = 0000 0000 0000 0000_B

PIC2DADCCnTSELx[3:0] = 0000_B

x = 1, 2

(4) Function

The interrupt request signal of each channel of TAUD is masked and OR'ed, and output to TAPA as the TAUD trigger signal.

CAUTION

This function is available only for the scan groups 1 and 2.

When using this function with the scan groups 1 and 2, select the TAUD trigger via TAPA. Do not select the TAUD trigger directly by the ADCC trigger select function.

(5) Flow chart

Set this function before starting A/D converter.

Section 25 Enhanced Motor Control Unit 3 (EMU3)

25.1 Features of the RH850/C1M-A EMU3

The enhanced motor control unit 3 (EMU3) is a set of motor control accelerator engines that calculate the 3-phase PWM compare value using the vector control algorithm and generate rectangle wave patterns based on the current value measured by an A/D converter and the motor's angle value obtained through an R/D converter. The calculation results of the EMU3 are used by the TSG3, a 3-phase motor timer, to output PWM and rectangle waves.

The EMU3 is provided with a SubCPU in addition to the high-speed arithmetic hardware, so that it can exercise flexible motor control in combination with software interventions.

25.1.1 Number of Units

This product has the number of EMU3 units listed below.

Table 25.1 Number of EMU3 Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of units	1	1
Name	EMU3	EMU3

25.1.1.1 Number of EMU3 Subunits

The EMU3 has the number of SubCPU units listed in **Table 25.2**.

Table 25.2 Number of SubCPU Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of units	1	1
Name	SubCPU	SubCPU

The EMU3 has the number of H/W accelerator units listed in **Table 25.3**.

Table 25.3 Number of H/W Accelerator Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of units	2	1
Name	EMU3n (n = 0, 1)	EMU3n (n = 0)

Table 25.4 Indices

Index	Meaning
n	In this section, the number of motor control H/W accelerator units is represented by “n” (n = 0 or 1) *1. For example, the EMU3n protect register is represented as EMU3nPRT.
m, k	In this section, variables appearing in the description column are represented by “m” and “k”.

Note 1. The H/W accelerator (EMU31) is not provided for the C1M-A1.

25.1.2 Register Base Addresses

EMU3 base addresses are listed in the following table.

EMU3 register addresses are given as offsets from the base addresses in general.

Table 25.5 Register Base Addresses

Base Address Name	Base Address of CPU1 and CPU2	Base Address of SubCPU
<EMU_base>	FF70 0000$_H$	FC00 0000$_H$
<EMU3n_base> (n = 0, 1)	FF70 n000$_H$	FC00 n000$_H$

25.1.3 Clock Supply

The clocks that are supplied to the EMU3 are listed below.

Table 25.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
EMU3	CLK_CPU	CLK_CPU (CPU clock)
	CLK_EMU_H	CLK_EMU_H (SubCPU clock)
	CLK_EMU_L	CLK_EMU_L (EMU3 motor control H/W accelerator clock)
	CLK_HSB	CLK_HSB (High-speed peripheral clock)
	CLKC_HSB	CLKC_HSB (Unmodulated high-speed peripheral clock)

25.1.4 Interrupt Requests

Table 25.7 gives a list of EMU3 interrupts.

For details of the interrupt sources, see **Section 25.4.15, Interrupt Control**.

Table 25.7 List of EMU3 Interrupts

Unit Interrupt Signal	Interrupt Number	DMA Trigger Number		DTS Trigger Number	
		1st	2nd	1st	2nd
EMU30					
EMU30 interrupt 0	56	77	—	77	—
EMU30 interrupt 1	57	78	—	78	—
EMU30 interrupt 2	58	79	—	79	—
EMU30 interrupt 3	59	80	—	80	—
EMU30 interrupt 4	60	81	—	81	—
EMU30 interrupt 5	61	—	35	—	35
EMU30 interrupt 6	62	—	36	—	36
EMU30 interrupt 7	63	—	37	—	37
EMU31					
EMU31 interrupt 0*1	66	82	—	82	—
EMU31 interrupt 1*1	67	83	—	83	—
EMU31 interrupt 2*1	68	84	—	84	—
EMU31 interrupt 3*1	69	85	—	85	—
EMU31 interrupt 4*1	70	86	—	86	—
EMU31 interrupt 5*1	71	—	40	—	40
EMU31 interrupt 6*1	72	—	41	—	41
EMU31 interrupt 7*1	73	—	42	—	42

Note 1. EMU31 interrupts 0 to 7 are only supported for the RH850/C1M-A2.

25.1.5 Reset Sources

The EMU3 reset sources are listed in the following table.

Table 25.8 Reset Sources

Unit Name	Reset Source
EMU3	Any reset source

25.2 Overview

25.2.1 Functional Overview

The EMU3 is furnished with two channels of motor control accelerator engines (motor control H/W accelerators)*[1] that calculate the 3-phase PWM compare value using the vector control algorithm and generate rectangle wave patterns based on the current value measured by an A/D converter and the motor's angle value obtained through an R/D converter and with a SubCPU that is used for control of the motor control H/W accelerators and for flexible motor control with software interventions.

Note 1. The H/W accelerator (EMU31) of channel 1 is not provided for the C1M-A1.

Figure 25.1 shows the configuration of the EMU3.

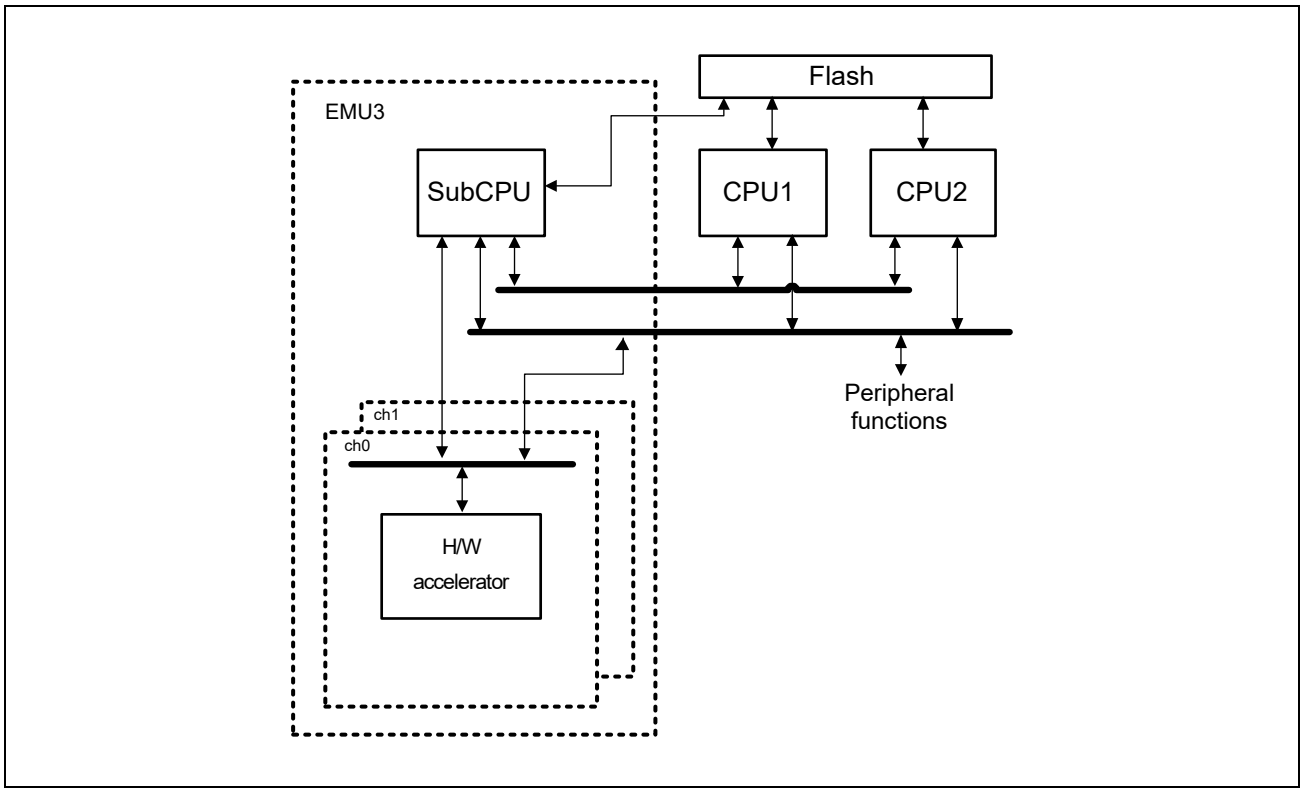


Figure 25.1 EMU3 Configuration Schematic

25.2.1.1 SubCPU

The EMU3 incorporates an RH850 G3MH core as the SubCPU that enables the control of the H/W accelerators and the modification/addition of motor control algorithms. The SubCPU has a dedicated bus to the H/W accelerators so that registers can be accessed at high speeds. See **Section 3, CPU System**, for the specifications for the RH850 G3MH core.

For the address map of the SubCPU, see **Section 4, Address Space**.

25.2.1.2 H/W Accelerators

A H/W accelerator is provided with the vector arithmetic control function that is used primarily to calculate the PWM duty value and the rectangle wave generation function. The accelerator can execute these PWM control and rectangle wave control functions simultaneously and can generate both the PWM compare value and rectangle wave pattern simultaneously.

Since the H/W accelerator can generate an interrupt on completion of processing in each IP and on a compare match and so on, it provides flexibility such that parts of arithmetic operations can be performed on a CPU.

Table 25.9 shows the outline of the H/W accelerator specifications.

Table 25.9 Major H/W Accelerator Specifications

Item	Function	Description
Inputs		Get various types of sensor information and triggers from A/D and R/D converters and so on.
	U/V/W phase current value inputs from an A/D converter	Get the results of A/D conversion on the U/V/W phase current values
	Resolver angle inputs from an R/D converter	Get the R/D conversion results and Z phase of the resolver.
	Carrier peak and trough trigger inputs from TSG3	Gets the peak and trough trigger signals from the carrier counter.
Outputs		Output rectangle wave pattern and PWM control signals to TSG3.
	Rectangle wave pattern outputs	1 bits×3 lines (U-phase pattern, V-phase pattern, W-phase pattern)
	PWM control value outputs	18 bits×4 lines (carrier period value, U-phase PWM compare value, V-phase PWM compare value, W-phase PWM compare value) 1 bit×1 line (Write Enable signal)
Register interface		Permits the SubCPU, CPU1, and CPU2 to manipulate the registers in the motor control H/W accelerators.
Interrupt outputs		8 output lines, selectable from 25 types of interrupt sources.
Motor control functions		The motor control functions are implemented in blocks as shown below.
	Input arithmetic function (input IP)	Performs dq conversion using the motor current value and electrical angle.
	PI control arithmetic function (PI control IP)	Exercises PI control using the current values of the dq-axes.
	PWM value arithmetic function (PWM IP)	Calculate the PWM duty value with 3-phase conversion using the voltage values of the dq-axes and electrical angles.
	Rectangle wave pattern arithmetic function (Rectangle IP)	Calculates the rectangle wave output level and compare value from the voltage phase value.
	Angle generation function (Angle generation IP)	Calculates the electrical angle from the resolver angle and detects resolver angle compare match and electrical angle compare match.
	Batch rectangle wave control function (batch rectangle IP)	Switches the U/V/W-phase rectangle wave output patterns all at once upon detection of an electrical angle compare match.
	Independent rectangle wave control function 1 (independent rectangle IP1)	Sets up three types each of compare values and rectangle wave output pattern values for each of the U/V/W phases and switches the rectangle wave output patterns at an independent timing of the phases.
	Independent rectangle wave control function 2 (independent rectangle IP2)	Generates rectangle waves of high degree of freedom with reinforcing the register compare function.
	Pulse period measurement timer / Resolver angle measurement timer	The timer that counts the number of cycles per Z-phase interval. It can be used as an item of information for calculating the speed.
	Checking buffer (fault detection function)	A buffer to be used by a CPU program to check the results of H/W accelerator processing.
	IIR filter	A quadratic IIR filter to be used filter out the current value obtained from an A/D converter.

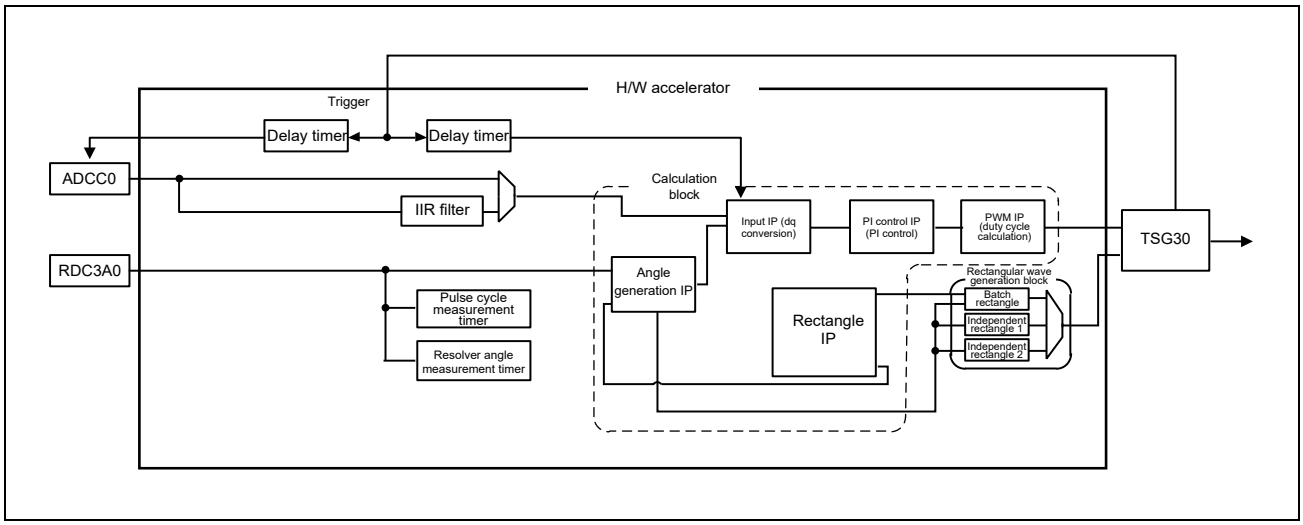
Simultaneous operation of an input IP, PI control IP, PWM IP, and Rectangle IP module is not possible. An attempt to start multiple IP modules from among those in this set at the same time leads to starting of that with the highest priority,

according to the priority order rectangle IP > input IP > PI control IP > PWM IP. An attempt to start an IP module which is identical to one that is already operating is ignored.

25.2.2 Block Diagram

The major components of the H/W accelerators are shown below*[1].

Note 1. The H/W accelerator (EMU31) of channel 1 is not provided for the C1M-A1.



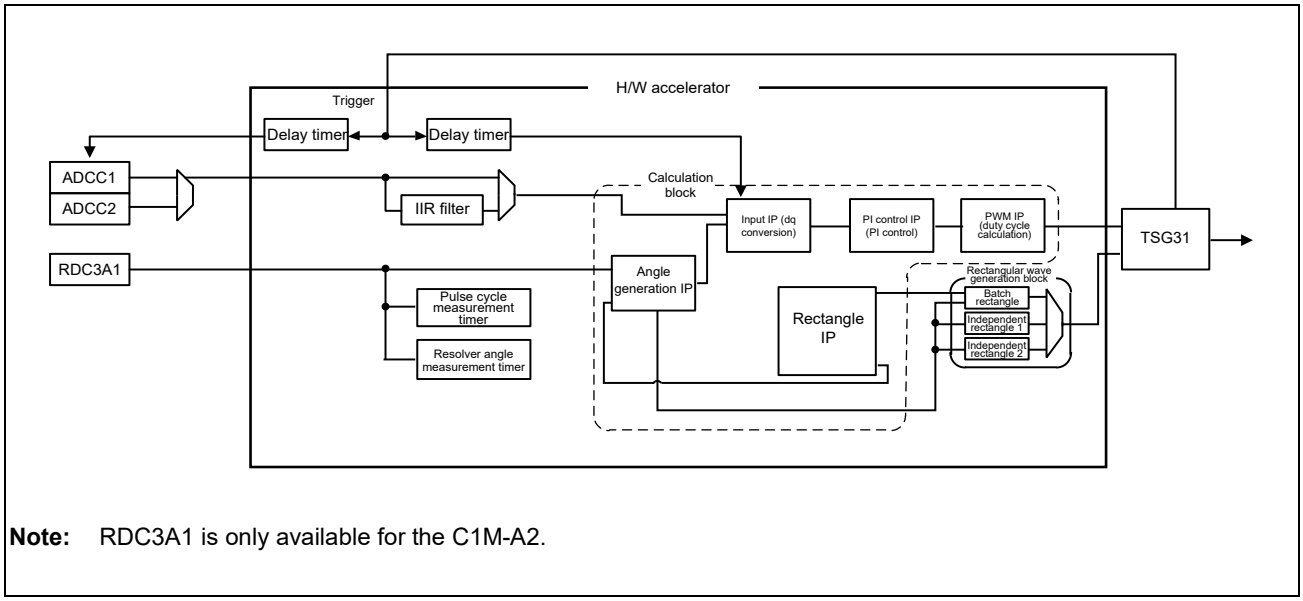


Figure 25.2 EMU30 Block Diagram

Note: RDC3A1 is only available for the C1M-A2.

Figure 25.3 EMU31 Block Diagram

The A/D converter data to be taken into the EMU31 can be selected from the ADC1 or ADC2. For details, see the register description of the ADC Select Register (EMU3ADCSEL).

25.3 Registers

25.3.1 List of Registers

The tables that follow list the registers of the EMU3. Blank entries in the Address column denote reserved areas. They must not be accessed.

Table 25.10 List of H/W Accelerator Registers (General/Common) (1/2)

Register Name	Symbol	Address	Access Width	Initial Value

EMU3n overflow detection result clear register	EMU3nOFMONC	<EMU3n_base> + 0052_H	8 R/W	00_H
EMU3n zero division detection result clear register	EMU3nZDMONC	<EMU3n_base> + 0053_H	8 R/W	00_H
EMU3n pulse period measurement timer control register	EMU3nPMTCTR	<EMU3n_base> + 0060_H	16 R/W	0000_H
EMU3n pulse period measurement timer counter register	EMU3nPMTCNT	<EMU3n_base> + 0064_H	32 R/W	$0000\ 0000_H$
EMU3n pulse period measurement timer capture register	EMU3nPMTCAP	<EMU3n_base> + 0068_H	32 R	$0000\ 0000_H$
EMU3n pulse period measurement timer overflow register	EMU3nPMTOF	<EMU3n_base> + $006C_H$	8 R/W	00_H

Table 25.10 List of H/W Accelerator Registers (General/Common) (2/2)

Register Name	Symbol	Address	Access Width	Initial Value
EMU3n resolver angle measurement timer control register	EMU3nPMT2CTR	<EMU3n_base> + 0070_H	8 R/W	00_H
EMU3n resolver angle measurement timer soft trigger register	EMU3nPMT2SFT	<EMU3n_base> + 0074_H	8 R/W	00_H
EMU3n resolver angle measurement timer counter register	EMU3nPMT2CNT	<EMU3n_base> + 0078_H	32 R/W	$0000\ 0000_H$
EMU3n resolver angle measurement timer capture register	EMU3nPMT2CAP	<EMU3n_base> + $007C_H$	32 R	$0000\ 0000_H$
EMU3n resolver angle measurement timer capture interval value register	EMU3nPMT2INVL	<EMU3n_base> + 0080_H	8 R/W	$0B_H$
EMU3n A/D conversion start soft trigger register	EMU3nADSFTTRG	<EMU3n_base> + 0084_H	8 R/W	00_H
EMU3n H/W arithmetic block IDLE time startup command A0 register	EMU3nFUNCIDLEGRPA0	<EMU3n_base> + 0090_H	16 R/W	0000_H
EMU3n H/W arithmetic block IDLE time startup command A1 register	EMU3nFUNCIDLEGRPA1	<EMU3n_base> + 0092_H	16 R/W	0000_H
EMU3n H/W arithmetic block IDLE time startup command A2 register	EMU3nFUNCIDLEGRPA2	<EMU3n_base> + 0094_H	16 R/W	0000_H
EMU3n H/W arithmetic block completion determination A register	EMU3nFUNCFINGRPA	<EMU3n_base> + 0096_H	16 R	0000_H
EMU3n H/W arithmetic block IDLE time startup command B register	EMU3nFUNCIDLEGRPB	<EMU3n_base> + 0098_H	16 R/W	0000_H
EMU3n H/W arithmetic block completion determination B register	EMU3nFUNCFINGRPB	<EMU3n_base> + $009A_H$	16 R	0000_H
EMU3n H/W arithmetic block WAIT time startup command A register	EMU3nFUNCWAITGRPA	<EMU3n_base> + $00A4_H$	16 R/W	0000_H
EMU3n H/W arithmetic block WAIT time startup command B register	EMU3nFUNCWAITGRPB	<EMU3n_base> + $00A8_H$	16 R/W	0000_H
EMU3n functional IP state determination A register	EMU3nFSMSTGRPA	<EMU3n_base> + $00D4_H$	32 R	$0000\ 0000_H$
EMU3n functional IP state determination B register	EMU3nFSMSTGRPB	<EMU3n_base> + $00D8_H$	32 R	$0000\ 0000_H$
EMU3n H/W arithmetic block post-completion transition control A0 register	EMU3nFUNCFLGRPA0	<EMU3n_base> + $00E4_H$	16 R/W	0000_H
EMU3n H/W arithmetic block post-completion transition control A1 register	EMU3nFUNCFLGRPA1	<EMU3n_base> + $00E8_H$	8 R/W	00_H
EMU3n H/W arithmetic block post-completion transition control A2 register	EMU3nFUNCFLGRPA2	<EMU3n_base> + $00EC_H$	32 R/W	$0000\ 0000_H$
EMU3n H/W arithmetic block post-completion transition control B register	EMU3nFUNCFLGRPB	<EMU3n_base> + $00F0_H$	32 R/W	$0000\ 0000_H$

Table 25.11 List of H/W Accelerator Registers (Angle Generation IP)

Register Name	Symbol	Address	Access Width	Initial Value
EMU3n angle generation IP control register	EMU3nANGCTR	<EMU3n_base> + 0180_H	8 R/W	00_H
EMU3n compare judgment correction register 0	EMU3nCPJUD0	<EMU3n_base> + 0182_H	8 R/W	FF_H
EMU3n compare judgment correction register 1	EMU3nCPJUD1	<EMU3n_base> + 0183_H	8 R/W	FF_H
EMU3n resolver angle software input register	EMU3nRESTHSFT	<EMU3n_base> + 0184_H	16 R/W	0000_H
EMU3n resolver angle offset value register	EMU3nANGOFS	<EMU3n_base> + 0186_H	16 R/W	0000_H
EMU3n electrical angle generation coefficient register	EMU3nPXR	<EMU3n_base> + 0188_H	16 R/W	0100_H
EMU3n resolver angle register	EMU3nRESTHETA	<EMU3n_base> + $018A_H$	16 R/W	0000_H
EMU3n electrical angle register	EMU3nTHTEFIX	<EMU3n_base> + $018C_H$	16 R/W	0000_H
EMU3n resolver pole number setting register	EMU3nRESRLD	<EMU3n_base> + $018E_H$	8 R/W	00_H
EMU3n resolver angle period count value register	EMU3nRESCNT	<EMU3n_base> + $018F_H$	8 R/W	00_H
EMU3n post error convolution resolver angle register	EMU3nTHTRESFIX	<EMU3n_base> + 0190_H	16 R/W	0000_H

Table 25.12 List of H/W Accelerator Registers (Input IP) (1/2)

Register Name	Symbol	Address	Access Width	Initial Value
EMU3n input IP control register	EMU3nCTRINMD	<EMU3n_base> + $01C0_H$	16 R/W	0000_H
EMU3n resolver angle monitor register	EMU3nTHTRESFIXIN	<EMU3n_base> + $01C4_H$	16 R	0000_H
EMU3n electrical angle retention register	EMU3nTHTE	<EMU3n_base> + $01C6_H$	16 R	0000_H
EMU3n input IP electrical angle software input register	EMU3nTHTESFT	<EMU3n_base> + $01C8_H$	16 R/W	0000_H
EMU3n electrical angle response delay correction variable register	EMU3nEARD	<EMU3n_base> + $01CA_H$	16 R/W	0000_H
EMU3n electrical angle input buffer register	EMU3nTHTEIBUF	<EMU3n_base> + $01CC_H$	16 R/W	0000_H
EMU3n input IP post correction electrical angle register	EMU3nTHTESEL	<EMU3n_base> + $01CE_H$	16 R/W	0000_H
EMU3n A/D data 0 register	EMU3nAD0	<EMU3n_base> + $01D0_H$	16 R/W	0000_H
EMU3n A/D data 0 input buffer register	EMU3nAD0IBUF	<EMU3n_base> + $01D2_H$	16 R/W	0000_H

EMU3n data set 3 READ3 register	EMU3nDATSETR33	<EMU3n_base> + 077E$_H$	16/32 R*4	0000$_H$
EMU3n data set 4 READ0 register	EMU3nDATSETR40	<EMU3n_base> + 0780$_H$	16/32 R*3	0000$_H$
EMU3n data set 4 READ1 register	EMU3nDATSETR41	<EMU3n_base> + 0782$_H$	16/32 R*4	0000$_H$
EMU3n data set 4 READ2 register	EMU3nDATSETR42	<EMU3n_base> + 0784$_H$	16/32 R*3	0000$_H$
EMU3n data set 4 READ3 register	EMU3nDATSETR43	<EMU3n_base> + 0786$_H$	16/32 R*4	0000$_H$
EMU3n data set 5 READ0 register	EMU3nDATSETR50	<EMU3n_base> + 0788$_H$	16/32 R*3	0000$_H$
EMU3n data set 5 READ1 register	EMU3nDATSETR51	<EMU3n_base> + 078A$_H$	16/32 R*4	0000$_H$
EMU3n data set 5 READ2 register	EMU3nDATSETR52	<EMU3n_base> + 078C$_H$	16/32 R*3	0000$_H$
EMU3n data set 5 READ3 register	EMU3nDATSETR53	<EMU3n_base> + 078E$_H$	16/32 R*4	0000$_H$

Note 1. Handles the lower-order 16 bits when using 32-bit data. See **Section 25.3.2.152, EMU3n Data Set kWRITEm Register (EMU3nDATSETWkm) (k = 0 to 5) (m = 0 to 3)** for details.

Note 2. Handles the higher-order 16 bits when using 32-bit data. See **Section 25.3.2.152, EMU3n Data Set kWRITEm Register (EMU3nDATSETWkm) (k = 0 to 5) (m = 0 to 3)** for details.

Note 3. Handles the lower-order 16 bits when using 32-bit data. See **Section 25.3.2.153, EMU3n Data Set kREADm Register (EMU3nDATSETRkm) (k = 0 to 5) (m = 0 to 3)** for details.

Note 4. Handles the higher-order 16 bits when using 32-bit data. See **Section 25.3.2.153, EMU3n Data Set kREADm Register (EMU3nDATSETRkm) (k = 0 to 5) (m = 0 to 3)** for details.

Table 25.21 List of EMUSS Registers

Register Name	Symbol	Address	Access Width	Initial Value
SubCPU startup register	EMU3CPUINIT	<EMU_base> + 0000_2000_H	8 R/W	00_H
ADC select register	EMU3ADCSEL	<EMU_base> + 0000_2040_H	8 R/W	00_H

In the register descriptions that follow, “Data (signed),” “Data bit (signed integer),” and “Data bit (signed fixed-point number)” are represented in 2's complement notation. The bit assigned to the sign part in each register description is represented by “(b**: Sign part).” For “(b15-11: Sign part),” for example, a 0 is written or read if b15-11 carry a positive number and a 1 is written or read if b15-11 carry a negative number.

25.3.2 Register Details

25.3.2.1 EMU3n Protect Register (EMU3nPRT)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0000_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PRTCT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.22 EMU3nPRT Register Contents

Bit Position	Bit	Function
7 to 1	—	These bits are read as 0. The write value should be 0.
0	PRTCT	Sets or resets protection of a register with a write protection. 0: Protected state 1: Unprotect

The EMU3nPRT register sets the protect function to prevent the EMU3nCTR register from being easily rewritten.

PRTCT bit

To change the EMU3nCTR register, follow the procedure below.

(1) Write "01_H" to the EMU3nPRT (Writing to the register is enabled).

(2) Change the value of the target register or bit(s).

(3) Write "00_H" to the EMU3nPRT (Writing to the register is disabled).

25.3.2.2 EMU3n Control Register (EMU3nCTR)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0004_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	EMUST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.23 EMU3nCTR Register Contents

Bit Position	Bit	Function
7 to 1	—	These bits are read as 0. The write value should be 0.
0	EMUST	EMU operation bit 0: Resets the EMU. 1: Runs the EMU.

The EMU3n control registers are initialized when the EMUST bit is set to 0. The target registers include the EMU3n control register (EMU3nCTR) and the registers other than the EMU3n protect register (EMU3nPRT), and the internal registers of the H/W accelerator.

The EMU3nCTR registers are in the protected state after a hardware reset. When writing to the EMU3nCTR register, use the EMU3nPRT register to release protection.

If writing to the EMU3nCTR register is inadvertently attempted while it is protected, set up a wait for at least 20 cycles of the CLK_EMU_L clock to elapse, then start again after releasing protection.

25.3.2.3 EMU3n Register Value Reflection Control Register (EMU3nREFCTR)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0008_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	FPWMREFPER
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.24 EMU3nREFCTR Register Contents

Bit Position	Bit	Function
7 to 1	—	These bits are read as 0. The write value should be 0.
0	FPWMREFPER	PWM IP register value reflection control bit Controls how the register value is to be reflected in the interior of the EMU circuitry. 0: Disables the value to be reflected. 1: Enables the value to be reflected.

The EMU3nREFCTR register selects the way in which the values loaded in the registers listed in **Table 25.25** are reflected in the interior of the H/W accelerator.

FPWMREFPER bit

The FPWMREFPER bit can be used to select the way in which the values of the registers listed in **Table 25.25** are to be reflected in the circuit interior when the PWM IP is started

The state of the signals in the interior of the circuits established after a reset is the “value of the corresponding register established after a reset”.

Table 25.25 Registers the Reflection of which Value can be Enabled or Disabled by the FPWMREFPER Bit

Register Name	Symbol
EMU3n d-axis voltage correction value register	EMU3nVDCRCT
EMU3n q-axis voltage correction value register	EMU3nVQCRCT
EMU3n PWM IP electrical angle offset register	EMU3nPHI
EMU3n non-interference control coefficient angular velocity value gain register	EMU3nDECVELG
EMU3n non-interference control coefficient Ld value register	EMU3nDECLD
EMU3n non-interference control coefficient Lq value register	EMU3nDECLQ
EMU3n non-interference control coefficient magnetic flux value register	EMU3nDECFLUX
EMU3n dq-axis voltage phase angle software input register	EMU3nTHTVSFT
EMU3n dq-axis voltage value software input register	EMU3nVDQSFT
EMU3n PWM modulation peak value register	EMU3nTMAX

25.3.2.4 EMU3n IP Startup Trigger Source Select Register (EMU3nIPTRG)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0010_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	RECIPTRG	PWMIPTRG	PIIPTRG	INIPTRG[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 25.26 EMU3nIPTRG Register Contents

Bit Position	Bit	Function
7 to 5	—	These bits are read as 0. The write value should be 0.
4	RECIPTRG	Rectangle IP startup trigger select bit 0: Software trigger (RECIPSFT bit of the EMU3nIPSFT register) 1: Angle compare 0 match
3	PWMIPTRG	PWM IP startup trigger select bit 0: Software trigger (PWMIPSFT bit of the EMU3nIPSFT register) 1: PI control IP complete
2	PIIPTRG	PI control P startup trigger select bit 0: Software trigger (PIIPSFT bit of the EMU3nIPSFT register) 1: Input IP complete
1, 0	INIPTRG[1:0]	Input IP startup trigger select bit 00: Software trigger (INIPSFT bit of the EMU3nIPSFT register) 01: Compare 0 match detected 10: A/D conversion complete*1 11: Compare 0 match detected or A/D conversion complete*1

Note 1. Selected by the combination of the EMU3nCTRINMD register, bits INSTCTR[1:0] and EMU3nADEND register, bits ADEND[1:0].

For details on the angle compare 0, see **Section 25.4.7.1, Batch Rectangle IP**.

25.3.2.5 EMU3n IP Software Startup Register (EMU3nIPSFT)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0014_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	RECIPSFT	PWMIPSFT	PIIPSFT	INIPSFT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.27 EMU3nIPSFT Register Contents

Bit Position	Bit	Function
7 to 4	—	These bits are read as 0. The write value should be 0.
3	RECIPSFT	Rectangle IP software startup bit Setting this bit to 1 starts the rectangle IP. The RECIPTRG bit of the EMU3nIPTRG register must be set to 0 in advance.
2	PWMIPSFT	PWM IP software startup bit Setting this bit to 1 starts the PWM IP. The PWMIPTRG bit of the EMU3nIPTRG register must be set to 0 in advance.
1	PIIPSFT	PI control IP software startup bit Setting this bit to 1 starts the PI control IP. The PIIPTRG bit of the EMU3nIPTRG register must be set to 0 in advance.
0	INIPSFT	Input IP software startup bit Setting this bit to 1 starts the input IP. The INIPTRG bit of the EMU3nIPTRG register must be set to 0 in advance.

This register is set up when starting the IPs under program control. The bits, after set to 1, are reset to 0 when the processing of the corresponding IPs is completed.

Before starting an IP under program control, clear the necessary bit of the EMU3nINTSD register associated with that IP. The bits of the EMU3nINTSD register are cleared through the EMU3nINTSDC register.

25.3.2.6 EMU3n A/D Conversion Completion Timing Select Register (EMU3nADEND)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0016_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ADEND	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.28 EMU3nADEND Register Contents

Bit Position	Bit	Function
7 to 2	—	These bits are read as 0. The write value should be 0.
1, 0	ADEND	A/D conversion completion timing select bit 00: A/D conversion complete 01: IIR filter channel 0 IIR filter processing complete 10: IIR filter channel 1 IIR filter processing complete 11: IIR filter channel 2 IIR filter processing complete

Note: For details, see **Section 25.4.8, A/D Conversion Control and Angle Value Latching Control.**

The value of the ADEND bit must be changed when the A/D converter is in the stopped state.

25.3.2.7 EMU3n A/D Conversion Start Trigger Source Select Register (EMU3nADTRG)

Access: Readable/writable in 8, 16, and 32 bit units.

Address: <EMU3n_base> + 0018_H

Value after reset: $0000\ 0000_H$

Category: General/common

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.30 EMU3nADMON Register Contents (1/3)

Bit Position	Bit	Function
31	NW7ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 W-phase compare 7 match detected) 0: No source. 1: Source occurred.
30	NW6ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 W-phase compare 6 match detected) 0: No source. 1: Source occurred.
29	NW5ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 W-phase compare 5 match detected) 0: No source. 1: Source occurred.
28	NW4ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 W-phase compare 4 match detected) 0: No source. 1: Source occurred.
27	NW3ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 W-phase compare 3 match detected) 0: No source. 1: Source occurred.
26	NW2ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 W-phase compare 2 match detected) 0: No source. 1: Source occurred.
25	NW1ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 W-phase compare 1 match detected) 0: No source. 1: Source occurred.
24	NW0ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 W-phase compare 0 match detected) 0: No source. 1: Source occurred.

Table 25.30 EMU3nADMON Register Contents (2/3)

Bit Position	Bit	Function
23	NV7ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 V-phase compare 7 match detected) 0: No source. 1: Source occurred.
22	NV6ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 V-phase compare 6 match detected) 0: No source. 1: Source occurred.
21	NV5ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 V-phase compare 5 match detected) 0: No source. 1: Source occurred.
20	NV4ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 V-phase compare 4 match detected) 0: No source. 1: Source occurred.
19	NV3ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 V-phase compare 3 match detected) 0: No source. 1: Source occurred.
18	NV2ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 V-phase compare 2 match detected) 0: No source. 1: Source occurred.
17	NV1ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 V-phase compare 1 match detected) 0: No source. 1: Source occurred.
16	NV0ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 V-phase compare 0 match detected) 0: No source. 1: Source occurred.
15	NU7ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 U-phase compare 7 match detected) 0: No source. 1: Source occurred.
14	NU6ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 U-phase compare 6 match detected) 0: No source. 1: Source occurred.
13	NU5ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 U-phase compare 5 match detected) 0: No source. 1: Source occurred.
12	NU4ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 U-phase compare 4 match detected) 0: No source. 1: Source occurred.
11	NU3ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 U-phase compare 3 match detected) 0: No source. 1: Source occurred.

Table 25.30 EMU3nADMON Register Contents (3/3)

Bit Position	Bit	Function
10	NU2ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 U-phase compare 2 match detected) 0: No source. 1: Source occurred.
9	NU1ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 U-phase compare 1 match detected) 0: No source. 1: Source occurred.
8	NU0ADM	A/D conversion start trigger source determination bit (independent rectangle IP2 U-phase compare 0 match detected) 0: No source. 1: Source occurred.
7 to 4	—	These bits are read as 0. The write value should be 0.
3	SFTADM	A/D conversion start trigger source determination bit (software trigger) 0: No source. 1: Source occurred.
2	CMPADM	A/D conversion start trigger source determination bit (angle compare 0 match detected) 0: No source. 1: Source occurred.
1	CAVALADM	A/D conversion start trigger source determination bit (carrier signal trough timing) 0: No source. 1: Source occurred.
0	CAMOUADM	A/D conversion start trigger source determination bit (carrier signal peak timing) 0: No source. 1: Source occurred.

Note: For details, see **Section 25.4.8, A/D Conversion Control and Angle Value Latching Control**.

This register is used to monitor the source of the A/D conversion start triggers that occurred. Each bit of the register is set to 1 when the source of the corresponding A/D conversion start trigger occurred. The bit is cleared by setting the corresponding bit of the EMU3nADMONC register.

25.3.2.9 EMU3n A/D Conversion Start Trigger Source Determination Clear Register (EMU3nADMONC)

Access: Readable/writable in 8, 16, and 32 bit units.

Address: <EMU3n_base> + 0020_H

Value after reset: $0000\ 0000_H$

Category: General/common

Table 25.31 EMU3nADMONC Register Contents (1/2)

Bit Position	Bit	Function
31	NW7ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 W-phase compare 7 match detected) Setting this bit to 1 resets the NW7ADM bit of the EMU3nADMON register to 0.
30	NW6ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 W-phase compare 6 match detected) Setting this bit to 1 resets the NW6ADM bit of the EMU3nADMON register to 0.
29	NW5ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 W-phase compare 5 match detected) Setting this bit to 1 resets the NW5ADM bit of the EMU3nADMON register to 0.
28	NW4ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 W-phase compare 4 match detected) Setting this bit to 1 resets the NW4ADM bit of the EMU3nADMON register to 0.
27	NW3ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 W-phase compare 3 match detected) Setting this bit to 1 resets the NW3ADM bit of the EMU3nADMON register to 0.
26	NW2ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 W-phase compare 2 match detected) Setting this bit to 1 resets the NW2ADM bit of the EMU3nADMON register to 0.
25	NW1ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 W-phase compare 1 match detected) Setting this bit to 1 resets the NW1ADM bit of the EMU3nADMON register to 0.
24	NW0ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 W-phase compare 0 match detected) Setting this bit to 1 resets the NW0ADM bit of the EMU3nADMON register to 0.
23	NV7ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 V-phase compare 7 match detected) Setting this bit to 1 resets the NV7ADM bit of the EMU3nADMON register to 0.
22	NV6ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 V-phase compare 6 match detected) Setting this bit to 1 resets the NV6ADM bit of the EMU3nADMON register to 0.

Table 25.31 EMU3nADMONC Register Contents (2/2)

Bit Position	Bit	Function
21	NV5ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 V-phase compare 5 match detected) Setting this bit to 1 resets the NV5ADM bit of the EMU3nADMON register to 0.
20	NV4ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 V-phase compare 4 match detected) Setting this bit to 1 resets the NV4ADM bit of the EMU3nADMON register to 0.
19	NV3ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 V-phase compare 3 match detected) Setting this bit to 1 resets the NV3ADM bit of the EMU3nADMON register to 0.
18	NV2ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 V-phase compare 2 match detected) Setting this bit to 1 resets the NV2ADM bit of the EMU3nADMON register to 0.
17	NV1ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 V-phase compare 1 match detected) Setting this bit to 1 resets the NV1ADM bit of the EMU3nADMON register to 0.
16	NV0ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 V-phase compare 0 match detected) Setting this bit to 1 resets the NV0ADM bit of the EMU3nADMON register to 0.
15	NU7ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 U-phase compare 7 match detected) Setting this bit to 1 resets the NU7ADM bit of the EMU3nADMON register to 0.
14	NU6ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 U-phase compare 6 match detected) Setting this bit to 1 resets the NU6ADM bit of the EMU3nADMON register to 0.
13	NU5ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 U-phase compare 5 match detected) Setting this bit to 1 resets the NU5ADM bit of the EMU3nADMON register to 0.
12	NU4ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 U-phase compare 4 match detected) Setting this bit to 1 resets the NU4ADM bit of the EMU3nADMON register to 0.
11	NU3ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 U-phase compare 3 match detected) Setting this bit to 1 resets the NU3ADM bit of the EMU3nADMON register to 0.
10	NU2ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 U-phase compare 2 match detected) Setting this bit to 1 resets the NU2ADM bit of the EMU3nADMON register to 0.
9	NU1ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 U-phase compare 1 match detected) Setting this bit to 1 resets the NU1ADM bit of the EMU3nADMON register to 0.
8	NU0ADMC	A/D conversion start trigger source determination register clear bit (independent rectangle IP2 U-phase compare 0 match detected) Setting this bit to 1 resets the NU0ADM bit of the EMU3nADMON register to 0.
7 to 4	—	These bits are read as 0. The write value should be 0.
3	SFTADMC	A/D conversion start trigger source determination register clear bit (software trigger) Setting this bit to 1 resets the SFTADM bit of the EMU3nADMON register to 0.
2	CMPADMC	A/D conversion start trigger source determination register clear bit (angle compare 0 match detected) Setting this bit to 1 resets the CMPADM bit of the EMU3nADMON register to 0.
1	CAVALADMC	A/D conversion start trigger source determination register clear bit (carrier counter trough) Setting this bit to 1 resets the CAVALADM bit of the EMU3nADMON register to 0.
0	CAMOUADMC	A/D conversion start trigger source determination register clear bit (carrier counter peak) Setting this bit to 1 resets the CAMOUADM bit of the EMU3nADMON register to 0.

Note: For details, see **Section25.4.8, A/D Conversion Control and Angle Value Latching Control**.

The bits of these register are automatically reset to 0 after they are set to 1. It is invalid to write a 0 to these bits. They are always read as 0.

25.3.2.10 EMU3n Data Delay Count Value Register (EMU3nDDCNT)

Access: Readable/writable in 32-bit units.

Address: <EMU3n_base> + 0024_H

Value after reset: $0000\ 0000_H$

Category: General/common

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDDATA(unsigned)[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDATA(unsigned)[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.32 EMU3nDDCNT Register Contents

Bit Position	Bit	Function
31 to 16	RDDATA[15:0]	Angle value latch delay setting bit The input IP latches the resolver angle and electrical angle value which are outputs from the angle generation to the input IP after the cycles specified in this register if an A/D conversion startup source specified by the IP EMU3nADTRG register occurs.
15 to 0	ADDATA[15:0]	A/D conversion trigger delay setting bit Output an A/D conversion start trigger to the A/D converter after the cycles specified in this register if an A/D conversion startup source specified by the EMU3nADTRG register occurs. Any new A/D conversion startup source occurring while the delay time processing is in progress is invalid.

Note: For details, see **Section 25.4.8, A/D Conversion Control and Angle Value Latching Control**.

This register defines the delay time of the A/D conversion trigger outputs and R/D conversion outputs. The conversions may be started with this register kept at their initial value of 0000_H. Any A/D conversion start trigger occurring while the delay counter is running is invalid.

25.3.2.11 EMU3n Interrupt Source Select k Register (EMU3nINTk) (k = 0 to 7)

Access: Readable/writable in 32-bit units.

Address: EMU3nINT0: <EMU3n_base> + 0028_H

EMU3nINT1: <EMU3n_base> + $002C_H$

EMU3nINT2: <EMU3n_base> + 0030_H

EMU3nINT3: <EMU3n_base> + 0034_H

EMU3nINT4: <EMU3n_base> + 0038_H

EMU3nINT5: <EMU3n_base> + $003C_H$

EMU3nINT6: <EMU3n_base> + 0040_H

EMU3nINT7: <EMU3n_base> + 0044_H

Value after reset: $0000\ 0000_H$

Category: General/common

Table 25.34 EMU3nINTSD Register Contents (1/3)

Bit Position	Bit	Function
31 to 25	—	When read, the value read is undefined.
24	FWGBIF	Interrupt source determination flag bit (angle generation IP WAIT transition detected) 0: Angle generation IP WAIT transition not occurred. 1: Angle generation IP WAIT transition occurred.
23	FWGAIF	Interrupt source determination flag bit (input, PI control, PWM IPWAIT transition detected) 0: Input, PI control, PWM IP WAIT transition not occurred. 1: Input, PI control, PWM IP WAIT transition occurred.
22	KCLIF	Interrupt source determination flag bit (Kirchhoff's current law violation detected) 0: Kirchhoff's current law violation not detected. 1: Kirchhoff's current law violation detected.
21	NRECWIF	Interrupt source determination flag bit (independent rectangle IP2 W-phase angle compare 0 match detected) 0: Independent rectangle IP2 W-phase angle compare 0 match not detected. 1: Independent rectangle IP2 W-phase angle compare 0 match detected.
20	NRECVIF	Interrupt source determination flag bit (independent rectangle IP2 V-phase angle compare 0 match detected.) 0: Independent rectangle IP2 V-phase angle compare 0 match not detected. 1: Independent rectangle IP2 V-phase angle compare 0 match detected.
19	NRECUIF	Interrupt source determination flag bit (independent rectangle IP2 U-phase angle compare 0 match detected.) 0: Independent rectangle IP2 U-phase angle compare 0 match not detected. 1: Independent rectangle IP2 U-phase angle compare 0 match detected.
18	IIR2IF	Interrupt source determination flag bit (IIR filter channel 2 complete) 0: IIR filter channel 2 completion not occurred. 1: IIR filter channel 2 completion occurred.

Table 25.34 EMU3nINTSD Register Contents (2/3)

Bit Position	Bit	Function
17	IIR1IF	Interrupt source determination flag bit (IIR filter channel 1 complete) 0: IIR filter channel 1 completion not occurred. 1: IIR filter channel 1 completion occurred.
16	IIR0IF	Interrupt source determination flag bit (IIR filter channel 0 complete) 0: IIR filter channel 0 completion not occurred. 1: IIR filter channel 0 completion occurred.
15	ADIF	Interrupt source determination flag bit (A/D conversion complete) 0: A/D conversion not completed. 1: A/D conversion completed.
14	PMT2CPIF	Interrupt source determination flag bit (resolver angle measurement timer capture) 0: Resolver angle measurement timer capture not occurred. 1: Resolver angle measurement timer capture occurred.
13	PMT2OFIF	Interrupt source determination flag bit (resolver angle measurement timer overflow) 0: Resolver angle measurement timer overflow not occurred. 1: Resolver angle measurement timer overflow occurred.
12	PMTOFIF	Interrupt source determination flag bit (pulse period measurement timer overflow) 0: Pulse period measurement timer overflow not occurred. 1: Pulse period measurement timer overflow occurred.
11	IRECWIF	Interrupt source determination flag bit (independent rectangle IP1W-phase angle compare 0 match detected) 0: Independent rectangle IP1W-phase angle compare 0 match not detected. 1: Independent rectangle IP1W-phase angle compare 0 match detected.
10	IRECVIF	Interrupt source determination flag bit (independent rectangle IP1V-phase angle compare 0 match detected.) 0: Independent rectangle IP1V-phase angle compare 0 match not detected. 1: Independent rectangle IP1V-phase angle compare 0 match detected.
9	IRECUIF	Interrupt source determination flag bit (independent rectangle IP1U-phase angle compare 0 match detected.) 0: Independent rectangle IP1U-phase angle compare 0 match not detected. 1: Independent rectangle IP1U-phase angle compare 0 match detected.
8	CMP1IF	Interrupt source determination flag bit (angle compare 1 match detected) 0: Angle compare 1 match not detected. 1: Angle compare 1 match detected.
7	CMP0IF	Interrupt source determination flag bit (angle compare 0 match detected.) 0: Angle compare 0 match not detected. 1: Angle compare 0 match detected.
6	CARMIF	Interrupt source determination flag bit (carrier counter peak) 0: Carrier counter peak not occurred. 1: Carrier counter peak occurred.
5	CARVIF	Interrupt source determination flag bit (carrier counter trough) 0: Carrier counter peak not occurred. 1: Carrier counter peak occurred.
4	CBUFIF	Interrupt source determination flag bit (checking buffering complete) 0: Checking register buffering not occurred. 1: Checking register buffering occurred.

Table 25.34 EMU3nINTSD Register Contents (3/3)

Bit Position	Bit	Function
3	RECIF	Interrupt source determination flag bit (rectangle IP complete) 0: rectangle IP completion not occurred. 1: rectangle IP completion occurred.
2	PWMIF	Interrupt source determination flag bit (PWM IP complete) 0: PWM IP completion not occurred. 1: PWM IP completion occurred.
1	PIIF	Interrupt source determination flag bit (PI control IP complete) 0: PI control IP completion not occurred. 1: PI control IP completion occurred.
0	INIF	Interrupt source determination flag bit (input IP complete) 0: Input IP completion not occurred. 1: Input IP completion occurred.

Note: For details, see **Section 25.4.15, Interrupt Control**.

The bits of this register are set to 1 when the operation initiated by the corresponding sources is completed. They can be used to determine the sources of interrupts that occurred.

25.3.2.13 EMU3n Interrupt Source Determination Clear Register (EMU3nINTSDC)

Access: Readable/writable in 32-bit units.

Address: <EMU3n_base> + $004C_H$

Value after reset: $0000\ 0000_H$

Category: General/common

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	FWGBIFC	FWGAIFC	KCLIFC	NRECWIFC	NRECVIFC	NRECUIFC	IIR2IFC	IIR1IFC	IIR0IFC

Table 25.35 EMU3nINTSDC Register Contents (1/2)

Bit Position	Bit	Function
31 to 25	—	These bits are read as 0. The write value should be 0.
24	FWGBIFC	Interrupt source determination flag clear bit (angle generation IP WAIT transition detected) Setting this bit to 1 resets the FWGBIF bit of the EMU3nINTSD register to 0.
23	FWGAIFC	Interrupt source determination flag clear bit (input, PI control, PWM IPWAIT transition detected) Setting this bit to 1 resets the FWGAIF bit of the EMU3nINTSD register to 0.
22	KCLIFC	Interrupt source determination flag clear bit (Kirchhoff's current law violation detected) Setting this bit to 1 resets the KCLIF bit of the EMU3nINTSD register to 0.
21	NRECWIFC	Interrupt source determination flag clear bit (independent rectangle IP2 W-phase angle compare 0 match detected) Setting this bit to 1 resets the NRECWIF bit of the EMU3nINTSD register to 0.
20	NRECVIFC	Interrupt source determination flag clear bit (independent rectangle IP2 V-phase angle compare 0 match detected) Setting this bit to 1 resets the NRECVIF bit of the EMU3nINTSD register to 0.
19	NRECUIFC	Interrupt source determination flag clear bit (independent rectangle IP2 U-phase angle compare 0 match detected) Setting this bit to 1 resets the NRECUIF bit of the EMU3nINTSD register to 0.
18	IIR2IFC	Interrupt source determination flag clear bit (IIR filter channel 2 complete) Setting this bit to 1 resets the IIR2IF bit of the EMU3nINTSD register to 0.
17	IIR1IFC	Interrupt source determination flag clear bit (IIR filter channel 1 complete) Setting this bit to 1 resets the IIR1IF bit of the EMU3nINTSD register to 0.
16	IIR0IFC	Interrupt source determination flag clear bit (IIR filter channel 0 complete) Setting this bit to 1 resets the IIR0IF bit of the EMU3nINTSD register to 0.
15	ADIFC	Interrupt source determination flag clear bit (A/D conversion complete) Setting this bit to 1 resets the ADIF bit of the EMU3nINTSD register to 0.
14	PMT2CPIFC	Interrupt source determination flag clear bit (resolver angle measurement timer capture) Setting this bit to 1 resets the PMT2CPIF bit of the EMU3nINTSD register to 0.
13	PMT2OFIFC	Interrupt source determination flag clear bit (resolver angle measurement timer overflow) Setting this bit to 1 resets the PMT2OFIF bit of the EMU3nINTSD register to 0.
12	PMTOFIFC	Interrupt source determination flag clear bit (pulse period measurement timer overflow) Setting this bit to 1 resets the PMTOFIF bit of the EMU3nINTSD register to 0.

Table 25.35 EMU3nINTSDC Register Contents (2/2)

Bit Position	Bit	Function
11	IRECWIFC	Interrupt source determination flag clear bit (independent rectangle IP1 W-phase angle compare 0 match detected) Setting this bit to 1 resets the IRECWIF bit of the EMU3nINTSD register to 0.
10	IRECVIFC	Interrupt source determination flag clear bit (independent rectangle IP1 V-phase angle compare 0 match detected.) Setting this bit to 1 resets the IRECVIF bit of the EMU3nINTSD register to 0.
9	IRECUIFC	Interrupt source determination flag clear bit (independent rectangle IP1 U-phase angle compare 0 match detected.) Setting this bit to 1 resets the IRECUIF bit of the EMU3nINTSD register to 0.
8	CMP1IFC	Interrupt source determination flag clear bit (angle compare 1 match detected) Setting this bit to 1 resets the CMP1IF bit of the EMU3nINTSD register to 0.
7	CMP0IFC	Interrupt source determination flag clear bit (angle compare 0 match detected.) Setting this bit to 1 resets the CMP0IF bit of the EMU3nINTSD register to 0.
6	CARMIFC	Interrupt source determination flag clear bit (carrier counter peak) Setting this bit to 1 resets the CARMIF bit of the EMU3nINTSD register to 0.
5	CARVIFC	Interrupt source determination flag clear bit (carrier counter trough) Setting this bit to 1 resets the CARVIF bit of the EMU3nINTSD register to 0.
4	CBUFIFC	Interrupt source determination flag clear bit (checking buffering complete) Setting this bit to 1 resets the CBUFIF bit of the EMU3nINTSD register to 0.
3	RECIFC	Interrupt source determination flag clear bit (rectangle IP complete) Setting this bit to 1 resets the RECIF bit of the EMU3nINTSD register to 0.
2	PWMIFC	Interrupt source determination flag clear bit (PWM IP complete) Setting this bit to 1 resets the PWMIF bit of the EMU3nINTSD register to 0.
1	PIIFC	Interrupt source determination flag clear bit (PI control IP complete) Setting this bit to 1 resets the PIIF bit of the EMU3nINTSD register to 0.
0	INIFC	Interrupt source determination flag clear bit (input IP complete) Setting this bit to 1 resets the INIF bit of the EMU3nINTSD register to 0.

Note: For details, see **Section 25.4.15, Interrupt Control**.

The bits of these registers are automatically reset to 0 after they are set to 1. It is invalid to write a 0 to these bits. They are always read as 0.

25.3.2.14 EMU3n Overflow Detection Result Register (EMU3nOFMON)

Access: Readable in 8-bit units.

Address: <EMU3n_base> + 0050_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	PWMIPOF	PIIPOF	INIPOF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 25.36 EMU3nOFMON Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	PWMIPOF	PWM IP overflow detection flag 0: No overflow detected. 1: Overflow detected.
1	PIIPOF	PI control IP overflow detection flag 0: No overflow detected. 1: Overflow detected.
0	INIPOF	Input IP overflow detection flag 0: No overflow detected. 1: Overflow detected.

25.3.2.15 EMU3n Zero Division Detection Result Register (EMU3nZDMON)

Access: Readable in 8-bit units.

Address: <EMU3n_base> + 0051_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	PWMIPZD	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 25.37 EMU3nZDMON Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	PWMIPZD	PWM IP zero division detection flag 0: No zero division detected. 1: Zero division detected.
1, 0	—	These bits are read as 0. The write value should be 0.

25.3.2.16 EMU3n Overflow Detection Result Clear Register (EMU3nOFMONC)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0052_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	PWMIPOFC	PIIPOFC	INIPOFC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.38 EMU3nOFMONC Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	PWMIPOFC	PWM IP overflow detection flag clear bit Setting this bit to 1 resets the PWMIPOF bit of the EMU3nOFMON register to 0.
1	PIIPOFC	PI control IP overflow detection flag clear bit Setting this bit to 1 resets the PIIPOF bit of the EMU3nOFMON register to 0.
0	INIPOFC	Input IP overflow detection flag clear bit Setting this bit to 1 resets the INIPOF bit of the EMU3nOFMON register to 0.

The bits of these registers are automatically reset to 0 after they are set to 1. It is invalid to write a 0 to these bits. They are always read as 0.

25.3.2.17 EMU3n Zero Division Detection Result Clear Register (EMU3nZDMONC)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0053_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	PWM IPZDC	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R	R

Table 25.39 EMU3nZDMONC Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	PWMIPZDC	PWM IP zero division detection flag clear bit Setting this bit to 1 resets the PWMIPZD bit of the EMU3nZDMON register to 0.
1, 0	—	These bits are read as 0. The write value should be 0.

The bits of these registers are automatically reset to 0 after they are set to 1. It is invalid to write a 0 to these bits. They are always read as 0.

25.3.2.18 EMU3n Pulse Period Measurement Timer Control Register (EMU3nPMTCTR)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + 0060_H

Value after reset: 0000_H

Category: General/common

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STTRG	—	—	—	—	—	—	—	—	—	—	—	—	—	OVFSW	STR

Table 25.41 EMU3nPMTCNT Register Contents

Bit Position	Bit	Function
31 to 25	—	These bits are read as 0. The write value should be 0.
24 to 0	DATA	Data bits (unsigned integer) These bits are loaded with a 25-bit up-counter value which is readable. The counter value can be updated by writing it in these bits.

Note: For details, see **Section 25.4.10, Pulse Cycle Measurement Timer**.

An EMU3nPMTCNT counter is a 25-bit counter that counts up on CLKC_HSB when the STR bit of the corresponding EMU3nPMTCTR register is set to 1. The value of this register can be rewritten regardless of whether the counter (capture operation) is running or stopped. Reading this register yields a counter value.

The EMU3nPMTCNT counter resets to $0000\ 0000_H$ when its value is loaded into the EMU3nPMTCAP register, that is capture operation, or when an overflow occurs in the EMU3nPMTCNT counter. The counter subsequently continues counting.

25.3.2.20 EMU3n Pulse Period Measurement Timer Capture Register (EMU3nPMTCAP)

Access: Readable in 32-bit units.

Address: <EMU3n_base> + 0068_H

Value after reset: $0000\ 0000_H$

Category: General/common

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	DATA (unsigned)								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA (unsigned)															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.42 EMU3nPMTCAP Register Contents

Bit Position	Bit	Function
31 to 25	—	These bits are read as 0. The write value should be 0.
24 to 0	DATA	Data bits (unsigned integer) These bits store a 25-bit capture value which is readable.

Note: For details, see **Section 25.4.10, Pulse Cycle Measurement Timer**.

An EMU3nPMTCAP register is a read-only register. It is loaded with the counter value from the EMU3nPMTCNT counter on a rising edge of the Z-phase signal or a software trigger (setting the STTRG bit of the EMU3nPMTCTR register to 1).

25.3.2.21 EMU3n Pulse Period Measurement Timer Overflow Register (EMU3nPMTOF)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $006C_H$

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.43 EMU3nPMTOF Register Contents

Bit Position	Bit	Function
7 to 1	—	These bits are read as 0. The write value should be 0.
0	OVF	Overflow flag bit 0: No overflow occurred. 1: Overflow occurred. The bit can be set to 1 manually if it is set to 0.

Note: For details, see **Section 25.4.10, Pulse Cycle Measurement Timer**.

The EMU3nPMTOF register is enabled when the OVFSW bit of the corresponding EMU3nPMTCTR register is set to 0.

OVF flag

[Set to 0 when:]

- A 0 is written to the OVF flag when the flag is set to 1.

[Set to 1 when]

- An overflow (01FF $FFFF_H \rightarrow 0000\ 0000_H$) occurs in the EMU3nPMTCNT counter when the OVFSW bit of the EMU3nPMTCTR register is set to 0 (EMU3nPMTOF register selected).
- A 1 is written to the OVF flag when the flag is set to 0.

25.3.2.22 EMU3n Resolver Angle Measurement Timer Control Register (EMU3nPMT2CTR)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0070_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	EN
Value after reset	0	0	0	0	0	0	0	0

Table 25.44 EMU3nPMT2CTR Register Contents

Bit Position	Bit	Function
7 to 1	—	These bits are read as 0. The write value should be 0.
0	EN	Counter enable bit 0: Disables the counter for counting. 1: Enables the counter for counting.

Note: For details, see **Section 25.4.11, Resolver Angle Measurement timer**.

25.3.2.23 EMU3n Resolver Angle Measurement Timer Soft Trigger Register (EMU3nPMT2SFT)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0074_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SCAPTRG
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.45 EMU3nPMT2SFT Register Contents

Bit Position	Bit	Function
7 to 1	—	These bits are read as 0. The write value should be 0.
0	SCAPTRG	Software capture trigger bit Setting this bit to 1, loads the value of the EMU3nPMT2CNT register into the EMU3nPMT2CAP register and a 0 value into the EMU3nPMT2CNT register (capture operation). The bit is automatically reset to 0 after it is set to 1. It is invalid to write a 0. The bit is always read as 0.

Note: For details, see **Section 25.4.11, Resolver Angle Measurement timer**.

25.3.2.24 EMU3n Resolver Angle Measurement Timer Counter Register (EMU3nPMT2CNT)

Access: Readable/writable in 32-bit units.

Address: <EMU3n_base> + 0078_H

Value after reset: $0000\ 0000_H$

Category: General/common

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA (unsigned)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA (unsigned)															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.46 EMU3nPMT2CNT Register Contents

Bit Position	Bit	Function
31 to 0	DATA	Data bits (unsigned integer) These bits store a 32-bit up-counter count value. The count value is updated every time a value is written into these bit positions.

Note: For details, see **Section 25.4.11, Resolver Angle Measurement timer**.

A resolver angle measurement timer is a 32-bit up-counter that counts up on each cycle in synchronization with CLKC_HSB. Its value can be rewritten regardless of whether the timer is running or stopped. Reading this register yields the count value of the timer.

The EMU3nPMT2CNT register is reset to 0 when the value of the EMU3nPMT2CNT register is loaded into the EMU3nPMT2CAP register as a capture operation or when a counter overflow occurs in the EMU3nPMT2CNT register. Subsequently, the timer continues count-up processing.

25.3.2.25 EMU3n Resolver Angle Measurement Timer Capture Register (EMU3nPMT2CAP)

Access: Readable in 32-bit units.

Address: <EMU3n_base> + $007C_H$

Value after reset: $0000\ 0000_H$

Category: General/common

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA (unsigned)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA (unsigned)															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.47 EMU3nPMT2CAP Register Contents

Bit Position	Bit	Function
31 to 0	DATA	Data bits (unsigned integer) These bits are loaded with the value of the EMU3nPMT2CNT register as a capture operation.

Note: For details, see **Section 25.4.11, Resolver Angle Measurement timer**.

The value of the EMU3nPMT2CNT register is loaded into the EMU3nPMT2CAP register on a “rising edge of the Z-phase signal”, which is selected by the EMU3nPMT2INVL register, or a software trigger (setting the STTRG bit of the EMU3nPMTCTR register to 1).

25.3.2.26 EMU3n Resolver Angle Measurement Timer Capture Interval Value Register (EMU3nPMT2INVL)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0080_H

Value after reset: $0B_H$

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	DATA (unsigned)				
Value after reset	0	0	0	0	1	0	1	1
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 25.48 EMU3nPMT2INVL Register Contents

Bit Position	Bit	Function
7 to 5	—	These bits are read as 0. The write value should be 0.
4 to 0	DATA	Data bits (unsigned integer) Select the capture interval according to the Z-phase signal or resolver angle as follows: $1F_H$: Capture on each rising edge of the Z-phase signal. $1E_H$ to 00_H: Inhibited

Note: For details, see **Section 25.4.11, Resolver Angle Measurement timer**.

The value this register must be changed after stopping the resolver angle measurement timer by setting the EN bit of the EMU3nPMT2CTR register to 0. It is inhibited to change the value of this register while the resolver angle measurement timer is running.

25.3.2.27 EMU3n A/D Conversion Start Soft Trigger Register (EMU3nADSFTTRG)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0084_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SFTAD
Value after reset	0	0	0	0	0	0	0	0

Table 25.50 EMU3nFUNCIDLEGRPA0 Register Contents

Bit Position	Bit	Function
15 to 13	—	These bits are read as 0. The write value should be 0.
12	SFTEN	Software startup enable bit This bit enables software startup of the input IP at a write access timing. If software startup is disabled, the input IP is started according to a startup source of the input IP. 0: Software startup disabled. 1: Software startup enabled. **CAUTION:** Any startup request issued when the IP bit of the EMU3nFUNCIDLEGRPA0 register is set to 0 is invalid.
11 to 9	—	These bits are read as 0. The write value should be 0.
8	IP	Startup IP specification enable bit This bit enables or disables the specification of starting H/W arithmetic block to be used when the input IP is started. 0: Disable. 1: Enable.
7 to 3	—	These bits are read as 0. The write value should be 0.
2 to 0	FUNC[2:0]	Startup H/W arithmetic block select bits These bits select the H/W arithmetic block to be initiated when starting the input IP.

Note: For details, see **Section 25.5.3, Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis)**.

- When starting the input IP on an input IP startup source

Register Value	Corresponding IP and H/W Arithmetic Block
01_00_H	Input IP's Func(input0) “No Operation”
01_01_H	Input IP's Func(input1) “Electrical angle source select”
01_04_H	Input IP's Func(input4) “Motor current value calculation”
01_05_H	Input IP's Func(input5) “dq-axis current conversion”

- When software-starting the input IP at timing of EMU3nFUNCIDLEGRPA0 register write access

Register Value	Corresponding IP and H/W Arithmetic Block
11_00_H	Input IP's Func(input0) “No Operation”
11_01_H	Input IP's Func(input1) “Electrical angle source select”
11_04_H	Input IP's Func(input4) “Motor current value calculation”
11_05_H	Input IP's Func(input5) “dq-axis current conversion”

25.3.2.29 EMU3n H/W Arithmetic Block IDLE Time Startup Command A1 Register (EMU3nFUNCIDLEGRPA1)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + 0092_H

Value after reset: 0000_H

Category: General/common

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 25.51 EMU3nFUNCIDLEGRPA1 Register Contents

Bit Position	Bit	Function
15 to 13	—	These bits are read as 0. The write value should be 0.
12	SFTEN	Software startup enable bit This bit enables software startup of the PI control IP at a write access timing. If software startup is disabled, the PI control IP is started according to a startup source of the PI control IP. 0: Software startup disabled. 1: Software startup enabled. **CAUTION:** Any startup request issued when the IP bit of the EMU3nFUNCIDLEGRPA1 register is set to 0 is invalid.
11 to 9	—	These bits are read as 0. The write value should be 0.
8	IP	Startup IP specification enable bit This bit enables or disables the specification of starting H/W arithmetic block to be used when the PI control IP is started. 0: Disable. 1: Enable.
7 to 1	—	These bits are read as 0. The write value should be 0.
0	FUNC	Startup H/W arithmetic block select bit These bits select the H/W arithmetic block to be initiated when starting the PI control IP.

Note: For details, see **Section 25.5.3, Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis)**.

- When not software-starting the PI control IP but starting it on a PI control IP startup source

Register Value	Corresponding IP and H/W Arithmetic Block
01_00_H	PI control IP Func(pi0) “No Operation”
01_01_H	PI control IP Func(pi1) “pi control”

- When software-starting the PI control IP at timing of EMU3nFUNCIDLEGRPA1 register write access

Register Value	Corresponding IP and H/W Arithmetic Block
11_00_H	PI control IP Func(pi0) “No Operation”
11_01_H	PI control IP Func(pi1) “pi control”

25.3.2.30 EMU3n H/W Arithmetic Block IDLE Time Startup Command A2 Register (EMU3nFUNCIDLEGRPA2)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + 0094_H

Value after reset: 0000_H

Category: General/common

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SFTEN	—	—	—	IP	—	—	—	—	FUNC[2:0]

R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.52 EMU3nFUNCIDLEGRPA2 Register Contents

Bit Position	Bit	Function
15 to 13	—	These bits are read as 0. The write value should be 0.
12	SFTEN	Software startup enable bit This bit enables software startup of the PWM IP at a write access timing. If software startup is disabled, the PWM IP is started according to a startup source of the PWM IP. 0: Software startup disabled. 1: Software startup enabled. **CAUTION:** Any startup request issued when the IP bit of the EMU3nFUNCIDLEGRPA2 register is set to 0 is invalid.
11 to 9	—	These bits are read as 0. The write value should be 0.
8	IP	Startup IP specification enable bit This bit enables or disables the specification of starting H/W arithmetic block to be used when the PWM IP is started. 0: Disable. 1: Enable.
7 to 4	—	These bits are read as 0. The write value should be 0.
3 to 0	FUNC[2:0]	Startup H/W arithmetic block select bit These bits select the H/W arithmetic block to be initiated when starting the PWM IP.

Note: For details, see **Section 25.5.3, Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis)**.

- When not software-starting the PWM IP but starting it on a PWM IP startup source

Register Value	Corresponding IP and H/W arithmetic block
01_00_H	PWM IP's Func(pwm0) “No Operation”
01_01_H	PWM IP's Func(pwm1) “dq-axis voltage correction (non-interference control)”
01_02_H	PWM IP's Func(pwm2) “Electrical angle offset processing”
01_03_H	PWM IP's Func(pwm3) “2-phase-to-3-phase conversion”
01_04_H	PWM IP's Func(pwm4) “PWM modulation”
01_05_H	PWM IP's Func(pwm5) “Duty factor calculation”
01_06_H	PWM IP's Func(pwm6) “Offset addition”
01_08_H	PWM IP's Func(pwm8) “Output voltage selection and limit processing”
01_09_H	PWM IP's Func(pwm9) “PWM value calculation”
01_0A_H	PWM IP's Func(pwm10) “Dead time compensation”
01_0B_H	PWM IP's Func(pwm11) “PWM value limit processing”

- When software-starting the PWM IP at timing of EMU3nFUNCIDLEGRPA2 register write access

Register Value	Corresponding IP and H/W Arithmetic Block
11_00_H	PWM IP's Func(pwm0) “No Operation”
11_01_H	PWM IP's Func(pwm1) “dq-axis voltage correction (non-interference control)”
11_02_H	PWM IP's Func(pwm2) “Electrical angle offset processing”
11_03_H	PWM IP's Func(pwm3) “2-phase-to-3-phase conversion”
11_04_H	PWM IP's Func(pwm4) “PWM modulation”
11_05_H	PWM IP's Func(pwm5) “Duty factor calculation”
11_06_H	PWM IP's Func(pwm6) “Offset addition”
11_08_H	PWM IP's Func(pwm8) “Output voltage selection and limit processing”
11_09_H	PWM IP's Func(pwm9) “PWM value calculation”
11_0A_H	PWM IP's Func(pwm10) “Dead time compensation”
11_0B_H	PWM IP's Func(pwm11) “PWM value limit processing”

25.3.2.31 EMU3n H/W Arithmetic Block Completion Determination A Register (EMU3nFUNCFINGRPA)

Access: Readable in 16-bit units.

Address: <EMU3n_base> + 0096_H

Value after reset: 0000_H

Category: General/common

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IP[1:0]		—	—	—	—	FUNC[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.53 EMU3nFUNCFINGRPA Register Contents

Bit Position	Bit	Function
15 to 10	—	These bits are read as 0. The write value should be 0.
9, 8	IP[1:0]	Completed IP determination bits Indicate the latest IP whose state has transited to IDEL or WAIT after completion of an H/W arithmetic block. 00: None 01: Input IP 10: PI control IP 11: PWM IP
7 to 4	—	These bits are read as 0. The write value should be 0.
3 to 0	FUNC[3:0]	Completed H/W arithmetic block determination bits Indicate the latest H/W arithmetic block whose state has transited to IDLE or WAIT after completion of a H/W arithmetic block

Note: For details, see **Section 25.5.3, Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis).**

NOTE

The register value is not updated when transiting to IDLE (input IP complete) with the INPUT5 bits of the EMU3nFUNCFLGRPA0 register indicating the last H/W arithmetic block of the input IP set to 00.

The register value is not updated when transiting to IDLE (PI control IP complete) with the PI1 bits of the EMU3nFUNCFLGRPA1 register indicating the last H/W arithmetic block of the PI control IP set to 00.

The register value is not updated when transiting to IDLE (PWM IP complete) with the PWM11 bits of the EMU3nFUNCFLGRPA2 register indicating the last H/W arithmetic block of the PWM IP set to 00.

Read Value	Corresponding IP and H/W Arithmetic Block
01_00_H	Input IP's Func(input0) “No Operation”
01_01_H	Input IP's Func(input1) “Electrical angle source select”
01_04_H	Input IP's Func(input4) “Motor current value calculation”
01_05_H	Input IP's Func(input5) “dq-axis current conversion”
02_00_H	PI control IP'S Func(pi0) “No Operation”
02_01_H	PI control IP's Func(pi1) “pi control”
03_00_H	PWM IP's Func(pwm0) “No Operation”
03_01_H	PWM IP's Func(pwm1) “dq-axis voltage correction (non-interference control)”
03_02_H	PWM IP's Func(pwm2) “Electrical angle offset processing”
03_03_H	PWM IP's Func(pwm3) “2-phase-to-3-phase conversion”
03_04_H	PWM IP's Func(pwm4) “PWM modulation”
03_05_H	PWM IP's Func(pwm5) “Duty factor calculation”
03_06_H	PWM IP's Func(pwm6) “Offset addition”
03_08_H	PWM IP's Func(pwm8) “Output voltage selection and limit processing”
03_09_H	PWM IP's Func(pwm9) “PWM value calculation”
03_0A_H	PWM IP's Func(pwm10) “Dead time compensation”
03_0B_H	PWM IP's Func(pwm11) “PWM value limit processing”

25.3.2.32 EMU3n H/W Arithmetic Block IDLE Time Startup Command B Register (EMU3nFUNCIDLEGRPB)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + 0098_H

Value after reset: 0000_H

Category: General/common

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	IP	—	—	—	—	FUNC[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.54 EMU3nFUNCIDLEGRPB Register Contents

Bit Position	Bit	Function
15 to 9	—	These bits are read as 0. The write value should be 0.
8	IP	Startup IP specification enable bit Enables or disables the specification of starting H/W arithmetic block when starting the angle generation IP. 0: Disable. 1: Enable.
7 to 4	—	These bits are read as 0. The write value should be 0.
3 to 0	FUNC[3:0]	Startup H/W arithmetic block specification bits These bits specify the H/W arithmetic block to be started when starting the angle generation IP.

Note: For details, see **Section 25.5.3, Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis)**.

Register Value	Corresponding IP and H/W Arithmetic Block
01_00_H	Angle generation IP Func(ang0) “No Operation”
01_06_H	Angle generation IP Func(ang6) “Offset error convolution”
01_07_H	Angle generation IP Func(ang7) “Electrical angle calculation”
01_08_H	Angle generation IP Func(ang8) “Angle compare match”

25.3.2.33 EMU3n H/W Arithmetic Block Completion Determination B Register (EMU3nFUNCFINGRPB)

Access: Readable in 16-bit units.

Address: <EMU3n_base> + $009A_H$

Value after reset: 0000_H

Category: General/common

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	IP	—	—	—	—	FUNC[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.55 EMU3nFUNCFINGRPB Register Contents

Bit Position	Bit	Function
15 to 9	—	These bits are read as 0. The write value should be 0.
8	IP	Completed IP determination bit Indicates the latest IP whose state has transited to IDLE or WAIT after completion of a H/W arithmetic block. 0: None 1: Angle generation IP
7 to 4	—	These bits are read as 0. The write value should be 0.
3 to 0	FUNC[3:0]	Completed H/W arithmetic block determination bits Indicate the latest H/W arithmetic block whose state has transited to IDLE or WAIT after completion of a H/W arithmetic block.

Note: For details, see **Section 25.5.3, Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis)**.

NOTE

The register value is not updated when transiting to IDLE (angle generation IP complete) with the ANG8 bits of the EMU3nFUNCFLGRPB register indicating the last H/W arithmetic block of the angle generation IP set to 00.

Read Value	Corresponding IP and H/W Arithmetic Block
01_00_H	Angle generation IP Func(ang0) “No Operation”
01_06_H	Angle generation IP Func(ang6) “Offset error convolution”
01_07_H	Angle generation IP Func(ang7) “Electrical angle calculation”
01_08_H	Angle generation IP Func(ang8) “Angle compare match”

25.3.2.34 EMU3n H/W Arithmetic Block WAIT Time Startup Command A Register (EMU3nFUNCWAITGRPA)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $00A4_H$

Value after reset: 0000_H

Category: General/common

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IP[1:0]		—	—	—	—	FUNC[3:0]

R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.56 EMU3nFUNCWAITGRPA Register Contents

Bit Position	Bit	Function
15 to 10	—	These bits are read as 0. The write value should be 0.
9, 8	IP[1:0]	WAIT time startup IP specification enable bits Specify the IP of the next H/W arithmetic block to be transited to while the input IP, PI control IP, or PWM IP is in WAIT state. The IP transits its state from WAIT and runs the specified H/W arithmetic block upon receipt of a register write access. 00: Disable 01: Input IP 10: PI control IP 11: PWM IP
7 to 4	—	These bits are read as 0. The write value should be 0.
3 to 0	FUNC[3:0]	WAIT time startup H/W arithmetic block specification bits Specify the next state to be transit, H/W arithmetic block or an IP completion (transition to IDLE), while the input IP, PI control IP, or PWM IP is in WAIT state.

Note: For details, see **Section 25.5.3, Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis)**.

Register Value	Corresponding IP and Arithmetic Block
01_00_H	Input IP's Func(input0) “No Operation”
01_01_H	Input IP's Func(input1) “Electrical angle source select”
01_04_H	Input IP's Func(input4) “Motor current value calculation”
01_05_H	Input IP's Func(input5) “dq-axis current conversion”
01_07_H	Input IP complete
02_00_H	PI control IP's Func(pi0) “No Operation”
02_01_H	PI control IP's Func(pi1) “pi control”
02_02_H	PI control IP complete
03_00_H	PWM IP's Func(pwm0) “No Operation”
03_01_H	PWM IP's Func(pwm1) “dq-axis voltage correction (non-interference control)”
03_02_H	PWM IP's Func(pwm2) “Electrical angle offset processing”
03_03_H	PWM IP's Func(pwm3) “2-phase-to-3-phase conversion”
03_04_H	PWM IP's Func(pwm4) “PWM modulation”
03_05_H	PWM IP's Func(pwm5) “Duty factor calculation”
03_06_H	PWM IP's Func(pwm6) “Offset addition”
03_08_H	PWM IP's Func(pwm8) “Output voltage selection and limit processing”
03_09_H	PWM IP's Func(pwm9) “PWM value calculation”
03_0A_H	PWM IP's Func(pwm10) “Dead time compensation”
03_0B_H	PWM IP's Func(pwm11) “PWM value limit processing”
03_0C_H	PWM IP complete

25.3.2.35 EMU3n H/W Arithmetic Block WAIT Time Startup Command B Register (EMU3nFUNCWAITGRPB)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $00A8_H$

Value after reset: 0000_H

Category: General/common

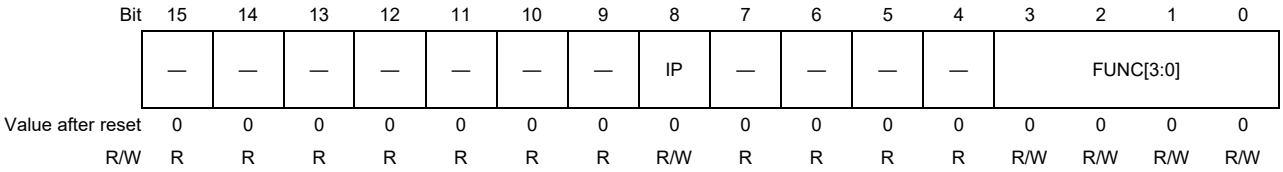

Table 25.57 EMU3nFUNCWAITGRPB Register Contents

Bit Position	Bit	Function
15 to 9	—	These bits are read as 0. The write value should be 0.
8	IP	WAIT time startup IP specification enable bits Specifies the next H/W arithmetic block to be transited to while the angle generation IP is in WAIT state. The IP transits its state from WAIT and runs the specified H/W arithmetic block upon receipt of a register write access. 0: Disable 1: Angle generation IP
7 to 4	—	These bits are read as 0. The write value should be 0.
3 to 0	FUNC[3:0]	WAIT time startup H/W arithmetic block specification bits Specify the next state to be transit, H/W arithmetic block or angle generation IP completion (transition to IDLE), while the angle generation IP is in WAIT state.

Note: For details, see **Section 25.5.3, Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis)**.

Register Value	Corresponding IP and Arithmetic Block
01_00_H	Angle generation IP Func(ang0) “No Operation”
01_06_H	Angle generation IP Func(ang6) “Offset error convolution”
01_07_H	Angle generation IP Func(ang7) “Electrical angle calculation”
01_08_H	Angle generation IP Func(ang8) “Angle compare match”
01_09_H	Angle generation IP complete

25.3.2.36 EMU3n Functional IP State Determination A Register (EMU3nFSMSTGRPA)

Access: Readable in 32-bit units.

Address: <EMU3n_base> + $00D4_H$

Value after reset: $0000\ 0000_H$

Category: General/common

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IP[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.58 EMU3nFSMSTGRPA Register Contents

Bit Position	Bit	Function
31 to 18	—	These bits are read as 0. The write value should be 0.
17, 16	IP[1:0]	Active IP determination bits Reading this bit indicates the function IP that is running. 00: All of the input IP, PI control IP, and PWM IP are in IDLE state. 01: The input IP is running (not in idle state). 10: The PI control IP is running (not in idle state). 11: The PWM IP is running (not in idle state).
15 to 9	—	These bits are read as 0. The write value should be 0.
8	WAIT	Wait state determination bit Reading this bit indicates the wait state of the function IP designated by the IP bits. 0: The function IP is not in wait state (idle or busy state). 1: The function IP is in wait state.
7 to 1	—	These bits are read as 0. The write value should be 0.
0	BUSY	Busy state determination bit Reading this bit indicates the busy state of the function IP designated by the IP bits. 0: The function IP is not in busy state (idle or wait state). 1: The function IP is in busy state.

Note: For details, see **Section 25.5.3, Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis)**.

25.3.2.37 EMU3n Functional IP State Determination B Register (EMU3nFSMSTGRPB)

Access: Readable in 32-bit units.

Address: <EMU3n_base> + $00D8_H$

Value after reset: $0000\ 0000_H$

Category: General/common

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IP

Note: For details, see **Section 25.5.3, Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis).**

25.3.2.42 EMU3n Angle Generation IP Control Register (EMU3nANGCTR)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0180_H

Value after reset: 00_H

Category: Angle generation IP

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ANGSEL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.64 EMU3nANGCTR Register Contents

Bit Position	Bit	Function
7 to 1	—	These bits are read as 0. The write value should be 0.
0	ANGSEL	Angle information select bit 0: Uses the resolver angle from the R/D converter. 1: Uses the value of the EMU3nRESTHSFT register.

Note: For details, see **Section 25.4.2, Angle Generation IP**. RDC3A1 is only available for the C1M-A2.

25.3.2.43 EMU3n Compare Judgment Correction Register 0 (EMU3nCPJUD0)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0182_H

Value after reset: FF_H

Category: Angle generation IP

Bit	7	6	5	4	3	2	1	0
	DATA (unsigned)							
Value after reset	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.65 EMU3nCPJUD0 Register Contents

Bit Position	Bit	Function
7 to 0	DATA	Data bits (unsigned integer) Store the correction value to be used to detect angle transitions.

Note: For details, see **Section 25.4.2(3), Func(ang8) angle compare match**.

This register must be rewritten during the initialization which is to be started before starting motor control. It is inhibited to rewrite this register after motor control is started.

25.3.2.44 EMU3n Compare Judgment Correction Register 1 (EMU3nCPJUD1)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0183_H

Value after reset: FF_H

Category: Angle generation IP

Bit	7	6	5	4	3	2	1	0
	DATA (unsigned)							
Value after reset	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.66 EMU3nCPJUD1 Register Contents

Bit Position	Bit	Function
7 to 0	DATA	Data bits (unsigned integer) Store the correction value to be used to detect resolver angle transitions.

Note: For details, see **Section 25.4.2(3), Func(ang8) angle compare match**.

This register must be rewritten during the initialization which is to be started before starting motor control. It is inhibited to rewrite this register after motor control is started.

25.3.2.45 EMU3n Resolver Angle Software Input Register (EMU3nRESTHSFT)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + 0184_H

Value after reset: 0000_H

Category: Angle generation IP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DATA (unsigned)											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.67 EMU3nRESTHSFT Register Contents

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA	Data bits (unsigned integer) Store the software set resolver angle that is applied to the angle generation IP.

Note: For details, see **Section 25.4.2(1) Func(ang6) Convolve offset error**.

25.3.2.46 EMU3n Resolver Angle Offset Value Register (EMU3nANGOFS)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + 0186_H

Value after reset: 0000_H

Category: Angle generation IP

	Sign part															
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA (signed)															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.68 EMU3nANGOFS Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (signed integer) (b15-11: Sign part) Store the offset value for the resolver angle that is applied to the angle generation IP.

Note: For details, see **Section 25.4.2(1) Func(ang6) Convolve offset error**.

25.3.2.47 EMU3n Electrical Angle Generation Coefficient Register (EMU3nPXR)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + 0188_H

Value after reset: 0100_H

Category: Angle generation IP

	Integer part								Fraction part							
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA (signed)															
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.69 EMU3nPXR Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (signed fixed-point numbers) (b15: Sign part) Store the multiplier coefficient value to be used for electrical angle generation. **CAUTION:** b15 must always be set to 0.

Note: For details, see **Section 25.4.2(2), Func(ang7) Electrical angle**.

This register is used to store fixed-point numbers consisting of an 8-bit integer part and an 8-bit fractional part. After a multiplication is performed using the value of this register as the multiplication coefficient, the results of the multiplication are shifted 8 bits to the right.

25.3.2.48 EMU3n Resolver Angle Register (EMU3nRESTHETA)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $018A_H$

Value after reset: 0000_H

Category: Angle generation IP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DATA (unsigned)											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.70 EMU3nRESTHETA Register Contents

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA	Data bits (unsigned integer) Store the value of the resolver angle that is applied to the angle generation IP.

Note: For details, see **Section 25.4.2(1) Func(ang6) Convolve offset error, Section 25.4.2(2) Func(ang7) Electrical angle calculation, Section 25.4.2(3) Func(ang8) angle compare match**.

25.3.2.49 EMU3n Electrical Angle Register (EMU3nTHTEFIX)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $018C_H$

Value after reset: 0000_H

Category: Angle generation IP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DATA (unsigned)											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.71 EMU3nTHTEFIX Register Contents

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA	Data bits (unsigned integer) Store the value of the electrical angle that is generated by the angle generation IP.

Note: For details, see **Section 25.4.2(1) Func(ang6) Convolve offset error, Section 25.4.2(2) Func(ang7) Electrical angle, Section 25.4.2(3) Func(ang8) angle compare match**.

25.3.2.50 EMU3n Resolver Angle Poles Value Register (EMU3nRESRLD)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $018E_H$

Value after reset: 00_H

Category: Angle generation IP

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	DATA (unsigned)		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.72 EMU3nRESRLD Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2 to 0	DATA	Data bits (unsigned integer) These bits must be set with the number of resolver angle poles minus 1.

Note: For details, see **Section 25.4.2(2)**, **Func(ang7) Electrical angle**.

25.3.2.51 EMU3n Resolver Angle Period Count Value Register (EMU3nRESCNT)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $018F_H$

Value after reset: 00_H

Category: Angle generation IP

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	DATA (unsigned)		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.73 EMU3nRESCNT Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2 to 0	DATA	Data bits (unsigned integer) Count value that increments or decrements as the position of the resolver angle pole transits. Writing a value in these bit positions updates the count value.

Note: For details, see **Section 25.4.2(2), Func(ang7) Electrical angle**.

25.3.2.52 EMU3n Post Error Convolution Resolver Angle Register (EMU3nTHTRESFIX)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + 0190_H

Value after reset: 0000_H

Category: Angle generation IP,

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DATA (unsigned)

R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.74 EMU3nTHTRESFIX Register Contents

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA	Data bits (unsigned integer)

Note: For details, see **Section 25.4.2(1) Func(ang6) Convolve offset error**.

25.3.2.53 EMU3n Input IP Control Register (EMU3nCTRINMD)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $01C0_H$

Value after reset: 0000_H

Category: Input IP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	INSTCTR[1:0]		CMUVW[1:0]			CMES	KCL	FREGIN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.75 EMU3nCTRINMD Register Contents

Bit Position	Bit	Function
15 to 8	—	These bits are read as 0. The write value should be 0.
7, 6	INSTCTR[1:0]	A/D conversion completion timing (input IP startup timing) select bits*1 00: All A/D conversions within A/D channel group are completed. (A/D converter scan group 4 scan ended) 01: A/D channel 0 A/D conversion completed (A/D converter virtual channel 0 conversion completed) 10: A/D channel 1 A/D conversion completed (A/D converter virtual channel 1 conversion completed) 11: A/D channel 2 A/D conversion completed (A/D converter virtual channel 2 conversion completed)
5 to 3	CMUVW[1:0]	These bits select the target of current value measurement when the CMES bit is set to 1. 000: 3 phases (U phase, V phase, and W phase) are measured. 001: 2 phases (V phase and W phase) are measured. 010: 2 phases (U phase and W phase) are measured. 100: 2 phases (U phase and V phase) are measured. Other than above are inhibited.
2	CMES	Selects the target of current measurement. 0: 2 phases (V phase and W phase) are measured. 1: Selected by the CMUVW bits.
1	KCL	Kirchhoff's current law violation detection processing setting bit 0: Disables Kirchhoff's current law violation detection processing. 1: Enables Kirchhoff's current law violation detection processing.
0	FREGIN	Angle data select bit This bit selects the electrical angle to be used by the input IP. 0: Uses the value of the EMU3nTHTESFT register. 1: Uses the electrical input buffer (EMU3nTHTEIBUF). (The above-mentioned buffer is the one that is loaded with the electrical angle (EMU3nTHTE register) generated by the angle generation IP when the input IP is started.

Note 1. The bits INSTCTR[1:0] must be changed only when the A/D converter is stopped.

This register is used to control the input IP. For control details of the bits, see **Section 25.4.3, Input IP**.

CAUTION

The connection relationship between the A/D converter's virtual channel registers (VCRk (k = 0, 1, 2)) and data registers (DRk (k = 0, 1, 2)) and the EMU3's A/D data channels (k = 0, 1, 2) is summarized below. Set up the registers in the A/D converter so that the A/D converter's virtual channels 0-2 can output the following current values that the EMU3 expects.

A/D Converter Side	EMU3 Side	Current Value that the EMU3 Expects
Virtual channel 0 (VCR0, DR0)	A/D data channel 0	V-phase current value
Virtual channel 1 (VCR1, DR1)	A/D data channel 1	W-phase current value
Virtual channel 2 (VCR2, DR2)	A/D data channel 2	U-phase current value

25.3.2.54 EMU3n Resolver Angle Monitor Register (EMU3nTHTRESFIXIN)
EMU3n Electrical Angle Retention Register (EMU3nTHTE)
EMU3n Input IP Electrical Angle Software Input Register (EMU3nTHTESFT)
EMU3n Electrical Angle Response Delay Correction Variable Register (EMU3nEARD)
EMU3n Electrical Angle Input Buffer Register (EMU3nTHTEIBUF)
EMU3n Input IP Post Correction Electrical Angle Register (EMU3nTHTESEL)

Access: EMU3nTHTRESFIXIN: Readable in 16-bit units.
EMU3nTHTE: Readable in 16-bit units.
EMU3nTHTESFT: Readable/writable in 16-bit units.
EMU3nEARD: Readable/writable in 16-bit units.
EMU3nTHTEIBUF: Readable/writable in 16-bit units.
EMU3nTHTESEL: Readable/writable in 16-bit units.

Address: EMU3nTHTRESFIXIN: <EMU3n_base> + $01C4_H$

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA	Data bits (unsigned integer) Loaded with the A/D conversion value from the A/D converter upon completion of A/D conversion. The A/D conversion value can be changed by writing this register with a new value.

Note: For details, see Section **25.4.3(2), Func(input4) Motor** current value calculation.

This register is loaded with the results of A/D conversion at the timing that is specified by the INSTCTR bit of the EMU3nCTRINMD register. The conversion value can also be rewritten from a CPU program. If the loading of the A/D conversion results and the writing by a CPU program occur at the same time, the loading of the A/D conversion results takes precedence.

25.3.2.56 EMU3n A/D Data k Input Buffer Register (EMU3nADkIBUF) (k = 0, 1, 2)

Access: Readable/writable in 16-bit units.

Address: EMU3nAD0IBUF: <EMU3n_base> + $01D2_H$

EMU3nAD1IBUF: <EMU3n_base> + $01D6_H$

EMU3nAD2IBUF: <EMU3n_base> + $01DA_H$

Value after reset: 0000_H

Category: Input IP

Table 25.78 EMU3nADkIBUF Register Contents

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA	Data bits (unsigned integer) Loaded with the A/D data or the data that is subjected to IIR filter processing according to the settings of the EMU3nADBUFSEL register when the input IP is started. The data is used for arithmetic processing.

Note: For details, see **Section 25.4.3(2), Func(input4) Motor current value calculation**.

25.3.2.57 EMU3n A/D Data k Conversion Value Register (EMU3nADkFIX) (k = 0, 1, 2)

Access: Readable/writable in 16-bit units.

Address: EMU3nAD0FIX: <EMU3n_base> + $01DC_H$

EMU3nAD1FIX: <EMU3n_base> + $01E0_H$

EMU3nAD2FIX: <EMU3n_base> + $01E4_H$

Table 25.80 EMU3nADkOFS Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (signed integer) (b15: Sign part) Set the origin correction value that is used to convert the sign of the A/D conversion value stored in the EMU3nADkFIX register from unsigned to signed.

Note: For details, see **Section 25.4.3(2), Func(input4) Motor current value calculation**.

The signed integer A/D data is calculated by subtracting the value of this register from the value of the EMU3nADkFIX register.

(Signed integer value) = EMU3nADkFIX - EMU3nADkOFS

25.3.2.59 EMU3n dq-Axis Current Transformation Coefficient Register (EMU3nSR2)

Access: Readable/writable in 32-bit units.

Address: <EMU3n_base> + $01E8_H$

Value after reset: $0000\ D106_H$

Category: Input IP

Integer part

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA (signed)															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Fraction part

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 25.81 EMU3nSR2 Register Contents

Bit Position	Bit	Function
31 to 0	DATA	Data bits (signed fixed-point numbers) (b31: Sign part) Set the coefficient to be used to convert 3-phase current values to dq-axis current values. The value established after a reset is $\sqrt{(2/3)}$.

Note: For details, see **Section 25.4.3(3), Func(input5) dq-axis current** .

This register is used to store fixed-point numbers consisting of a 16-bit integer part and a 16-bit fractional part. After a multiplication is performed using the value of this register as the multiplication coefficient, the results of the multiplication are shifted 16 bits to the right.

This register is set a value of $0000\ D106_H$ after a reset. This is equivalent to the following calculation results:

$\sqrt{(2/3)} \times 65536 = 0000\ D106_H$ (rounded off the fractional part)

25.3.2.60 EMU3n LSB Adjustment Register (EMU3nDIVLSB)

Access: Readable/writable in 32-bit units.

Address: <EMU3n_base> + $01EC_H$

Value after reset: $0001\ 0000_H$

Category: Input IP

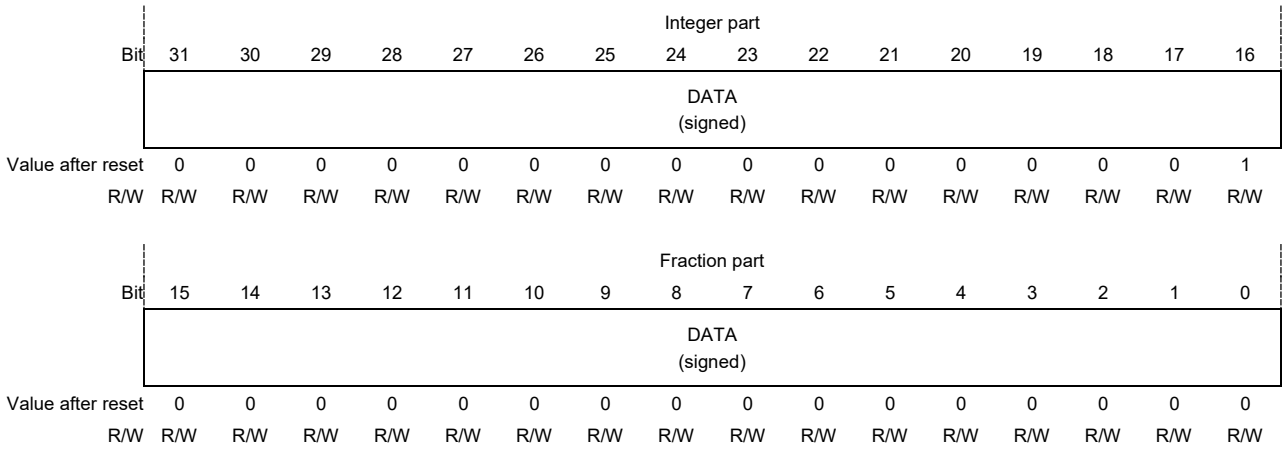

Table 25.82 EMU3nDIVLSB Register Contents

Bit Position	Bit	Function
31 to 0	DATA	Data bits (signed fixed-point numbers) (b31: Sign part) Set the multiplication coefficient that is applied to each phase of the 3-phase current values.

Note: For details, see Section **25.4.3(2), Func(input4) Motor current value calculation**.

This register is used to store fixed-point numbers consisting of a 16-bit integer part and a 16-bit fractional part. After a multiplication is performed using the value of this register as the multiplication coefficient, the results of the multiplication are shifted 16 bits to the right.

25.3.2.61 EMU3n U-Phase Current Value Register (EMU3nIUFIX)
EMU3n V-Phase Current Value Register (EMU3nIVFIX)
EMU3n W-Phase Current Value Register (EMU3nIWFIX)
EMU3n d-Axis Current Value Register (EMU3nIDFIX)
EMU3n q-Axis Current Value Register (EMU3nIQFIX)

Access: Readable/writable in 32-bit units.

Address: EMU3nIUFIX: <EMU3n_base> + $01F0_H$

EMU3nIVFIX: <EMU3n_base> + $01F4_H$

EMU3nIWFIX: <EMU3n_base> + $01F8_H$

Table 25.92 EMU3nPWMCTR Register Contents (1/2)

Bit Position	Bit	Function
31 to 21	—	These bits are read as 0. The write value should be 0.
20	FPWMIBTH	PWM IP internal input buffer function setting bit 0: Enables the PWM IP internal input buffer function. 1: Disables the PWM IP internal input buffer function.
19 to 17	—	These bits are read as 0. The write value should be 0.
16	—	These bits are read as 1. The write value should be 1.
15	SETDTO	Dead time compensation processing setting bit 0: Disables dead time compensation processing. 1: Enables dead time compensation processing.
14, 13	PWMOP[1:0]	PWM directive value operation select bits 00: PWM 50% duty + voltage directive value 01: PWM 50% duty – voltage directive value 10: Voltage directive value 11: Inhibited
12	SETDEC	Non-interference control setting bit 0: Disables non-interference control processing. 1: Enables non-interference control processing.
11, 10	DECIDQ[1:0]	Non-interference control dq-axis current value select bits 00: Uses the values of the EMU3nID and EMU3nIQ registers as the dq-axis current values. 01: Uses the values of the EMU3nIDFIXOBUFand EMU3nIQFIXOBUF registers as the dq-axis current values. 10: Uses the values of the EMU3nIDIN and EMU3nIQIN registers as the dq-axis current values. 11: Inhibited
9	SETVEL	Angle velocity select bit 0: Uses the value of the EMU3nVELSFT register. 1: Uses the angle velocity value from the RDC.

Table 25.92 EMU3nPWMCTR Register Contents (2/2)

Bit Position	Bit	Function
8	VDQSEL	dq-axis voltage input select bit 0: Designates the d-axis voltage (Vd) and q-axis voltage (Vq) as the inputs to the PWM IP. 1: Designates the dq-axis voltage (Vdq) and dq-axis phase difference (Vθ) as the inputs to the PWM IP.
7	PWMSEL	PWM arithmetic reference value select bit 0: Generates from the value specified in the EMU3nCARR register (carrier period). 1: Generates from the values of the EMU3nCARR register (carrier period) and EMU3nDTT register (short-circuit prevention time).
6	SHIPWM	Output carrier /PWM compare value shift bit 0: Outputs the carrier period and PWM compare values to the TSG3 without shifts. 1: Outputs the carrier period and PWM compare values that shifted 1 bit to the left (doubling) before outputting to the TSG3.
5, 4	FLININIP[1:0]	Electrical angle select bits 00: Use the value of the EMU3nTHTFORESFT register. 01: Use the value of the EMU3nTHTESEL register that is calculated by the input IP. 10: Use the value that is calculated by the angle generation IP. 11: Inhibited
3 to 1	SETHARM[2:0]	PWM modulation mode setting bits 000: Does not apply modulation. 001: Applies SVM. 010: Applies 2-phase modulation. 011: Applies 2-phase SVM (PWM0). 100: Applies 2-phase SVM (PWM1). 101: Applies 2-phase SVM (PWM2). 110: Applies 2-phase SVM (PWM3). 111: Applies third harmonic wave convolution. (Settings other than VDQSEL = 1 are inhibited.)
0	SETPWM	PWM setting bit Selects the output to the TSG3. 0: Uses the values of the EMU3nPWMU, EMU3nPWMV, and EMU3nPWMW registers. 1: Uses the values of the EMU3nPWMUIP, EMU3nPWMVIP, and EMU3nPWMWIP registers that are calculated by the PWM IP.

This register controls the PWM IP. For details on the control of each bit, see **Section 25.4.5, PWM IP**.

25.3.2.71 EMU3n PWM Data Software Transfer Register (EMU3nPWMDT)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0304_H

Value after reset: 00_H

Category: PWM IP

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWMDT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.93 EMU3nPWMDT Register Contents

Bit Position	Bit	Function
7 to 1	—	These bits are read as 0. The write value should be 0.
0	PWMDT	PWM data software transfer trigger bit Setting this bit to 1 causes the carrier period and PWM compare values to be transferred to the TSG3. This bit is automatically reset to 0 after being set to 1. It is inhibited to write a 0. This bit is always read as 0.

Note: For details, see **Section 25.4.5(11) Func(pwm_out) PWM value output processing**.

25.3.2.72 EMU3n d-Axis Voltage Correction Value Register (EMU3nVDCRCT) EMU3n q-Axis Voltage Correction Value Register (EMU3nVQCRCT)

Access: Readable/writable in 32-bit units.

Address: EMU3nVDCRCT: <EMU3n_base> + 0308_H

EMU3nVQCRCT: <EMU3n_base> + $030C_H$

Value after reset: $0000\ 0000_H$

Category: PWM IP

Table 25.94 EMU3nVDCRCT, EMU3nVQCRCT Register Contents

Bit Position	Bit	Function
31 to 0	DATA	Data bits (signed integer) (b31: Sign part) Set the correction value for the d-axis voltage value that is applied to the PWM IP. Set the correction value for the q-axis voltage value that is applied to the PWM IP.

Note: For details, see **Section 25.4.5(1) Func(pwm1) dq-axis voltage correction (non-interference control)**.

25.3.2.73 EMU3n Angular Velocity Value Register (EMU3nVEL)
EMU3n Angular Velocity Value Software Input Register (EMU3nVELSFT)

Access: EMU3nVEL: Readable in 32-bit units.
EMU3nVELSFT: Readable/writable in 32-bit units.

Address: EMU3nVEL: <EMU3n_base> + 0310_H
EMU3nVELSFT: <EMU3n_base> + 0314_H

Value after reset: $0000\ 0000_H$

Category: PWM IP

Table 25.99 EMU3nPHI Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (signed integer) (b15: Sign part) Set the offset value for the electrical angle to be applied to the PWM IP.

Note: For details, see **Section 25.4.5(2) Func(pwm2) Electrical angle offset processing**.

25.3.2.78 EMU3n PWM IP Electrical Angle Adjustment Coefficient Register (EMU3nGTHT)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $033C_H$

Value after reset: 0100_H

Category: PWM IP

Table 25.100 EMU3nGTHT Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (signed fixed-point numbers) (b15: Sign part) Set the coefficient of the multiplication to be executed for the electrical angle to be applied to the PWM IP.

Note: For details, see **Section 25.4.5(2) Func(pwm2) Electrical angle offset processing**.

This register is used to store fixed-point numbers consisting of an 8-bit integer part and an 8-bit fractional part. After a multiplication is performed using the value of this register as the multiplication coefficient, the results of the multiplication are shifted 8 bits to the right.

25.3.2.79 EMU3n PWM IP Electrical Angle Software Input Register (EMU3nTHTFORESFT)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $033E_H$

Value after reset: 0000_H

Category: PWM IP

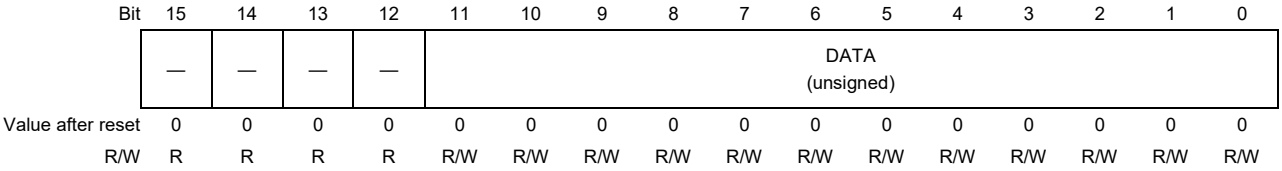

Table 25.101 EMU3nTHTFORESFT Register Contents

Table 25.105 EMU3nSR23 Register Contents

Bit Position	Bit	Function
31 to 0	DATA	Data bits (signed fixed-point numbers) (b31: Sign part) Set the coefficient to be used when converting the dq-axis voltage values to the 3-phase voltage values. The value established after a reset is $\sqrt{(2/3)}$.

Note: For details, see **Section 25.4.5(3) Func(pwm3) 2-phase-to-3-phase conversion**.

This register is used to store fixed-point numbers consisting of a 16-bit integer part and a 16-bit fractional part. After a multiplication is performed using the value of this register as the multiplication coefficient, the results of the multiplication are shifted 16 bits to the right.

This register is set a value of $0000\ D106_H$ after a reset. This is equivalent to the following calculation results:

$$\sqrt{(2/3)} \times 65536 = 0000\ D106_H \text{ (rounded off the fractional part)}$$

Table 25.107 EMU3nPWMK1 Register Contents

Bit Position	Bit	Function
31 to 0	DATA	Data bits (signed fixed-point numbers) (b31: Sign part) Set the coefficient value to be applied to 3-phase voltage scaling adjustment processing.

Note: For details, see **Section 25.4.5(5) Func(pwm5) Duty factor calculation**.

This register is used to store fixed-point numbers consisting of a 16-bit integer part and a 16-bit fractional part. After a multiplication is performed using the value of this register as the multiplication coefficient, the results of the multiplication are shifted 16 bits to the right.

25.3.2.86 EMU3n Input Voltage Register (EMU3nVOLV)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $036C_H$

Value after reset: 0000_H

Category: PWM IP

		Integer part															
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 25.108 EMU3nVOLV Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (signed integer) (b15: Sign part) Set the coefficient value to be applied to 3-phase voltage scaling adjustment processing.

Note: For details, see **Section25.4.5(5) Func(pwm5) Duty factor calculation**, **Section 25.4.5(10) Func(pwm11) PWM value limit processing**.

This register is for integers. After a division is performed on the number in this register as the denominator, the fractional part of the calculation results is truncated.

25.3.2.87 EMU3n U-Phase Voltage Correction Value Register (EMU3nVUOFS)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $037C_H$

Value after reset: 0000_H

Category: PWM IP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 25.114 EMU3nCARR Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (unsigned integer) Set the carrier period value to be applied to PWM value calculation processing by the PWM IP. The value of this register is also applied when software-inputting the PWM compare values and carrier period to be output to the TSG3.

Note: For details, see **Section 25.4.5(9) Func(pwm10) Dead time compensation**, **Section 25.4.5(10) Func(pwm11) PWM value limit processing**, and **Section 25.4.5(11) Func(pwm_out) PWM value output processing**.

Set up the register so that the sum of the values of the EMU3nCARR and EMU3nDTT registers is not greater than $FFFF_H$.

25.3.2.93 EMU3n Carrier Period Buffer Register (EMU3nCARRBUF)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $03AA_H$

Value after reset: $FFFF_H$

Category: PWM IP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA (unsigned)															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.115 EMU3nCARRBUF Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (unsigned integer) The value of this register is applied as the carrier period value when outputting the PWM compare values from the PWM IP to the TSG3.

Note: For details, see **Section 25.4.5(10) Func(pwm11) PWM value limit processing**.

25.3.2.94 EMU3n Dead Time Compensation Threshold Value Register (EMU3nDTOTH)

Access: Readable/writable in 32-bit units.

Address: <EMU3n_base> + $03B8_H$

Value after reset: $7FFF\ FFFF_H$

Category: PWM IP

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	1	0	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.123 EMU3nPWMU, EMU3nPWMV, EMU3nPWMW Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (unsigned integer)

Note: For details, see **Section 25.4.5(11) Func(pwm_out) PWM value output processing**.

This register must not be set a value that is greater than the sum of the values of the EMU3nCARR and EMU3nDTT registers.

25.3.2.102 EMU3n Rectangle IP Control Register (EMU3nRECCTR)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0480_H

Value after reset: 04_H

Category: Rectangle IP

Bit	7	6	5	4	3	2	1	0
	FDRCT	—	—	—	—	FIP POSI	SLCT CMP0	SET REC
Value after reset	0	0	0	0	0	1	0	0
R/W	R/W	R	R	R	R	R/W	R/W	R/W

Table 25.124 EMU3nRECCTR Register Contents

Bit Position	Bit	Function
7	FDRCT	Rotational direction select bit 0: Positive rotation 1: Reverse rotation
6 to 3	—	These bits are read as 0. The write value should be 0.
2	FIPPOSI	Switching instruction select bit 0: Uses the value calculated by the rectangle IP. 1: Uses the value of the EMU3nPSWSFT register.
1	SLCTCMP0	Angle compare 0 match detection compare value select bit 0: Uses the value of the EMU3nCMP0 register. 1: Uses the value calculated by the rectangle IP.
0	SETREC	rectangle setting bit 0: Uses the value of the EMU3nPTNN register. 1: Uses the value selected by the rectangle IP (selected from the values of the EMU3nPTNAB, EMU3nPTNCD, and EMU3nPTNEF registers).

This register is used to control the rectangle IP. For details on the control bits of this register, see **Section 25.4.7.1, Batch Rectangle IP**.

It is disallowed to set the combination of the SLCTCMP0 bit to "0" and the SETREC bit to "1".

25.3.2.103 EMU3n Rectangle Output Software Control Pattern Register (EMU3nPTNN)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0484_H

Value after reset: 00_H

Category: Rectangle IP

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	WPTN	VPTN	UPTN
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.125 EMU3nPTNN Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	WPTN	W-phase rectangle wave pattern setting bit 0: Low level 1: High level
1	VPTN	V-phase rectangle wave pattern setting bit 0: Low level 1: High level
0	UPTN	U-phase rectangle wave pattern setting bit 0: Low level 1: High level

Note: For details, see **Section 25.4.7.1, Batch Rectangle IP**.

The value of this register is used as the rectangle wave pattern value when outputting the rectangle wave pattern in combination with the software processing by the CPU program.

25.3.2.104 EMU3n Rectangle Output Pattern AB Register (EMU3nPTNAB)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0485_H

Value after reset: 00_H

Category: Rectangle IP

Bit	7	6	5	4	3	2	1	0
	—	—	WPTNB	VPTNB	UPTNB	WPTNA	VPTNA	UPTNA
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.126 EMU3nPTNAB Register Contents

Bit Position	Bit	Function
7, 6	—	These bits are read as 0. The write value should be 0.
5	WPTNB	W-phase rectangle wave pattern B setting bit. 0: Low level 1: High level
4	VPTNB	V-phase rectangle wave pattern B setting bit. 0: Low level 1: High level
3	UPTNB	U-phase rectangle wave pattern B setting bit. 0: Low level 1: High level
2	WPTNA	W-phase rectangle wave pattern A setting bit. 0: Low level 1: High level
1	VPTNA	V-phase rectangle wave pattern A setting bit. 0: Low level 1: High level
0	UPTNA	U-phase rectangle wave pattern A setting bit. 0: Low level 1: High level

Note: For details, see **Section 25.4.7.1, Batch Rectangle IP**.

The value of this register is used as the rectangle wave pattern value when outputting the rectangle wave pattern by rectangle IP hardware.

25.3.2.105 EMU3n Rectangle Output Pattern CD Register (EMU3nPTNCD)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0486_H

Value after reset: 00_H

Category: Rectangle IP

Bit	7	6	5	4	3	2	1	0
	—	—	WPTND	VPTND	UPTND	WPTNC	VPTNC	UPTNC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.127 EMU3nPTNCD Register Contents

Bit Position	Bit	Function
7, 6	—	These bits are read as 0. The write value should be 0.
5	WPTND	W-phase rectangle wave pattern D setting bit. 0: Low level 1: High level
4	VPTND	V-phase rectangle wave pattern D setting bit. 0: Low level 1: High level
3	UPTND	U-phase rectangle wave pattern D setting bit. 0: Low level 1: High level
2	WPTNC	W-phase rectangle wave pattern C setting bit. 0: Low level 1: High level
1	VPTNC	V-phase rectangle wave pattern C setting bit. 0: Low level 1: High level
0	UPTNC	U-phase rectangle wave pattern C setting bit. 0: Low level 1: High level

Note: For details, see **Section 25.4.7.1, Batch Rectangle IP**.

The value of this register is used as the rectangle wave pattern value when outputting the rectangle wave pattern by rectangle IP hardware.

25.3.2.106 EMU3n Rectangle Output Pattern EF Register (EMU3nPTNEF)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0487_H

Value after reset: 00_H

Category: Rectangle IP

Bit	7	6	5	4	3	2	1	0
	—	—	WPTNF	VPTNF	UPTNF	WPTNE	VPTNE	UPTNE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.128 EMU3nPTNEF Register Contents

Bit Position	Bit	Function
7, 6	—	These bits are read as 0. The write value should be 0.
5	WPTNF	W-phase rectangle wave pattern F setting bit. 0: Low level 1: High level
4	VPTNF	V-phase rectangle wave pattern F setting bit. 0: Low level 1: High level
3	UPTNF	U-phase rectangle wave pattern F setting bit. 0: Low level 1: High level
2	WPTNE	W-phase rectangle wave pattern E setting bit. 0: Low level 1: High level
1	VPTNE	V-phase rectangle wave pattern E setting bit. 0: Low level 1: High level
0	UPTNE	U-phase rectangle wave pattern E setting bit. 0: Low level 1: High level

Note: For details, see **Section 25.4.7.1, Batch Rectangle IP**.

The value of this register is used as the rectangle wave pattern value when outputting the rectangle wave pattern by rectangle IP hardware.

25.3.2.107 EMU3n Angle Compare 0 Comparison Value Software Input Register (EMU3nCMP0)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + 0488_H

Value after reset: 0000_H

Category: Angle generation IP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DATA (unsigned)											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.129 EMU3nCMP0 Register Contents

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA	Data bits (unsigned integer) Set the software -input comparison value for angle compare 0 (electrical angle).

Note: For details, see **Section 25.4.6, Rectangle IP,** and **Section 25.4.2(3) Func(ang8) angle compare match**.

The value of this register is used as the comparison value for angle compare 0 match detection when outputting the batch rectangle wave patterns in combination with software processing by the CPU program.

The value of this register is also used as the comparison value for the first angle compare 0 match detection when outputting the batch rectangle wave patterns by rectangle IP hardware.

25.3.2.108 EMU3n Angle Compare 1 Comparison Value Software Input Register (EMU3nCMP1)

Access: Readable/writable in 16 bit units.

Address: <EMU3n_base> + $048A_H$

Value after reset: 0000_H

Category: Angle generation IP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DATA (unsigned)											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.130 EMU3nCMP1 Register Contents

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA	Data bits (unsigned integer) Set the software -input comparison value for angle compare 1 (resolver angle).

Note: For details, see **Section 25.4.2(3) Func(ang8) angle compare match**.

25.3.2.109 EMU3n q-Axis Reference Voltage Phase Software Input Register (EMU3nPHQSFT)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $048C_H$

Value after reset: 0000_H

Category: Rectangle IP

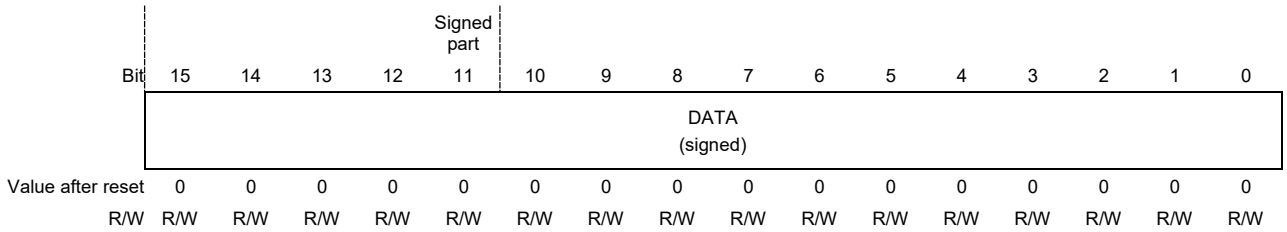

Table 25.131 EMU3nPHQSFT Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (signed integer) (b15-11: Sign part) Set the correction value for the “angle compare 0 match detection” by the rectangle IP.

Note: For details, see **Section 25.4.7.1, Batch Rectangle IP**.

25.3.2.110 EMU3n Switching Instruction Software-input Register (EMU3nPSWSFT)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $048E_H$

Value after reset: 00_H

Category: Rectangle IP

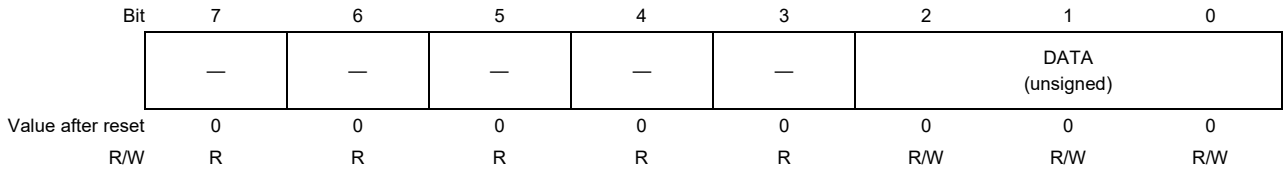

Table 25.132 EMU3nPSWSFT Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2 to 0	DATA	Data bits (unsigned integer) Set the software -input switching instruction value to be applied to the rectangle IP. It is inhibited to write a value of 6 or 7 to this register. Set this register with a value from 0 to 5.

Note: For details, see **Section 25.4.7.1, Batch Rectangle IP**.

25.3.2.111 EMU3n Switching Instruction Register (EMU3nPSW)

Access: Readable in 8-bit units.

Address: <EMU3n_base> + 048F$_H$

Value after reset: 00$_H$

Category: Rectangle IP

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	DATA (unsigned)		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 25.133 EMU3nPSW Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2 to 0	DATA	Data bits (unsigned integer) Set the switching instruction value that is calculated by the rectangle IP.

Note: For details, see **Section 25.4.7.1, Batch Rectangle IP**.

25.3.2.112 EMU3n Angle Compare 0 Comparison Value IP Output Register (EMU3nIPCMP0)

Access: Readable in 16-bit units.

Address: <EMU3n_base> + 0490$_H$

Value after reset: 0000$_H$

Category: Rectangle IP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DATA (unsigned)											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.134 EMU3nIPCMP0 Register Contents

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA	Data bits (unsigned integer) Loaded with the comparison value for angle compare 0 match detection that is calculated by the rectangle IP.

Note: For details, see **Section 25.4.7.1, Batch Rectangle IP**.

The value of this register is used as the comparison value for angle compare 0 match detection processing other than the first angle compare 0 match detection when outputting the rectangle wave patterns by rectangle IP hardware.

25.3.2.113 EMU3n Independent Rectangle IP 1 Control Register (EMU3nIRECCTR)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $04C0_H$

Value after reset: 00_H

Category: Rectangle wave generation block

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RECMD	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.135 EMU3nIRECCTR Register Contents

Bit Position	Bit	Function
7 to 2	—	These bits are read as 0. The write value should be 0.
1, 0	RECMD	Rectangle wave output mode switching bits 00: Outputs rectangle wave patterns to the TSG3. 01: Outputs independent rectangle IP1 wave patterns to the TSG3. 10: Outputs independent rectangle IP2 wave patterns to the TSG3. 11: inhibited

Note: For details, see **Section 25.4.7 Rectangle Wave Generation Block, Section 25.4.7.2 Independent Rectangle IP1**, and **Section 25.4.7.3, Independent Rectangle IP2.**

25.3.2.114 EMU3n Independent Rectangle IP 1 Output Pattern Update Register (EMU3nIRPTN)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $04C4_H$

Value after reset: 00_H

Category: Independent rectangle IP1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	WINIPTN	VINIPTN	UINIPTN
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.136 EMU3nIRPTN Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	WINIPTN	W-phase rectangle wave pattern update bit. 0: Low level 1: High level
1	VINIPTN	V-phase rectangle wave pattern update bit. 0: Low level 1: High level
0	UINIPTN	U-phase rectangle wave pattern update bit. 0: Low level 1: High level

Note: For details, see **Section 25.4.7.2, Independent Rectangle IP1**.

25.3.2.115 EMU3n Independent Rectangle IP1 Flag Select Signal Initialization Register (EMU3nIRCTRST)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $04C6_H$

Value after reset: 00_H

Category: Independent rectangle IP1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	WINIT	VINIT	UINIT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.137 EMU3nIRCTRST Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	WINIT	W-phase flag/select signal initialization bit Setting this bit to 1 initializes the flag/select signals for W-phase processing by the independent rectangle IP1.
1	VINIT	V-phase flag/select signal initialization bit Setting this bit to 1 initializes the flag/select signals for V-phase processing by the independent rectangle IP1.
0	UINIT	U-phase flag/select signal initialization bit Setting this bit to 1 initializes the flag/select signals for U-phase processing by the independent rectangle IP1.

Note: For details, see **Section 25.4.7.2, Independent Rectangle IP1**.

The bits of these registers are automatically reset to 0 after they are set to 1. It is invalid to write a 0 to these bits. They are always read as 0.

25.3.2.116 EMU3n Independent Rectangle IP1 U-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 0 Register (EMU3nIRUCPPN0)
EMU3n Independent Rectangle IP1 U-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 1 Register (EMU3nIRUCPPN1)
EMU3n Independent Rectangle IP1 U-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 2 Register (EMU3nIRUCPPN2)
EMU3n Independent Rectangle IP1 V-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 0 Register (EMU3nIRVCPPN0)
EMU3n Independent Rectangle IP1 V-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 1 Register (EMU3nIRVCPPN1)
EMU3n Independent Rectangle IP1 V-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 2 Register (EMU3nIRVCPPN2)
EMU3n Independent Rectangle IP1 W-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 0 Register (EMU3nIRWCPPN0)
EMU3n Independent Rectangle IP1 W-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 1 Register (EMU3nIRWCPPN1)
EMU3n Independent Rectangle IP1 W-Phase Angle Compare 0 Match Detection Comparison Value/Pattern Setting 2 Register (EMU3nIRWCPPN2)

Access: Readable/writable in 16 and 32 bit units.

Address: EMU3nIRUCPPN0: <EMU3n_base> + $04C8_H$

EMU3nIRUCPPN1: <EMU3n_base> + $04CC_H$

EMU3nIRUCPPN2: <EMU3n_base> + $04D0_H$

EMU3nIRVCPPN0: <EMU3n_base> + $04D4_H$

EMU3nIRVCPPN1: <EMU3n_base> + $04D8_H$

EMU3nIRVCPPN2: <EMU3n_base> + $04DC_H$

EMU3nIRWCPPN0: <EMU3n_base> + $04E0_H$

EMU3nIRWCPPN1: <EMU3n_base> + $04E4_H$

EMU3nIRWCPPN2: <EMU3n_base> + $04E8_H$

Value after reset: $0000\ 0000_H$

Category: Independent rectangle IP1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit	Function
31 to 17	—	These bits are read as 0. The write value should be 0.
16	UPTN0,1,2 VPTN0,1,2 WPTN0,1,2	U-phase pattern values 0,1,2 setting bit V-phase pattern values 0,1,2 setting bit W-phase pattern values 0,1,2 setting bit 0: Low level 1: High level
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	UCMP0, 1, 2[11:0] VCMP0, 1, 2[11:0] WCMP0, 1, 2[11:0]	U-phase angle compare 0 match detection comparison values 0,1,2 setting bits (unsigned integer) V-phase angle compare 0 match detection comparison values 0,1,2 setting bits (unsigned integer) W-phase angle compare 0 match detection comparison values 0,1,2 setting bits (unsigned integer) Set comparison values for angle compare 0 match detection.

Note: For details, see **Section 25.4.7.2, Independent Rectangle IP1**.

25.3.2.117 EMU3n Independent Rectangle IP 1 Flag Monitor Register (EMU3nIRFLGM)

Access: Readable in 16-bit units.

Address: <EMU3n_base> + $04EC_H$

Value after reset: 0000_H

Category: Independent rectangle IP1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WFLG2	WFLG1	WFLG0	VFLG2	VFLG1	VFLG0	UFLG2	UFLG1	UFLG0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.139 EMU3nIRFLGM Register Contents (1/2)

Bit Position	Bit	Function
15 to 9	—	These bits are read as 0. The write value should be 0.
8	WFLG2	W-phase flag 2 status bit 0: Before the write from CPU to EMU3nIRWCPPN2 register or after detection of an angle compare 0 match 1: After the write from CPU to EMU3nIRWCPPN2 register and no angle compare 0 match is detected.
7	WFLG1	W-phase flag 1 status bit 0: Before the write from CPU to EMU3nIRWCPPN1 register or after detection of an angle compare 0 match 1: After the write from CPU to EMU3nIRWCPPN1 register and no angle compare 0 match is detected.
6	WFLG0	W-phase flag 0 status bit 0: Before the write from CPU to EMU3nIRWCPPN0 register or after detection of an angle compare 0 match 1: After the write from CPU to EMU3nIRWCPPN0 register and no angle compare 0 match is detected.
5	VFLG2	V-phase flag 2 status bit 0: Before the write from CPU to EMU3nIRVCPPN2 register or after detection of an angle compare 0 match 1: After the write from CPU to EMU3nIRVCPPN2 register and no angle compare 0 match is detected.
4	VFLG1	V-phase flag 1 status bit 0: Before the write from CPU to EMU3nIRVCPPN1 register or after detection of an angle compare 0 match 1: After the write from CPU to EMU3nIRVCPPN1 register and no angle compare 0 match is detected.
3	VFLG0	V-phase flag 0 status bit 0: Before the write from CPU to EMU3nIRVCPPN0 register or after detection of an angle compare 0 match 1: After the write from CPU to EMU3nIRVCPPN0 register and no angle compare 0 match is detected.
2	UFLG2	U-phase flag 2 status bit 0: Before the write from CPU to EMU3nIRUCPPN2 register or after detection of an angle compare 0 match 1: After the write from CPU to EMU3nIRUCPPN2 register and no angle compare 0 match is detected.

Table 25.139 EMU3nIRFLGM Register Contents (2/2)

Bit Position	Bit	Function
1	UFLG1	U-phase flag 1 status bit 0: Before the write from CPU to EMU3nIRUCPPN1 register or after detection of an angle compare 0 match 1: After the write from CPU to EMU3nIRUCPPN1 register and no angle compare 0 match is detected.
0	UFLG0	U-phase flag 0 status bit 0: Before the write from CPU to EMU3nIRUCPPN0 register or after detection of an angle compare 0 match 1: After the write from CPU to EMU3nIRUCPPN0 register and no angle compare 0 match is detected.

Note: For details, see **Section 25.4.7.2, Independent Rectangle IP1.**

25.3.2.118 EMU3n Independent Rectangle IP 1 Select Signal Monitor Register (EMU3nIRSELM)

Access: Readable in 16-bit units.

Address: <EMU3n_base> + $04EE_H$

Value after reset: 0049_H

Category: Independent rectangle IP1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WSEL[2:0]			VSEL[2:0]			USEL[2:0]

Table 25.140 EMU3nIRSELM Register Contents

Bit Position	Bit	Function
15 to 9	—	These bits are read as 0. The write value should be 0.
8 to 6	WSEL[2:0]	W-phase selection status bit 001: EMU3nIRWCPPN0 register is selected. 010: EMU3nIRWCPPN1 register is selected. 100: EMU3nIRWCPPN2 register is selected.
5 to 3	VSEL[2:0]	V-phase selection status bit 001: EMU3nIRVCPPN0 register is selected. 010: EMU3nIRVCPPN1 register is selected. 100: EMU3nIRVCPPN2 register is selected.
2 to 0	USEL[2:0]	U-phase selection status bit 001: EMU3nIRUCPPN0 register is selected. 010: EMU3nIRUCPPN1 register is selected. 100: EMU3nIRUCPPN2 register is selected.

Note: For details, see **Section 25.4.7.2, Independent Rectangle IP1**.

25.3.2.119 EMU3n Independent Rectangle IP 2 Control Register (EMU3nNRECCTR)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + 0500_H

Value after reset: 00_H

Category: Independent rectangle IP2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	EN
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.141 EMU3nNRECCTR Register Contents

Bit Position	Bit	Function
7 to 1	—	These bits are read as 0. The write value should be 0.
0	EN	Independent rectangle IP2 operation bit. 0: Stopped (U-phase /V-phase /W-phase pattern values are fixed at low level.) 1: Running

Note: For details, see **Section 25.4.7.3, Independent Rectangle IP2**.

25.3.2.120 EMU3n Independent Rectangle IP2 3-Phase Common Angle Correction Value Register (EMU3nNRECOFSALL)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + 0508_H

Value after reset: 0000_H

Category: Independent rectangle IP2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DATA (signed)											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.142 EMU3nNRECOFSALL Register Contents

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA (signed)	Data bits (signed integer) (b11: Signed part) Set the U-/V-/W-phase offset values for the electrical angle to be applied to the independent rectangle IP2 all at once.

Note: For details, see **Section 25.4.7.3, Independent Rectangle IP2**.

The angle correction value of the U phase is the EMU3nNRECOFSALL register value + the EMU3nNRECOFSU value.

The angle correction value of the V phase is the EMU3nNRECOFSALL register value + the EMU3nNRECOFSV value.

The angle correction value of the W phase is the EMU3nNRECOFSALL register value + the EMU3nNRECOFSW value.

25.3.2.121 EMU3n Independent Rectangle IP2 U-Phase Angle Correction Value Register (EMU3nNRECOFSU)
EMU3n Independent Rectangle IP2 V-Phase Angle Correction Value Register (EMU3nNRECOFSV)
EMU3n Independent Rectangle IP2 W-Phase Angle Correction Value Register (EMU3nNRECOFSW)

Access: Readable/writable in 16-bit units.

Address: EMU3nNRECOFSU: <EMU3n_base> + $050A_H$

EMU3nNRECOFSV: <EMU3n_base> + $050C_H$

EMU3nNRECOFSW: <EMU3n_base> + $050E_H$

Value after reset: 0000_H

Category: Independent rectangle IP2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DATA (signed)											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.143 EMU3nNRECOFSU, EMU3nNRECOFSV, EMU3nNRECOFSW Register Contents

Bit Position	Bit	Function
15 to 12	—	These bits are read as 0. The write value should be 0.
11 to 0	DATA (signed)	Data bits (signed integer) (b11: Signed part)

Note: For details, see **Section 25.4.7.3, Independent Rectangle IP2**.

The angle correction value of the U phase is the EMU3nNRECOFSALL register value + the EMU3nNRECOFSU value.

The angle correction value of the V phase is the EMU3nNRECOFSALL register value + the EMU3nNRECOFSV value.

The angle correction value of the W phase is the EMU3nNRECOFSALL register value + the EMU3nNRECOFSW value.

25.3.2.122 EMU3n Independent Rectangle IP2 U-Phase Compare Control k Register (EMU3nNRECUk) (k = 0 to 7)

Access: Readable/writable in 8, 16, and 32 bit units.

Address: EMU3nNRECU0: <EMU3n_base> + 0510_H
EMU3nNRECU1: <EMU3n_base> + 0514_H
EMU3nNRECU2: <EMU3n_base> + 0518_H
EMU3nNRECU3: <EMU3n_base> + $051C_H$
EMU3nNRECU4: <EMU3n_base> + 0520_H
EMU3nNRECU5: <EMU3n_base> + 0524_H
EMU3nNRECU6: <EMU3n_base> + 0528_H
EMU3nNRECU7: <EMU3n_base> + $052C_H$

Other than above: Not started

Note: For details, see **Section 25.4.9, IIR Filters**.

25.3.2.126 EMU3n IIR Filter Initialization Register (EMU3nIIRINIT)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $05C4_H$

Value after reset: 00_H

Category: IIR filter

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	INIT2	INIT1	INIT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.148 EMU3nIIRINIT Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	INIT2	IIR filter channel 2 initialization bit 0: Does not initialize delay 1 data and delay 2 data. 1: Initializes delay 1 data and delay 2 data.
1	INIT1	IIR filter channel 1 initialization bit 0: Does not initialize delay 1 data and delay 2 data. 1: Initializes delay 1 data and delay 2 data.
0	INIT0	IIR filter channel 0 initialization bit 0: Does not initialize delay 1 data and delay 2 data. 1: Initializes delay 1 data and delay 2 data.

Note: For details, see **Section 25.4.9, IIR Filters**.

Setting a bit to 1 initializes the corresponding channel. The bits are automatically reset to 0 after being set to 1. It is inhibited to write a 0. The bits are always read as 0.

25.3.2.127 EMU3n IIR Filter Software Startup Register (EMU3nIIRSFT)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $05C8_H$

Value after reset: 00_H

Category: IIR filter

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TRG2	TRG1	TRG0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.149 EMU3nIIRSFT Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	TRG2	IIR filter channel 2 software start bit 0: Does not software-start the channel. 1: Software-starts the channel.
1	TRG1	IIR filter channel 1 software start bit 0: Does not software-start the channel. 1: Software-starts the channel.
0	TRG0	IIR filter channel 0 software start bit 0: Does not software-start the channel. 1: Software-starts the channel.

Note: For details, see **Section 25.4.9, IIR Filters**.

Setting a bit to 1 software-starts the corresponding channel. The bits are automatically reset to 0 after being set to 1. It is inhibited to write a 0. The bits are always read as 0.

25.3.2.128 EMU3n IIR Filter Coefficient Shift Amount Reload Register (EMU3nIIRRLD)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $05CC_H$

Value after reset: 00_H

Category: IIR filter

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	RLD2	RLD1	RLD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.150 EMU3nIIRRLD Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	RLD2	IIR filter channel 2 coefficient shift amount reload bit 0: Does not reload. 1: Reloads.
1	RLD1	IIR filter channel 1 coefficient shift amount reload bit 0: Does not reload. 1: Reloads.
0	RLD0	IIR filter channel 0 coefficient shift amount reload bit 0: Does not reload. 1: Reloads.

Note: For details, see **Section 25.4.9, IIR Filters**.

Setting a bit to 1 reloads the corresponding channel. The bits are automatically reset to 0 after being set to 1. It is inhibited to write a 0. The bits are always read as 0.

Do not write 1 to the bits while the IIR filters are running.

25.3.2.129 EMU3n IIR Filter Completion Flag Register (EMU3nIIRSTAT)

Access: Readable in 8-bit units.

Address: <EMU3n_base> + $05CE_H$

Value after reset: 00_H

Category: IIR filter

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	STAT2	STAT1	STAT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 25.151 EMU3nIIRSTAT Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	STAT2	IIR filter channel 2 completion flag bit 0: Waits for filtering to be completed 1: Filtering completed
1	STAT1	IIR filter channel 1 completion flag bit 0: Waits for filtering to be completed 1: Filtering completed
0	STAT0	IIR filter channel 0 completion flag bit 0: Waits for filtering to be completed 1: Filtering completed

Note: For details, see **Section 25.4.9, IIR Filters**.

This register is used to monitor the completion of IIR filtering.

The bits are set to 1 when the processing of the corresponding IIR filter channel becomes completed.

The bits are cleared by setting the corresponding bits of the EMU3nIIRSTATC register.

25.3.2.130 EMU3n IIR Filter Completion Flag Clear Register (EMU3nIIRSTATC)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $05CF_H$

Value after reset: 00_H

Category: IIR filter

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	STATC2	STATC1	STATC0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.152 EMU3nIIRSTATC Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	STATC2	IIR filter channel 2 completion flag clear bit Setting this bit to 1 resets the STAT2 bit of the EMU3nIIRSTAT register.
1	STATC1	IIR filter channel 1 completion flag clear bit Setting this bit to 1 resets the STAT1 bit of the EMU3nIIRSTAT register.
0	STATC0	IIR filter channel 0 completion flag clear bit Setting this bit to 1 resets the STAT0 bit of the EMU3nIIRSTAT register.

Note: For details, see **Section 25.4.9, IIR Filters**.

The bits are automatically reset to 0 after being set to 1.

It is inhibited to write a 0. The bits are always read as 0.

25.3.2.131 EMU3n IIR Filter Coefficient k Value Register (EMU3nIIRCOEFFk) (k = 0 to 5)

Access: Readable/writable in 16-bit units.

Address: EMU3nIIRCOEFF0: <EMU3n_base> + $05D0_H$

EMU3nIIRCOEFF1: <EMU3n_base> + $05D2_H$

25.3.2.139 EMU3n Checking Buffer Control Register (EMU3nCBCTR0)

Access: Readable/writable in 8-bit units.

Address: <EMU3n_base> + $06C4_H$

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	CBMON	CBEN1	CBEN0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.161 EMU3nCBCTR0 Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	CBMON	Buffering status bit 0: Buffering is completed or in idle state. 1: Waiting for buffering to be completed.
1	CBEN1	Buffering enable bit 1 0: Buffering is enabled by the CBEN0 bit. 1: Buffering is always enabled.
0	CBEN0	Buffering enable bit 0 Setting this bit to 1 enables buffering. The bit is automatically reset to 0 after being set to 1. Writing a 0 is invalid. The bit is always read as 0.

Note: For details, see **Section 25.4.14, Fault Detection Function**.

The values that are to be buffered are listed below.

- EMU3n A/D data k register (EMU3nADk) (k = 0, 1, 2)
- EMU3n resolver angle monitor register (EMU3nTHTRESFIXIN)
- EMU3n d-axis current value register (EMU3nIDFIX)
- EMU3n q-axis current value register (EMU3nIQFIX)
- U/V/W-phase PWM compare value pin output values
- U/V/W-phase rectangle wave pin output values
- U/V/W-phase independent rectangle IP1 wave pin output values

CBEN0 Bit

If the CBEN0 bit is set to 1, buffering to the checking buffer register is performed only once at the timing, out of the timings enabled by the EMU3nCBTIM register, that is associated with the first event that occurred. To perform buffering again, set the CBEN0 bit to 1 in each case. When specifying two or more timings in the EMU3nCBTIM register, set the CBEN0 bit to 1 for each of the timings.

CBEN1 Bit

If the CBEN1 bit is set to 1, buffering to the checking buffer register is performed each time a timing enabled by the EMU3nCBTIM register occurs.

CBMON Bit

If buffering is enabled by the CBEN0 bit, this bit is set to 1 and held from the time the CBEN0 bit is set to 1 till the buffering becomes completed. If buffering is enabled by the CBEN1 bit, this bit is set to and held at 1 from the time the CBEN1 bit is set to 1 till the CBEN1 bit is set to 0.

25.3.2.140 EMU3n Checking Buffer Timing Select Register (EMU3nCBTIM)

Access: Readable/writable in 16-bit units.

Address: <EMU3n_base> + $06C6_H$

Value after reset: 0000_H

Category: General/common

17 to 0	DATA	Data bits (unsigned integer) Loaded with the results of buffering the W-phase PWM compare value pin output value.

Note: For details, see **Section 25.4.14, Fault Detection Function**.

25.3.2.148 EMU3n Rectangle Pattern Value Checking Buffer Register (EMU3nCBBREC)

Access: Readable in 8-bit units.

Address: <EMU3n_base> + $06E4_H$

Value after reset: 00_H

Category: Checking buffer

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	WPTN	VPTN	UPTN
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 25.170 EMU3nCBBREC Register Contents

Bit Position	Bit	Function
7 to 3	—	These bits are read as 0. The write value should be 0.
2	WPTN	rectangle W-phase output pattern bit Loaded with the result of buffering the rectangle W-phase output pattern value.
1	VPTN	rectangle V-phase output pattern bit Loaded with the result of buffering the rectangle V-phase output pattern value.
0	UPTN	rectangle U-phase output pattern bit Loaded with the result of buffering the rectangle U-phase output pattern value.

Note: For details, see **Section 25.4.14, Fault Detection Function**.

25.3.2.149 EMU3n Independent Rectangle IP 1 Pattern Value Checking Buffer Register (EMU3nCBIREC)

Access: Readable in 8-bit units.

Address: <EMU3n_base> + $06E5_H$

Value after reset: 00_H

Category: Checking buffer

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	WPTN	VPTN	UPTN
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

7 to 3	—	These bits are read as 0. The write value should be 0.
2	WPTN	Independent rectangle IP1 W-phase output pattern bit Loaded with the result of buffering the independent rectangle IP1 W-phase output pattern value.
1	VPTN	Independent rectangle IP1 V-phase output pattern bit Loaded with the result of buffering the independent rectangle IP1 V-phase output pattern value.
0	UPTN	Independent rectangle IP1 U-phase output pattern bit Loaded with the result of buffering the independent rectangle IP1 U-phase output pattern value.

Note: For details, see **Section 25.4.14, Fault Detection Function**.

25.3.2.150 EMU3n Data Set WBk Transfer Trigger Register (EMU3nDATSETWBk) (k = 0 to 2)

Access: Readable/writable in 8-bit units.

Address: EMU3nDATSETWB0: <EMU3n_base> + 0700_H

EMU3nDATSETWB1: <EMU3n_base> + 0704_H

EMU3nDATSETWB2: <EMU3n_base> + 0708_H

Value after reset: 00_H

Category: Handshaking register

Bit	7	6	5	4	3	2	1	0
	—	—	TRG5	TRG4	TRG3	TRG2	TRG1	TRG0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.172 EMU3nDATSETWBk Register Contents

Bit Position	Bit	Function
7, 6	—	These bits are read as 0. The write value should be 0.
5	TRG5	Transfer trigger bit Triggers a bulk transfer of data from the data set 5WRITEm registers EMU3nDATSETW5m (m: 0 to 3) to the intermediate registers corresponding to the data set 5READm registers EMU3nDATSETR5m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.
4	TRG4	Transfer trigger bit Triggers a bulk transfer of data from the data set 4WRITEm registers EMU3nDATSETW4m (m: 0 to 3) to the intermediate registers corresponding to the data set 4READm registers EMU3nDATSETR4m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.
3	TRG3	Transfer trigger bit Triggers a bulk transfer of data from the data set 3WRITEm registers EMU3nDATSETW3m (m: 0 to 3) to the intermediate registers corresponding to the data set 3READm registers EMU3nDATSETR3m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.
2	TRG2	Transfer trigger bit Triggers a bulk transfer of data from the data set 2WRITEm registers EMU3nDATSETW2m (m: 0 to 3) to the intermediate registers corresponding to the data set 2READm registers EMU3nDATSETR2m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.
1	TRG1	Transfer trigger bit Triggers a bulk transfer of data from the data set 1WRITEm registers EMU3nDATSETW1m (m: 0 to 3) to the intermediate registers corresponding to the data set 1READm registers EMU3nDATSETR1m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.
0	TRG0	Transfer trigger bit Triggers a bulk transfer of data from the data set 0WRITEm registers EMU3nDATSETW0m (m: 0 to 3) to the intermediate registers corresponding to the data set 0READm registers EMU3nDATSETR0m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.

Note: For details, see **Section 25.4.13, Asynchronous Data Passing Function**.

Setting these bits to 1 triggers a bulk transfer. The bits are automatically reset to 0 after being set to 1. Writing a 0 is invalid. The bits are always read as 0.

25.3.2.151 EMU3n Data Set BRk Transfer Trigger Register (EMU3nDATSETBRk) (k = 0 to 2)

Access: Readable/writable in 8-bit units.

Address: EMU3nDATSETBR0: <EMU3n_base> + 0710_H

EMU3nDATSETBR1: <EMU3n_base> + 0714_H

EMU3nDATSETBR2: <EMU3n_base> + 0718_H

Value after reset: 00_H

Category: Handshaking register

Bit	7	6	5	4	3	2	1	0
	—	—	TRG5	TRG4	TRG3	TRG2	TRG1	TRG0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.173 EMU3nDATSETBRk Register Contents

Bit Position	Bit	Function
7, 6	—	These bits are read as 0. The write value should be 0.
5	TRG5	Transfer trigger bit Triggers a bulk transfer of data from the intermediate registers corresponding to the data set 5WRITEm registers EMU3nDATSETW5m (m: 0 to 3) to the data set 5READm registers EMU3nDATSETR5m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.
4	TRG4	Transfer trigger bit Triggers a bulk transfer of data from the intermediate registers corresponding to the data set 4WRITEm registers EMU3nDATSETW4m (m: 0 to 3) to the data set 4READm registers EMU3nDATSETR4m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.
3	TRG3	Transfer trigger bit Triggers a bulk transfer of data from the intermediate registers corresponding to the data set 3WRITEm registers EMU3nDATSETW3m (m: 0 to 3) to the data set 3READm registers EMU3nDATSETR3m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.
2	TRG2	Transfer trigger bit Triggers a bulk transfer of data from the intermediate registers corresponding to the data set 2WRITEm registers EMU3nDATSETW2m (m: 0 to 3) to the data set 2READm registers EMU3nDATSETR2m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.
1	TRG1	Transfer trigger bit Triggers a bulk transfer of data from the intermediate registers corresponding to the data set 1WRITEm registers EMU3nDATSETW1m (m: 0 to 3) to the data set 1READm registers EMU3nDATSETR1m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.
0	TRG0	Transfer trigger bit Triggers a bulk transfer of data from the intermediate registers corresponding to the data set 0WRITEm registers EMU3nDATSETW0m (m: 0 to 3) to the data set 0READm registers EMU3nDATSETR0m (m: 0 to 3). 0: Triggers no transfer. 1: Triggers bulk transfer.

Note: For details, see **Section 25.4.13 Asynchronous Data Passing Function**.

Setting these bits to 1 triggers a bulk transfer. The bits are automatically reset to 0 after being set to 1. Writing a 0 is invalid. The bits are always read as 0.

25.3.2.152 EMU3n Data Set kWRITEm Register (EMU3nDATSETWkm) (k = 0 to 5) (m = 0 to 3)

Access: Readable/writable in 16, and 32-bit units.

Address:

EMU3nDATSETW00: <EMU3n_base> + 0720_H,	EMU3nDATSETW01: <EMU3n_base> + 0722_H
EMU3nDATSETW02: <EMU3n_base> + 0724_H,	EMU3nDATSETW03: <EMU3n_base> + 0726_H
EMU3nDATSETW10: <EMU3n_base> + 0728_H,	EMU3nDATSETW11: <EMU3n_base> + $072A_H$
EMU3nDATSETW12: <EMU3n_base> + $072C_H$,	EMU3nDATSETW13: <EMU3n_base> + $072E_H$
EMU3nDATSETW20: <EMU3n_base> + 0730_H,	EMU3nDATSETW21: <EMU3n_base> + 0732_H
EMU3nDATSETW22: <EMU3n_base> + 0734_H,	EMU3nDATSETW23: <EMU3n_base> + 0736_H
EMU3nDATSETW30: <EMU3n_base> + 0738_H,	EMU3nDATSETW31: <EMU3n_base> + $073A_H$
EMU3nDATSETW32: <EMU3n_base> + $073C_H$,	EMU3nDATSETW33: <EMU3n_base> + $073E_H$
EMU3nDATSETW40: <EMU3n_base> + 0740_H,	EMU3nDATSETW41: <EMU3n_base> + 0742_H
EMU3nDATSETW42: <EMU3n_base> + 0744_H,	EMU3nDATSETW43: <EMU3n_base> + 0746_H
EMU3nDATSETW50: <EMU3n_base> + 0748_H,	EMU3nDATSETW51: <EMU3n_base> + $074A_H$
EMU3nDATSETW52: <EMU3n_base> + $074C_H$,	EMU3nDATSETW53: <EMU3n_base> + $074E_H$

Value after reset: 0000_H

Category: Handshaking register

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA (unsigned)

Table 25.174 EMU3nDATSETWkm Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (unsigned integer) Set write data.

Note: For details, see **Section 25.4.13, Asynchronous Data Passing Function**.

The EMU3nDATSETWk0 register and EMU3nDATSETWk1 register can be handled as 16-bit data registers and combined into a 32-bit data register and used for data reads and writes. The EMU3nDATSETWk0 register is assumed to hold the lower-order 16 bits and the EMU3nDATSETWk1 register to hold the higher-order 16 bits.

The EMU3nDATSETWk2 register and EMU3n0DATSETWk3 register can be handled as 16-bit data registers and combined into a 32-bit data register and used for data reads and writes. The EMU3nDATSETWk2 register is assumed to hold the lower-order 16 bits and the EMU3nDATSETWk3 register to hold the higher-order 16 bits.

The following symbols and addresses should be used when accessing 32-bit data:

EMU3nDATSETW00W: <EMU3n_base> + 0720_H,	EMU3nDATSETW02W: <EMU3n_base> + 0724_H,
EMU3nDATSETW10W: <EMU3n_base> + 0728_H,	EMU3nDATSETW12W: <EMU3n_base> + $072C_H$,
EMU3nDATSETW20W: <EMU3n_base> + 0730_H,	EMU3nDATSETW22W: <EMU3n_base> + 0734_H,
EMU3nDATSETW30W: <EMU3n_base> + 0738_H,	EMU3nDATSETW32W: <EMU3n_base> + $073C_H$,
EMU3nDATSETW40W: <EMU3n_base> + 0740_H,	EMU3nDATSETW42W: <EMU3n_base> + 0744_H,
EMU3nDATSETW50W: <EMU3n_base> + 0748_H,	EMU3nDATSETW52W: <EMU3n_base> + $074C_H$

25.3.2.153 EMU3n Data Set kREADm Register (EMU3nDATSETRkm) (k = 0 to 5) (m = 0 to 3)

Access: Readable in 16, and 32-bit units.

Address:

EMU3nDATSETR00: <EMU3n_base> + 0760_H,	EMU3nDATSETR01: <EMU3n_base> + 0762_H
EMU3nDATSETR02: <EMU3n_base> + 0764_H,	EMU3nDATSETR03: <EMU3n_base> + 0766_H
EMU3nDATSETR10: <EMU3n_base> + 0768_H,	EMU3nDATSETR11: <EMU3n_base> + $076A_H$
EMU3nDATSETR12: <EMU3n_base> + $076C_H$,	EMU3nDATSETR13: <EMU3n_base> + $076E_H$
EMU3nDATSETR20: <EMU3n_base> + 0770_H,	EMU3nDATSETR21: <EMU3n_base> + 0772_H
EMU3nDATSETR22: <EMU3n_base> + 0774_H,	EMU3nDATSETR23: <EMU3n_base> + 0776_H
EMU3nDATSETR30: <EMU3n_base> + 0778_H,	EMU3nDATSETR31: <EMU3n_base> + $077A_H$
EMU3nDATSETR32: <EMU3n_base> + $077C_H$,	EMU3nDATSETR33: <EMU3n_base> + $077E_H$
EMU3nDATSETR40: <EMU3n_base> + 0780_H,	EMU3nDATSETR41: <EMU3n_base> + 0782_H
EMU3nDATSETR42: <EMU3n_base> + 0784_H,	EMU3nDATSETR43: <EMU3n_base> + 0786_H
EMU3nDATSETR50: <EMU3n_base> + 0788_H,	EMU3nDATSETR51: <EMU3n_base> + $078A_H$
EMU3nDATSETR52: <EMU3n_base> + $078C_H$,	EMU3nDATSETR53: <EMU3n_base> + $078E_H$

Value after reset: 0000_H

Category: Handshaking register

Table 25.175 EMU3nDATSETRkm Register Contents

Bit Position	Bit	Function
15 to 0	DATA	Data bits (unsigned integer) Loaded with read data.

Note: For details, see **Section 25.4.13, Asynchronous Data Passing Function**.

The EMU3nDATSETRk0 register and EMU3nDATSETRk1 register can be handled as 16-bit data registers and combined into a 32-bit data register and used for data reads. The EMU3nDATSETRk0 register is assumed to hold the lower-order 16 bits and the EMU3nDATSETRk1 register to hold the higher-order 16 bits.

The EMU3nDATSETRk2 register and EMU3nDATSETRk3 register can be handled as 16-bit data registers and combined into a 32-bit data register and used for data reads. The EMU3nDATSETRk2 register is assumed to hold the lower-order 16 bits and the EMU3nDATSETRk3 register to hold the higher-order 16 bits.

The following symbols and addresses should be used when accessing 32-bit data:

EMU3nDATSETR00W: <EMU3n_base> + 0760_H,	EMU3nDATSETR02W: <EMU3n_base> + 0764_H,
EMU3nDATSETR10W: <EMU3n_base> + 0768_H,	EMU3nDATSETR12W: <EMU3n_base> + $076C_H$,
EMU3nDATSETR20W: <EMU3n_base> + 0770_H,	EMU3nDATSETR22W: <EMU3n_base> + 0774_H,
EMU3nDATSETR30W: <EMU3n_base> + 0778_H,	EMU3nDATSETR32W: <EMU3n_base> + $077C_H$,
EMU3nDATSETR40W: <EMU3n_base> + 0780_H,	EMU3nDATSETR42W: <EMU3n_base> + 0784_H,
EMU3nDATSETR50W: <EMU3n_base> + 0788_H,	EMU3nDATSETR52W: <EMU3n_base> + $078C_H$

25.3.2.154 SubCPU Startup Register (EMU3CPUINIT)

Access: Readable/writable in 8-bit units.

Address: <EMU_base> + 0000 2000$_H$

Value after reset: 00$_H$

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CPINIT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.176 EMU3CPUINIT Register Contents

Bit Position	Bit	Function
31 to 1	—	These bits are read as 0. The write value should be 0.
0	CPINIT	0: Stops SubCPU operation. 1: Starts SubCPU operation (starts fetching)

Note 1. This bit should not be cleared to after having been set to 1.

This register is used to start the SubCPUs of the EMU3. To start the EMU3 after releasing the reset, access this register from the main CPU.

25.3.2.155 ADC Select Register (EMU3ADCSEL)

Access: Readable/writable in 8-bit units.

Address: <EMU_base> + 0000 2040_H

Value after reset: 00_H

Category: General/common

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SEL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.177 EMU3ADCSEL Register Contents

Bit position	Bit	Function
31 to 1	—	These bits are read as 0. The write value should be 0.
0	SEL	Selects the A/D converter data to be taken into the EMU31. 0: ADCC1 data 1: ADCC2 data

Accessing this register from the SubCPU's dedicated bus (base address is FC00 0000_H) is disallowed.

Like accesses form the CPU1 and CPU2, the register must be accessed from the SubCPUs via the base address of FF70 0000_H.

The setting made in this register must not be changed after the EMU3 is started.

25.4 Functions

25.4.1 Arithmetic Block Descriptions

1. Each variable is suffixed with the information indicating whether it is signed or unsigned, and the valid bit length. _s denotes the sign and _u denotes unsigned. The following number denotes the bit length. For a signed variable, the most significant bit is the sign bit.
   Example
   Ia_v_Lo_fix_s[31:0] represents data bits 0 to 31 of the variable Ia_v_Lo_fix. Bit 31 contains sign data.

2. For an arithmetic expression, an overflow occurs if it yields a value that exceeds the number of available bits.
   Example
   A: $7FFF_H$ B: $7FFF_H$
   C_s[15:0] ← A_s[15:0] + B_s[15:0]
   Note: The INIPOF bit of the EMU3nOFMON register is set to 1 if an overflow occurs during the operation in the input IP and the PIIPOF bit is set to 1 if an overflow occurs during the operation in the PI control IP, the PWMIPOF bit is set to 1 if an overflow occurs during the operation in the PWM IP.

3. If a division or right shift follows immediately after an arithmetic expression, a bit extension occurs and the divided or shifted value is stored.
   Example
   C_s[15:0] ← (A_s[15:0] × B_s[15:0]) >> 10
   The results of (A_s[15:0] × B_s[15:0]) is extended to 32 bits before the 16 bits that are shifted 10 bits to the right are stored in C_s[15:0].
   (Similarly, if all of A, B, and C are 32 bits long, the results of A_s[31:0] × B_s[31:0] are extended to 64 bits before the 32 bits that are shifted 10 bits to the right are stored.)

   D_s[15:0] ← (A_s[15:0] × B_s[15:0]) / C_s[15:0]
   32 bits of the results of D(A_s[15:0] × B_s[15:0]) are divided by C_s[15:0] and the results of the division are stored in D_s[15:0].

4. An arithmetic expression is bit-extended according to the number of bits of the location for storing the results.
   Example
   D_s[31:0] ← C_s[31:0] + A_s[15:0] × B_s[15:0]
   The results of (A_s[15:0] × B_s[15:0]) are extended to 32 bits and then added to C_s[31:0] as they are.
   Note: An overflow occurs if the result of adding the value to C_s[31:0] exceeds 32 bits.

   Example
   C_s[15:0] ← A_s[11:0] + B_s[11:0]
   The results of (A_s[11:0] + B_s[11:0]) are sign-extended to 16 bits and stored in C_s[15:0].

5. A division is processed as follows:
   In division, the fractional part is rounded down.

   Examples
   5 / 2 = 2
   – 5 / 2 = –2
   (1) 16 bits ← 32 bits divided by 16 bits
   0 / 0 = 0
   Negative number / 0 = 8000_H
   Positive number / 0 = $7FFF_H$

   (2) 32 bits ← 32 bits divided by 16 bits
   0 / 0 = 0
   Negative number / 0 = $8000\ 0000_H$
   Positive number / 0 = $7FFF\ FFFF_H$

   (3) 16 bits ← 32 bits divided by 16 bits
   0 / 0 = 0
   If $7FFF_H \leq$ results, then results ← $7FFF_H$
   If $8000_H \geq$ results, then results ← 8000_H

6. The variables represented in the lowercase alphanumeric character in this section is basically preset in a register, bit(s), or cache of the EMU3. It cannot be set directly by the user. Unless specifically specified, the initial value of the internal registers of the EMU3 is 0.

7. The left column of a table delineated by a double line contains the target that is subjected to the condition in question and the right column contains the location where the result is to be stored.
   A table having a double line in this section (see the table below) shows the situation such that when the target A satisfies the condition B, the result E is stored in D or that when the target A satisfies the condition C, the result F is stored in D.

   Example

Target A subjected to a condition	Result in destination D
Condition B	Result E
Condition C	Result F

8. There are sections in which modules appear in C-like code. The example given below illustrates this case.

   Example) PWM IP Func(pwm2) electrical angle offset processing

[pwm2] Electrical angle offset processing

Explanation	Adds the offset value to the angle value and outputs the results for phase adjustment.	
Arguments	*etht1i*: Input angle value (EMU3nTHTESEL) *etht2i*: Input angle value (EMU3nTHTEFIX)	**ethto*: Output angle value (EMU3nTHTEPWM)
Related registers	EMU3nPWMCTR.FLININIP: Electrical angle select bits (0,1,2) EMU3nTHTFORESFT: PWM IP electrical angle soft input register (uint12_t) EMU3nPHI: PWM IP electrical angle offset register (uint16_t) EMU3nGTHT: PWM IP electrical angle adjustment coefficient register (int16_t)	

Processing	void pwm2 (uint12_t *etht1i*, uint12_t *etht2i*,
	uint12_t **ethto*) {
	
	if(EMU3nPWMCTR.FLININIP == 0) // Select electrical angle soft input.
	**ethto* = (((EMU3nTHTFORESFT + EMU3nPHI) & 0x0FFF) * EMU3nGTHT) >> 8 ;
	else if (EMU3nPWMCTR.FLININIP == 1) // Select input from input IP.
	**ethto* = (((*etht1i* + EMU3nPHI) & 0x0FFF) * EMU3nGTHT) >> 8 ;
	else if (EMU3nPWMCTR.FLININIP == 2) // Select input from angle generation IP.
	**ethto* = (((*etht2i* + EMU3nPHI) & 0x0FFF) * EMU3nGTHT) >> 8 ;
	}	

The function name “pwm2” corresponds to a module.
Variables “uint12_t etht1i, uint12_t etht2i, uint12_t *ethto” correspond to input/output signals of the module.
uintXX_t represents an unsigned signal with a bit width of [XX-1:0] and

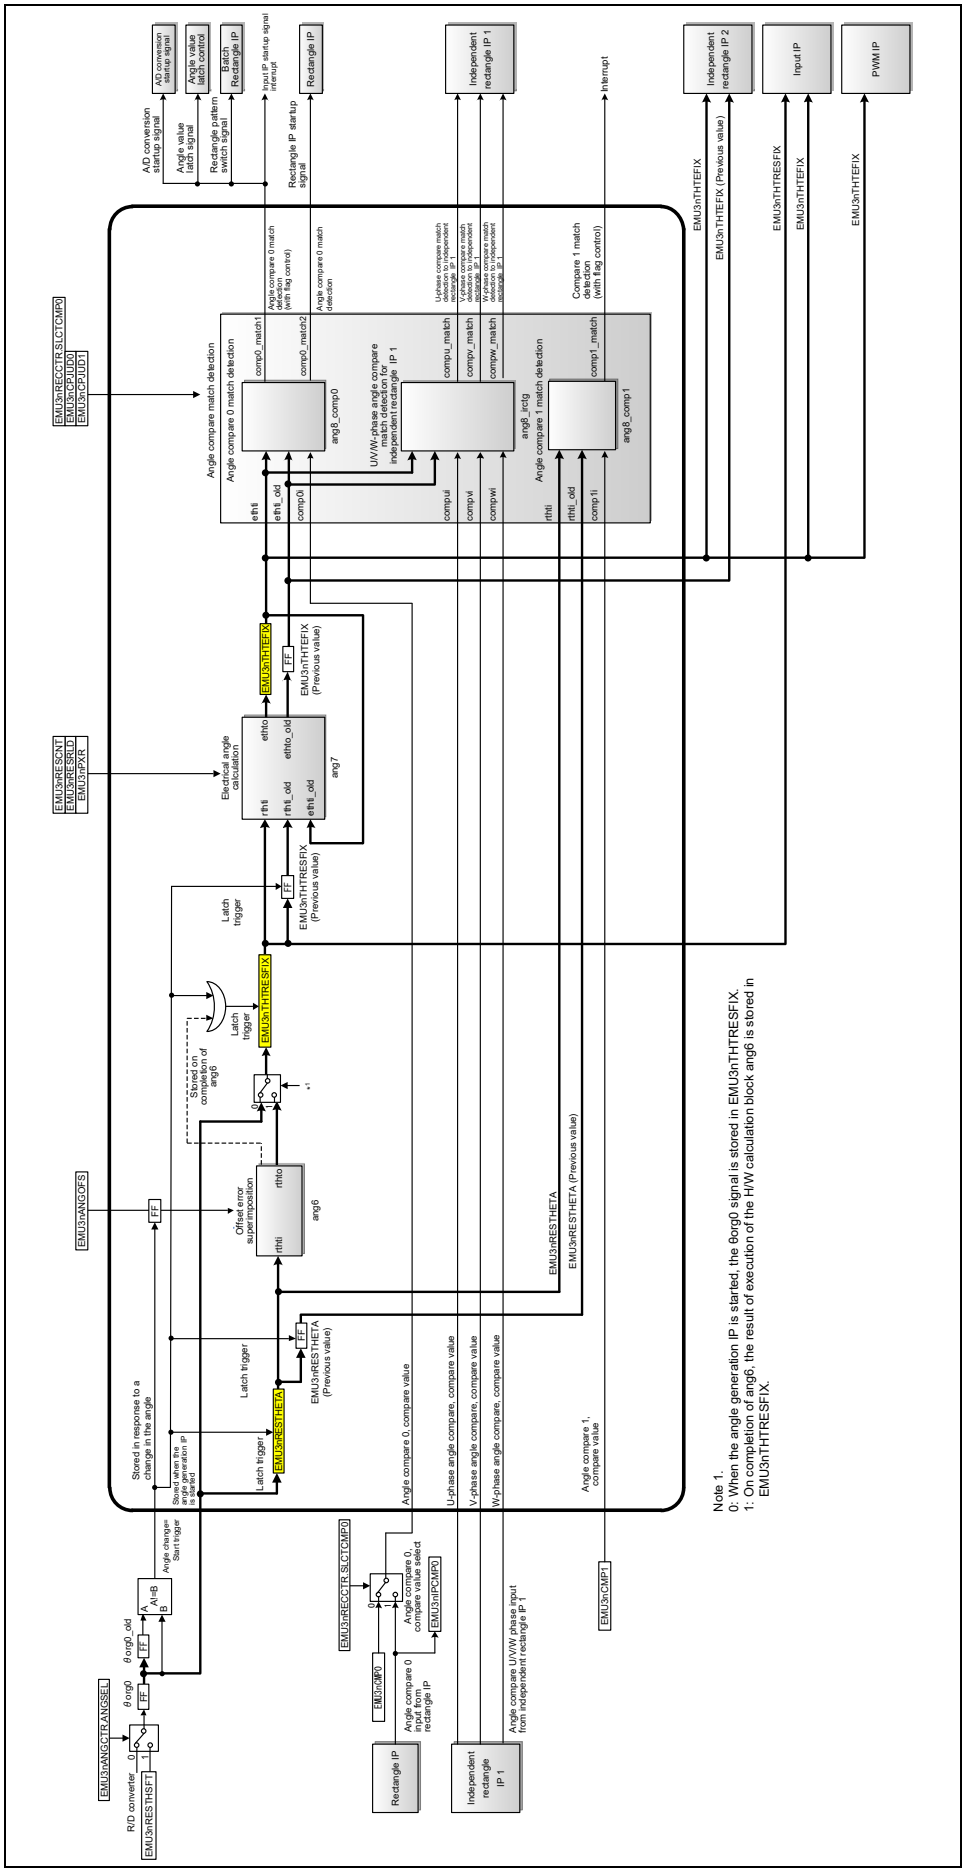
intYY_t represents a signed signal with a bit width of [YY-1:0].
“register_name.bit” represents a bit name of the register.

25.4.2 Angle Generation IP

The angle generation IP generates electrical angle data from a resolver angle and performs resolver angle compare match detection and electrical angle compare match detection processing.

The angle generation IP is started every time the resolver angle which is selected from the R/D converter or EMU3nRESTHSFT register is updated. Any startup request issued while the angle generation IP is active is invalid.

Figure 25.4 shows the outline of the angle generation IP processing and **Figure 25.5** shows an example of angle generation.



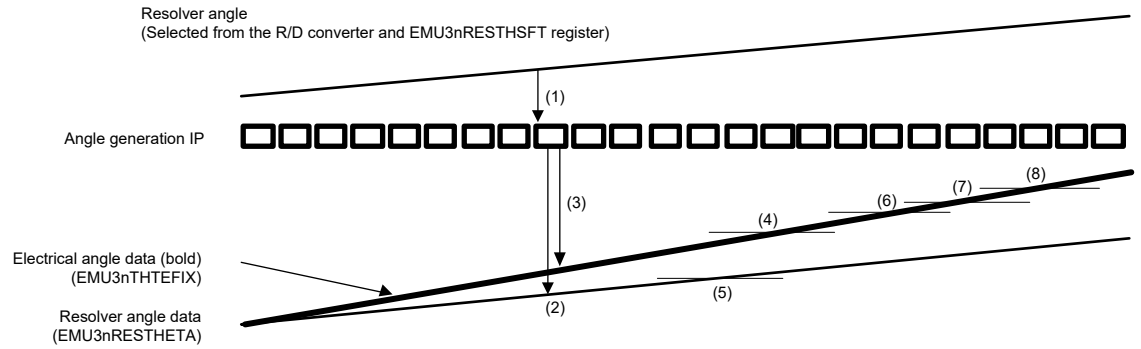


Figure 25.4 Angle Generation IP Processing

(1) The angle generation IP is started by the change of resolver angle.
(2) The resolver angle data (EMU3nRESTHETA) is generated.
(3) The electrical angle data (EMU3nTHTEFIX) is generated.
(4) When the electrical angle data matches with the compare value for electrical angle, angle compare 0 match detection signal is generated.
(5) When the resolver angle data matches with the compare value for resolver angle, angle compare 1 match detection signal is generated.
(6) When the electrical angle data matches with the compare value for independent rectangle IP 1 U-phase, angle compare match detection signal for independent rectangle IP 1 U-phase is generated.
(7) When the electrical angle data matches with the compare value for independent rectangle IP 1 V-phase, angle compare match detection signal for independent rectangle IP 1 V-phase is generated.
(8) When the electrical angle data matches with the compare value for independent rectangle IP 1 W-phase, angle compare match detection signal for independent rectangle IP 1 W-phase is generated.

The compare value for electrical angle is set by the EMU3nCMP0 register or rectangle IP.
The compare value for resolver angle is set by the EMU3nCMP1 register.
The compare value for independent rectangle IP 1 U-phase is selected from the EMU3nIRUCPPNn register (n = 0 to 2) by the independent rectangle IP 1.
The compare value for independent rectangle IP 1 V-phase is selected from the EMU3nIRVCPPNn register (n = 0 to 2) by the independent rectangle IP 1.
The compare value for independent rectangle IP 1 W-phase is selected from the EMU3nIRWCPPNn register (n = 0 to 2) by the independent rectangle IP 1.

Figure 25.5 Example of Angle Generation

Processing for Calculating an Electrical Angle from a Resolver Angle

The angle generation IP calculates an electrical angle from a resolver angle during electrical angle calculation processing which are shown in **Figure 25.4**. The angle generation IP processing and register setting are explained below according to examples 1 and 2 shown in **Figure 25.6**.

- Example 1 in **Figure 25.6**

  The configuration has 6 2-pole 3-phase coils. 1 cycle of the 3-phase waveform (electrical angle) is equal to 1 cycle of the mechanical angle. The resolver angle, however, has a twice larger frequency than the mechanical angle. The resolver angle pole count is represented by 2. Consequently, the electrical angle is calculated as follows:

  (Angle value of electrical angle) = (Angle value equivalent to 2 cycles of resolver angle (0° to 720°)) × 0.5

- Example 2 in **Figure 25.6**

  The configuration has 12 4-pole 3-phase coils. 1 cycle of the 3-phase waveform (electrical angle) is equal to 1/2 cycle of the mechanical angle. The resolver angle has the same period as the mechanical angle and the resolver angle pole count is represented by 1. Consequently, the electrical angle is calculated as follows:

  (Angle value of electrical angle) = (Angle value equivalent to 1/2 cycle of resolver angle (0° to 180°)) × 2.0

The above-mentioned “angle values equivalent to n cycles of resolver angle” exceeding 360° are calculated by extracting the transition of the position of the resolver angle pole. More specifically, a counter is provided that detects transitions of maximum value ↔ minimum value of the resolver angle and counts up and down the transitions. The sum

of the count value of the counter multiplied by 4096 and the resolver angle is equivalent to the angle value corresponding to n cycles of resolver angle.

(The maximum value of the counter can be changed using the resolver angle pole count that is specified by the EMU3nRESRLD register.)

The above "× 0.5" and "× 2.0" coefficients are set in the EMU3nPXR register.

The register settings for examples 1 and 2 in **Figure 25.6** are listed in **Table 25.178**. The transitions of the angle values are shown in the respective examples.

Table 25.178 Sample Parameter Settings for Calculating the Electrical Angle

Register	Example 1 in **Figure 25.6**	Example 2 in **Figure 25.6**
EMU3nRESRLD	"1" (resolver angle pole count 2)	"0" (resolver angle pole count 1)
EMU3nPXR	"0080_H" (0.5 fixed-point number)	"0200_H" (2.0 fixed-point number)

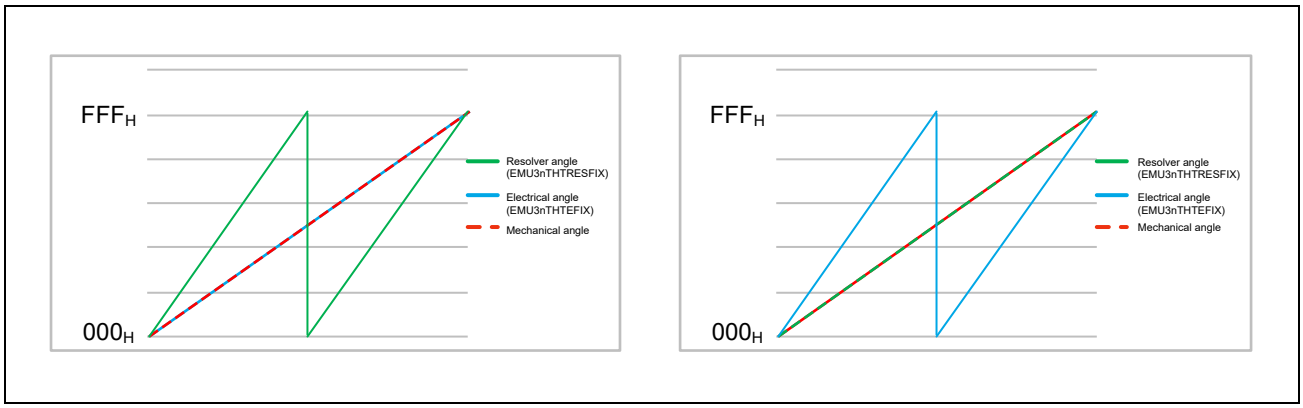

Figure 25.6 Examples of Electrical Angle Calculation (Left: Example 1, Right: Example 2)

CAUTION

The H/W accelerator expresses electrical angles of 0° to 360° with the EMU3nTHTEFIX register values 0000_H to $0FFF_H$ (unsigned integer values). There are cases in which the resolution of the resolver angle value indicated in the EMU3nRESTHETA register differs depending on the motor system; for example, the resolver values of 0° to 360° may be expressed as 0000_H to $00FF_H$ (unsigned integer values). In such a case, the magnification with which the resolver angle value is to be set in the EMU3nPXR register need be changed so as to ensure yield the 16-bit resolution.

(For inputs that cause the EMU3nRESTHETA register to be loaded with values 0000_H to $00FF_H$, the EMU3nTHTEFIX register can be loaded with values of 0000_H to $0FF0_H$ by setting EMU3nPXR to "16.0.")

The rest of this section details the functions that are shown in **Figure 25.4**.

(1) Func(ang6) Convolve offset error

[ang6] Convolution offset error

Explanation	Adds offset value to resolver angle value for output.
Arguments	rthti: Input resolver angle value (EMU3nRESTHETA) *rthto: Output resolver angle value (EMU3nTHTRESFIX)
Related registers	EMU3nANGOFS: Resolver angle offset value register (int12_t)

Processing	void ang6 (uint12_t rthti, uint12_t *rthto) {
	
	*rthto = (rthti + EMU3nANGOFS) & 0x0FFF;
	}

(2) Func(ang7) Electrical angle calculation

[ang7] Calculate electrical angle

Explanation	Calculates the electrical angle value from the resolver angle value and resolver angle number of cycles count value.
Arguments	rthti: Resolver angle value (EMU3nTHTRESFIX) rthti_old: Resolver angle value (previous value) (EMU3nTHTRESFIX (previous value)) ethti_old: Electrical angle value (EMU3nTHTEFIX (previous value)) *ethto: Electrical angle value (EMU3nTHTEFIX) *ethto_old: Electrical angle value (previous value) (EMU3nTHTEFIX (previous value))
Related register	EMU3nRESCNT: Resolver angle cycle count value register (uint3_t) EMU3nRESRLD: Resolver angle pole count value register (uint3_t) EMU3nPXR: Electrical angle generation coefficient register (int16_t)

Processing	void ang7 (uint12_t rthti, uint12_t rthti_old, uint12_t ethti_old, uint12_t *ethto, uint12_t *ethto_old) {
	
	//Note: The input value of ethti_old is loaded with the ethto value established during the preceding ang7 execution.
	// The value of ethti_old is propagated to ethto_old after ang7 execution.
	*ethto_old = ethti_old;
	
	//Note: rthti_old is loaded with the rthti value that is established during the e preceding angle generation IP execution.
	
	uint1_t max2min, min2max;
	int5_t rescnt;
	uint15_t tmp_tht;
	
	if(0xF00 < rthti_old && rthti < 0x0FF)
	max2min = 1;
	else
	max2min = 0;
	
	if(0xF00 < rthti && rthti_old < 0x0FF)
	min2max = 1;
	else
	min2max = 0;

```
  if       (max2min == 1)
    rescnt = EMU3nRESCNT + 1;
  else if(min2max == 1)
    rescnt = EMU3nRESCNT - 1;
  else
    rescnt = EMU3nRESCNT;

  if        ( rescnt > EMU3nRESRLD)
    EMU3nRESCNT = 0;
  else if ( rescnt < 0 )
    EMU3nRESCNT = EMU3nRESRLD;
  else
    EMU3nRESCNT = rescnt & 0x7;

  tmp_tht = (EMU3nRESCNT << 12) | rthti ;
  *ethto = ( (tmp_tht * EMU3nPXR) >> 8 ) & 0x0FFF ;

  *rthti_old = rthti;

}
```

(3) Func(ang8) angle compare match

Angle compare 0, angle compare 1, independent rectangle IP1 U phase, V phase, and W phase compare matches are detected as follows:

COMP: angle compare 0, angle compare 1, independent rectangle IP1 U phase, V phase, and W phase compare match register

i: 1 for angle compare 1 match detection and 0 for the other detections

Angle: EMU3nTHTEFIX for angle compare 0, independent rectangle IP1 U phase, V phase, and W phase compares.
EMU3nRESTHETA for angle compare 1

A match is recognized when the following conditions are met:

Positive rotation mode

Angle (previous value) < Compare set value ≤ Angle

Reverse rotation mode

Angle (previous value) > Compare set value ≥ Angle

But judgment 1 and judgment 2 are added as match criteria because additional conditions are required when making judgments on a compare match in between the situation in which the angle changes from "FFF_H" to "0_H" (or from "0_H" to "FFF_H").

When the angle changes from "FFF_H" to "0_H"

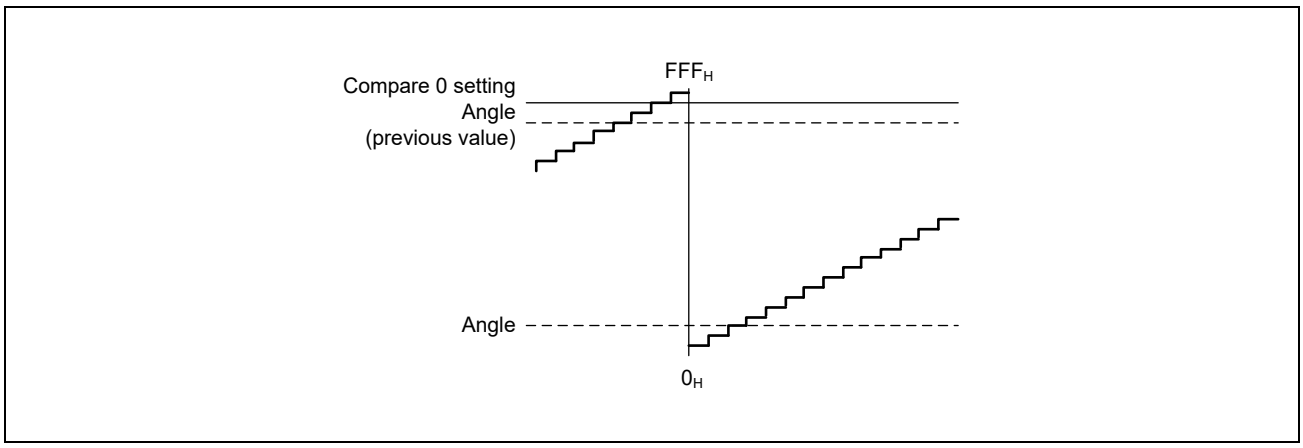

Figure 25.7 When the Angle Changes from FFF_H to 0_H

Judgment 1: FFF_H – EMU3nCPJUDi_u[7:0] < angle_u[11:0] (previous value) and angle_u[11:0] < EMU3nCPJUDi_u[7:0]

Judgment 2: FFF_H – EMU3nCPJUDi_u[7:0] < angle_u[11:0] and angle_u[11:0] (previous value) < EMU3nCPJUDi_u[7:0]

Positive rotation mode

Judgment 1 = Not met AND Judgment 2 = Not met AND angle_u[11:0] (previous value) < COMP ≤ angle_u[11:0]

Reverse rotation mode

Judgment 1 = Not met AND Judgment 2 = Not met AND angle_u[11:0] (previous value) > COMP ≥ angle_u[11:0]

When in positive mode and the electrical angle changes from "FFF_H" to "0_H"

Judgment 1 = Met AND ((angle_u[11:0] (previous value) < COMP) OR (COMP ≤ angle_u[11:0]))

When in reverse mode and the electrical angle changes from "0_H" to "FFF_H"

Judgment 2 = Met AND ((angle_u[11:0] (previous value) > COMP) OR (COMP ≥ angle_u[11:0]))

In angle compare 0 comparison value select processing, if the SLCTCMP0 bit of the EMU3nRECCTR is set to 0, the value of the EMU3nCMP0 register is set as the angle compare 0 comparison value. If the SLCTCMP0 bit of the EMU3nRECCTR register is set to 1, the results of rectangle IP operation are set. Even if the SLCTCMP0 bit of the EMU3nRECCTR register is set to 1, however, the first compare operation performed after the EMU3 is started sets up the value of the EMU3nCMP0 register as the angle compare 0 comparison value.

(4) About the compare match of the rectangle wave output

In angle compare 0 match or angle compare 1 match with the angle data, even if another compare match is performed again with the same value after one compare match is performed, the latter compare match is held cancelled until a new compare value is set up (flag control). This prevention of consecutive compare matches is applied to angle compare matches except the one for starting the rectangle IP. Any rectangle IP startup through a compare match occurring during the execution of the rectangle IP is ignored.

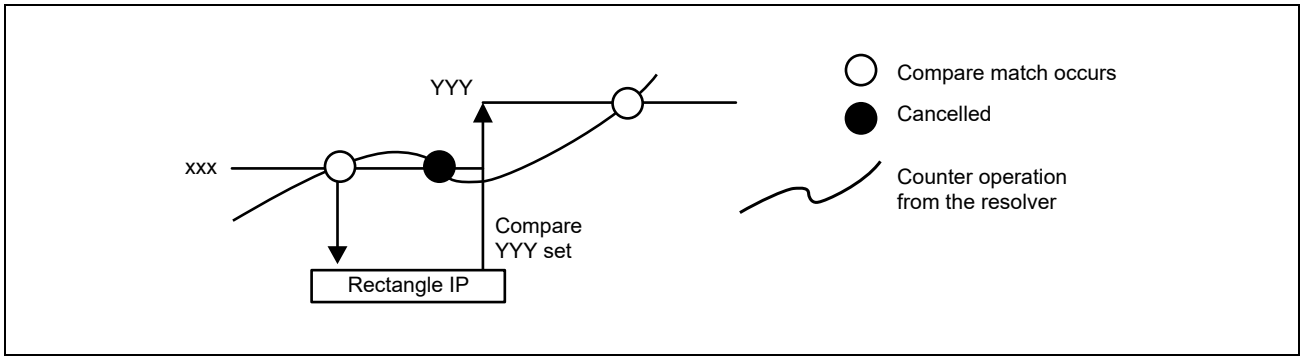

Figure 25.8 Prevention of Consecutive Compare Matches

(5) Angle comparison 0 match and angle comparison 1 match after EMU3 initialization

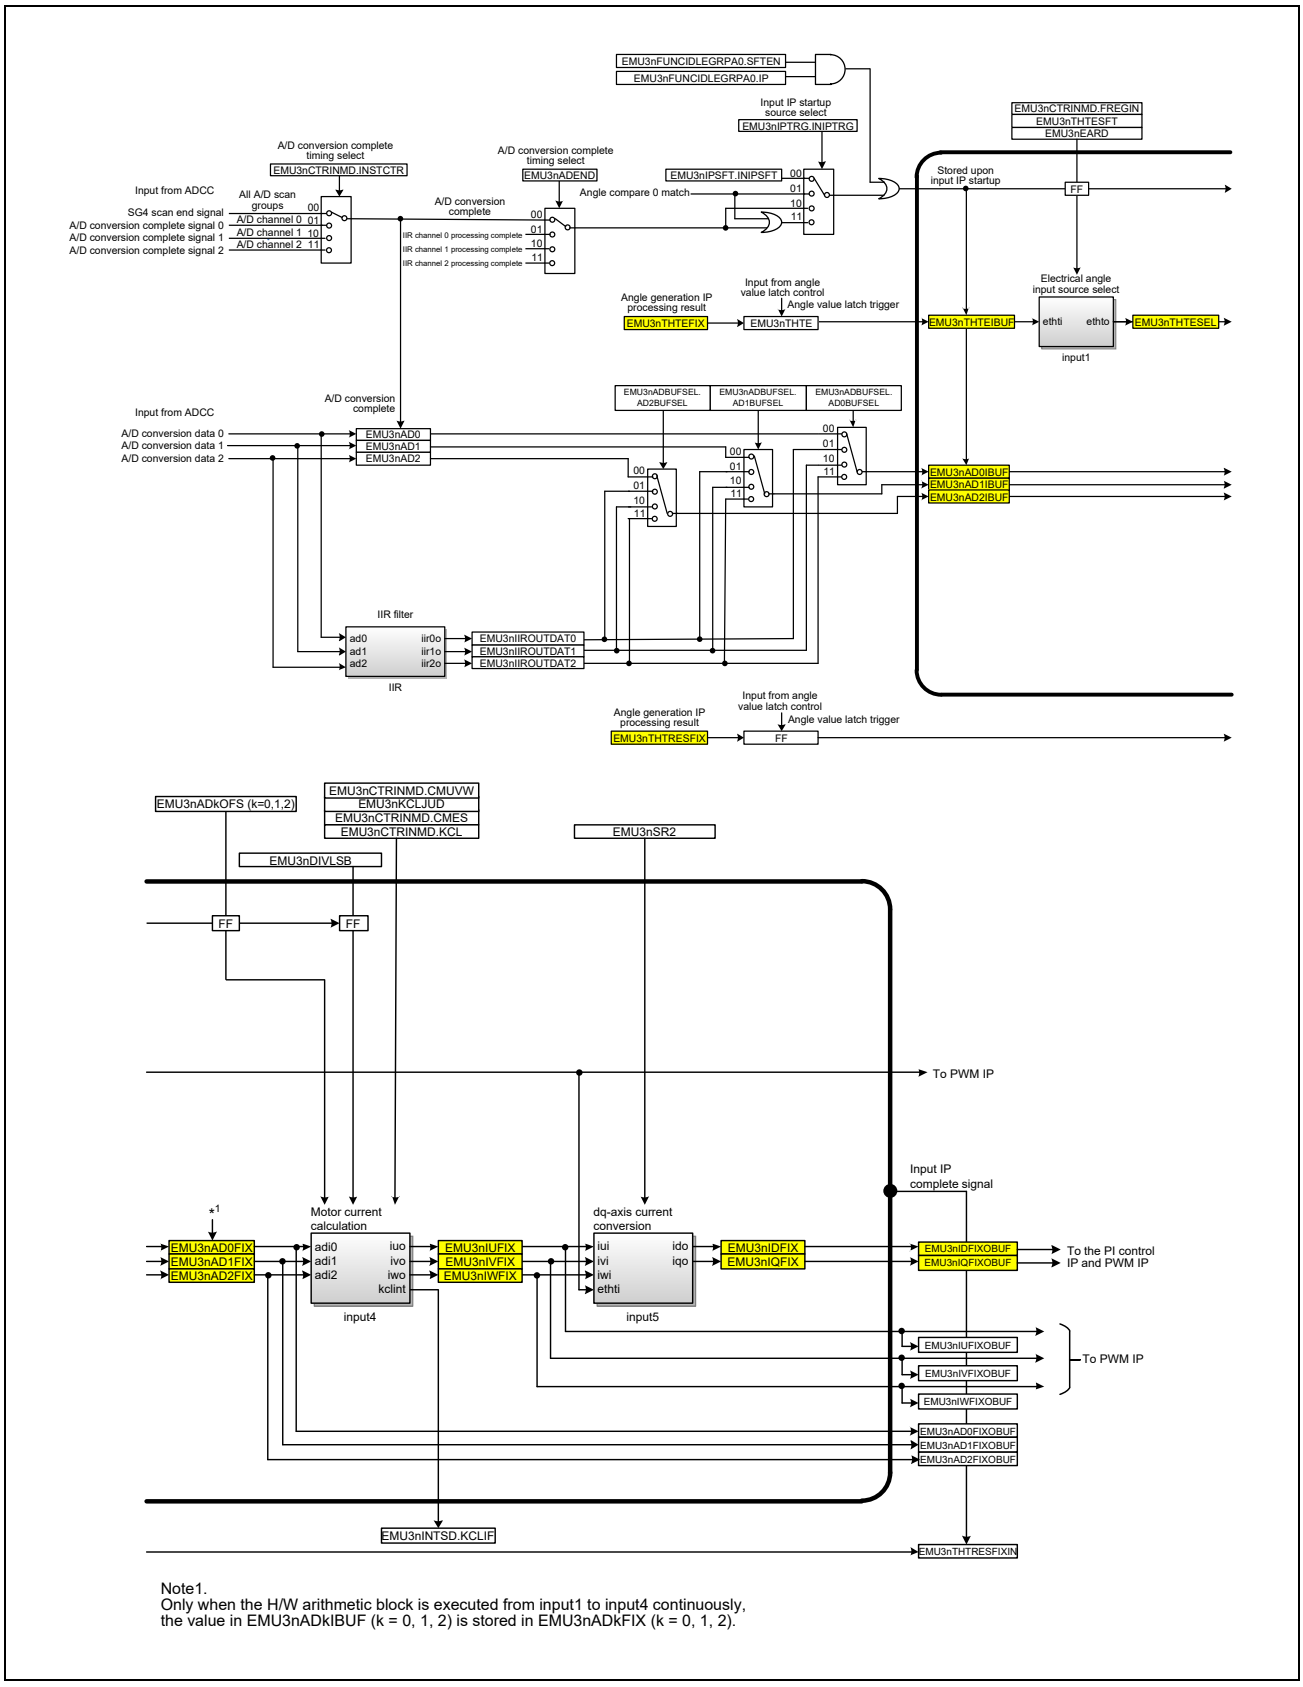
The settings of the angle generation IP immediately after EMU3 initialization are as follows.

- 0° is selected by the EMU3nCMP0 register for the value for comparison for an angle comparison 0 match.
- 0° is selected by the EMU3nCMP1 register for the value for comparison for an angle comparison 1 match.
- The resolver angle from the R/D converter is selected by the ANGSEL bit of the EMU3nANGCTR register for the angle value input to the angle generation IP.

If the angle value output from the R/D converter is static at around 0°, the angle indicated by the R/D converter may fluctuate (e.g. 12 bits ±4LSB), causing angle comparison 0 matches to occur and the setting of the CMP0IF bit of the EMU3nINTSD register to become “1”.

Similarly, the CMP1IF bit of the EMU3nINTSD register may become “1” in response to an angle comparison 1 match.

25.4.3 Input IP



The input IP calculates the dq-axis current values based on the motor's 3-phase current values and the electrical angle. The motor's 3-phase current values are supplied from the EMU3nADk registers (k = 0, 1, 2) which contain the converted values (3-phase current values) from the A/D converters or from the EMU3nIIROUTDATk registers (k = 0, 1, 2) which contain the outputs from the IIR filters. The electrical angle can be selected through the EMU3nTHTEFIX register which contains the electrical angle input from the angle generation IP or through the EMU3nTHTESFT register which contains a software input value.

Figure 25.9 shows the flow of the input IP processing.

The input IP is started when the startup source, which is selected by the INIPTRG bits of the EMU3nIPTRG register, occurs. If the software trigger is selected, the input IP can be started by setting the INIPSFT bit of the EMU3nIPSFT register to 1. It can also be started by software by setting the IP and SFTEN bits of the EMU3nFUNCIDLEGRPA0 register to 1 regardless of the value of the INIPTRG bit in the EMU3nIPTRG register.

The INIF bit of the EMU3nINTSD register is set to 1 when the input IP processing is completed. The INIF bit can be cleared by setting the INIFC bit of the EMU3nINTSDC register to 1.

The rest of this subsection gives a detailed description of the functions that are shown in **Figure 25.9**.

Note1.
Only when the H/W arithmetic block is executed from input1 to input4 continuously, the value in EMU3nADkIBUF (k = 0, 1, 2) is stored in EMU3nADkFIX (k = 0, 1, 2).

Figure 25.9 Flow of Input IP Processing

(1) Func(input1) Electrical angle source select

[input1] Electrical angle source select

Explanation	Adds the offset value to the angle value.	
Arguments	ethti: Input angle value (EMU3nTHTEIBUF)	*ethto: Output angle value (EMU3nTHTESEL)

  }
}
```

Processing description: Motor current value calculation processing

The A/D values are quantized as shown below when calculating the U/V/W phase current values from the A/D converted values.

The origin correction value which is used to convert unsigned A/D converted values to signed values is placed in the EMU3nADkOFS register. Signed integer A/D data is calculated by subtracting the value of the EMU3nADkOFS register from the A/D converted values.

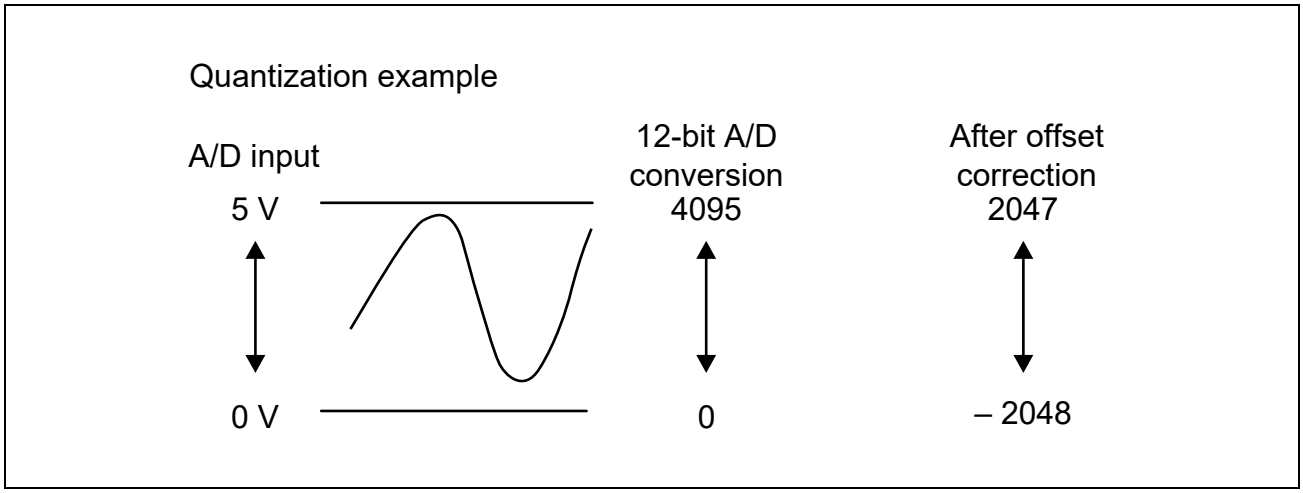

Figure 25.10 Example Quantization of the A/D Values and Calculation of Signed Integer A/D Data by Offset Correction

Processing description: Kirchhoff's current law violation detection processing

The sum of the motor current values of the U/V/W phases are basically 0 according to the first law of Kirchhoff (current law).

If the sum of the phase currents exceeds the threshold value, it is supposed that a circuit fault has occurred in the control feedback loop of either one phase.

If the KCL bit of the EMU3nCTRINMD register is set to 1 (enabling the detection of Kirchhoff's current law violations), a Kirchhoff's current law violation detect interrupt source is generated when the sum of the phase currents exceeds the threshold value specified by the EMU3nKCLJUD register.

The KCLIF bit of the EMU3nINTSD register is set to 1 when the above-mentioned interrupt source occurs. The KCLIF bit can be cleared by setting the KCLIFC bit of the EMU3nINTSDC register.

A Kirchhoff's current law interrupt source is generated when

$-Jud \leq Iu + Iv + Iw \leq Jud$

is not established.

Iu: Motor current value of the U phase

Iv: Motor current value of the V phase

Iw: Motor current value of the W phase

Jud: Kirchhoff's current law threshold value (EMU3nKCLJUD)

(3) Func(input5) dq-axis current conversion

[input5] dq-axis current conversion

Explanation	Converts the UVW phase current values to dq-axis current values.	
Arguments	iui: Input U phase current value (EMU3nIUFIX) ivi: Input V phase current value (EMU3nIVFIX) iwi: Input W phase current value (EMU3nIWFIX) ethti: Input electrical angle (EMU3nTHTESEL)	*ido: Output d-axis current value (EMU3nIDFIX) *iqo: Output q-axis current value (EMU3nIQFIX)
Related register	EMU3nSR2: dq-axis current conversion coefficient register (int32_t)	

Processing

```
void input5 (int32_t   iui, int32_t   ivi, int32_t   iwi, uint12_t ethti,
int32_t *ido, int32_t *iqo ) {

   int32_t sin60,sin30;
   int32_t cos60,cos30;

  //sin(θ+60°) = (sin(θ) * cos(60°) + cos(θ) * sin(60°) ) >> 15;
  sin60 = (sin_table[ethti] * 0x4000 + cos_table[ethti] * 0x6EDA ) >> 15;
  //sin(θ+30°) = (sin(θ) * cos(30°) + cos(θ) * sin(30°) ) >> 15;
  sin30 = (sin_table[ethti] * 0x6EDA + cos_table[ethti] * 0x4000 ) >> 15;

// sin(60°) = 0x00006EDA; value obtained by multiplying “sin(60°)” by 0x8000
// cos(30°) = 0x00006EDA; value obtained by multiplying “cos(30°)” by 0x8000
// sin_table and cos_table represent
// 32-bit signed fixed-point data whose fractional part is 15 bits long and which
// are generated from tables whose index is the 12-bit electrical angle (in 1-bit increments).
```

Processing description: dq-axis current conversion processing

The dq-axis current values (EMU3nIDFIX and EMU3nIQFIX) are generated from the U/V/W phase current values (EMU3nIUFIX, EMU3nIVFIX, and EMU3nIWFIX) and the electrical angle θ (EMU3nTHTESEL).

The formulas for generating the dq-axis current values (Id, Iq) from the U/V/W phase current values (Iu, Iv, Iw) input data.

$$I_d = \sqrt{\frac{2}{3}} \times (\cos\theta \times I_u - \cos(\theta + 60°) \times I_v - \sin(\theta + 30°) \times I_w)$$

$$I_q = \sqrt{\frac{2}{3}} \times (-\sin\theta \times I_u + \sin(\theta + 60°) \times I_v - \cos(\theta + 30°) \times I_w)$$

θ: Electrical angle specified by the EMU3nTHTESEL register

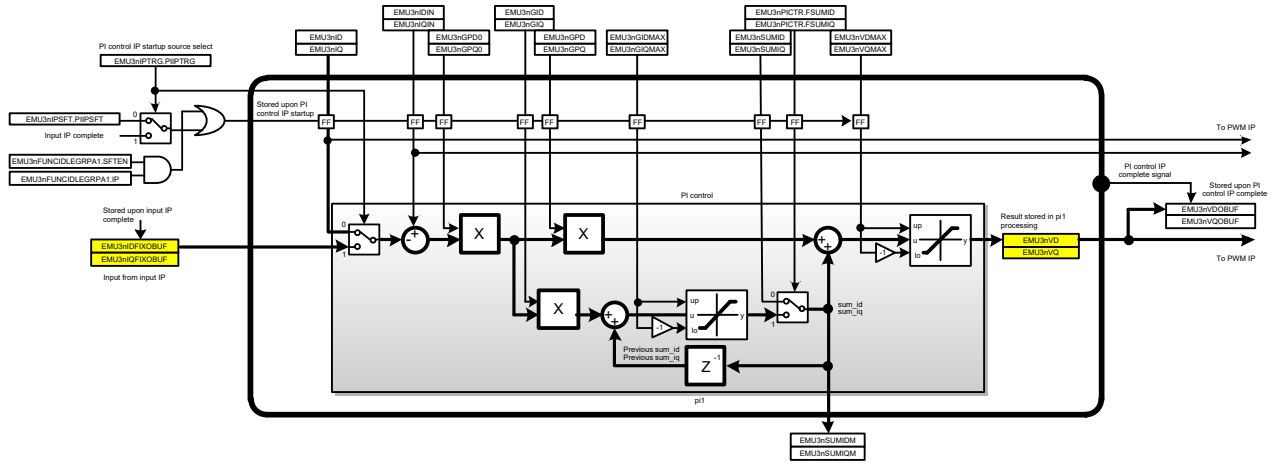
Iu: U phase current value specified by the EMU3nIUFIX register

Iv: V phase current value specified by the EMU3nIVFIX register

Iw: W phase current value specified by the EMU3nIWFIX register

Id: d-axis current value specified by the EMU3nIDFIX register

Iq: q-axis current value specified by the EMU3nIQFIX register



25.4.4 PI Control IP

The PI control IP generates dq-axis voltage values from the dq-axis current values. The dq-axis current values can be selected from the EMU3nIDFIX register and EMU3nIQFIX register that hold the operation results from the input IP or from the EMU3nID register and EMU3nIQ register that hold software input value.

The PI control IP is started upon completion of input IP processing if the PIIPTRG bit of the EMU3nIPTRG register is set to 1. If the PIIPTRG bit is set to 0, it can be started by setting the PIIPSFT bit of the EMU3nIPSFT register. It can also be started by software by setting the IP and SFTEN bits of the EMU3nFUNCIDLEGRPA1 register to 1 regardless of the value of the INIPTRG bit in the EMU3nIPTRG register.

When the PI control IP processing is completed, the PIIF bit of the EMU3nINTSD register is set to 1. The PIIF bit can be cleared by setting the PIIFC bit of the EMU3nINTSDC register to 1.

Figure 25.11 shows the flow of PI control IP processing.

Note: "Z-1" in the figure denotes a delay and also indicates that the results of sum_id and sum_iq that are established during the preceding PI control IP execution are referenced.

```

25.4.5 PWM IP

The PWM IP calculates the PWM compare values from the dq-axis voltage values and electrical angle. The dq-axis voltage values can be selected from the EMU3nVD register and EMU3nVQ register that hold the operation results of the PI control IP and the electrical angle can be selected from the input from the input IP, the input from the angle generation IP, or from the EMU3nTHTFORESFT register which holds the software input.

Figure 25.12 shows the flow of PWM IP processing.

If the PWMIPTRG bit of the EMU3nIPTRG register is set to 1, the PWM IP is started upon completion of PI control IP processing. If the PWM3nIPTRG bit is set to 0, the PWM IP can be started by setting the PWMIPSFT bit of the EMU3nIPSFT register to 1. It can also be started by software by setting the IP and SFTEN bits of the EMU3nFUNCIDLEGRPA2 register to 1 regardless of the value of the INIPTRG bit in the EMU3nIPTRG register.

The PWMIF bit can be cleared by setting the PWMIFC bit of the EMU3nINTSDC registe to 1.

The rest of this subsection gives a detailed description of the functions that are shown in **Figure 25.12**.

```

Processing description: angular velocity calculation processing

The PWM IP is provided with the capability to calculate the angular velocity of the resolver angle for exercising non-interference control.

The angular velocity value output from the R/D converter is a signed 26-bit value and its 1LSB is equivalent to approximately 0.07[min^{-1}]. The data signal equivalent to the RDC angular velocity [min^{-1}] is multiplied by a correction coefficient inside the H/W accelerator to obtain the actual angular velocity [min^{-1}] in hexadecimal before being multiplied by ($2\pi/60$). The resultant value is stored in the EMU3nVEL register as a signed 32-bit angular velocity value [rad/sec] with a 12-bit fractional part.

Angular velocity [rad/sec] (12-bit fractional part)

= RDC angular velocity value [25:0] (signed bit extended) × correction coefficient (0.0698...) × (2π/60)

= RDC angular velocity value [25:0] (signed bit extended) × $001DF5E7_H$ >> 16

$001DF5E7_H$: Fixed value signal having a total length of 32 bits whose value is the correction coefficient (0.0698...) × (2π / 60) multiplied by $1000\ 0000_H$ (268435456).

When using the EMU3nVELSFT register with a software input value, configure it for a signed 32-bit angular velocity value [rad/sec] with a 12-bit fractional part.

Processing description: Non-interference control

The PWM IP is provided with the capability to exercise non-interference control.

Since the d-axis current and q-axis current interfere with each other, the control efficiency is improved by making corrections on the d- and q-axes in advance.

The correction processing is performed as shown below. The values of the coefficients need be preset from the CPU program. The angular velocity can be calculated using the angular velocity value in the EMU3nVEL register which is output from the R/D converter or the software input value through the EMU3nVELSFT register.

$vd^* = vd' - (iq \times (\omega \times \omega\ gain) \times Lq)$

$vq^* = vq' + (id \times (\omega \times \omega\ gain) \times Ld) + ((\omega \times \omega\ gain) \times \phi)$

vd*: d-axis voltage value output by the non- interference control function

vq*: q-axis voltage value output by the non- interference control function

vd': d-axis voltage value (d-axis after PI control) to be input to the non-interference control function

vq': q-axis voltage value (q-axis after PI control) to be input to the non- interference control function

id: d-axis current value specified by either one of EMU3nID, EMU3nIDFIXOBUF, and EMU3nIDIN in the figure (d-axis before PI control)

iq: q-axis current value specified by either one of EMU3nIQ, EMU3nIQFIXOBUF, and EMU3nIQIN in the figure (q-axis before PI control)

ω: Angular velocity value specified by EMU3nVEL or EMU3nVELSFT*[1]

ω gain: Coefficient value for the angular velocity value specified by EMU3nDECVELG

Ld: d-axis inductance value specified by EMU3nDECLD

Lq: q-axis inductance value specified by EMU3nDECLQ

ϕ: Magnetic flux value specified by EMU3nDECFLUX

Note 1. Since ω represents the angular velocity of the resolver angle, it is necessary to represent the coefficient for converting to the angular velocity of the electrical angle also with the ω gain.

CAUTION

The current values to be input for PI control are used as the input to non-interference control calculations.

When the input IP, PI control IP, and PWM IP are run for H/W arithmetic operations, the values of the EMU3nIDFIXOBUF (EMU3nIQFIXOBUF) registers which hold the results of input IP operation are used as the input current values for the PI control IP and the input current values for non-interference control by the PWM IP. When the PI control IP is not to be used for PI control, write the value that is calculated during the software processing into the EMU3nIDFIXOBUF (EMU3nIQFIXOBUF) register, which is used to hold the results of input IP operation, as the input current values for non-interference control processing before starting the PWM IP.

(2) Func(pwm2) Electrical angle offset processing

[pwm2] Electrical angle offset processing

Explanation	Adds the offset value to the angle value and outputs the results for phase adjustment.
Arguments	*etht1i*: Input angle value (EMU3nTHTESEL) **ethto*: Output angle value (EMU3nTHTEPWM) *etht2i*: Input angle value (EMU3nTHTEFIX)
Related registers	EMU3nPWMCTR.FLININIP: Electrical angle select bits (0,1,2) EMU3nTHTFORESFT: PWM IP electrical angle soft input register (uint12_t) EMU3nPHI: PWM IP electrical angle offset register (uint16_t) EMU3nGTHT: PWM IP electrical angle adjustment coefficient register (int16_t)

	/// are generated from tables whose index is the 12-bit electrical angle (in 1-bit increments).

Processing description: 2-phase-to-3-phase conversion processing

The U/V/W phase voltage values are generated as the input data to the dq-axes from the following two types of data in addition to the electrical angle θ (EMU3nTHTEPWM).

Given below are the formulas for generating the U/V/W phase voltage values (Vu, Vv, Vw) from the dq-axis input data.

Input data “d-axis voltage: Vd (EMU3nVD2), q-axis voltage Vq (EMU3nVQ2)”

$$V_u = \sqrt{\frac{2}{3}} \cdot \left(V_d \cdot \cos\theta - V_q \cdot \sin\theta\right)$$

$$V_w = \sqrt{\frac{2}{3}} \cdot \left(V_d \cdot \cos(\theta + 120°) - V_q \cdot \sin(\theta + 120°)\right)$$

$$V_v = -(V_u + V_w)$$

Input data “dq-axis voltage values: Vdq (EMU3nVDQSFT), dq-axis voltage phase angle: Vθ (EMU3nTHTVSFT)”

$$V_{dq} = \sqrt{{V_d}^2 + {V_q}^2}$$

$$V_\theta = \tan^{-1}\frac{V_q}{V_d}$$

$$V_u = \sqrt{\frac{2}{3}} \cdot V_{dq} \cdot \cos(\theta + V_\theta)$$

$$V_w = \sqrt{\frac{2}{3}} \cdot V_{dq} \cdot \cos(\theta + V_\theta + 120°)$$

$$V_v = -(V_u + V_w)$$

θ: Electrical angle specified by the EMU3nTHTEPWM register

Vd: d-axis voltage specified by the EMU3nVD2 register

Vq: q-axis voltage specified by the EMU3nVQ2 register

Vdq: dq-axis voltage specified by the EMU3nVDQSFT register

Vθ: dq-axis voltage phase angle specified by the EMU3nTHTVSFT register

Vu: U-phase voltage value specified by the EMU3nVU register

Vv: V-phase voltage value specified by the EMU3nVV register

Vw: W-phase voltage value specified by the EMU3nVW register

(4) Func(pwm4) PWM modulation

This function modulates the 3-phase voltage values EMU3nVU, EMU3nVV, and EMU3nVW and outputs the results to EMU3nVU0, EMU3nVV0, and EMU3nVW0. For details of processing, contact our sales representative.

[pwm4] PWM modulation processing

Processing description: Performs modulation to improve the output voltage characteristics.

The PWM IP is provided with the function to modulate the 3-phase voltage waveforms for improved output voltage characteristics.

Figure 25.13 shows the waveforms that are obtained without using the modulation function and **Figure 25.14** waveforms that are obtained using the modulation function. Using the modulation function, it is possible to get line voltages of large amplitudes from 3-phase voltage waveforms of the same amplitude.

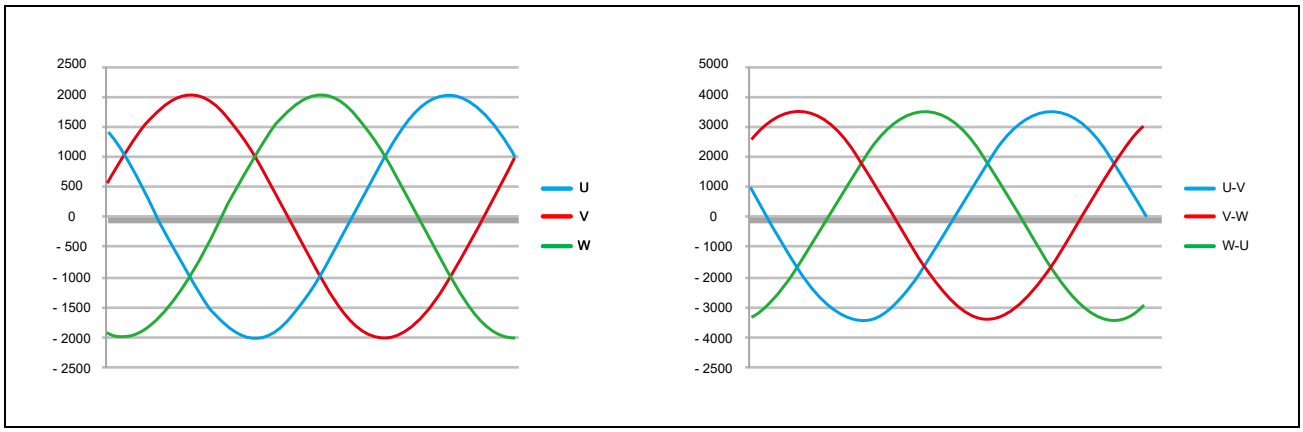

Figure 25.13 3-phase Waveforms without Modulation (Left: 3-phase Voltage Waveforms, Right: Line Voltage Waveforms)

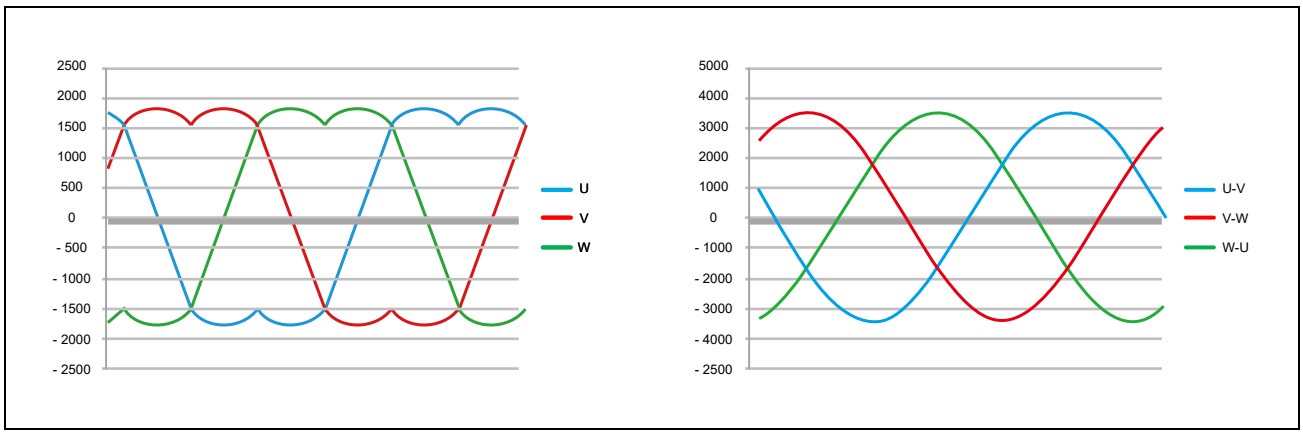

Figure 25.14 3-phase Waveforms with Modulation (Left: 3-phase Voltage Waveforms, Right: Line Voltage Waveforms)

The PWM IP can generate the following 8 types of waveforms according to the SETHARM bit settings of the EMU3nPWMCTR register:

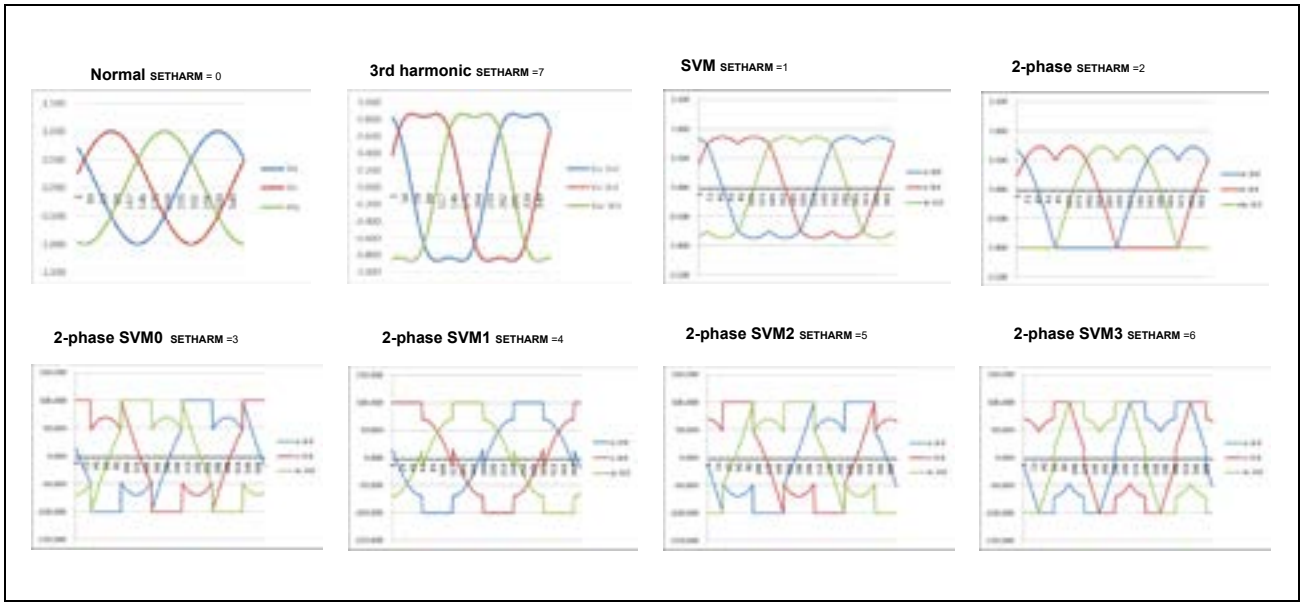

Figure 25.15 Waveforms that can be Generated according to the SETHARM Bit Settings

The peak value of the 2-phase SVM can be made greater by setting the EMU3nTMAX register with a ratio value greater than the value of the EMU3nVDQSFT register (dq-axis voltage value: Vdq).

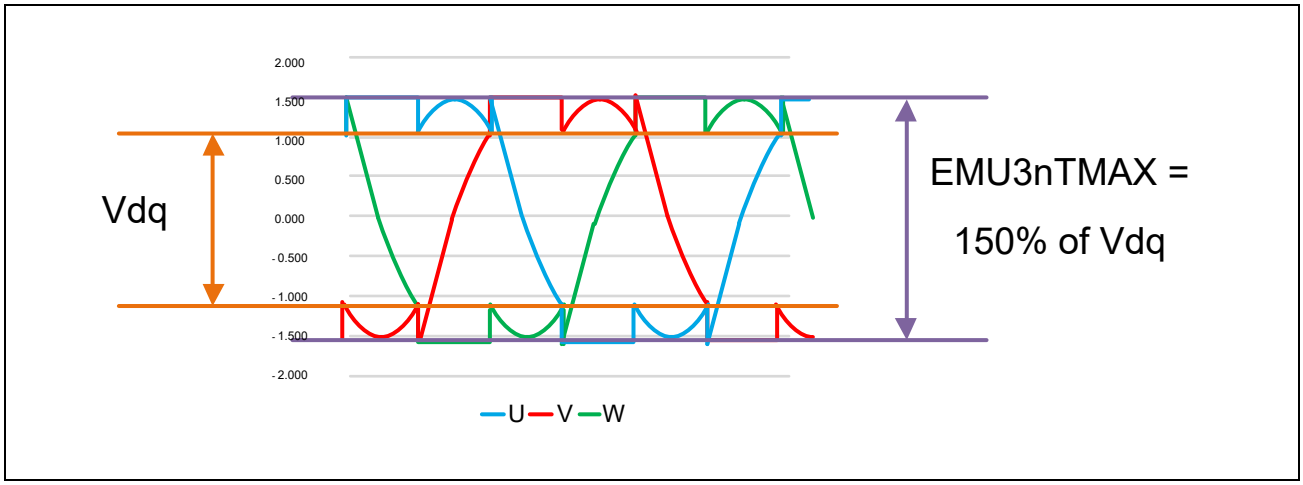

Figure 25.16 Example of Setting up the Peak Value using the EMU3nTMAX Register

Furthermore, the peak value can also be made greater by changing the coefficient value that is set in the EMU3nSR23 register.

(5) Func(pwm5) Duty factor calculation

[pwm5] Duty factor calculation processing

Explanation	Multiplies the UVW phase voltage values by the gain specified through a register for making scaling adjustment.
Arguments	*vui*: Input U phase voltage value (EMU3nVU0) **vuo*: Output U phase voltage value (EMU3nVU1) *vvi*: Input V phase voltage value (EMU3nVV0) **vvo*: Output V phase voltage value (EMU3nVV1) *vwi*: Input W phase voltage value (EMU3nVW0) **vwo*: Output W phase voltage value (EMU3nVW1)

}
```

Processing description: Dead time compensation processing

The PWM IP is provided with the function to perform dead time compensation processing for the purpose of compensating for the dead time that is added.

Figure 25.17 shows the possible influence that the dead time exerts on the output of an inverter. Since the potential in the dead time period varies according to the positive/negative state of the motor current, the output waveform may get longer or shorter than the ideal waveform represented by the 3-phase PWM compare values. The PWM IP can make the inverter output closer to the ideal waveform by adding correction value to the PWM compare values in advance according to the positive or negative state of the current values. Depending on the threshold value, the addition of the correction value is cancelled if the motor current values lie near the value of 0.

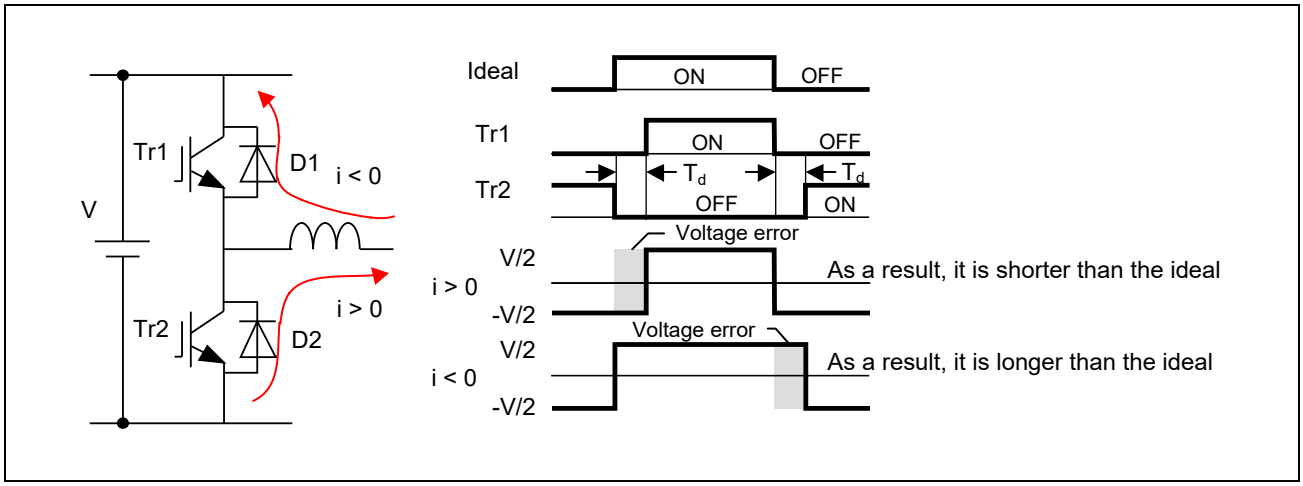

Figure 25.17 Dead Time Adding Processing by TSG3

Table 25.179 gives sample register settings.

Table 25.179 Sample Register Settings for Dead Time Compensation Processing

    }
}
```

Processing description: PWM value output processing

The value of the EMU3nCARR register is buffered into the inside of the PWM IP when the PWM IP is started.

The buffered value is transferred to the TSG3 upon completion of the PWM IP processing as the value of the EMU3nCARRBUF register, which holds the data output from the H/W arithmetic block Func(pwm11), together with the values of the EMU3nPWMUIP, EMU3nPWMVIP, and EMU3nPWMWIP registers at the same time.

In the PWM data transfer (software startup) started by the PWMDT bit of the EMU3nPWMDT register, the values of the EMU3nCARR, EMU3nPWMU, EMU3nPWMV, and EMU3nPWMW registers are also transferred to the TSG3 at the same time.

The register values transfer to the TSG3 are, depending on the value of the SHIPWM bit of the EMU3nPWMCTR register, output as they are or shifted by 1 bit to the left as in the table below.

Table 25.180 Relationship between the TSG3 Registers and the EMU3 Registers that are Involved in TSG3 Transfer

TSG3 Register	EMU3nPWMCTR.SHIPWM = 0	EMU3nPWMCTR.SHIPWM = 1
TSG3nCMP0E[17:0]	EMU3nCARRBUF[15:0] (EMU3nCARR[15:0])	EMU3nCARRBUF[15:0] << 1 (EMU3nCARR[15:0] << 1)
TSG3nCMP2E[17:0] TSG3nCMP1E[17:0]	EMU3nPWMUIP[15:0] (EMU3nPWMU[15:0])	EMU3nPWMUIP[15:0] << 1 (EMU3nPWMU[15:0] << 1)
TSG3nCMP6E[17:0] TSG3nCMP5E[17:0]	EMU3nPWMVIP[15:0] (EMU3nPWMV[15:0])	EMU3nPWMVIP[15:0] << 1 (EMU3nPWMV[15:0] << 1)
TSG3nCMP10E[17:0] TSG3nCMP9E[17:0]	EMU3nPWMWIP[15:0] (EMU3nPWMW[15:0])	EMU3nPWMWIP[15:0] << 1 (EMU3nPWMW[15:0] << 1)

Note: Items enclosed in parentheses in lower columns represent EMU3 registers associated with PWM data transfer (software startup).

25.4.6 Rectangle IP

The rectangle IP calculates the rectangle wave output level and compare values. It can also input the voltage phases. **Figure 25.18** shows the flow of rectangle IP processing.

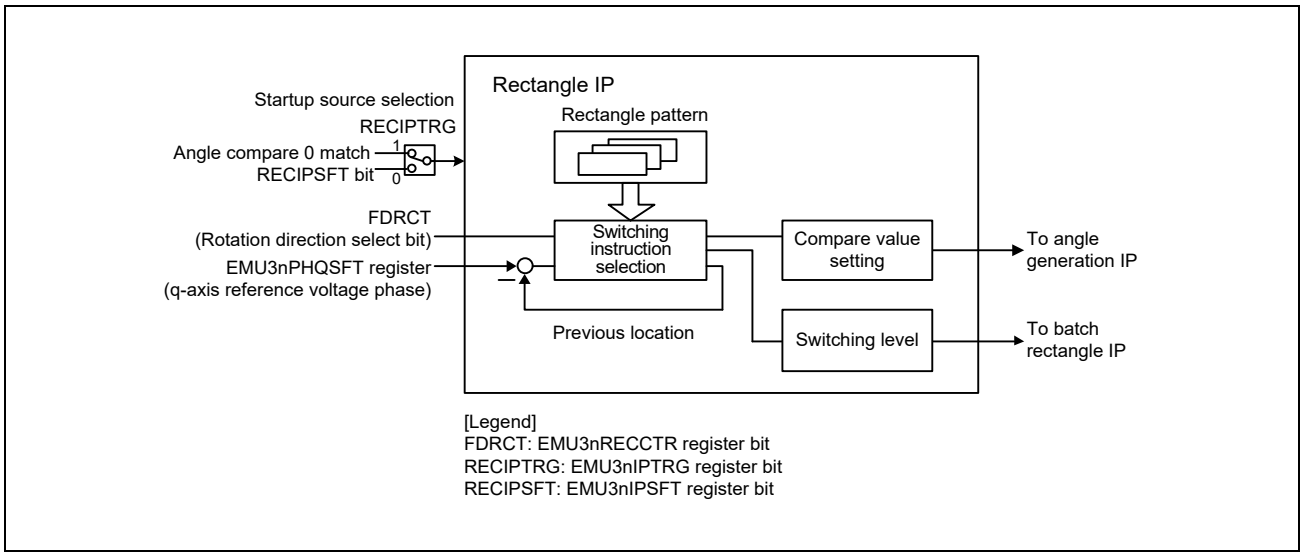

Figure 25.18 Flow of Rectangle IP Processing

The rectangle IP starts when an angle compare 0 match is detected if the RECIPTRG bit of the EMU3nIPTRG register is set to 1. If the RECIPTRG bit is set to 0, the rectangle IP can be started by setting the RECIPSFT bit of the EMU3nIPSFT register to 1.

The RECIF bit of the EMU3nINTSD register is set to 1 when the rectangle IP processing is completed.

The RECIF bit can be cleared by setting the RECIFC bit of the EMU3nINTSDC register to 1.

The completion of rectangle IP processing can be used as a trigger to generate an interrupt.

(1) Switching instruction generation

"Feedback data select" FIPPOSI bit of the EMU3nRECCTR register	psw_old_u[2:0]
"0" (Use EMU3 calculation value)	EMU3nPSW_u[2:0]
"1" (Use user-supplied value)	EMU3nPSWSFT_u[2:0]

$\phi q_s[11:0] \leftarrow EMU3nPHQSFT_s[11:0]$

Direction of rotation FDRCT bit of the EMU3nRECCTR register	psw_old_u[2:0]	EMU3nPSW_u[2:0]	Switching angle EMU3nIPCMP0_u[11:0]	Next switching
"0" (Positive rotation)	0	1	60° – ϕq_s[11:0]	EMU3nPTNAB A side
	1	2	120° – ϕq_s[11:0]	EMU3nPTNAB B side
	2	3	180° – ϕq_s[11:0]	EMU3nPTNCD C side
	3	4	240° – ϕq_s[11:0]	EMU3nPTNCD D side
	4	5	300° – ϕq_s[11:0]	EMU3nPTNEF E side
	5	0	360° – ϕq_s[11:0]	EMU3nPTNEF F side
"1" (Reverse rotation)	0	5	180° + ϕq_s[11:0]	EMU3nPTNEF E side
	1	0	240° + ϕq_s[11:0]	EMU3nPTNEF F side
	2	1	300° + ϕq_s[11:0]	EMU3nPTNAB A side
	3	2	360° + ϕq_s[11:0]	EMU3nPTNAB B side
	4	3	60° + ϕq_s[11:0]	EMU3nPTNCD C side
	5	4	120° + ϕq_s[11:0]	EMU3nPTNCD D side

Note 1. ϕ appearing in the text is calculated in degrees but actually calculated using values of 0 to FFF_H.
$60° = 2AA_H$, $120° = 555_H$, $180° = 800_H$, $240° = AAA_H$, $300° = D55_H$, $360°(0°) = 000_H$
EMU3nIPCMP0_u[11:0] is handled as an unsigned 12-bit value by masking the calculation results with $\&0FFF_H$.

25.4.7 Rectangle Wave Generation Block

The rectangle wave generation block consists of batch rectangle IP, independent rectangle IP1, and independent rectangle IP2. The rectangle wave generated here is output via the TSG3. The RECMD bit of the EMU3nIRECCTR register can be used to select the IP of which the rectangle wave is to be output.

The batch rectangle IP updates the output waveforms of the U/V/W phases all at once based on the rectangle wave output level and compare values that are calculated by the rectangle IP in the arithmetic block.

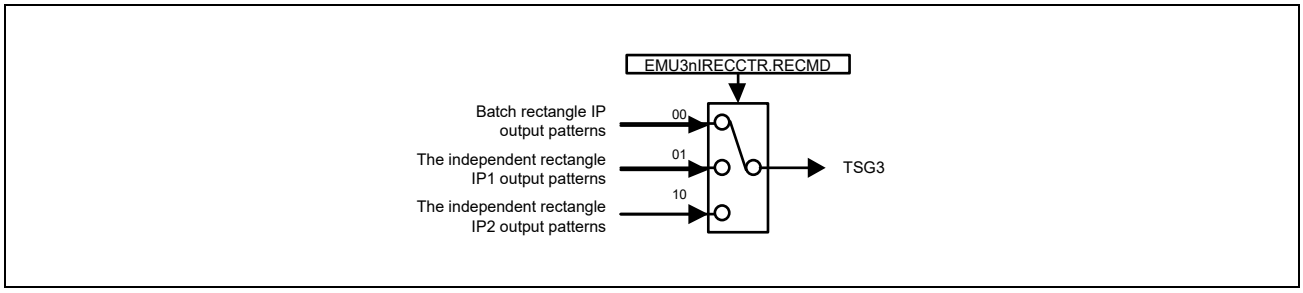

Figure 25.19 Output Waveform Selection Function

The independent rectangle IP1 and independent rectangle IP2 update the output waveforms at different timings for different phases based on the compare values and output levels that are specified separately for each of the U, V, and W phases.

Note: The batch rectangle IP, independent rectangle IP1, and independent rectangle IP2 must not be switched while they are generating rectangle wave outputs.

25.4.7.1 Batch Rectangle IP

The methods of switching the rectangle wave pattern output by the H/W accelerator are divided into hardware processing using the rectangle IP's arithmetic processing and software processing in which register values are rewritten at appropriate times by CPU software.

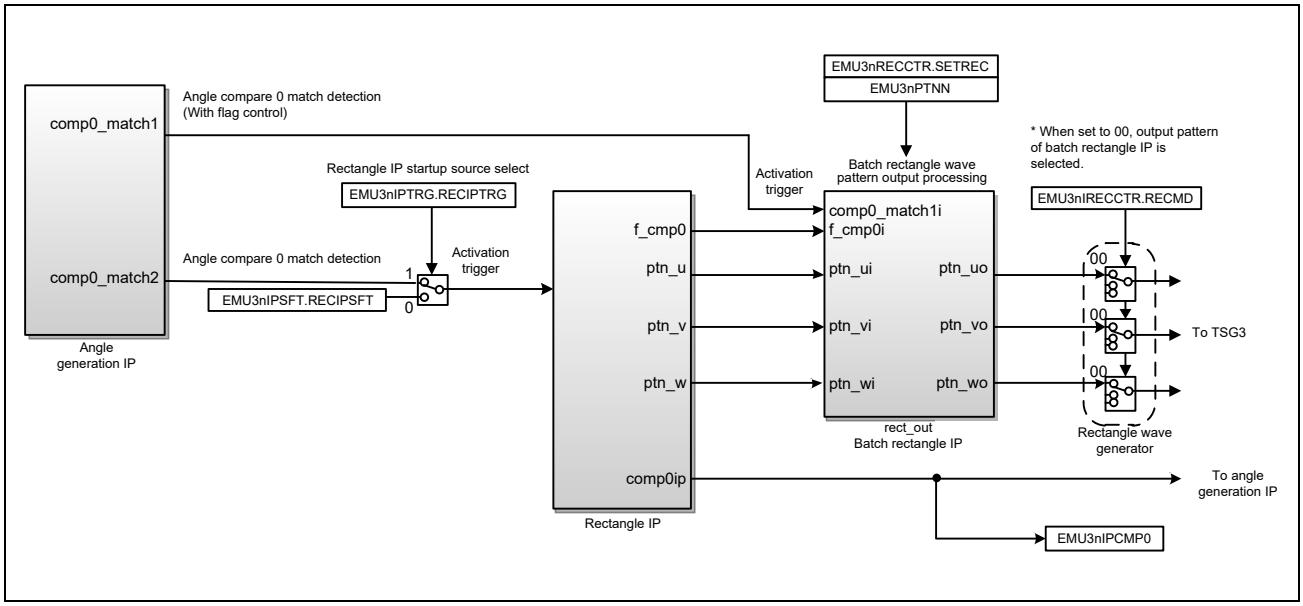

Figure 25.20 Processing from the Angle Generation IP to Rectangle Wave Generation Block

Hardware Processing

The batch rectangle IP selects, every time started for arithmetic processing, the compare value to be used for angle compare 0 match detection and the rectangle wave pattern data that is to be applied on detection of an angle compare 0 match, switch the rectangle wave pattern output with the selected data on each detection of an angle compare 0 match.

To apply the value selected by the batch rectangle IP to compare value established on the detection of an angle compare 0 match, it is necessary to set the SLCTCMP0 bit of the EMU3nRECCTR register to 1.

CAUTION

Even if the SLCTCMP0 bit of the EMU3nRECCTR register is set to 1, the value of the EMU3nCMP0 register is used as the compare value for the first angle compare 0 match processing that is performed after the H/W accelerator is started.

If the FDRCT bit of the EMU3nRECCTR register is set to 0 (positive rotation), the case switches in the order of "0→1→2→3→4→5→0→…" shown in **Table 25.181 (1/2)** on each angle compare 0 match detection occurring every 60°. If the FDRCT bit of the EMU3nRECCTR register is set to 1 (reverse rotation), the case switches in the order of "0→5→4→3→2→1→0→…" shown in **Table 25.181 (2/2)** on each angle compare 0 match detection occurring every 60°.

The selection of the rectangle wave patterns is set by EMU3nPTNAB register, EMU3nPTNCD register, and EMU3nPTNEF register if the SETREC bit of the EMU3nRECCTR register is set to 1. If the SETREC bit of the EMU3nRECCTR register is set to 0, the value of only the EMU3nPTNN is selected and therefore it is necessary for the CPU software to rewrite the EMU3nPTNN register on each detection of an angle compare 0 match.

Table 25.181 Sets of Compare Values for Angle Compare 0 Match Detection and Rectangle Wave Patterns to be selected by the Batch Rectangle IP (1/2)

	* Positive Rotation Mode (FDRCT bit = 0)		
Case*1	EMU3nIPCMP0 register	rectangle wave pattern (SETREC bit = 1)	rectangle wave pattern (SETREC bit = 0)
0	2AA (60°)	EMU3nPTNAB register, nPTNA bits (n=W,V,U)	EMU3nPTNN register, nPTN bits (n=W, V, U)

5	555 (120°)	EMU3nPTNCD register, nPTND bits (n=W,V,U)	Same as above.

Note 1. “Case” denotes the value of psw_old_u[2:0]. See **Section 25.4.6, Rectangle IP.**

For the operation of the batch rectangle hardware, see **Section 25.4.6, Rectangle IP.**

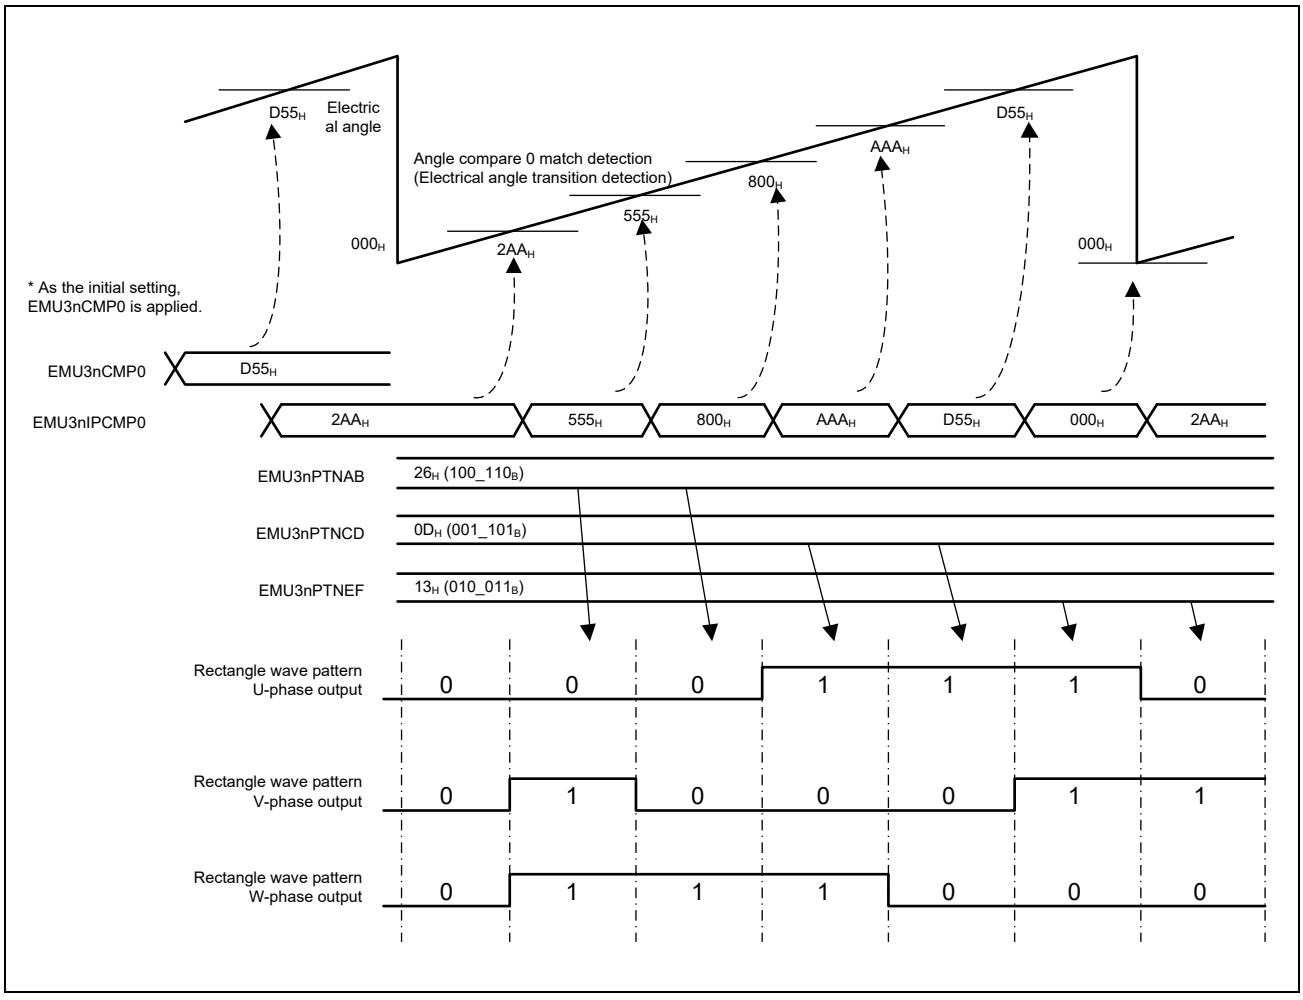

Figure 25.21 Example of Hardware Processing of the Batch Rectangle IP

Software Processing

The EMU3nCMP0 register is configured for the comparison value for angle compare 0 match detection by setting the SLCTCMP0 bit of the EMU3nRECCTR register to 0 and the EMU3nPTNN register is configured for the rectangle wave pattern value by setting the SETREC bit of the EMU3nRECCTR register to 0.

When an angle compare 0 match is detected based on the EMU3nCMP0 register, the rectangle wave pattern is switched by the value that is specified in the EMU3nPTNN register. Software-based rectangle wave pattern switching is accomplished under control of the CPU software by repeating the cycle of processing to rewrite the EMU3nCMP0 register and the EMU3nPTNN register and to wait angle compare 0 match detection.

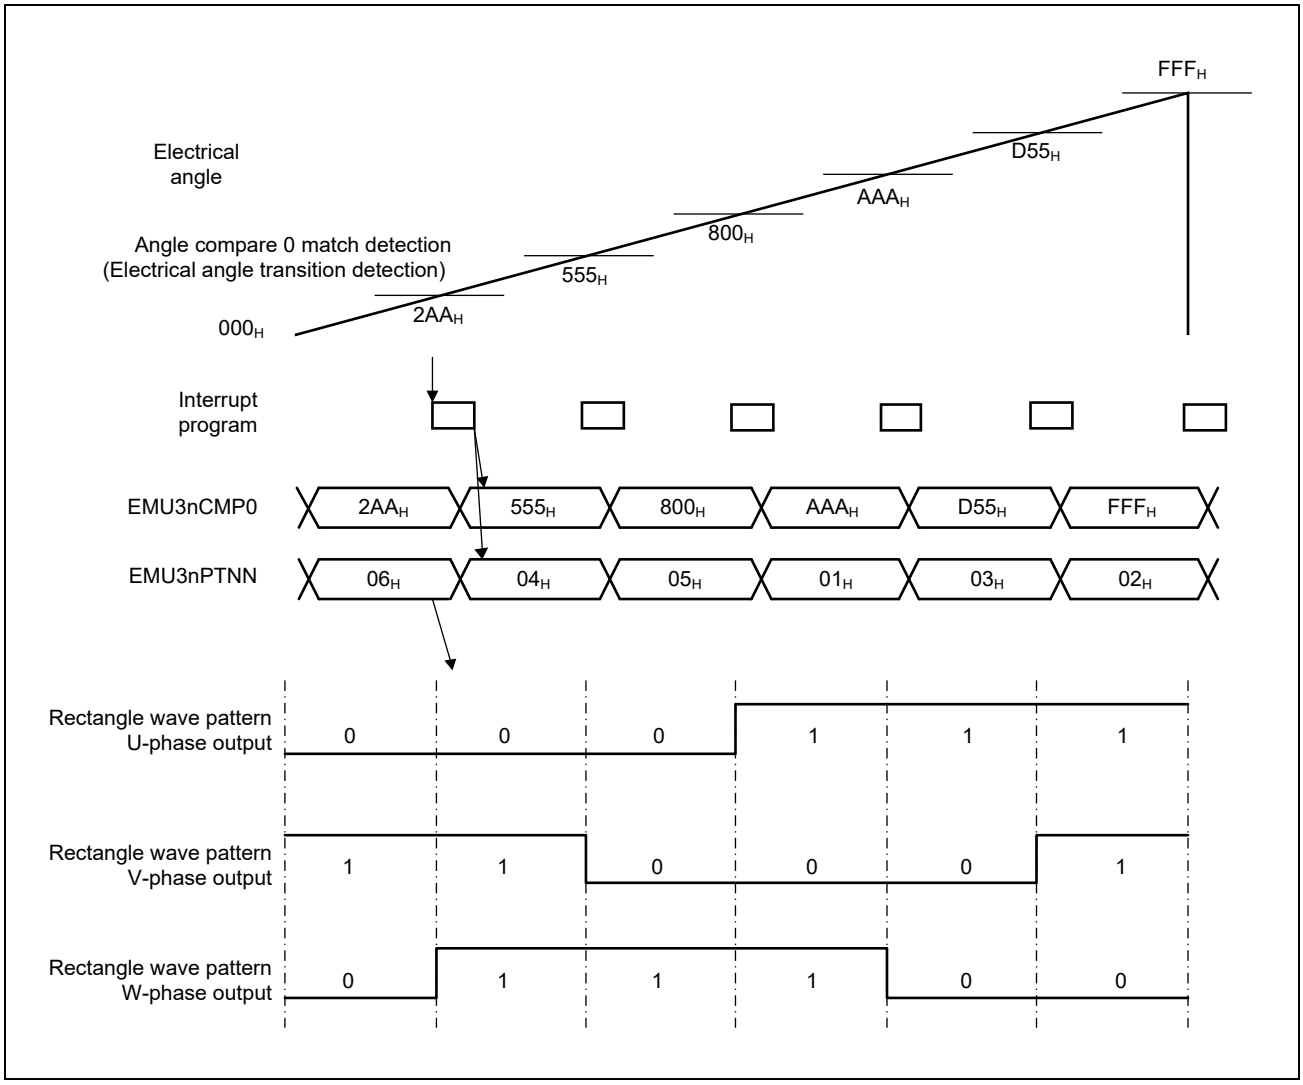

Figure 25.22 Example of Software Processing of the Batch Rectangle IP

25.4.7.2 Independent Rectangle IP1

The independent rectangle IP1 can generate more complex waveforms than the batch rectangle IP by switching each of the U/V/W phases of the rectangle wave patterns when they match the given electrical angles respectively.

The phase switchings in the independent rectangle IP1 occur independently of one another. When a match occurs between the electrical angle and one of the comparison values for angle compare 0 match detection, the output level of the matching phase is switched. Three unique comparison values and pattern values (EMU3nIRkCPPN0 to EMU3nIRkCPPN2 registers (k = U, V, W)) can be set for each of the U/V/W phases. The independent rectangle IP1 switches the comparison value on each detection of an electrical angle compare match. The interrupt source determination bits (IRECWIF, IRECVIF, and IRECUIF bits of the EMU3nINTSD register) are switched to 1 only when electrical angle compare matches are detected based on the comparison values in the EMU3nIRkCPPN2 registers (k = U, V, W).

Independent rectangle IP1 operation

The H/W accelerator outputs the rectangle wave patterns from the independent rectangle IP1 to the TSG3 when the RECMD bits of the EMU3nIRECCTR register are set to 01.

Figure 25.23 shows the configuration of the independent rectangle IP1 for 1 phase. Three circuits of similar configuration are implemented in the independent rectangle IP1 for 3 phases.

The comparison values 0-2 and pattern values 0-2 (EMU3nIRkCPPN0 to EMU3nIRkCPPN2 registers (k = U, V, W)) are rewritten by the CPU. The independent rectangle IP1 selects a set of comparison and pattern values according to an internal selector value. The selector value is set to 001_B after a reset. It switches, on each detection of an electrical angle compare match, in the order of 001_B (compare 0 value/pattern 0 value selected)→010_B (compare 1 value/pattern 1 value selected)→100_B (compare 2 value/pattern 2 value selected)→001_B (compare 0 value/pattern 0 value selected)→…. The interrupt source determination bit is set to 1 when an electrical angle compare match detection is accepted in the select value 100_B state. The current selector value can be referenced through the EMU3nIRSELM register.

Flags 0 to 2 are set to 1 when the CPU write the configuration register (EMU3nIRkCPPN0 to EMU3nIRkCPPN2 (k = U, V, W)) as the comparison value/pattern value and to 0 when the corresponding angle compare match is detected by the angle generation IP. If a flag is set to 0, neither selector value nor pattern output are updated even when the corresponding angle compare match is detected. In this case, no interrupt source will be generated. The state of these flags can be referenced through the EMU3nIRFLGM register.

Flags 0 to 2 are reset to 0 and the select value to 001_B by writing a 1 to the flag select signal initialization register (EMU3nIRCTRST).

The pattern outputs of the respective phases can be updated by writing a value into the UINIPTN, VINIPTN, and WINIPTN bits of the EMU3nIRPTN register. Reading these bits yield the pattern value that has been last written.

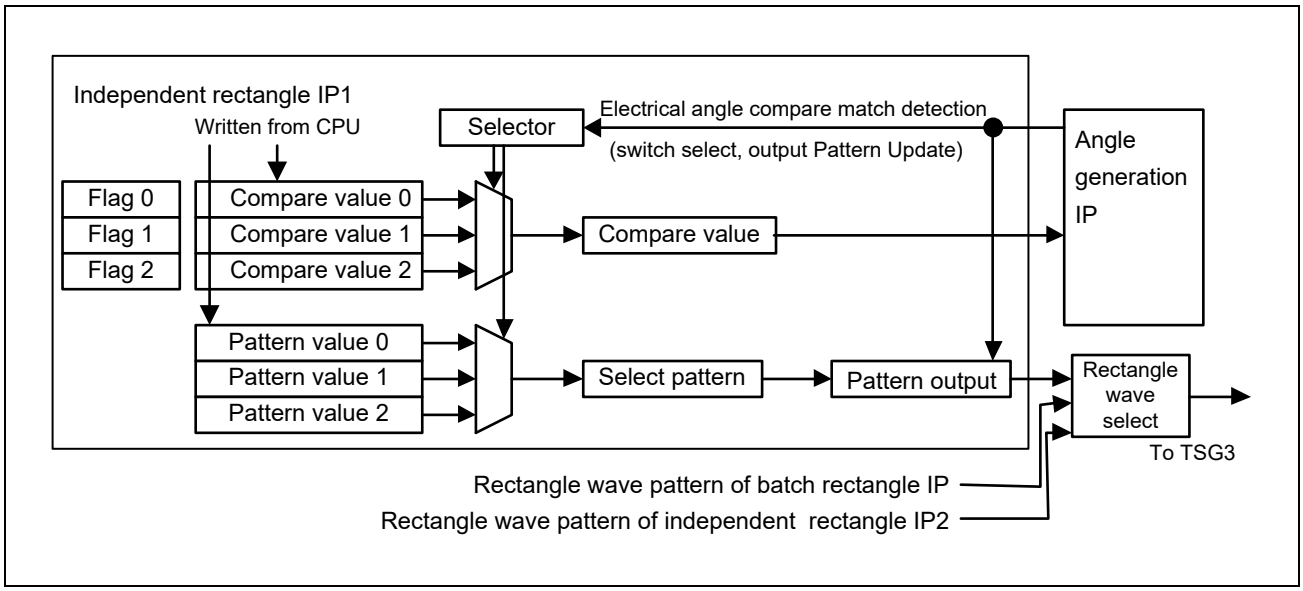

Figure 25.23 Independent Rectangle IP1 Configuration (for 1 Phase)

CAUTION

Since the selector value transits in the order of $001_B \rightarrow 010_B \rightarrow 100_B \rightarrow 001_B \rightarrow \ldots$, it is applied in the order of compare 0 value→compare 1 value→compare 2 value→compare 0 value→…. If a 0 flag occurs in the middle of this processing, however, the transition of the selector value is held pending until that flag is set to 1. In such a case, update the compare value/pattern registers sequentially.

25.4.7.3 Independent Rectangle IP2

The independent rectangle IP2 generates more flexible rectangle wave output patterns by matching 8 compare values which can be separately specified for the U, V, and W phases and the electrical angle.

If the RECMD bits of the MU3nIRECCTR register are set to 10 (enable independent rectangle IP2 waveform output), the independent rectangle IP2 sends its output pattern to the TSG3. When either of U phase compare match, V phase compare match, and W phase compare match occurs, the rectangle output pattern of the corresponding phase is updated.

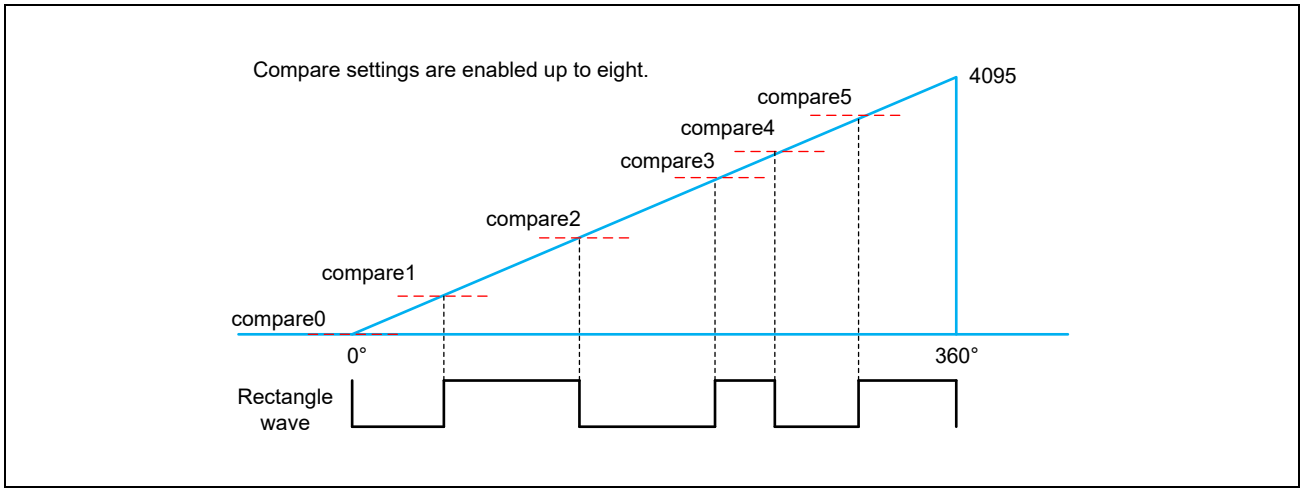

Figure 25.24 Example of Application of the Independent Rectangle IP2

The compare matching of the respective phases can be configured in the EMU3nNRECUk register, EMU3nNRECVk register, and EMU3nNRECWk register.

Table 25.182 Compare Match Settings for the Respective Phases

U phase compare control k register (EMU3nNRECUk) (k = 0-7)	V phase compare control k register (EMU3nNRECVk) (k = 0-7)	W phase compare control k register (EMU3nNRECWk) (k = 0-7)	Function
UPTN bit	VPTN bit	WPTN bit	Sets the output level.
UCMP[11:0]	VCMP[11:0]	WCMP[11:0]	Sets the compare value.
UEN bit	VEN bit	WEN bit	Enables or disables updating of rectangle wave output patterns.
UMOD bit	VMOD bit	WMOD bit	Specifies whether to set UEN (or VEN or WEN) = 0 at every compare match which occurs when UEN (or VEN or WEN) = 1.
UINT bit	VINT bit	WINT bit	Enables or disables compare match interrupts.

A compare match is generated when the electrical angle (previous value) and electrical angle (this time value) inputs, which are output from the angle generation IP, are across the compare value that is set up by the independent rectangle IP2.

Two types of functions to correct the electrical angle (adding an offset) are available for the electrical angle (previous value) and electrical angle (this time value).

The 2 types of offsets may be used at the same time or reconfigured while the independent rectangle IP2 is running.

(Example)
It is possible to make an additional correction on the U phase only while correcting the 3 phases at the same time.

Table 25.183 Settings for Electrical Angle Correction

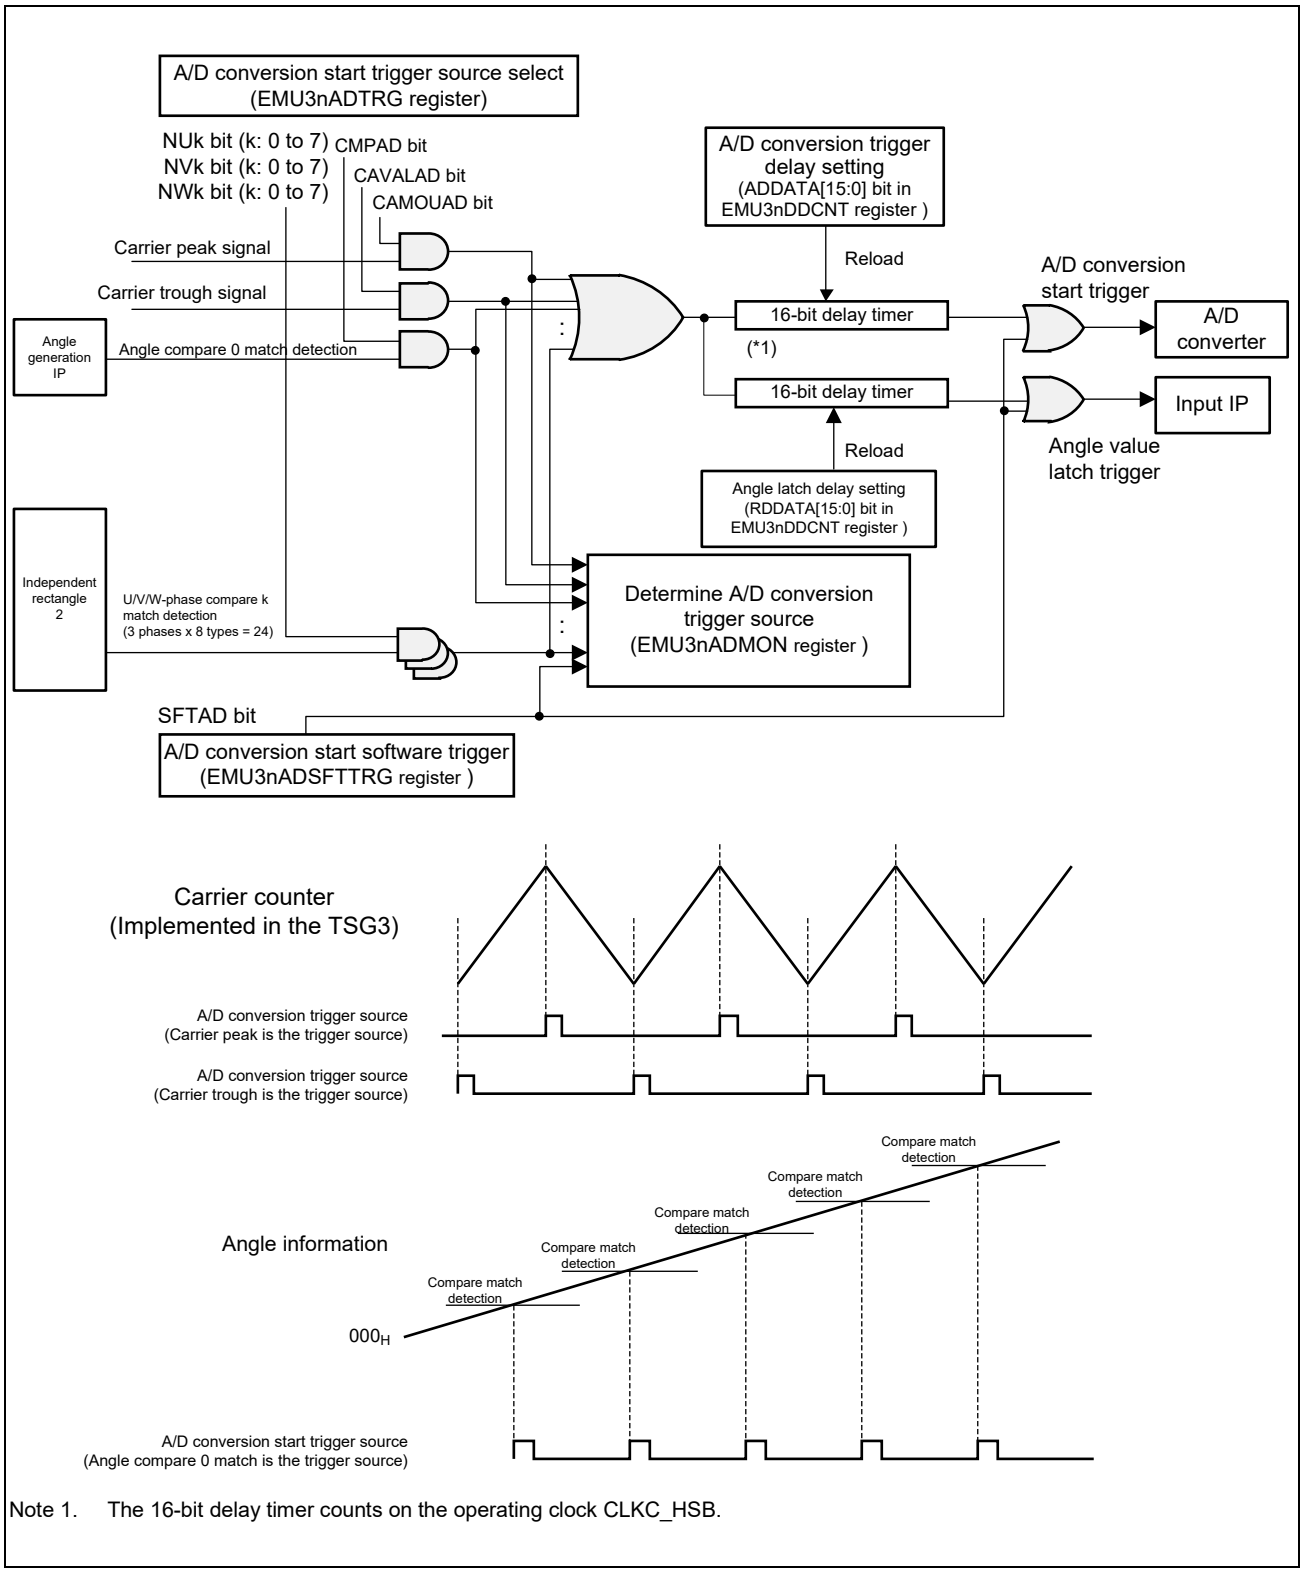
Register	U phase	V phase	W phase	Function
3-phase common angle correction value register (EMU3nNRECOFSALL)	√	√	√	Angle correction common to 3 phases Adds a common offset value to all of the U, V, and W phases.
U phase angle correction value register (EMU3nNRECOFSU)	√	—	—	U phase angle correction Adds a specific offset to the U phase.
V phase angle correction value register (EMU3nNRECOFSW)	—	√	—	V phase angle correction Adds a specific offset to the V phase.
W phase angle correction value register (EMU3nNRECOFSW)	—	—	√	W phase angle correction Adds a specific offset to the W phase.

CAUTION

No compare match occurs if the spanning of the compare value is caused by the addition of an offset that is made while the independent rectangle IP2 is running.

CAUTION

In cases where multiple valid values for comparison are spanned in the same phase, the output level of the rectangular wave depends on the value of the corresponding pattern value setting bit of a comparison control register.



Example: U Phase

- When the pattern value setting bits of multiple valid comparison control registers (EMU3nNRECUk.UPTN) are all 0
  The output level becomes “0” at the time of a match in comparison.
- When the pattern value setting bits of multiple valid comparison control registers (EMU3nNRECUk.UPTN) are all 1
  The output level becomes “1” at the time of a match in comparison.
- When the pattern value setting bits of multiple valid comparison control registers (EMU3nNRECUk.UPTN) have a mixture of the values 0 and 1.
  The output level becomes “1” at the time of a match in comparison.

25.4.8 A/D Conversion Control and Angle Value Latching Control

By configuring the CAMOUAD bit, CAVALAD bit, CMPAD bit, NUk bits, NVk bits, and NWk bits (k = 0 to 7) of the EMU3nADTRG register as A/D conversion start trigger source enable bit, it is possible to generate “A/D conversion start trigger to A/D converter” and “angle value latch trigger to input IP” at the peak and trough of the carrier, on the detection of an angle compare 0 match by the angle generation IP, and on the detection of U/V/W phase compare k matches (3 phases × 8 types = total of 24 lines) by the independent rectangle IP2.

Writing a 1 into the SFTAD bit of the EMU3nADSFTTRG register generates “A/D conversion start trigger to A/D converter” and “angle value latch trigger to input IP” as software startup triggers.

Note 1. The 16-bit delay timer counts on the operating clock CLKC_HSB.

Figure 25.25 Configuration of the Function to Generate the A/D Conversion Start Trigger and Angle Value Latch Trigger

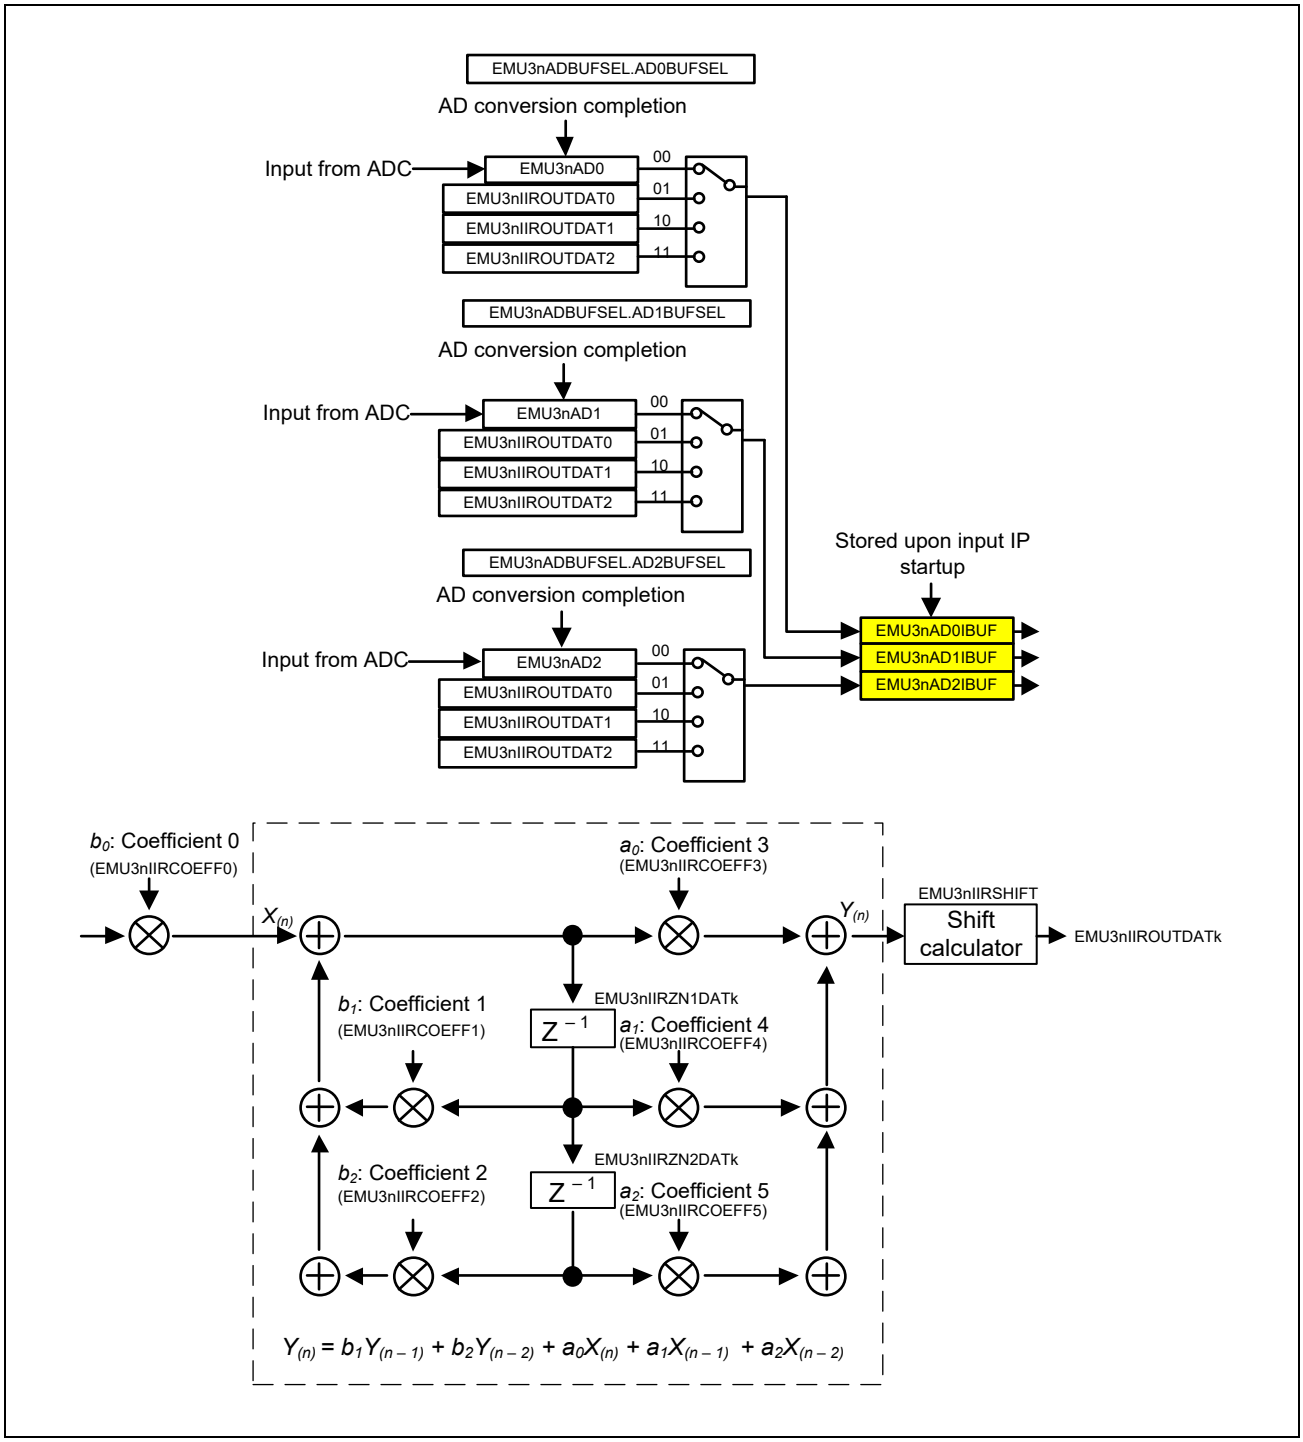
It is possible to determine the source that causes the event by reading the EMU3nADMON register. Any new A/D conversion start trigger sources that occur within the period from the generation of an A/D conversion start trigger source to the end of the conversion are invalidated but the corresponding A/D startup source determination bits of the EMU3nADMON register are set to 1. The source determination bits of the EMU3nADMON register are cleared by setting the corresponding bits of the EMU3nADMONC register to 1.

The delay from the time an A/D conversion start trigger source occurs till the time an A/D conversion start trigger occurs can be extended by setting a value in the ADDATA[15:0] bits of the EMU3nDDCNT register and the delay from the time an A/D conversion start trigger source occurs till the time an angle value latch trigger to input IP occurs can be extended by setting a value into the RDDATA[15:0] bits of the EMU3nDDCNT register. The delay counter is a 16-bit timer which starts counting on the occurrence of an A/D conversion start trigger and generates a trigger when it reaches 0.

25.4.9 IIR Filters

Three channels of quadratic IIR filters are provided to filter out the current values from the A/D converters. Six filter coefficients need be set up for one channel of IIR filter.

A filter startup signal input starts the IIR filtering processing on the current values from the A/D converters. The filtering results (24 bits) are stored in a filtering results register. The filtering results may be shifted to the right as required when they are to be used as post-filtering current values in EMU3.



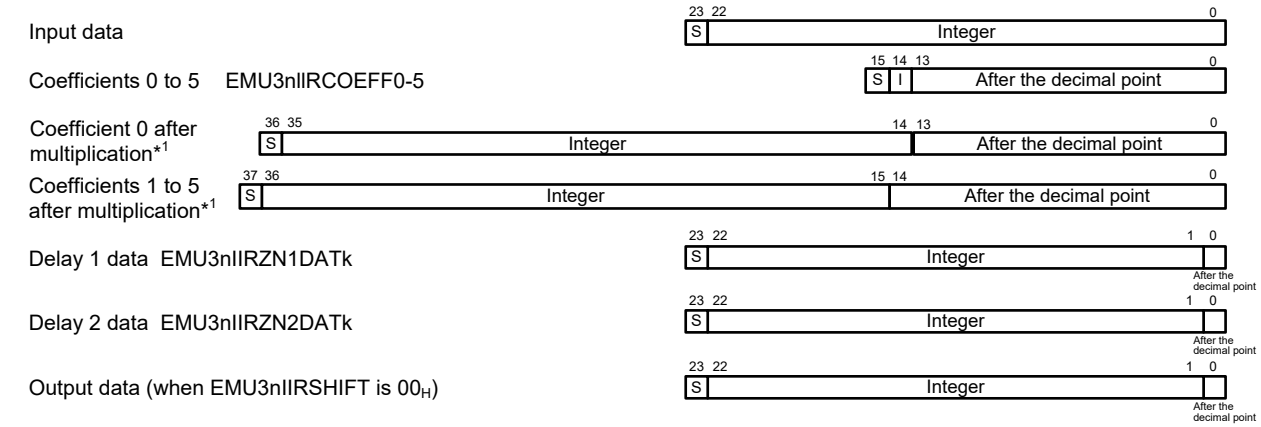


Figure 25.26 Flow of IIR Filtering

The input/output data formats of the IIR filters are shown below.

Note 1. Only the higher-order 24 bits of the data after multiplication are used in the final stage of calculation.

Figure 25.27 The Input/Output Data Formats of the IIR Filters

In addition to the current values from the A/D converters, EMU3nIIRCTRk register can be used to select the input data to the IIR filters, such as software input data and filtering results from other channels of filters, as well as the filtering startup sources.

If a startup trigger is generated when no IIR filtering operations are performed on any of the channels, the channel to be started for IIR filtering processing is selected before filtering is started.

If IIR filtering is in progress on a channel, the new filtering processing is held pending until the current filtering ends.

When triggers are generated for two or more channels, the channels are selected according to their priorities of CH0 > CH1 > CH2.

Table 25.184 Triggers and Input Signals that can be selected using the EMU3nIIRCTRk Register

EMU3nIIRCTRk Register, Bits TRGSEL[3:0]	Startup Trigger
“0000”	IIR filter channel 0 software startup (EMU3nIIRSFT.TRG0)
“0001”	IIR filter channel 1 software startup (EMU3nIIRSFT.TRG1)
“0010”	IIR filter channel 2 software startup (EMU3nIIRSFT.TRG2)
“0100”	A/D converter channel group completion startup
“0101”	A/D converter channel 0 completion.
“0110”	A/D conversion channel 1 completion.
“0111”	A/D conversion channel 2 completion.
“1000”	IIR filter channel 0 completion.
“1001”	IIR filter channel 1 completion.
“1010”	IIR filter channel 2 completion.
Other than above	Not started.

EMU3nIIRCTRk Register, Bits DATSEL[3:0]	Input Signal
“0000”	IIR filter channel 0 software data input value (EMU3nIIRSFTDAT0)
“0001”	IIR filter channel 1 data software input value (EMU3nIIRSFTDAT1)
“0010”	IIR filter channel 2 data software input value (EMU3nIIRSFTDAT2)
“0100”	0 software data input value
“0101”	A/D data channel 0
“0110”	A/D data channel 1
“0111”	A/D data channel 2
“1000”	IIR filter channel 0 operation result data
“1001”	IIR filter channel 1 operation results data
“1010”	IIR filter channel 2 operation result data
Other than above	Data retained.

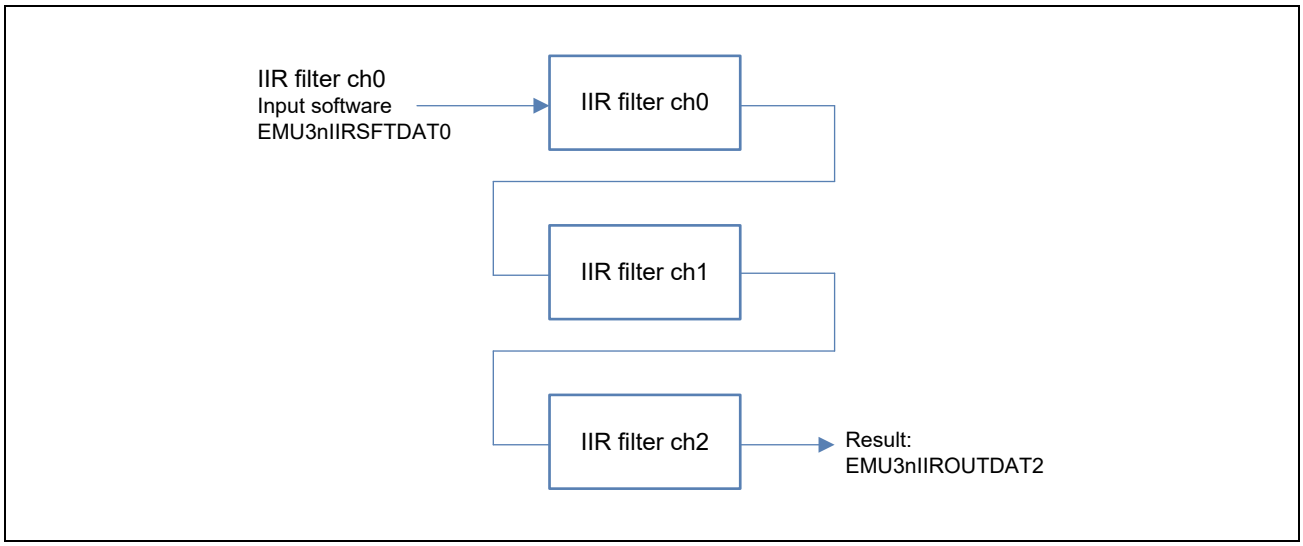

Figure 25.28 Example of IIR Filtering

CAUTION

This facility is provided with 3 input channels and 3 output channels. Its arithmetic block is common to all the channels and therefore performs arithmetic operations for the 3 channels on a time-division basis. The setup of the filtering coefficients and input signal need be completed before the IIR filtering processing is started.

The operations performed before the IIR filtering results are output must handle data values that fit within 24 bits.

25.4.10 Pulse Cycle Measurement Timer

The pulse cycle measurement timer counts the number of pulse cycles per interval between the adjacent rising edges of the Z-phase signal from the R/D converter or the input signal from the Z pin occur within the pulse rising interval.

Table 25.185 Pulse Cycle Measurement Timer Specifications

Item	Specification
Operating clock name	CLKC_HSB
Count start/stop	Controlled by the STR bit of the EMU3nPMTCTR register.
Count operation	• 25-bit up-count • Resets to 0 and continues counting during a capture operation or on an overflow.
Counter read	The 25-bit count value can be read out by reading the EMU3nPMTCNT register.
Counter write	It is possible to write a count value into the counter through the EMU3nPMTCNT register regardless of whether the timer is running or stopped.
Overflow-time operation	Select the destination of the interrupt by setting the OVFSW bit of the EMU3nPMTCTR register. 0: Sets the OVF bit of the EMU3nPMTOF register to 1. 1: Generates an interrupt source signal.
Capture source	• On the rising edge of the Z-phase signal • Software trigger (writing 1 into the STTRG bit of the EMU3nPMTCTR register)
Capture operation	Loads the count value into the EMU3nPMTCAP register on detection of a capture source.
Capture value read	The count captured value can be read from the 25-bit counter by reading the EMU3nPMTCAP register.

CAUTION

Since the pulse period measurement timer runs on the clock CLKC_HSB, it takes some time for the results of writing a register associated with the pulse period measurement timer to be reflected. When reading the latest value of the EMU3nPMTCNT register, EMU3nPMTCAP register, or EMU3nPMTOF register, read the registers after waiting for 10 cycles or more of the CLK_EMU_L clock from completing to write into the timer.

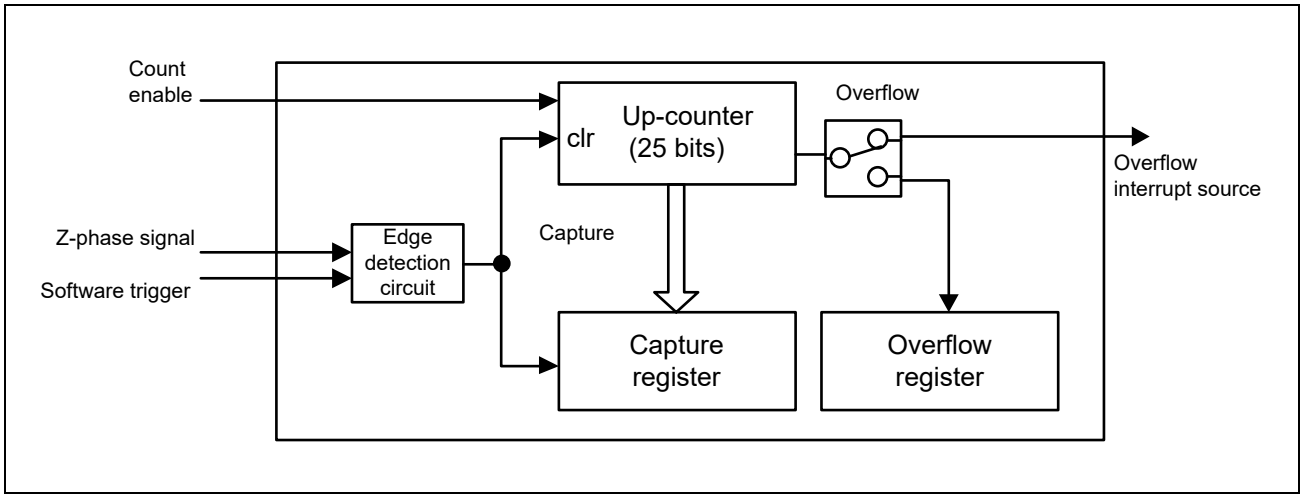

Figure 25.29 Pulse Period Measurement Timer Configuration

When measuring the Z-phase rise interval

When a rising edge of the Z-phase signal pulse is detected, the counter value is stored in the EMU3nPMTCAP register. At this moment, the timer is reset to a count value of 0 and counting is continued.

25.4.11 Resolver Angle Measurement timer

The resolver angle measurement timer counts the number of the number of pulse cycles per interval between the adjacent rising edges or the number of pulse cycles per specified resolver angle interval of the Z-phase signal.

Table 25.186 Resolver Angle Measurement Timer Specifications

Item	Specification
Operating clock name	CLKC_HSB
Count start/stop	Controlled by the EN bit of the EMU3nPMT2CTR register.
Count operation	• 32-bit up-count • Resets to 0 and continues counting during a capture operation or on an overflow.
Counter read	The count value of the 32-bit counter can be read by reading the EMU3nPMT2CNT register.
Counter write	It is possible to write a count value into the counter through the EMU3nPMT2CNT register regardless of whether the timer is running or stopped.
Overflow-time operation	Generates an interrupt source signal.
Capture source	• The interval as every rising edges of the Z-phase signal is selectable through the EMU3nPMT2INVL register. • Software trigger (writing 1 into the SCAPTRG bit of the EMU3nPMT2SFT register)
Capture operation	Loads the count value into the EMU3nPMT2CAP register on detection of a capture source. At this moment, an interrupt source signal is generated.
Capture value read	The count captured value can be read from the 32-bit counter by reading the EMU3nPMT2CAP register.

CAUTION

Since the resolver angle measurement timer runs on the clock CLKC_HSB, it takes some time for the results of writing a register associated with the resolver angle measurement timer to be reflected. When reading the latest value of the EMU3nPMT2CNT register or EMU3nPMT2CAP register, read the registers after waiting for 10 cycles or more of the CLK_EMU_L clock from completing to write into the timer.

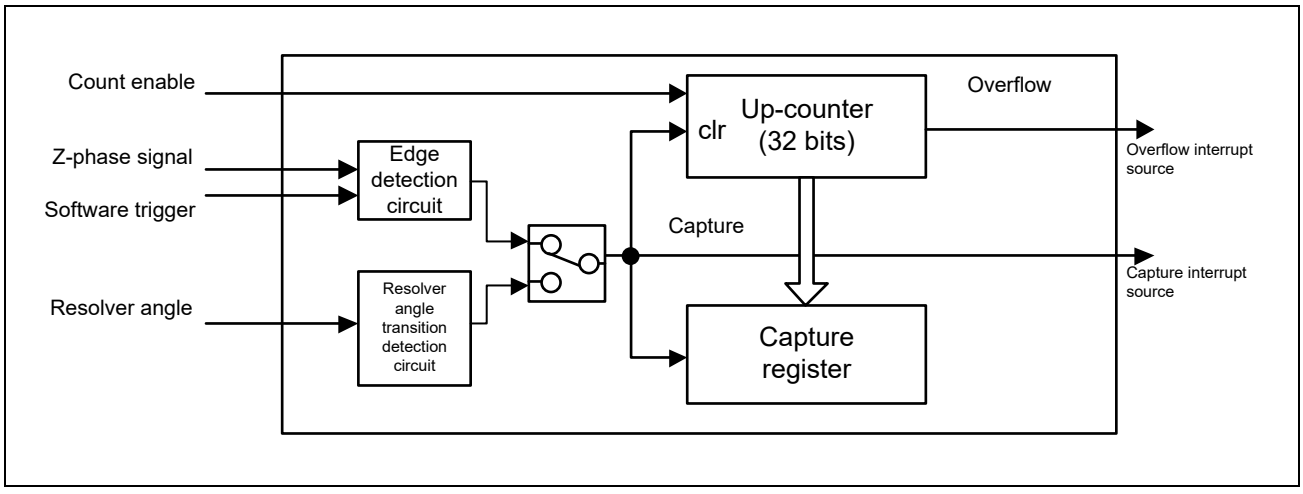

Figure 25.30 Resolver Angle Measurement Timer Configuration

When measuring the Z-phase rise interval

When a rising edge of the Z-phase signal pulse is detected, the counter value is stored in the EMU3nPMT2CAP register. At this moment, the timer is reset to a count value of 0 and counting is continued.

25.4.12 Internal Buffer Registers

Table 25.187 to Table 25.193 show the registers that have internal buffers and their update timings.

The operation of readable/writable registers without buffer may become unstable if they are updated while the IPs are running. Such registers need be updated before starting the IPs. Since the value of a register with a buffer is propagated into the IP at the update timing of each buffer as shown in **Figure 25.31**, the register can be updated at any time even when the IP is running.

When read-only registers without buffer are read while each IP is running, the results of the preceding or current IP processing are read out. Such a register must be read after the IP processing is completed. The value of a register with a buffer is propagated out of the IP when the buffer is updated as shown in **Figure 25.32,** so that the value can be read as the register's value.

The column entitled “simultaneous reflection control” in **Table 25.190** shows the control bit that enables the function to ensure the simultaneity of the updates of more than one register. As shown in **Figure 25.33**, the value is propagated into the IP interior when the PWM IP is started if the FPWMREFPER bit of the EMU3nREFCTR register is set to 1.

For the registers for which “Register set” is indicated in the “Timing” column of **Table 25.193**, if buffering is enabled by the EMU3nCBCTR0 register at the timing specified by the EMU3nCBTIM register, their buffer is updated and its value can be read out as the value of the respective registers.

25.4.13 Asynchronous Data Passing Function

The EMU3 is provided with the function to transfer two or more items of data simultaneously between tasks running at different cycle timings (register handshaking function).

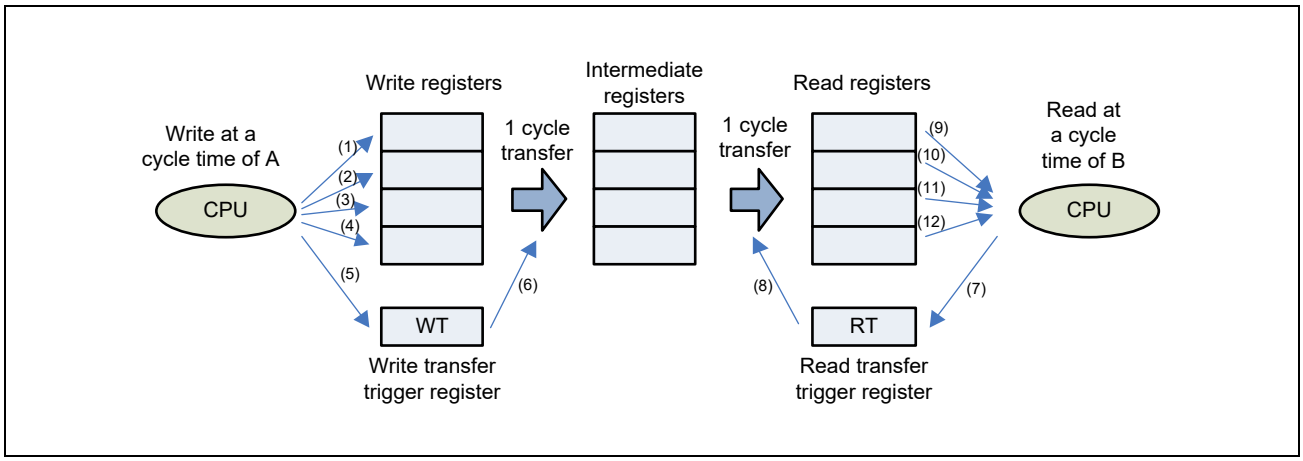

Figure 25.34 Operations of Asynchronous Handshaking Registers

Figure 25.34 shows an example of transferring data from the CPU with a cycle time of A to the CPU with a cycle time of B.

The CPU which has finished regular processing at a cycle time of A writes data sets sequentially into the data set write register (EMU3nDATSETWkm) which are used for handshaking. After the writing of all data sets is completed, the CPU transfer them to the intermediate registers in 1 cycle by manipulating the bits of the data set WBk transfer trigger register (EMU3nDATSETWBk). Subsequently, the CPU can write data into the data set write register (EMU3nDATSETWkm) again at an arbitrary timing.

The data stored in the intermediate registers are taken out at a cycle time of B. The data sets which are temporarily stored in the intermediate registers are transferred to the read registers by manipulating the bits of the data set BRk transfer trigger register (EMU3nDATSETBRk). The data that is read into the read registers can be used at any timing within the cycles B.

25.4.14 Fault Detection Function

The H/W accelerator is provided with the function to buffer the resultant values of motor control processing, which is performed to detect circuit faults, in dedicated registers. It is possible to buffer the following values at the specified timings such as “input IP completion” and “detection of an angle compare 0 match”.

The buffered values can be converted and their correctness be verified through the diagnostic program of the CPU.

Table 25.194 Checking Buffer Register

Register and Value (Source)	Checking Buffer Register (Destination)
EMU3n A/D data k register (EMU3nADk) (k = 0, 1, 2)	EMU3n A/D data k checking buffer register (EMU3nCBADk) (k = 0, 1, 2)
EMU3n resolver angle monitor register (EMU3nTHTRESFIXIN)	EMU3n resolver angle checking buffer register (EMU3nCBTHTRESFIXIN)
EMU3n d-axis current value register (EMU3nIDFIX)	EMU3n d-axis current value checking buffer register (EMU3nCBIDFIX)
EMU3n q-axis current value register (EMU3nIQFIX)	EMU3n q-axis current value checking buffer register (EMU3nCBIQFIX)
U phase PWM compare value pin output value	EMU3n U phase PWM compare value checking buffer register (EMU3nCBPWMUIP)
V phase PWM compare value pin output value	EMU3n V phase PWM compare value checking buffer register (EMU3nCBPWMVIP)
W phase PWM compare value pin output value	EMU3n W phase PWM compare value checking buffer register (EMU3nCBPWMWIP)
U/V/W phase rectangle output pattern value	EMU3n rectangle pattern value checking buffer register (EMU3nCBBREC)
U/V/W phase independent rectangle 1 output pattern value	EMU3n Independent rectangle 1 pattern value checking buffer register (EMU3nCBIREC)

The use of the buffering function makes it possible to transfer the target register and its value to the corresponding checking buffer register at the timing selected through the EMU3nCBTIM register.

Register buffering can be enabled in two ways. When the CBEN1 bit of the EMU3nCBCTR0 register to 0, buffering is permitted only once every time the CBEN0 bit is set to 1. The CBMON bit of the EMU3nCBCTR0 register is set to 1 when the CBEN0 bit is set to 1 and reset to 0 when the buffering is completed.

When the CBEN1 bit is set to 1, buffering is always enabled. The CBMON bit is held at 1 while the CBEN1 bit is set to 1.

Setting the CBUFINT bit of the EMU3nINTk registers (k = 0 to 7) to 1 (enable interrupts) causes a checking buffering completion interrupt to be generated upon completion of buffering.

25.4.15 Interrupt Control

The EMU3 has 16 interrupt output pins as listed in **Table 25.195***[1].

EMU3n interrupts 0 to 7 can be assigned two or more selected interrupt sources from the H/W accelerator (channel n). If multiple interrupt source conditions of a single interrupt are satisfied simultaneously, the result may be the output of only a single instance of the interrupt signal.

The interrupt source select register (EMU3nINTk) can be used to select the interrupt sources. The priorities of the interrupts to the CPU should be set in the interrupt controller.

Table 25.195 Interrupt Signal Outputs

Name	Function	Register that can Select the Interrupt Source
EMU30 interrupt 0	Channel 0 H/W accelerator interrupt source 0	EMU30 interrupt source select register 0
EMU30 interrupt 1	Channel 0 H/W accelerator interrupt source 1	EMU30 interrupt source select register 1
EMU30 interrupt 2	Channel 0 H/W accelerator interrupt source 2	EMU30 interrupt source select register 2
EMU30 interrupt 3	Channel 0 H/W accelerator interrupt source 3	EMU30 interrupt source select register 3
EMU30 interrupt 4	Channel 0 H/W accelerator interrupt source 4	EMU30 interrupt source select register 4
EMU30 interrupt 5	Channel 0 H/W accelerator interrupt source 5	EMU30 interrupt source select register 5
EMU30 interrupt 6	Channel 0 H/W accelerator interrupt source 6	EMU30 interrupt source select register 6
EMU30 interrupt 7	Channel 0 H/W accelerator interrupt source 7	EMU30 interrupt source select register 7
EMU31 interrupt 0	Channel 1 H/W accelerator interrupt source 0	EMU31 interrupt source select register 0
EMU31 interrupt 1	Channel 1 H/W accelerator interrupt source 1	EMU31 interrupt source select register 1
EMU31 interrupt 2	Channel 1 H/W accelerator interrupt source 2	EMU31 interrupt source select register 2
EMU31 interrupt 3	Channel 1 H/W accelerator interrupt source 3	EMU31 interrupt source select register 3
EMU31 interrupt 4	Channel 1 H/W accelerator interrupt source 4	EMU31 interrupt source select register 4
EMU31 interrupt 5	Channel 1 H/W accelerator interrupt source 5	EMU31 interrupt source select register 5
EMU31 interrupt 6	Channel 1 H/W accelerator interrupt source 6	EMU31 interrupt source select register 6
EMU31 interrupt 7	Channel 1 H/W accelerator interrupt source 7	EMU31 interrupt source select register 7

Note 1. EMU31 interrupts 0 to 7 are only supported for the RH850/C1M-A2.

Types of interrupt sources that can be assigned to the interrupt outputs from the H/W accelerator

- Angle compare 0 match detection, angle compare 1 match
- Independent rectangle IP1 U phase angle compare detection, V phase angle compare detection, W phase angle compare detection
- Independent rectangle IP2 U phase angle compare detection, V phase angle compare detection, W phase angle compare detection
- Carrier trigger peak and trough
- Input IP completion, PI control IP completion, PWM IP completion, rectangle IP completion
- pulse cycle measurement timer overflow detection
- Resolver angle measurement timer capture/overflow detection
- A/D conversion completion
- IIR channel 0, 1, 2 processing completion
- Checking register update completion

- Kirchhoff's current law violation
- Input, PI control, and PWM IP WAIT transition detection
- Angle generation IP WAIT transition detection

25.5 Operations

25.5.1 EMU3 Initialization

A sample flow for initializing the H/W accelerator is given below. There is no need to configure any functions that are not to be used.

This setting procedure should be observed when restarting the EMU3 (operation→reset→operation) using the EMUST bit.

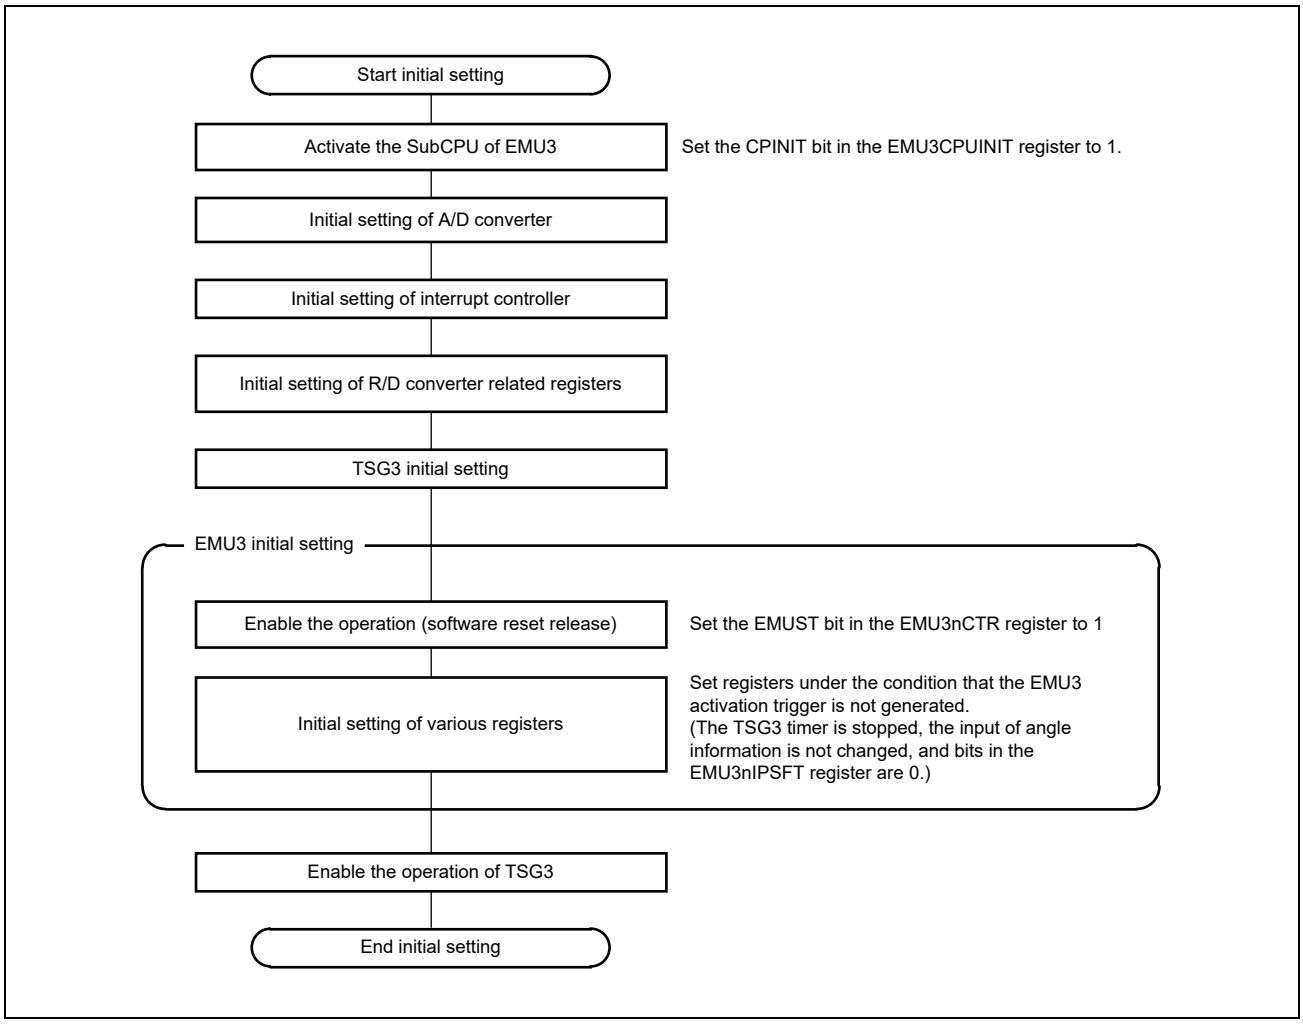

Figure 25.35 Sample Flow for Initializing the H/W Accelerator

25.5.2 Procedures for Initializing and Processing Interrupts of the IPs of the H/W Accelerator

Given below are the examples of procedures for initializing the functions of the H/W accelerator and for processing related interrupts. By combining the CPU interrupts and software executions, it is possible in below methods.

- Correct the processing results of the PI control IP with the CPU program and to implement various execution procedures such as let the PWM IP succeed in processing the rest.
- Exercise PI control from within the CPU program based on the processing results of the input IP and let the PWM IP succeed in processing the rest.

When exercising rectangle wave control under software processing of the batch rectangle IP and rectangle wave control using the independent rectangle IP1 and independent rectangle IP2, it is also possible to use the procedure such as “update the comparison and pattern values under CPU program control on detection of an angle compare 0 match”.

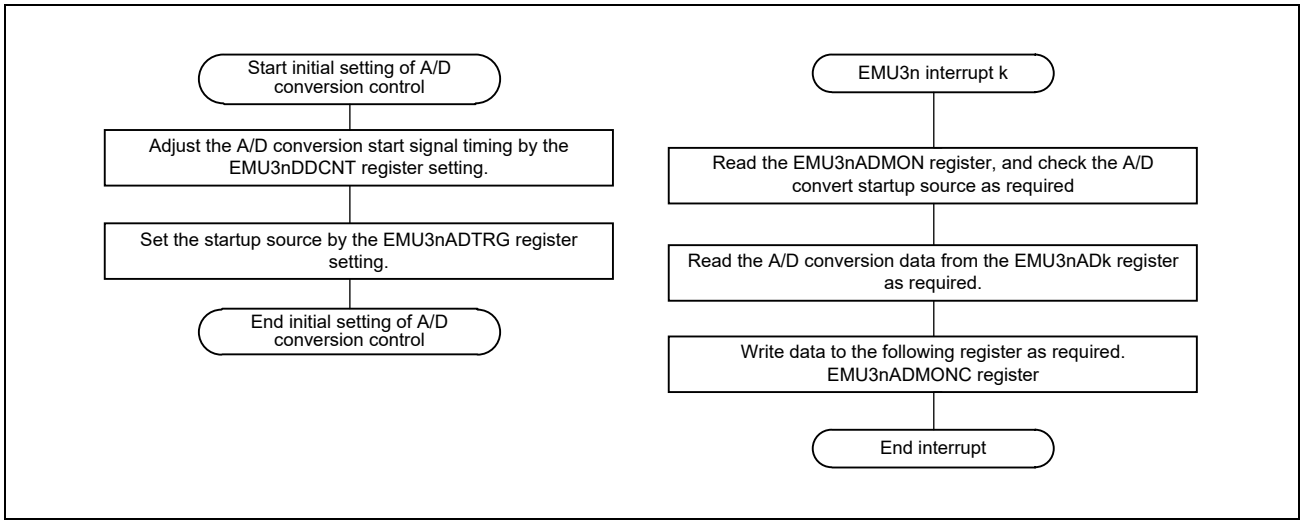

Figure 25.36 Sample Setting Procedure for Making Initialization for A/D Conversion Control (Using Interrupts)

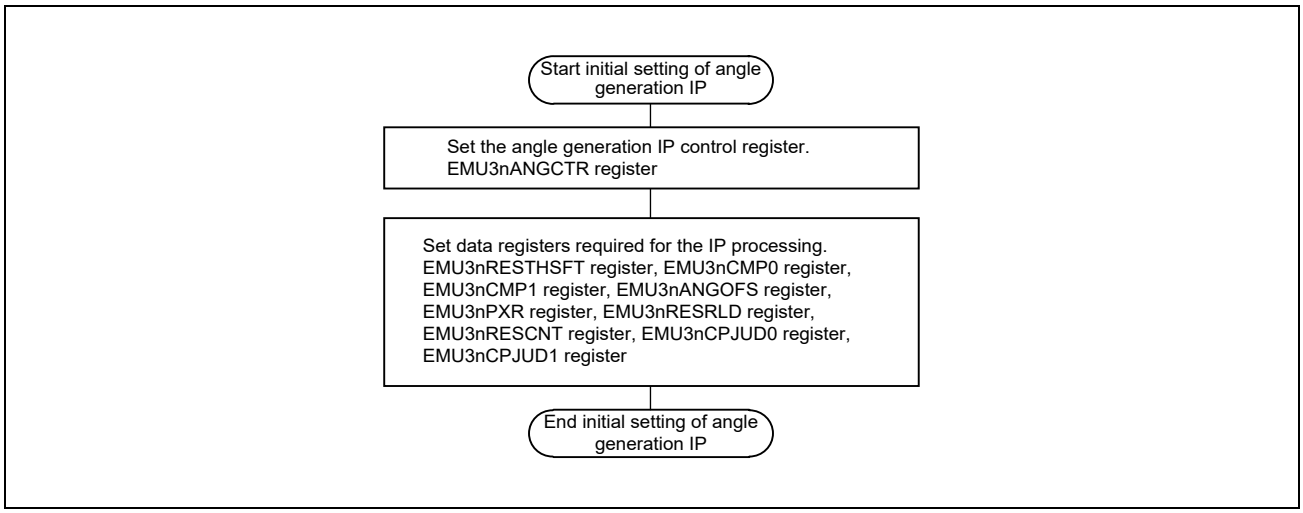

Figure 25.37 Sample Setting Procedure for Initializing the Angle Generation IP

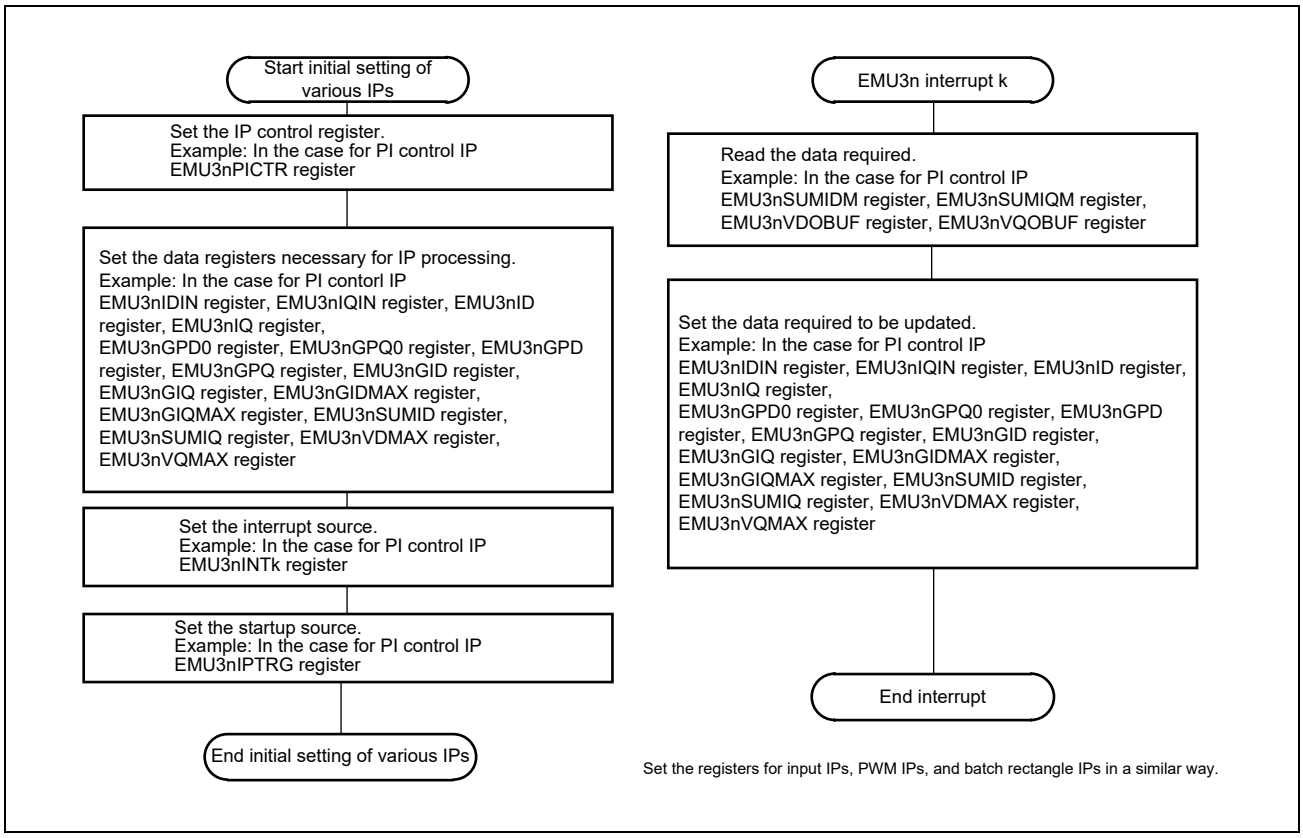

Figure 25.38 Sample Setting Procedure for Initializing the Input IP, PI Control IP, PWM IP, and Batch Rectangle IP (Hardware Processing) (Using Interrupts)

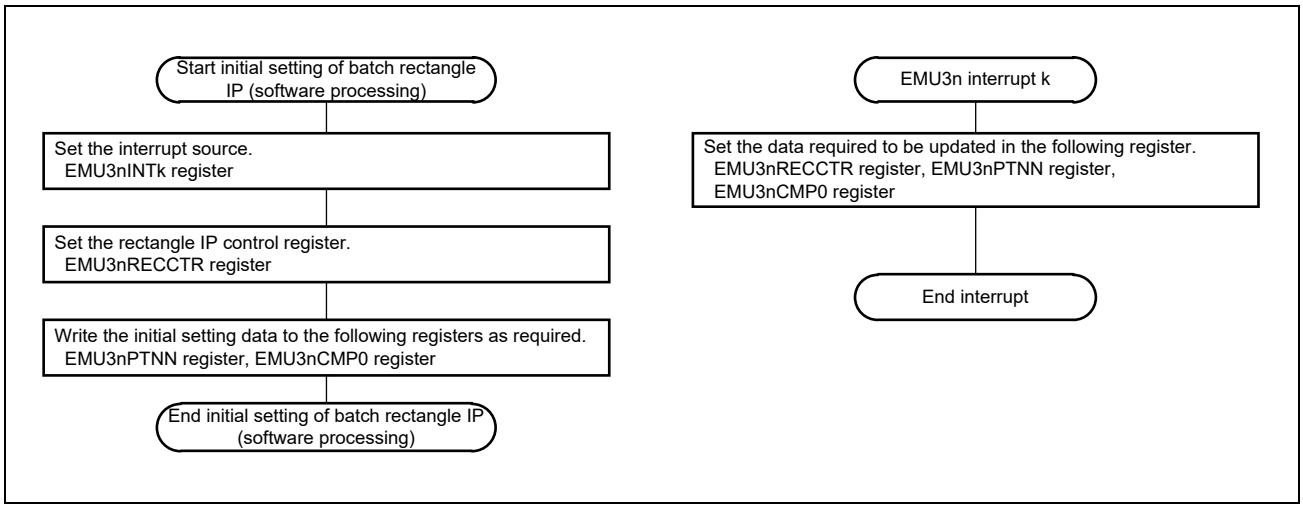

Figure 25.39 Sample Setting Procedure for Initializing the Batch Rectangle IP (Software Processing) (Using Interrupts)

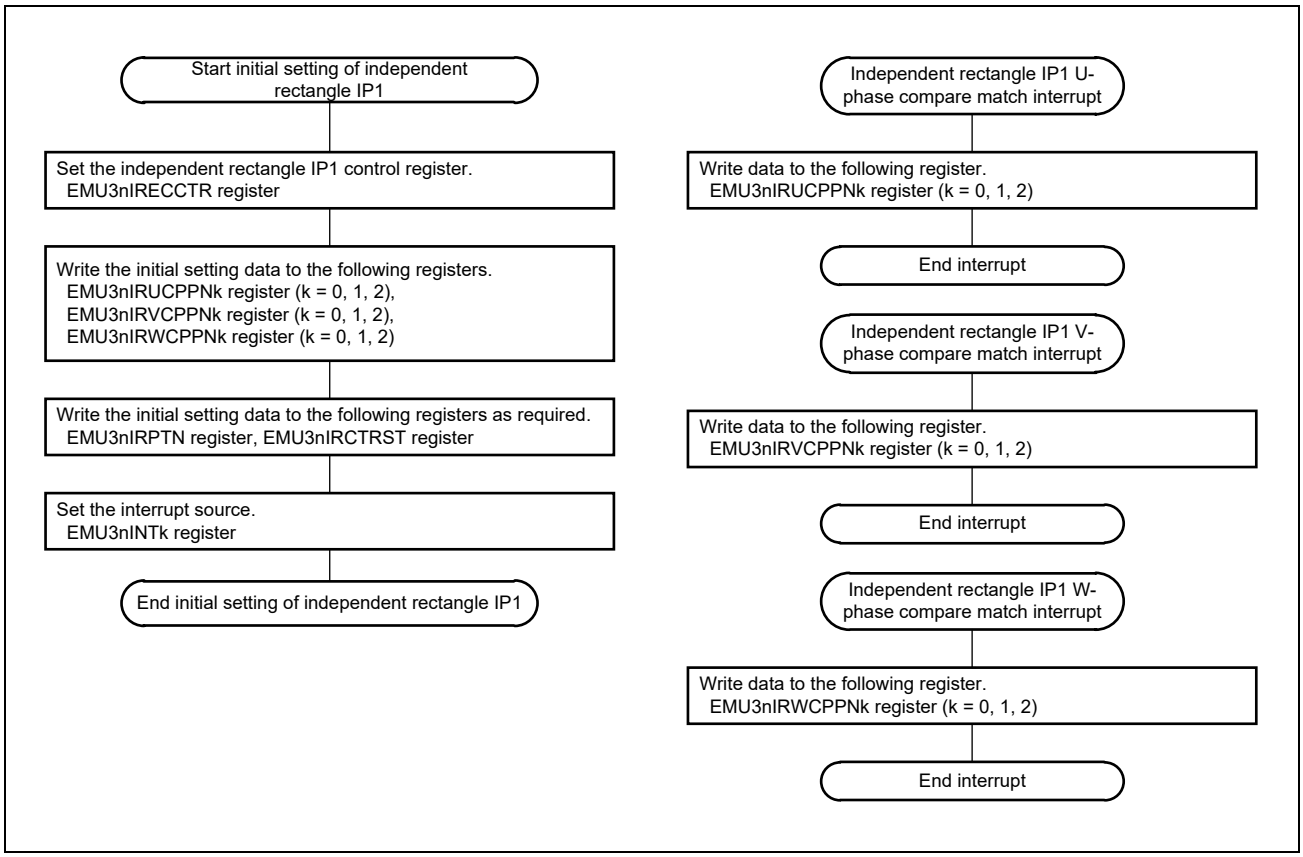

Figure 25.40 Sample Setting Procedure for Initializing the Independent Rectangle IP1 (Using Interrupts)

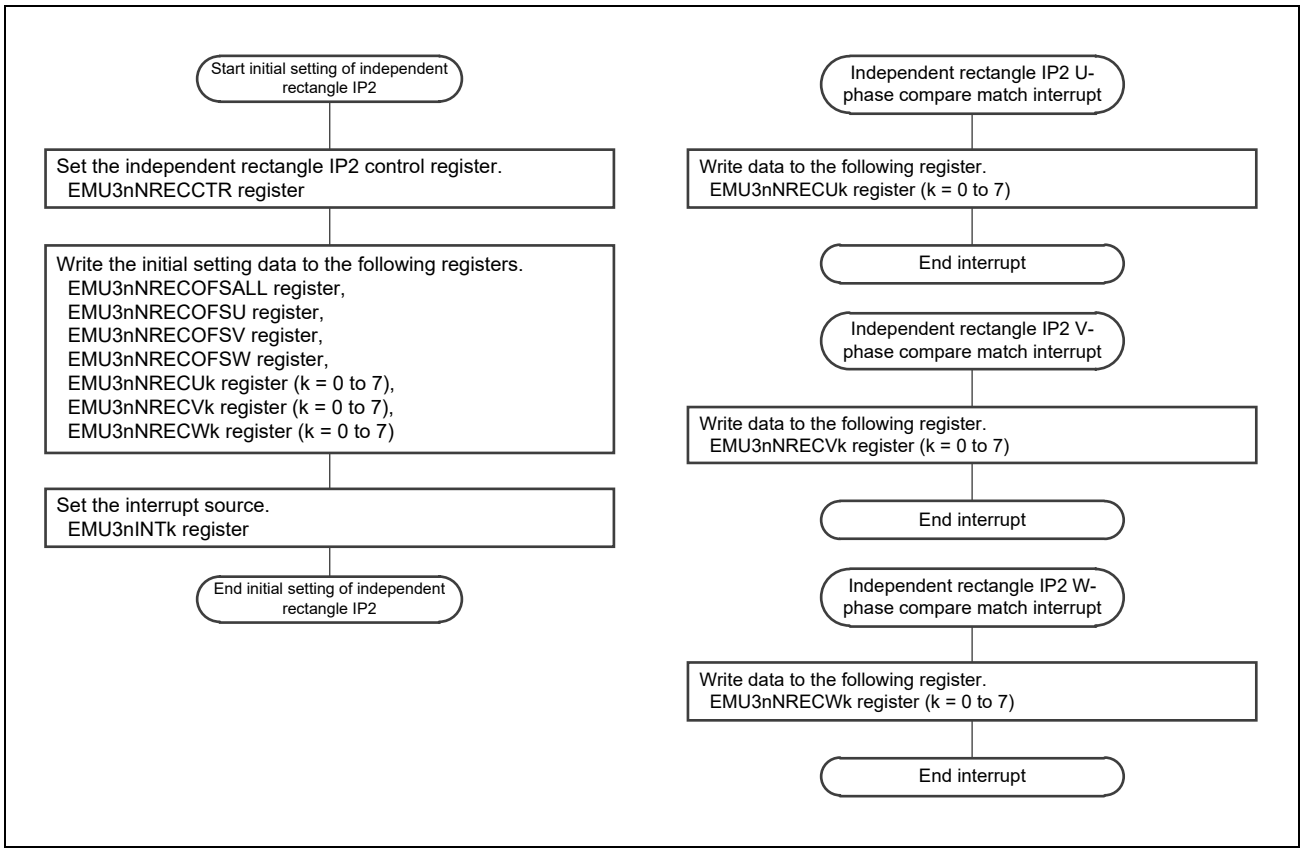

Figure 25.41 Sample Setting Procedure for Initializing the Independent Rectangle IP2 (Using Interrupts)

25.5.3 Collaborative Operation of the CPU and H/W Accelerator (on a H/W Arithmetic Block Basis)

The input IP, PI control IP, PWM IP, and angle generation IP of the H/W accelerator can realize flexible arithmetic processing by inserting CPU-based software processing in between the fine-grained H/W arithmetic blocks Func(*).

The collaboration from a H/W arithmetic block to the CPU is accomplished by the notification of an interrupt to CPU.

The collaboration from the CPU to a H/W arithmetic block is accomplished by writing data into the EMU3nFUNCWAITGRP* register (*: A or B).

Figure 25.42 shows the outline of CPU to H/W accelerator collaboration using the PWM IP as an example.

The state of each IP is represented by the following four terms:

- RUN:

  Indicates that the IP is running.

  This corresponds to the IP bits of the EMU3nFSMSTGRP* register (*: A or B). For example, “11” in the IP bits of the EMU3nFSMSTGRPA mean that the PWM IP is running.

- IDLE:

  Indicates that the IP is stopped.

  This corresponds to the IP bits of the EMU3nFSMSTGRP* register (*: A or B). For example, a value other than “11” in the IP bits of the EMU3nFSMSTGRPA register means that the PWM IP is stopped.

- WAIT:

  Indicates that no H/W arithmetic block Func(*) is being executed while the IP is running.

  This corresponds to the WAIT bit of the EMU3nFSMSTGRP* register (*: A or B).

- BUSY:

  Indicates that a H/W arithmetic block Func(*) is being executed while the IP is running.

  This corresponds to the BUSY bit of the EMU3nFSMSTGRP* register (*: A or B).

(a) in **Figure 25.42** shows an example of running the PWM IP execution in the normal state. After the PWM IP is started, it completes its processing after running all H/W arithmetic blocks.

(b) in **Figure 25.42** shows an example of inserting CPU software processing between PWM IP's H/W arithmetic blocks.

Interrupt are notified to the CPU by switching the H/W arithmetic block into the WAIT state, so that the CPU can execute the interrupt processing. The H/W arithmetic block is restarted by writing the EMU3nFUNCWAITGRP* register (*: A or B).

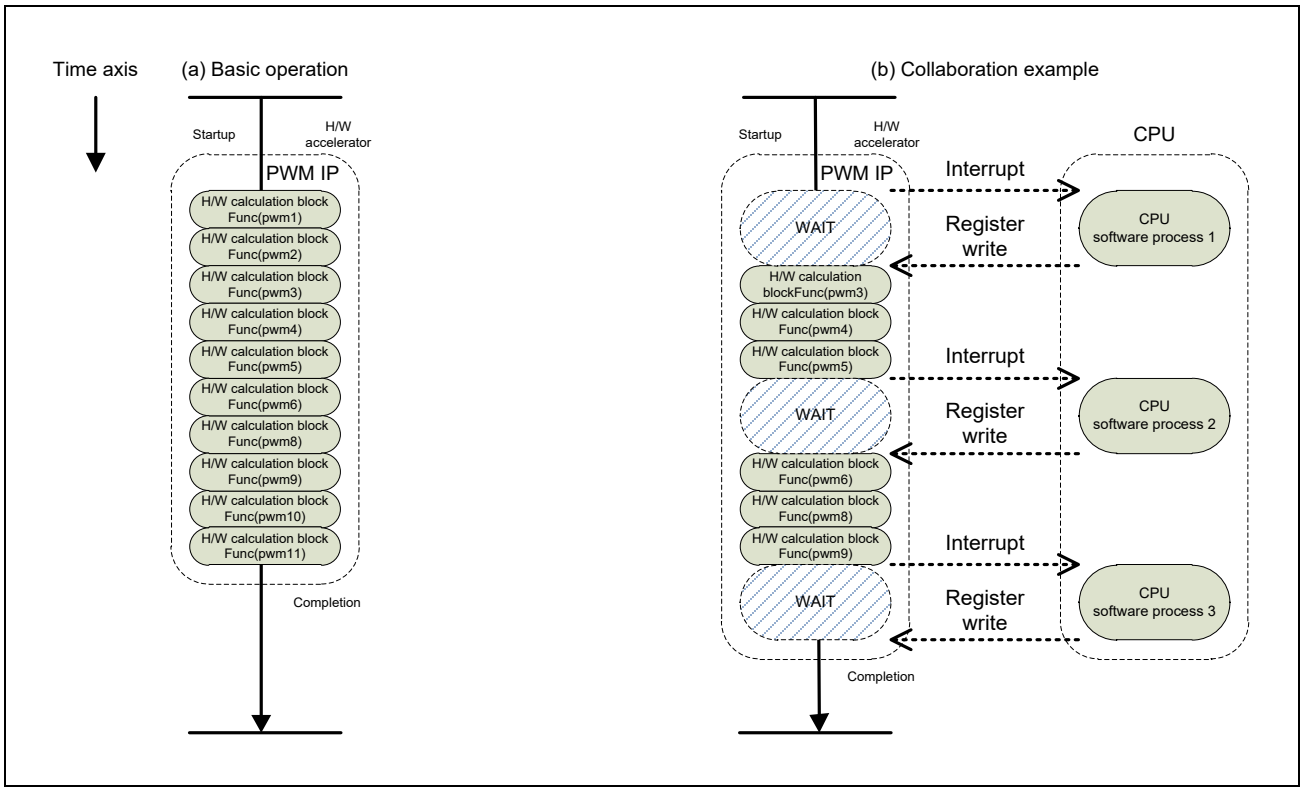

Figure 25.42 Outline of H/W Accelerators' Collaboration

25.5.3.1 Related Registers

Table 25.196 shows a list of registers that are necessary to run the H/W arithmetic block basis.

The registers that are associated with the input IP, PI control IP, PWM IP, and angle generation IP are listed in **Table 25.197**.

Table 25.196 List of Registers Associated with the H/W Accelerator Collaborative Operations (on a H/W Arithmetic Block Basis)

Register	Function
EMU3nFUNCIDLEGRP* (*:A0,A1,A2,B)	Specifies the H/W arithmetic block that is transited if IP is started during “IP stopped state (IDLE)”. If the SFTEN bit of the EMU3nFUNCIDLEGRP* (*A0,A1,A2) register is set to 0, the specified H/W arithmetic block is transited from IDLE at the timing that IP startup source occurs. If the SFTEN bit of the EMU3nFUNCIDLEGRP* (*A0,A1,A2) register is set to 1, the specified H/W arithmetic block is transited from IDLE by write access to the required register. that is, the transition is software startup.
EMU3nFUNCFLGRP* (*:A0,A1,A2,B)	Specifies the type of transition upon completion of the execution of a H/W arithmetic block selected from “Next block”, “IDLE”, and “WAIT”.
EMU3nFUNCWAITGRP* (*:A,B)	Specifies the next H/W arithmetic block to transition from WAIT state. By write access to this register, the specified H/W arithmetic block is startup from WAIT state.
EMU3nFUNCFINGRP* (*:A,B)	Indicates the latest H/W arithmetic block that is transited to IDLE or WAIT at completion of H/W arithmetic block execution if setting each symbol of the EMU3nFUNCFLGRP* register (*:A0,A1,A2,B) is “01” or “10”.
EMU3nFSMSTGRP* (*:A,B)	It can monitor that the state of each IP becomes any of RUN, IDLE, WAIT or BUSY.
EMU3nINTk (k = 0 to 7) EMU3nINTSD EMU3nINTSDC	There are interrupt source select bits of “WAIT transition detection of each IP”. By outputting the interrupt into CPU at the timing of WAIT transition after H/W arithmetic block completion, it is noticed the timing of WAIT transition into CPU. By checking the value of of EMU3nFUNCFINGRP* register, it can identify the H/W arithmetic block that was executed before the WAIT transition.

Table 25.197 List of Registers Associated with the IPs

Register	input IP	PI control IP	PWM IP	Angle generation IP
EMU3nFUNCIDLEGRP* (*:A0,A1,A2,B)	*=A0	*=A1	*=A2	*=B
EMU3nFUNCFLGRP* (*:A0,A1,A2,B)	*=A0	*=A1	*=A2	*=B
EMU3nFUNCWAITGRP* (*:A,B)	*=A	*=A	*=A	*=B
EMU3nFUNCFINGRP* (*:A,B)	*=A	*=A	*=A	*=B
EMU3nFSMSTGRP* (*:A,B)	*=A	*=A	*=A	*=B
EMU3nINTk.FWG* (k = 0 to 7) (*:A,B) EMU3nINTSD.FWG*IF (*:A,B) EMU3nINTSDC.FWG*IFC (*:A,B)	*=A	*=A	*=A	*=B

25.5.3.2 Fine-Grained IP State Transitions

Figure 25.43 shows the relationship between the fine-grained IP state transitions and the above-mentioned registers using the H/W arithmetic block Func(pwm3) of the PWM IP. The similar mechanism also applies to the input IP, PI control IP, and angle generation IP.

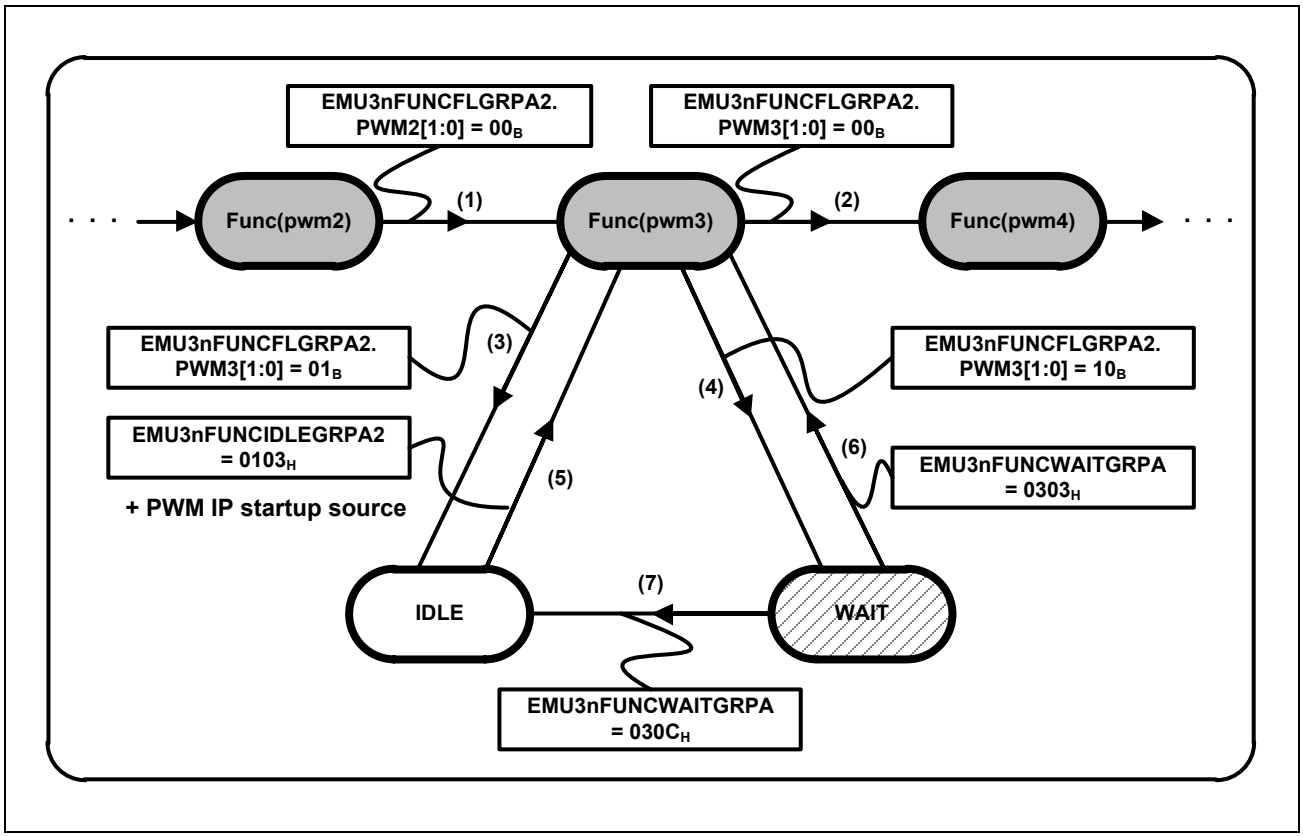

Figure 25.43 PWM IP State Transitions

(1) Func(pwm2)→Func(pwm3)

Setting the PWM2 bits of the EMU3nFUNCFLGRPA2 register to “00” causes a transition to Func(pwm3) which is the next H/W arithmetic block.

(2) Func(pwm3)→Func(pwm4)

Setting the PWM3 bits of the EMU3nFUNCFLGRPA2 register to “00” causes a transition to Func(pwm4) which is the next H/W arithmetic block.

(3) Func(pwm3)→IDLE

Setting the PWM3 bits of the EMU3nFUNCFLGRPA2 register to “01” causes a transition to IDLE.

(4) Func(pwm3)→WAIT

Setting the PWM3 bits of the EMU3nFUNCFLGRPA2 register to “10” causes a transition to WAIT.

(5) IDLE→Func(pwm3)

Setting the EMU3nFUNCIDLEGRPA2 register with a value of "0103_H" causes a transition not to ordinary Func(pwm1) but to Func(pwm3) to occur when the PWM IP is started. If a source of starting up the PWM IP occurs with this register setting, a transition to Func(pwm3) occurs when the PWM IP is started.

In addition to this, it is possible to start the PWM IP at the timing when the EMU3nFUNCIDLEGRPA2 register is written while the PWM IP is stopped (IDLE). Writing a value of "1103_H" into the EMU3nFUNCIDLEGRPA2 register when the PWM IP is stopped ((IDLE) causes the PWM IP to start and a transition to Func(pwm3) at this write timing.

(6) WAIT→Func(pwm3)

Setting the EMU3nFUNCWAITGRPA register with a value of "0303_H" causes a transition from the WAIT state to Func(pwm3).

(7) WAIT→IDLE

Setting the EMU3nFUNCWAITGRPA register with a value of "$030C_H$" causes a transition from the WAIT state to PWM IP complete (IDLE).

25.5.3.3 Setting Examples

Figure 25.44 is a use case of collaborative processing with the CPU based on the collaborative operations of the H/W accelerator.

In the use case shown in **Figure 25.44**, the register settings and states for inserting CPU software processing in between the H/W arithmetic blocks of the PWM IP are explained in chronological order in paragraphs (1) to (9) that follow.

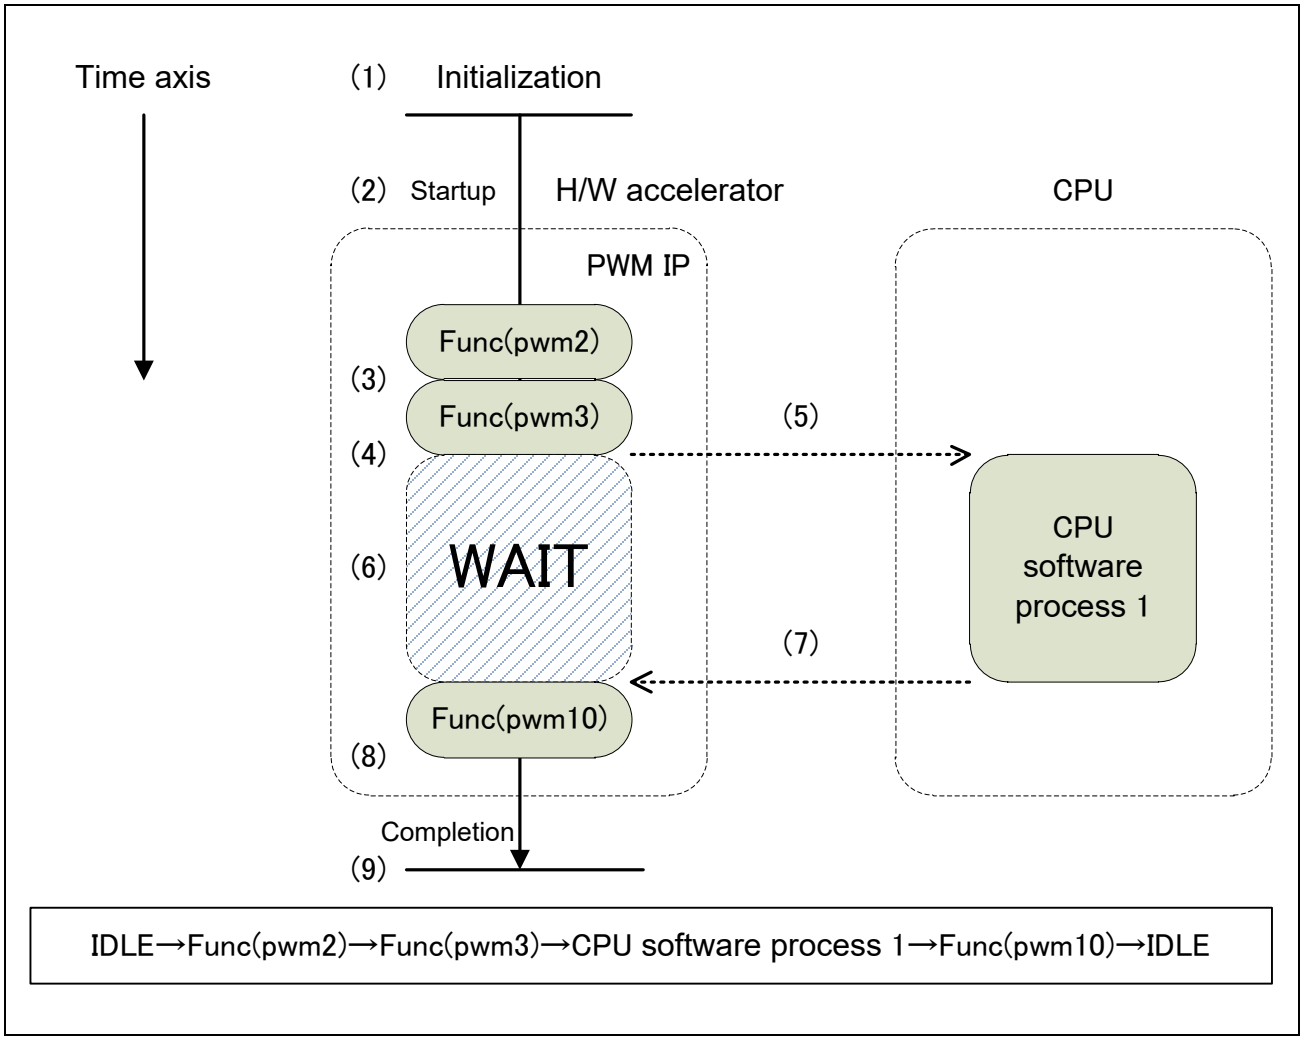

Figure 25.44 Use Case of Setting for H/W Accelerator's Collaborative Operations

(1) Initialization

The initialization is performed for implementing the use case shown in **Figure 25.46**.

In this example, the EMU3nIPTRG register and EMU3nFUNCIDLEGRPA2 register are set up so that the PWM IP can be started by a software trigger.

The EMU3nINTk registers (k = 0 to 7) are set up so that an interrupt to CPU can occur when the PWM IP transits to the WAIT state.

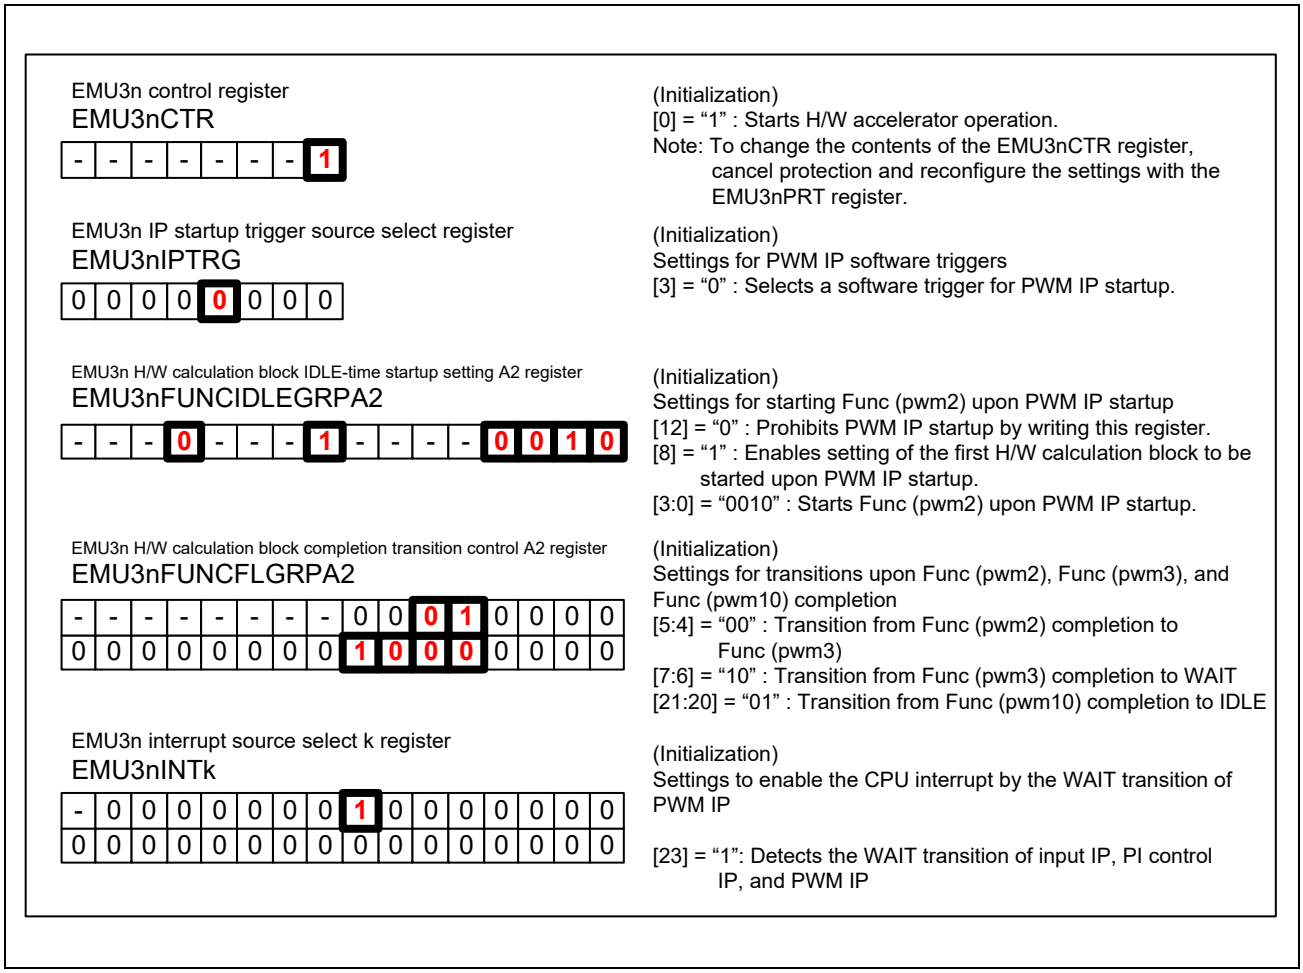

Figure 25.45 H/W Accelerator's Collaborative Operations (1) Initialization

(2) PWM IP startup to Func(pwm2) transition

The CPU manipulates the EMU3nIPSFT register to make setting for software startup of the PWM IP.

According to the initial settings of the EMU3nFUNCIDLEGRPA2 register, processing starts from H/W arithmetic block Func(pwm2) when the PWM IP is started.

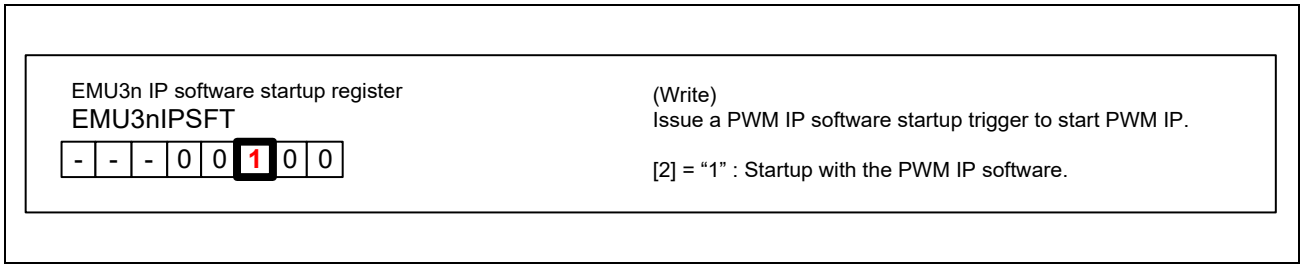

Figure 25.46 H/W Accelerator's Collaborative Operations (2) PWM IP startup to Func(pwm2)

(3) Func(pwm2) to Func(pwm3) transition

According to the initialization value ("00") of EMU3nFUNCFLGRPA2[5:4], a transition to Func(pwm3), which is the next H/W arithmetic block, occurs upon completion of the H/W arithmetic block Func(pwm2).

(4) Func(pwm3) to WAIT transition

According to the initialization value ("10") of EMU3nFUNCFLGRPA2[7:6], a transition to the WAIT state occurs in which the PWM IP remains active upon completion of the H/W arithmetic block Func(pwm3).

(5) Func(pwm3) to CPU interrupt

According to the initialization values of the (EMU3nINTk registers (k = 0 to 7), an interrupt is notified to the CPU at the timing of Func(pwm3) completion. The interrupt source can be determined by checking the EMU3nINTSD register. The H/W arithmetic block in which processing is stopped can be determined by checking the EMU3nFSMSTGRPA register. After the interrupt source is determined, the interrupt state is cleared using the EMU3nINTSDC register.

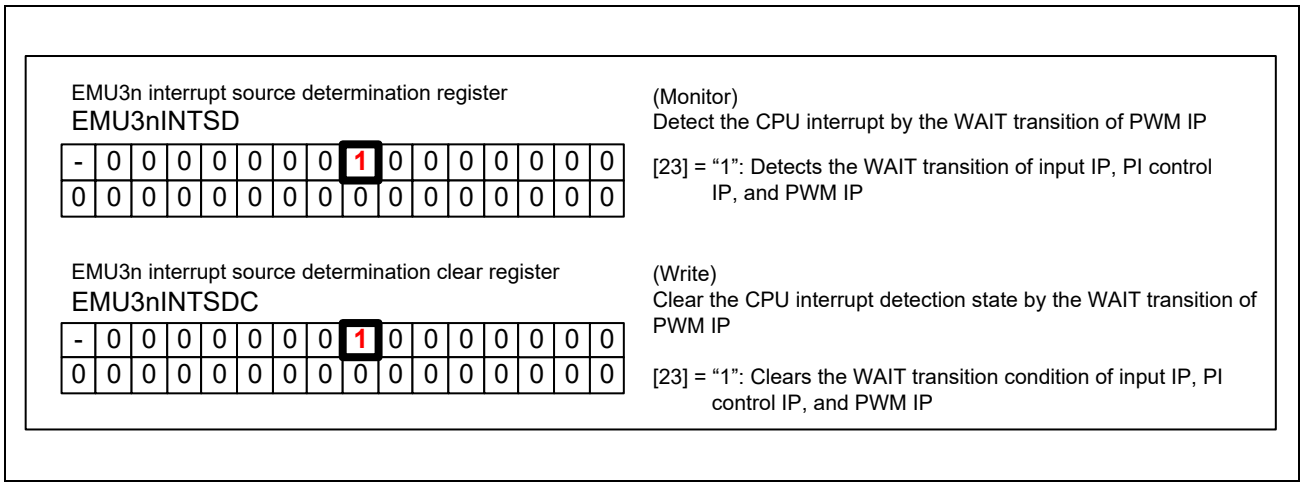

Figure 25.47 H/W Accelerator's Collaborative Operations (5) Func(pwm3) to CPU Interrupt

(6) WAIT state

The PWM IP being in the WAIT state can also be confirmed by checking the monitor registers shown in **Figure 25.48**.

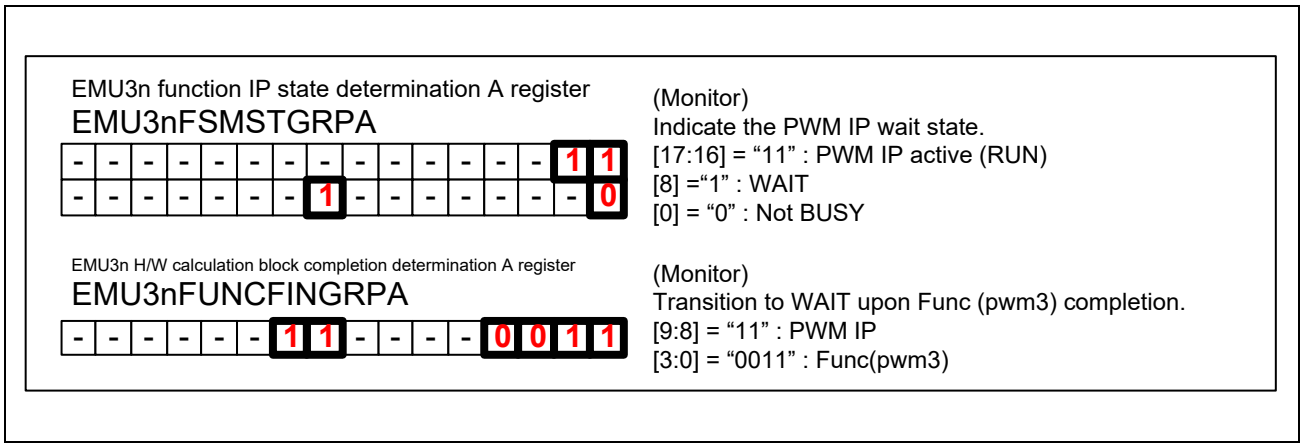

Figure 25.48 H/W Accelerator's Collaborative Operations (6) WAIT State

(7) CPU processing completion to Func(pwm10) transition

Writing the EMU3nFUNCWAITGRPA register resumes the processing at H/W arithmetic block Func(pwm10).

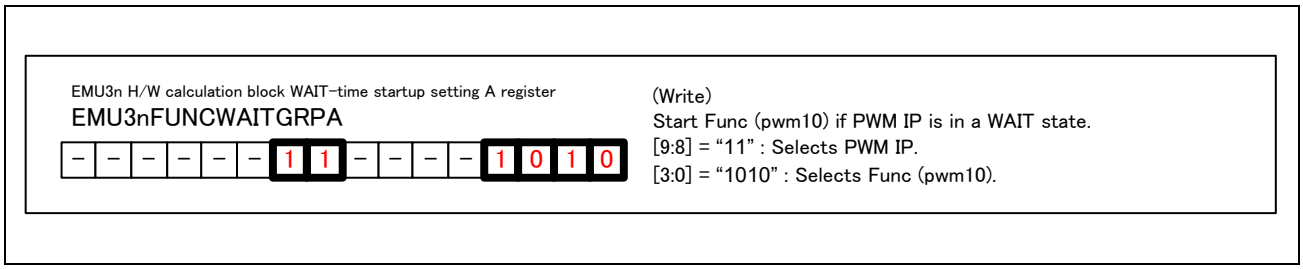

Figure 25.49 H/W Accelerator's Collaborative Operations (7) CPU Processing Completion to Func(pwm10) Transition

(8) Func(pwm10) to PWM IP completion

According to the initialized value (“01”) of the EMU3nFUNCFLGRPA2[21:20], a transition from Func(pwm10) to IDLE, i.e., PWM IP completion, occurs.

(9) PWM IP stopped

The states of the monitor registers established after the PWM IP is stopped are shown in **Figure 25.50**.

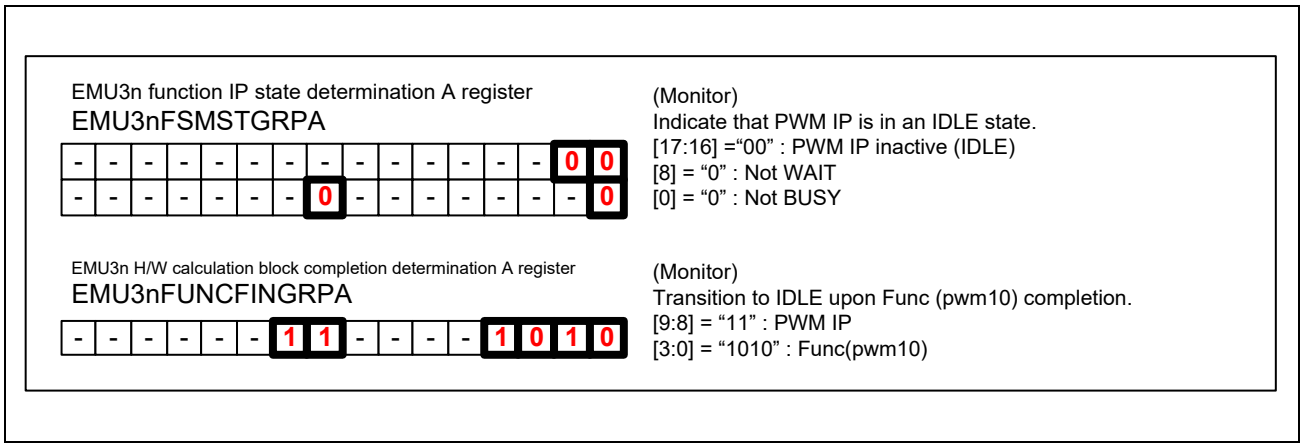

Figure 25.50 H/W Accelerator's Collaborative Operations (9) PWM IP Stopped

25.5.4 3-Phase PWM Waveform Output Control

Examples of 3-phase PWM control operation using the H/W accelerator are given below.

For details on the IIR filtering function, see **Section 25.4.9, IIR Filters.**

For details on the input IP function, see **Section 25.4.3, Input IP**.

For details on the PI control IP function, see **Section, 25.4.4, PI Control IP**.

For details on the PWM IP function, see **Section 25.4.5, PWM IP**.

25.5.4.1 Exercising 3-Phase PWM Control with the H/W Accelerator

- Startup conditions:
  - The IIR filter is started upon completion of an A/D conversion.
  - The input IP is started upon completion of IIR filtering.
  - The PI control IP is started upon completion of input IP processing.
  - The PWM IP is started upon completion of PI control IP processing.
- Operation example:

  (1) An A/D conversion is started at a trough of the carrier as a trigger.

  (2) The IIR filter is started upon completion of the A/D conversion.

  (3) The input IP is started upon completion of IIR filtering.

  (4) The PI control IP is started upon completion of input IP processing.

  (5) The PWM IP is started upon completion of PI control IP processing and calculates the PWM compare values for the next carrier.

  (6) The PWM compare values are stored in the required registers of the TSG3.

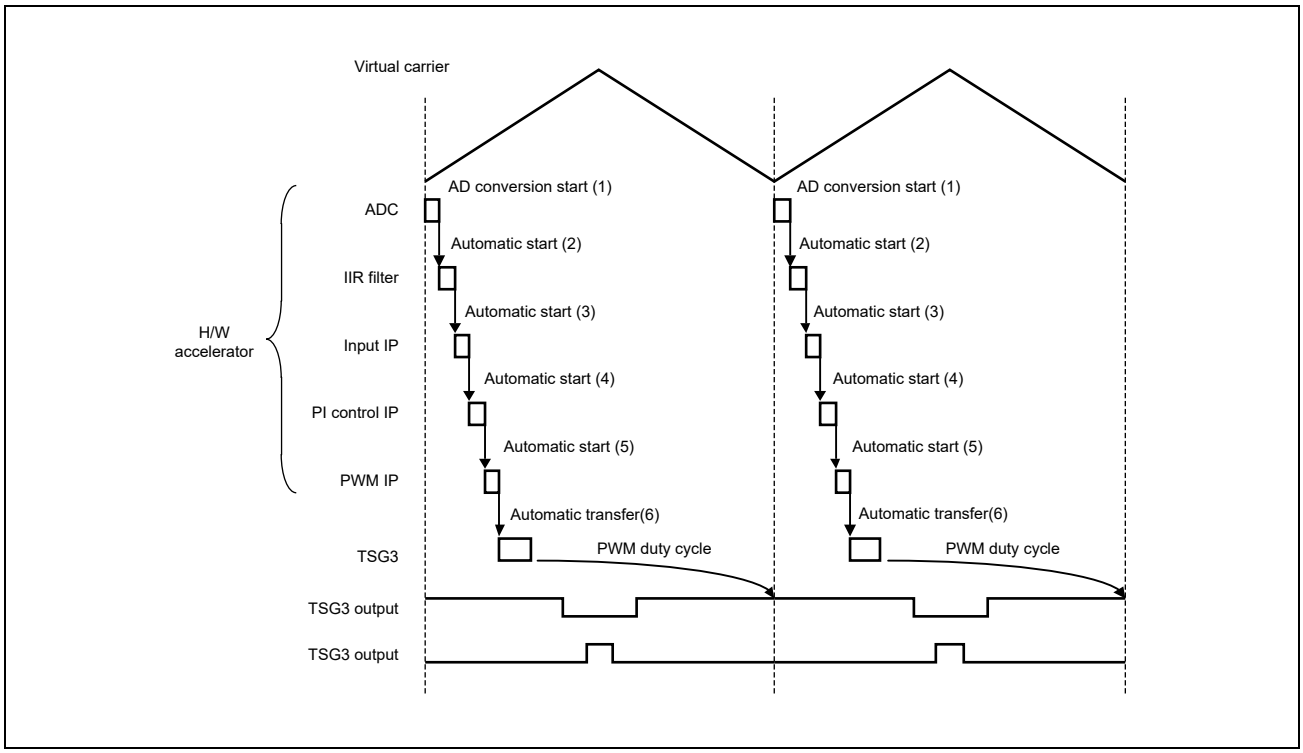

Figure 25.51 Example of 3-Phase PWM Control by the H/W Accelerator

25.5.4.2 Exercising 3-Phase PWM Control with the H/W Accelerator and CPU

- Startup conditions:
  - The IIR filter is started upon completion of an A/D conversion.
  - The input IP is started upon completion of IIR filtering.
  - The PWM IP is started on a software trigger.
- Operation example:

(1) An A/D conversion is started at a trough of the carrier as a trigger.

(2) The IIR filter is started upon completion of the A/D conversion.

(3) The input IP is started upon completion of IIR filtering.

(4) Interrupt program processing is started upon completion of input IP processing.

(5) The PWM IP is started by the interrupt program processing and calculates the PWM compare values for the next carrier.

(6) The PWM compare values are stored in the required registers of theTSG3.

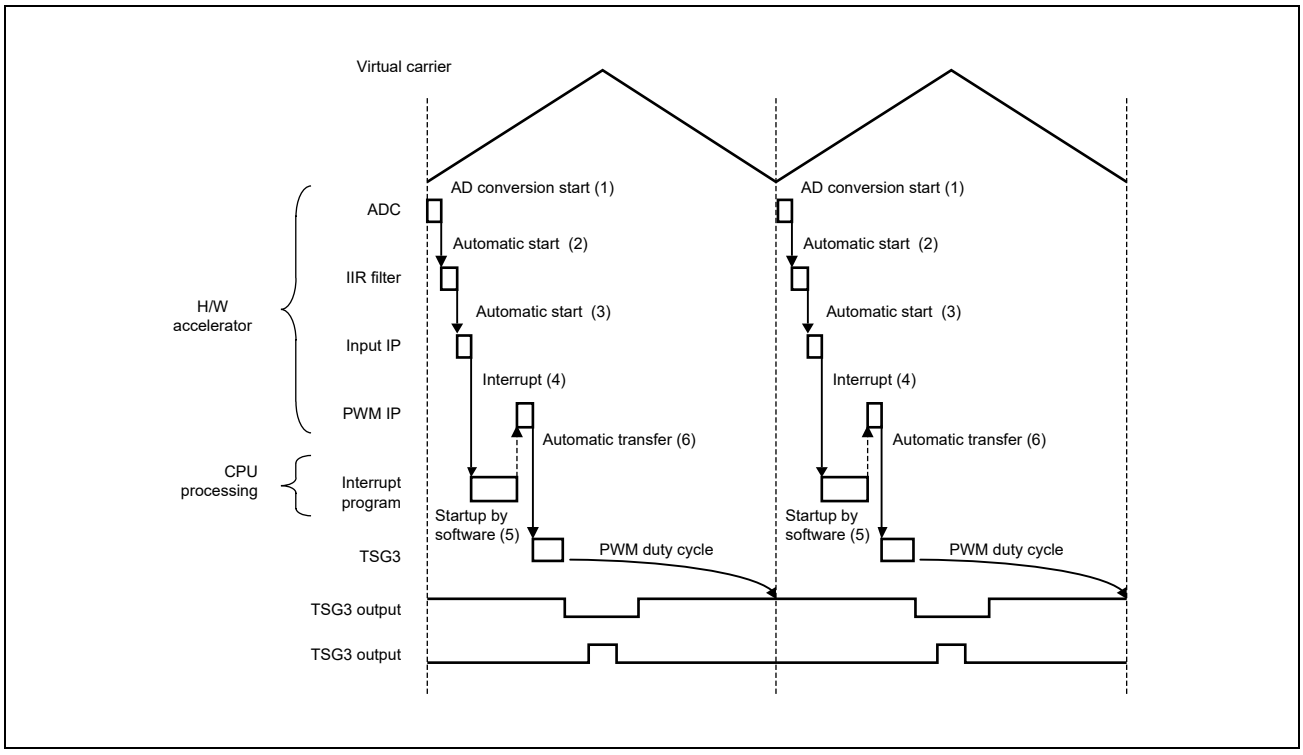

Figure 25.52 Example of 3-phase PWM Control by the H/W Accelerator and CPU

25.5.5 Rectangle Wave Output Control

An operation example of rectangle wave control using the H/W accelerator is given below.

For details on the IIR filter function, see **Section 25.4.9, IIR Filters**.

For details on the input IP function, see **Section 25.4.3, Input IP**.

For details on the rectangle IP function, see **Section 25.4.6, Rectangle IP**.

- Startup conditions:
  - The IIR filter is started upon completion of an A/D conversion.
  - The input IP is started upon completion of IIR filtering.
  - The rectangle IP is started on a software trigger.
- Operation example:

  (1) The A/D converter starts conversion and the rectangle wave output patterns are switched on a compare 0 match as a trigger.

  (2) The IIR filter is started upon completion of the A/D conversion.

  (3) The input IP is started upon completion of IIR filtering.

  (4) Interrupt program processing is started upon completion of input IP processing.

  (5) The rectangle IP is started by the interrupt program processing and makes the next EMU3nCMP0 configuration and sets up the output patterns.

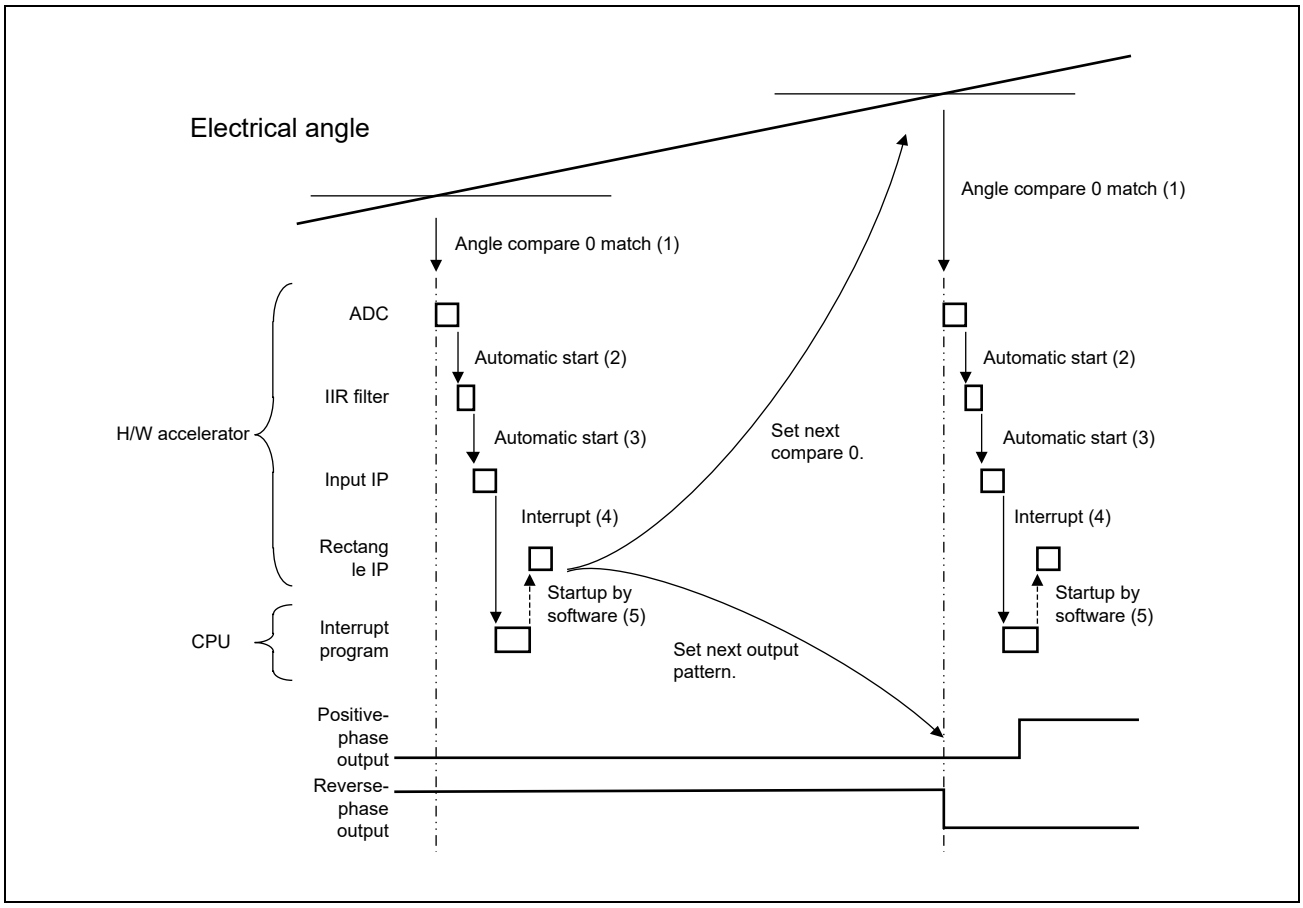

Figure 25.53 Example of Rectangle Wave Output Control

Section 26 R/D Converter (RDC3A)

This section contains a generic description of the R/D (resolver-to-digital) converter 3A (RDC3A).

The first part of this section describes specific properties in RH850/C1M-A products, such as the numbers of units and register base addresses, etc. The remainder of the section describes the functions and registers of the RDC3A.

26.1 Features of the RH850/C1M-A RDC3A

26.1.1 Numbers of Units

These microcontrollers have the following numbers of RDC3A units.

Table 26.1 Numbers of Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of units	2	1
Name	RDC3An (n = 0, 1)	RDC3An (n = 0)

Table 26.2 Index

Index	Meaning
n	Throughout this section, the individual RDC3A units are identified by the index “n” (n = 0, 1), for example, RDC3AnRDSTP for the RDC3An stop register.

26.1.2 Register Base Addresses

RDC3A base addresses are listed in the table below.

In general, RDC3A register addresses are given as offsets from these base addresses.

Table 26.3 Register Base Address

Base Address Name	Base Address
<RDC3A0_base>	FF78 0000$_H$
<RDC3A1_base>	FF78 1000$_H$

26.1.3 Clock Supply

The RDC3A clock supply is shown in the following table.

Table 26.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
RDC3An	PCLK	CLK_HSB (High speed peripheral clock)
	CCLK	CLKC_LSB (Unmodulated low speed peripheral clock)

26.1.4 Interrupt Requests

RDC3A interrupt requests are listed in the following table.

Table 26.5 Interrupt Requests

Interrupt Name	Interrupt Number	DMA Trigger Number*1		DTS Trigger Number*1	
		1st	2nd	1st	2nd
RDC3A0					
RDC3A0 Z phase interrupt	76	67		67	
RDC3A0 RDC error interrupt	77	—	—	—	—
RDC3A0 compare match interrupt 0	78	68	—	68	—
RDC3A0 compare match interrupt 1	79	69	—	69	—
RDC3A0 compare match interrupt 2	80	70	—	70	—
RDC3A0 excitation timer (ET) interrupt	81	—	—	—	—
RDC3A0 excitation timer (ET) DMA request	—	71	—	71	—
RDC3A0 BIST completion interrupt	82	—	—	—	—
RDC3A1					
RDC3A1 Z phase interrupt	83	72	—	72	—
RDC3A1 RDC error interrupt	84	—	—	—	—
RDC3A1 compare match interrupt 0	85	73	—	73	—
RDC3A1 compare match interrupt 1	86	74	—	74	—
RDC3A1 compare match interrupt 2	87	75	—	75	—
RDC3A1 excitation timer (ET) interrupt	88	—	—	—	—
RDC3A1 excitation timer (ET) DMA request	—	76	—	76	—
RDC3A1 BIST completion interrupt	89	—	—	—	—

Note: —: No number is assigned.

Note 1. 1st: Primary channel, 2nd: Secondary channel

26.1.5 Reset Source

RDC3A reset sources are listed in the following table. RDC3A is initialized by the following reset sources.

Table 26.6 Reset Sources

Unit Name	Reset Source
RDC3An	All reset sources

26.1.6 External Input/Output Signals

External input and output signals of the RDC3A are listed in the following table.

Table 26.7 External Input and Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal Name	Products Supported	
			C1M-A2	C1M-A1
Common to RDC3A0 and RDC3A1				
RVCC	RDC3A analog power supply (5V)	RVCC	√	√
RVSS	RDC3A analog ground (0V)	RVSS	√	√
RDC3A0				
RDC3A0SINMNT*1	Input amplifier monitor output	RDC3A0SINMNT	√	√
RDC3A0S4	Resolver signal input	RDC3A0S4	√	√
RDC3A0S2	Resolver signal input	RDC3A0S2	√	√
RDC3A0S1	Resolver signal input	RDC3A0S1	√	√
RDC3A0S3	Resolver signal input	RDC3A0S3	√	√
RDC3A0COSMNT*1	Input amplifier monitor output	RDC3A0COSMNT	√	√
RDC3A0RSO	Input/output for input/output excitation signal	RDC3A0RSO	√	√
RDC3A0COM	Input/output of common voltage for input/output excitation signal	RDC3A0COM	√	√
RD0_OUT_U	Encoder pulse output	RDC3A0_OUT_U	√	√
RD0_OUT_V	Encoder pulse output	RDC3A0_OUT_V	√	√
RD0_OUT_W	Encoder pulse output	RDC3A0_OUT_W	√	√
RDC3A1				
RDC3A1SINMNT*1	Input amplifier monitor output	RDC3A1SINMNT	√	—
RDC3A1S4	Resolver signal input	RDC3A1S4	√	—
RDC3A1S2	Resolver signal input	RDC3A1S2	√	—
RDC3A1S1	Resolver signal input	RDC3A1S1	√	—
RDC3A1S3	Resolver signal input	RDC3A1S3	√	—
RDC3A1COSMNT*1	Input amplifier monitor output	RDC3A1COSMNT	√	—
RDC3A1RSO	Input/output for input/output excitation signal	RDC3A1RSO	√	—
RDC3A1COM	Input/output of common voltage for input/output excitation signal	RDC3A1COM	√	—
RD1_OUT_U	Encoder pulse output	RDC3A1_OUT_U	√	—
RD1_OUT_V	Encoder pulse output	RDC3A1_OUT_V	√	—
RD1_OUT_W	Encoder pulse output	RDC3A1_OUT_W	√	—

Note 1. Input amplifier monitor pins (RDC3AnSINMNT and RDC3AnCOSMNT) also act as the A/D converter analog input pins. Do not use these pins as input amplifier monitor output pin and A/D conversion pin at the same time.

26.2 Overview

26.2.1 Functional Overview

The R/D (resolver-to-digital) converter 3A converts the analog value (angle information) indicating the rotor angle of the resolver into a 16-bit (at maximum) digital value.

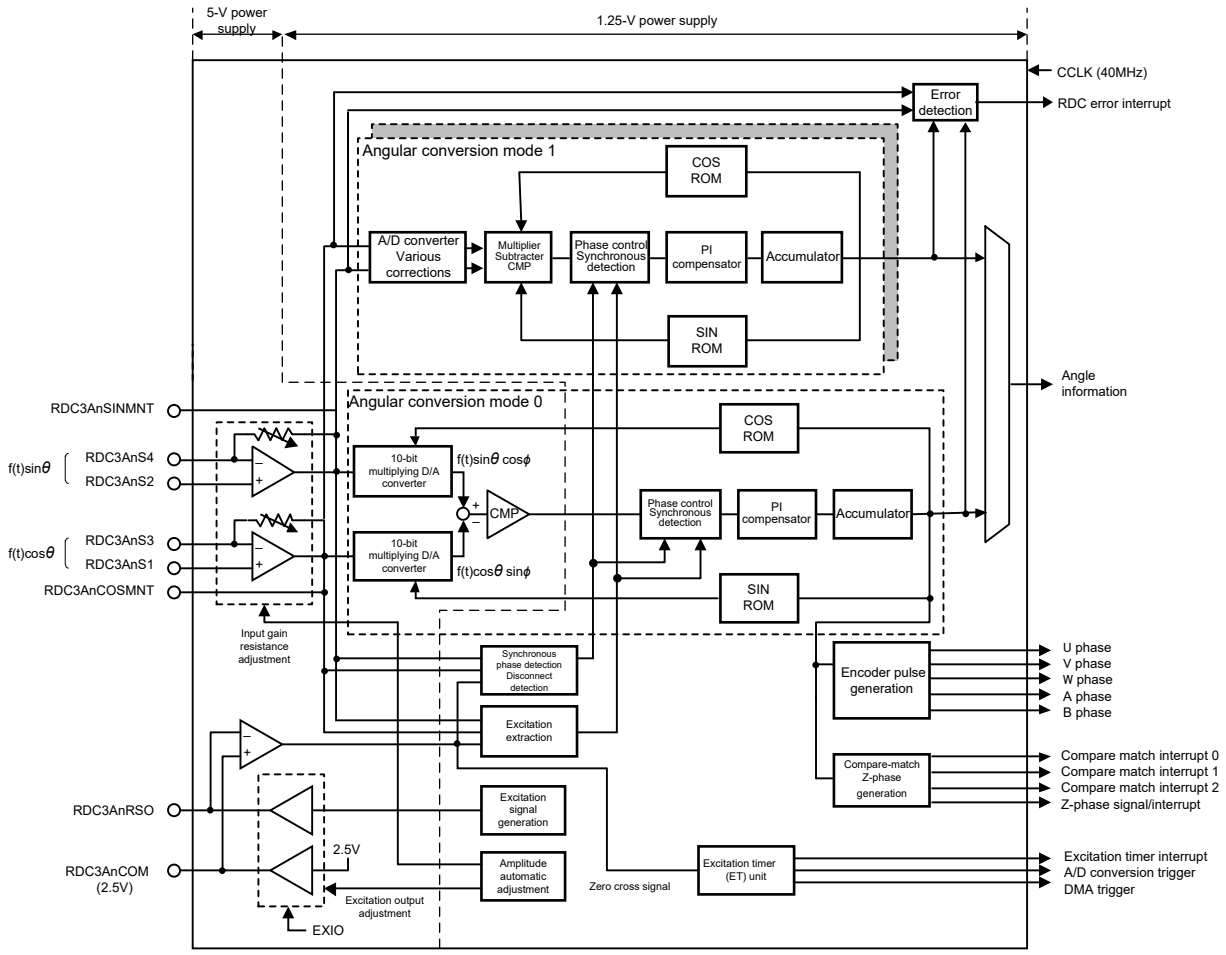
There are two conversion methods;

- Angular conversion mode 0:
  The analog value is converted to the digital value by using the analog calculation block and the digital tracking loop.
- Angular conversion mode 1:
  The analog signal is obtained by the A/D converter and converted by the digital tracking loop.

In addition to the function of converting the analog angle signal from the resolver into a digital angle signal, the RDC3A provides excitation signal output function, error detection function, and self-diagnosis function.

Table 26.8 lists the specifications for the RDC3A.

Table 26.8 RDC3A Specifications (1/2)



Item	Function	Description	Applicable mode	
			Angular Conversion Mode 0	Angular Conversion Mode 1
Tracking loop	Excitation signal source selection	Selects the excitation signal generated in the RDC3A (RDC3AnRSO, RDC3AnCOM) or that input from outside.	√	√
	Required sensor selection	Selects VR resolver or DC resolver.	√	√
	Excitation component extraction	Uses the excitation components extracted from the resolver signal for R/D conversion.	√	√
	PI compensator bandwidth setting	Selects from six bandwidths (five fixed and one auto-adjusted).	√	√
	Forced gain control	Improves the tracking performance when the resolver angle deviates significantly from the R/D converted angle.	√	√
	Maximum angular velocity setting	Sets a maximum angular velocity (resolution) in the range from 960,000 rpm (10 bits) to 15,000 rpm (16 bits).	√	√
	PHI angular velocity information reading	Reads the angular velocity from the PHI angle output register.	√	√
	Monitor	Reads angle information (°), angular velocity information (rpm), and control variation values (%) directly from a register.	√	√
	Angle compare	When the angle that is set in the angle compare registers 0 to 2 and the R/D converted angle match, a compare match interrupt request is generated.	√	√
	Encoder pulse output	Outputs U-phase, V-phase, W-phase, A-phase, B-phase, and Z-phase signals (4096 Edge/Revolution).	√	√

Table 26.8 RDC3A Specifications (2/2)

Item	Function	Description	Applicable mode	
			Angular Conversion Mode 0	Angular Conversion Mode 1
Sine and cosine correction function	ADC noise elimination	Discards the converted values of the RDC3AnSINMNT and RDC3AnCOSMNT signals acquired by AD conversion if they contain noise.	—	√
	Sine/cosine gain correction	Automatically detects the amplitudes of the sine and cosine signals by comparing them and corrects them.	—	√
	Sine/cosine common offset correction	Automatically detects an offset of the common levels of the sine and cosine signals input from the original common level and corrects them.	—	√
	Sine/cosine phase correction	Automatically detects the phase deviations of the excitation components of the sine and cosine signals to be input and corrects them.	—	√
	Sine/cosine angle correction	Inputs the value for correcting the sine and cosine angles to the SIN-ROM and COS-ROM tables. This function handles the mounting of the resolver at an angle toward the motor shaft by correcting the resulting orthogonality errors of the sine and cosine signals from the resolver.	√	√
Excitation signal output	Excitation signal output function (RDC3AnRSO, RDC3AnCOM)	Generates the excitation signal with the voltage buffer. Outputs the sine-wave voltage signal generated in the 7-bit D/A converter through the RDC3AnRSO pin. Voltage amplitude (Vpp) is 2 V, which can be changed with the register setting. Outputs common voltage, which is RVCC divided by 2, from the RDC3AnCOM pin.	√	√
	Automatic amplitude adjustment function	Automatically adjusts the amplitude of the input monitor signals (RDC3AnSINMNT, RDC3AnCOSMNT) into appropriate values. Targets to be adjusted: Input gain resistance and excitation signal output amplitudes	√	√
Error detection	Error detection function	Detects resolver signal error, resolver signal disconnect error, R/D conversion error, two paths comparison conversion error, resolver signal power/ground short error, and sum-of-squares amplitude error.	√	√

26.2.2 Block Diagram

Figure 26.1 is a block diagram of the entire RDC3A module.

Note: Self-test circuits are omitted from this block diagram.

Note: n = 0, 1
f(t): excitation signal
RDC3AnS1 to RDC3AnS4: resolver signals
EXIO: A bit in the RDC3AnREF register
SIN ROM: Sine wave ROM
COS ROM: Cosine wave ROM
RDC3AnCOSMNT, RDC3AnSINMNT: Monitor signals output from the input amplifier

Figure 26.1 Block Diagram of the Entire RDC3A Module

26.2.3 Operating Principle

The following describes the operating principles of the RDC3A module.

This R/D converter module uses the tracking method to convert analog resolver signals to digital signals (R/D conversion).

The tracking loop runs at 20 MHz.

When the excitation signal f(t) is input to the excitation coil, f(t) • sinθ and f(t) • cosθ are output from the resolver according to the angle (θ) of the resolver rotor. These signals are input to the RDC3AnS2-RDC3AnS4 and RDC3AnS1-RDC3AnS3 pins, respectively.

These signals are amplified and then input to the multiplying D/A converter. At the same time, cos ϕ (or sin ϕ) is generated by passing the accumulator output through COS ROM (or SIN ROM) and is fed back to the corresponding D/A converter. Then, the subtraction is performed on the outputs from both D/A converters.

$$f(t) \cdot (\sin\theta \cdot \cos\phi - \cos\theta \cdot \sin\phi)$$

$$= f(t) \cdot \sin(\theta - \phi)$$

$$\approx f(t) \cdot (\theta - \phi)$$

The result is converted to 1-bit digital value by the comparator (CMP) and then passed to the digital block.

The excitation component f(t) is removed in the synchronous detection circuit to obtain the control variation $\varepsilon = \theta - \phi$.

The negative feedback control over the entire analog and digital circuits provides feedback so that the control variation becomes zero. When $\theta = \phi$, the analog angle information from the resolver has been converted to digital angle ϕ (16-bit wide). **Figure 26.2** describes the PI compensator and accumulator.

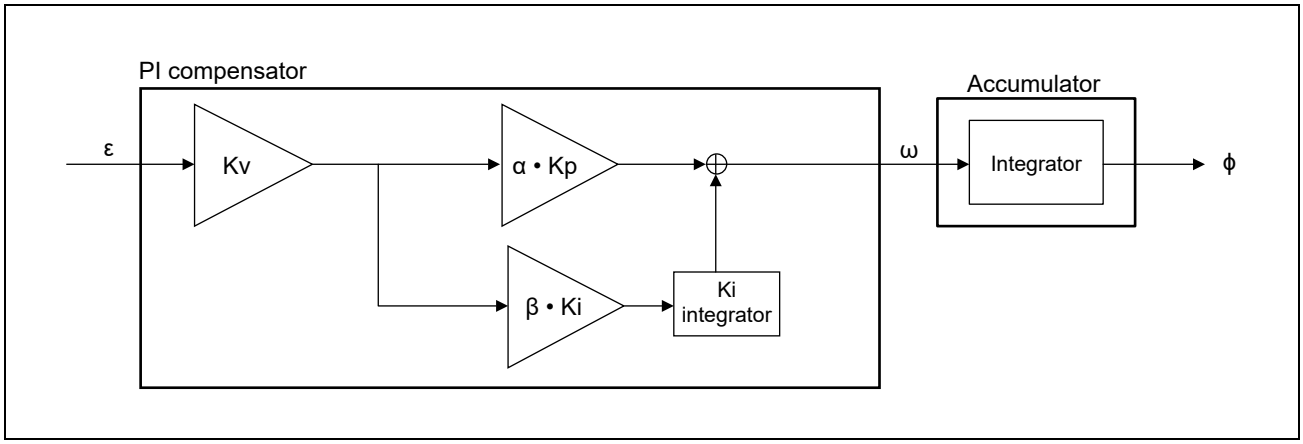

Figure 26.2 PI Compensator and Accumulator

The PI compensator converts the control variation according to the following formula, and passes the result to the accumulator circuit

$\omega = (\alpha \bullet Kp + (\beta \bullet Ki)/(s \bullet T)) \bullet Kv \bullet \varepsilon$

Kv, Kp, Ki: control coefficients that can be set in a register

α, β: fixed values

s: Laplace variable

T: Integration time constant

ω: PI compensator output, angular velocity information

The accumulator circuit calculates the angle ϕ based on the angular velocity information ω.

26.3 Register

26.3.1 List of Registers

The following table lists the RDC3A registers.

For <RDC3An_base>, see **Section 26.1.2, Register Base Addresses**.

Table 26.9 List of Registers

Module Name	Register Name	Symbol	Address
RDC3An	RDC Stop register	RDC3AnRDSTP	<RDC3An_base> + 0000_H
RDC3An	Control gain select register 0	RDC3AnPI0	<RDC3An_base> + 0004_H
RDC3An	Control gain select register 1	RDC3AnPI1	<RDC3An_base> + 0008_H
RDC3An	PHI compare setting register 0	RDC3AnPHICP0	<RDC3An_base> + $000C_H$
RDC3An	PHI compare setting register 1	RDC3AnPHICP1	<RDC3An_base> + 0010_H
RDC3An	PHI compare setting register 2	RDC3AnPHICP2	<RDC3An_base> + 0014_H
RDC3An	Sine/cosine angle correction register	RDC3AnSCCOR0	<RDC3An_base> + 0018_H
RDC3An	Sine/cosine correction register 0	RDC3AnSCCOR1	<RDC3An_base> + $001C_H$
RDC3An	Sine/cosine correction register 1	RDC3AnSCCOR2	<RDC3An_base> + 0020_H
RDC3An	Sine/cosine correction register 2	RDC3AnSCCOR3	<RDC3An_base> + 0024_H
RDC3An	Automatic amplitude adjustment register 0	RDC3AnATMNT0	<RDC3An_base> + 0028_H
RDC3An	Automatic amplitude adjustment register 1	RDC3AnATMNT1	<RDC3An_base> + $002C_H$
RDC3An	Error detection register 0	RDC3AnDIAG0	<RDC3An_base> + 0030_H
RDC3An	Error detection register 1	RDC3AnDIAG1	<RDC3An_base> + 0034_H

Table 26.11 RDC3AnPI0 Register Contents (1/3)

Bit Position	Bit Name	Description
31, 30	KVMS[1:0]	Kv Gain Method Select Selects the Kv gain method. b31 b30 0 0: 1-step-shifted 12-level AGC (default) 0 1: 1-step-shifted 7-level AGC 1 0: 1-step-shifted 2-level AGC 1 1: Fixed Kv
29, 28	DVW[1:0]	ERR Deviation Weighting Selects weighting of ERR deviation. b29 b28 0 0: ×1 (default) 0 1: ×3 1 0: ×5 1 1: ×7
27	Reserved	This bit is read as 0. The write value should be 0.
26	KPF	Kp Gain Quadruple Selects whether or not to quadruple the gain on the Kp side of the PI compensator.*1 0: Kp gain is not quadrupled. (×1) 1: Kp gain is quadrupled.
25, 24	KPS[1:0]	Kp Gain Select Selects the Kp gain in the PI compensator*1 b25 b24 0 0: ×1 (default) 0 1: ×0.25 1 0: ×0.5 1 1: ×2
23	Reserved	This bit is read as 0. The write value should be 0.

Table 26.11 RDC3AnPI0 Register Contents (2/3)

Bit Position	Bit Name	Description
22 to 20	KIS[2:0]	Ki Gain Select Sets the Ki gain in the PI compensator. b22 b21 b20 0 0 0: ×1 (default) 0 0 1: ×0.125 0 1 0: ×0.25 0 1 1: ×0.5 1 0 0: ×2 1 0 1: ×4 1 1 0: ×8 1 1 1: ×16
19	Reserved	This bit is read as 0. The write value should be 0.
18 to 16	DEVCK[2:0]	Control Variation Determination Clock Select*2 Selects the clock period used for determining the control variation. 0 0 0: 50-µs* clock period 0 0 1: 100-µs* clock period 0 1 0: 200-µs* clock period (default) 0 1 1: 25-µs* clock period 1 0 0: 400-µs* clock period 1 0 1: 800-µs* clock period 1 1 0: 50-µs* clock period 1 1 1: 50-µs* clock period
15 to 12	LKVS[3:0]	Low Kv Gain Select Sets the gain in the lower Kv side when the fixed Kv method or 2-level AGC method is selected. b15 b14 b13 b12 0 0 0 0: ×1 (default) 0 0 0 1: ×0.0625 0 0 1 0: ×0.125 0 0 1 1: ×0.25 0 1 0 0: ×0.5 0 1 0 1: ×1 0 1 1 0: ×2 0 1 1 1: ×4 1 0 0 0: ×8 1 0 0 1: ×16 1 0 1 0: ×32 1 0 1 1: ×64 1 1 0 0: ×128 1 1 0 1: ×1 1 1 1 0: ×1 1 1 1 1: ×1

Table 26.11 RDC3AnPI0 Register Contents (3/3)

Bit Position	Bit Name	Description
11 to 8	HKVS[3:0]	High Kv Gain Select Sets the gain in the higher Kv side when the fixed Kv method or 2-level AGC method is selected. b11 b10 b9 b8 0 0 0 0: ×32 (default) 0 0 0 1: ×0.0625 0 0 1 0: ×0.125 0 0 1 1: ×0.25 0 1 0 0: ×0.5 0 1 0 1: ×1 0 1 1 0: ×2 0 1 1 1: ×4 1 0 0 0: ×8 1 0 0 1: ×16 1 0 1 0: ×32 1 0 1 1: ×64 1 1 0 0: ×128 1 1 0 1: ×32 1 1 1 0: ×32 1 1 1 1: ×32
7 to 5	Reserved	These bits are read as 0. The write value should be 0.
4	BWCS	Bandwidth Setting Selects the PI compensator setting method. 0: Sets the coefficients by using the RDC3AnPI0 register. 1: Using the LPGS[2:0] bits in this register (see the description in the LPGS[2:0] for the set value.)
3	Reserved	This bit is read as 0. The write value should be 0.
2 to 0	LPGS[2:0]	Loop Gain Select By setting the BWCS bit in this register to 1, the LPGS[2:0] bits are enabled and the PI compensator can be set by using them. See **Table 26.17**

Note: The timing value is when the CCLK is running at 40 MHz.

Note 1. Do not set the DVW[1:0], KPS[1:0], KPF, and HKVS[3:0] bits in the RDC3AnPI0 register to values listed in **Table 26.12** and **Table 26.13**. In case of using the combinations listed in these tables, the P component in the PI compensator overflows, resulting in unexpected value if the Kv gain is large.

Note 2. Set the control variation determination clock period to be longer than the excitation signal period currently used. For example, when a 10-kHz (100-µs period) excitation signal is used, set the control variation determination clock period to 100, 200, 400 or 800 µs. Do not select 50 or 25 µs.

Table 26.12 Prohibited Combinations of DVW[1:0], KPS[1:0], and KPF
• When KVMS[1:0] = 00 or 01 (at 12- or 7- level AGC)

11 (×7)	00 (×1)	1 (×4)	1100 (×128)
11 (×7)	00 (×1)	1 (×4)	1011 (×64)
11 (×7)	10 (×0.5)	1 (×4)	1100 (×128)

Kv Gain Method Select Bits

These bits select the Kv gain method in the PI compensator. When the AGC (Auto Gain Control) method is selected, the Kv gain is automatically selected according to the amount of control variation. It is recommended to use the value after reset (12-level AGC method).

- 12-level AGC method (default)

Table 26.14 lists the control variation amount and the value of the selected Kv gain for the 12-level AGC. The control variation amount indicates a bias of control variation ε (High or Low) within the determination clock period. With

regard to the resolver angle signal θ and the R/D converter output angle signal ϕ, the High and the Low appear in equal proportions if θ and ϕ are equal. In such a case, the control variation amount is ± 0%. If ϕ is completely behind θ, the ε always becomes high. In this case, the control variation amount is +100%. If ϕ is completely ahead of θ, ε always becomes Low. In this case, the control variation amount is –100%. The determination clock period can be selected by the DEVCK[2:0] bits.

Table 26.14 Control Variation Amount and Kv Gain for 12-Level AGC

Control Variation Amount (Absolute Value)	Kv Gain
After released from a reset	×128
76.8% to 100%	×64
64.0% to 76.8%	×32
57.6% to 64.0%	×16
51.2% to 57.6%	×8
44.8% to 51.2%	×4
38.4% to 44.8%	×2
32.0% to 38.4%	×1
25.6% to 32.0%	×0.5
19.2% to 25.6%	×0.25
12.8% to 19.2%	×0.125
0.0% to 12.8%	×0.0625

If the Kv gain falles below ×128 after a reset, the Kv returns to ×128 on any of the following conditions:

1. The KIRST bit is set to 1 when the AGDS bit is 0 (Ki reset)
2. Recovery from the resolver signal error state when the AGDS bit is 0.

The Kv gain does not return to ×128 on the above conditions when the AGDS bit is 1.

- 7-level AGC method

Table 26.15 lists the control variation amount and the value of the selected Kv gain for the 7-level AGC.

Table 26.15 Control Variation Amount and Kv Gain for 7-Level AGC

Control Variation Amount (Absolute Value)	Kv Gain
After released from a reset	×128
76.8% to 100 %	×64
51.2% to 76.8%	×16
38.4% to 51.2%	×4
25.6% to 38.4%	×1
12.8% to 25.6%	×0.25
0.0 % to 12.8%	×0.0625

If the Kv gain falls below × 128 after a reset, the Kv returns to × 128 on the following conditions:

1. The KIRST bit is set to 1 when the AGDS bit is 0 (Ki reset)
2. Recovery from the resolver signal error state when the AGDS bit is 0.

The Kv gain does not return to ×128 on the above conditions when the AGDS bit is 1.

- 2-level AGC method

Table 26.16 lists the control variation amount and the value of the selected Kv gain for the 2-level AGC. The low and high gains can be set using bits LKVS[3:0] and HKVS[3:0], respectively.

Table 26.16 Control Variation Amount and Kv Gain for 2-Level AGC

Control Variation Amount (Absolute Value)	Kv Gain
76.8% to 100%	Makes transition to the high Kv gain
25.6% to 76.8%	Kv gain maintained (no transition)
0.0 % to 25.6%	Makes transition to the low Kv gain

If the Kv gain falles below ×128 after a reset, the Kv returns to ×128 on any of the following conditions:

1. The KIRST bit is set to 1 when the AGDS bit is 0 (Ki reset)
2. Recovery from the resolver signal error state when the AGDS bit is 0.

The Kv gain does not return to ×128 on the above conditions when the AGDS bit is 1.

- Fixed Kv method

If the fixed Kv method is selected, the module operates with the low Kv gain irrespective of the control variation amount. The module, however, makes a transition to the high Kv gain only when an error is detected and then the erorr signal makes a transition to 0 (recovery from the error). After that, the module makes a transition to the low Kv gain side when the absolute value of the control variation amount falls below 25.6%.

Loop Gain Select Bits

Combinations of values in the LPGS[2:0] bits and corresponding settings in the PI compsensator when the BWCS bit is 1 are shown in **Table 26.17**.

Table 26.17 LPGS[2:0] and Corresponding Settings in the PI Compensator

	LPGS[2:0]			Settings in PI Compensator
BWCS	b2	b1	b0	Bandwidth
0	X	X	X	Set by the RDC3AnPI0 register
1	0	0	0	800 Hz
1	0	1	1	1500 Hz
1	1	0	0	1000 Hz
1	1	0	1	500 Hz
1	1	1	0	200 Hz
1	1	1	1	Adjusted automatically.

Note: The default setting is b2:b0 = 000 which sets the bandwidth as 800 Hz.

Note: Settings other than those listed above are prohibited.

26.3.4 RDC3AnPI1 ─ Control Gain Select Register 1

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + 0008_H

Table 26.18 RDC3AnPI1 Register Contents (1/2)

Bit Position	Bit Name	Description
31 to 29	Reserved	These bits are read as 0. The write value should be 0.
28	SAGD	Short-Period BIST Recovery Forced Gain Control Function Disable Controls whether the RD converter makes a transition to the forced gain control state on completion of a short-period BIST (ADBIST, resolver signal error BIST, disconnect error BIST, power/ground short error BIST). 0: Use the forced control gain function. 1: Do not use the forced gain control function.
27 to 25	Reserved	These bits are read as 0. The write value should be 0.
24	AGCD	Forced Gain Control Function Disable Selects whether or not to use the forced gain control function*1. 0: Use the forced gain control function. 1: Do not use the forced gain control function.
23 to 17	Reserved	These bits are read as 0. The write value should be 0.
16	AGDS	AGC Kv High Gain Transition Restriction Restricts the AGC Kv gain from going high. 0: The Kv goes high in response to excitation errors or after a Ki reset. 12-level AGC is selected: Kv is fixed to ×128 7-level AGC is selected: Kv is fixed to ×128 2-level AGC is selected: Kv is fixed to the higher side 1: The Kv does not go high in response to excitation errors or after a Ki reset.
15 to 12	Reserved	These bits are read as 0. The write value should be 0.

Table 26.18 RDC3AnPI1 Register Contents (2/2)

Bit Position	Bit Name	Description
11 to 8	AGST[3:0]	Short-Period BIST Recovery Initial AGC Gain Sets the initial value for the Kv gain on transitions to the forced gain control state after completion of a short-period BIST (ADBIST, resolver signal error BIST, disconnect error BIST, power/ground short error BIST) or ending on detection of power/ground short error. b11 b10 b9 b8 Initial value for the Kv gain 0 0 0 0: ×4 (default) 0 0 0 1: ×0.0625 0 0 1 0: ×0.125 0 0 1 1: ×0.25 0 1 0 0: ×0.5 0 1 0 1: ×1 0 1 1 0: ×2 0 1 1 1: ×4 1 0 0 0: ×8 1 0 0 1: ×16 1 0 1 0: ×32 1 0 1 1: ×64 1 1 0 0: ×128 1 1 0 1: ×4 1 1 1 0: ×4 1 1 1 1: ×4
7 to 3	Reserved	These bits are read as 0. The write value should be 0.
2 to 0	MAXV[2:0]	Maximum Angular Velocity Select Sets the maximum angular velocity. See **Table 26.19**.

Note 1. To change the setting of AGCD, write 1 to the KIRST bit after the setting has been changed. Otherwise, the phi angle values are output under the free-running condition.
The setting of AGCD should be changed while the resolver is not running.

Maximum Angular Velocity Setting Function

Table 26.19 lists the maximum angular velocity selected by the MAXV bits and corresponding R/D conversion resolutions.

Table 26.19 Maximum Angular Velocity Select Bit Settings

b2	b1	b0	Maximum Angular Velocity (min^{-1})	Resolution (bits)
0	0	0	120000*1	13
0	0	1	240000*1	12 (default)
0	1	0	480000*1	11
0	1	1	960000*1	10
1	0	0	15000*1	16
1	0	1	60000*1	14
1	1	0	240000*1	12
1	1	1	240000*1	12

Note 1. The timing value is when the CCLK is running at 40 MHz.

26.3.5 RDC3AnPHICP0 ─ PHI Compare Setting Register 0

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + $000C_H$

Value after reset $0000\ 0000_H$

Table 26.24 RDC3AnSCCOR1 Register Contents (1/3)

Bit Position	Bit Name	Description
31 to 27	Reserved	These bits are read as 0. The write value should be 0.
26	PHCST	Phase Correction Start Writing 1 to this bit starts phase correction. Set this bit to 1 after the RDC has entered the angular tracking state. This bit returns to 0 after two clock cycles has elapsed following it being set to 1. This bit is effective only for once after a reset.
25	Reserved	This bit is read as 0. The write value should be 0.
24	GNCST	Gain Correction Start Writing 1 to this bit starts gain correction or common offset correction. Set this bit to 1 after the RDC has entered the angular tracking state and the resolver has rotated through an electrical angle of at least 180°. This bit returns to 0 after two clock cycles has elapsed following it being set to 1.
23, 22	CMCLT[1:0]	Common Offset Correction Limit Sets limitation for the range of correcting the common offset value. If the value for correction obtained from the input signal exceeds the set limitation, the set value is used for correction. b23 b22 Limitation on the value for correction 0 0: ± 0.0312 × RVCC (approx. ± 150 mV) (default) 0 1: ± 0.0156 × RVCC (approx. ± 78 m V) 1 0: ± 0.125 × RVCC (approx. ± 625 mV) 1 1: ± 0 × RVCC (± 0 mV) (no correction applied)
21, 20	CMCSL[1:0]	Common Offset Correction Type Select Selects the type of correcting by the common offset value. b21 b20 Type of correction 0 0: No correction (fixed to 00_H, this is the default setting) 0 1: Always use the fixed offset correction value set by CSOSN[9:0] and CCOSN[9:0]. 1 0: Use the offset correction value obtained from the calculation. The timing to apply this value depends on the setting of the GNCSL bit. 1 1: Setting prohibited

Table 26.24 RDC3AnSCCOR1 Register Contents (2/3)

Bit Position	Bit Name	Description
19, 18	GNCLT[1:0]	Gain Correction Range Limit Sets limitation for the range of correcting the gain value. If the value for correction obtained from the input signal exceeds the set limitation, the set value is used for correction. b19 b18 Limitation on the value for correction 0 0: ± 20% (default) 0 1: ± 10% 1 0: ± 40% 1 1: ± 0% (no correction applied)
17, 16	GNCSL[1:0]	Gain Correction Type Select Selects the type of correcting by the gain value. b17 b16 Type of correction 0 0: No correction (fixed to 1024, this is the default setting) 0 1: Always use the fixed correction value set by GNCNM[10:0] 1 0: Use the correction value obtained from the calculation at the time of GNCST being set 1 1: Use the correction value obtained from the calculation at the time of z-phase output following GNCST being set (correct the value on every single rotation).
15 to 12	Reserved	These bits are read as 0. The write value should be 0.
11, 10	PHCLT[1:0]	Phase Correction Limit Sets limitation for the range of correcting the sine and cosine phases. If the value for delay obtained from the input signal exceeds the set limitation, the set value is used for delay compensation. b11 b10 Limitation of delay compensation 0 0: 3 µs (default) 0 1: 1 µs 1 0: 6 µs 1 1: 0 µs (no correction applied)
9, 8	PHCSL[1:0]	Sine/Cosine Phase Correction Type Select Selects the type of correction for the sine and cosine phases. b9 b8 Type of correction 0 0: No correction (default) 0 1: Obtain the average of phase deviations on the sixteen crossings of the excitation signals after the PHCST bit is set to 1. The value for correction is updated every time 1 is written to the PHCST bit. 1 0: Obtain the average of phase deviations on the sixteen crossings of the excitation signals after the PHCST bit is set to 1. The value for correction obtained in the first round is retained. 1 1: Use the fixed correction value set by PHCNM[5:0] and PHSNM[5:0].
7	Reserved	This bit is read as 0. The write value should be 0.
6	NSRSL	AD Noise Elimination Target Select 0: Apply the AD noise filter to the sine, cosine, gain, and common offset compensation calculating circuits (default). 1: Apply the AD noise filter to the sine, cosine, gain, and common offset compensation calculating circuits and multiplication and subtraction circuits.
5	GNCND	AD Noise Elimination Disable Disables the AD noise eliminator. 0: Noise eliminator is enabled (default) 1: Noise eliminator is disabled
4	SGLMD	AD Stucking Detection Circuit Disable Disables the AD stucking detector. 0: Stucking detector is enabled (default) 1: Stucking detector is disabled (default)

Table 26.24 RDC3AnSCCOR1 Register Contents (3/3)

Bit Position	Bit Name	Description
3	GNJSP	Noise Elimination Comparison Sessions Select Selects the sessions of AD conversion whose results are compared. 0: The results of AD conversion from the current session and previous sessions are compared. 1: The results of AD conversion from the current session are compared with those from the sessions immediately before the previous session.
2 to 0	GNCNS[2:0]	AD Noise Elimination Setting Sets the threshold for judging the value of AD conversion to be noise. If the value obtained as the result of AD conversion exceeds the value of these bits, it is rejected. b2 b1 b0 Threshold for noise 0 0 0: 128(approx. 156 mV) (default) 0 0 1: 32 (approx. 39 mV) 0 1 0: 64 (approx. 78 mV) 0 1 1: 128 (approx. 156 mV) 1 0 0: 256 (approx. 313 mV) 1 0 1: 512 (approx. 625 mV) 1 1 0: 1024 (approx. 1250 mV) 1 1 1: 2048 (approx. 2500 mV)

26.3.10 RDC3AnSCCOR2 ─ Sine/Cosine Correction Register 1

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + 0020_H

Value after reset $0000\ 0000_H$

Table 26.25 RDC3AnSCCOR2 Register Contents

Bit Position	Bit Name	Description
31 to 28	Reserved	These bits are read as 0. The write value should be 0.
27 to 16	GNCNM[11:0]	Gain Correction Fixed Value Sets the fixed value for use in gain correction. The value obtained from the calculation below is multiplied by the gain value for the cosine side. – Value for correction of the cosine side = d'(GNCNM[11:0])/1024 Set these bits to 1024 (multiplication by 1) for no correction. If 1178($49A_H$) is set , for example, the value for the cosine side is corrected by +15%.
15, 14	Reserved	These bits are read as 0. The write value should be 0.
13 to 8	PHCNM[5:0]	Cosine Side Phase Correction Fixed Value Sets the fixed value for use in correction of the phase (amount of delay) of the cosine side. The value for delay obtained from the calculation below is inserted on the cosine side. – Value for delay of the cosine side = d'(PHCNM[5:0]) × 200 ns Setting of $1F_H$ is not allowed. Allowed values are between 0 µs to 6 µs.
7, 6	Reserved	These bits are read as 0. The write value should be 0.
5 to 0	PHSNM[5:0]	Sine Side Phase Correction Fixed Value Sets the fixed value for use in correction of the phase (amount of delay) of the sine side. The value for delay obtained from the calculation below is inserted on the sine side. – Value for delay of the sine side = d'(PHSNM[5:0]) × 200 ns Setting of $1F_H$ is not allowed. Allowed values are between 0 µs to 6 µs.

26.3.11 RDC3AnSCCOR3 ─ Sine/Cosine Correction Register 2

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + 0024_H

Value after reset $0000\ 0000_H$

Table 26.27 RDC3AnATMNT0 Register Contents (1/3)

Bit Position	Bit Name	Description
31, 30	Reserved	These bits are read as 0. The write value should be 0.
29	IRSS0	Input Gain Resistance Value Flash Trimming Value Invalidate Selects the value for use in the input gain resistance to be output from the excitation amplitude automatic adjustment circuit as any among the following: input gain resistance automatic adjustment value, the value set in the relevant register, or the value for trimming set in the flash memory. The selection is made by the combination of the values of this bit, the IRSS1 bit, and the IGRT signal from the flash memory.
28	IGRT	Flash Input Gain Resistance Value Invalid Confirmation This bit is for conforming the level of the input signal (IGRT) from the flash memory, which invalidates the trimming value for the input gain resistance. 0: The trimming value set in the flash memory is valid. 1: The trimming value set in the flash memory is invalid.
27 to 24	IGRM[3:0]	Flash Input Gain Resistance Value Confirmation These bits reflect the levels of the input signal from the flash memory which hold the value for the input gain resistance (IGRM[3:0]). b27 b26 b25 b24 0 0 0 0: input gain resistance value TYP – 40% 0 0 0 1: input gain resistance value TYP – 30% 0 0 1 0: input gain resistance value TYP – 20% 0 0 1 1: input gain resistance value TYP – 10% 0 1 0 0: input gain resistance value TYP± 0% 0 1 0 1: input gain resistance value TYP + 10% 0 1 1 0: input gain resistance value TYP + 20% 0 1 1 1: input gain resistance value TYP + 30% 1 0 0 0: input gain resistance value TYP + 40% 1 0 0 1: input gain resistance value TYP + 40% 1 0 1 0: input gain resistance value TYP + 40% 1 0 1 1: input gain resistance value TYP + 40% 1 1 0 0: input gain resistance value TYP + 40% 1 1 0 1: input gain resistance value TYP + 40% 1 1 1 0: input gain resistance value TYP + 40% 1 1 1 1: input gain resistance value TYP + 40%

Table 26.27 RDC3AnATMNT0 Register Contents (2/3)

Bit Position	Bit Name	Description
23, 22	Reserved	These bits are read as 0. The write value should be 0.
21, 20	EXOC[1:0]	Excitation Output Value Setting These bits make settings of the excitation output. The value in these bits are output from the excitation amplitude automatic adjustment circuit as the excitation output amplitude setting when the EXOS bit is 0. b21 b20 0 0: excitation output value TYP – 40% 0 1: excitation output value TYP – 20% 1 0: excitation output value TYP± 0% (default) 1 1: excitation output value TYP + 20%
19 to 16	IRSC[3:0]	Input Gain Resistance Value Select These bits specify the input gain resistance value. The value in these bits are output from the excitation amplitude automatic adjustment circuit as the input gain resistance value setting when the IRSS1 bit is 0 and the IRSS0 bit is 1, or when the IRSS1 bit is 0 and the signal from the flash memory is 1. b19 b18 b17 b16 0 0 0 0 : input gain resistance value TYP – 40% 0 0 0 1 : input gain resistance value TYP – 30% 0 0 1 0 : input gain resistance value TYP – 20% 0 0 1 1 : input gain resistance value TYP – 10% 0 1 0 0 : input gain resistance value TYP ± 0% (default) 0 1 0 1 : input gain resistance value TYP + 10% 0 1 1 0 : input gain resistance value TYP + 20% 0 1 1 1 : input gain resistance value TYP + 30% 1 0 0 0 : input gain resistance value TYP + 40% 1 0 0 1 : input gain resistance value TYP + 40% 1 0 1 0 : input gain resistance value TYP + 40% 1 0 1 1 : input gain resistance value TYP + 40% 1 1 0 0 : input gain resistance value TYP + 40% 1 1 0 1 : input gain resistance value TYP + 40% 1 1 1 0 : input gain resistance value TYP + 40% 1 1 1 1 : input gain resistance value TYP + 40%
15	Reserved	This bit is read as 0. The write value should be 0.
14	EAAOD	Excitation Amplitude Automatic Adjustment Order Select Selects which amplitude adjustment factor to apply first to the excitation amplitude automatic adjustment circuit as correction by the input gain resistance value or by the excitation output. 0: Correction by the excitation output and then the input gain resistance. 1: Correction by the input gain resistance value and then the excitation output.
13	IRSS1	Input Gain Resistance Value Adjustment Output Select Selects the value for use in the input gain resistance to be output from the excitation amplitude automatic adjustment circuit as any among the following: input gain resistance automatic adjustment value, the value set in the relevant register, or the value for trimming set in the flash memory. The selection is made by the combination of the values of this bit, the IRSS0 bit, and the IGRT signal from the flash memory.
12	EXOS	Excitation Output Amplitude Setting Select Selects the value for use in the excitation amplitude to be output from the excitation amplitude automatic adjustment circuit as either of the following: the value set in the relevant register or the value set for excitation output automatic adjustment. 0: The value set in the EXOC[1:0] bits. 1: The value set for the excitation output automatic adjustment.
11, 10	Reserved	These bits are read as 0. The write value should be 0.

Table 26.27 RDC3AnATMNT0 Register Contents (3/3)

Bit Position	Bit Name	Description
9	EAATSP	Excitation Amplitude Automatic Adjustment Stop Stops excitation amplitude adjustment by the excitation amplitude automatic adjustment circuit. When this bit is changed from 0 to 1, the adjustment value at that time is retained. 0: Performs automatic adjustment. 1: Stops automatic adjustment.
8	SQJGT	Excitation Amplitude Sum-of-Squares Judgment Time Select Sets the interval for adjusting the amplitude of the excitation waveform generated by the excitation amplitude automatic adjustment circuit. 0: Adjusts the amplitude of excitation waveforms every 1 milliseconds*. 1: Adjusts the amplitude of excitation waveforms every 10 milliseconds*.
7 to 0	Reserved	These bits are read as 0. The write value should be 0.

Note: The timing value is when the CCLK is running at 40 MHz.

Selection of the Input Gain Resistance Value

One of the following three values is selected as the input gain resistance value to be output from the excitation amplitude automatic adjustment circuit.

- Automatically adjusted input gain resistance value
- The value set in the IRSC[3:0] bits
- The value for trimming from the flash memory (which is read from the IGRM[3:0] bits)

The values of the IRSS1 and IRSS0 bits, and of the IGRT signal from the flash memory, are used in combination to select the value to use for input gain resistance as shown in **Table 26.28**.

Table 26.28 Selection of Input Gain Resistance Value Adjustment Code

IRSS1 Bit	IRSS0 Bit	The IGRT Signal from the Flash Memory	Selected Setting of the Input Gain Resistance Value
0	0	0	The value for trimming from the flash memory
0	0	1	The value in the IRSC[3:0] bits
0	1	X	The value in the IRSC[3:0] bits
1	X	X	Automatically adjusted input gain resistance value

26.3.13 RDC3AnATMNT1 ─ Amplitude Automatic Adjustment Register 1

Access Readable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + $002C_H$

Value after reset $0000\ 0000_H$

Table 26.31 RDC3AnDIAG1 Register Contents (1/2)

Bit Position	Bit Name	Description
31	Reserved	This bit is read as 1. The write value should be 1.
30	CVEDS	Conversion Error Detection Circuit Select Selects the conversion error detection circuit. 0: The conversion error detection circuit which supports high-speed rotation of the RD conversion error detection signal.*1 1: The conversion error detection circuit which does not support high-speed rotation of the RD conversion error detection signal.
29, 28	EDPS[1:0]	RD Conversion Error Determination Time Select Selects the error determination time (for preventing sudden acceleration) for RD conversion errors*2 b29 b28 0 0: 95.8* millisecond*3 0 1: 147* millisecond*3 1 0: 4.92* millisecond 1 1: 7.37* millisecond (default)
27, 26	Reserved	These bits are read as 0. The write value should be 0.
25, 24	VGASL[1:0]	Power/Ground Short Error Detection Start Method Select Selects the timing to start detection of a power/ground short error. b25 b24 Starting method 0 0: No detection (default) 0 1: When 1 is written to the VGST bit 1 0: Every 10 ms 1 1: No detection
23 to 21	Reserved	These bits are read as 0. The write value should be 0.
20	VGST	Power/Ground Short Error Detection Start Writing 1 to this bit executes power/ground short error detection a single time over all six analog pins. This bit becomes 0 after two clock cycles have elapsed following it being set to 1.
19 to 17	Reserved	These bits are read as 0. The write value should be 0.

Table 26.31 RDC3AnDIAG1 Register Contents (2/2)

Bit Position	Bit Name	Description
16	INIT	Writing 1 to this bit leads to initialization within RDC3A. After this bit has been set to 1, its value is restored to 0 following the completion of initialization within RDC3A.*4
15 to 13	Reserved	These bits are read as 0. The write value should be 0.
12	ERDEN	Error Detection Start Error detection is enabled when the error detection output mask is released after 26 milliseconds* have elapsed following this bit being set to 1.*5
11	Reserved	This bit is read as 0. The write value should be 0.
10	SQERST	Sum-of-Squares Amplitude Error Excitation Counter Reset Writing 1 to this bit resets the sum-of-squares amplitude error excitation counter to 0. This bit becomes 0 after two clock cycles have elapsed following it being set to 1.
9	Reserved	This bit is read as 0. The write value should be 0.
8	ERRST	Error Signal Reset Bit Writing 1 to this bit resets the register bits listed below to 0. Note that each of these bits remains at 1 if an error is continuous. This bit becomes 0 after two clock cycles have elapsed following it being set to 1. Register bits: ERHD, ERDEXC, ERDSBC, ERDSBS, ERDP2, ERDCNV, ERDR1 to 4V
7 to 1	Reserved	These bits are read as 0. The write value should be 0.
0	KIRST	Ki Component Reset The values of the Ki integrator and accumulator integrator become 0 by writing 1 to this bit. On reset, the forced gain control function is enabled and the Kv gain of the PI compensator goes high. This bit becomes 0 after two clock cycles have elapsed following it being set to 1. Setting this bit to 1 while it is 1, wait for at least 2 µs.

Note: The timing value is when the CCLK is running at 40 MHz.

Note 1. Input the excitation signal whose frequency is below 22 kHz when the RD conversion error detection circuit (which supports high-speed rotation) is used (CVEDS = 0).

Note 2. Do not set EDPS[1:0] to a shorter determination time than the current setting while the R/D converter is operating. In other words, the settings below are prohibited;
When EDPS[1:0] = 01, setting EDPS[1:0] to 00, 10, or 11
When EDPS[1:0] = 00, setting EDPS[1:0] to 10 or 11
When EDPS[1:0] = 11, setting EDPS[1:0] to 10
However, changing from 11b to 10b is allowed if the ERDEN bit in the RDC3AnDIAG1 register is 0 after a reset. After changing the bits, set the ERDEN bit to 1.

Note 3. Do not set this value when the RD conversion error detection circuit (which supports high-speed rotation) is selected (CVEDS = 0).

Note 4. The user must not clear the INIT bit once it has been set.

Note 5. The functionality of error detection is disabled after a reset. It is enabled after 26 milliseconds* since the ERDEN bit has been set to 1. Enabling this functionality by setting this bit to 1 takes effects only once, following a reset (setting this bit to 0 does not disable error detection). To disable this functionality after enabling it, disable interrupts by setting the EINTEN bit to 0.

R/D Conversion Error Determination Time Select Bits

These bits are used to set the time to determine R/D conversion errors. If a deviation (ε) between the input angle and R/D converted angle remains large for more than 50% of the specified determination time, it is considered as the R/D conversion error and the ERCNV bit in the RDC3AnDGOUT0 register is set to 1 if the ERCNVS bit selects detection of a conversion error.

Furthermore, if the EINTEN bit in the RDC3AnENC0 register is 1, the ERR and ERHD bits in the RDC3AnDGOUT0 register are set to 1 and an RDC error interrupt occurs.

26.3.16 RDC3AnDIAG2 – Error Detection Register 2

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + 0038_H

Value after reset $0000\ 0000_H$

Table 26.33 RDC3AnDGOUT0 Register Contents (1/2)

Bit Position	Bit Name	Description
31	VGFLG	Power/Ground Short Error Detection Running This flag indicates whether or not the power/ground short error detection BIST is running or not. The BIST is running if the flag is 1.
30, 29	Reserved	These bits are read as 0. The write value should be 0.
28	ERR	Error This flag is set to 1 if the active level of the detection signal for any of the errors indicated by flags in the RDC3AnDIAG2 register is being output. This signal returns to 0 when recovered from an error. This flag is not set to 1 if the EINTEN bit of the RDC3AnENC0 register is 0.
27 to 25	Reserved	These bits are read as 0. The write value should be 0.
24	ERHD	Error Hold This flag is set to 1 if the active level of the detection signal for any of the errors indicated by flags in the RDC3AnDIAG2 register is being output. This signal is reset to 0 by setting the ERRST bit to 1. Note that this bit remains at 1 if errors occur continuously. This flag is not set to 1 if the EINTEN bit of the RDC3AnENC0 register is 0.
23	Reserved	This bit is read as 0. The write value should be 0.
22	EREXC	Resolver Signal Error The value of this flag becomes 1 when a resolver signal error occurs and returns to 0 on recovery from the error.
21	ERSBC	Disconnect Error (Cosine Side) The value of this flag becomes 1 when a disconnect error (cosine side) occurs and returns to 0 on recovery from the error.
20	ERSBS	Disconnect Error (Sine Side) The value of this flag becomes 1 when a disconnect error (sine side) occurs and returns to 0 on recovery from the error.
19	Reserved	This bit is read as 0. The write value should be 0.
18	ERSQ	Sum-of-Squares Amplitude Error The value of this flag becomes 1 when a sum-of-squares amplitude error occurs and returns to 0 on recovery from the error.

Table 26.33 RDC3AnDGOUT0 Register Contents (2/2)

Bit Position	Bit Name	Description
17	ERP2	Two Paths Conversion Error The value of this flag becomes 1 when a two path conversion error occurs and returns to 0 on recovery from the error.
16	ERCNV	Conversion Error The value of this flag becomes 1 when a conversion error occurs and returns to 0 on recovery from the error.
15, 14	Reserved	These bits are read as 0. The write value should be 0.
13	ERR1V	RSO Power Short Error The value of this flag becomes 1 when an RSO pin power short error occurs and returns to 0 on recovery from the error.
12	ERR2V	COM Power Short Error The value of this flag becomes 1 when a COM pin power short error occurs and returns to 0 on recovery from the error.
11	ERS1V	S1 Power Short Error The value of this flag becomes 1 when a S1 pin power short error occurs and returns to 0 on recovery from the error.
10	ERS2V	S2 Power Short Error The value of this flag becomes 1 when a S2 pin power short error occurs and returns to 0 on recovery from the error.
9	ERS3V	S3 Power Short Error The value of this flag becomes 1 when a S3 pin power short error occurs and returns to 0 on recovery from the error.
8	ERS4V	S4 Power Short Error The value of this flag becomes 1 when a S4 pin power short error occurs and returns to 0 on recovery from the error.
7, 6	Reserved	These bits are read as 0. The write value should be 0.
5	ERR1G	RSO Ground Short Error The value of this flag becomes 1 when an RSO pin ground short error occurs and returns to 0 on recovery from the error.
4	ERR2G	COM Ground Short Error The value of this flag becomes 1 when a COM pin ground short error occurs and returns to 0 on recovery from the error.
3	ERS1G	S1 Ground Short Error The value of this flag becomes 1 when a S1 pin ground short error occurs and returns to 0 on recovery from the error.
2	ERS2G	S2 Ground Short Error The value of this flag becomes 1 when a S2 pin ground short error occurs and returns to 0 on recovery from the error.
1	ERS3G	S3 Ground Short Error The value of this flag becomes 1 when a S3 pin ground short error occurs and returns to 0 on recovery from the error.
0	ERS4G	S4 Ground Short Error The value of this flag becomes 1 when a S4 pin ground short error occurs and returns to 0 on recovery from the error.

Table 26.34 RDC3AnDGOUT1 Register Contents (1/2)

Bit Position	Bit Name	Description
31 to 29	Reserved	These bits are read as 0. The write value should be 0.
28	ERR	Error This flag is set to 1 if the active level of the detection signal for any of the errors indicated in the RDC3AnDIAG2 register is being output. This signal returns to 0 when recovered from an error. This flag is not set to 1 if the EINTEN bit of the RDC3AnENC0 register is 0.
27 to 25	Reserved	These bits are read as 0. The write value should be 0.
24	ERHD	Error Hold This flag is set to 1 if the active level of the detection signal for any of the errors indicated in the RDC3AnDIAG2 register is being output. This signal is reset to 0 by setting the ERRST bit to 1. Note that this bit remains at 1 if an error is continuous. This flag is not set to 1 if the EINTEN bit of the RDC3AnENC0 register is 0.
23	Reserved	This bit is read as 0. The write value should be 0.
22	ERDEXC	Resolver Signal Error Hold The value of this flag becomes 1 when a resolver signal error occurs. This bit remains at 1 until it is reset by the ERRST bit.
21	ERDSBC	Disconnect Error (Cosine Side) Hold The value of this flag becomes 1 when a disconnect error (cosine side) occurs. This bit remains at 1 until it is reset by the ERRST bit.
20	ERDSBS	Disconnect Error (Sine Side) Hold The value of this flag becomes 1 when a disconnect error (sine side) occurs. This bit remains at 1 until it is reset by the ERRST bit.
19	Reserved	This bit is read as 0. The write value should be 0.
18	ERDSQ	Sum-of-Squares Amplitude Error Hold The value of this flag becomes 1 when a sum-of-squares amplitude error occurs. This bit remains at 1 until it is reset by the ERRST bit.
17	ERDP2	Two Paths Conversion Error Hold The value of this flag becomes 1 when a two path conversion error occurs. This bit remains at 1 until it is reset by the ERRST bit.
16	ERDCNV	Conversion Error Hold The value of this flag becomes 1 when a conversion error occurs. This bit remains at 1 until it is reset by the ERRST bit.
15, 14	Reserved	These bits are read as 0. The write value should be 0.

Table 26.34 RDC3AnDGOUT1 Register Contents (2/2)

Bit Position	Bit Name	Description
13	ERDR1V	RSO Power Short Error Hold The value of this flag becomes 1 when an RSO pin power short error occurs. This bit remains at 1 until it is reset by the ERRST bit.
12	ERDR2V	COM Power Short Error Hold The value of this flag becomes 1 when a COM pin power short error occurs. This bit remains at 1 until it is reset by the ERRST bit.
11	ERDS1V	S1 Power Short Error Hold The value of this flag becomes 1 when a S1 pin power short error occurred. This bit remains at 1 until it is reset by the ERRST bit.
10	ERDS2V	S2 Power Short Error Hold The value of this flag becomes 1 when a S2 pin power short error occurred. This bit remains at 1 until it is reset by the ERRST bit.
9	ERDS3V	S3 Power Short Error Hold The value of this flag becomes 1 when a S3 pin power short error occurred. This bit remains at 1 until it is reset by the ERRST bit.
8	ERDS4V	S4 Power Short Error Hold The value of this flag becomes 1 when a S4 pin power short error occurred. This bit remains at 1 until it is reset by the ERRST bit.
7, 6	Reserved	These bits are read as 0. The write value should be 0.
5	ERDR1G	RSO Ground Short Error Hold The value of this flag becomes 1 when an RSO pin ground short error occurred. This bit remains at 1 until it is reset by the ERRST bit.
4	ERDR2G	COM Ground Short Error Hold The value of this flag becomes 1 when a COM pin ground short error occurred. This bit remains at 1 until it is reset by the ERRST bit.
3	ERDS1G	S1 Ground Short Error Hold The value of this flag becomes 1 when a S1 pin ground short error occurred. This bit remains at 1 until it is reset by the ERRST bit.
2	ERDS2G	S2 Ground Short Error Hold The value of this flag becomes 1 when a S2 pin ground short error occurred. This bit remains at 1 until it is reset by the ERRST bit.
1	ERDS3G	S3 Ground Short Error Hold The value of this flag becomes 1 when a S3 pin ground short error occurred. This bit remains at 1 until it is reset by the ERRST bit.
0	ERDS4G	S4 Ground Short Error Hold The value of this flag becomes 1 when a S4 pin ground short error occurred. This bit remains at 1 until it is reset by the ERRST bit.

Table 26.35 RDC3AnBIST0 Register Contents

Bit Position	Bit Name	Description
31 to 26	Reserved	These bits are read as 0. The write value should be 0.
25, 24	ADB3TH[1:0]	ADBIST Threshold Setting Sets the threshold for ADBIST determination. b25 b24 Threshold for determination 0 0: ± 16LSB 0 1: ± 8LSB 1 0: ± 32LSB (default) 1 1: ± 64LSB
23 to 21	Reserved	These bits are read as 0. The write value should be 0.
20	ERCVP2D	Two Paths Conversion Error BIST Disable Selects whether or not to include two paths conversion error in the conversion error BIST. 0: Two paths conversion error is included in the conversion error BIST (default). 1: Two paths conversion error is not included in the conversion error BIST
19 to 17	Reserved	These bits are read as 0. The write value should be 0.
16	CBSP2D	Two Paths Conversion BIST Disable Selects whether or not to include two paths conversion in the conversion BIST. 0: Two paths conversion is included in the conversion BIST (default). 1: Two paths conversion is not included in the conversion BIST
15 to 9	Reserved	These bits are read as 0. The write value should be 0.
8	BSTF	BIST Flag This flag indicates whether a BIST is running or not. A BIST is running if the flag is 1 and another BIST cannot be executed while the flag remains 1.
7 to 4	Reserved	These bits are read as 0. The write value should be 0.
3 to 0	BISTCD[3:0]	BIST Result Store The result of BIST is stored in these bits (see **Table 26.36**).

BIST Result Store Bits

The result of BIST executed by the BCON [3:0] bits is stored in the BISTCD [3:0] bits. The relation between the BCON[3:0] and BISTCD[3:0] are shown in **Table 26.36**.

Table 26.36 Contents of BCON[3:0] and BISTCD[3:0]

Bits for Selecting the BIST to be Executed BCON[3:0]				Bits where the result of BIST is Stored BISTCD[3:0]				
b3	b2	b1	b0	b7	b6	b5	b4	Content indicated by BISTCD[3:0]
0	0	0	0	0	0	0	0	BEXE is disabled. BISTCD[3:0] = 0000 is stored without any determination.
0	0	0	1	X	X	X	X	This combination is not allowed.
0	0	1	0	0	0	1	0	The result of sum-of-squares amplitude error detection BIST (low side) was passed.
				1	1	1	1	The result of sum-of-squares amplitude error detection BIST (low side) was failure.
0	0	1	1	0	0	1	1	The result of sum-of-squares amplitude error detection BIST (high side) was passed.
				1	1	1	1	The result of sum-of-squares amplitude error detection BIST (high side) was failure.
0	1	0	0	0	1	0	0	The result of the ADBIST was passed.
				1	1	1	1	The result of the ADBIST was failure.
0	1	0	1	0	1	0	1	The result of the angle conversion BIST1 (0°) was passed.
				1	1	1	1	The result of the angle conversion BIST1 (0°) was failure.
0	1	1	0	0	1	1	0	The result of the angle conversion BIST2 (45°) was passed.
				1	1	1	1	The result of the angle conversion BIST2 (45°) was failure.
0	1	1	1	0	1	1	1	The result of the angle conversion BIST3 (270°) was passed.
				1	1	1	1	The result of the angle conversion BIST3 (270°) was failure.
1	0	0	0	X	X	X	X	This combination is not allowed.
1	0	0	1	1	0	0	1	The result of the resolver signal error detection BIST was passed.
				1	1	1	1	The result of the resolver signal error detection BIST was failure.
1	0	1	0	1	0	1	0	The result of the resolver signal disconnect detection BIST (cosine side) was passed.
				1	1	1	1	The result of the resolver signal disconnect detection BIST (cosine side) was failure.
1	0	1	1	1	0	1	1	The result of the resolver signal disconnect detection BIST (sine side) was passed.
				1	1	1	1	The result of the resolver signal disconnect detection BIST (sine side) was failure.
1	1	0	0	1	1	0	0	The result of the conversion error BIST was passed.
				1	1	1	1	The result of the conversion error BIST was failure.
1	1	0	1	1	1	0	1	The result of the power short error BIST was passed.
				1	1	1	1	The result of the power short error BIST was failure.
1	1	1	0	1	1	1	0	The result of the ground short error BIST was passed.
				1	1	1	1	The result of the ground short error BIST was failure.
1	1	1	1	X	X	X	X	This combination is not allowed.

26.3.20 RDC3AnBIST1 – BIST Register 1

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + 0048_H

Value after reset $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BISTCL

Table 26.37 RDC3AnBIST1 Register Contents

Bit Position	Bit Name	Description
31 to 17	Reserved	These bits are read as 0. The write value should be 0.
16	BISTCL	BIST Result Clear Writing 1 to this bit clears the result of the BIST (BISTCD[3:0]) to 0. This bit is returned to 0 after two clock cycles have elapsed following it being set to 1.
15 to 9	Reserved	These bits are read as 0. The write value should be 0.
8	BEXE	BIST Execution This signal is used for starting a BIST. Setting this bit to 1 leads to execution of a BIST. This bit is returned to 0 after two clock cycles have elapsed after having been set to 1. Select the BIST to be executed by the combination of values in BCON[3:0] (see **Table 26.38**).
7 to 4	Reserved	These bits are read as 0. The write value should be 0.
3 to 0	BCON[3:0]	Executing BIST Setting Selects the BIST to be executed (see **Table 26.38**).

Executing BIST Setting

The BIST to be executed is selected by the combination of values in the BCON[3:0]. The combination of values in BCON[3:0] and corresponding BIST to be executed are shown in **Table 26.38**.

Table 26.38 BIST Selected by the Combination of Values in BCON[3:0]

b3	b2	b1	b0	BIST to be Executed
0	0	0	0	BEXE is disabled.
0	0	0	1	This combination is not allowed.
0	0	1	0	Error detection BIST: sum-of-squares amplitude error detection BIST (low side)
0	0	1	1	Error detection BIST: sum-of-squares amplitude error detection BIST (high side)
0	1	0	0	ADBIST
0	1	0	1	Angle conversion BIST: target angle 1 (0°)
0	1	1	0	Angle conversion BIST: target angle 2 (45°)
0	1	1	1	Angle conversion BIST: target angle 3 (270°)
1	0	0	0	This combination is not allowed.
1	0	0	1	Error detection BIST: resolver signal error detection BIST
1	0	1	0	Error detection BIST: resolver signal disconnect detection BIST (cosine side)
1	0	1	1	Error detection BIST: resolver signal disconnect detection BIST (sine side)
1	1	0	0	Error detection BIST: conversion error BIST
1	1	0	1	Error detection BIST: power short error BIST
1	1	1	0	Error detection BIST: ground short error BIST
1	1	1	1	This combination is not allowed.

26.3.21 RDC3AnREF ─ Excitation Setting Register

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + $004C_H$

Value after reset $0A0F\ 0400_H$

Table 26.39 RDC3AnREF Register Contents (1/2)

Bit Position	Bit Name	Description
31 to 28	EXFS2[3:0]	Excitation Frequency Select 2 The frequency of the excitation signal is determined by the combination of values in the EXFS2 and EXFS bits. Note that the frequency is fixed to 15 kHz when EXF15 = 1. See **Table 26.40** for the frequencies to be output*2.
27	RFEXS	Excitation Component Extraction Function 0: Excitation component extraction function is disabled. 1: Excitation component extraction function is enabled (default)
26	Reserved	This bit is read as 0. The write value should be 0.
25	SENS	Required Sensor Selection Function Selects the required sensor. 0: Use the DC resolver*1 1: Use the VR resolver (default)
24	EXIO	RSO/COM Input/Output Switching Switches input and output through the RSO and COM pins. 0: Excitation signal input from outside (default) 1: Excitation voltage output
23, 22	Reserved	These bits are read as 0. The write value should be 0.
21	EXF15	Excitation Signal 15 kHz Setting Selects whether to set the frequency of the excitation signal to 15 kHz or not. 0: The frequency of the excitation signal is the value set by the EXFS[4:0] bits. 1: The frequency of the excitation signal is 15 kHz.
20 to 16	EXFS[4:0]	Excitation Signal Frequency Select The frequency of the excitation signal is determined by the combination of values in the EXFS2 and EXFS bits. Note that the frequency is fixed to 15 kHz when EXF15 = 1. See **Table 26.40** for the frequencies to be output*2.
15	Reserved	This bit is read as 0. The write value should be 0.

Table 26.39 RDC3AnREF Register Contents (2/2)

Bit Position	Bit Name	Description
14 to 12	COMSTS[2:0]	AD Comparator Stop Function Select Selects how stopping the AD comparator at the time of switching of the excitation buffer code. b14 b13 b12 0 0 0: Does not stop. 0 0 1: Stops when all of the DA[6:0] bits are changed. 0 1 0: Stops when the DA[6:3] bits are changed. 0 1 1: Stops when the DA[6:4] bits are changed. 1 0 0: Stops when the DA[6:5] bits are changed. 1 0 1: Stops when the DA[6] bit is changed. 1 1 0: Does not stop. 1 1 1: Does not stop. DA: excitation sine wave control signal*3
11	Reserved	This bit is read as 0. The write value should be 0.
10	Reserved	This bit is read as 1. The write value should be 1.
9 to 5	Reserved	These bits are read as 0. The write value should be 0.
4	PLSNFS	Excitation Extraction Noise Filter Selects the noise filter for the excitation component extraction circuit. b4 0: The noise filter is not used. 1: The noise filter is used.
3 to 0	Reserved	This bit is read as 0. The write value should be 0.

Note 1. DC resolver is selected when EXIO = 1 and SENS = 0.

Note 2. When the frequency of the excitation signal is 22 kHz or above, do not set the CVEDS bit to 0. When the user sets the frequency by using the EXFS[4:0] and EXFS2[3:0] bits, set the EXF15 bit to 0.

Note 3. When the frequency of the excitation signal is set as 20 kHz or more (the values within the thick frame in **Table 26.40)**, set COMSTS[2:0] = 000 (AD comparatore does not stop).

Table 26.40 Excitation Frequency Setting

Table 26.41 RDC3AnENC0 Register Contents (1/2)

Bit Position	Bit Name	Description
31 to 20	Reserved	These bits are read as 0. The write value should be 0.
19 to 16	XUVW	Encoder Pulse Pole Selection Selects the number of poles for the output of the encoder pulses. b19-b16 U phase V phase W phase 1111: ×1 ×1 ×1 1110: ×1 ×1 ×1 1101: ×1 ×1 ×1 1100: ×1 ×1 ×1 1011: ×1 ×1 ×1 1010: ×10 ×1 ×1 1001: ×9 ×1 ×1 1000: ×8 ×1 ×1 0111: ×1 ×1 ×1 0110: ×6 ×1 ×1 0101: ×5 ×1 ×1 0100: ×4 ×4 ×4 0011: ×3 ×3 ×3 0010: ×2 ×2 ×2 0001: ×1 ×1 ×1 0000: ×1 ×1 ×1
15 to 9	Reserved	These bits are read as 0. The write value should be 0.
8	HYSS	Hysteresis Output Select Selects whether to output the encoder pulse signal and compare flag signal through the hysteresis circuit or without going through it.*1 0: Outputs the encoder pulse signal or compare flag signal through the hysteresis circuit. 1: Outputs the encoder pulse signal or compare flag signal without going through the hysteresis circuit.
7 to 5	Reserved	These bits are read as 0. The write value should be 0.
4	CINTEN	Angle Compare Interrupt Enable 0: Interrupt is disabled. 1: Interrupt is enabled.

Table 26.41 RDC3AnENC0 Register Contents (2/2)

Bit Position	Bit Name	Description
3	ABEN	A/B Phase Output Enable 0: Output is disabled. 1: Output is enabled.
2	UVWEN	Encoder Pulse U/V/W Phase Output Enable Controls output of the U, V, and W phases of the encoder pulse signal. 0: Output of the encoder pulse signals as the external output signals RD0_OUT_U, RD0_OUT_V, or RD0_OUT_W is disabled and they are fixed to 0. 1: Output of the encoder pulse signals as the external output signals RD0_OUT_U, RD0_OUT_V, or RD0_OUT_W is enabled.
1	ZEN	Z Phase Output and Z Phase Signal Interrupt Enable 0: Output is disabled. 1: Output is enabled.
0	EINTEN	RDC Error Interrupt Enable 0: Interrupt is disabled. 1: Interrupt is enabled.

Note 1. When output through the hysteresis circuit is selected (HYSS = 0), the RD angle conversion resolution should be 12 bits (MAXV = 001).

26.3.23 RDC3AnENC1 ─ Encoder Register 1

Access Readable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + 0054_H

Value after reset $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.45 RDC3AnTBUS Register Contents

Bit Position	Bit Name	Description
31, 30	Reserved	These bits are read as 0. The write value should be 0.
29, 28	OMGPTC[1:0]	Angular Velocity Measuring Period Select Selects the period for measuring the amount of change in angle by the angular velocity measuring circuit. b29 b28 0 0: 12.8 µs (default) 0 1: 51.2 µs 1 0: 102.4 µs 1 1: 204.8 µs
27 to 22	Reserved	These bits are read as 0. The write value should be 0.
21 to 16	DATSEL[5:0]	RDC Data Select Outputs the RDC data to DATA[15:0] (see **Table 26.46**).
15 to 0	DATA[15:0]	Data The data selected by the DATSEL[5:0] bits of the RDC3AnTBUS register are stored in these bits.

RDC Data Select Bits

Table 26.46 Data Selection

DATASEL[5:0]	Output Signal	Output Destination DATA[X:X]
11.1011	12-bit AD output code [11:0]	[11:0]
10.1111	Control variation value [7:0] in angular conversion mode 1	[7:0]
00.0101	Control variation value [7:0] in angular conversion mode 0	[7:0]

The selected data are read from the DATA[15:0] bits.

26.3.27 RDC3AnADRD – Angular Conversion Mode Select Register

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + 0068_H

Value after reset $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 26.47 RDC3AnADRD Register Contents

Bit Position	Bit Name	Description
31 to 1	Reserved	These bits are read as 0. The write value should be 0.
0	ADRD	Angular Conversion Mode Select Selects the angular conversion mode. 0: Angle conversion using the angular conversion mode 0. 1: Angle conversion using the angular conversion mode 1. The ADC is operating for error detection and amplitude automatic adjustment even though the angular conversion mode 0 is selected. On the other hand, the multiplier, subtractor, and comparator of the analog circuit are stopped when the angular conversion mode 1 is selected.

26.3.28 RDC3AnETEN ─ ET Control Register

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + $006C_H$

Value after reset $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.48 RDC3AnETEN Register Contents (1/2)

Bit Position	Bit Name	Description
31 to 25	Reserved	These bits are read as 0. The write value should be 0.
24	ZCSTRG	Software Trigger This is the software trigger for output of the zero-crossing signal from the excitation timer. 0: No operation. 1: Outputs a trigger. **CAUTION:** Writing 1 to this bit outputs a pulse as trigger signal for one cycle. Reading this bit always returns 0.
23 to 22	Reserved	These bits are read as 0. The write value should be 0.
21	CMPEN	Compare Match Function Enable Enables and disables the compare match function. 0: Disables the compare match function. 1: Enables the compare match function.
20	IREN	Interrupt Request Enable Enables and disables interrupt requests. 0: Disables the output of interrupt. 1: Enables the output of interrupt.
19	DREN	DMA Request Enable Enables and disables DMA requests. 0: Disables the DMA requests. 1: Enables the DMA requests.
18	ADTEN	A/D Conversion Start Trigger Enable Enables and disables the AD conversion start trigger. 0: Disables the A/D conversion start trigger. 1: Enables the A/D conversion start trigger.
17	ZCES	Zero-Crossing Signal Edge Select Selects the edge on the zero-crossing signal to be detected. 0: Detects the rising edge on the zero-crossing signal. 1: Detects the falling edge on the zero-crossing signal.

Table 26.48 RDC3AnETEN Register Contents (2/2)

Bit Position	Bit Name	Description
16	CNTEN	Counter Operation Enable This is the count enable signal for the period measurement timer and the event timer. 0: Operation of the period measurement timer and the event timer is stopped. The value of the reload register is read into the ET counter. 1: The period measurement timer and the event timer are operated.
15 to 0	CNT[15:0]	ET Counter Register The data from the ET counter is stored in these bits.

26.3.29 RDC3AnETCAP – ET Capture Register

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + 0070_H

Value after reset $0000\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.49 RDC3AnETCAP Register Contents

Bit Position	Bit Name	Description
31 to 16	CAP[15:0]	ET Capture [1] This register captures the data from the ET zero-crossing period measurement counter on detection of a zero-crossing signal. [2] This register captures the data from the ET zero-crossing period measurement counter on a match of the values in the counter and that in the compare match register, when compare match is enabled. [3] This register holds the value captured the last time in the conditions other than above.
15 to 0	CMP[15:0]	ET Compare [1] This register captures the value from the ET zero-crossing period measurement counter into CAP[15:0] on a match of the values in the counter and that in this register, and initializes the counter to 0000_H. [2] An excitation timer interrupt request is issued in the cycle after one in which the value in the ET zero-crossing period measurement counter matches that of this register.

26.3.30 RDC3AnETMCNT ─ ET Zero-Crossing Counter Register

Access Readable/writable in 8-, 16-, and 32-bit units.

Address <RDC3An_base> + 0074_H

Value after reset $0000\ 0000_H$

26.4 Functional Description

26.4.1 Tracking Loop

26.4.1.1 PI Compensator Bandwidth Setting Function

This RDC can be set from six different bandwidths (five fixed and one auto-adjusted) using the registers. In addition, coefficients in the PI compensator can be configured in detail by setting the BWCS bit in the RDC3AnPI0 register to 0. For further details, refer to the section on the RDC3AnPI0 register.

26.4.1.2 Forced Gain Control Function

The forced gain control function is designed to improve the tracking performance when the resolver angle deviates significantly from the R/D converted angle in situations such as after a reset.

The forced gain control state is entered when any of the following conditions is met:

[Conditions for starting the forced gain control function]

- Release from the reset state
- The recovery from a resolver signal error
- The recovery from a resolver signal disconnect error
- The start of angular conversion BIST or conversion error BIST
- The end of sum-of-squares amplitude error detection BIST, ADBIST, angular conversion BIST, resolver signal error BIST, disconnection error BIST, conversion error BIST, or power/ground short error BIST
- The end of detection of a power/ground short error
- 1 being written to the KIRST bit of the RDC3AnDIAG1 register

Forced gain control function is applied for approximately 5 ms*[1]. If one of the above conditions is met again during the execution, the forced gain control state is entered again from this point and the period of its execution is extended by approximately 5 ms.
The value of the Kv gain becomes greater on entry to the forced gain state, so even if the resolver rotation angle signal θ and the R/D converter output angle signal ϕ have matched, ϕ may fluctuate significantly for approximately 1 ms.
When the AGCD bit is set to 1, the forced gain state will not be entered even if a condition for starting forced gain control is met, with the exception of following release from the reset state. The initial Kv gain value depends on the type of BIST.

- Angular conversion BIST and conversion error BIST: Initial gain value = × 128 (the maximum value)
- When a short-period BIST (sum-of-squares amplitude error detection BIST, ADBIST, resolver signal error BIST, disconnection error BIST, or power/ground short error BIST) ends: Initial gain value = gain value specified by the AGST[3:0] bits
- When detection of a power/ground short error ends: Initial gain value = gain value specified by the AGST[3:0] bits

A short-period BIST or detection of a power/ground short error can also proceed during angle conversion since both end in a short period of time and tracking of the angle continues even while the test is running. This function has a mechanism to adjust the initial gain by using a register since fluctuations of phi increase if the initial Kv gain value at the end of BIST or detection of a power/ground short error is too large.

Forced gain control is subject to the following restrictions.

1. When changing the setting of the AGCD bit of the register for enabling or disabling forced gain control, do so while the resolver is not running.
   After that, write 1 to the KIRST bit. Not setting the KIRST bit to 1 may result in entry to the free-running state.
2. Forced gain control is subject to restrictions on the angular velocity that allows operation. The upper-limits according to the maximum angular velocity/resolution setting (MAXV[2:0] bit setting) are as listed below.

   When the resolution is equal to or less than 12 bits: 120000 min^{-1}
   When the resolution is 13 bits: 60000 min^{-1}
   When the resolution is 14 bits: 30000 min^{-1}
   When the resolution is 16 bits: 7500 min^{-1}

Note 1. The timing value is when the CCLK is running at 40 MHz.

26.4.1.3 Excitation Signal Source Selection Function

Without the excitation signal output from the RDC3AnRSO pin and common voltage output from the RDC3AnCOM pin, the R/D conversion can be performed using externally generated excitation signal input to pins RDC3AnRSO and RDC3AnCOM pins. When an externally input signal is used, set the EXIO bit in the RDC3AnREF register to 0.

26.4.1.4 Required Sensor Selection Function

The DC resolver signal (E • sinθ, E • cosθ) which does not contain excitation component can be used by setting the SENS bit in the RDC3AnREF register to 0. When the DC resolver signal is used, the excitation component extraction function is disabled.

26.4.1.5 Excitation Component Extraction Function

The excitation signals (RDC3AnRSO, RDC3AnCOM) and resolver signals (RDC3AnS1 to RDC3AnS4) are analog signals input to the RDC. If there is a phase difference between the excitation component (sine wave component) in the excitation signal line and that in the resolver signal line, it can cause an error in the angle conversion result in proportion to the phase difference. The phase difference between the resolver signal and excitation signal can be reduced by using the excitation component contained in the resolver signal line for an angle conversion.

When using an external excitation signal by setting the EXIO bit in the RDC3AnREF register to 0, extracted excitation components cannot be used if the difference between the electrical angle of the resolver and the RDC converted angle is large (such as during power-up or occurrence of error). Therefore, when using an external excitation signal, be sure to enter the external excitation signal into the RDC3AnRSO, RDC3AnCOM pins.

The excitation component extraction function automatically performs the following process; the excitation signal (RDC3AnRSO, RDC3AnCOM) is used when the difference between the resolver electrical angle and the R/D converted angle is large, and the extracted excitation component is used when the difference is small. The exact adjustment of the phase difference between excitation and resolver signals is not required because of this function.

For successful operation of the excitation component extraction circuit, the excitation component phase deviation between the excitation component of the excitation signal (RDC3AnRSO, RDC3AnCOM) and that of the resolver signal (RDC3AnS1 to RDC3AnS4) should be within 45°.

26.4.1.6 Maximum Angular Velocity Setting Function

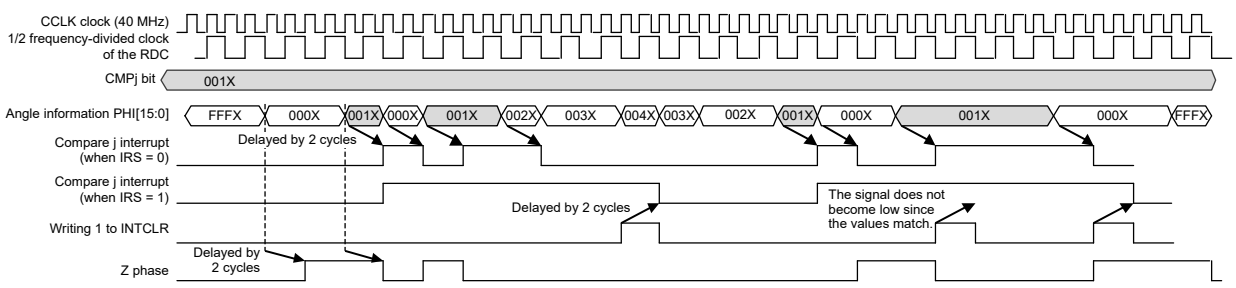
This function can set the maximum angular velocity (resolution) that is capable of tracking operation by using the MAXV [2:0] bits in the RDC3AnPI1 register. Discrete values do not occur in the selected resolution.

26.4.1.7 Compare Match Interrupt

When the angle set in the CMPj register (j = 0 to 2) and the R/D converted angle match, a compare match interrupt request signal is generated. The bit width that is compared for a match is set using the MAXV [2:0] bits (maximum angular velocity selection) in the RDC3AnPI1 register.

The compare match interrupt request signal can be selected from either a compare match signal or a signal latching a compare match signal by using the IRS bit in the RDC3AnPHICP0 register. When the IRS bit is set to 0, the compare match interrupt request signal becomes high when the R/D converted angle and the angle set in the CMPj register match, and becomes low when the values do not match.

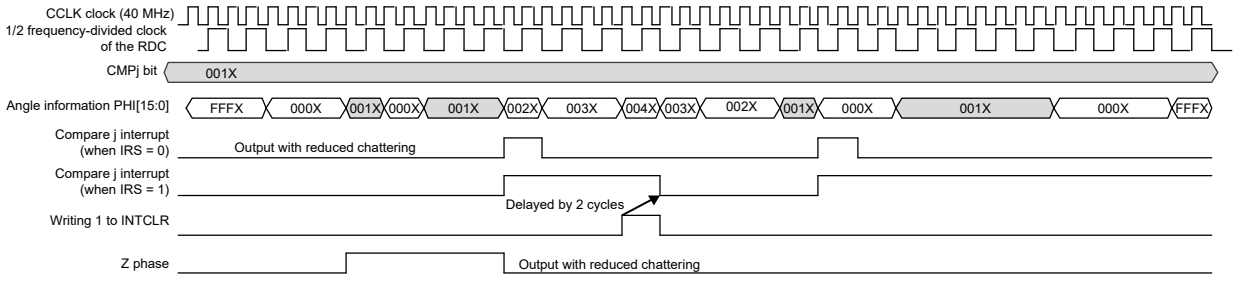
When the IRS bit is set to 1, the compare match interrupt request signal becomes high when the R/D converted angle and the angle set in the CMPj register match, and also the INTFLG[2:0] flag in the RDC3AnPHICP0 register becomes 1. In this case, the request signal retains the high level even when the values do not match.



When 1 is written to the INTCLR[2:0] bit in the RDC3AnPHICP0 register while the R/D converted angle and the angle set in the CMPj register do not match, the request signal becomes low and the INTFLG[2:0] flag becomes 0.

If 1 is written to the INTCLR[2:0] bit while the R/D converted angle and the angle set in the CMPj register match, the request signal remains high and the INTFLG[2:0] flag does not become 0.

Turning hysteresis on by setting the HYSS bit in the RDC3AnENC0 register to 0 prevents chattering of the output of the compare match interrupt signal and Z output signal when the angle output near the target bit for comparison is not stable.



This hysteresis circuit can only be used when 12-bit resolution is selected (MAXV[2:0] = 001_B).

Figure 26.3 and **Figure 26.4** show the timing charts for the compare match interrupt request signal when hysteresis is off and on, respectively.

Note: n = 0, j = 0 to 2
IRS, INTCLRj: Bits in the RDC3AnPHICP0 register
This example is the case when MAXV[2:0] = 001_B (12-bit resolution selected).

Figure 26.3 Timing Chart for the Compare Match Interrupt Request Signal when Hysteresis is Off

Note: n = 0, j = 0 to 2
IRS, INTCLRj: Bits in the RDC3AnPHICP0 register
This example is the case when MAXV[2:0] = 001_B (12-bit resolution selected).

Figure 26.4 Timing Chart for the Compare Match Interrupt Request Signal when Hysteresis is On

26.4.1.8 Encoder Pulse Output Function

This function enables to output encoder pulse signals (A, B, Z, U, V, W phases).

The Z-phase interrupt signal becomes high while the R/D converted angle is 0º. The bit width compared for a match is set using the MAXV [2:0] bits in the RDC3AnPI1 register as it is for the compare match interrupt request signal. The encoder pulse signal is output when the corresponding bit in the RDC3AnENC0 register is set to 1 (enables output).

Whether the encoder pulse signals are to be output through the hysteresis circuit or without going through it can be selected using the HYSS bit in the RDC3AnENC0 register. This hysteresis circuit can only be used when 12-bit resolution is selected (MAXV[2:0] = 001_B).

Figure 26.5 and **Figure 26.6** show the waveforms of encoder phase pulse operation when hysteresis is on and off, respectively.

See **Figure 26.3** and **Figure 26.4** for the z output waveform when the angle output near the target bit for comparison is not stable.

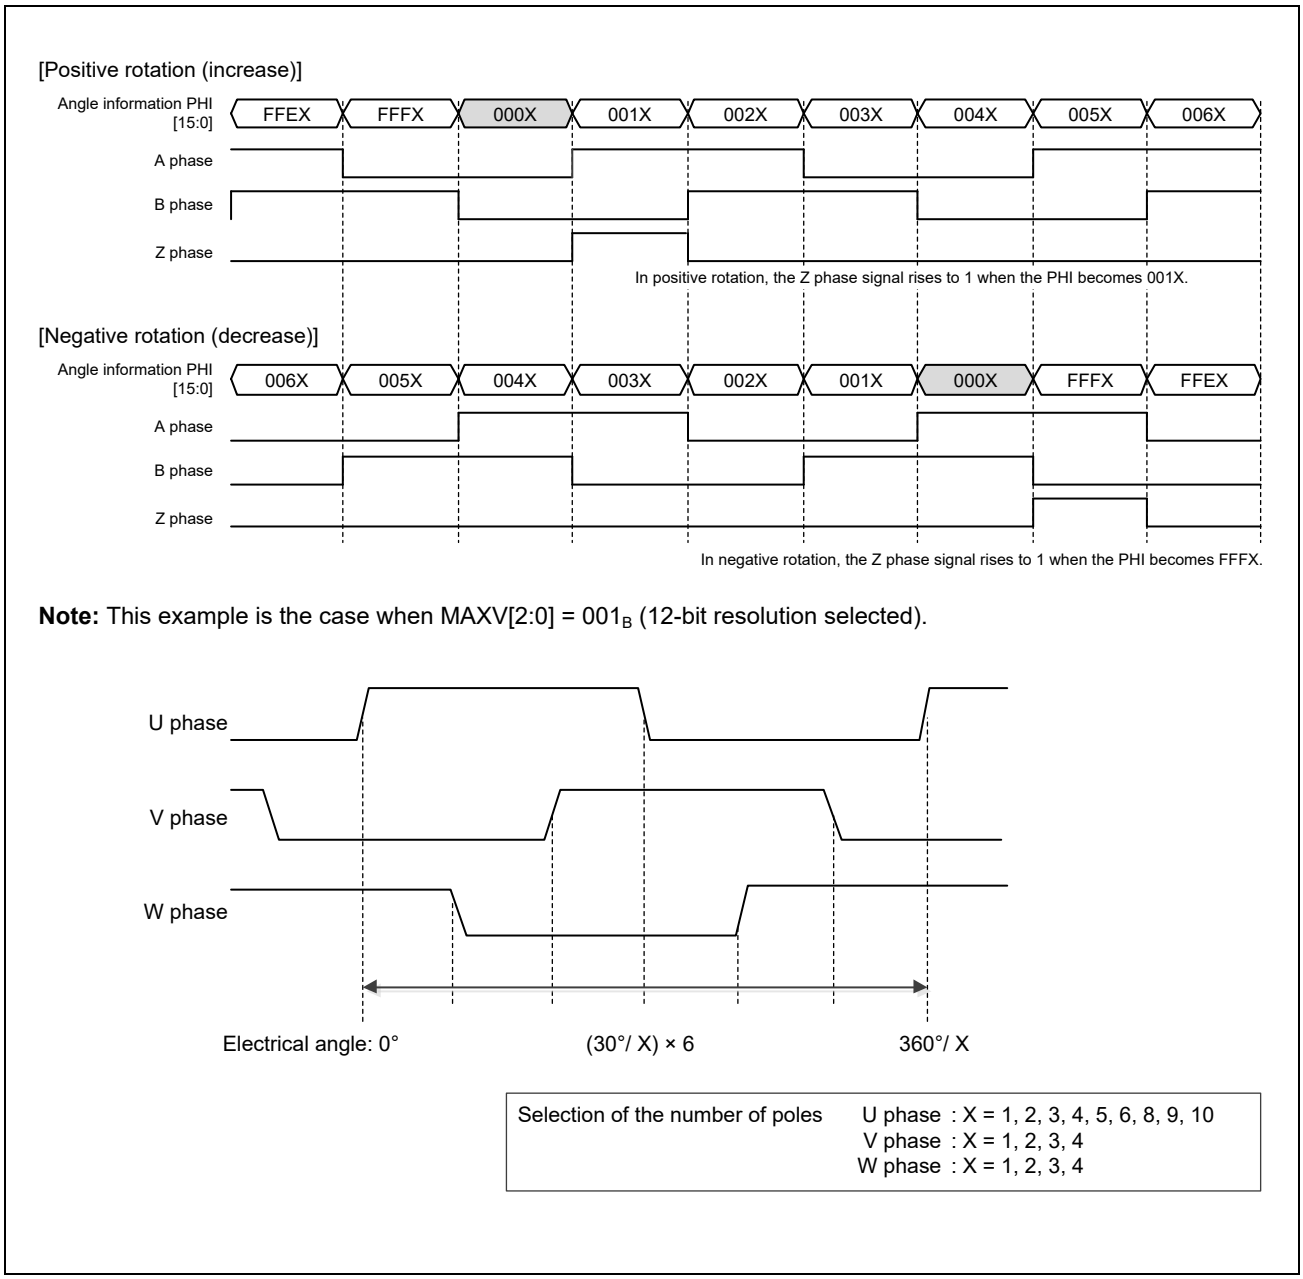


Figure 26.5 Waveform of Encoder Phase Pulse Operation when Hysteresis is On

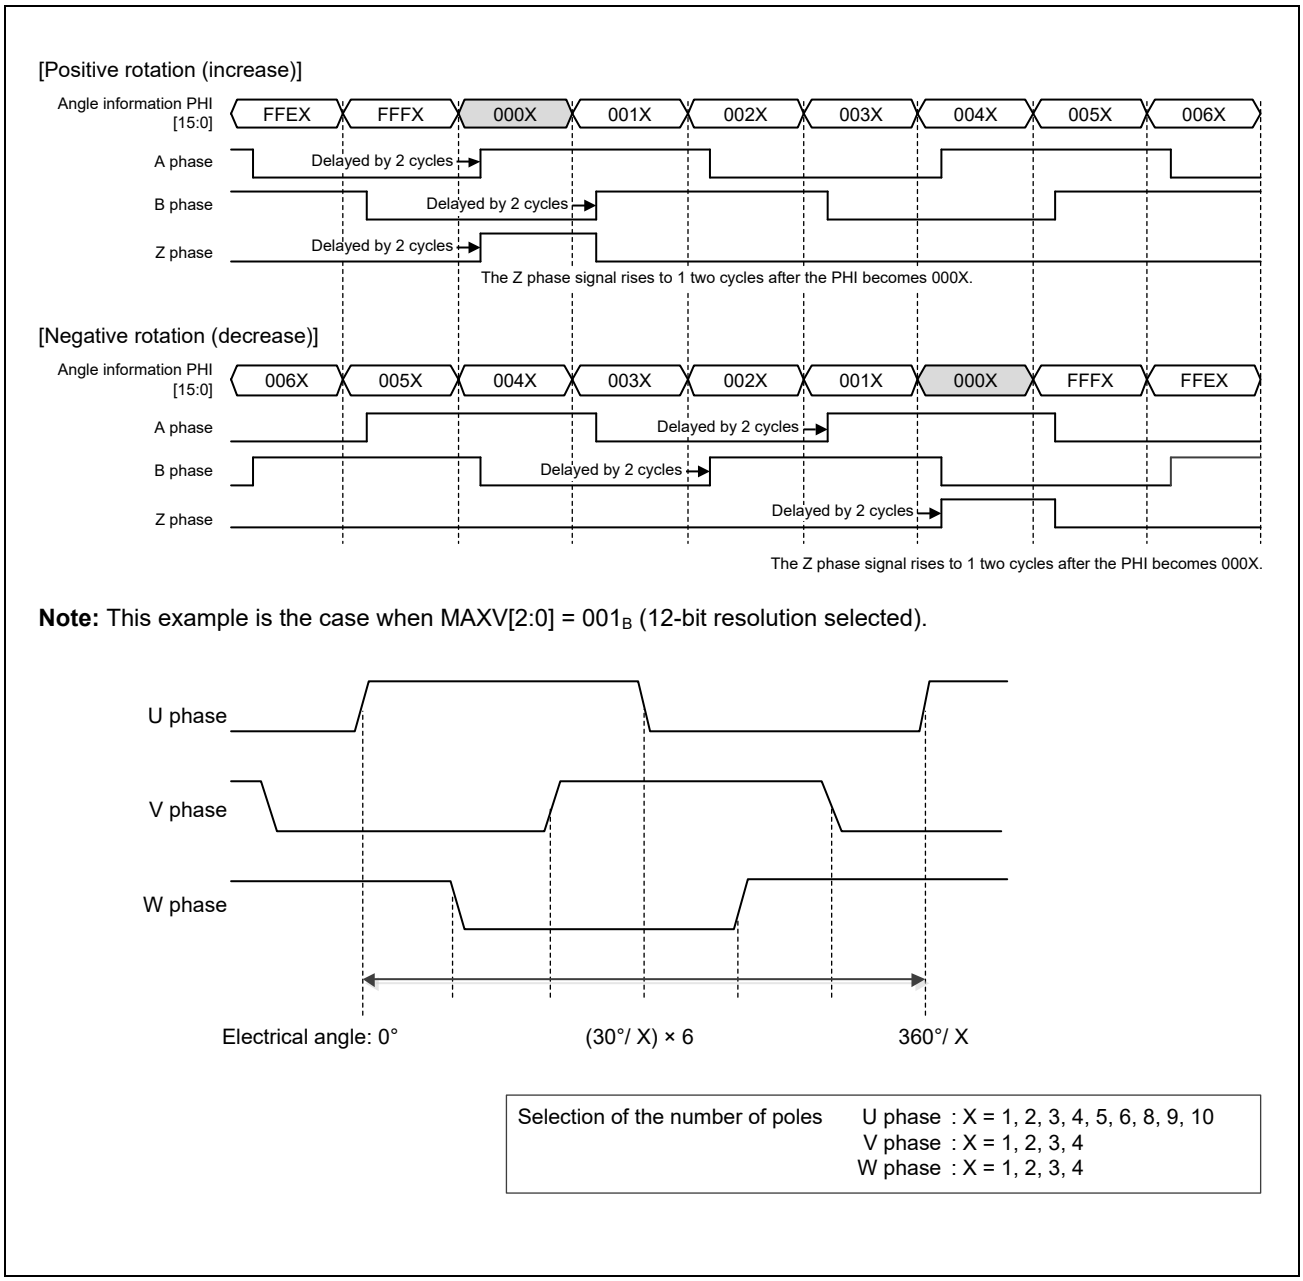

Figure 26.6 Waveform of Encoder Phase Pulse Operation when Hysteresis is Off

26.4.1.9 PHI Angular Velocity Information Reading Function

The angular velocity of the phi angle is read from the relevant register. The amount of change in the phi angle is measured over the period selected by the OMGPTC[1:0] bits, converted into the units of angular velocity (min^{-1}), and stored in the OMG[31:0] bits of the RDC3AnOMG register. The angular velocity of phi (in min^{-1}) does not depend on the selected measuring period, but the maximum measurable angular velocity does. The value of the OMG[31:0] bits is updated every time the measuring period is changed, and the period can be changed even during conversion.

Table 26.60 Contents of OMGPTC[1:0] Bits

OMGPTC[1:0]	Measuring Period	Maximum Measurable Angular Velocity (min^{-1})
00	12.8 µs	2,343,750
01	51.2 µs	585,938
10	102.4 µs	292,969
11	204.8 µs	146,484

Note: This table shows the relation between the measuring period and the range of measurable angular velocity.

Table 26.61 OMG Bits and the PHI Angular Velocity (min^{-1})

Bit	Angular Velocity (min^{-1})
b31 to 25	Sign (0: +, 1: –)
b24	1,171,875
b23	585,937.5
b22	292,968.8
b21	146,484.4
b20	73,242.19
b19	36,621.09
b18	18,310.55
b17	9,155.27
b16	4,577.64
b15	2,288.82
b14	1,144.41
b13	572.20
b12	286.10
b11	143.05
b10	71.53
b9	35.76
b8	17.88
b7	8.94
b6	4.47
b5	2.24
b4	1.12
b3	0.56
b2	0.28
b1	0.14
b0	0.07

For example, the angular velocity is – 164,795 min^{-1} if the result for angular velocity read from the OMG bits is FFDB $FFFF_H$.

26.4.1.10 Monitor Function

This function is for reading a control variation value directly from a register.

When reading the control variation in angular conversion mode 0 (ADRD = 0), read the DATA[7:0] bits while the DATSEL[5:0] bits are set to 05_H.

When reading the control variation in angular conversion mode 1 (ADRD = 1), read the DATA[7:0] bits while the DATSEL[5:0] bits are set to $2F_H$.

Values read are expressed as two's complements. The control variation is ± 0% under the ideal condition where the resolver input angle exactly matches the phi digital angle output ($\theta = \phi$).

When the ADRD bit is 0, the value read is the control variation within angular conversion mode 0.

When the ADRD bit is 1, the value read is the control variation within angular conversion mode 1.

Table 26.62 lists the relationship between the DATA[7:0] bits and control variation values (%).

Table 26.62 Relationship between the Bits of the RDC3AnTBUS Register and Control Variation Values (%)

Bit	Control Variation (%)
b7	Sign (0: positive, 1: negative)
b6	50%
b5	25%
b4	12.5%
b3	6.25%
b2	3.13%
b1	1.56%
b0	0.78%

26.4.2 Sine and Cosine Correction Function

26.4.2.1 ADC Noise Elimination Function

This function eliminates noise from the values of the SINMNT and COSMNT signals obtained by AD conversion.

The converted values of the SINMNT and COSMNT signals change every 2 µs (when angle conversion using the angular conversion mode 1 is selected by setting ADRD to 1).

The value of the MNT signal obtained from a conversion is compared with that from the previous session, and, if the gap between two values is greater than the threshold set in the GNCNS[2:0] bits, the value from the current session is judged to be noise, and the previous value is retained. It is also possible to compare the value of the MNT signal with that from the session before the previous one (by setting the GNJSP bit to 1).

Figure 26.7 shows how noise is detected and removed from the SINMNT signal.

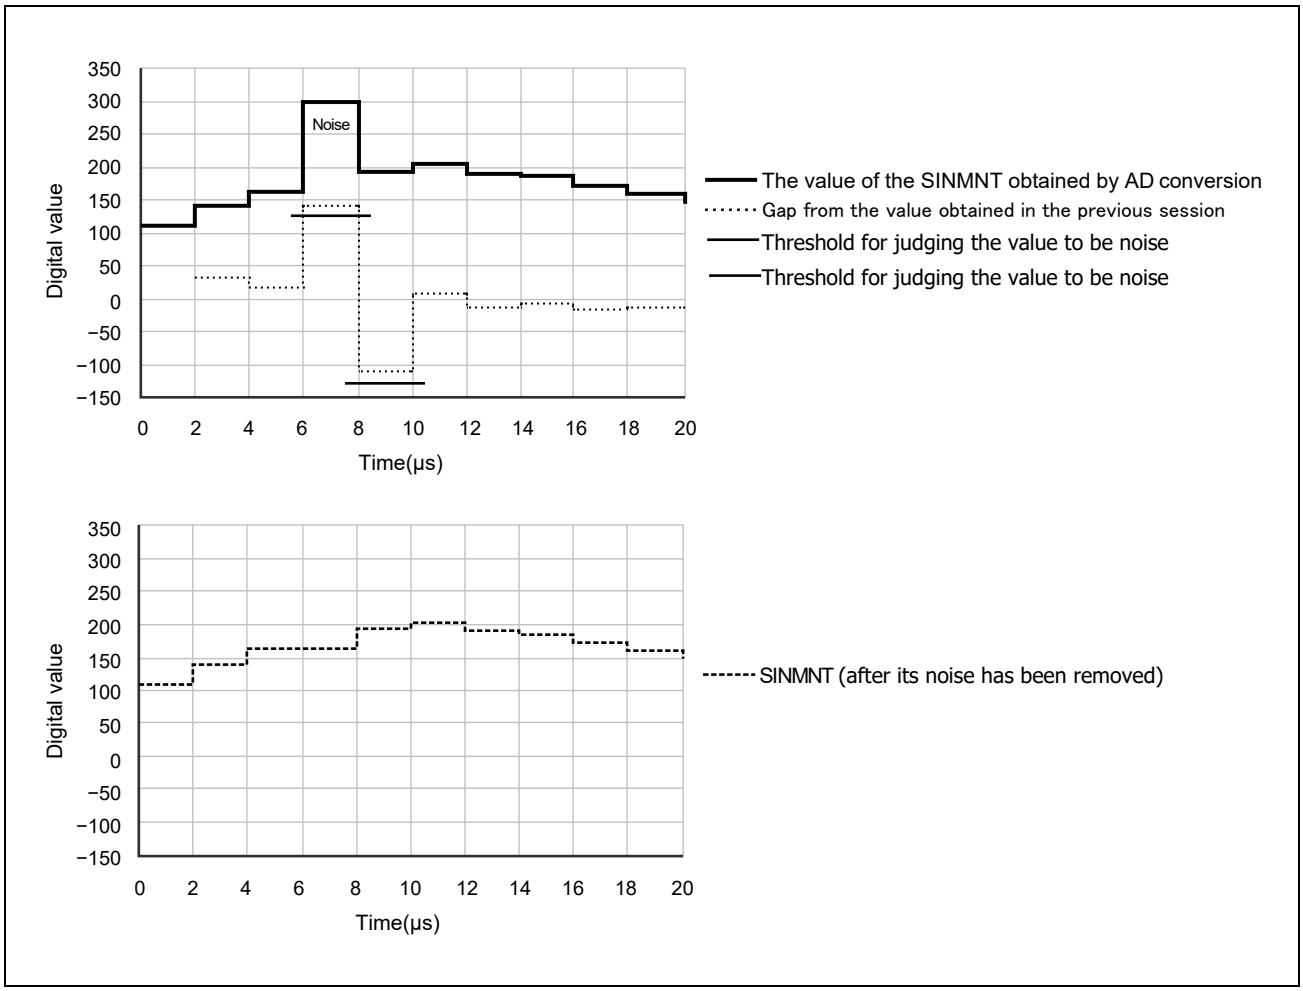

Figure 26.7 Judging and Eliminating Noise

If the result of AD conversion becomes stuck at a value equivalent to the power supply voltage or the ground due to extremely strong noise, the gaps between the compared values may not exceed the thresholds with the result that noise is directly output. To avoid this, this device is also equipped with a function to detect the value obtained by AD conversion being stuck. If the result of AD conversion is greater than 0.992 × RVCC or smaller than 0.008, the input is determined to be stuck, and the result from the previous conversion is retained.

Writing 1 to the GNCND bit disables the noise elimination function for the ADC. If it is disabled, results of AD conversion are used in operations as they are, without being checked for noise.

The circuits which use the ADC output signal whose noise has been removed by this function are selected by the NSRSL bit.

- NSRSL = 0: (default) Use the ADC output signal of which noise has been removed only in the sine and cosine gain correction circuits and the sine and cosine common offset correction circuits.
- NSRSL = 1: Use the ADC output signal of which noise has been remobed in the sine and cosine gain correction circuits, the sine and cosine common offset correction circuits, and the angle conversion calculation (adder and subtractor) circuits.

26.4.2.2 Sine and Cosine Gain Correction

Resolver errors or errors in the accuracy of components of the printed circuit board may lead to gaps between the amplitudes of the sine- and cosine-wave signals input to the RD converter that lead to errors in the result of angle conversion by the RDC. In order to reduce errors in the results of conversion, the maximum amplitudes of the sinmnt and cosmnt signals are compared, and if there is a gap between the amplitudes, that of the cosmnt signal is automatically adjusted to have the same range as that of the sinmnt signal. The values after correction are used in operations. This function is only applicable to the values used internally. The SINMNT and COSMNT signals from the LSI chip are not adjusted.

Note that this function is effective for reducing errors in the results of angle conversion only in angler conversion mode 1 (ADRD = 1). This function can be run with the angular conversion mode 0 (ADRD = 0), but does not have the effect of reducing differences between the results of angle conversion.

If the resolver angle is fixed, the maximum amplitudes of the sinmnt and cosmnt signals cannot be compared.

In this case, the resolver is required to go through at least half a rotation (electrical angle) to obtain signal values for comparison.
Accordingly, when the RDC is ready to output results of conversion, the user needs to wait for the resolver to go through at least half a rotation (electrical angle) before writing 1 to the GNCST bit. The gain correction function will then be ready for use. Writing 1 to the GNCST bit before waiting for the required period may result in invalid correction value.

The range of values for correction is specified by setting a percentage for the limit on correction values in the GNCLT[1:0] bits. Results of conversion beyond the specified range will not corrected in the same way as values within the range.
If the value for correction obtained from comparison of sinmnt and cosmnt is greater than the specified limit, the specified limit is applied to the value for correction.

GNCLT[1:0] = 00_B: limit ± 20% (default)

GNCLT[1:0] = 01_B: limit ± 10%

GNCLT[1:0] = 10_B: limit ± 40%

GNCLT[1:0] = 11_B: limit ± 0% (no correction)

Figure 26.8 below shows how the amplitude of COSMNT, which is initially smaller than that of SINMNT, is corrected to have the same amplitude as SINMNT.

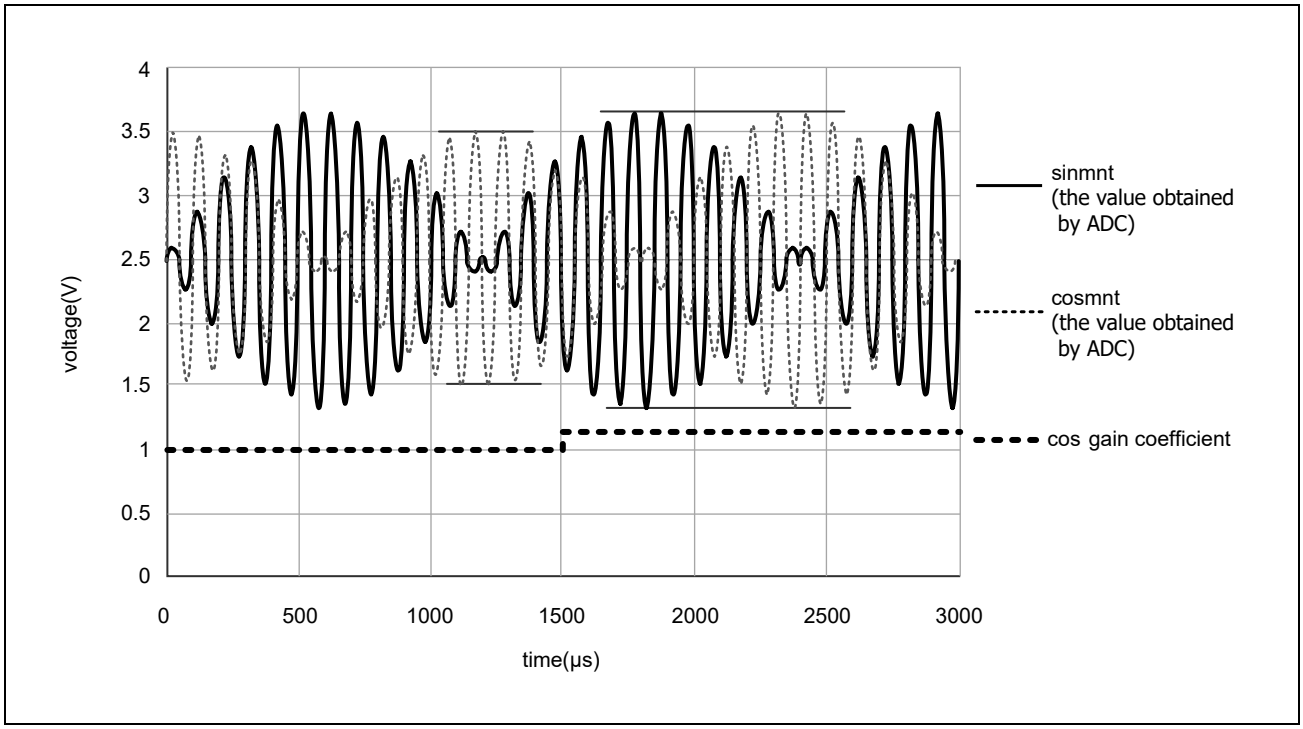

Figure 26.8 Correction to Make the Amplitudes Correspond

The timing of correcting the gain value is selected by the GNCSL[1:0] bits as follows;

- GNCSL[1:0] = 00_B

  No correction (the default value, 1024, is used as the value for correction)

- GNCSL[1:0] = 01_B

  The fixed value set in the GNCNM[11:0] bits is used as the value for correction.

- GNCSL[1:0] = 10_B

  The value calculated when the GNCST bit is set to 1 is used as the value for correction. The value from the calculation is retained.

- GNCSL[1:0] = 11_B

  The value is updated at the time of z-phase output following GNCST being set to 1.

  The value is updated on every single rotation.

A limit can be set to the value for common offset correction. No correction value beyond the limit specified by the CMCLT[1:0] bits will be applied. If the value for correction obtained from calculation is greater than the specified limit, the specified limit is applied. If the value for correction obtained from calculation is within the specified limit, the calculated value is applied.

26.4.2.3 Sine and Cosine Common Offset Correction

A resolver error or error in the accuracy of the components in the printed circuit board may lead to an offset from the original common level (0.5 × RVCC) for the common levels of the sine- and cosine-wave signals, which are input to the RD converter. This may lead to errors in the results of angle conversion by the RDC.

In order to reduce errors in the results of conversion, an offset of the common level of the sinmnt and cosmnt signals from the original one is detected and automatically adjusted. The values after correction are used in operations. This function is only applicable to the values used internally. The SINMNT and COSMNT signals from the LSI chip are not adjusted.

Note that this function is effective for reducing errors in the results of angle conversion in the angular conversion mode 1 (ADRD = 1). This function can be run in the angular conversion mode 0 (ADRD = 0), but does not have the effect of reducing differences between the results of angle conversion.

If the resolver angle is fixed, the maximum amplitudes of the sinmnt and cosmnt signals cannot be compared. In this case, the resolver is required to go through half a rotation (electrical angle) to obtain signal values for comparison.

Accordingly, when the RDC is ready to output the results of conversion, the user needs to wait for the resolver to go through at least half a rotation (electrical angle) before writing 1 to the GNCST bit. The gain correction function will then be ready for use. Writing 1 to the GNCST bit before waiting for the required period may result in invalid correction values.

A limit can be set to the value for common offset correction by CMCLT[1:0] bits. No correction value beyond the specified limit will be applied. If the value for correction obtained from sinmnt and cosmnt is greater than the specified limit, the specified limit is applied.

CMCLT[1:0]=00_B: limit ± 0.0312 × RVCC (approx. ± 150mV) (default)

CMCLT[1:0]=01_B: limit ± 0.0156 × RVCC (approx. ± 78mV)

CMCLT[1:0]=10_B: limit ± 0.125 × RVCC (approx. ± 625mV)

CMCLT[1:0]=11_B: limit ± 0 × RVCC (± 0mV) (no correction)

Figure 26.9 below shows how the common offset of COSMNT and SINMNT are corrected to 2.5V (= 0.5 × RVCC).

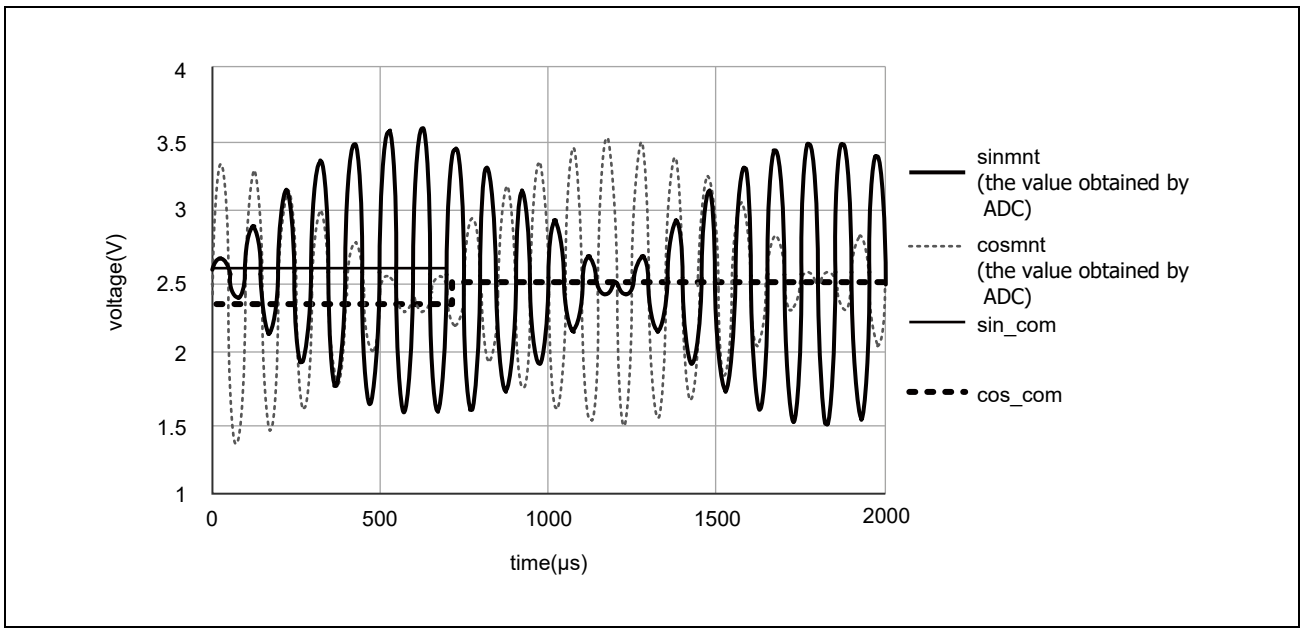

Figure 26.9 Correction of Common Offsets to 2.5V (= 0.5 × RVCC)

The timing of updating the value for common offset correction in selected by the CMCSL[1:0] bits as follows;

- CMCSL[1:0] = 00_B
  No correction (0 is used as the value for correction)
- CMCSL[1:0] = 01_B
  The value for correction set in CCOSN[9:0] is selected as the value for the cosine side.
  The value for correction set in CSOSN[9:0] is selected as the value for the sine side.
- CMCSL[1:0] = 10_B
  The calculated value is used as the value for correction.
  - When GNCSL[0] = 0, the value calculated when the GNCST bit is set to 1 is used as the value for correction. The value from the calculation is retained.
  - When GNCSL[0] = 1, the value is updated at the time of z-phase output following GNCST being set to 1. The common value for correction is updated on every single rotation.
- CMCSL[1:0] = 11_B
  Setting prohibited

A limit can be set to the value for common offset correction by CMCLT[1:0] bits. No correction value beyond the specified limit will be applied. If the value for correction obtained from sinmnt and cosmnt is greater than the specified limit, the specified limit is applied.

26.4.2.4 SIN and COS Phase Correction Function

Resolver errors or errors in the accuracy of components on the printed circuits board may lead to deviations between the time (phase) of the sine- and cosine-wave signals input to the RD converter. In order to reduce errors in the results of conversion, deviations between the phases of the sinmnt and cosmnt signals are detected by comparing the timing of their excitation zero-crossing. Detected deviations are corrected by delaying the signal which has a phase in advance of the other.
This function is only applicable to the values used internally.
The SINMNT and COSMNT signals from the LSI chip are not adjusted.

Note that this function is effective for reducing errors in the results of angle conversion in the angular conversion mode 1 (ADRD = 1). This function can be run in the angular conversion mode 0 (ADRD = 0), but does not have the effect of reducing difference between the results of angle conversion.

When the power supply voltage is applied and the RDC initialization sequence is performed so that it is ready for use in angular tracking, write 1 to the register bit PHCST which gives an instruction to start phase correction of the Sine and Cosine signals. After 1 is written to this bit, application of the corrected values starts.

Note that the obvious variations in amplitude between the sinmnt and cosmnt signals are required in order to compare the timing of their excitation zero-crossings. For this reason, this function automatically detects the phase deviation when the output phi angle is within ± 16.8° of either 45°, 135°, 225°, and 315°.

A limit can be set to the delay value for phase correction by PHCLT[1:0] bits. No correction value beyond the specified limit will be applied. If the value for correction obtained from sinmnt and cosmnt is greater than the specified limit, the specified limit is applied.

PHCLT[1:0]=00_B: limit is 3 µs (default)

PHCLT[1:0]=01_B: limit is 1 µs

PHCLT[1:0]=10_B: limit is 6 µs

PHCLT[1:0]=11_B: limit is 0 µs (no correction)

Figure 26.10 below shows the waveforms where the sinmnt signal delays from the cosmnt signal.

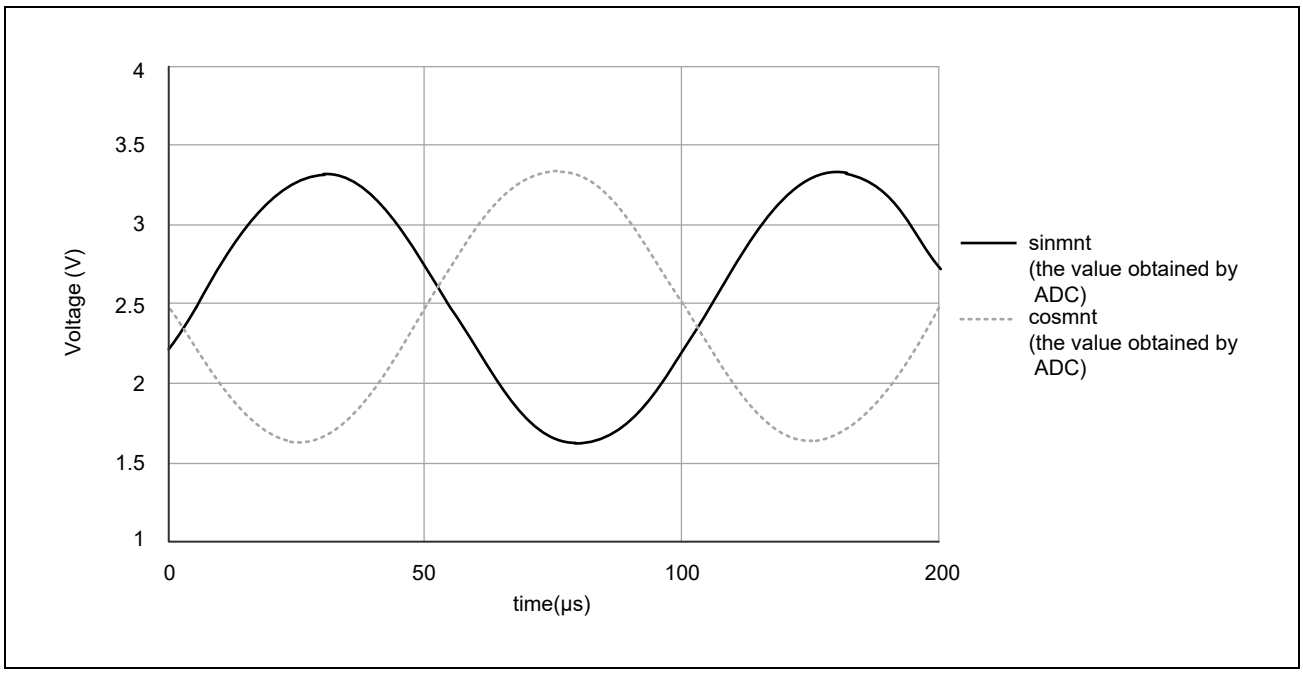

Figure 26.10 Signal with Delay

Figure 26.11 below shows the two synchronized waveforms obtained by detecting the advanced phase of the cosmnt signal and delaying.

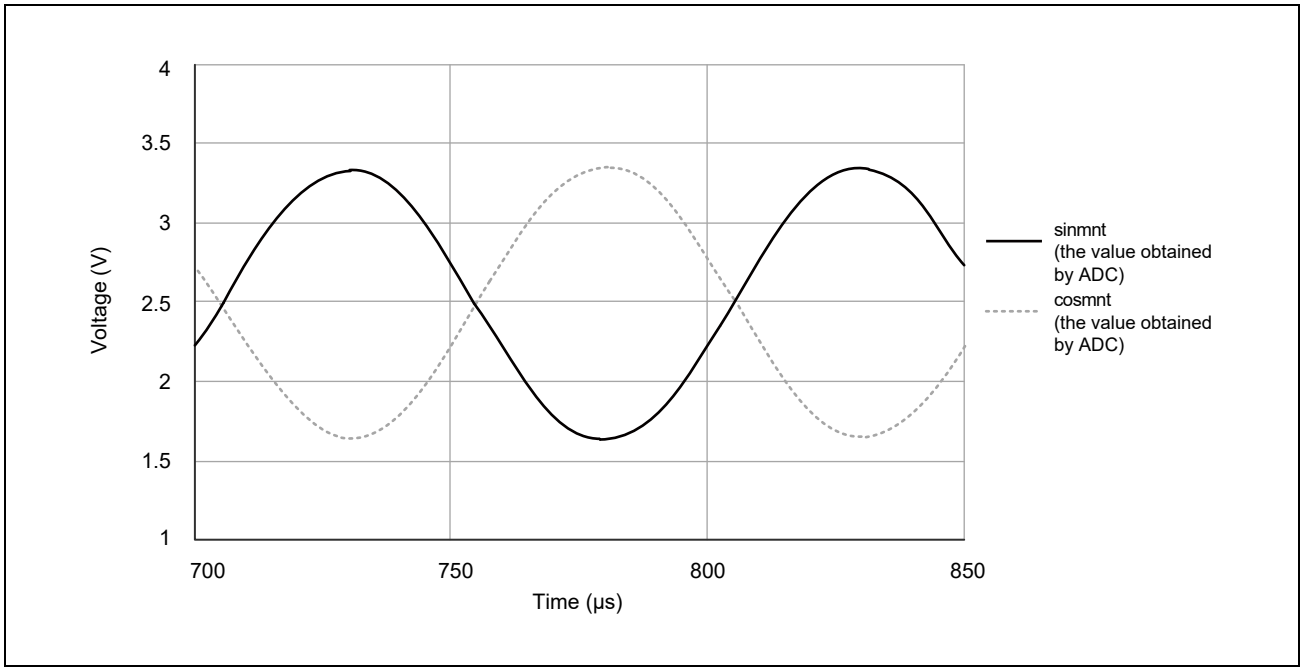

Figure 26.11 Phase Synchronization

The timing of correcting the phase deviation after writing 1 to the PHCST bit is select by the GNCSL[1:0] bits as follows;

- PHCSL[1:0] = 00_B
  No correction (default)
- PHCSL[1:0] = 01_B
  The value for correction is obtained by taking the average of phase deviations on the sixteen zero-crossings of the excitation signals. The value for correction is updated every time 1 is written to the PHCST bit.
- PHCSL[1:0] = 10_B
  The value for correction is obtained by taking the average of phase deviations on the sixteen zero-crossings of the excitation signals. The value for correction obtained in the first round is retained.
- PHCSL[1:0] = 11_B
  The fixed correction values set by the PHSNM[5:0] bits (value for delay in the sine side) and the PHCNM[5:0] bits (value for delay in the cosine side) are used.

26.4.2.5 Sine and Cosine Angle Correction Function

The RDC is capable of handling the mounting of the resolver at an angle to the motor shaft by correcting the resulting orthogonality errors of the sine and cosine signals from the resolver. Correction in this case is by adding fixed values for correction to the phi angles to be input to the individual SINROM and COSROM tables. These values are set in the SINPO[11:0] and COSPO[11:0] bits in the sine and cosine angle correction register. Set these bits to 0° for angle conversion BIST.

Sine phase correction bits SINPO[11:0] = 000_H

Cosine phase correction bits COSPO[11:0] = 000_H

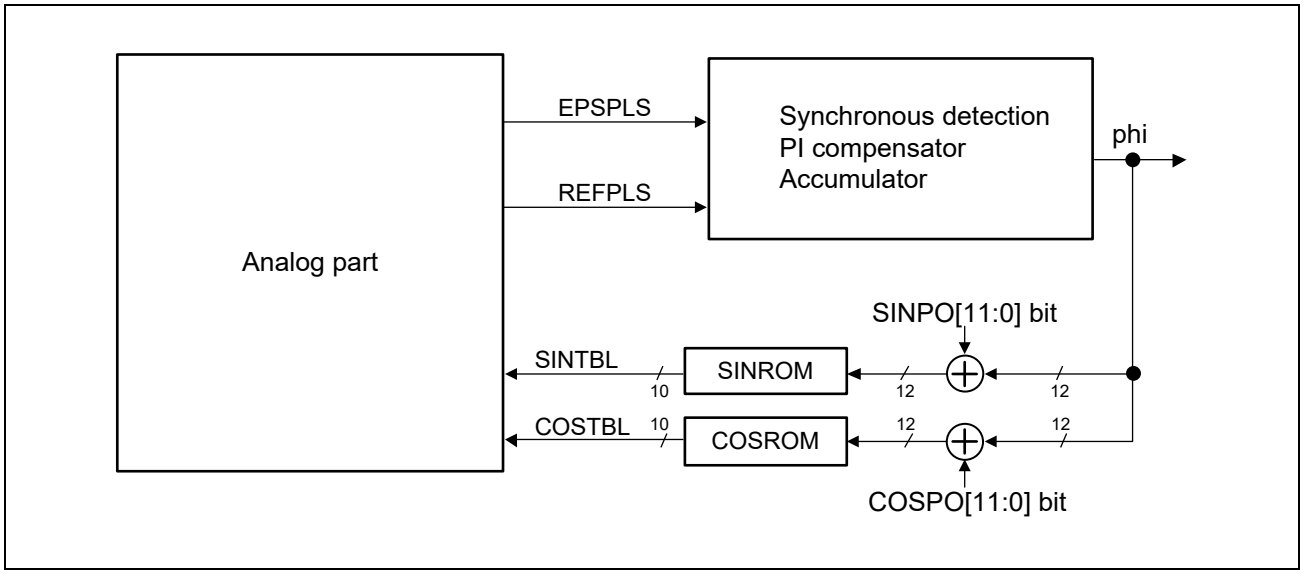

Figure 26.12 Structure of Sine and Cosine Angle Correction Circuit

26.4.3 Excitation Signal Output

26.4.3.1 Excitation Signal Output (RDC3AnRSO, RDC3AnCOM)

Sine wave voltage signal generated by 7-bit D/A can be output from the RDC3AnRSO pin. RVCC/2 (2.5V) common voltage can be output from the RDC3AnCOM pin. Setting the EXIO bit in the RDC3AnREF register to 0 (excitation signal input) disables the output and the RDC3AnRSO and RDC3AnCOM pins become input. The amplitude of the sine wave signal that is output from the RDC3AnRSO pin is set in the EXOC[1:0] bits in the RDC3AnATMNT0 register. The amplitude of the standard value is 0.4 × RVCC [Vp-p].

26.4.3.2 Automatic Amplitude Adjustment

In order to obtain an appropriate R/D conversion accuracy, the resolver signal input amplitude (monitor signal amplitude) needs to be controlled within a range of 0.36 × RVCC to 0.64 × RVCC [Vp-p]. The automatic amplitude adjustment function automatically adjusts the excitation signal output amplitude and the input gain resistance so that the monitor signal amplitude fits within the approximate range of 0.36 × RVCC to 0.64 × RVCC [Vp-p].

The automatic adjustment is performed on the excitation signal output amplitude and the input gain resistance. Priority can be specified by setting the EAAOD bit in the RDC3AnATMNT0 register. When the EAATSP bit in the RDC3AnATMNT0 register is set to 0, the automatic adjustment can be performed continuously. By setting the EAATSP bit to 1, the automatic adjustment can be stopped and the adjusted value at that time is retained. Setting the EAATSP bit to 0 restarts the automatic adjustment process.

The function monitors the amplitude with a 12-bit SAR-ADC, determines the size of amplitude based on the integrated sum-of-squares of the excitation amplitude for a period of 1 ms, and adjusts the amplitude. The determination threshold is approximately 3 Vp-p on the high side, and approximately 2 Vp-p on the low side.

It is also possible to use the excitation signal output settings and the input gain resistance settings that are specified in the register, without using the results of automatic adjustments.

26.4.4 Error Detection

26.4.4.1 Error Detection

This function monitors and detects errors in resolver signal and in R/D conversion operations. If any of the errors listed in **Table 26.63** is detected, an RDC error interrupt request is generated, and the corresponding bit in the RDC3AnDGOUT0 and 1 registers become 1.

The following table lists factors that lead to error detection.

Table 26.63 Detected Errors

Item	Detected Factor
Resolver signal error	• Excitation signal line disconnection (RDC3AnRSO, RDC3AnCOM) including contact failure • Excitation signal down (excitation signal output circuit down, short circuit between lines) • Short circuits between signal lines (RDC3AnS1 and RDC3AnS3, RDC3AnS2 and RDC3AnS4) • Resolver coil layer short
Resolver signal disconnect error	Resolver signal lines disconnection (RDC3AnS1 to RDC3AnS4) including contact failure
R/D conversion error	Excessive control variation (ε) of tracking control loop (negative feedback control system)
Two path comparison conversion error	Comparison of the conversion results from the two angle conversion loops
Resolver signal Power/ground short error	Short circuit of the power supply (power short error) and short circuit to the ground (ground short error) for the resolver signal lines
Square-sum amplitude error	Modulation, distortion, or noise on the amplitude of the sine and cosine resolver input signals.

26.4.4.2 Resolver Signal Error Detection

This function detects disturbance in the resolver signal balance caused by an error in excitation signals input to the resolver. When a resolver signal error is detected, an RDC error interrupt request signal becomes high. A resolver signal error is detected if the monitor outputs (RDC3AnSINMNT, RDC3AnCOSMNT) fall below the threshold for approximately 220 µs.

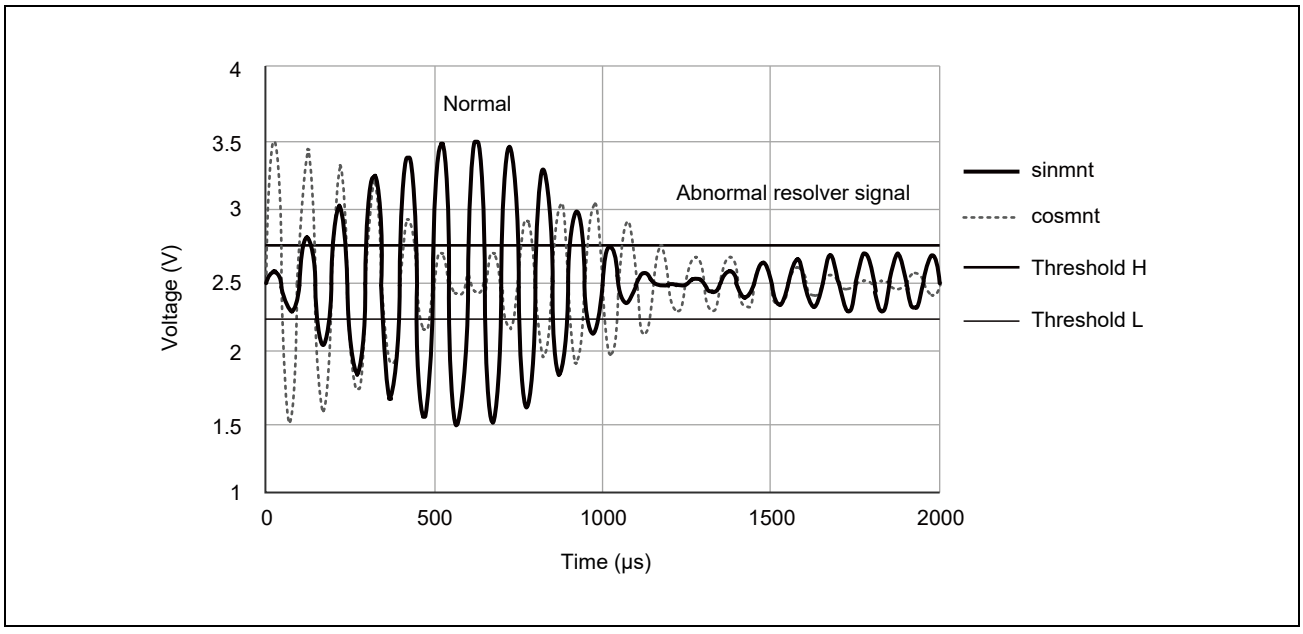

Figure 26.13 Monitor Signal Waveforms when the Resolver Signal is Abnormal

26.4.4.3 Resolver Signal Disconnection Error Detection

This function detects disconnection (including contact failure) of the resolver signals (RDC3AnS1 to RDC3AnS4). When a resolver signal disconnect error is detected, the RDC error interrupt request signal becomes high. A resolver signal disconnect error is detected if the DC level fluctuations in the monitor output (RDC3AnSINMNT, RDC3AnCOSMNT) rise above the threshold. For a description of the relationship between register values and threshold values, see **Section 39.5.3, Error Detect Characteristics**.

When operation with a VR resolver is selected (by setting values other than the combination of EXIO = 1 and SENS = 0), this function monitors the common levels of the monitored signals and determines any case of them exceeding the configured threshold to be a disconnection error. The threshold is set at 2.9V as the default and can be changed by the SGBTH[7:0] bits.

When operation with a DC resolver is selected (by setting the combination of values as EXIO = 1 and SENS = 0), this function monitors the DC level of the monitored signals and determines any case of them exceeding the configured threshold to be a disconnection error. The threshold is set at 4.25 V as the default and can be changed by the SGBDTH[7:0] bits.

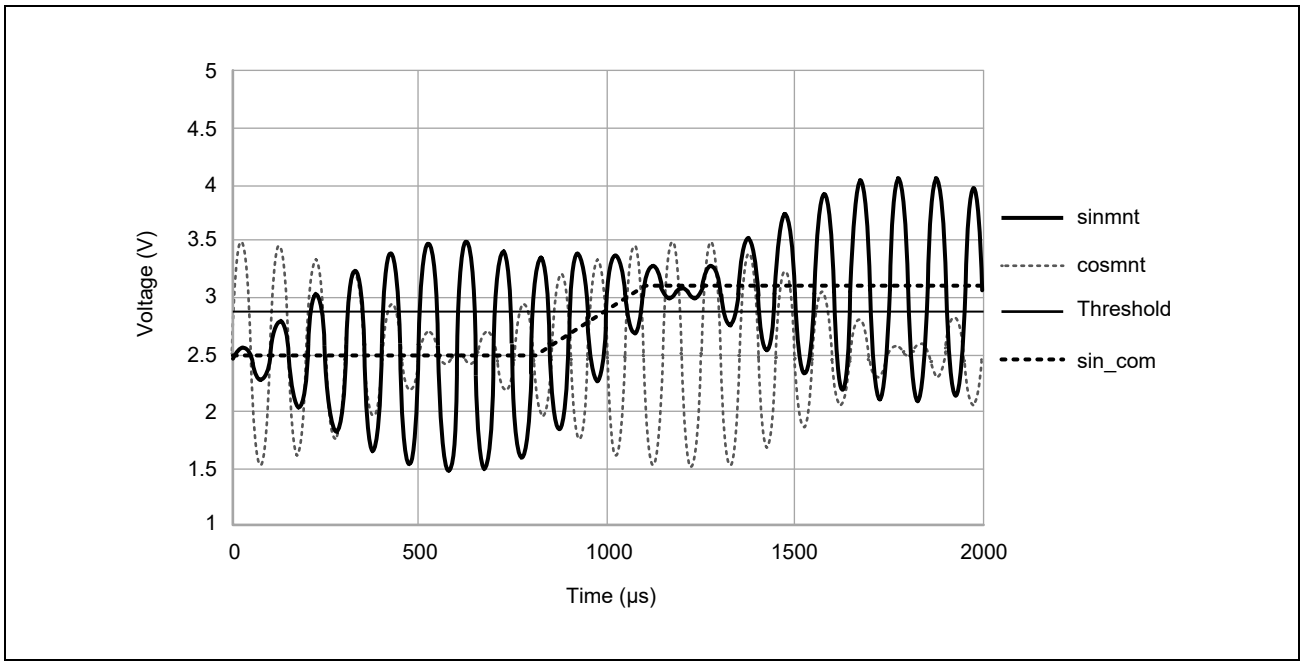

Figure 26.14 Monitor Signal Waveforms on Occurrence of Sinmnt Signal Disconnection in VR Resolver

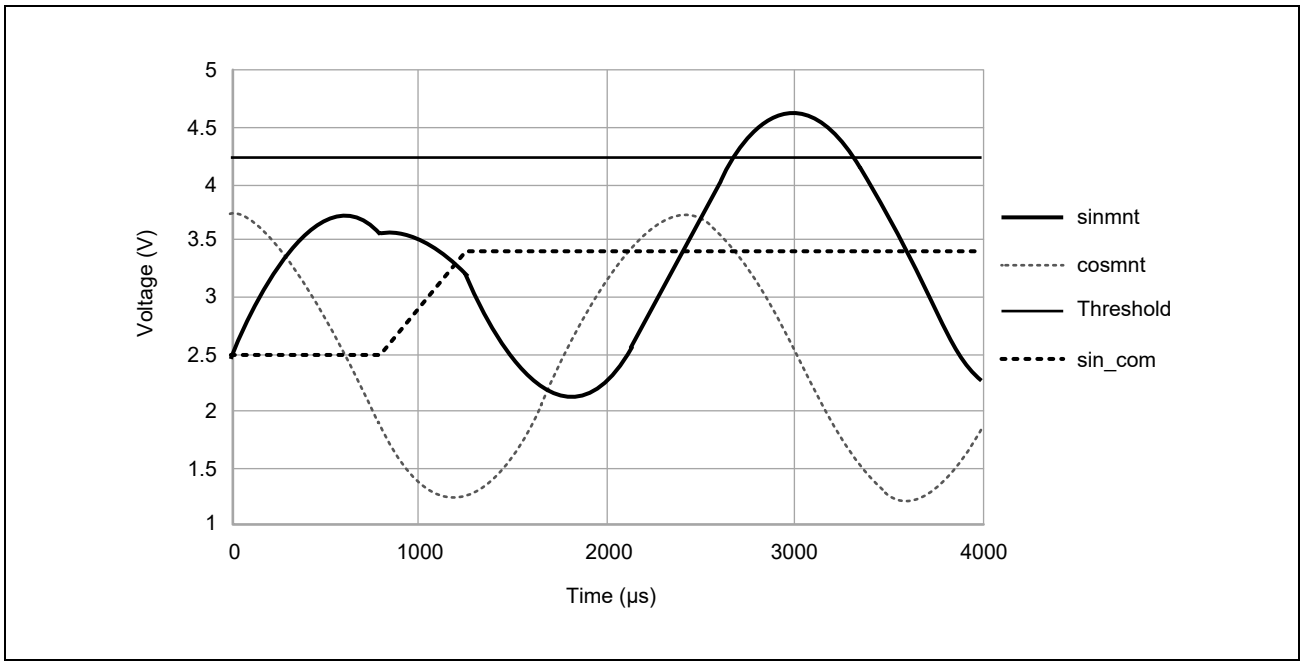

Figure 26.15 Monitor Signal Waveforms on Occurrence of Sinmnt Signal Disconnection in DC Resolver

26.4.4.4 R/D Conversion Error Detection

This function monitors the control variation in R/D conversion loop, and detects operation errors in the R/D conversion function. When an R/D conversion error is detected, the RDC error interrupt request signal becomes high.

A control variation (ε) is considered excessive if the control variation rises above or falls below a configured threshold level. For a description of the relationship between register values and threshold values, see **Section 39.5.3, Error Detect Characteristics**.

An R/D conversion error is detected if the control variation stay excessive for more than 50% of the error determination time set in the EDPS[1:0] bits in the RDC3AnDIAG1 register.

The R/D conversion error detection circuit includes a circuit supporting high-speed rotation of a resolver and a circuit not supporting it. These circuits can be selected by using the CVEDS bit in the RDC3AnDIAG1 register.

CVEDS = “0”: A circuit supporting high-speed rotation is selected. However, this setting is not allowed when the excitation frequency is set to 22 kHz or above.
When this setting is selected, set EDPS[1:0] to 10 or 11.

CVEDS = “1”: A circuit not supporting high-speed rotation is selected.

26.4.4.5 Two Paths Comparison Conversion Error Detection

This function compares the results of angle conversion from two loops, and detects conversion errors and failures in the circuit. In the angular conversion mode 0 (ADRD = 0), this function compares the phi angles output from the angular conversion mode 0 path and that from the angular conversion mode 1 path, and if the difference between two angles is larger than the threshold, this is judged to be a two paths comparison conversion error. The threshold value is set by the P2ANT[1:0] bits.

26.4.4.6 Resolver Signal Power/Ground Short Error Detection

This function detects power short errors (short circuits to the power supply) and ground short errors (short circuits to the ground) of the resolver signal lines RDC3AnRSO, RDC3AnCOM, RDC3AnS1, RDC3AnS2, RDC3AnS3, and RDC3AnS4. Note that if these errors are on the RDC3AnRSO and RDC3AnCOM pins, they are not correctly detected when the internal excitation signal is in use (EXIO = 1, SENS = 1) due to a conflict between the current from the short to the power supply or ground and the excitation current from the buffer. When an external excitation signal is used (EXIO = 0), errors on those pins are detected.

Detection is also possible during an angle conversion and the angular tracking is continued even while detection of power/ground short error is running (for 78 µs). The timing to start this function is selected by the VGASL[1:0] bits as follows;

- VGASL[1:0] = 00 (default)
  No detection performed.
- VGASL[1:0] = 01
  When the VGST bit is set to 1.
- VGASL[1:0] = 10
  Performed automatically every 10 ms.
  When this setting is selected, set the CVEDS bit to 1 to select a circuit not supporting high-speed rotation.
- VGASL[1:0] = 11
  No detection performed.

When the detection of power/ground short errors starts, the following operations are automatically performed by the circuit.

[Operation Sequence]

1. The RDC3AnS1, RDC3AnS2, RDC3AnS3, and RDC3AnS4 pins are disconnected from the PGA input circuit (**Figure 26.16**).
2. Each of the six resolver signal lines RDC3AnCOM, RDC3AnRSO, RDC3AnS1, RDC3AnS2, RDC3AnS3, RDC3AnS4 is selected, in sequence and in that order, for 13 µs*[1]. Detection finishes after all six signals have been selected, one after another, in a total of 78 µs.
3. The RDC3AnS1, RDC3AnS2, RDC3AnS3, and RDC3AnS4 pins are connected to the PGA input circuits.
4. The RDC enters the forced gain control state (for approx. 5 ms) and the angle is tracked.
   (If SAGD is set to 1, the RDC does not enter the forced gain control state.)

Note 1. The timing value is when the CCLK is running at 40 MHz.

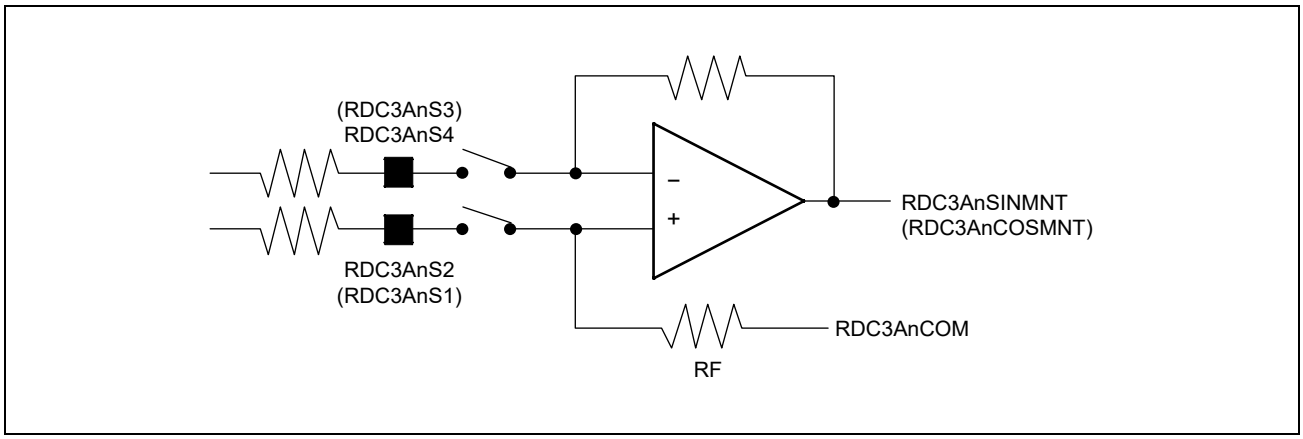

Figure 26.16 RDC3AnS1, RDC3AnS2, RDC3AnS3, RDC3AnS4 Pins on Detection of Power/Ground Short Error

While the detection of power/ground short errors is running (for 78 µs), the RDC3AnS1, RDC3AnS2, RDC3AnS3, RDC3AnS4 pins are disconnected from the PGA input circuit.

26.4.4.7 Sum-of-Squares Amplitude Error Detection

This function detects modulation, distortion and noise in the amplitudes of the sine and cosine signals input from the the resolver. This function is only available for resolvers requiring the input of signals with excitation components, but not for DC resolvers, which do not require this.

The sum-of-squares of the monitored signals (SINMNT, COSMNT) acquired in the ADC within the RDC are taken and integrated within the excitation period. Upper and lower threshold values are set for the value thus calculated and the number of times the calculated value rise above or fall below the thresholds is counted. If the number exceeds the threshold for the counted value, it is output as a sum-of-squares amplitude error.

The procedure runs automatically, but the user is required to set the upper and lower threshold for the integrated sum-of-squares values in the SQHTH and SQLTH bits and the threshold for the number of times the calculated value falls outside the range in the SQCTH bits. The counter values are cleared at the desired time by the writing to the SQERST bit.

Setting the ERSQS bit to 0 enables the detection of sum-of-squares amplitude errors. After setting this bit to 0, clear the counted value by setting the SQERST bit to 1.

In checking for a power/ground short error, the excitation amplitude disappears for 78 µs, so the resulting error is counted once in sum-of-squares amplitude error detection.

When checking for a power/ground short error by writing to the VGST bit when VGASL[1:0] = 01, set the ERSQS bit to 1 to switch sum-of-squares amplitude error detection off during the check.

When automatic checking for power/ground short errors is to proceed at 10-ms intervals because the setting of VGASL[1:0] = 10, clear the effect of this on the counting of sum-of-squares amplitude errors at least once per 10 ms by using the SQERST bit.

If you want to check for power/ground short errors but do not require checking of sum-of-squares amplitude errors, leave the value of ERSQS as 1.

Figure 26.17 shows an example of waveforms where the amplitudes of the signals input to the resolver are reduced, the calculated value fell outside the threshold range three times, and a sum-of-squares amplitude error is generated.

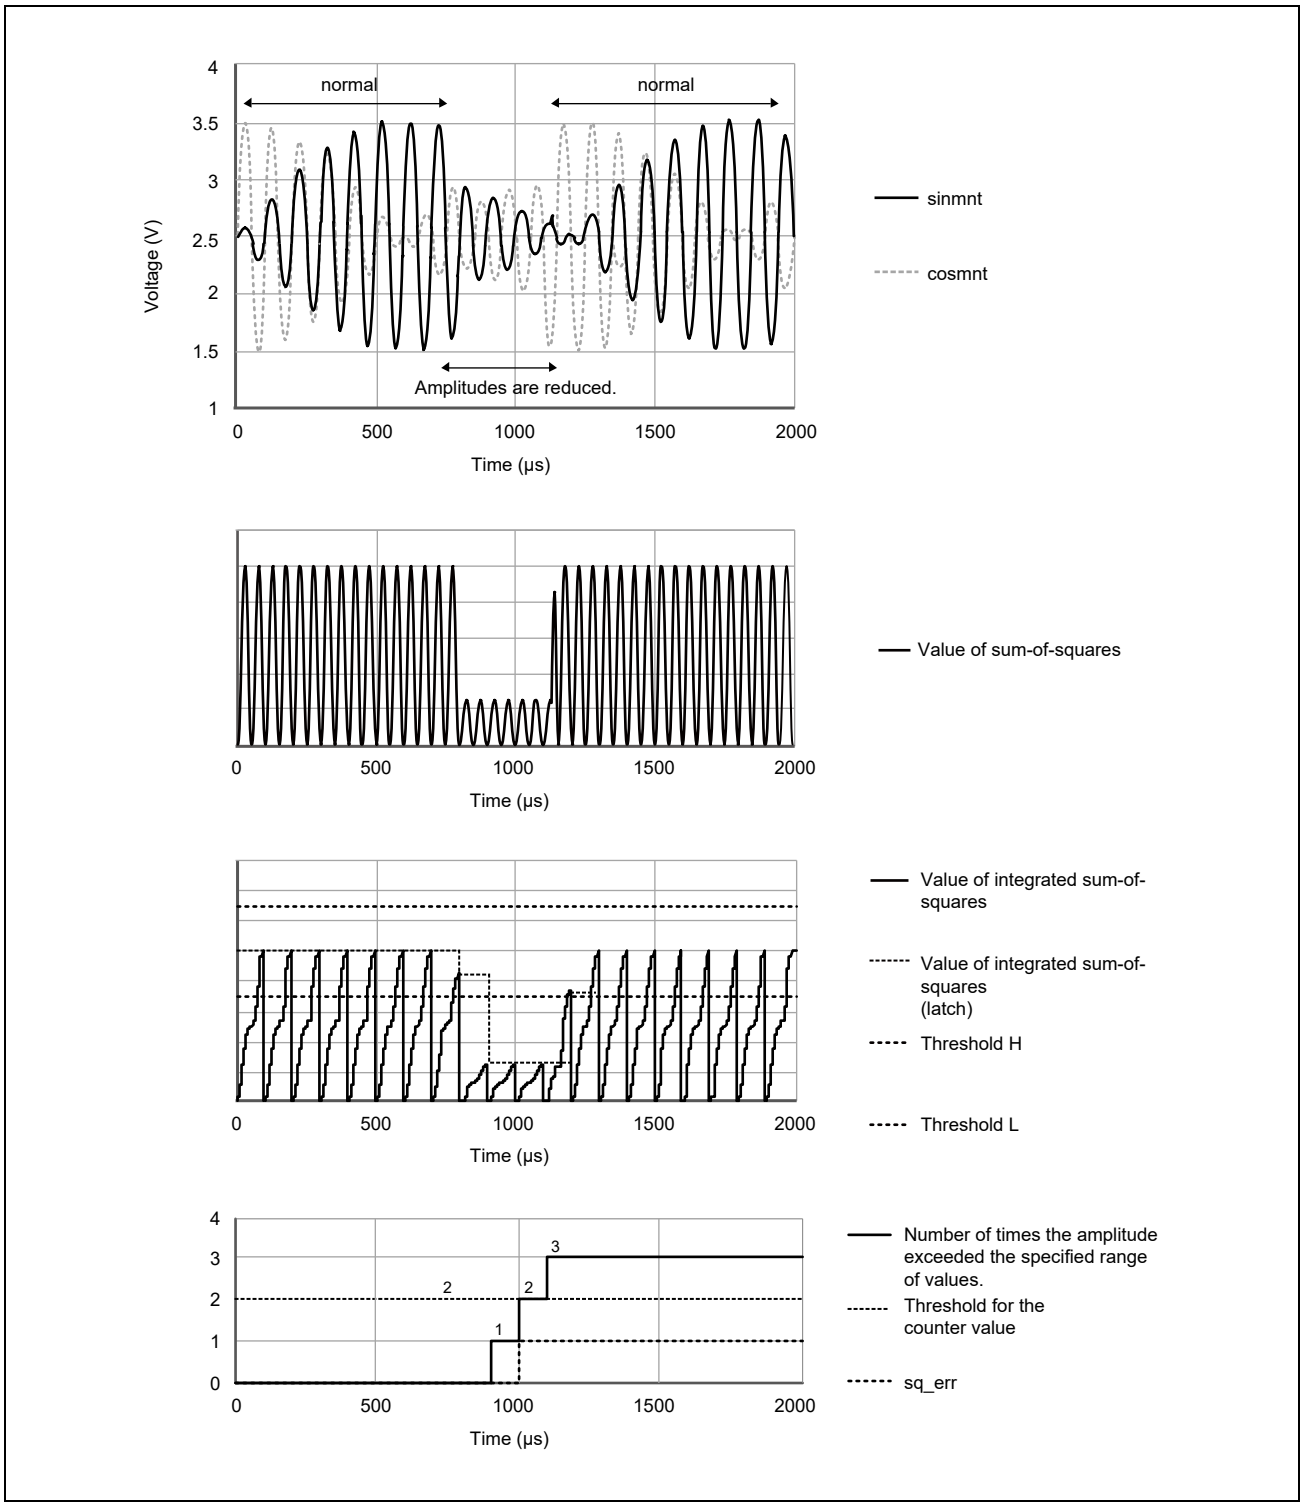

Figure 26.17 Example of Waveforms with Sum-of-Squares Error

26.4.5 Self-Diagnosis

26.4.5.1 Built-in Self-Test Function

In order to check the validity of a given operation, the Built-in Self-Test (BIST) function generates an intended signal input that is simulated internally by setting a BIST instruction in the RDC3AnBIST1 register, and monitors the signal that is output in response to the simulated signal input. **Table 26.64** lists test items.

Each output during the execution of BIST operates in response to the simulated signal.

Perform the following settings to execute BIST.

(1) Enable the forced gain control function during BIST operation. (Set the AGCD bit in the RDC3AnPI1 register to 0.)

(2) When the BIST is completed, set the ERRST bit in the RDC3AnDIAG1 register to 1 to reset the error signal.

Table 26.64 BIST Instructions

Item	Diagnosis
Angle conversion BIST	Self-test of the R/D conversion function The following electrical angles can be set as a resolve signal input: • Target angle 0° • Target angle 45° • Target angle 270°
Error detection BIST	Self-test for the error detection function • Resolver signal error detection BIST • Resolver signal disconnect error detection BIST • R/D conversion error detection BIST • Power/ground short error detection BIST • Square-sum amplitude error detection BIST
ADBIST	Self-test for the validity of the result of 12-bit SAR-ADC conversion • Apply voltages of 1, 2.5, and 4 V in order and judge the result of ADC conversion. • The threshold value for determination is set by the ADB3TH[1:0] bits.

Each output during the execution of BIST operates in response to the simulated signal. Depending on the BIST, an RDC error interrupt is generated due to the erroneous internal state. If the occurrence of this error disturbs the operation, disable RDC error interrupt by the EINTEN bit.

For the types of BIST which can be executed during angle conversion, tracking of the angle for the resolver input signal continues during execution of the BIST.

The angle output during the types of BIST which can only be executed during power up does not match the resolver input signal during execution of the BIST.

The BISTs are categorized into two groups depending on their execution timing as follows;

- Execution is possible during angle conversion and when starting up the power (short-period BIST): ADBIST, resolver signal error detection BIST, resolver signal disconnect detection BIST, power short error BIST, ground short error BIST, sum-of-squares amplitude error detection BIST (high side), sum-of-squares amplitude error detection BIST (low side)
- Execution is possible when starting up the power: angle conversion BIST, conversion error BIST

Perform the following settings to execute BIST.

(1) Enable the forced gain control function when executing a BIST. (Set the AGCD bit in the RDC3AnPI1 register to 0.)

(2) To execute a short-period BIST, set the EINTEN bit to 0 to disable error interrupts.

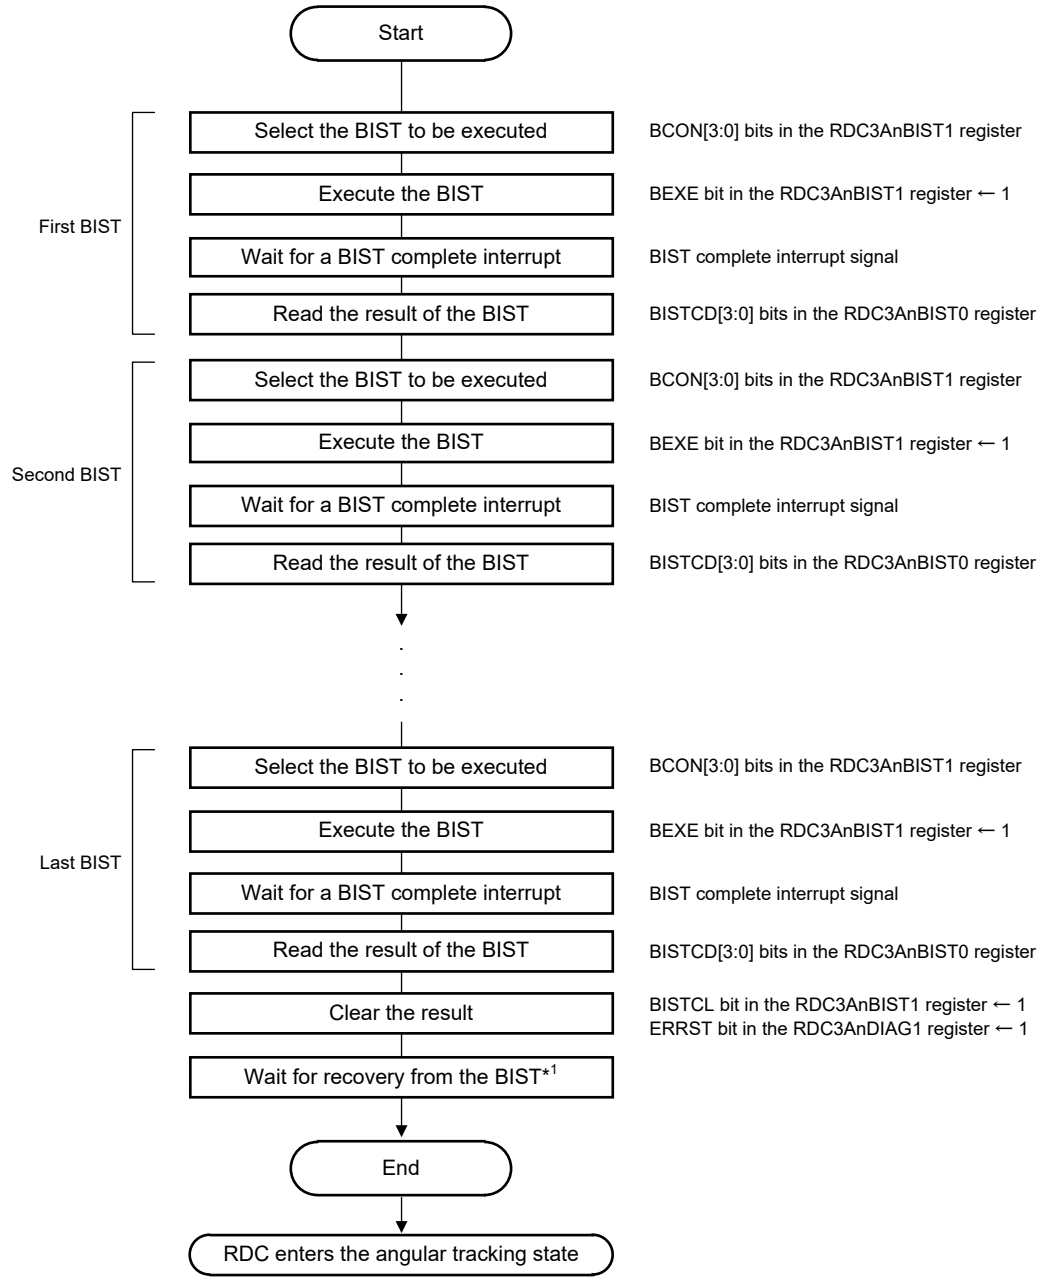
(3) Set the VGASL[1:0] bits to 00_B when executing a BIST.

(4) Read the VGFLG bit (Power/ground short error detection running bit) as 0. If the value is 1, read the bit again after waiting for about 80 µs.

(5) Set the phase correction bits in the sine and cosine angle correction register to 0° when executing the angle conversion BIST.
Sine phase correction bits SINPO[11:0] = 000_H
Cosine phase correction bits COSPO[11:0] = 000_H

(6) To execute conversion error BIST, set the EDPS bit to 10_B.

(7) Set the input gain resistance value at default (21 kΩ) when executing a BIST.
IRSS1 = 0, IRSS0 = 1, IRSC[3:0] = 0100_B



(8) Clear the count value in the SQERST bit by setting 1 before runningsum-of-squares amplitude detection BIST (high and low sides).

(9) When the BIST is completed, set the ERRST bit in the RDC3AnDIAG1 register to 1 to reset the error signal. Return the settings of the registers which were changed in steps (1), (2), (3), (5), (6), and (7) to their original values.

Table 26.65 lists the BISTs to be executed depending on the setting of values.

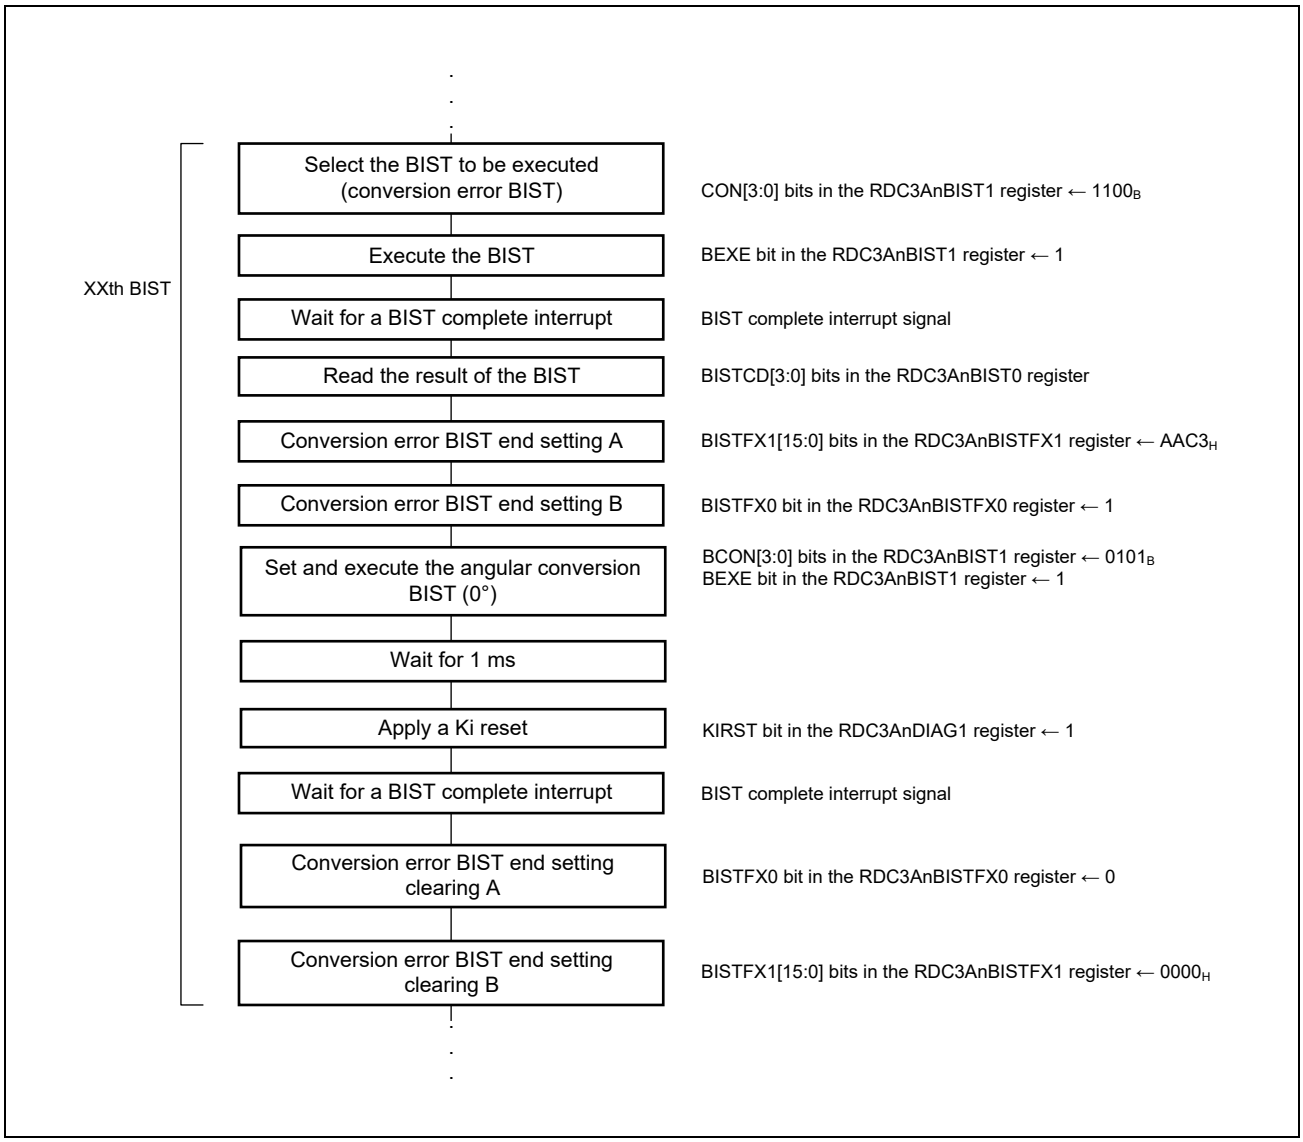
Table 26.65 BISTs for Each Setting of Values

BCON[3:0]	BIST to be Executed
0000	BEXE bit is disabled.
0001	This setting is not allowed.
0010	Square-sum amplitude error detection BIST (low side)
0011	Square-sum amplitude error detection BIST (high side)
0100	ADBIST
0101	Angle conversion BIST (0°)
0110	Angle conversion BIST (45°)
0111	Angle conversion BIST (270°)
1000	This setting is not allowed.
1001	Error detection BIST: resolver signal error detection BIST
1010	Error detection BIST: resolver signal disconnect detection BIST (cosine side)
1011	Error detection BIST: resolver signal disconnect detection BIST (sine side)
1100	Error detection BIST: conversion error BIST
1101	Error detection BIST: power short error BIST
1110	Error detection BIST: ground short error BIST
1111	This setting is not allowed.

Note: In the conversion error BIST, write 1 to the KIRST bit after reading the result.
If the type of BIST to be executed is conversion error BIST in conversion mode 1 (ADRD bit = 1), execution of the XXth BIST must follow the sequence in Figure 26.19.

Note 1. See **Section 39.5.1, RDC Conversion Performance** for the recovery time from a BIST.

Figure 26.18 Sequence of Executing BISTs after Starting Up the Power



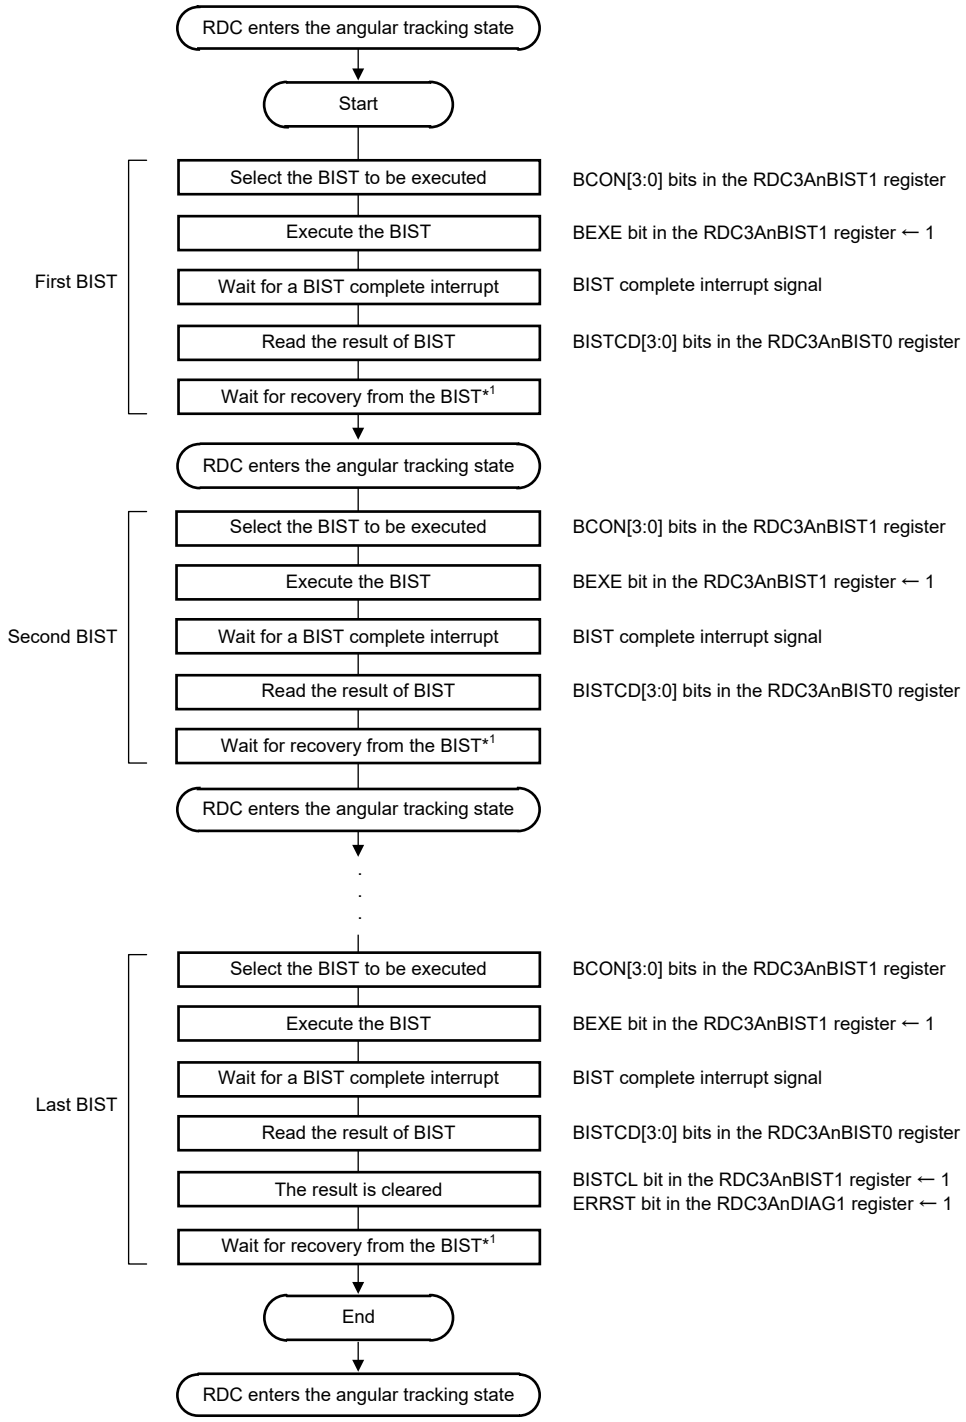


Figure 26.19 Sequence of Executing Conversion Error BIST in Angular Conversion Mode 1

Note: In the sequence of executing a BIST that is possible during angle conversion, tracking of the resolver continues even during execution of the BIST.

Note 1. See **Section 39.5.1, RDC Conversion Performance** for the recovery time from a BIST.

Figure 26.20 Sequence of Executing BISTs during Angle Conversion

26.4.5.2 ADC Software BIST

Failures in the ADC are diagnosed by the CPU through the following procedure: the DAC code in the 12-bit SAR-ADC written to the relevant register is converted in the ADC and the result is read from the relevant register.

The user can set the DAC codes freely, that is, to any of the 4096 codes for the 12-bit ADC. In the ideal state, the software will return the exact value of the DAC code which was set for the software BIST as the result of AD conversion. In actual operations, however, values with errors are output due to non-ideal factors. Therefore, users are required to set a suitable value for the CPU to judge these errors (around ± 32 LSB).

This BIST is capable of diagnosing the normality of combined operations for all DAC switches in the ADC. On the other hand, the ADBIST described in **Section 26.4.5.1, Built-in Self-Test Function**, diagnoses the results of conversion by applying three voltages to the input nodes of the ADC. In summary, failures in all nodes of the 12-bit ADC are diagnosed by using the ADBIST and software BIST in combination.

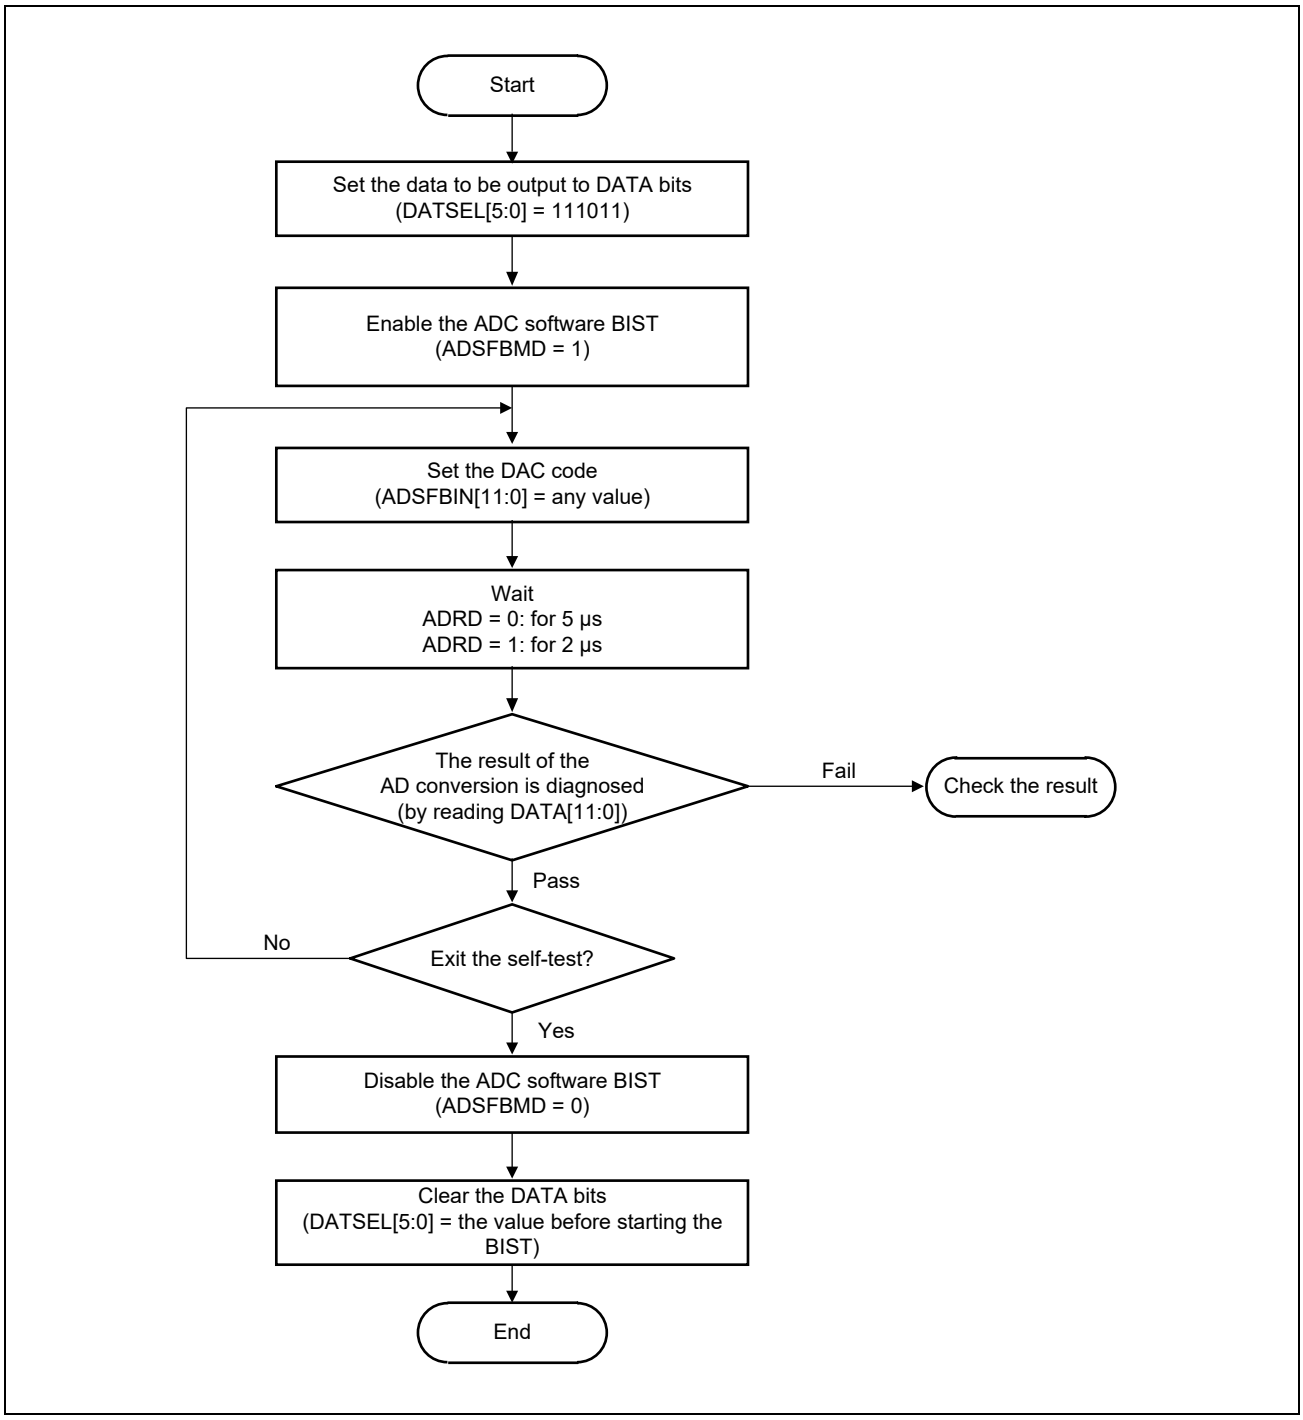

Figure 26.21 Operating Sequence of the ADC Software BIST

26.4.6 Excitation Timer (ET) Function

The excitation timer comprises two 16-bit timers: a period measurement timer and an event generation timer. The operating clock of the timers is CCLK (40 MHz). **Figure 26.22** shows a block diagram of the excitation timer.

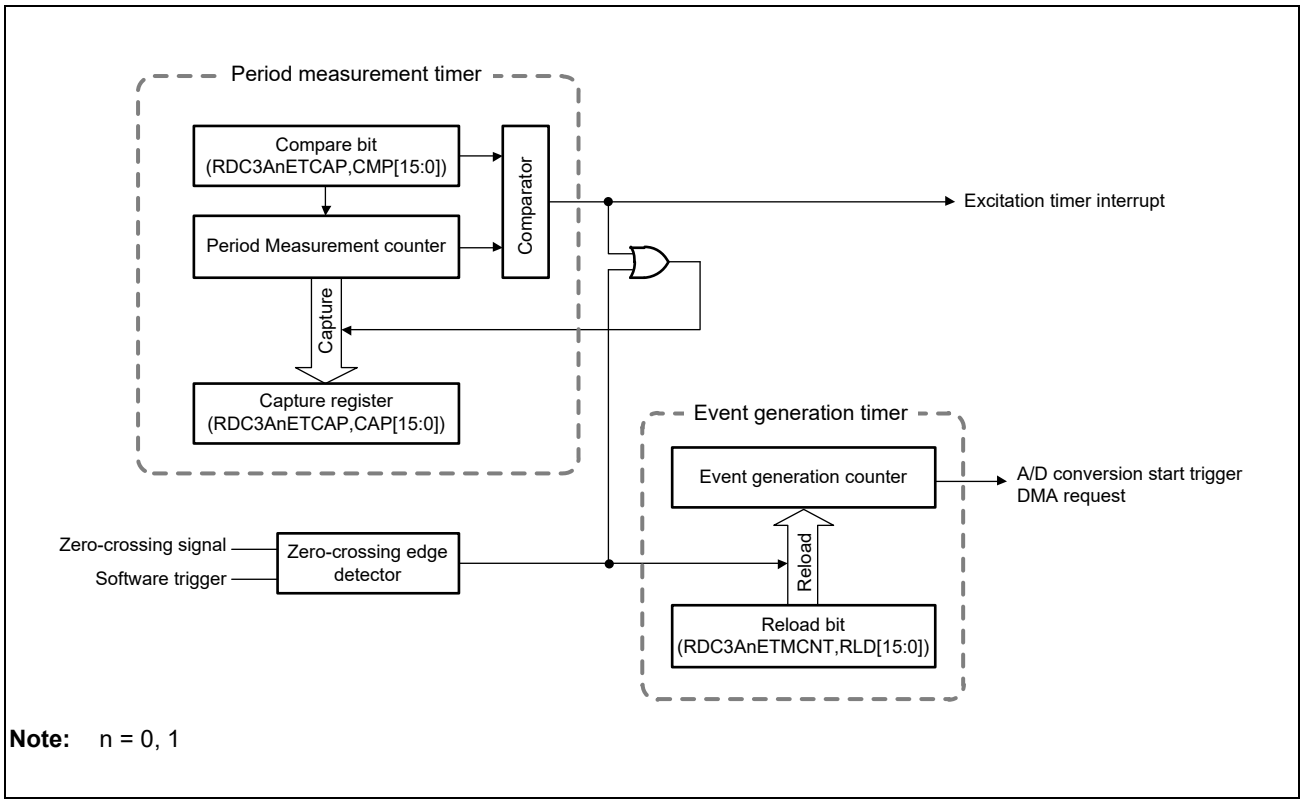

Figure 26.22 Block Diagram of Excitation Timer

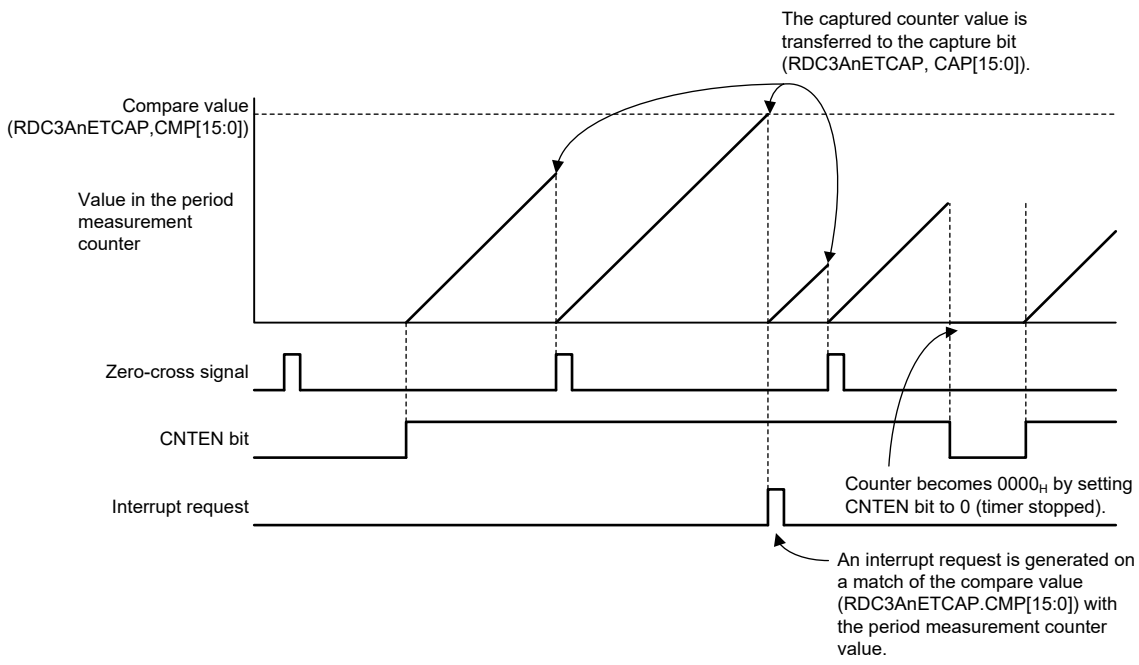
26.4.6.1 Period Measurement Timer



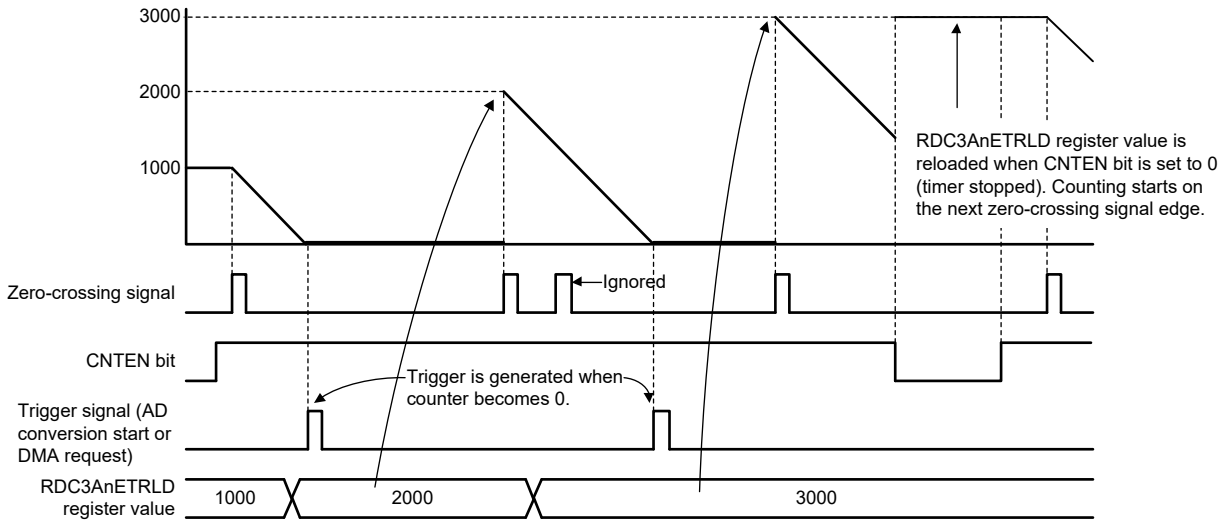
The period measurement timer measures the cycle of excitation signal (zero-crossing signal). When an edge (selectable from rise edge and fall edge) of the zero-crossing signal is detected, the value of the period measurement counter is captured and stored in the RDC3AnETCAP register. By reading the RDC3AnETCAP register, the cycle of excitation signal can be obtained.

The cycle of excitation signal can be calculated from the following formula: (RDC3AnETCAP register value + 1) × CCLK cycle (25 ns).

When the IREN bit in the RDC3AnETEN register is set to 1 (enables the interrupt), an excitation timer interrupt request is generated if the value set in the RDC3AnETCAP register matches the period measurement counter value. The excitation signal cycle error can be detected by setting a value of longer duration than the excitation signal cycle to the RDC3AnETCAP register.

When a zero-crossing signal trigger is generated by writing 1 to the ZCSTRG bit in the RDC3AnETEN register, the period measurement timer operates in the same way as the zero-crossing signal edge detection.

Figure 26.23 shows an example of period measurement timer operation.



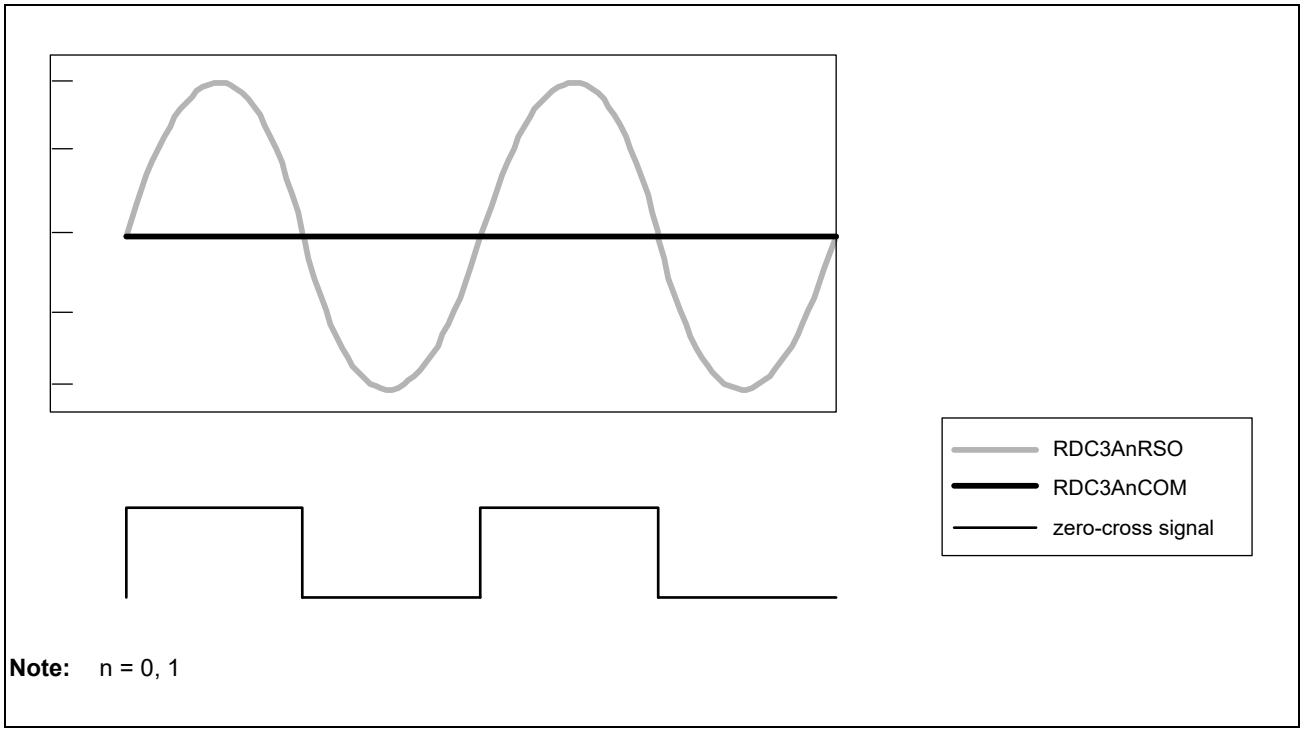
Note: n = 0, 1
CNTEN: A bit in the RDC3AnETEN register

Figure 26.23 Example of Period Measurement Timer Operation

26.4.6.2 Event Generation Timer

The event generation timer can generate a trigger signal (A/D conversion trigger, DMA request) after the time set in the RDC3AnETMCNT register has elapsed since the occurrence of an edge of the zero-crossing signal. When a zero-crossing signal trigger is generated by writing 1 to the ZCSTRG bit in the RDC3AnETEN register, the event generation timer operates in the same way as the zero-crossing signal edge detection.

Figure 26.24 shows an example of event generation timer operation.



Note: n = 0, 1
CNTEN: A bit in the RDC3AnETEN register

Figure 26.24 Example of Event Generation Timer Operation

26.4.6.3 Excitation Zero-Crossing Signal

The zero-crossing signal indicates zero-crossing timing for differential excitation signal input. The zero-crossing signal is input to the excitation timer circuit to be used for detecting the excitation vertex.

Figure 26.25 shows the relationship between the differential excitation signal input waveforms and zero-crossing signal.

Note: n = 0, 1

Figure 26.25 Relationship between Differential Excitation Signal Input (RDC3AnRSO, RDC3AnCOM) and Zero-Crossing Signal

26.4.7 PGA Inversion

When the resolver angle is near 135° or 315°, the sine and cosine signals output through the PGA shapes are vertically symmetrical to each other relative to a common potential. The input potentials of the two signals acquired by the 12-bit SAR-ADC are significantly different and are relatively strongly affected by the nonlinearity error of the ADC. The RDC is equipped with functionality to reduce this effect (by PGA inversion). The output voltage from the PGA is inverted in the range where the output phi angles whose input potentials of the sine and cosine signals become opposite to one another.

Whether to invert the sine and cosine waves or not is decided depending on the output phi angles as follows.

- Range of phi output angles = 0° to 90°: sin is not inverted, cos is not inverted
- Range of phi output angles = 90° to 180°: sin is not inverted, cos is inverted
- Range of phi output angles = 180° to 270°: sin is inverted, cos is inverted
- Range of phi output angles = 270° to 360°: sin is inverted, cos is not inverted

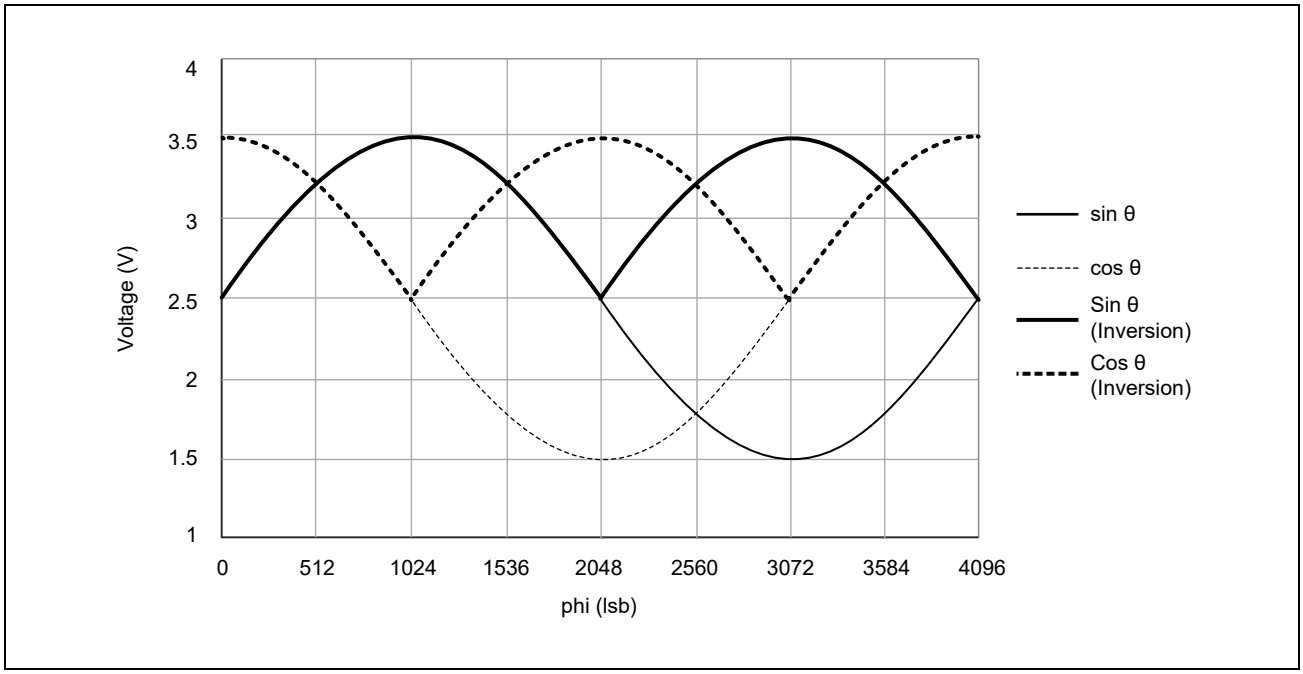


Figure 26.26 Output Phi Angle and Sine and Cosine Signals when Inversion is Enabled

For example, in the case where the resolver stays very close to 90° (1024 LSB), the output phi angle rises and falls at 90°. Here, the cosine signal output through the PGA becomes unstable due to repeated inversion and non-inversion. To avoid this, hysteresis can be added to the thresholds for the range of output phi angles where PGA inversion is applied.

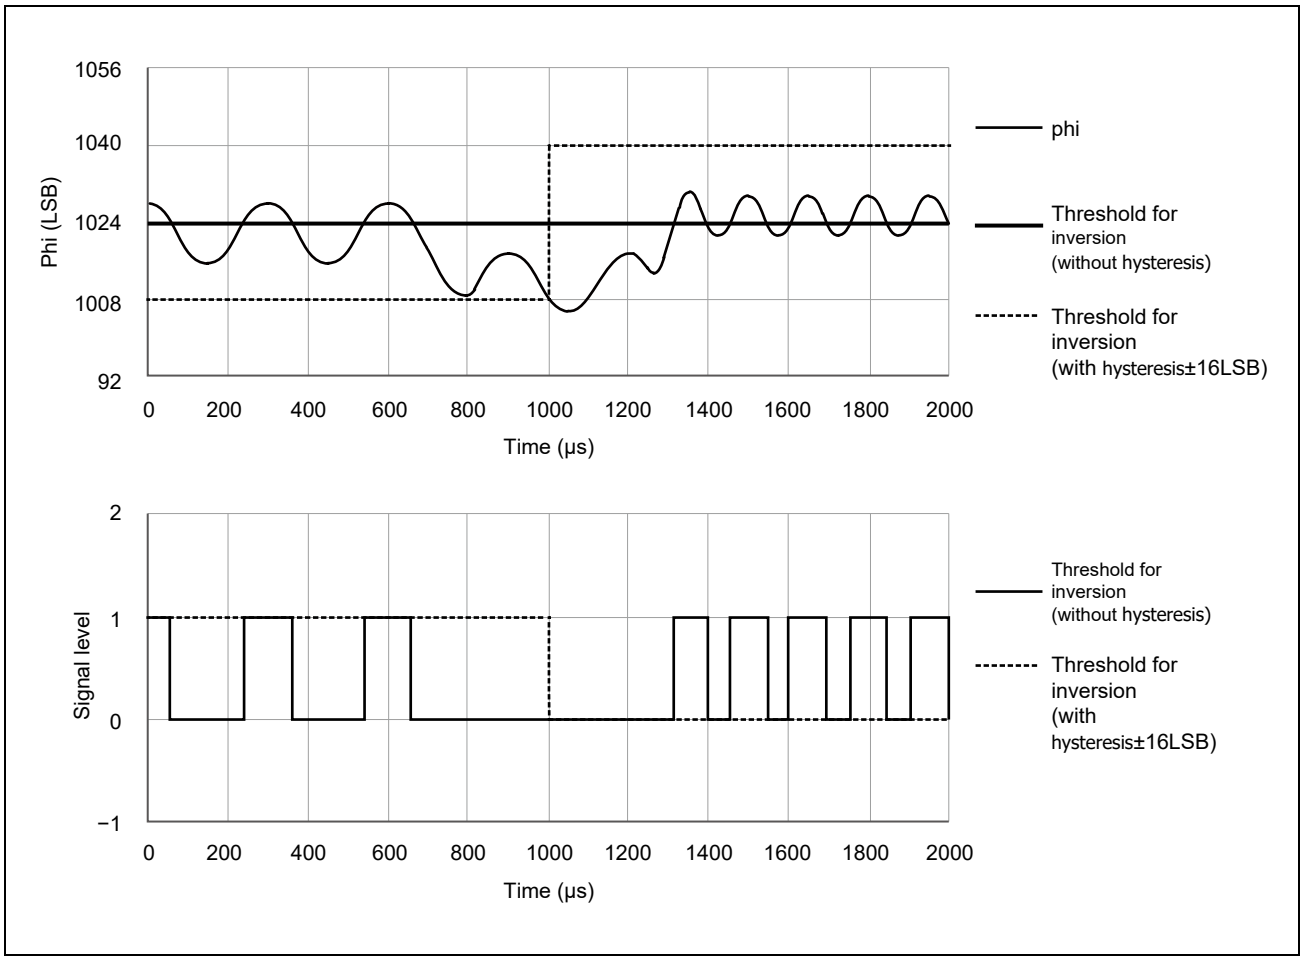

Figure 26.27 Comparison of Thresholds with and without Hysteresis for the Angle with PGA Inversion

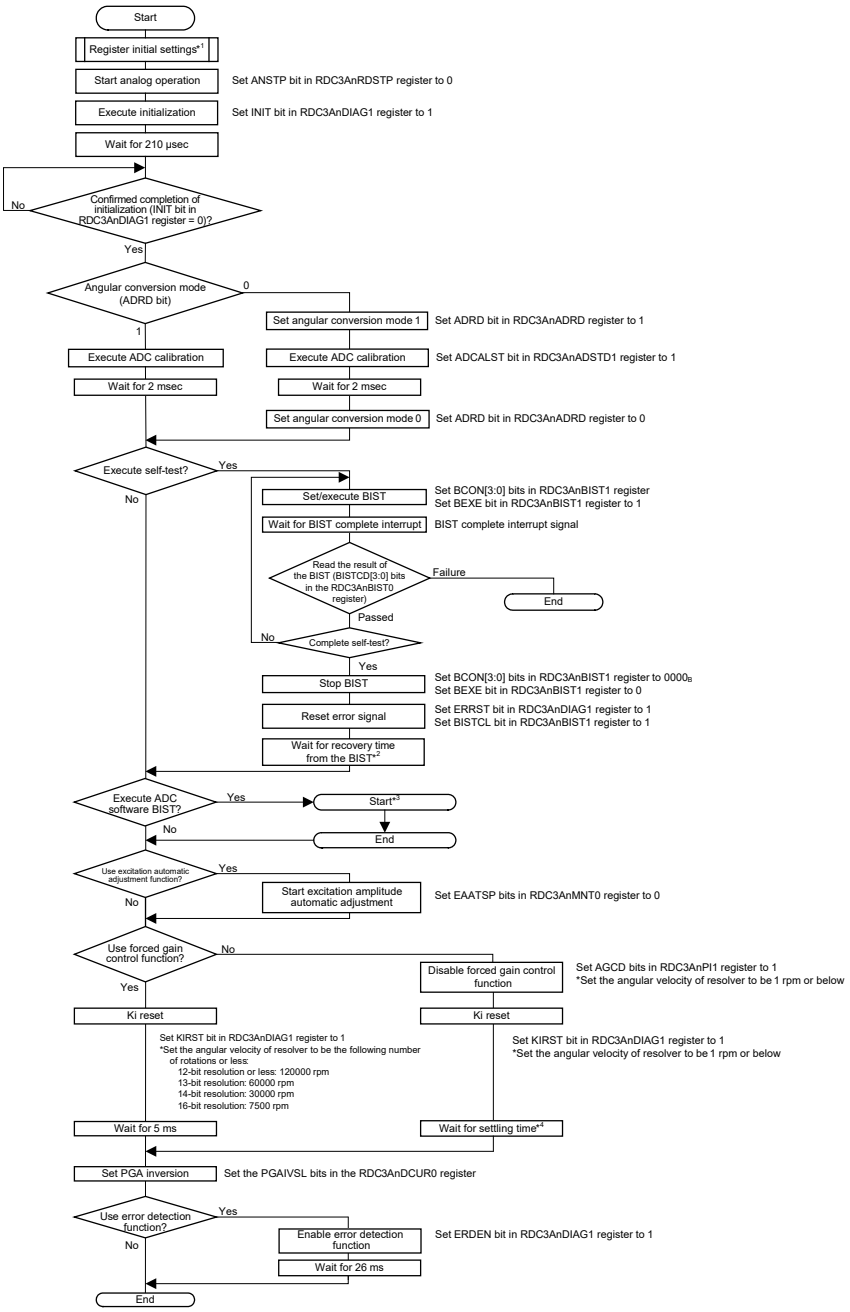
The timing of PGA inversion is selected by the PGAIVSL[1:0] bits.



- PGAIVSL[1:0] = 00: no inversion (default)
- PGAIVSL[1:0] = 01: the output phi angle falling outside the thresholds for switching between inversion and non-inversion, followed by an excitation zero-crossing.
- PGAIVSL[1:0] = 10: the output phi angle falling outside the thresholds for switching between inversion and non-inversion, followed by input to the ADC being switched between the sine and cosine signals.
- PGAIVSL[1:0]=11: the output phi angle falling outside the thresholds for switching between inversion and non-inversion, followed by an excitation zero-crossing and input to the ADC being switched between the sine and cosine signals.

Set PGAIVSL[1:0] = 00 in angular conversion mode 0 (ADRD = 0).

To further improve the accuracy of angular conversion in angular conversion mode 1 (ADRD = 1), set PGAIVSL[1:0] to a value other than 00.

26.5 Initial Operation Procedure

Figure 26.28 shows the flow of initial operation of the RDC3A and **Figure 26.29** shows the flow of the initial settings for the registers.

Note 1. n = 0, 1

Note 2. If the angle cannot be tracked when the R/D unit is started, apply a ki reset after the amplitude of RDC3AnSINMNT or RDC3AnCOSMNT rises to at least 1 V p-p and the amplitude of RDC3AnRSO rises to at least 200 mV p-p.

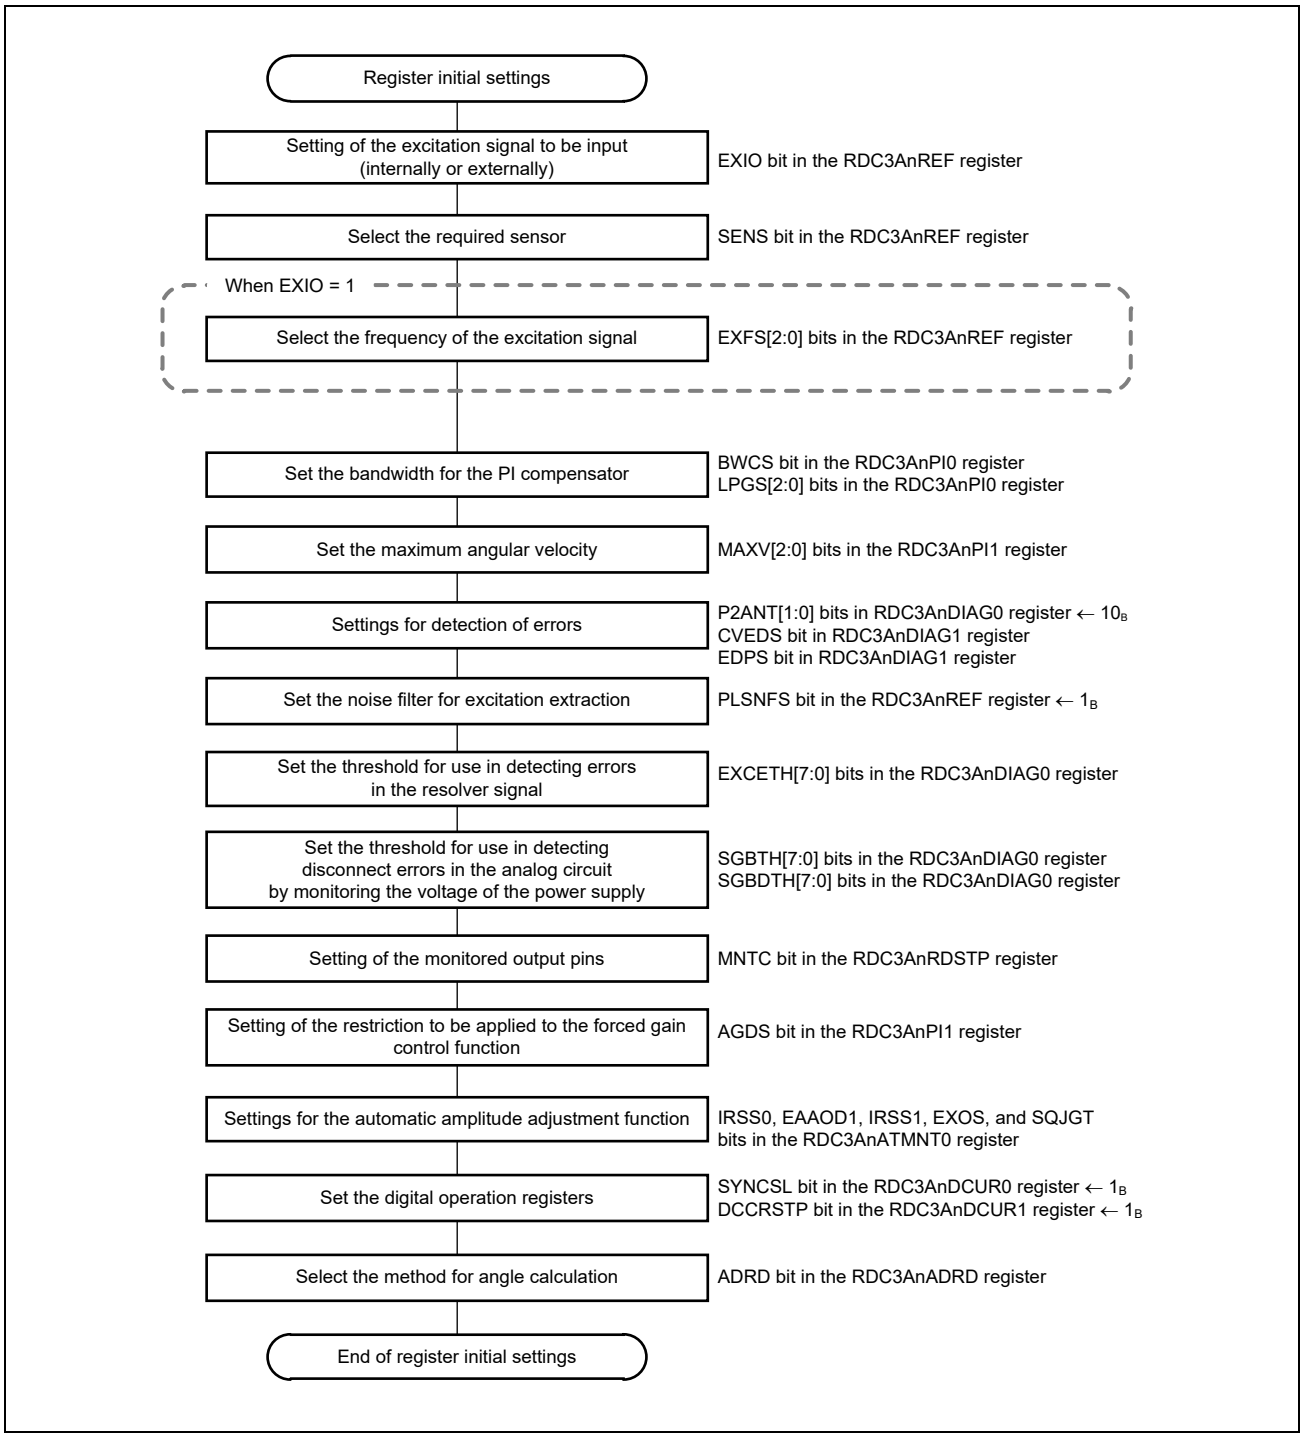
Note 1. See **Figure 26.29, Flow of Initial Settings of the Registers**

Note 2. For the recovery time from a BIST, see **Section 39.5.1, RDC Conversion Performance**

Note 3. See **Figure 26.21, Operating Sequence of the ADC Software BIST**

Note 4. For the settling time, see **Section 39.5.1, RDC Conversion Performance**

Figure 26.28 RDC3A Initial Operation Flow



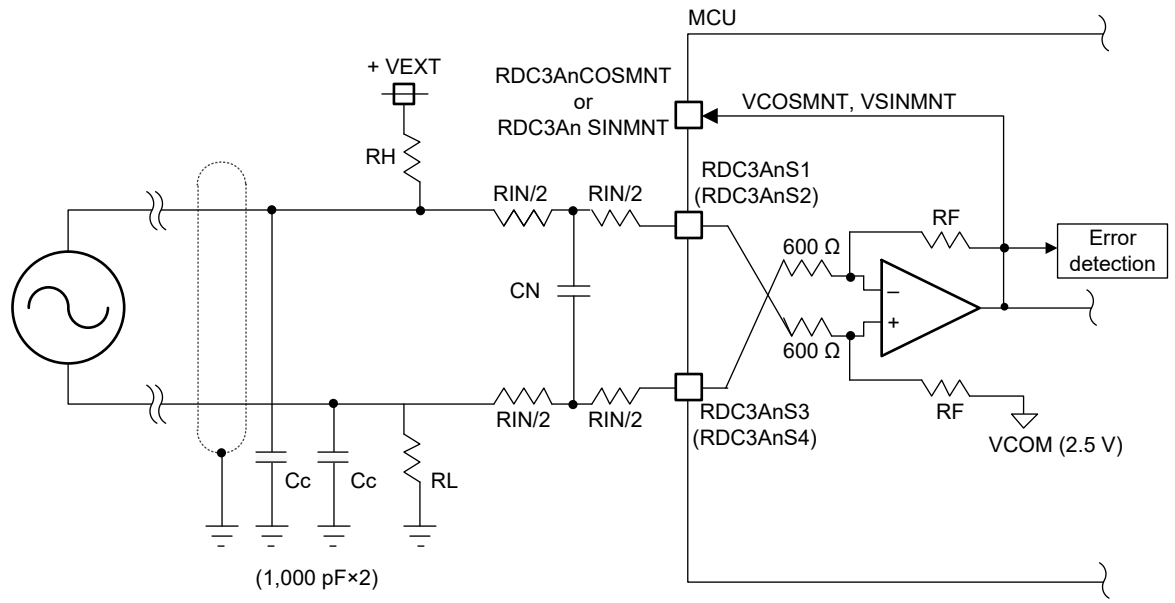


Figure 26.29 Flow of Initial Settings of the Registers

26.6 Resolver Interface Circuit

The following shows specific interface circuits as reference examples. When determining constants such as a resistance value and adding functions such as an input/output protection circuit, a careful decision must be made for each system and conduct adequate evaluation.

26.6.1 Resolver Signal Input (Differential Input) Circuit

Figure 26.30 shows a VR resolver signal input circuit and an equivalent circuit of monitor output.

Note: The input resistance (RIN) tolerance (%) can affect the conversion accuracy (LSB). Approximately 0.3% corresponds with 1 LSB.

VCOSMNT, VSINMNT: Resolver signal monitor voltage
VCOM: IC internal reference voltage (= RVCC/2)
RF: 21 kΩ (typ). Subject to register setting and automatic adjustment function.

Figure 26.30 VR Resolver Signal Input Circuit and Equivalent Circuit of Monitor Output

- RIN: Resolver signal level

  Adjust the signal level so that VCOSMNT or VSINMNT = (VIN) × (RF / (RIN + 600 Ω)) falls within the range from 0.36 × RVCC to 0.64 × RVCC [Vpp].

  (where VIN denotes the signal output voltage between resolver pins [Vpp], RIN ≥ 2[kΩ])

- RH and RL: Determine a resistance value in an 89% to 100% range from the following calculated values:

  1. $RH \approx \{(RVCC - VCOM) / (22.0 \times 10^{-6})\} - RIN$, where VCOM = RVCC/2[V]
  2. $RL \approx \{VCOM/(22.0 \times 10^{-6})\} - RIN$, where VCOM = RVCC/2[V]

Figure 26.31 shows an equivalent circuit when the DC resolver signal input is used.

Note: The input resistance (RIN) tolerance (%) can affect the conversion accuracy (LSB). Approximately 0.3% corresponds with 1 LSB. Differences in input signal conditions and peripheral circuits can affect the RD conversion accuracy and the error detection function.

Figure 26.31 Equivalent Circuit when DC Resolver Signal Input is Used

26.6.2 Excitation Voltage Booster Amplifier Circuit

26.6.2.1 Excitation Voltage Booster Amplifier Circuit (Single Power Supply)

Figure 26.32 shows an equivalent circuit of the excitation voltage booster amplifier circuit with single power supply.

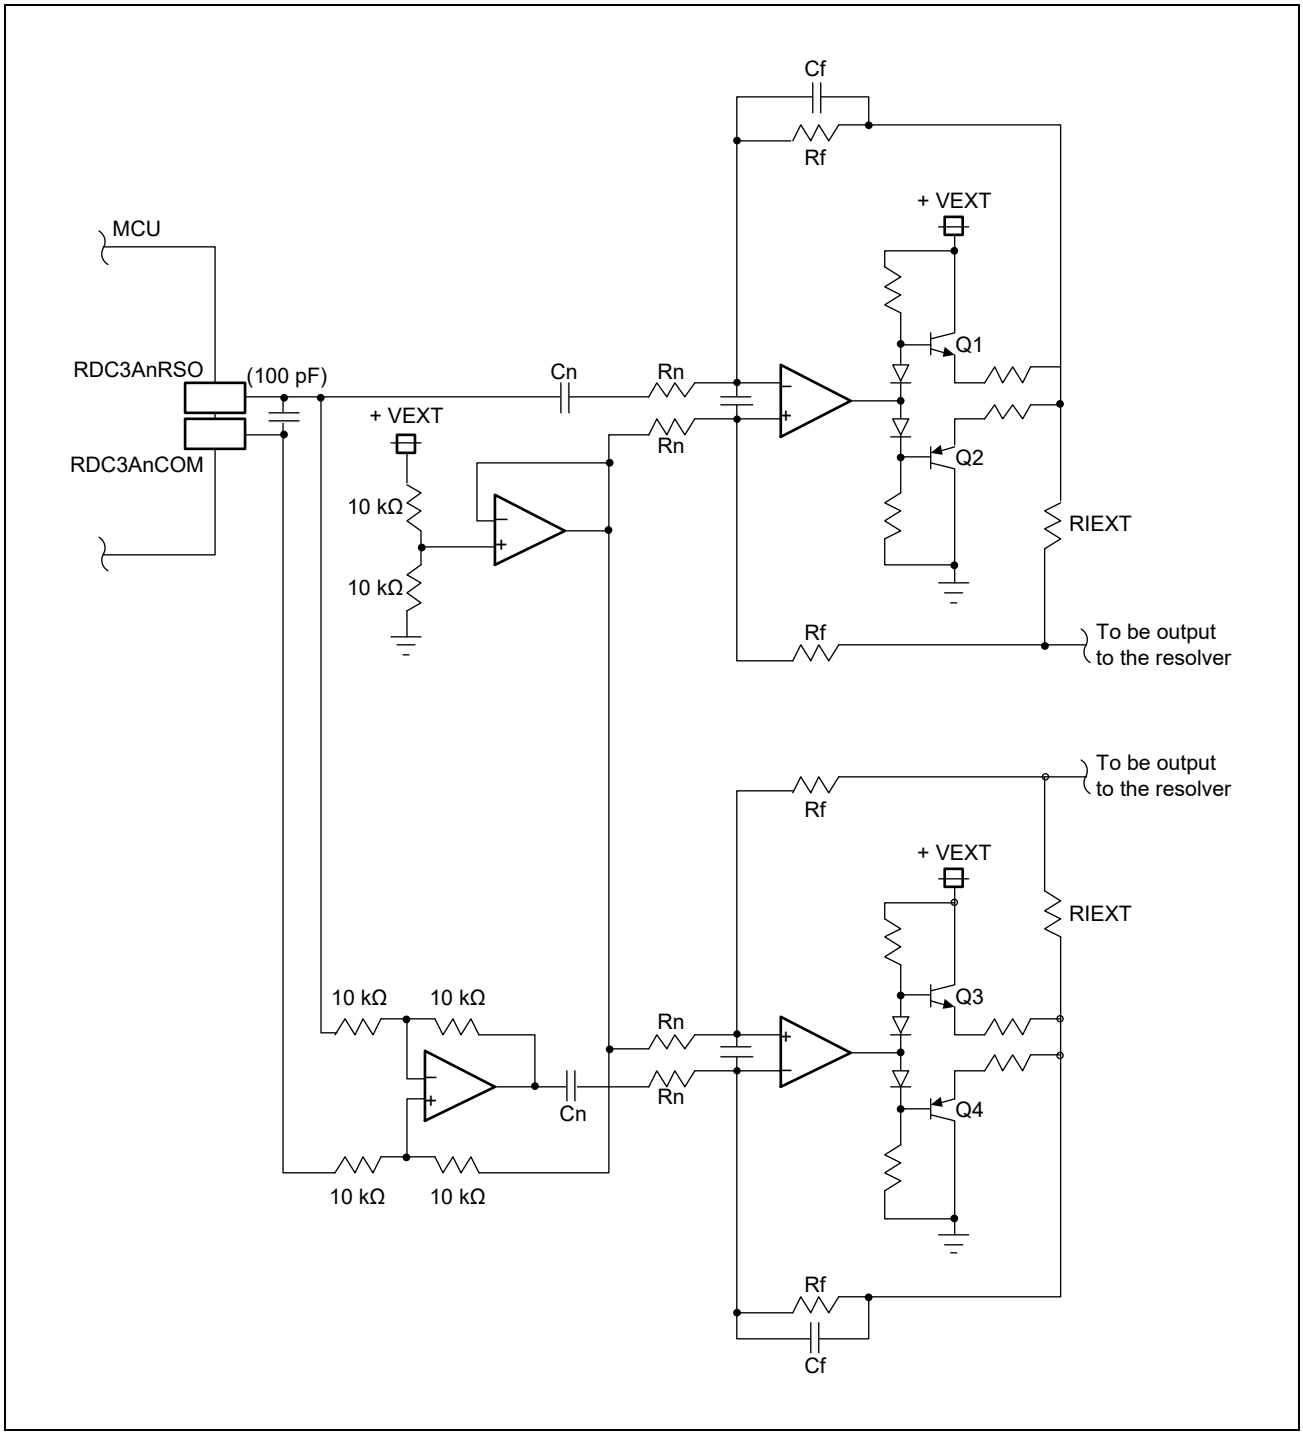

Figure 26.32 Equivalent Circuit Example of Excitation Voltage Booster Amplifier Circuit (Single Power Supply)

26.6.2.2 Excitation Voltage Booster Amplifier Circuit (Dual Power Supply)

Figure 26.33 shows an equivalent circuit of the excitation voltage booster amplifier circuit with dual power supply.

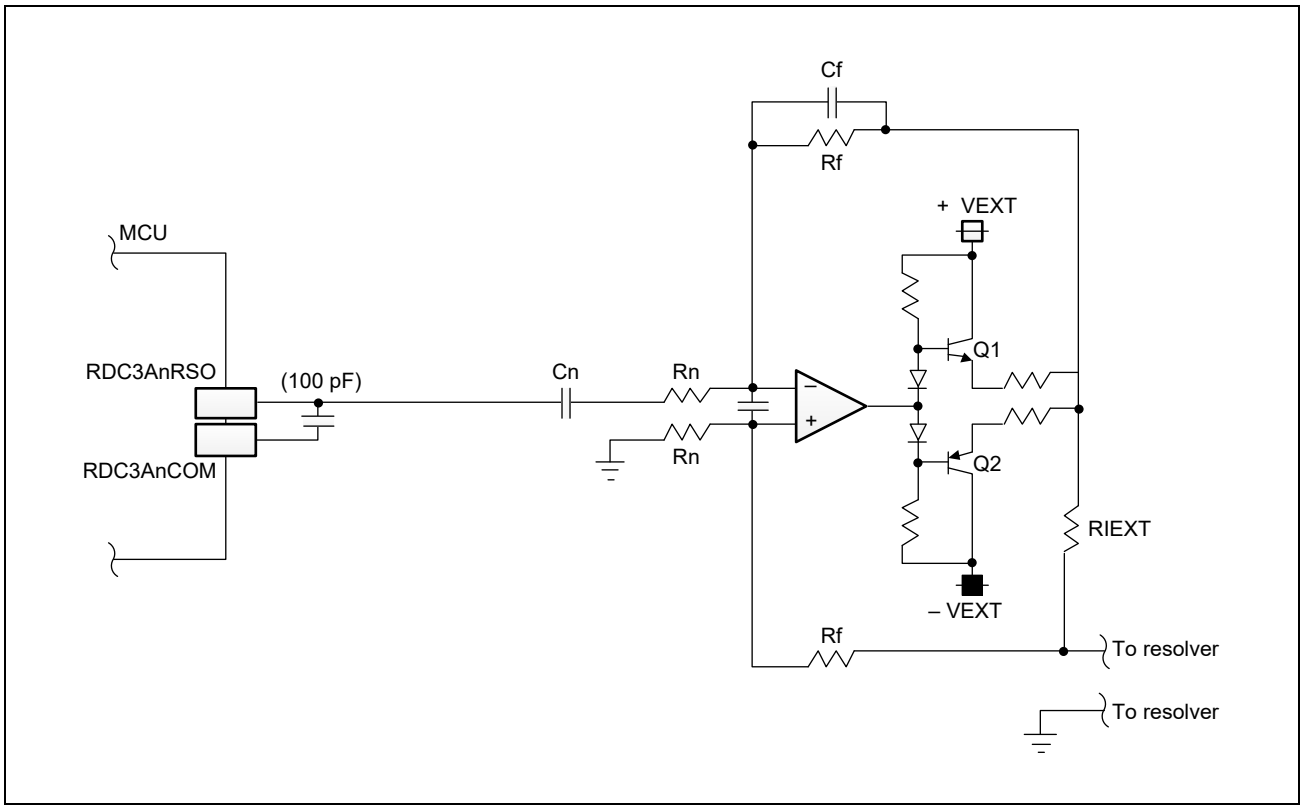

Figure 26.33 Equivalent Circuit Example of Excitation Voltage Booster Amplifier Circuit (Dual Power Supply)

26.6.2.3 Method for Setting Constants of Excitation Voltage Booster Amplifier Circuit

Both of the excitation voltage booster amplifier circuits shown as reference use the current control type. This type is effective in preventing secondary failure caused by short-circuit accident between excitation lines. Also, it is expected to improve the S/N ratio of resolver signal by boosting voltage.

Step (1): Calculate the excitation current by setting the excitation voltage based on the voltage of external power supply.

VREF = IREF × ZRO

Step (2): Calculate the circuit constants based on the excitation current.

IREF = (VRSO × Rf) / RIEXT × Rn)

[Legend]

+VEXT, – VEXT: External power supplies (for the excitation voltage booster amplifier circuit)

IREF : Excitation current of the resolver

RIEXT : Resistor for setting excitation current of the resolver

VREF : Excitation voltage for the resolver

ZRO : Input impedance of the resolver (specification value)

VRSO : RDC3AnRSO pin output voltage (= 2Vp-p)

<Settings conditions>

- RIEXT ≤ (ZRO / 10) [Ω]
- Rf ≥ 50 kΩ, Cn × Rn ≥ 5×10^{-4}[s], Cf × Rf ≤ 5×10^{-6}[s]
- Use the same power supply for an operational amplifier as that for the transistor buffer.

26.6.3 Resolver Excitation Signal External Input Method

26.6.3.1 Resolver Excitation Signal Input Circuit (Single Power Supply)

Figure 26.34 shows an equivalent circuit when the resolver excitation signal is input from an external source (single power supply). **Table 26.66** lists additional resistor values (reference values) of the resolver excitation signal external input circuit with a single power supply.

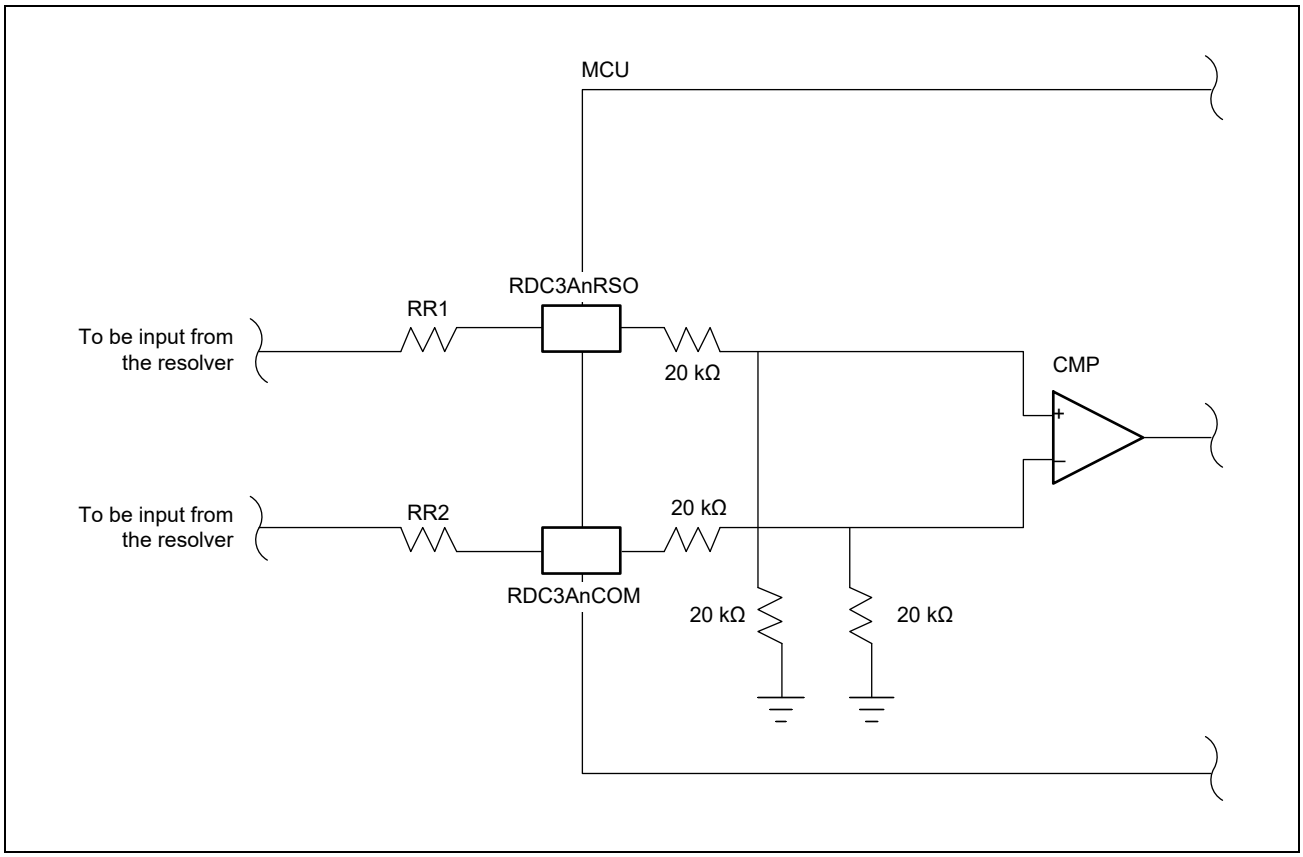

Figure 26.34 Resolver Excitation Signal External Input Circuit (With Single Power Supply)

Table 26.66 Additional Resistor Value for Resolver Excitation Signal External Input Circuit (Reference Values, Single Power Supply)

+VEXT	RR1, RR2
5 V system	0 kΩ
12 V system	47 kΩ
24 V system	120 kΩ

26.6.3.2 Resolver Excitation Signal Input Circuit (Dual Power Supply)

Figure 26.35 shows an equivalent circuit when the resolver excitation signal is input from an external source (dual power supply). Adjust Rn1 and Rn2 so that the voltage on the RDC3AnCOM pin does not exceed 5V.

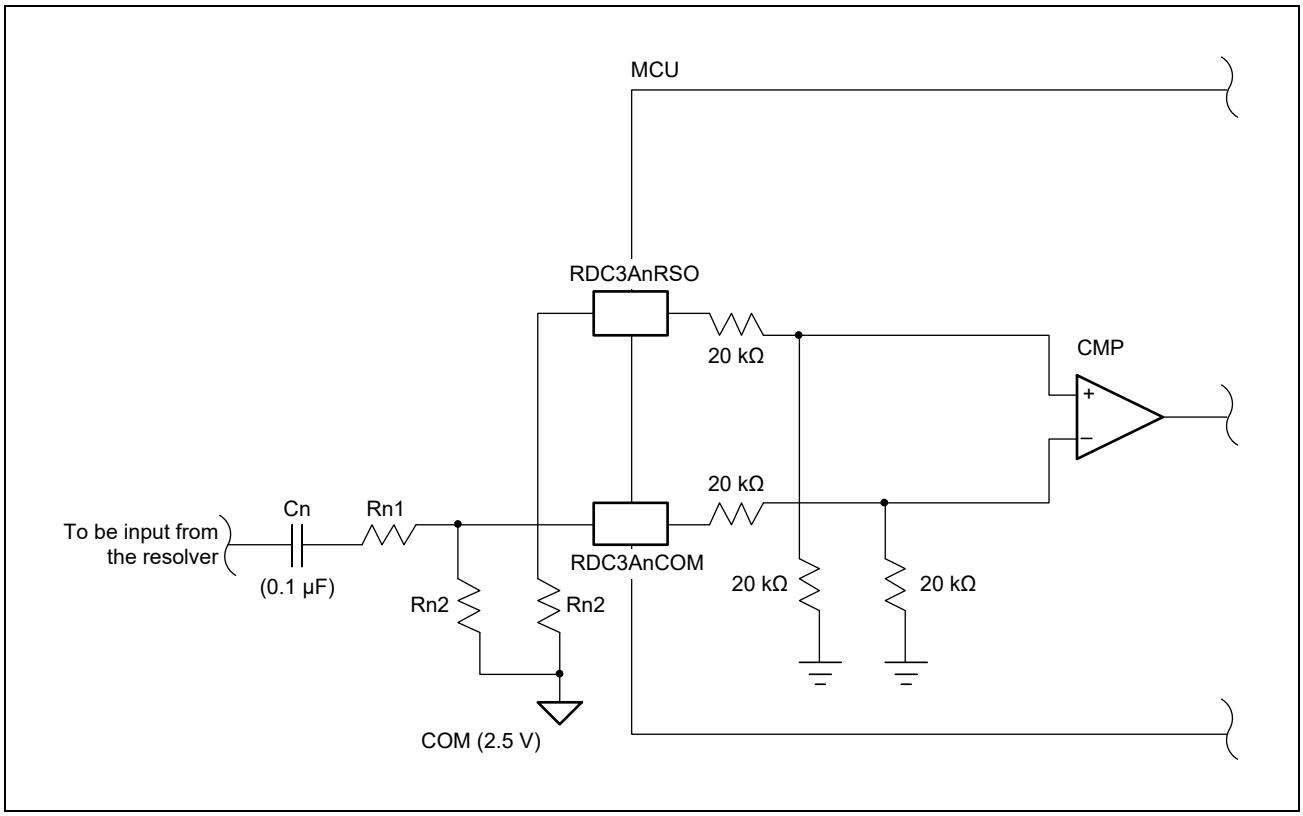

Figure 26.35 Resolver Excitation Signal External Input Circuit (with Dual Power Supply)

26.7 Usage Notes

When the resolver is used as a motor sensor, the resolver signal is affected by various types of noises depending on the drive control configuration of the motor. To perform R/D conversion successfully, sufficient S/N ratio of the resolver signal is required.

This RDC is a highly responsive R/D conversion module. Although considerations have been made for noise immunity, the RDC by itself is not designed to accommodate all noise environmental factors. Appropriate peripheral circuits need to be considered depending on the environment in which the module is deployed. The following describes the specific countermeasures for noise in [Countermeasure I] to [Countermeasure VIII] as reference.

26.7.1 Countermeasures for Magnetic Disturbance Noise

If the leakage flux of the motor passes through the resolver, the resolver signal behaves as if the angle changes, resulting in malfunction.

[Countermeasure I]

When installing the motor and resolver, use the configuration and material that block the magnetic loop passing through the resolver (magnetic shield effect) to minimize the leakage flux of the motor that passes through the resolver.

[Countermeasure II]

If the leakage flux of the motor that passes through the resolver cannot be completely avoided, raise the resolver excitation voltage (current) to improve the S/N ratio of the original signals.

26.7.2 Countermeasures for Electric Disturbance Noise

The electric disturbance (spike noise, and so on) caused by the PWM drive of the motor is extremely large, and affects all power systems, such as the excitation signal lines of resolver and power supply line, via various paths.

[Countermeasure III]

Insert a common mode/normal mode filter into the resolver excitation lines to remove the spike noise components. Generally, the low-impedance excitation line hardly has noise and the countermeasure is less needed.

[Countermeasure IV]

Insert a common mode/normal mode filter into the resolver signal lines (RDC3AnS1-RDC3AnS3, RDC3AnS2-RDC3AnS4) to remove the spike noise components. Select the time constant that takes effect only on noise and leaves the original resolver signal waveform undistorted. In addition, ensure that the electric noise waveform of the RDC3AnS1 to RDC3AnS4 pins viewed from RVSS (ground) are in phase.

If an error due to electric external disturbance noise persists after this countermeasure is taken, keeping the resolver signal level low can be effective.

[Countermeasure V]

If necessary, insert a bypass capacitor to the power supply (RVCC) line.

26.7.3 Other General Measures

[Countermeasure VI]

Use a shielded twisted pair cable for resolver wiring. Shielded terminals must be treated collectively on the circuit side (grounded to GND). The cable must be routed separately from the motor cable.

[Countermeasure VII]

Enhance the GND system for low impedance to reduce common impedance noise and to provide shielding effect. Another possible measure is to fix the potential of the motor driver radiator and motor case to the control-system ground potential.

[Countermeasure VIII]

Physically separate the motor driver from the sensor circuit and cover each of them with a shield case.

Section 27 A/D Converter (ADCC)

This section contains a generic description of the A/D Converter (ADCC).

The first part describes all RH850/C1M-A specific properties such as the number of units, register base address, etc. The subsequent parts describe the functions and registers of ADCC.

27.1 Features of RH850/C1M-A ADCC

27.1.1 Number of Units

This LSI has the following number of units of ADCC.

Table 27.1 Number of Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of units	3	3
Name	ADCCn (n = 0, 1, 2)	ADCCn (n = 0, 1, 2)

Table 27.2 Indices

Index	Meaning
n	Throughout this section, the individual ADCC units are identified by the index “n” (n = 0, 1, 2), for example, ADCCnVCRj for the virtual channel register j.
j	Throughout this section, the number of data registers and virtual channels of ADCC is indicated by the index “j” (j = 0 to 39), for example, ADCCnDRj for the data register j.
k	Throughout this section, the number of each T&H channel of ADCC is indicated by the index “k” (k = 0 to 5).
p	Throughout this section, the physical channel group is identified by the index “p” (p = 0 to 3).
q	Throughout this section, the physical sub-channel group identified by the index “q” (q = 0 to 3).
x	Throughout this section, the scan group is identified by the index “x” (x = 0 to 4).
y	Throughout this section, the number of A/D timers is indicated by the index “y” (y = 3 to 4).

27.1.2 Register Base Address

ADCC base addresses are listed in the following table.

ADCC register addresses are given as offsets from the individual base address.

Table 27.3 Register Base Address

Base Address Name	Base Address
<ADCC0_base>	$FFF2\ 0000_H$
<ADCC1_base>	$FF92\ 1000_H$
<ADCC2_base>	$FFF2\ 2000_H$

27.1.3 Clock Supply

ADCC clock is listed in following table.

Table 27.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
ADCCn	PCLK	CLK_LSB (low-speed peripheral clock)
	clkad	CLKC_LSB (non-modulated low-speed peripheral clock)

27.1.4 Interrupt Requests

ADCC interrupt requests are listed in the following table. Scan group x end interrupt of ADCCn is expressed as ADInx.

Table 27.5 Interrupt Requests

Interrupt Name (Outline)		Interrupt Number	DMA Trigger Number		DTS Trigger Number	
			1st	2nd	1st	2nd
ADCC0						
ADI00	ADCC0 scan group 0 end interrupt	243	0	—	0	—
ADI01	ADCC0 scan group 1 end interrupt	244	1	—	1	—
ADI02	ADCC0 scan group 2 end interrupt	245	2	—	2	—
ADI03	ADCC0 scan group 3 end interrupt	246	3	—	3	—
ADI04	ADCC0 scan group 4 end interrupt	247	4	—	4	—
ADE0	ADCC0 AD error interrupt	258	—	—	—	—
ADCC1						
ADI10	ADCC1 scan group 0 end interrupt	248	5	—	5	—
ADI11	ADCC1 scan group 1 end interrupt	249	6	—	6	—
ADI12	ADCC1 scan group 2 end interrupt	250	7	—	7	—
ADI13	ADCC1 scan group 3 end interrupt	251	8	—	8	—
ADI14	ADCC1 scan group 4 end interrupt	252	9	—	9	—
ADE1	ADCC1 AD error interrupt	259	—	—	—	—
ADCC2						
ADI20	ADCC2 scan group 0 end interrupt	253	10	—	10	—
ADI21	ADCC2 scan group 1 end interrupt	254	11	—	11	—
ADI22	ADCC2 scan group 2 end interrupt	255	12	—	12	—
ADI23	ADCC2 scan group 3 end interrupt	256	13	—	13	—
ADI24	ADCC2 scan group 4 end interrupt	257	14	—	14	—
ADE2	ADCC2 AD error interrupt	260	—	—	—	—

—: No number is assigned.

Note: 1st: Primary channel, 2nd: Secondary channel

27.1.5 Reset Sources

ADCC reset sources are listed in the following table. ADCC is initialized by these reset sources.

Table 27.6 Reset Source

Unit	Reset Source
ADCCn	Any reset source

27.1.6 External Input/Output Signals

External input/output signals of ADCC and pin assignment of track and hold (T&H) circuit are listed in the following table.

External output pins are not assigned for ADCC.

Table 27.7 External Input/Output Signals (1/2)

Unit Signal Name	Outline	Alternative Port Signal	Assignment of T & H circuit	Product	
				C1M-A2 252 pin	C1M-A1 176 pin
AVcc0	ADCC0 power supply pin	A0VCC	—	√	√
AVss0	ADCC0 ground pin	A0VSS	—	√	√

27.1.7 Rule for Naming Analog Input Pins

An analog input pin name is represented by a unit signal name or alternative port signal name. An analog input pin is called a physical channel. The name of an analog input pin is represented by a physical channel group number and physical subchannel number.

A rule for naming the unit signal name and alternative port signal name of an analog input pin is as follows:

Unit signal name: AN + Unit number + Physical channel group + Physical subchannel

Alternative port signal name: ADCC + Unit number + I + Physical channel group + Physical subchannel

For example, AN120 (ADCC1I20) for ADCC1, physical channel group 2, and physical subchannel 0.

27.2 Overview

27.2.1 Functional Overview

ADCC has the following features.

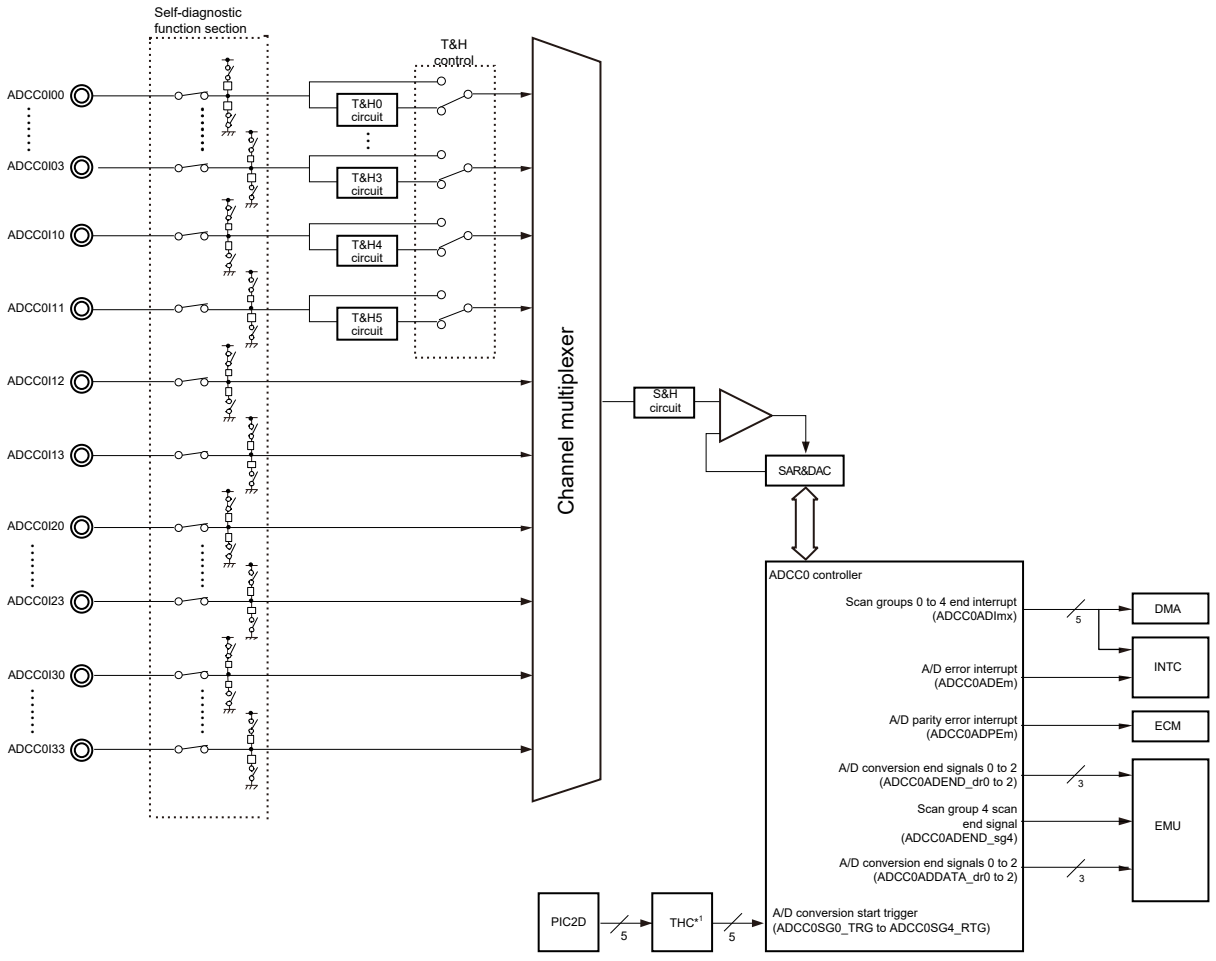

Table 27.8 Functional Overview of ADCC

Item	Outline
Resolution	12 bits
A/D converter	Successive approximation method
Conversion speed	1.0 μs per channel
Number of virtual channels (virtual channel)	ADCC0: 40 channels (virtual ch0 to 39) ADCC1: 40 channels (virtual ch0 to 39) ADCC2: 40 channels (virtual ch0 to 39)
Number of scan groups (SG)	ADCC0: 5 groups (SG0 to 4) ADCC1: 5 groups (SG0 to 4) ADCC2: 5 groups (SG0 to 4)
A/D conversion mode	Each ADCC has four A/D conversion modes: • Normal A/D conversion • A/D conversion with a hold value • Self-diagnosis for A/D conversion circuits • Addition A/D conversion
Scan mode	Each ADCC has two scan modes: • Multicycle scan mode: Specified number of scans are executed. • Continuous scan mode: Scans are repeatedly executed without limit.
A/D conversion start trigger	Each ADCC has three A/D conversion start triggers: • Hardware trigger (HW trigger) • Software trigger (SW trigger) • A/D timer trigger (only supported by SG3 and SG4) **Note:** When you use the simultaneous track and hold function, A/D timer trigger cannot be used.
Priority of scan group processing	A processing for a scan group can interrupt an ongoing processing for another scan group. The priority is as follows: High Low SG4 > SG3 > SG2 > SG1 > SG0
Suspend function	Each ADCC has three suspend methods: • Synchronous suspend • Asynchronous suspend • Synchronous and asynchronous combination suspend Make sure that you select asynchronous suspend when using the simultaneous track and hold function.
Interrupts and DMA and DTS transfers function	Each ADCC can make the following interrupts: • Scan group × end interrupt • A/D error interrupt DMA and DTS transfers can be started by a scan group × end interrupt signal.
Function for transferring results of A/D conversion to EMU	Each ADCC can output the following signals to the EMU. • A/D conversion end signal (virtual ch0 to 2) • A/D converted data (virtual ch0 to 2) • SG4 scan end signal
Self-diagnosis function	Each ADCC has the following self-diagnosis functions: • Self-diagnosis for A/D conversion circuits • Pin-level self-diagnosis • Self-diagnosis for wiring-break detection

27.2.2 Block Diagram

Figure 27.1, **Figure 27.2**, and **Figure 27.3** show the block diagram of ADCC0, ADCC1, and ADCC2, respectively.

Figure 27.3 ADCC2 Block Diagram

(4) ADCC functional block diagram

Figure 27.4 shows a functional block diagram of the ADCC.

Note 1. T&H controller

Figure 27.4 ADCC Functional Block Diagram

27.2.3 Virtual Channel (Virtual ch)

A virtual channel is an analog input pathway which can select an analog input pin (physical channel), T&Hk circuit output, or A/D conversion circuit self-diagnosis output. Each ADCC has 40 virtual channels. The result of A/D conversion is stored in the data register whose number is the same as the virtual channel.

The following diagram is an image of virtual channels.

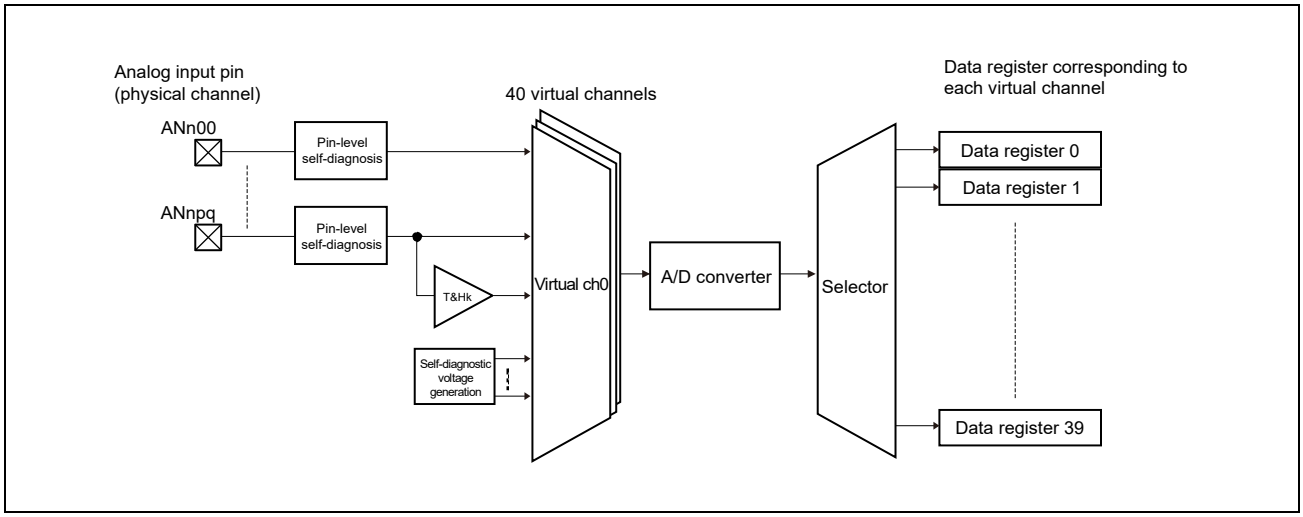

Figure 27.5 Image Diagram of Virtual Channels

27.2.4 Scan Group (SG)

A scan group is a group of multiple virtual channels.

Each ADCC has five scan groups. The priority of A/D conversion is as follows:
SG4 > SG3 > SG2 > SG1 > SG0

SGx can group sequential virtual channels. Specify the grouping settings with a start pointer (ADCCnSGVCSPx register) and an end pointer (ADCCnSGVCEPx register). Disable A/D conversion trigger input for unused scan groups.

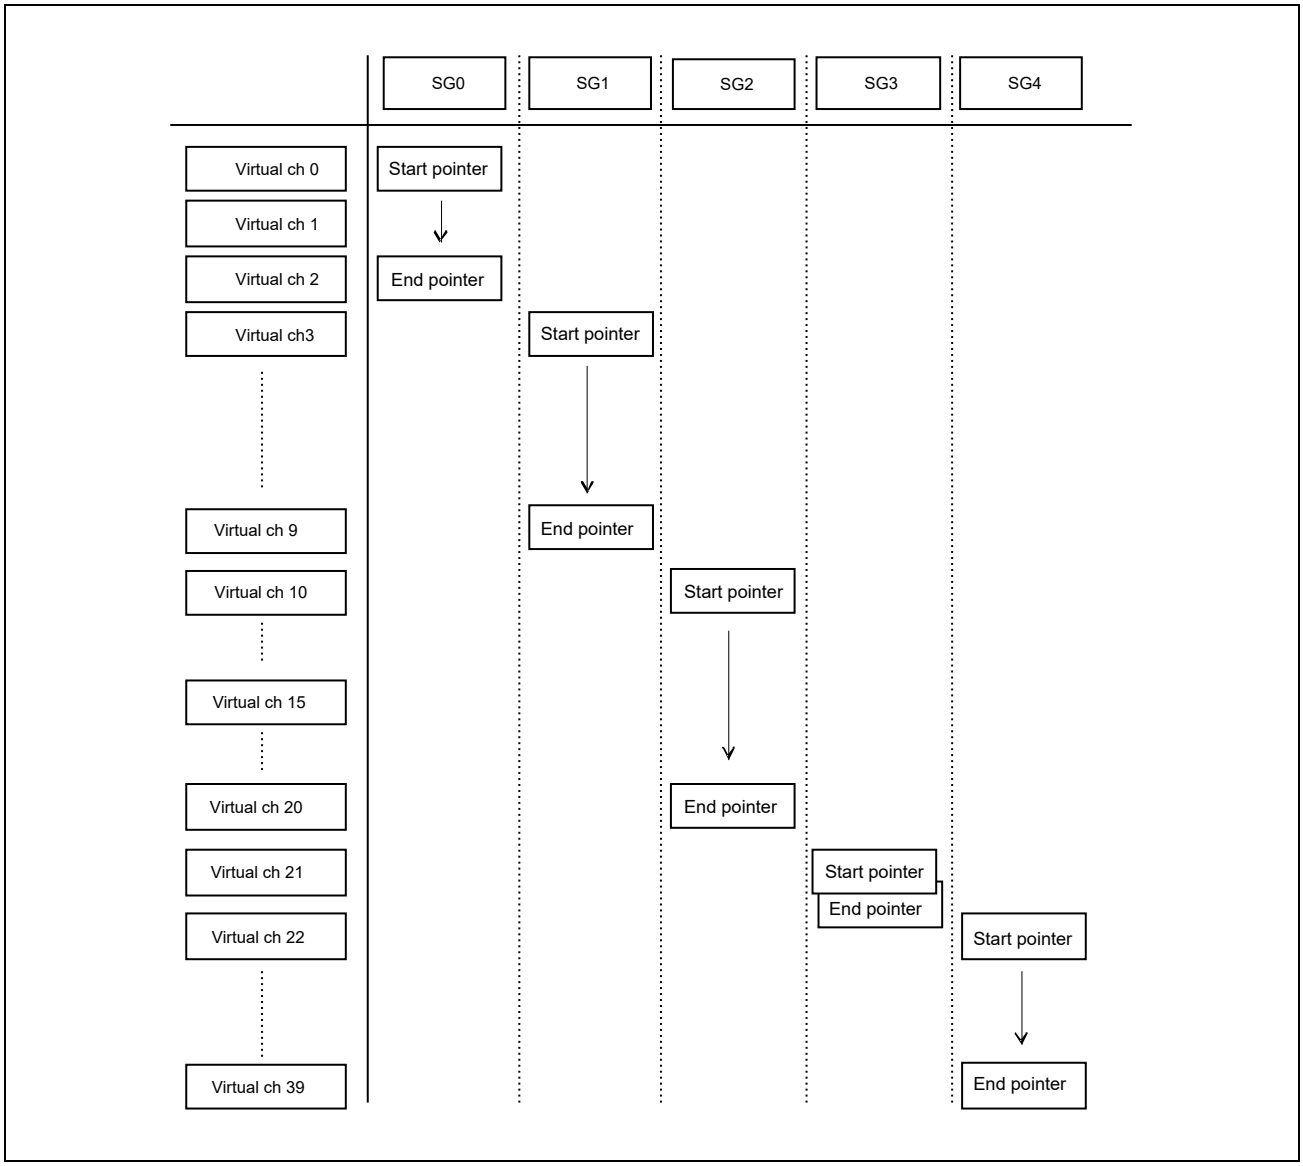

Figure 27.6 Example of SG Assignment

27.3 Register

27.3.1 List of Registers

ADCC registers are listed in the following table.

For <ADCC0_base> and <ADCCn_base>, see **Section 27.1.2, Register Base Address**.

Table 27.9 List of Registers (1/2)

Module Name	Register Name	Symbol	Address
ADCCn	A/D synchronization start control register	ADCC0ADSYNSTCR	<ADCC0_base> + 300_H
ADCCn	A/D timer synchronization start control register	ADCC0ADTSYNSTCR	<ADCC0_base> + 304_H
ADCCn	Virtual channel register j	ADCCnVCRj	<ADCCn_base> + j × 4_H
ADCCn	Data register j	ADCCnDRj	<ADCCn_base> + 100_H + j × 2_H
ADCCn	Data supplementary information register j	ADCCnDIRj	<ADCCn_base> + 200_H + j × 4_H
ADCCn	A/D halt register	ADCCnADHALTR	<ADCCn_base> + 380_H
ADCCn	A/D control register 1	ADCCnADCR1	<ADCCn_base> + 384_H
ADCCn	A/D control register 2	ADCCnADCR2	<ADCCn_base> + 398_H
ADCCn	T&H sampling start control register	ADCCnTHSMPSTCR	<ADCCn_base> + 400_H
ADCCn	T&H stop control register	ADCCnTHSTPCR	<ADCCn_base> + 404_H
ADCCn	T&H control register	ADCCnTHCR	<ADCCn_base> + 408_H
ADCCn	T&H group A hold start control register	ADCCnTHAHLDSTCR	<ADCCn_base> + 410_H
ADCCn	T&H group B hold start control register	ADCCnTHBHLDSTCR	<ADCCn_base> + 414_H
ADCCn	T&H group A control register	ADCCnTHACR	<ADCCn_base> + 420_H
ADCCn	T&H group B control register	ADCCnTHBCR	<ADCCn_base> + 424_H
ADCCn	T&H enable register	ADCCnTHER	<ADCCn_base> + 430_H
ADCCn	T&H group select register	ADCCnTHGSR	<ADCCn_base> + 434_H
ADCCn	Safety control register	ADCCnSFTCR	<ADCCn_base> + $3C0_H$
ADCCn	Pin level self-diagnostic control register	ADCCnTDCR	<ADCCn_base> + $3C4_H$
ADCCn	Wiring-break detection control register	ADCCnODCR	<ADCCn_base> + $3C8_H$
ADCCn	Upper-limit/lower-limit table register 0	ADCCnULLMTBR0	<ADCCn_base> + $3CC_H$
ADCCn	Upper-limit/lower-limit table register 1	ADCCnULLMTBR1	<ADCCn_base> + $3D0_H$
ADCCn	Upper-limit/lower-limit table register 2	ADCCnULLMTBR2	<ADCCn_base> + $3D4_H$
ADCCn	Error clear register	ADCCnECR	<ADCCn_base> + $3D8_H$
ADCCn	Upper-limit/lower-limit error register	ADCCnULER	<ADCCn_base> + $3DC_H$
ADCCn	Overwrite error register	ADCCnOWER	<ADCCn_base> + $3E0_H$
ADCCn	Parity error register	ADCCnPER	<ADCCn_base> + $3E4_H$
ADCCn	ID error register	ADCCnIDER	<ADCCn_base> + $3E8_H$
ADCCn	Scan group x start control register	ADCCnSGSTCRx	<ADCCn_base> + x × 80_H + 480_H
ADCCn	A/D timer y start control register	ADCCnADTSTCRy	<ADCCn_base> + y × 80_H + 488_H
ADCCn	A/D timer y end control register	ADCCnADTENDCRy	<ADCCn_base> + y × 80_H + $48C_H$
ADCCn	Scan group x control register	ADCCnSGCRx	<ADCCn_base> + x × 80_H + 490_H
ADCCn	Scan group x start virtual channel pointer	ADCCnSGVCSPx	<ADCCn_base> + x × 80_H + 494_H
ADCCn	Scan group x end virtual channel pointer	ADCCnSGVCEPx	<ADCCn_base> + x × 80_H + 498_H
ADCCn	Scan group x multicycle register	ADCCnSGMCYCRx	<ADCCn_base> + x × 80_H + $49C_H$
ADCCn	Scan group x virtual channel pointer register	ADCCnSGVCPRx	<ADCCn_base> + x × 80_H + $4A0_H$
ADCCn	Scan group x status register	ADCCnSGSRx	<ADCCn_base> + x × 80_H + $4A4_H$
ADCCn	A/D timer initial phase register y	ADCCnADTIPRy	<ADCCn_base> + y × 80_H + $4A8_H$

Table 27.9 List of Registers (2/2)

Module Name	Register Name	Symbol	Address
ADCCn	A/D timer cycle register y	ADCCnADTPRRy	<ADCCn_base> + y × 80_H + $4AC_H$
ADCCn	Scan group x upper-limit/lower-limit table select register	ADCCnULLMSRx	<ADCCn_base> + x × 80_H + $4B0_H$
ADCCn	Virtual channel threshold table register 0	ADCCnVCULLMTBR0	<ADCCn_base> + 700_H
ADCCn	Virtual channel threshold table register 1	ADCCnVCULLMTBR1	<ADCCn_base> + 704_H
ADCCn	Virtual channel threshold table register 2	ADCCnVCULLMTBR2	<ADCCn_base> + 708_H
ADCCn	Virtual channel threshold table register 3	ADCCnVCULLMTBR3	<ADCCn_base> + $70C_H$
ADCCn	Virtual channel threshold table register 4	ADCCnVCULLMTBR4	<ADCCn_base> + 710_H
ADCCn	Virtual channel threshold table register 5	ADCCnVCULLMTBR5	<ADCCn_base> + 714_H
ADCCn	Virtual channel threshold table register 6	ADCCnVCULLMTBR6	<ADCCn_base> + 718_H

27.3.2 ADCC0ADSYNSTCR ─ A/D Synchronization Start Control Register

This is a register that controls simultaneous start of A/D conversion for each scan group of ADCC0, ADCC1, and ADCC2. Only ADCC0 has this register.

Access: This register can be written in 8-bit units.

Address: <ADCC0_base> + 300_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADSTART
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.10 ADCC0ADSYNSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	ADSTART	This bit simultaneously starts A/D conversion for each scan group of ADCC0, ADCC1, and ADCC2. 0: Nothing occurs. (A written value of 0 is ignored.) 1: A/D conversion starts. Enable the SG synchronization start enable (ADCCnSGCRx.ADSTARTE bit) of the SG for which you want to simultaneously start A/D conversion.

27.3.3 ADCC0ADTSYNSTCR ─ A/D Timer Synchronization Start Control Register

This is a register that controls simultaneous start of count operation for each A/D timer of ADCC0, ADCC1, and ADCC2. Only ADCC0 has this register.

Access: This register can be written in 8-bit units.

Address: <ADCC0_base> + 304_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADTSTART
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.11 ADCC0ADTSYNSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	ADTSTART	This bit simultaneously starts count operation for each A/D timer of ADCC0, ADCC1, and ADCC2. 0: Nothing occurs. (A written value of 0 is ignored.) 1: A/D timer count starts. Enable the A/D timer synchronization start enable (ADCCnSGCRx.ADTSTARTE bit) of the A/D timer for which you want to simultaneously start count operation.

27.3.4 ADCCnVCRj ─ Virtual Channel Register j

This is a register for specifying the virtual channel settings.

Access: This register can be read or written in 32-bit units.

Address: <ADCCn_base> + j × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VCULME	VCLLME	—	—	—	VCULLMTBS[2:0]			—	—	—	—	—	—	PUE	PDE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 27.12 ADCCnVCRj Register Contents (1/3)

Bit Position	Bit Name	Function
31	VCULME	Virtual channel result exceeded upper limit notification enable 0: Notification of the result of A/D conversion on a virtual channel exceeding the upper limit is not given. 1: Notification of the result of A/D conversion on a virtual channel exceeding the upper limit is given.
30	VCLLME	Virtual channel result below limit notification enable 0: Notification of the result of A/D conversion on a virtual channel falling below the lower limit is not given. 1: Notification of the result of A/D conversion on a virtual channel falling below the lower limit is given.
29 to 27	Reserved	When read, the value after reset is read. When written, write the value after reset.
26 to 24	VCULLMTBS[2:0]	Virtual channel upper-/lower-limit threshold table register select These bits select the virtual channel upper- and lower-limit threshold table registers containing the values to be compared with the results of conversion. 0_H: ADCCnVCULLMTBR0 is selected 1_H: ADCCnVCULLMTBR1 is selected 2_H: ADCCnVCULLMTBR2 is selected 3_H: ADCCnVCULLMTBR3 is selected 4_H: ADCCnVCULLMTBR4 is selected 5_H: ADCCnVCULLMTBR5 is selected 6_H: ADCCnVCULLMTBR6 is selected 7_H: Setting prohibited
23 to 18	Reserved	When read, the value after reset is read. When written, write the value after reset.

Table 27.12 ADCCnVCRj Register Contents (2/3)

Bit Position	Bit Name	Function
17	PUE	Physical channel I/O pull-up resistor control 0_H: The pull-up resistor connected to the I/O pin of the relevant physical channel is switched off. 1_H: The pull-up resistor connected to the I/O pin of the relevant physical channel is switched on. When PUE = 1, the pull-up resistor connected to the I/O pin of the physical channel set in GCTRL[5:0] for the given virtual channel is switched on whenever wiring-break detection and the wiring-break detection self-diagnosis circuit are used. Setting PDE and PUE to 1 at the same time is prohibited. Note 1. Use of track-and-hold is prohibited while PUE = 1. Note 2. Use of the pin-level self-diagnosis function is prohibited while PUE = 1. Note 3. When setting ADCCnVCRj.PUE to 1_B, ADCCnTDCR.TDE should be set to 0_B. Similarly, when setting ADCCnTDCR.TDE to 1_B, PUE of ADCCnVCRj for the virtual channel to handle A/D conversion should be set to 0_B while ADCCnTDCR.TDE = 1_B.
16	PDE	Physical channel I/O pull-down resistor control 0_H: The pull-down resistor connected to the I/O pin of the relevant physical channel is switched off. 1_H: The pull-down resistor connected to the I/O pin of the relevant physical channel is switched on. When PDE = 1, the pull-down resistor connected to the I/O pin of the physical channel set as the given virtual channel is switched on whenever wiring-break detection and the wiring-break detection self-diagnosis circuit are used. Setting PDE and PUE to 1 at the same time is prohibited. Note 1. Use of track-and-hold is prohibited while PDE = 1. Note 2. Use of the pin-level self-diagnosis function is prohibited while PDE = 1. Note 3. When setting ADCCnVCRj.PDE to 1_B, ADCCnTDCR.TDE should be set to 0_B. Similarly, when setting ADCCnTDCR.TDE to 1_B, PDE of ADCCnVCRj for the virtual channel to handle A/D conversion should be set to 0_B while ADCCnTDCR.TDE = 1_B.
15 to 13	CNVCLS[2:0]	These bits set the conversion mode: 0_H: Normal A/D conversion 1_H: Hold value A/D conversion 3_H: Self-diagnosis for A/D conversion circuits 4_H: Addition A/D conversion Other than above: Setting prohibited
12 to 8	Reserved	When read, the value after reset is read. When written, write the value after reset.
7	ADIE	This bit sets whether to output a scan group x end interrupt signal (ADInx). 0: Output prohibited 1: Output allowed
6	Reserved	When read, the value after reset is read. When written, write the value after reset.

Table 27.12 ADCCnVCRj Register Contents (3/3)

Bit Position	Bit Name	Function
5 to 0	GCTRL[5:0]	These bits specify the A/D conversion settings for each conversion mode. • For normal A/D conversion (CNVCLS[2:0] = 0_H) GCTRL[5:2]: Physical channel group GCTRL[1:0]: Physical subchannel • For A/D conversion of the voltage held by the T&H circuit (CNVCLS[2:0] = 1_H) 00_H: The voltage held by T&H0 is A/D converted. 01_H: The voltage held by T&H1 is A/D converted. 02_H: The voltage held by T&H2 is A/D converted. 03_H: The voltage held by T&H3 is A/D converted. 04_H: The voltage held by T&H4 is A/D converted. 05_H: The voltage held by T&H5 is A/D converted. Other than above: Setting prohibited. • For A/D converter self-diagnosis (CNVCLS[2:0] = 3_H) 00_H: AVREFH × 0 04_H: AVREFH × 1/4 08_H: AVREFH × 1/2 $0C_H$: AVREFH × 3/4 10_H: AVREFH × 1 Other than above: Setting prohibited. • For additive A/D conversion (CNVCLS[2:0] = 4_H) GCTRL[5:2]: Physical channel group GCTRL[1:0]: Physical subchannel

CAUTION

To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.5 ADCCnDRj ─ Data Register j

This is a register that stores A/D conversion result data. This register can be read in 32-bit units (ADCCnDRj and ADCCnDRj + 1) because the ADCCnDRj register and the ADCCnDRj + 1 register are aligned successively.

When the read and clear enable (ADCCnSFTCR.RDCLRE bit) is 1 (enabled), be sure to read this register in 32-bit units (ADCCnDRj_j + 1). For the structure of the register, see **Figure 27.7, Data Register Alignment for 32-bit Read**.

Access: This register can be read in 16-bit units.

Address: <ADCCn_base> +100_H + j × 2_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRj[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.13 ADCCnDRj Register Contents

Bit Position	Bit Name	Function
15 to 0	DRj[15:0]	Data register These bits store A/D conversion result data.

CAUTION

Note that ADCCnDIRj.WFLG and ADCCnDIR(j+1).WFLG are cleared by reading ADCCnDRj in 16-bit units.

The ADCCnADCR2.DFMT bit can be used for changing the format to the signed fixed-point format or signed integer format. The following tables show data arrangement for each format. Convert twice and Convert four times in the table are data formats for addition A/D conversion.

- For signed fixed-point format (ADCCnADCR2.DFMT = 0)

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once	S	A/D conversion result												0	0	0
Convert twice	S	A/D conversion result (twice additional value)													0	0
Convert four times	S	A/D conversion result (four times additional value)														0

Position of decimal point

- For signed integer format (ADCCnADCR2.DFMT = 1)

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Convert once	S	S	S	S	A/D conversion result											
Convert twice	S	S	S	A/D conversion result (twice additional value)												
Convert four times	S	S	A/D conversion result (four times additional value)													

Position of decimal point

S	: Sign bit (always 0)
0	: Zero extension

When you want to read the data register j in 32-bit units, read ADCCnDRj_j + 1. The data alignment of ADCCnDRj_j + 1 is as follows.

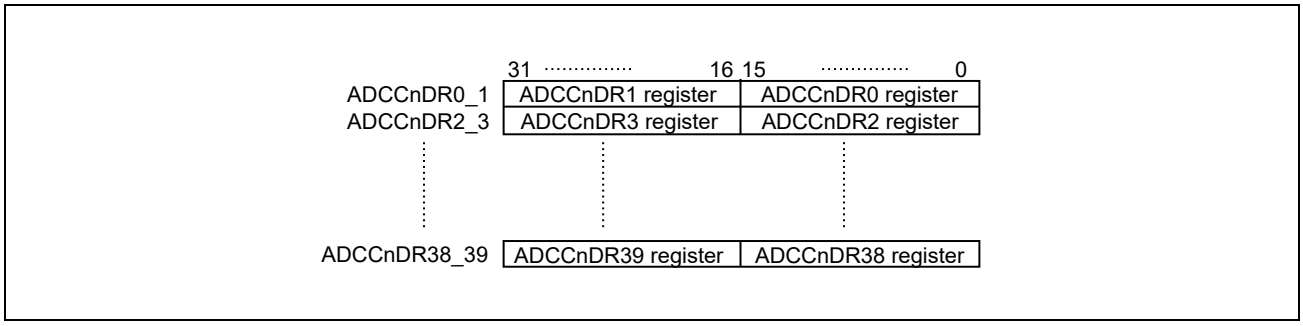

Figure 27.7 Data Register Alignment for 32-bit Read

27.3.6 ADCCnDIRj – Data Supplementary information Register j

This is a register that stores supplementary information of data register (ADCCnDRj register) and A/D converted value. This register must always be read as 32-bit data.

When the read and clear setting (ADCCnSFTCR.RDCLRE bit) is 1, if the ADCCnDRj or ADCCnDIRj register is read, the ADCCnDRj and ADCCnDIRj registers are all cleared to 0. The ADCCnDIRj.WFLG bit is cleared when the ADCCnDRj or ADCCnDIRj register is read regardless of the read and clear setting (ADCCnSFTCR.RDCLRE bit).

Access: This register can be read in 32-bit units.

Address: <ADCCn_base> +200_H + j × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	WFLG	PRTY	—	—	—	ID[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRj[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.14 ADCCnDIRj Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is read.
25	WFLG	Write Flag Setting condition: An A/D converted value is stored in ADCCnDRj. Clearing condition: The ADCCnDRj or ADCCnDIRj register is read.
24	PRTY	Parity Parity bit (even parity) for the bits of the ADCCnDRj register and the ADCCnDIR.ID[4:0] bits
23 to 21	Reserved	When read, the value after reset is read.

Table 27.14 ADCCnDIRj Register Contents (2/2)

Bit Position	Bit Name	Function
20 to 16	ID[4:0]	ID information: Hold the physical channel information which has actually been A/D converted. • For normal A/D conversion (CNVCLS[2:0] = 0_H) ID[4:2]: Indicate the physical channel group. ID[1:0]: Indicate the physical sub-channel. • For A/D conversion of the voltage held by the T&H circuit (CNVCLS[2:0] = 1_H) ID[2:0]: Indicate the A/D converted value of the voltage held by the T&H circuit. 0_H: The voltage held by T&H0 is A/D converted. 1_H: The voltage held by T&H1 is A/D converted. 2_H: The voltage held by T&H2 is A/D converted. 3_H: The voltage held by T&H3 is A/D converted. 4_H: The voltage held by T&H4 is A/D converted. 5_H: The voltage held by T&H5 is A/D converted. The other ID bits are fixed to 0. • For self-diagnostic A/D conversion by the AD core (CNVCLS[2:0] = 3_H) ID[4:0]: Indicate the AD-core self-diagnosis level. 10_H: AVREFH × 1 $0C_H$: AVREFH × 3/4 08_H: AVREFH × 1/2 04_H: AVREFH × 1/4 00_H: AVREFH × 0 • For additive A/D conversion mode (CNVCLS[2:0] = 4_H) ID[4:2]: Indicate the physical channel group. ID[1:0]: Indicate the physical sub-channel.
15 to 0	DRj[15:0]	Data register These bits store the same A/D conversion result data as the ADCCnDRj register.

27.3.7 ADCCnADHALTR ─ A/D Halt Register

This is a register for terminating each ADCC.

Access: This register can be written in 8-bit units.

Address: <ADCCn_base> + 380_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	HALT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.15 ADCCnADHALTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	HALT	This bit forcibly terminates all the scan groups, A/D conversions, and A/D timers. 0: Nothing occurs. (A written value of 0 is ignored.) 1: Termination is performed.

27.3.8 ADCCnADCR1 ─ A/D Control Register 1

This is a register for setting ADCC common control (suspend method).

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + 384_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SUSMTD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 27.16 ADCCnADCR1 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When written, write the value after reset.
1, 0	SUSMTD[1:0]	These bits select the suspend method. 0: Synchronous suspend 1: Synchronous and asynchronous combination suspend 2: Asynchronous suspend 3: Setting prohibited

CAUTION

To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.9 ADCCnADCR2 ─ A/D Control Register 2

This is a register for setting ADCC common control (data format and addition count for addition A/D conversion).

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + 398_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	DFMT	—	—	—	ADDNT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R/W

Table 27.17 ADCCnADCR2 Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is read. When written, write the value after reset.
4	DFMT	This bit is the data format setting for the ADCCnDRj and ADCCnDIRj register. 0: Signed fixed-point format 1: Signed integer format For details of data format, see **Section 27.3.5, ADCCnDRj ─ Data Register j**.
3 to 1	Reserved	When read, the value after reset is read. When written, write the value after reset.
0	ADDNT	This bit selects the addition count for addition A/D conversion. 0: Add twice 1: Add four times

CAUTION

To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.10 ADCCnTHSMPSTCR ─ T&H Sampling Start Control Register

This is a register that controls start of all T&H sampling.

Access: This register can be written in 8-bit units.

Address: <ADCCn_base> + 400_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SMPST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.18 ADCCnTHSMPSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	SMPST	This bit starts all T&H sampling. 0: Nothing occurs. (A written value of 0 is ignored.) 1: Starts sampling

27.3.11 ADCCnTHSTPCR ─ T&H Stop Control Register

This is a register that controls stop of all T&H.

Access: This register can be written in 8-bit units.

Address: <ADCCn_base> + 404_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	THSTP
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.19 ADCCnTHSTPCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	THSTP	This bit stops all T&H. 0: Nothing occurs. (A written value of 0 is ignored.) 1: Stops all T&H.

Use the ADCCnTHSTPCR.THSTP bit after stopping all SGs by using the ADCCnADHALTR register. After stopping an SG by setting the ADCCnTHSTPCR.THSTP bit, set ADCCnTHER.THkE to all 0s to prevent re-sampling operations due to the auto-sampling function (ADCCnTHCR.ASMPMSK bit).

27.3.12 ADCCnTHCR ─ T&H Control Register

This is a register that controls T&H sampling.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + 408_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ASMPMSK
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 27.20 ADCCnTHCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When written, write the value after reset.
0	ASMPMSK	This bit selects whether to perform auto sampling when A/D conversion of the relevant hold value is completed. 0: Automatic sampling is performed. 1: Automatic sampling is not performed.

CAUTION

To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.13 ADCCnTHAHLDSTCR ─ T&H Group A Hold Start Control Register

This is a register that controls the start of hold for T&H group A.

Access: This register can be written in 8-bit units.

Address: <ADCCn_base> + 410_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	HLDST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.21 ADCCnTHAHLDSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	HLDST	This bit starts hold for T&H group A. 0: Nothing occurs. (A written value of 0 is ignored.) 1: Starts hold.

27.3.14 ADCCnTHBHLDSTCR ─ T&H Group B Hold Start Control Register

This is a register that controls the start of hold for T&H group B.

Access: This register can be written in 8-bit units.

Address: <ADCCn_base> + 414_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	HLDST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.22 ADCCnTHBHLDSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	HLDST	This bit starts hold for T&H group B. 0: Nothing occurs. (A written value of 0 is ignored.) 1: Starts hold.

27.3.15 ADCCnTHACR ─ T&H Group A Control Register

This is a register that controls T&H group A.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + 420_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	HLDCTE	HLDTE	—	—	SGS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 27.23 ADCCnTHACR Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When written, write the value after reset.
5	HLDCTE	This bit selects whether hold control is enabled or disabled. 0: Disabled. 1: Hold control is enabled.
4	HLDTE	This bit selects whether H/W trigger signals are enabled or disabled. 0: Disabled. 1: The H/W trigger signal of the scan group selected in the ADCCnTHACR.SGS[1:0] bits is enabled.
3, 2	Reserved	When read, the value after reset is read. When written, write the value after reset.
1, 0	SGS[1:0]	These bits select the scan group for T&H group A. 0: SG1 1: SG2 2: SG3 3: SG4

CAUTION

Set both the ADCCnTHACR.HLDCTE and ADCCnTHACR.HLDTE bits to 1 when using the simultaneous track and hold function with a H/W trigger. Set the ADCCnTHACR.HLDCTE bit to 1 and the ADCCnTHACR.HLDTE bit to 0 when using the simultaneous track and hold function with a S/W trigger.

Do not set the ADCCnTHACR.SGS[1:0] bits and the ADCCnTHBCR.SGS[1:0] bits to the same scan group when both T&H group A and B are used. Set this register in an A/D conversion stop state.

When the ADCCnTHACR.HLDCTE bit is set to 1, set the ADCCnSGCRx.TRGMD1 bit and the ADCCnSGCRx.TRGMD0 bit in SGx to be selected by using ADCCnTHACR.SGS[1:0] bits to 0 and 1 respectively.

27.3.16 ADCCnTHBCR ─ T&H Group B Control Register

This is a register that controls T&H group B.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + 424_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	HLDCTE	HLDTE	—	—	SGS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 27.24 ADCCnTHBCR Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When written, write the value after reset.
5	HLDCTE	This bit selects whether hold control is enabled or disabled. 0: Disabled. 1: Hold control is enabled.
4	HLDTE	This bit selects whether H/W trigger signals are enabled or disabled. 0: Disabled. 1: The H/W trigger signal of the scan group selected in the ADCCnTHBCR.SGS[1:0] bits is enabled.
3, 2	Reserved	When read, the value after reset is read. When written, write the value after reset.
1, 0	SGS[1:0]	These bits select the scan group for T&H group B. 0: SG1 1: SG2 2: SG3 3: SG4

CAUTION

Set both the ADCCnTHBCR.HLDCTE and ADCCnTHBCR.HLDTE bits to 1 when using the simultaneous track and hold function with a H/W trigger. Set the ADCCnTHBCR.HLDCTE bit to 1 and the ADCCnTHBCR.HLDTE bit to 0 when using the simultaneous track and hold function with a S/W trigger.

Do not set the ADCCnTHACR.SGS[1:0] bits and the ADCCnTHBCR.SGS[1:0] bits to the same scan group when both T&H group A and B are used. Set this register in an A/D conversion stop state.

When the ADCCnTHBCR.HLDCTE bit is set to 1, set the ADCCnSGCRx.TRGMD1 bit and the ADCCnSGCRx.TRGMD0 bit in SGx to be selected by using ADCCnTHBCR.SGS[1:0] bits to 0 and 1 respectively.

27.3.17 ADCCnTHER ─ T&H Enable Register

This is a register that controls whether to enable or disable of each T&H circuit.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + 430_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	TH5E	TH4E	TH3E	TH2E	TH1E	TH0E
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.25 ADCCnTHER Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When written, write the value after reset.
5 to 0	THkE	These bits set whether to enable or disable track and hold operation for T&Hk circuits. 0: Disabled 1: Enabled

27.3.18 ADCCnTHGSR ─ T&H Group Select Register

This is a register that selects the T&H group for each T&H.

Access: This register can be read or written in 16-bit units.

Address: <ADCCn_base> + 434_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TH5GS	—	TH4GS	—	TH3GS	—	TH2GS	—	TH1GS	—	TH0GS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W

Table 27.26 ADCCnTHGSR Register Contents

Bit Position	Bit Name	Function
15 to 11, 9, 7, 5, 3, 1	Reserved	When read, the value after reset is read. When written, write the value after reset.
10, 8, 6, 4, 2, 0	THkGS	These bits selects the T&H group for T&Hk. 0: Selects T&H group A. 1: Selects T&H group B.

CAUTION

To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.19 ADCCnSFTCR ─ Safety Control Register

This is a register for safety control.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + $3C0_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RDCLRE	ULEIE	OWEIE	PEIE	IDEIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 27.27 ADCCnSFTCR Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is read. When written, write the value after reset.
4	RDCLRE	This bit sets whether to perform or prohibit read and clear operations. This bit sets whether to clear the ADCCnDRj and ADCCnDIRj registers to 0 (all 0) when reading the ADCCnDRj or ADCCnDIRj register. 0: Not read and cleared. 1: Read and cleared
3	ULEIE	This bit sets whether to allow or prohibit upper-limit/lower-limit error interrupts. 0: Prohibited 1: Allowed
2	OWEIE	This bit sets whether to allow or prohibit overwrite error interrupts. 0: Prohibited 1: Allowed
1	PEIE	This bit sets whether to allow or prohibit parity errors. 0: Prohibited 1: Allowed
0	IDEIE	This bit sets whether to allow or prohibit ID error interrupts. 0: Prohibited 1: Allowed

CAUTION

To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.20 ADCCnTDCR ─ Pin Level Self-diagnostic Control Register

This is a register that controls the pin level self-diagnosis.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + $3C4_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TDE	—	—	—	—	—	TDLV[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R/W	R/W

Table 27.28 ADCCnTDCR Register Contents

Bit Position	Bit Name	Function
7	TDE	This bit sets whether to perform or prohibit pin level self-diagnosis. 0: Pin level self-diagnosis is not performed. 1: Pin level self-diagnosis is performed. When TDE is set to 1, all analog pins are disconnected from the input buffer.
6 to 2	Reserved	When read, the value after reset is read. When written, write the value after reset.
1, 0	TDLV[1:0]	These bits set the diagnosis voltage to be applied when pin level self-diagnosis is performed. 0: AVSS is applied to even numbers of physical subchannels, and AVCC is applied to odd numbers of physical subchannels. 1: AVCC is applied to even numbers of physical subchannels, and AVSS is applied to odd numbers of physical subchannels. 2: AVSS is applied to even numbers of physical subchannels, and 1/2 × AVCC is applied to odd numbers of physical subchannels. 3: 1/2 × AVCC is applied to even numbers of physical subchannels, and AVSS is applied to odd numbers of physical subchannels.

CAUTION

To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.21 ADCCnODCR ─ Wiring-break Detection Control Register

This is a register that controls wiring-break detection.

Access: This register can be read or written in 32-bit units.

Address: <ADCCn_base> + $3C8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ODDE	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.29 ADCCnODCR Register Contents

Bit Position	Bit Name	Function
31	ODDE	This bit sets whether to perform or prohibit wiring-break detection self-diagnosis. 0: Wiring-break detection diagnosis is not performed. 1: Wiring-break detection diagnosis is performed. When ODDE is set to 1, wiring-break detection self-diagnosis is enabled for all analog pins of ADCCn.
30 to 0	Reserved	When read, the value after reset is read. When written, write the value after reset.

CAUTION

To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.22 ADCCnULLMTBR0 to ADCCnULLMTBR2 ─ Upper Limit/Lower Limit Table Registers 0 to 2

These registers are for setting the upper-limit and lower-limit values of an A/D converted value.

Access: This register can be read or written in 32-bit units.

Address: ADCCnULLMTBR0: <ADCCn_base> + $3CC_H$
ADCCnULLMTBR1: <ADCCn_base> + $3D0_H$
ADCCnULLMTBR2: <ADCCn_base> + $3D4_H$

Value after reset: $7FFE\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ULMTB[15:0]															
Value after reset	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LLMTB[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 27.30 ADCCnULLMTBR Register Contents

Bit Position	Bit Name	Function
31 to 16	ULMTB[15:0]	These bits set the upper-limit of an A/D converted value. Setting range: 0000_H to $7FFE_H$ These bits should be set with the signed fixed-point format. ULMTB[15] and ULMTB[0] are always fixed to 0. In additive A/D conversion mode (ADCCnVCRj.CNVCLS[2:0] = 4_H), these bits specify the value for comparison with the sum of the converted values.
15 to 0	LLMTB[15:0]	These bits set the lower-limit of an A/D converted value. Setting range: 0000_H to $7FFE_H$ These bits should be set with the signed fixed-point format. LLMTB[15] and LLMTB[0] are always fixed to 0. In additive A/D conversion mode (ADCCnVCRj.CNVCLS[2:0] = 4_H), these bits specify the value for comparison with the sum of the converted values.

CAUTION

To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.23 ADCCnECR ─ Error Clear Register

This is a register that controls error clear.

Access: This register can be written in 8-bit units.

Address: <ADCCn_base> + $3D8_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	ULEC	OWEC	PEC	IDEC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 27.31 ADCCnECR Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When written, write the value after reset.
3	ULEC	This bit clears upper-limit and lower-limit errors. 0: Not cleared. 1: Cleared.
2	OWEC	This bit clears overwrite errors. 0: Not cleared. 1: Cleared.
1	PEC	This bit clears parity errors. 0: Not cleared. 1: Cleared.
0	IDEC	This bit clears ID errors. 0: Not cleared. 1: Cleared.

27.3.24 ADCCnULER ─ Upper Limit/Lower Limit Error Register

This is a register that indicates an upper limit or lower limit error. This register can be cleared by writing 1 to the upper-limit and lower-limit error clear (ADCCnECR.ULEC bit).

Access: This register can be read in 8-bit units.

Address: <ADCCn_base> + $3DC_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ULE	—	ULECAP[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.32 ADCCnULER Register Contents

Bit Position	Bit Name	Function
7	ULE	This bit indicates whether an upper-limit or lower-limit error exists. 0: An upper-limit or lower-limit error does not exist. 1: An upper-limit or lower-limit error exists.
6	Reserved	When read, the value after reset is read.
5 to 0	ULECAP[5:0]	These bits indicate the number of the virtual channel at the time when an upper-limit or lower-limit error occurred.

CAUTION

This register is retained until 1 is written to the upper-limit and lower-limit error clear (ADCCnECR.ULEC bit). While the value of this register is retained, if an upper-limit and lower-limit error occurs, the new error information is discarded.

27.3.25 ADCCnOWER – Overwrite Error Register

This is a register that indicates an overwrite error. This register can be cleared by writing 1 to the overwrite error clear (ADCCnECR.OWEC bit).

Access: This register can be read in 8-bit units.

Address: <ADCCn_base> + $3E0_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	OWE	—	OWECAP[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.33 ADCCnOWER Register Contents

Bit Position	Bit Name	Function
7	OWE	This bit indicates whether an overwrite error exists. 0: An overwrite error does not exist. 1: An overwrite error exists.
6	Reserved	When read, the value after reset is read.
5 to 0	OWECAP[5:0]	These bits indicate the number of the virtual channel at the time when an overwrite error occurred.

CAUTION

This register is retained until 1 is written to the overwrite error clear (ADCCnECR.OWEC bit). While the value of this register is retained, if an overwrite error occurs, the new error information is discarded.

27.3.26 ADCCnPER ─ Parity Error Register

This is a register that indicates a parity error. This register can be cleared by writing 1 to the parity error clear (ADCCnECR.PEC bit).

Access: This register can be read in 8-bit units.

Address: <ADCCn_base> + $3E4_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PE	—	PECAP[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.34 ADCCnPER Register Contents

Bit Position	Bit Name	Function
7	PE	This bit indicates whether a parity error exists. 0: A parity error does not exist. 1: A parity error exists.
6	Reserved	When read, the value after reset is read.
5 to 0	PECAP[5:0]	These bits indicate the number of the virtual channel at the time when a parity error occurred.

CAUTION

This register is retained until 1 is written to the parity error clear (ADCCnECR.PEC bit). While the value of this register is retained, if a parity error occurs, the new error information is discarded.

27.3.27 ADCCnIDER – ID Error Register

This is a register that indicates an ID error. This register can be cleared by writing 1 to the ID error clear (ADCCnECR.IDEC bit).

Access: This register can be read in 8-bit units.

Address: <ADCCn_base> + $3E8_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDE	—	IDECAP[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.35 ADCCnIDER Register Contents

Bit Position	Bit Name	Function
7	IDE	This bit indicates whether an ID error exists. 0: An ID error does not exist. 1: An ID error exists
6	Reserved	When read, the value after reset is read.
5 to 0	IDECAP[5:0]	These bits indicate the number of the virtual channel at the time when an ID error occurred.

CAUTION

This register is retained until 1 is written to the ID error clear (ADCCnECR.IDEC bit). While the value of this register is retained, if an ID error occurs, the new error information is discarded.

27.3.28 ADCCnSGSTCRx ─ Scan Group x Start Control Register

This is a register that controls the start of A/D conversion for SGx.

Access: This register can be written in 8-bit units.

Address: <ADCCn_base> + x × 80_H + 480_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SGST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.36 ADCCnSGSTCRx Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	SGST	This bit starts A/D conversion for SGx. 0: Nothing occurs. (A written value of 0 is ignored.) 1: Start A/D conversion when the A/D conversion start scan group status (ADCCnSGSRx.SGACT) is 0.

27.3.29 ADCCnADTSTCRy ─ A/D Timer y Start Control Register

This is a register that controls the start of A/D timer y.

Access: This register can be written in 8-bit units.

Address: <ADCCn_base> + y × 80_H + 488_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADTST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.37 ADCCnADTSTCRy Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	ADTST	This bit starts A/D timer y. 0: Nothing occurs. (A written value of 0 is ignored.) 1: Starts the A/D timer. Start the A/D timer when the A/D timer status (ADCCnSGSRx.ADTACT) is 0.

27.3.30 ADCCnADTENDCRy ─ A/D Timer y End Control Register

This is a register that controls the end of A/D timer y.

Access: This register can be written in 8-bit units.

Address: <ADCCn_base> + y × 80_H + $48C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADTEND
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.38 ADCCnADTENDCRy Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	ADTEND	This bit ends the A/D timer. 0: Nothing occurs. (A written value of 0 is ignored.) 1: Ends the A/D timer.

27.3.31 ADCCnSGCRx ─ Scan Group x Control Register

This is a register that controls SGx.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + x × 80_H + 490_H

Value after reset: 00_H

- When x = 0 to 2

Bit	7	6	5	4	3	2	1	0
	—	ADSTARTE	SCANMD	ADIE	—	—	—	TRGMD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R/W

Table 27.39 ADCCnSGCRx Register Contents (x = 0 to 2)

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When written, write the value after reset.
6	ADSTARTE	This bit sets whether the synchronization start signal of SG is enabled or disabled. 0: Disabled 1: Enabled
5	SCANMD	This bit sets scan mode. 0: Multicycle scan mode 1: Continuous scan mode
4	ADIE	This bit sets whether the output of the scan group x end interrupt signal ADInx is allowed or prohibited. 0: Output prohibited. 1: Output allowed.
3 to 1	Reserved	When read, the value after reset is read. When written, write the value after reset.
0	TRGMD0	This bit sets whether A/D conversion start trigger input to scan group x is enabled or disabled. 0: Disabled 1: Enabled

CAUTIONS

1. An A/D conversion start trigger input to the same scan group x that occurs while A/D conversion is being performed for scan group x is ignored.
2. If either of the scan groups is set to continuous scan mode (SCANMD = 1), operation of the lower-priority scan group is not possible.
3. To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

- When x = 3 or 4

Bit	7	6	5	4	3	2	1	0
	ADTSTARTE	ADSTARTE	SCANMD	ADIE	—	—	TRGMD1	TRGMD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Table 27.40 ADCCnSGCRx Register Contents (x = 3 or 4)

Bit Position	Bit Name	Function
7	ADTSTARTE	This bit sets whether the synchronization start signal of A/D timers is enabled or disabled. 0: Disabled 1: Enabled
6	ADSTARTE	This bit sets whether the synchronization start signal of SG is enabled or disabled. 0: Disabled 1: Enabled
5	SCANMD	This bit sets scan mode. 0: Multicycle scan mode 1: Continuous scan mode
4	ADIE	This bit sets whether the output of the scan group x end interrupt signal ADInx is allowed or prohibited. 0: Output prohibited. 1: Output allowed.
3, 2	Reserved	When read, the value after reset is read. When written, write the value after reset.
1	TRGMD1	This bit sets whether trigger input to A/D timers is enabled or disabled. 0: Disabled 1: Enabled
0	TRGMD0	This bit sets whether A/D conversion start trigger input to scan group x is enabled or disabled. 0: Disabled 1: Enabled

27.3.32 ADCCnSGVCSPx ─ Scan Group x Start Virtual Channel Pointer

This is a register that specifies the start pointer of a virtual channel.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + x × 80_H + 494_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	VCSP[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.41 ADCCnSGVCSPx Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When written, write the value after reset.
5 to 0	VCSP[5:0]	These bits set the start virtual channel number of SGx.

CAUTIONS

1. ADCCnSGVCSPx must be equal or less than ADCCnSGVCEPx.
2. Do not make a setting greater than the number of virtual channels that are included.
3. This register has a mirrored configuration as shown below. Be sure to use the mirror register if the value of SGVCSP must be changed while scan group x is operating.

This Register	Mirror Register
SGVCSPx.VCSP[5:0]	SGVCPRx.VCSP[5:0]

4. Setting a single virtual channel (VCRj) to be in multiple scan groups x is possible by setting the start and end pointers. However, if the value of the virtual channel is overwritten during operation of a scan group, A/D conversion may be performed for the scan group in operation with different settings from those desired.
   To avoid this, note the following point.
   - Confirm that VCRj settings for common use among multiple scan groups to which it is to be assigned will always be the same at the time of system design.
   - Modifications to VCRj should only be made after stopping all multiple scan groups to which it has been assigned.

   If the above is not observed, the results of A/D conversion cannot be guaranteed.
5. See also **Section 27.3.40, ADCCnSGVCPRx ─ Scan Group x Virtual Channel Pointer Register**.
6. To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.33 ADCCnSGVCEPx ─ Scan Group x End Virtual Channel Pointer

This is a register that specifies the end pointer of a virtual channel.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + x × 80_H + 498_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	VCEP[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.42 ADCCnSGVCEPx Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When written, write the value after reset.
5 to 0	VCEP[5:0]	These bits set the end virtual channel number of SGx.

CAUTIONS

1. ADCCnSGVCSPx must be equal or less than ADCCnSGVCEPx.
2. Do not make a setting greater than the number of virtual channels that are included.
3. This register has a mirrored configuration as shown below. Be sure to use the mirror register if the value of SGVCEP must be changed while scan group x is operating.

This Register	Mirror Register
SGVCEPx.VCEP[5:0]	SGVCPRx.VCEP[5:0]

4. To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

For the other precautions, see **Sections 27.3.32, ADCCnSGVCSPx ─ Scan Group x Start Virtual Channel Pointer**, and **27.3.40 ADCCnSGVCPRx ─ Scan Group x Virtual Channel Pointer Register**.

27.3.34 ADCCnSGMCYCRx – Scan Group x Multicycle Register

This is a register that specifies the number of times for A/D conversion in multicycle scan mode.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + x × 80_H + $49C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	MCYC[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.43 ADCCnSGMCYCRx Register Contents

Bit Position	Bit Name	Function
7 to 0	MCYC[7:0]	These bits set the frequency of A/D conversion in multicycle scan mode. Number of times for A/D conversion = MCYC[7:0] + 1

27.3.35 ADCCnSGSRx ─ Scan Group x Status Register

This is a register that indicates the A/D conversion operation status of SGx.

Access: This register can be read in 8-bit units.

Address: <ADCCn_base> + x × 80_H + $4A4_H$

Value after reset: 00_H

- When x = 0 to 2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SGACT	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.44 ADCCnSGSRx Register Contents (x = 0 to 2)

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read.
1	SGACT	This bit indicates the A/D conversion operation status of SGx. 0: A/D conversion for SGx is in idle state. 1: A/D conversion for SGx is running.
0	Reserved	When read, the value after reset is read.

- When x = 3 or 4

Bit	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.45 ADCCnSGSRx Register Contents (x = 3 or 4)

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is read.
2	ADTACT	This bit indicates the operation status of an A/D timer. 0: A/D timer x is in idle state. 1: A/D timer x is running.
1	SGACT	This bit indicates the A/D conversion operation status of SGx. 0: A/D conversion for SGx is in idle state. 1: A/D conversion for SGx is running.
0	Reserved	When read, the value after reset is read.

27.3.36 ADCCnADTIPRy ─ A/D Timer Initial Phase Register y

This is a register that sets the initial phase (initial value of the counter) of A/D timer y.

Access: This register can be read or written in 32-bit units.

Address: <ADCCn_base> + y × 80_H + $4A8_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ADTIP[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 27.46 ADCCnADTIPRy Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read. When written, write the value after reset.
20 to 0	ADTIP[20:0]	These bits set the initial phase (initial value of the counter) of A/D timer y. Setting range: 000000_H to $1FFFFF_H$

CAUTIONS

1. For details, see **Section 27.4.3.2(2), Starting scan groups by A/D timer triggers**.
2. To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.37 ADCCnADTPRRy ─ A/D Timer Cycle Register y

This is a register that sets the cycle of A/D timer y.

Access: This register can be read or written in 32-bit units.

Address: <ADCCn_base> + y × 80_H + $4AC_H$

Value after reset: 001F $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ADTPR[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADTPR[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.47 ADCCnADTPRRy Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read. When written, write the value after reset.
20 to 0	ADTPR[20:0]	These bits set the cycle of A/D timer y. Setting range: 000000_H to $1FFFFF_H$

CAUTIONS

1. For details, see **Section 27.4.3.2(2), Starting scan groups by A/D timer triggers**.
2. To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.38 ADCCnULLMSRx ─ Scan Group x Upper Limit/Lower Limit Table Select Register

This is a register that selects the upper-limit/lower-limit table of SGx.

Access: This register can be read or written in 8-bit units.

Address: <ADCCn_base> + x × 80_H + $4B0_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ULS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 27.48 ADCCnULLMSRx Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When written, write the value after reset.
1, 0	ULS[1:0]	These bits select the upper-limit/lower-limit table. 0: Neither upper limit nor lower limit is checked. 1: Upper limit and lower limit are checked in ADCCnULLMTBR0. 2: Upper limit and lower limit are checked in ADCCnULLMTBR1. 3: Upper limit and lower limit are checked in ADCCnULLMTBR2. When the A/D-converted value is stored in DRn, use the upper-limit/lower-limit table selected by ULS[1:0] to check the value against the upper and lower limits.

CAUTION

To prevent malfunctions, this register should be set while the scan groups to be set are stopped.

27.3.39 ADCCnVCULLMTBR0 to ADCCnVCULLMTBR6 ─ Virtual Channel Threshold Table Registers 0 to 6

These are 32-bit readable/writable registers used for setting the upper and lower limits of the threshold values for the A/D converted value. One register among ADCCnVCULLMTBR0 to ADCCnVCULLMTBR6 is selected by the VCULLMTBS[2:0] bits of the ADCCnVCRj register.

Access: This register can be read or written in 32-bit units.

Address: ADCCnVCULLMTBR0 : <ADCCn_base> + 700_H
ADCCnVCULLMTBR1 : <ADCCn_base> + 704_H
ADCCnVCULLMTBR2 : <ADCCn_base> + 708_H
ADCCnVCULLMTBR3 : <ADCCn_base> + $70C_H$
ADCCnVCULLMTBR4 : <ADCCn_base> + 710_H
ADCCnVCULLMTBR5 : <ADCCn_base> + 714_H
ADCCnVCULLMTBR6 : <ADCCn_base> + 718_H

Value after reset: 7FFE 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VCULMTB[15:0]															
Value after reset	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VCLLMTB[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 27.49 ADCCnVCULLMTBR0 to ADCCnVCULLMTBR6 Registers Contents

Bit Position	Bit Name	Function
31 to 16	VCULMTB[15:0]	Upper limit threshold table entry These bits specify the upper limit for A/D converted values. Setting range: 0000_H to $7FFE_H$ One of the threshold table registers 0 to 6 is selected for each virtual channel by ADCCnVCRj.VCULLMTBS[2:0]. Entries in VCULMTB[15:0] are handled as signed fixed-point format regardless of the format selected for ADCCnDRj. In additive A/D conversion mode (CNVCLS[2:0] = 4_H), these bits specify the value for comparison with the sum of the converted values.
15 to 0	VCLLMTB[15:0]	Lower limit threshold table entry These bits specify the lower limit for A/D converted values. Setting range: 0000_H to $7FFE_H$ One of the threshold table registers 0 to 6 is selected for each virtual channel by ADCCnVCRj. VCULLMTBS[2:0]. Entries in VCLLMTB[15:0] are handled as signed fixed-point format regardless of the format selected for ADCCnDRj. In additive A/D conversion mode (CNVCLS[2:0] = 4_H), these bits specify the value for comparison with the sum of the converted values.

27.3.40 ADCCnSGVCPRx ─ Scan Group x Virtual Channel Pointer Register

This is a register for specifying the pointers for start and end of the virtual channel.

Access: This register can read or written in 16-bit units.

Address: <ADCCn_base> + x × 80_H + $4A0_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	VCEP[5:0]						—	—	VCSP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.50 ADCCnSGVCPRx Register Contents

Bit Position	Bit Name	Function
15 to 14	Reserved	When read, the value after reset is read. When written, write the value after reset.
13 to 8	VCEP[5:0]	Scan group x virtual channel end pointer (mirror register to ADCCnSGVCEPx).
7 to 6	Reserved	When read, the value after reset is read. When written, write the value after reset.
5 to 0	VCSP[5:0]	Scan group x virtual channel start pointer (mirror register to ADCCnSGVCSPx).

For details of the functions, see **Sections 27.3.32, ADCCnSGVCSPx ─ Scan Group x Start Virtual Channel Pointer**, and **27.3.33, ADCCnSGVCEPx ─ Scan Group x End Virtual Channel Pointer**.

27.4 Function

27.4.1 Method of A/D Conversion

A/D conversion is performed for each scan group. Trigger signals for A/D conversion are prepared for the number of scan groups. When a trigger signal (SGx_TRG) is input, A/D conversion is performed for the signals of virtual channels assigned to the scan group in ascending order. A/D conversion for each virtual channel is completed or A/D conversion for all virtual channels assigned to the scan group is completed, an A/D completion interrupt (ADInx) occurs.

The multiscan mode repeats A/D conversion for the specified number of times when a trigger signal is input. The continuous scan mode repeats A/D conversion unlimitedly when a trigger signal is input.

The signed fixed-point format or signed integer format can be selected as the data format for A/D conversion. For details about the bit alignment in the data format, see **Section 27.3.5, ADCCnDRj — Data Register j**.

The following figure shows an operation example of conversion.

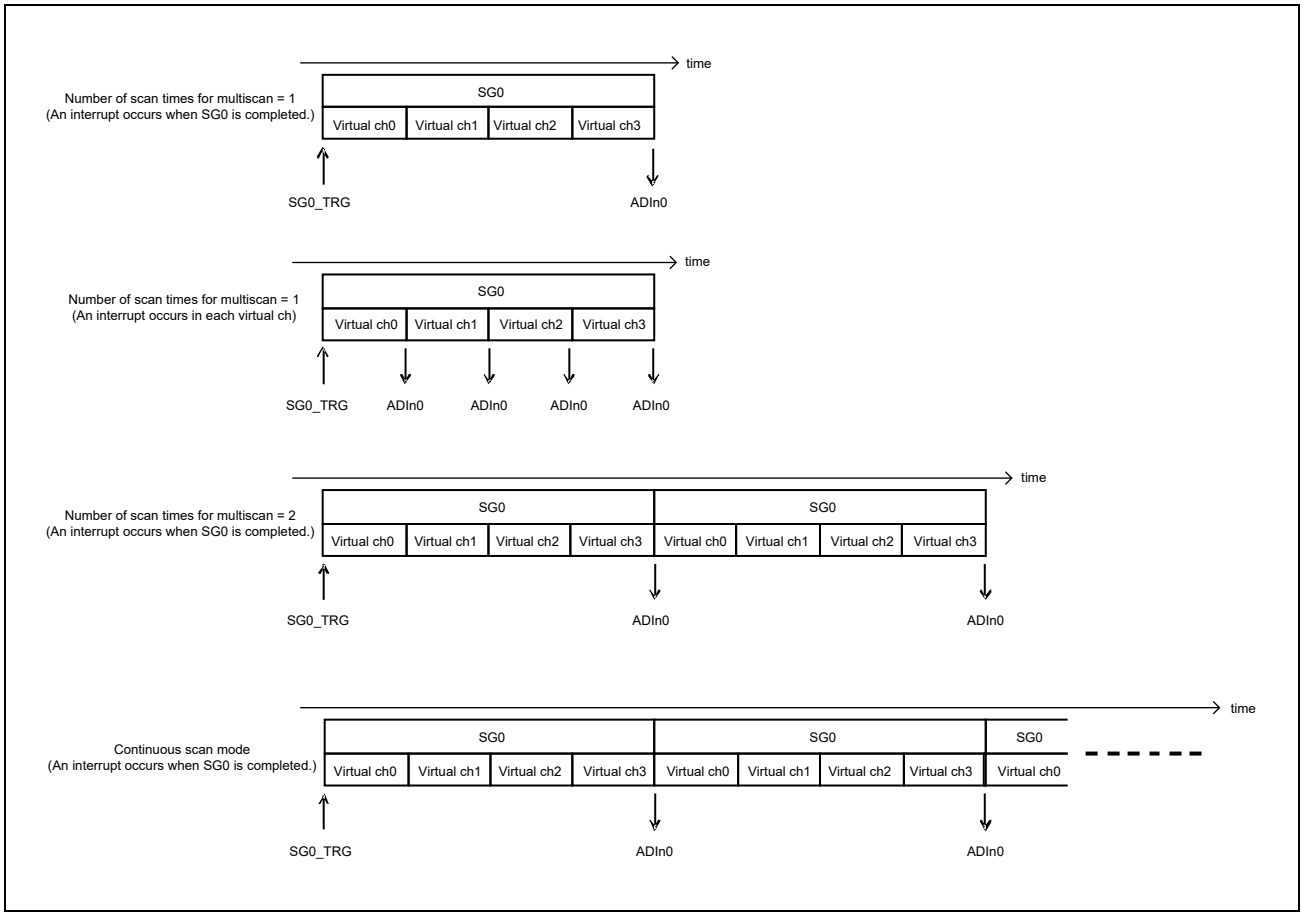

Figure 27.8 Operation Example of A/D Conversion

27.4.2 A/D Conversion Function

27.4.2.1 Normal A/D Conversion Function

The normal A/D conversion function performs A/D conversion for the analog signals of a physical channel.

27.4.2.2 Simultaneous track and hold function

This function holds multiple analog signals and performs A/D conversion for them. Analog signals to be simultaneously held can be assigned to two groups, T&H groups A and B, and can be held in a different timing for each group.

A physical channel that has a T&H circuit is assigned to a virtual channel and scan group, and the scan group is assigned to a T&H group. Note that SG0 cannot be assigned to a T&H group.

The method of T&H hold has the automatic sampling mode. This mode starts sampling automatically when A/D conversion for held analog signals is completed. If you do not specify the automatic sampling mode, you need to perform sampling by software.

The following figure is an operation example of the simultaneous track and hold function.

As shown in **Figure 27.9**, if a trigger signal (hold trigger A) for SG2 is input during A/D conversion, the virtual channel for which A/D conversion is currently being performed is forcibly stopped. After the virtual channel is stopped and analog signals become stable, the analog signals are held by the T&H circuit. After the hold operation is completed, A/D conversion resumes according to the priority of the scan groups.

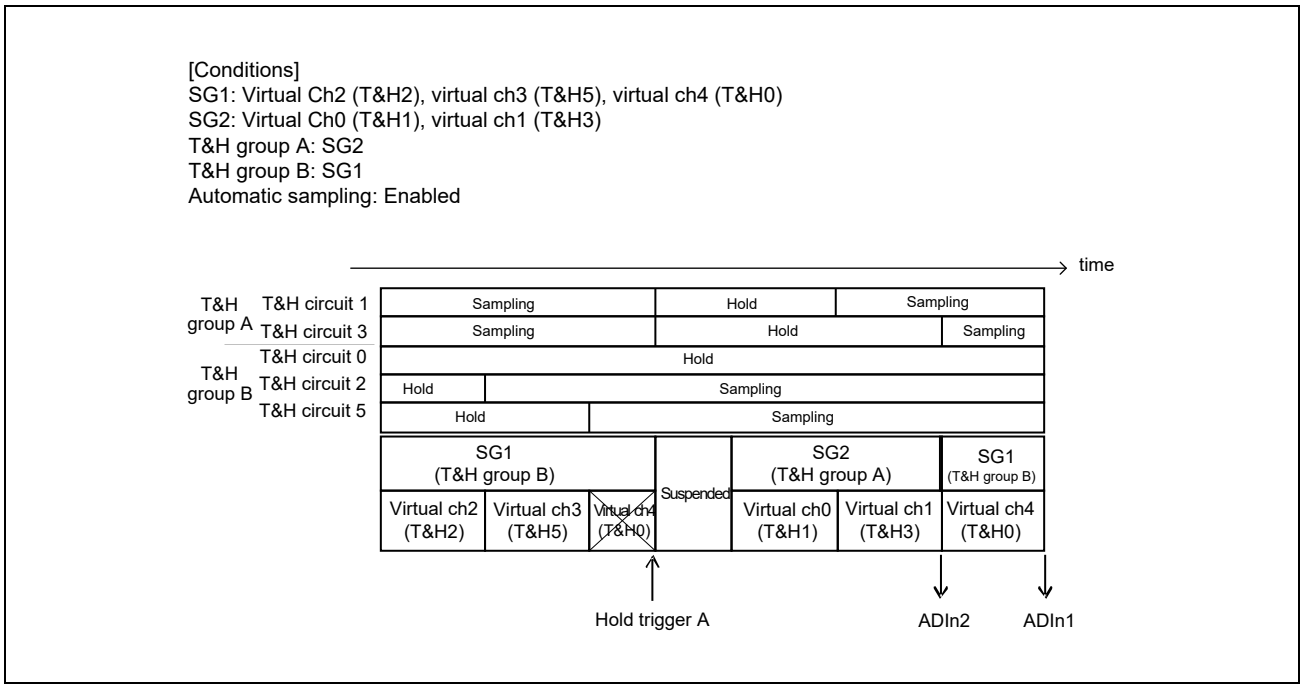

Figure 27.9 Operation Example of Simultaneous Track and Hold (High-Priority SG Hold Trigger Input)

For example, if the A/D conversion that is forcibly stopped is for SG3 as shown in **Figure 27.10**, A/D conversion for SG3 is first performed and then A/D conversion for SG2 is performed because SG3 has a higher priority.

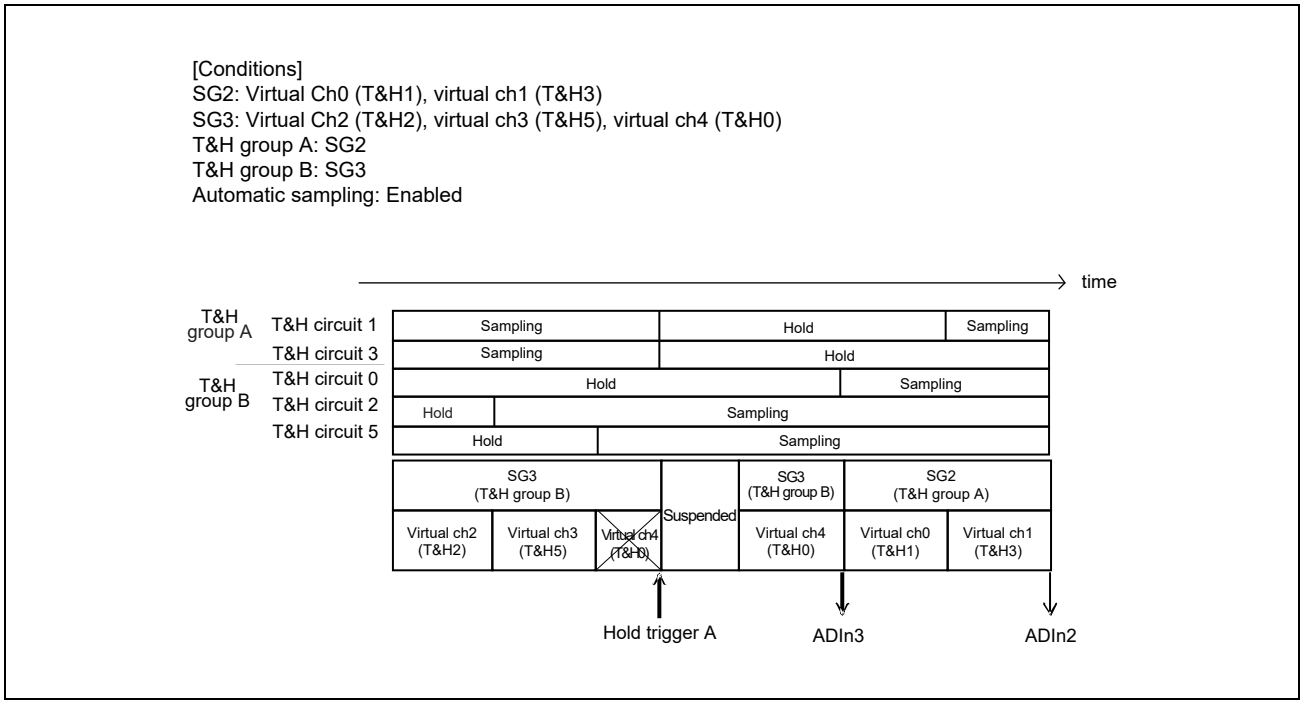

Figure 27.10 Operation Example of Simultaneous Track and Hold (Low-Priority SG Hold Trigger Input)

Also, when another trigger signal (hold trigger B) is input while A/D conversion is being forcibly stopped as shown in **Figure 27.11**, the stop time becomes longer than that in the case in which one trigger signal is input because of the waiting time until analog signals assigned to SG1 (T&H group B) are held.

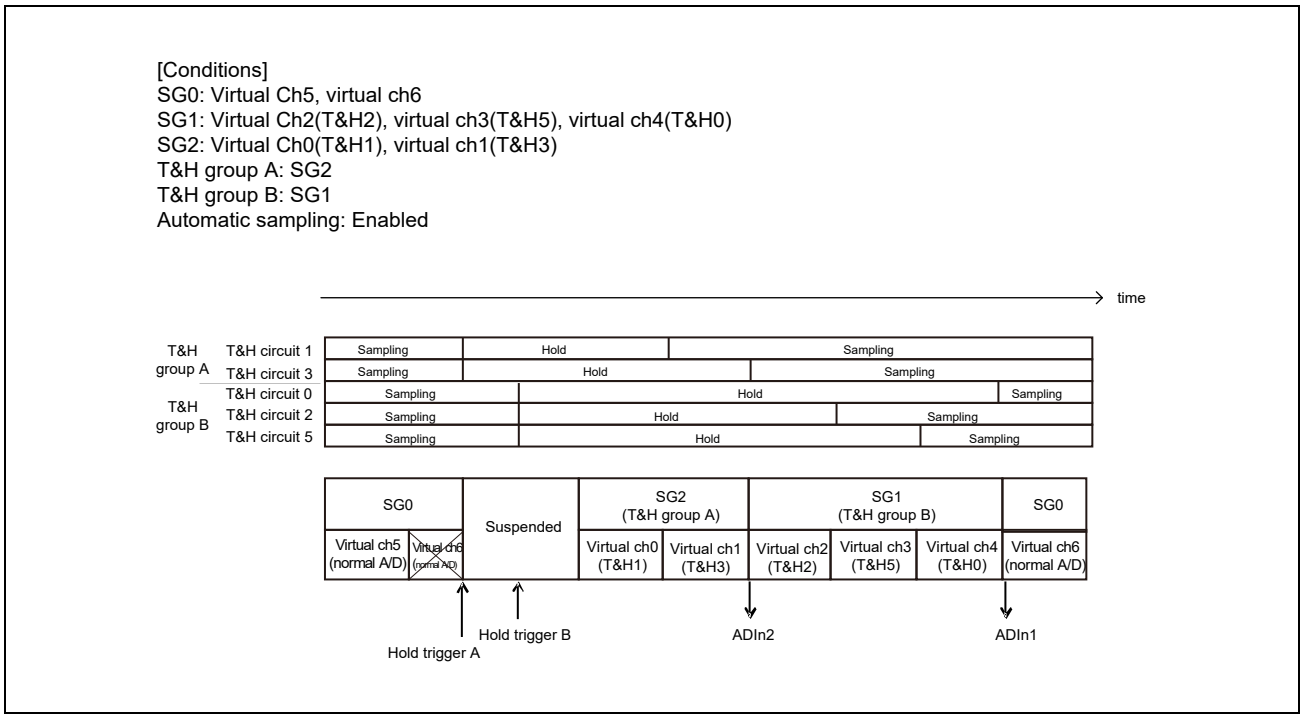

Figure 27.11 Operation Example of Simultaneous Track and Hold (Continuous Hold Trigger Input)

27.4.2.3 Addition A/D Conversion Function

This function performs A/D conversion two or four times in a row for analog signals of a physical channel and stores the added value in a data register. The addition count (two or four times) is common to all virtual channels.

27.4.2.4 Multicycle Scan Mode

This mode repeats A/D conversion for the specified number of times (1 to 256 times) for virtual channels assigned to a target SGx when a trigger is input.

27.4.2.5 Continuous Scan Mode

This mode repeats A/D conversion unlimitedly for virtual channels assigned to a target SGx when a trigger is input.

If you want to stop the continuous scan mode, stop A/D conversion according to the procedure for stopping A/D conversion. For details about the A/D conversion stop procedure, see **Section 27.5.3, Procedure for Stopping A/D Conversion**. You can stop all SGx and A/D timers by using the A/D halt register (ADCCnADHALTR register).

If a trigger for a lower-priority scan group is input to a scan group that is set to the continuous scan mode, the trigger is not accepted. Therefore, it is assumed that the continuous scan mode is set for SG0, which has the lowest priority.

27.4.3 Trigger Function

27.4.3.1 Input Selection of Triggers for Scan Groups

The following triggers can be selected as an A/D conversion start trigger for each scan group. Disable trigger input for unused scan groups.

Table 27.51 List of Trigger Supports

	HW Trigger		SW Trigger		
	SGx Trigger (SGx_TRG)	A/D Timer Trigger (SGy_TRG)	A/D Conversion Trigger	Hold Trigger	A/D Timer Trigger
SG0	√	×	√	×	×
SG1, SG2	√	×	√	√	×
SG3, SG4	√	√	√	√	√

Note: √: Supported, ×: Not supported

27.4.3.2 Starting Scan Groups by HW triggers

HW triggers include SGx triggers and A/D timer triggers.

(1) Starting scan groups by SGx triggers

A/D conversion can be started by starting SGx by a SGx_TRG signal. The simultaneous track and hold function holds analog signals by a hold trigger and then performs A/D conversion for them.

A SGx_TRG signal is input from PIC2D. PIC2D controls trigger signals from each unit or pin with masks and outputs them as SGx_TRG signals. For details about trigger factors, see **Section 24.3.3.1, ADCC Trigger Select Function**.

(2) Starting scan groups by A/D timer triggers

A SGy_TRG signal starts an A/D timer (free run) and an A/D timer trigger signal is output for each underflow of the counter as shown in **Figure 27.12**. This A/D timer trigger signal allows A/D conversion for SGy to start at regular intervals. However, when you use the simultaneous track and hold function, A/D timer trigger cannot be used.

An A/D timer is counted by clkad.

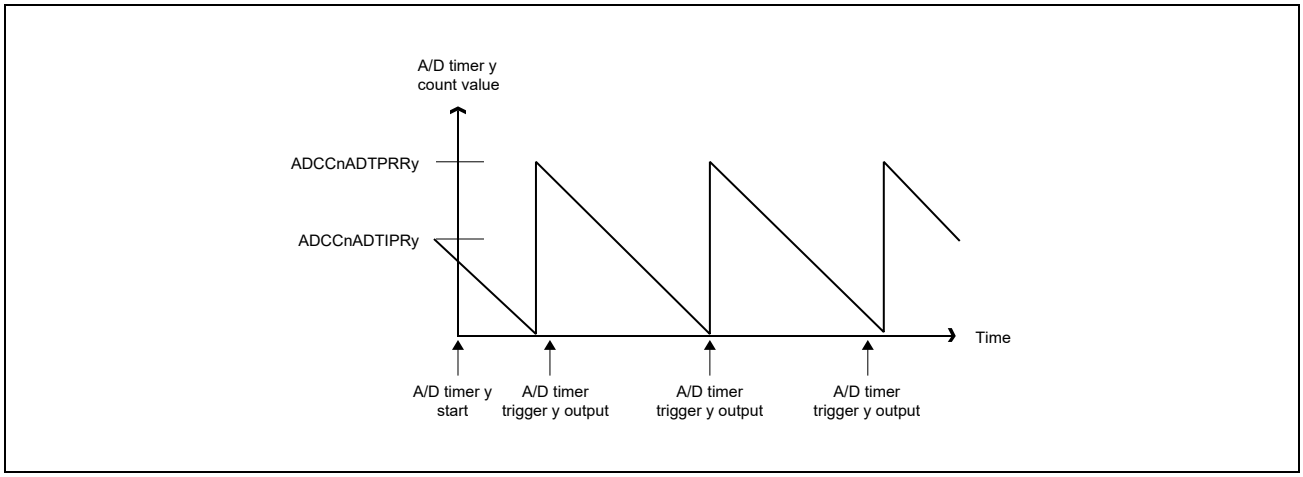

Figure 27.12 Operation Example of an A/D Timer

CAUTION

If you set the A/D timer initial phase register y (ADCCnADTIPRy register) to 0, an A/D timer trigger is output simultaneously with the start of an A/D timer. Also, if you set the A/D timer cycle register (ADCCnADTPRRy register) to 0, an A/D timer trigger is output for each clock.

27.4.3.3 Starting Scan Groups by SW Triggers

SW triggers include A/D conversion triggers, hold triggers, and A/D timer triggers. Note that before enabling each trigger, you should confirm that the target SG trigger is disabled and the target scan group is stopped.

(1) A/D conversion trigger

This trigger function can simultaneously start multiple SGx in ADCC0, ADCC1, and ADCC2, and start A/D conversion as shown in **Figure 27.13**. Also, this trigger function can start A/D conversion for SGx individually.

(2) A/D timer trigger

This trigger function can simultaneously start multiple A/D timer y in ADCC0, ADCC1, and ADCC2 as shown in **Figure 27.13**. Also, this trigger function can start A/D timer y individually.

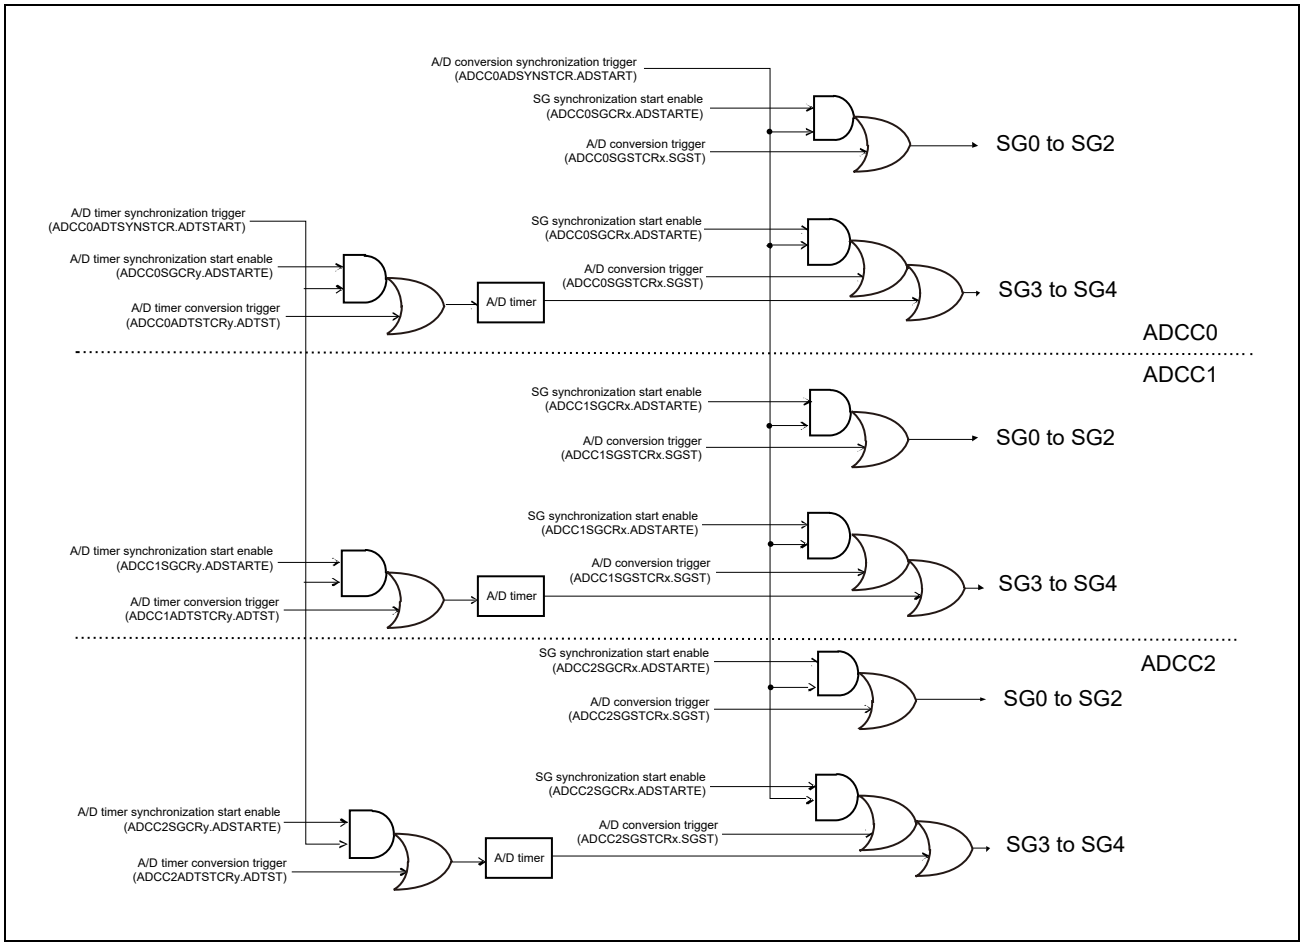

Figure 27.13 Functional Diagram of the SW Trigger Function

(3) Hold trigger

This trigger function can start hold at any timing as shown in **Figure 27.14**. Make sure that you perform 30 clkad or more samplings before starting hold.

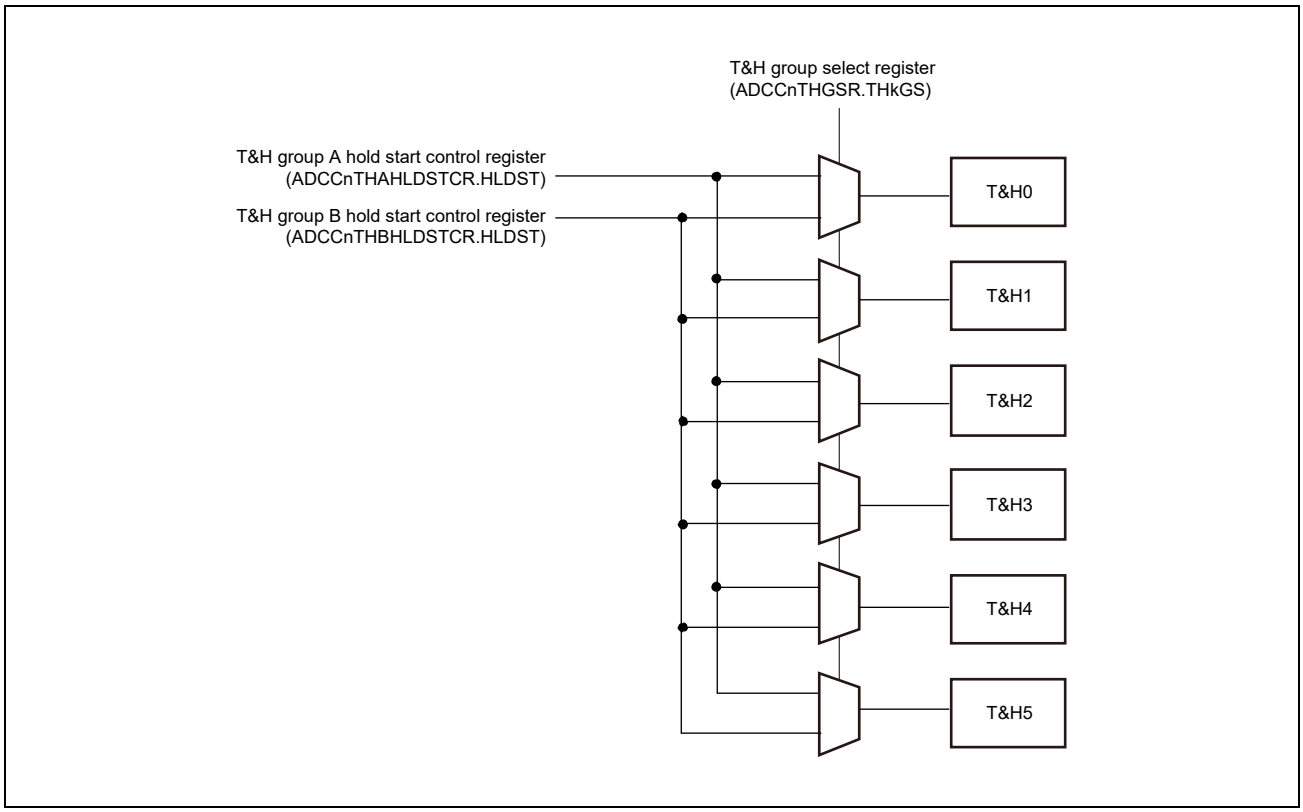

Figure 27.14 Functional Diagram of the Hold Trigger Function

27.4.4 Suspend Function

When a higher-priority scan group request is received during the processing of a lower-priority scan group, the suspend function suspends the lower-priority A/D conversion and performs the higher-priority A/D conversion. There are three types of suspend operation.

27.4.4.1 Synchronous Suspend Operation

If an A/D conversion trigger for a higher-priority scan group than the scan group for which A/D conversion is being performed occurs, after the conversion of the virtual channel for which A/D conversion is being performed is completed, A/D conversion for the higher-priority scan group is performed. After the A/D conversion for the higher-priority scan group is completed, A/D conversion resumes from the suspended virtual channel.

The following figures show operation examples.

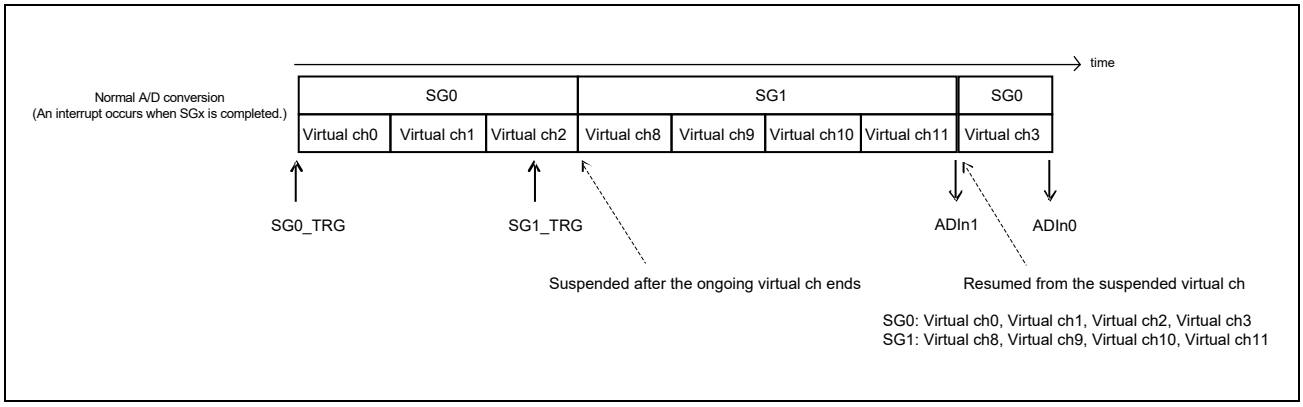

Figure 27.15 Operation Example of Synchronous Suspend (Normal A/D Conversion)

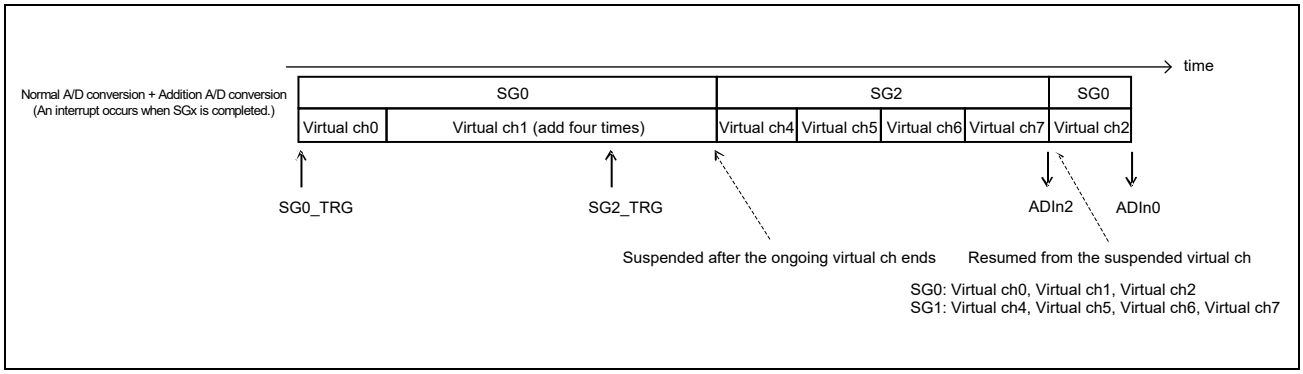

Figure 27.16 Operation Example of Synchronous Suspend (Normal A/D Conversion + Addition A/D Conversion)

27.4.4.2 Asynchronous Suspend Operation

If an A/D conversion trigger for a higher-priority scan group than the scan group for which A/D conversion is being performed occurs, the conversion for the virtual channel for which A/D conversion is being performed is immediately suspended, and A/D conversion for the higher-priority scan group is performed. After the A/D conversion for the higher-priority scan group is completed, A/D conversion for the suspended virtual channel starts from the beginning.

The following figures show operation examples.

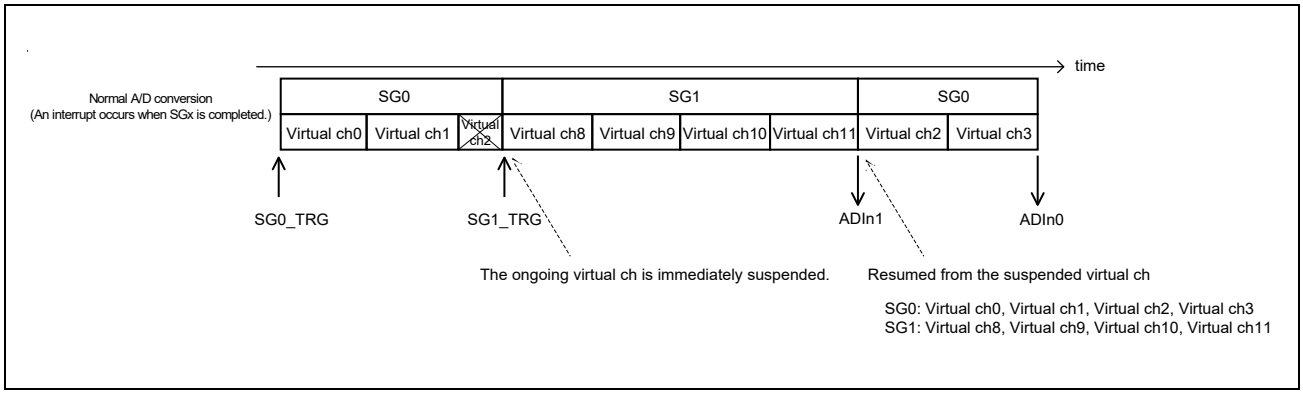

Figure 27.17 Operation Example of Asynchronous Suspend (Normal A/D Conversion)

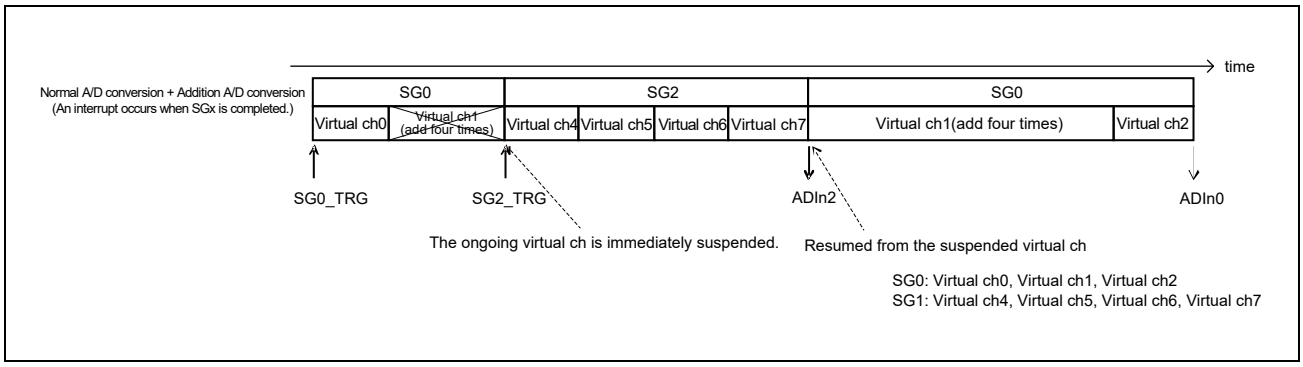

Figure 27.18 Operation Example of Asynchronous Suspend (Normal A/D Conversion + Addition A/D Conversion)

27.4.4.3 Synchronous and Asynchronous Combination Suspend Operation

If an A/D conversion trigger for a higher-priority scan group occurs during A/D conversion for SG0, asynchronous suspend operation is performed. If an A/D conversion trigger for a higher-priority scan group occurs during A/D conversion for a scan group other than SG0, synchronous suspend operation is performed. After the A/D conversion for the higher-priority scan group is completed, A/D conversion for the suspended virtual channel starts from the beginning.

The following figure shows an operation example.

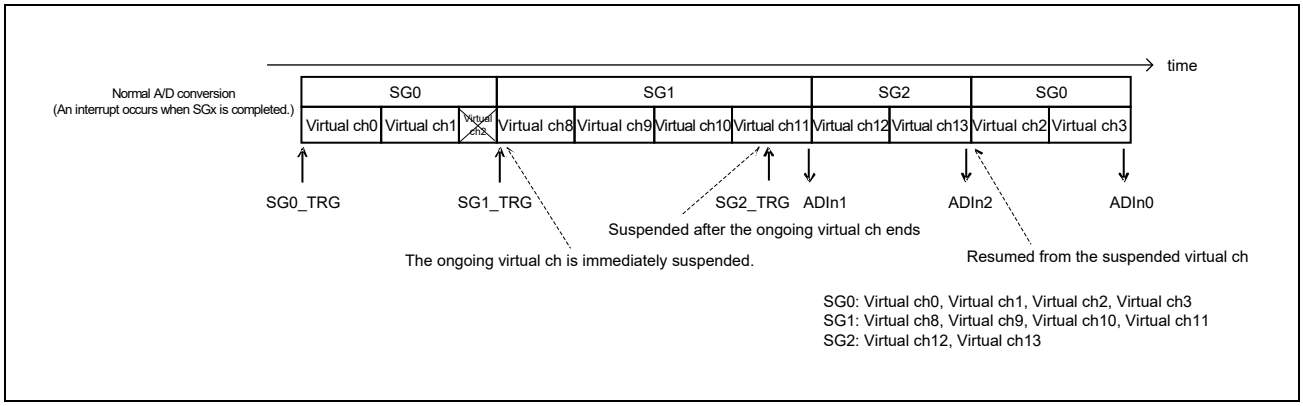

Figure 27.19 Operation Example of Synchronous and Asynchronous Combination Suspend

27.4.5 Interrupt Request Function

This function includes scan group x end interrupts and A/D error interrupts. An interrupt request signal is a pulse. You can start DMA/DTS by a scan group x end interrupt.

Interrupt output can be masked. Even if interrupt output is masked, the status register is set to 1 (an interrupt occurs).

27.4.5.1 Scan Group X End Interrupt

An end interrupt can occur at the following timing.

1. An interrupt occurs for each virtual channel.
   After A/D conversion for a virtual channel is completed, an interrupt occurs.
2. An interrupt occurs for each scan group.
   After A/D conversion for all the virtual channel assigned to the scan group is completed, an interrupt occurs.

In multiscan mode, an interrupt occurs in each A/D conversion for scan groups for a one-time scan. Therefore, if you perform multiscan two times in the above setting 2, an end interrupt occurs two times.

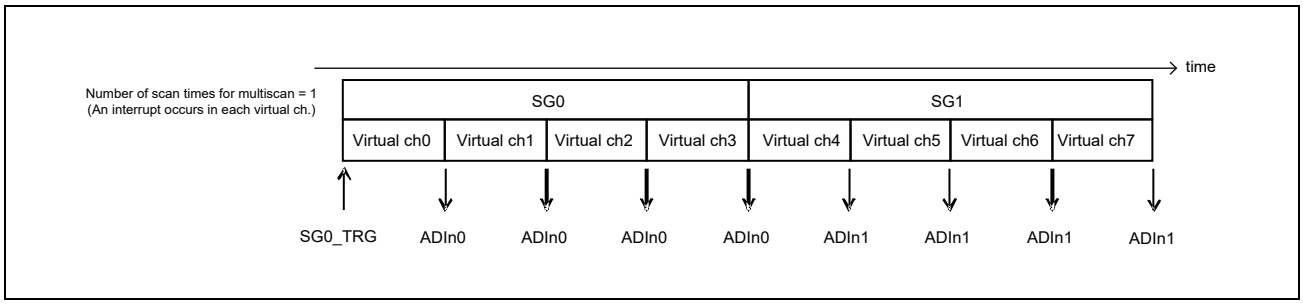

Figure 27.20 Scan Group X End Interrupt (An Interrupt Occurs for each Virtual Channel)

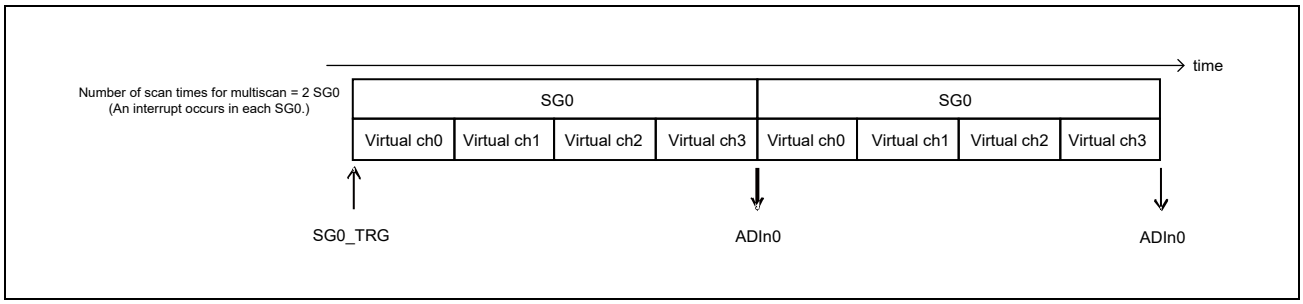

Figure 27.21 Scan Group X End Interrupt (An Interrupt Occurs for each SG)

27.4.5.2 A/D Error Interrupt Request

An A/D error interrupt can occur when the following A/D errors occur. The timing of the occurrence of A/D error interrupts is the same as that of end interrupts.

An A/D error interrupt request occurs when one of an upper-limit/lower-limit error, overwrite error, and an ID error occurs (OR condition). After an interrupt occurs, perform error status clear in the interrupt handler.

1. Upper-limit/lower-limit error
2. Overwrite error
3. ID error

(1) Upper-limit/lower-limit error

When an A/D converted value exceeds the specified upper-limit or lower-limit value, an error occurs. The number of the virtual channel in which an error occurs is retained in a register (ADCCnULER.ULECAP[5:0] bits). You can select one from three tables for the upper-limit or lower-limit value.

An upper-limit/lower-limit error is judged by the addition result that is stored in the data register.

(2) Overwrite error

When an A/D converted value has not been read (ADCCnDIRj.WFLG bit = 1) and the A/D converted value is updated (overwritten), an error occurs. The number of the virtual channel in which an error occurs is retained in a register (ADCCnOWER.OWECAP[5:0] bits).

(3) ID error

When a physical channel assigned to a virtual channel does not match with the physical channel for which conversion is actually performed, an error occurs. The number of the virtual channel in which an error occurs is retained in a register (ADCCnIDER.IDECAP[5:0] bits).

CAUTION

When an error has not been cleared, if the same error occurs again, the subsequent error information is discarded.

27.4.5.3 A/D Parity Error Trigger

A parity error interrupt can occur when a parity error occurs. A parity error trigger occurs when a data register (ADCCnDRj register) is read.

An A/D parity error trigger occurs by a parity error. An A/D parity error trigger is reported to the ECM.

When a data register is read, the contents are checked by the parity (ADCCnDIRj.PRTY bit) in the data supplementary information register. If a parity error is detected, the conversion is considered as an error. The number of the virtual channel in which an error occurs is retained in a register (ADCCnPER.PECAP[5:0] bits).

CAUTION

When an error has not been cleared, if the same error occurs again, the subsequent error information is discarded.

27.4.6 Function for Transferring Results of A/D Conversion to EMU

Each ADCC can output A/D conversion completion signals for virtual channels 0, 1, and 2, A/D converted data, and SG4 scan end signals to the EMU. An A/D conversion completion signal is a signal that indicates that the A/D conversion result value is stored in a data register and the A/D conversion is completed.

Data stored in data registers ADCCnDR0, 1, and 2 is output as A/D converted data. Note that the upper 4 bits of data to be output are fixed to 0 and the lower 12 bits are A/D converted data regardless of the data format setting (ADCCnADCR2.DFMT bit). Also, when the read and clear enable is enabled (ADCCnSFTCR.RDCLRE bit = 1), if the ADCCnDRj register or the ADCCnDIRj register is read, A/D converted data is cleared to 0000_H similarly to the ADCCnDR0, 1, and 2 registers.

CAUTION

When you use this function, virtual channels 0, 1, and 2 should be assigned to SG4.

Specify the settings so that a scan group end interrupt occurs for each scan group (The settings in which an interrupt occurs for each virtual channel are prohibited).

Do not use this function in the addition A/D conversion settings (ADCCnVCRj.CNVCLS[2:0] bits = 4_H).

27.4.7 Self-Diagnostic Functions

Each ADCC has the following self-diagnostic functions. The self-diagnostic function compares the conversion result with the expected value and confirms whether the result is as expected.

- Pin-level self-diagnostic function
- A/D conversion circuit self-diagnostic function
- Wiring-break detection self-diagnostic circuit function

27.4.7.1 Pin-Level Self-Diagnostic Function

This is a function to check an abnormal path from pins. This function checks an abnormal path from pins by specifying an even physical subchannel and odd physical subchannel as a set, setting a different voltage by the pin-level self-diagnostic control register (ADCCnTDCR register), and then executing A/D conversion. As shown in **Figure 27.22**, disconnect ADCC from analog input pins, apply the specified voltage, and then perform A/D conversion.

You can use a combination of AVSS, AVCC, and 1/2 × AVCC for different voltage. Also, you can use any physical channel for diagnosis.

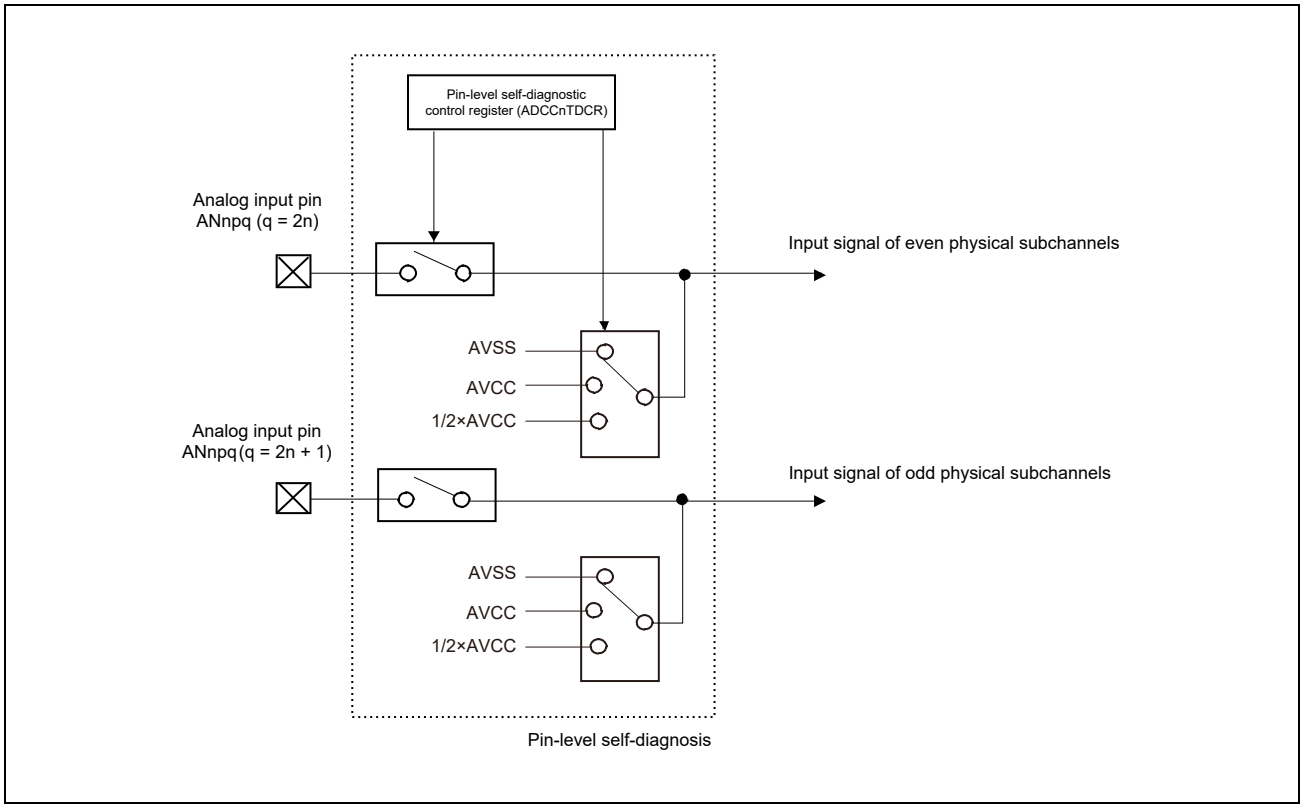

Figure 27.22 Functional Diagram of Pin-Level Self-Diagnosis

27.4.7.2 A/D Conversion Circuit Self-Diagnosis Function

This is a function to input a self-diagnostic voltage level and check the A/D conversion circuit from the result of A/D conversion. You can select a self-diagnostic voltage level from AVREFH × 1, AVREFH × 3/4, AVREFH × 1/2, AVREFH × 1/4, and AVREFH × 0.

27.4.7.3 Wiring-Break Detection Self-Diagnosis Circuit Function

This is a function to detect a wiring-break in a pin due to solder separation.

Discharge the target analog pin for the specified time in the wiring-break detection control register (ADCCnODCR register) and then perform A/D conversion. If the conversion result attenuates to approximately 0 V, you can determine that a wiring-break is present.

27.5 Procedure

27.5.1 Procedure for Setting A/D Conversion

Figure 27.23 shows the flow of A/D conversion settings, and **Figure 27.24** shows the flow of initial settings. Perform the initial settings in a state in which trigger factors for all scan groups are disabled and all scan groups and T&H are stopped. If they are active, perform the A/D conversion stop settings.

Set the value after reset for the setting values of unused functions.

In the following flow, before starting A/D conversion, pin-level self-diagnosis is performed in a state in which A/D conversion is disabled, and then A/D conversion start settings are performed.

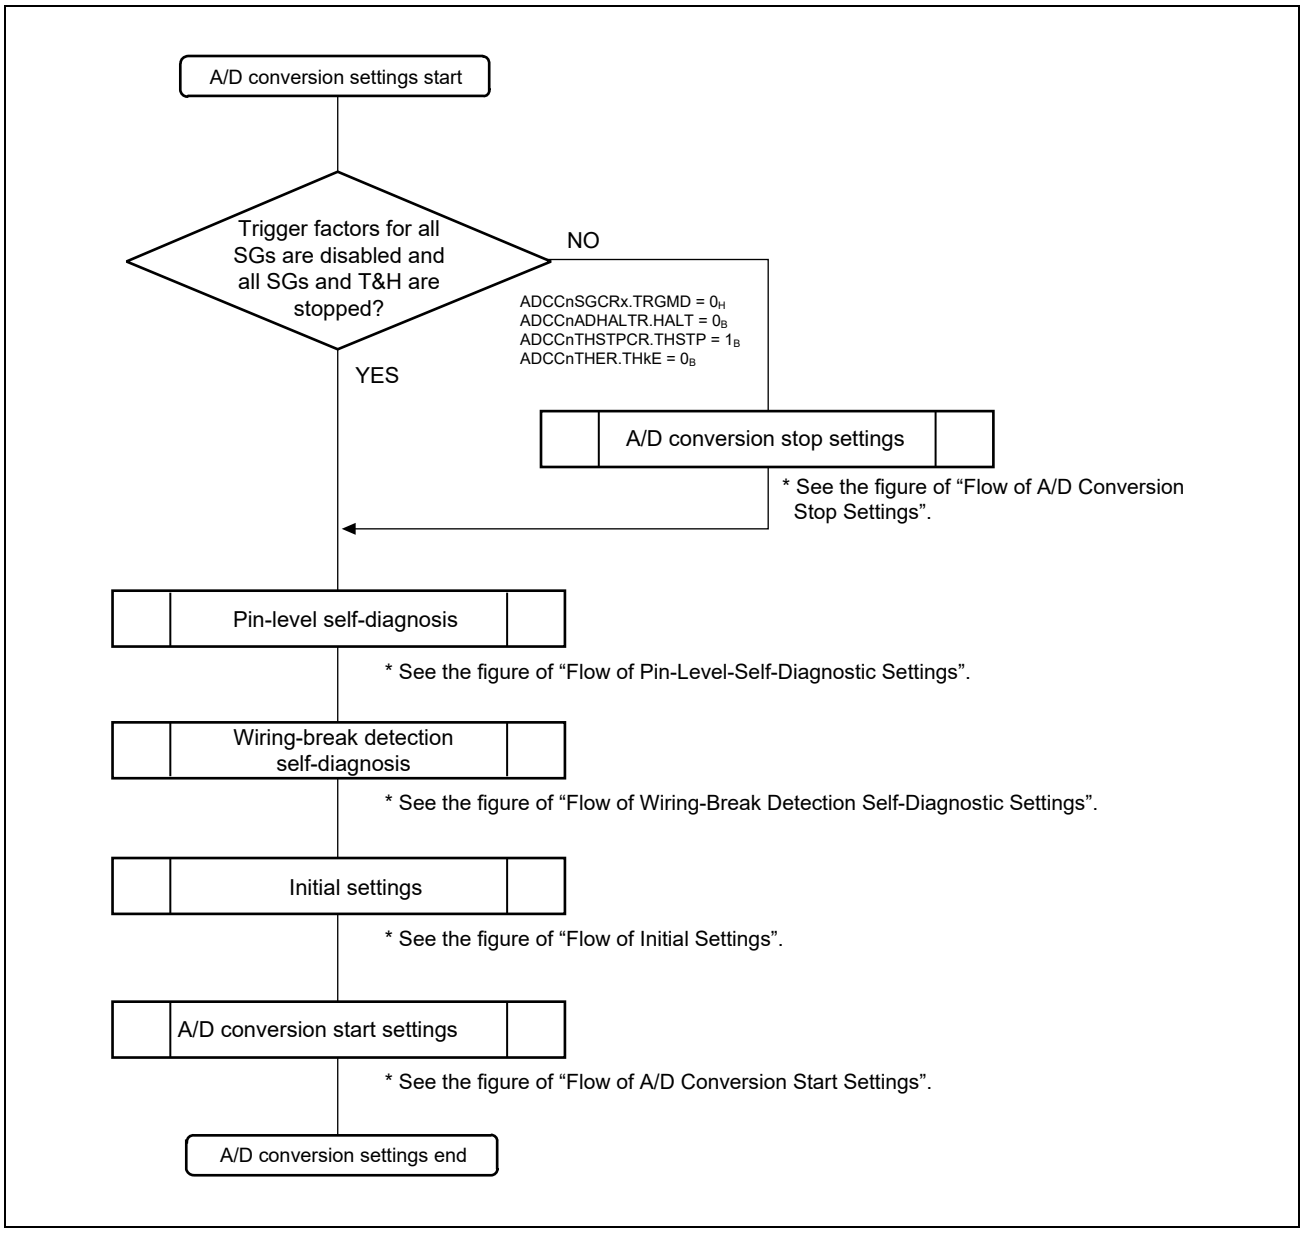

Figure 27.23 Flow of A/D Conversion Settings

The following initial settings flow is a flow for performing the basic settings of ADCC such as the A/D conversion mode settings.

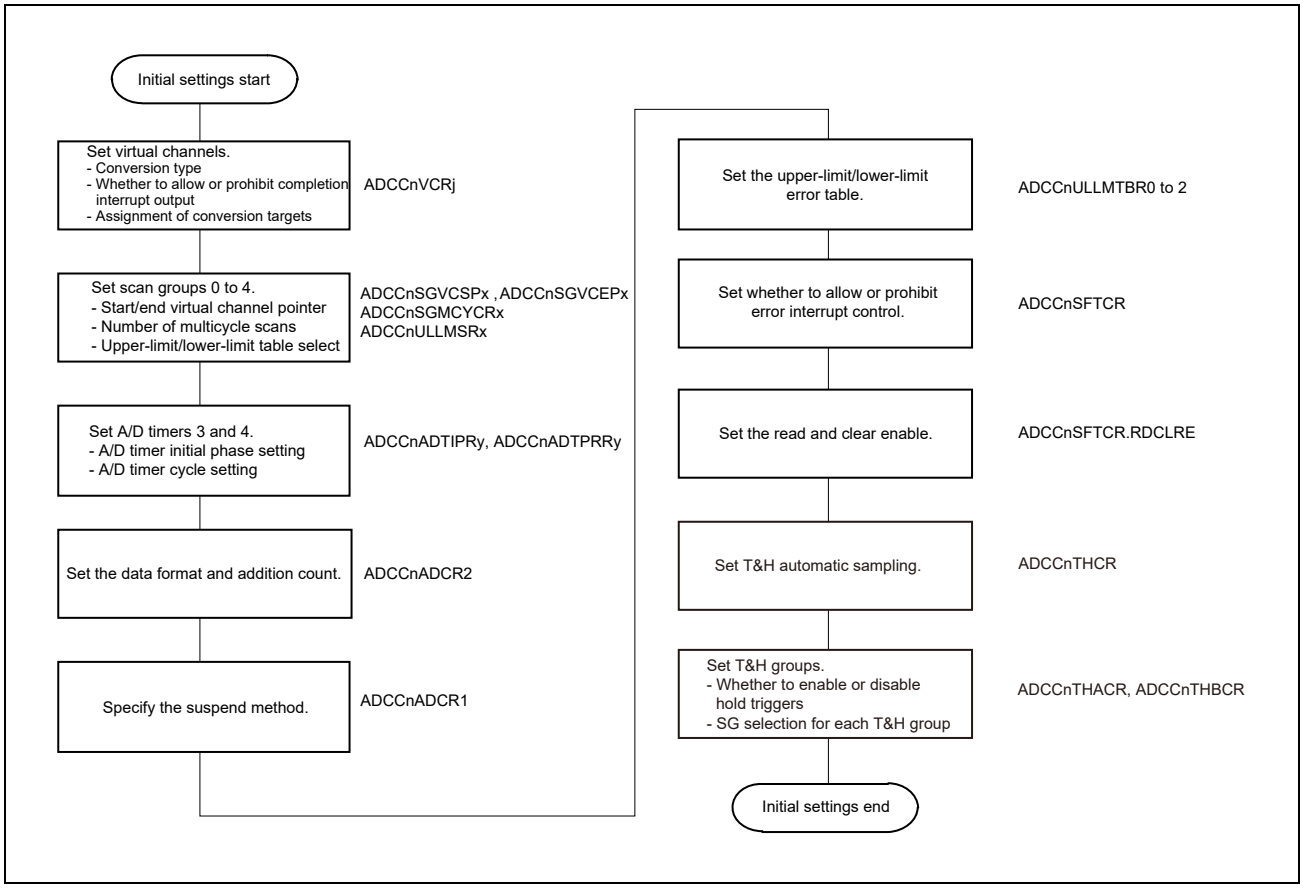

Figure 27.24 Flow of Initial Settings

27.5.2 Procedure for Starting A/D Conversion

Figure 27.25 shows the flow of A/D conversion start settings.

The following flow is a flow for starting A/D conversion operation by using a HW trigger. When you use the simultaneous track and hold function, you should perform hold after starting T&H sampling and then waiting 30 clkad or more samplings.

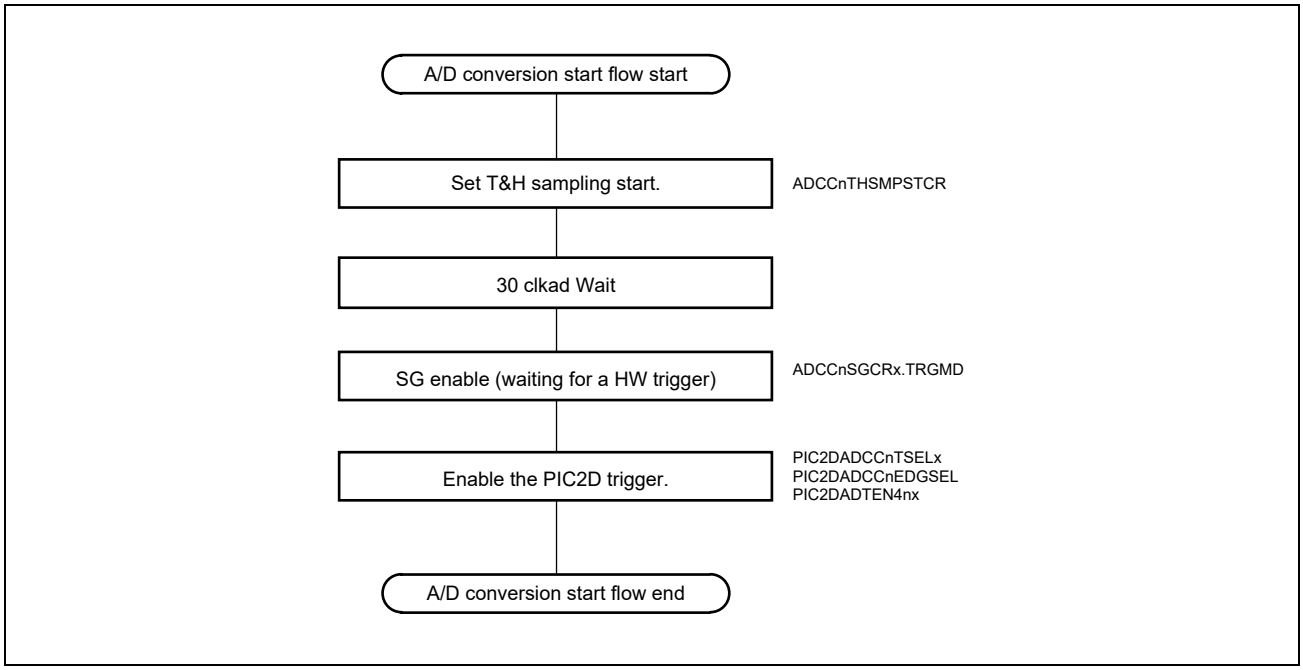

Figure 27.25 Flow of A/D Conversion Start Settings

27.5.3 Procedure for Stopping A/D Conversion

Figure 27.26 shows the flow of A/D conversion stop settings.

The following flow is a flow for stopping A/D conversion operation by disabling triggers for all scan groups and stopping operation of all scan groups and T&H.

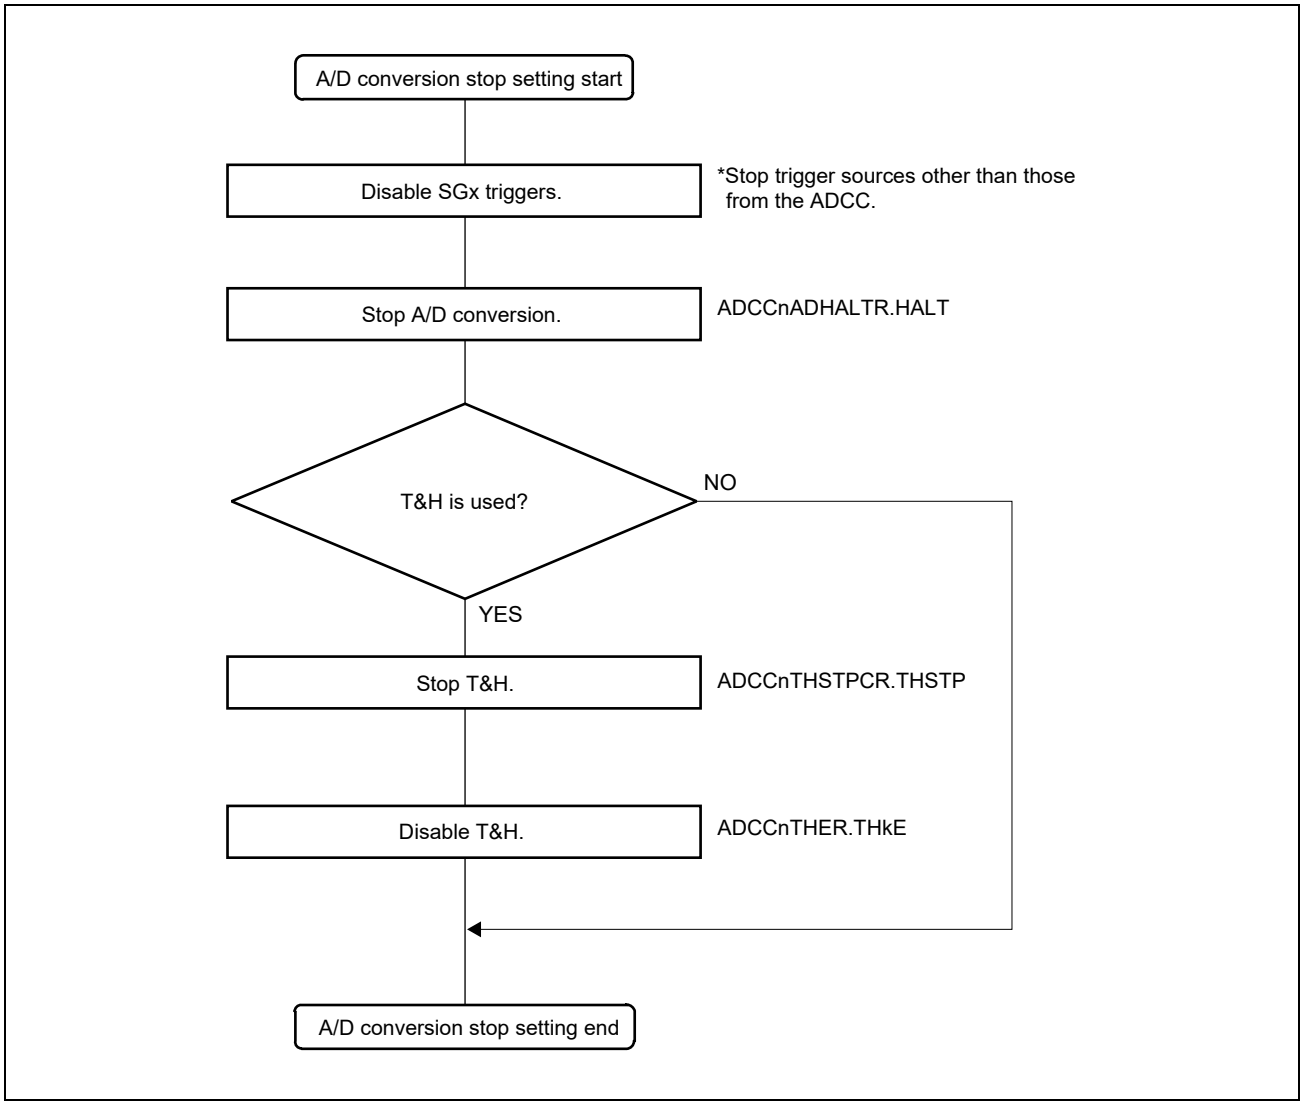

Figure 27.26 Flow of A/D Conversion Stop Settings

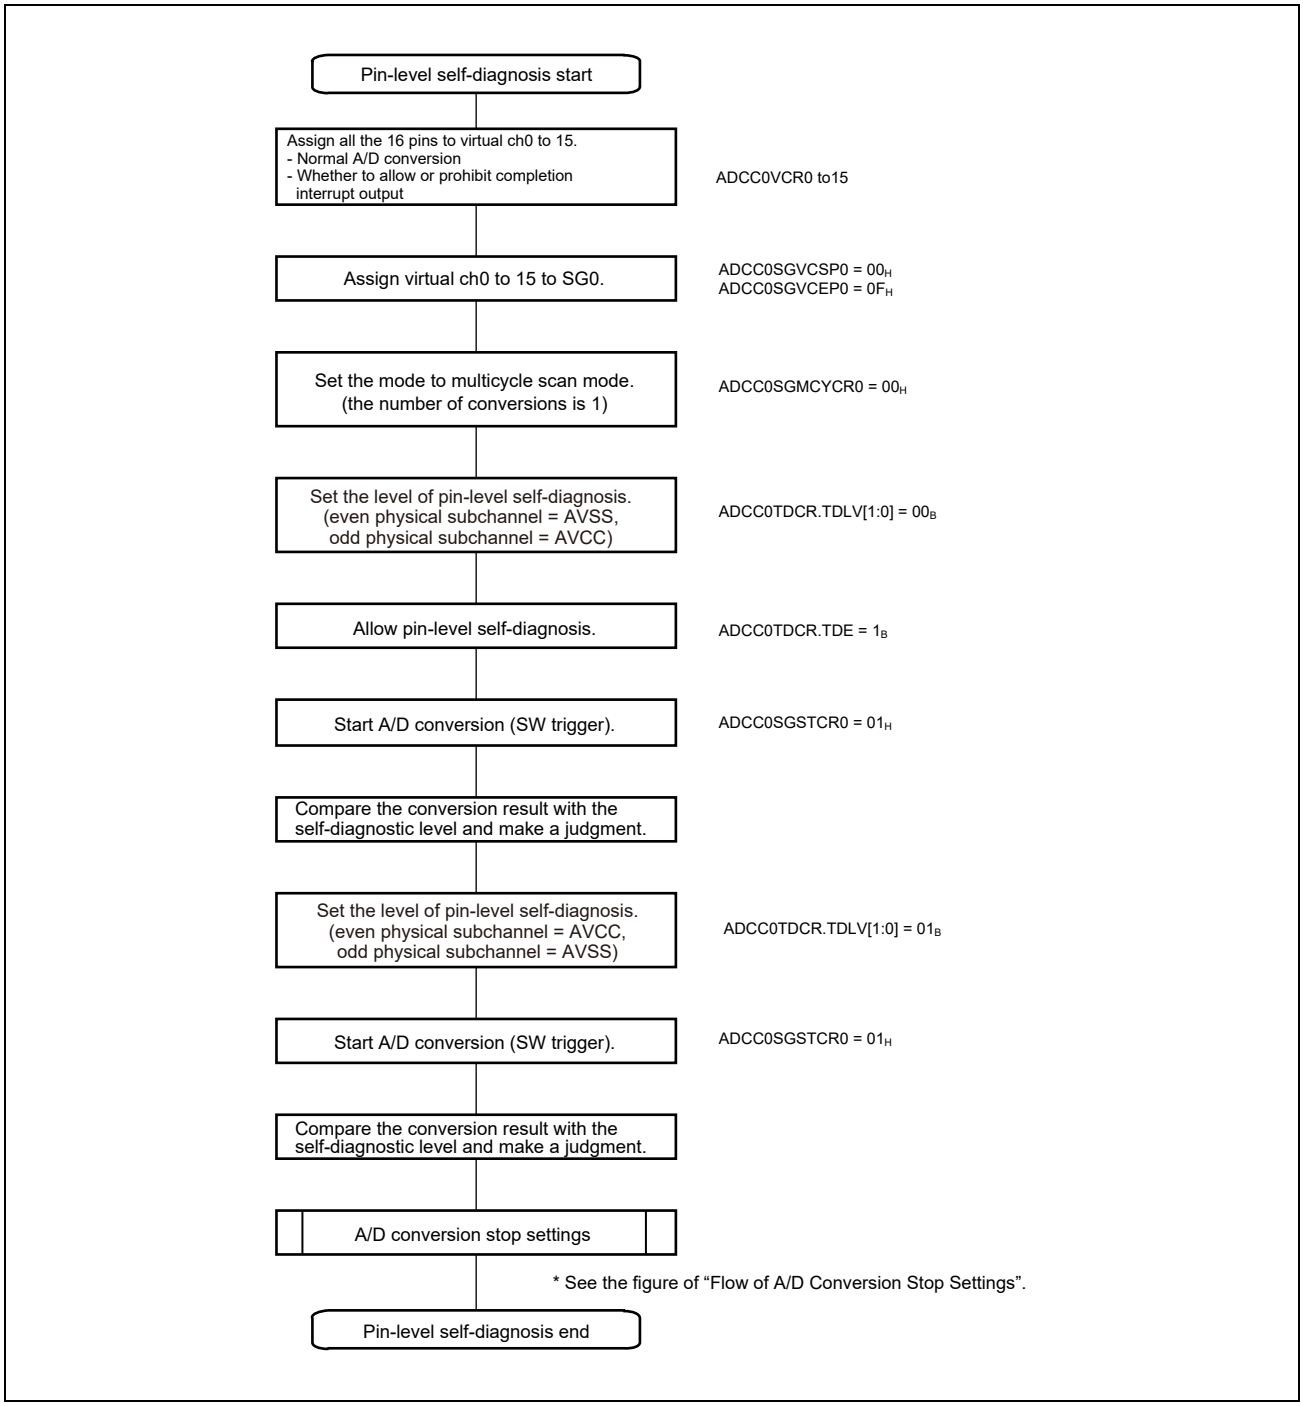
27.5.4 Procedure for Setting Pin-Level Self-Diagnosis

Figure 27.27 shows the flow of pin-level self-diagnostic settings.

The following flow uses an example in which all the pins of ADCC0 are assigned to virtual channels, and pin-level self-diagnosis is performed by switching applied voltage to even physical subchannels and odd physical subchannels. Also, it is assumed that the flow is performed before starting A/D conversion. Do not perform a self-diagnosis while the current is injected into the analog input pin.



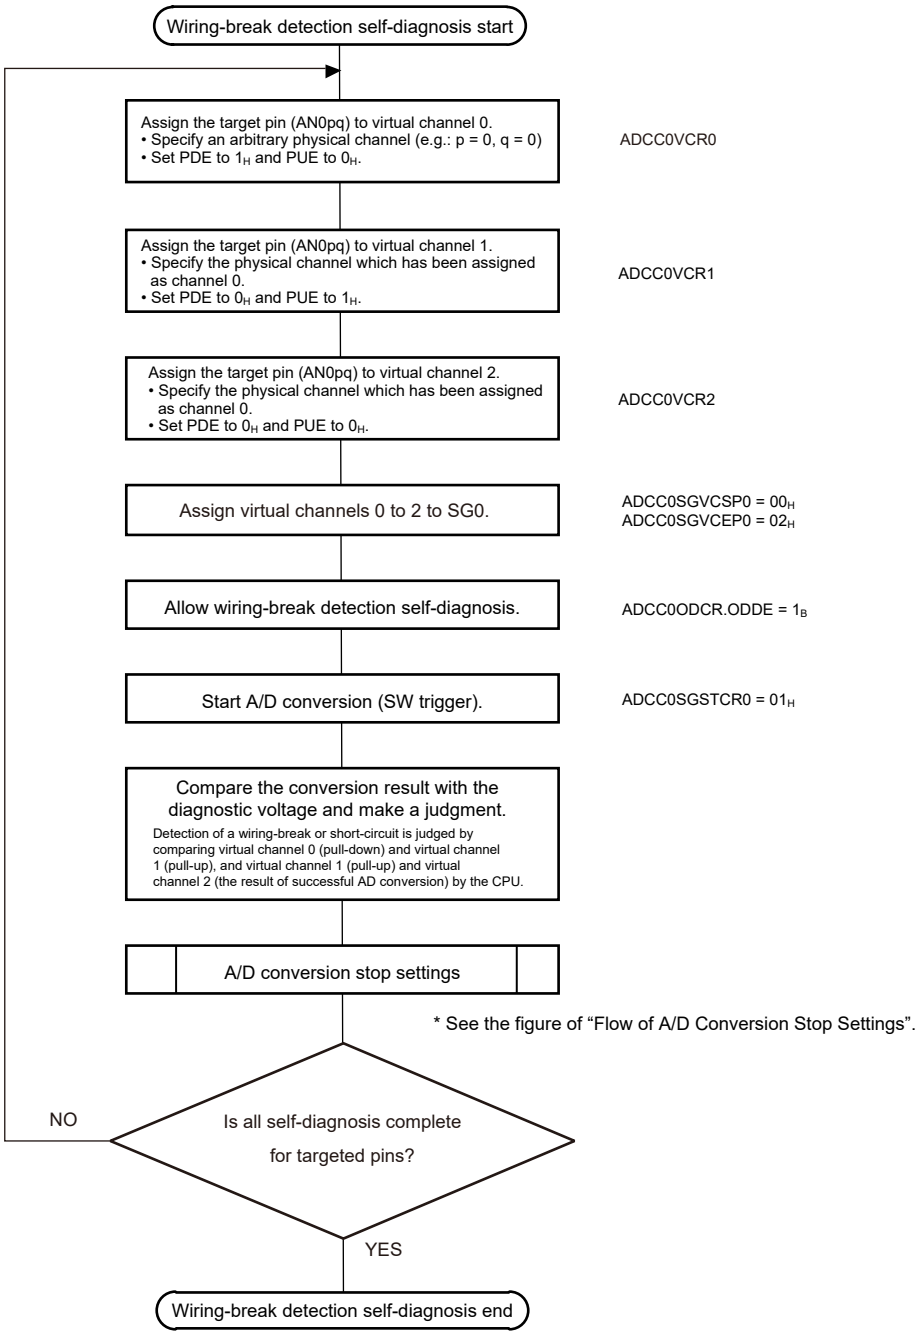


Figure 27.27 Flow of Pin-Level-Self-Diagnostic Settings

27.5.5 Procedure for Setting Wiring-Break Detection Self-Diagnosis

Wiring-break detection is a facility for detecting wiring breaks in ANI. Both pull-down and pull-up methods are used for detection. In pull-down method, if a wiring-break occurs, the result of the AD conversion is attenuated to approximately 0V, which is detected as an abnormal value. Therefore, the user can judge that a wiring-break has been detected. In pull-up method, if a wiring-break occurs, the result of the AD conversion is booted to approximately 5V, which is detected as an abnormal value. Therefore, the user can judge that a wiring-break has been detected.

Figure 27.28 shows the flow of wiring-break detection self-diagnostic settings. The following flow uses an example in which each pin of ADCC0 is assigned to virtual channels, and wiring-break detection self-diagnosis is performed by applying diagnostic voltage (other than the neighborhood of 0 V) to targeted pins. Also, it is assumed that the flow is performed before starting A/D conversion.

Note: Perform wiring-break detection self-diagnosis on each pin one by one.

Figure 27.28 Flow of Wiring-Break Detection Self-Diagnostic Settings

27.6 Definition of A/D Conversion Accuracy

A/D conversion accuracy is defined below.

- Resolution
  Number of digital output codes of the A/D converter
- Quantization error
  An error essentially contained in A/D converters, which is given as 1/2 LSB (**Figure 27.29**).
- Offset error
  Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from the minimum voltage value 000_H to 001_H. However, the quantization error is not included (**Figure 27.29**).
- Full-scale error
  Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from FFE_H to FFF_H. However, the quantization error is not included (**Figure 27.29**).
- DNL (Differential nonlinear error)
  Deviation between the ideal digital output code width (Vq) and the actual digital output code width (Va), which is given as (Va - Vq) / Vq. However, the offset error, the full-scale error, and the quantization error are not included (**Figure 27.29**).
- INL (Integral nonlinear error)
  Deviation of the actual value from the ideal A/D conversion characteristics, from the zero voltage to the full-scale voltage, which is given as an integral of DNL from 000_H to a digital output code. However, the offset error, the full-scale error, and the quantization error are not included (**Figure 27.29**).
- Absolute accuracy
  Deviation between the digital value and the analog input value. The offset error, the full-scale error, the quantization error, DNL, and INL are included (**Figure 27.29**).

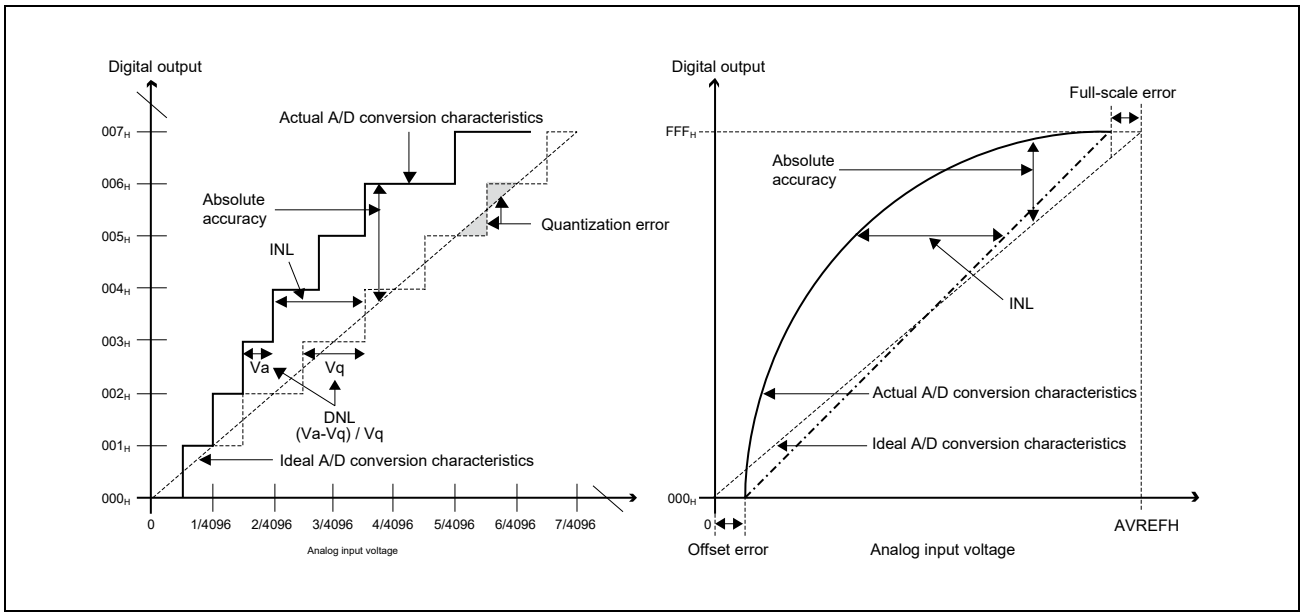

Figure 27.29 Definition of A/D Conversion Accuracy

27.7 Notes

27.7.1 Notes on Register Settings

1. When you use the simultaneous track and hold function, be sure to select asynchronous suspend.
2. When you use the simultaneous track and hold function, be sure to select the multicycle scan mode and set the number of scans to 1.
3. When you use the simultaneous track and hold function, be sure to hold first to perform A/D conversion.
4. When you use the simultaneous track and hold function, be sure to disable an AD timer trigger input to SGx to be selected in T&H group A or B.
5. Do not perform wiring-break detection in A/D conversion using the simultaneous track and hold function. Set the ADCCnTHER.THkE bit to 0 or the ADCCnTHSTPCR.THSTP bit to 1 before using the wiring-break detection function.
6. Do not perform a self-diagnosis while the current is injected into the analog input pin.

The following table shows notes on setting registers.

Before setting values for the following registers, set and check the contents of Check Steps.

Table 27.52 Notes on Setting Registers

Registers	Check Steps
ADCCnVCRj ADCCnADCR1 ADCCnADCR2 ADCCnSFTCR ADCCnTDCR ADCCnODCR ADCCnULLMTBR0 to ADCCnULLMTBR2	1. The hold trigger enable (ADCCnTHACR.HLDTE bit and ADCCnTHBCR.HLDTE bit) of T&H groups A and B is 0. 2. The scan group synchronization start enable (ADCCnSGCRx.ADSTARTE bit) of all scan groups is 0 and the trigger mode (ADCCnSGCRx.TRGMD bit) of all scan groups is 0. 3. The scan group status (ADCCnSGSRx.SGACT bit) of all scan groups is 0 (before starting scan groups).
ADCCnTHCR ADCCnTHGSR	1. The hold trigger enable (ADCCnTHACR.HLDTE bit and ADCCnTHBCR.HLDTE bit) of T&H groups A and B is 0. 2. The scan group status (ADCCnSGSRx.SGACT bit) of SGx specified in the scan group select (ADCCnTHACR.SGS[1:0] bits and ADCCnTHBCR.SGS[1:0] bits) of T&H groups A and B is 0 (before starting scan groups). 3. The ADCCnTHER.THkE bit of all T&H is 0 (all T&H are stopped).
ADCCnTHACR.HLDCTE bit, SGS[1:0] bit ADCCnTHBCR.HLDCTE bit, SGS[1:0] bit	1. The hold trigger enable (ADCCnTHACR.HLDTE bit and ADCCnTHBCR.HLDTE bit) of T&H groups A and B is 0. 2. The scan group synchronization start enable (ADCCnSGCRx.ADSTARTE bit) of all scan groups is 0 and the trigger mode (ADCCnSGCRx.TRGMD bit) of all scan groups is 0. 3. The scan group status (ADCCnSGSRx.SGACT bit) of all scan groups is 0 (before starting scan groups). 4. The ADCCnTHER.THkE bit of all T&H is 0 (all T&H are stopped).
ADCCnTHER	1. The hold trigger enable (ADCCnTHACR.HLDTE bit and ADCCnTHBCR.HLDTE bit) of T&H groups A and B is 0. 2. The scan group status (ADCCnSGSRx.SGACT bit) of SGx specified in the scan group select (ADCCnTHACR.SGS[1:0] bits and ADCCnTHBCR.SGS[1:0] bits) of T&H groups A and B is 0 (before starting scan groups).
ADCCnSGCRx.SCANMD bit, ADIE bit ADCCnSGMCYCRx ADCCnULLMSRx ADCCnSGVCSPx ADCCnSGVCEPx	1. When the scan group select (ADCCnTHACR.SGS[1:0] bits) of T&H group A is specified to SGx, the hold trigger enable (ADCCnTHACR.HLDTE bit) of T&H group A is 0. 2. When the scan group select (ADCCnTHBCR.SGS[1:0] bits) of T&H group B is specified to SGx, the hold trigger enable (ADCCnTHBCR.HLDTE bit) of T&H group B is 0. 3. The scan group synchronization start enable (ADCCnSGCRx.ADSTARTE bit) of SGx is 0 and the trigger mode (ADCCnSGCRx.TRGMD bit) of SGx is 0. 4. The scan group status (ADCCnSGSRx.SGACT bit) of SGx is 0 (before starting scan groups).
ADCCnTHCR ADCCnTHACR ADCCnTHBCR ADCCnTHER ADCCnTHGSR ADCCnSGCRx ADCCnSGVCSPx ADCCnSGVCEPx	When setting the registers listed at left, write to the registers after they have been read. If this procedure is not followed, the written register value may not be correctly reflected in operations.

Section 28 A/D Converter Option (ADPA)

This section contains a generic description of the A/D converter option (ADPA).

The first part of the section describes all RH850/C1M-A specific properties such as the number of units, the register base address, etc. The remainder of the section describes the functions and registers of ADPA.

28.1 Features of RH850/C1M-A ADPA

28.1.1 Number of Units

This LSI has the following number of units of ADPA.

Table 28.1 Number of Units

Product	RH850/C1M-A2	RH850/C1M-A1
Number of units	1	1
Name	ADPAn (n = 0)	ADPAn (n = 0)

Table 28.2 Indices

Index	Meaning
m	Throughout this section, the individual TSG3 units are identified by the index “m” (m = 0 to 2).
j	Throughout this section, the individual counters incorporated in ADPA are identified by the index “j” (j = 0 to 23).
k	The individual ADC units referred to from this section are identified by the index “k” (k = 0 to 2).
n	Throughout this section, the individual ADPA units are identified by the index “n” (n = 0).
q	Throughout this section, the DMA request numbers is indicated by the index “q” (q = 0 to 23).

28.1.2 Register Base Address

ADPA base addresses are listed in the following table.

ADPA register addresses are given as offsets from the individual base address.

Table 28.3 Register Base Address

Base Address Name	Base Address
<ADPA0_base>	FFF4 0000_H

28.1.3 Clock Supply

The ADPA clock supply is shown below.

Table 28.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
ADPAn	PCLK	CLK_LSB (low-speed peripheral clock)

28.1.4 Interrupt Requests

The ADPA interrupt requests are listed below.

Table 28.5 Interrupts and DMA Requests

Unit Interrupt Signal	Interrupt/DMA Request Name (Outline)	Interrupt Number	DMA Trigger Number*1		DTS Trigger Number*1	
			1st	2nd	1st	2nd
INTADPA0	ADPA control notification interrupt 0	333	—	—	—	—
INTADPA1	ADPA control notification interrupt 1	334	—	—	—	—
INTADPA2	ADPA control notification interrupt 2	335	—	—	—	—
DRQADPA0	ADPA DMA request 0	—	—	19	—	19
DRQADPA1	ADPA DMA request 1	—	—	20	—	20
DRQADPA2	ADPA DMA request 2	—	—	21	—	21
DRQADPA3	ADPA DMA request 3	—	—	22	—	22
DRQADPA4	ADPA DMA request 4	—	—	23	—	23
DRQADPA5	ADPA DMA request 5	—	—	24	—	24
DRQADPA6	ADPA DMA request 6	—	—	49	—	49
DRQADPA7	ADPA DMA request 7	—	—	50	—	50
DRQADPA8	ADPA DMA request 8	—	—	53	—	53
DRQADPA9	ADPA DMA request 9	—	—	54	—	54
DRQADPA10	ADPA DMA request 10	—	—	55	—	55
DRQADPA11	ADPA DMA request 11	—	—	56	—	56
DRQADPA12	ADPA DMA request 12	—	—	57	—	57
DRQADPA13	ADPA DMA request 13	—	—	58	—	58
DRQADPA14	ADPA DMA request 14	—	—	59	—	59
DRQADPA15	ADPA DMA request 15	—	—	60	—	60
DRQADPA16	ADPA DMA request 16	—	—	68	—	68
DRQADPA17	ADPA DMA request 17	—	—	69	—	69
DRQADPA18	ADPA DMA request 18	—	—	70	—	70
DRQADPA19	ADPA DMA request 19	—	—	71	—	71
DRQADPA20	ADPA DMA request 20	—	—	103	—	103
DRQADPA21	ADPA DMA request 21	—	—	104	—	104
DRQADPA22	ADPA DMA request 22	—	—	105	—	105
DRQADPA23	ADPA DMA request 23	—	—	106	—	106

Note 1. 1st: Primary channel, 2nd : Secondary channel

28.1.5 Reset Sources

ADPA reset sources are listed in the following table. ADPA is initialized by the reset source below.

Table 28.6 Reset Source

Unit Name	Reset Source
ADPAn	All reset sources

28.1.6 External Input/Output Signals

ADPA does not have external I/O signals.

28.2 Overview

28.2.1 Functional Overview

ADPA provides the following functionalities.

(1) Hi-Z control based on the upper and lower threshold values for AD conversion results

This function controls the outputs from the TSG3 units, whether to be placed into a high-impedance state or not, according to the number of counts of threshold judgment results based on the values read from ADC with the successive approximation method and the settings of upper and lower thresholds for those read values. Output from TSG3 are set for or released from a hi-Z state by the hardware. It can be also configured to be released from a hi-Z state by the software.

A hi-Z state is controlled according to the values of the error determination counter and normal recovery counter.

(2) Counting the number of met conditions for upper/lower threshold for ADC values

ADPA has twenty-four counters that count the number of met conditions. The individual counters are used for counting the results from the corresponding virtual channel registers of ADCC (VCR0 to VCR7) as follows.

- Counters 0 to 7 respectively corresponds to ADCC0.VCR0 to 7.
- Counters 8 to 15 respectively corresponds to ADCC1.VCR0 to 7.
- Counters 16 to 23 respectively corresponds to ADCC2.VCR0 to 7.

The judgment result from any counter above can be used for controlling outputs through any channel of TSG3s.

See **Figure 28.1** and **Figure 28.2** for connections between the modules.

28.2.2 Block Diagram

The relationships between ADPA, ADC, and TSG3 are shown below.

Outputs through the TSG3 units can be set for or release from a hi-Z state by using any judgment result read from the ADC. However, if hi-Z control by the timer option (TAPA) is also available, controlling by the timer option is prioritized. The result of VCRn threshold value judgment is output at every A/D conversion according to the settings of the vertical channel threshold value register. For details, see **Section 27, AD Converter (ADCC)**.

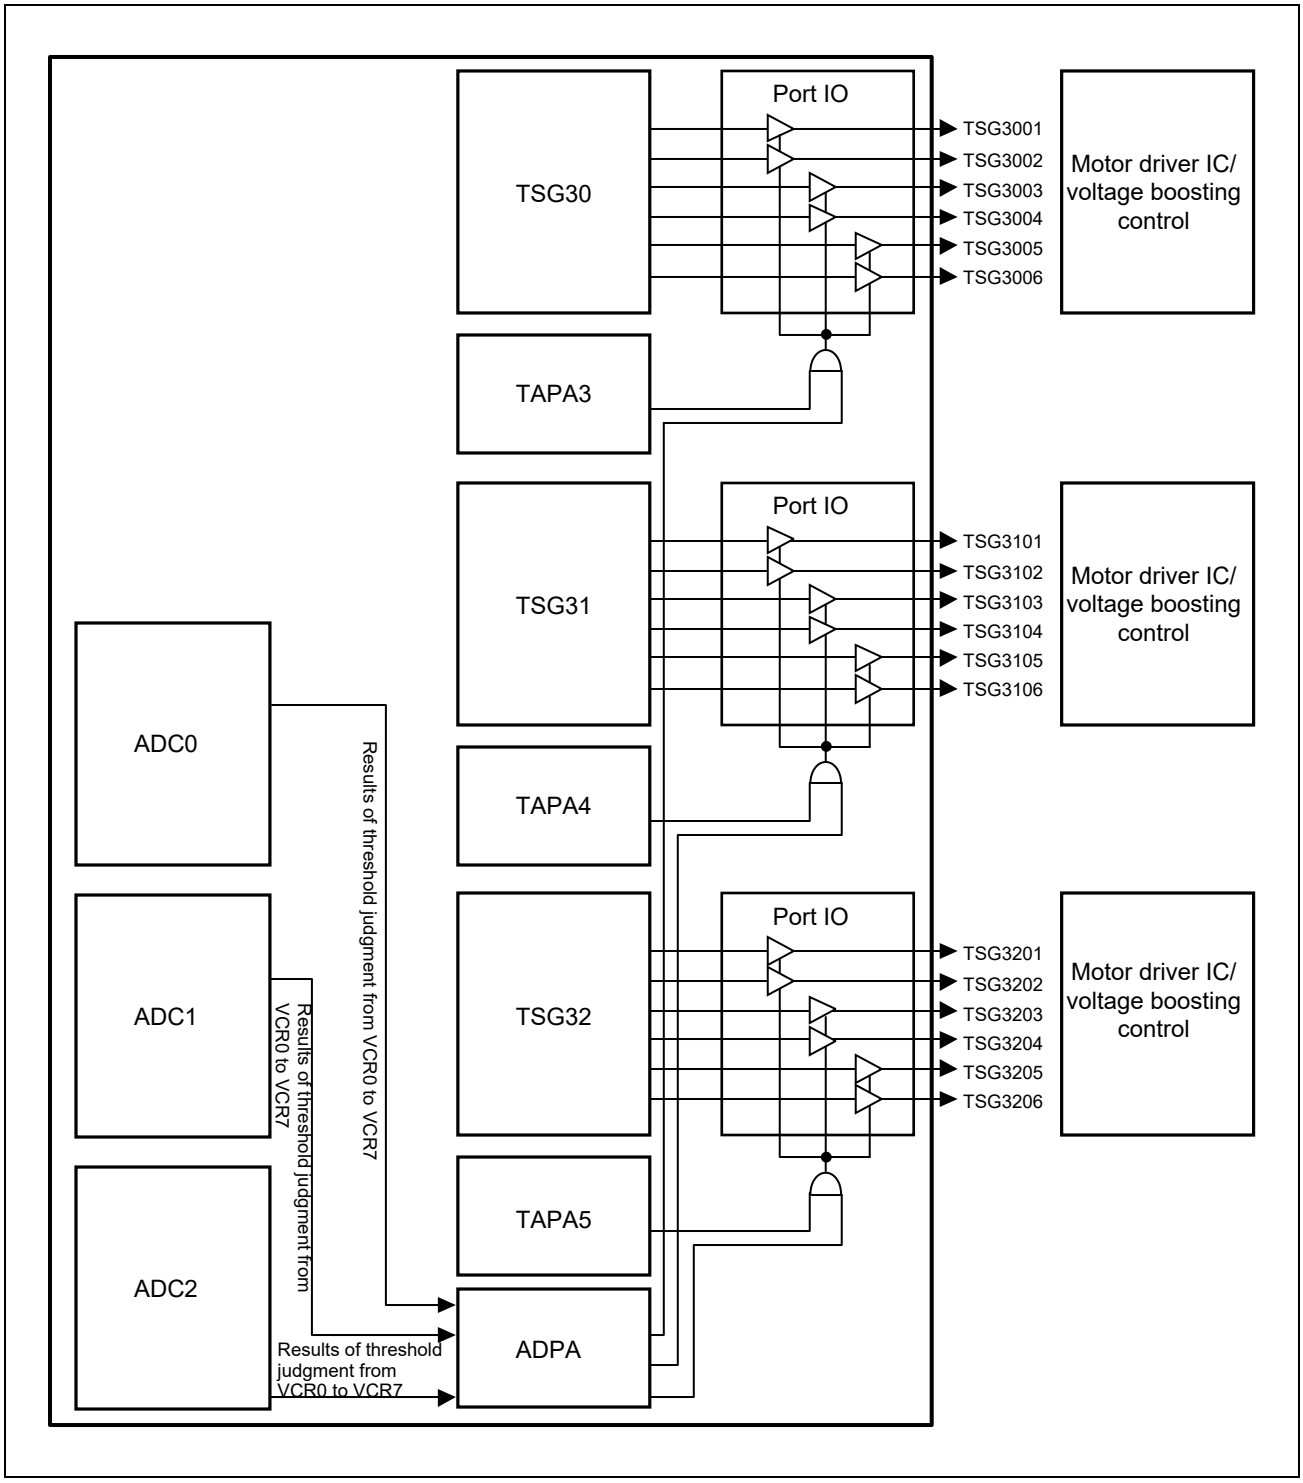

Figure 28.1 Block Diagram

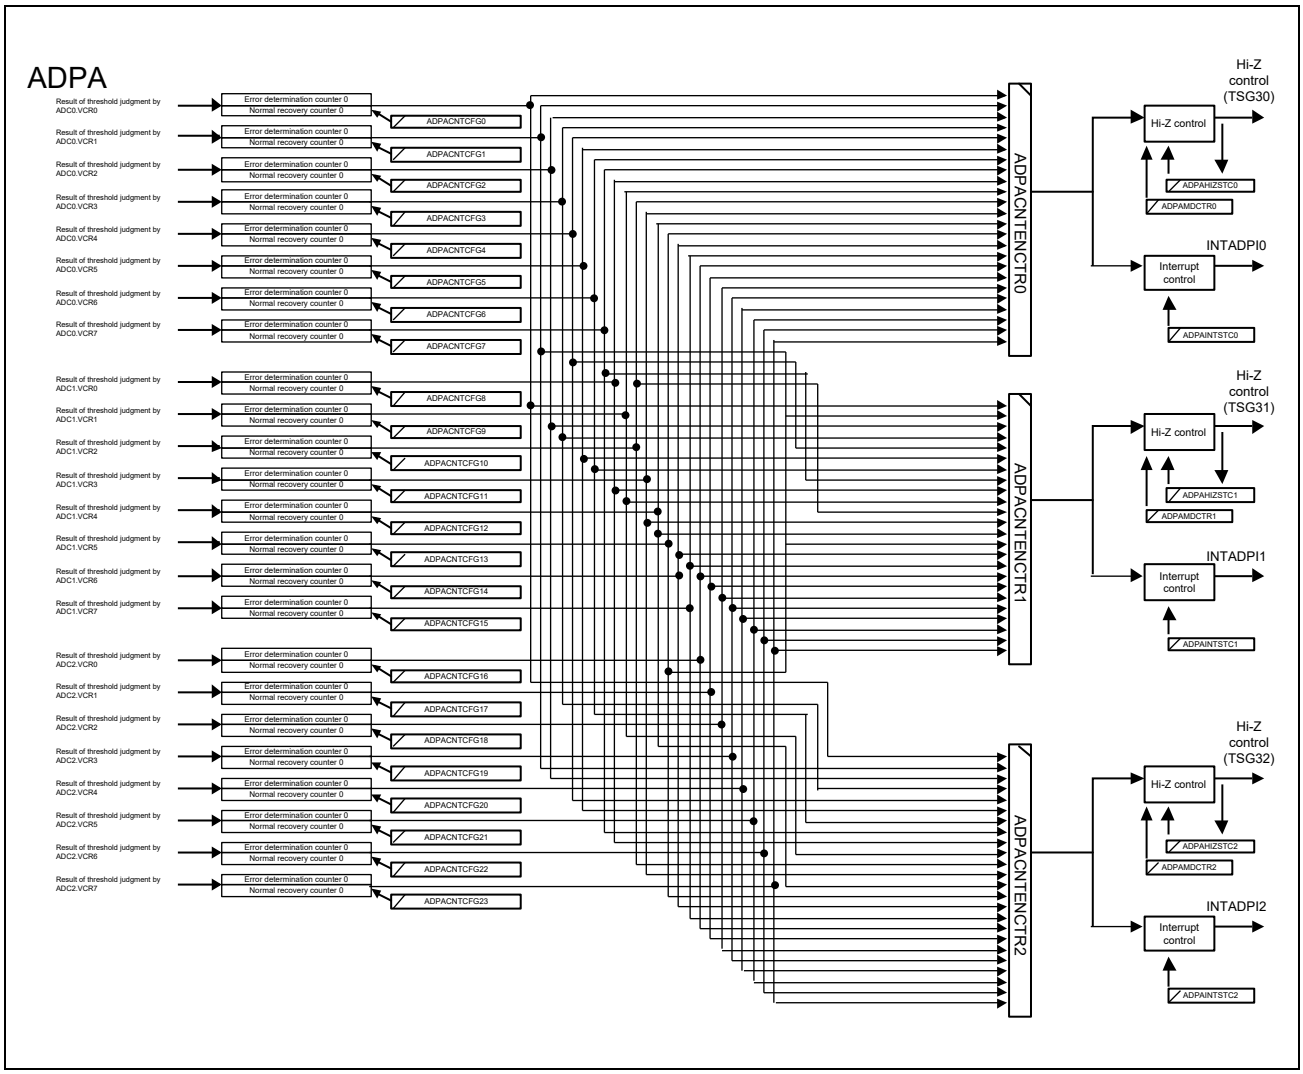

Figure 28.2 ADPA Internal Diagram

28.3 Registers

28.3.1 List of Registers

The ADPA registers are listed in the table below.

All registers of ADPA can be accessed only in 32-bit units. Do not make accesses to those registers in 8 or 16-bit units.

For <ADPAn_base>, see the register base address.

Table 28.7 List of Registers

Module Name	Register Name	Symbol	Address
ADPA	Hi-Z Control State Register m	ADPAHIZSTCm	<ADPAn_base> + 000_H + 100_H × m
ADPA	Interrupt Control Register m	ADPAINTSTCm	<ADPAn_base> + 008_H + 100_H × m
ADPA	Counter State Register m	ADPACNTSTSm	<ADPAn_base> + 010_H + 100_H × m
ADPA	Hi-Z Control Release Mode Selection Register m	ADPAMDCTRm	<ADPAn_base> + 020_H + 100_H × m
ADPA	Counter Enable Register m	ADPACNTENCTRm	<ADPAn_base> + 040_H + 100_H × m
ADPA	Hi-Z Control Request State Register m	ADPACNTRQSTSm	<ADPAn_base> + 044_H + 100_H × m
ADPA	Counter Setting Register j	ADPACNTCFGj	<ADPAn_base> + 800_H + 4_H × j
ADPA	Counter Control Register j	ADPACNTCTRj	<ADPAn_base> + 900_H + 4_H × j
ADPA	DMA Resource Selection Register q	ADPADMASELq	<ADPAn_base> + $C00_H$ + 4_H × q
ADPA	Test Pulse Injection Register 0	ADPATPUL0	<ADPAn_base> + $F00_H$
ADPA	Test Pulse Injection Register 1	ADPATPUL1	<ADPAn_base> + $F04_H$
ADPA	Test Pulse Injection Register 2	ADPATPUL2	<ADPAn_base> + $F08_H$

28.3.2 ADPAHIZSTCm – Hi-Z Control State Register m

This register indicates the state of hi-Z control. Writing 1 to this register while all bits of the hi-Z control request state register (ADPACNTRQSTSm) indicate “a request for the hi-Z state was not issued” releases the relevant output from the hi-Z state, if releasing by the software is selected by the mode register.

Access: Readable/writable in 32-bit units.

Address: <ADPAn_base> +100_H × m

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 28.8 ADPAHIZSTC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after a reset.
0	STS	Hi-Z Control State This bit indicates whether the output from TSG3x is in a hi-Z state or not. If releasing by the software is selected, writing 1 to this bit releases the output from the hi-Z state. 0 : Output from TSG3m is in a normal state. 1 : Output from TSG3m is in a hi-Z state.

28.3.3 ADPAINTSTCm – Interrupt Control Register m

This register controls the timing to notify interrupts.

Access: Readable/writable in 32-bit units.

Address: <ADPAn_base> + 8 + 100_H × m

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 28.9 ADPAINTSTC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after a reset.
1, 0	INTEN	Interrupt Control Register 00 : Interrupts are not notified. 01 : An interrupt is notified when the relevant output is released from the hi-Z state. 10 : An interrupt is notified when the relevant output is placed into a hi-Z state. 11 : An interrupt is notified when the relevant output is placed into or released from the hi-Z state.

28.3.4 ADPACNTSTSm – Counter State Register m

This register indicates the state of the individual counters.

Access: Readable in 32-bit units.

Address: <ADPAn_base> + 10_H + 100_H × m

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CNTSTS

	CNTSTS															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.10 ADPACNTSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned.
23 to 0	CNTSTS	Counter State Register Each of these bits indicates whether the corresponding counters have made a request for the hi-Z state or not. 0 : The counter has made no request for the hi-Z state. 1 : The counter has made a request for the hi-Z state.

28.3.5 ADPAMDCTRm – Hi-Z Control Release Mode Selection Register m

This register is used to select whether to release the output from the hi-Z state by the hardware or the software.

Access: Readable/writable in 32-bit units.

Address: <ADPAn_base> +20_H + 100_H × m

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 28.11 ADPAMDCTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after a reset.
0	SFTEN	Hi-Z Control Release Mode Selection This bit selects whether to release the relevant output from a hi-Z state by the hardware or by the software. Releasing by the software does not make any effect if all counters (which have been enabled to make a request for the hi-Z state) have made a request for the hi-Z state. 0 : Hardware mode: the relevant output is released from the hi-Z state according to the control made by the counters. 1 : Software mode: the relevant output is released from the hi-Z state by the software.

28.3.6 ADPACNTENCTRm – Counter Enable Register m

This register enables and disables the counter to make a request for the hi-Z state.

Access: Readable/writable in 32-bit units.

Address: <ADPAn_base> + 40_H + 100_H × m

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.12 ADPACNTENCTR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When writing, write the value after a reset.
23 to 0	CNTEN	Hi-Z Control Enable Counter Setting Each of these bits enables or disables the corresponding counter to make a request for the hi-Z state. 0 : The counter is disabled to make a request for the hi-Z state. 1 : The counter is enabled to make a request for the hi-Z state.

28.3.7 ADPACNTRQSTSm –Hi-Z Control Request Status Register m

This register indicates whether a request for the hi-Z state from the counter was issued or not.

Access: Readable in 32-bit units.

Address: <ADPAn_base> + 44_H + 100_H × m

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CNTRQ							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.13 ADPACNTRQSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned.
23 to 0	CNTRQ	Hi-Z Control Request Each of these bits indicates whether a request for the hi-Z state from the corresponding counter was issued or not. 0 : No request for the hi-Z state has been issued. 1 : A request for the hi-Z state has been issued.

28.3.8 ADPACNTCFGj – Counter Setting Register j

Each of these registers makes settings of the corresponding counter. The normal recovery counter and the error determination counter are used to decide the period for eliminating noise. Rewriting this register resets the values of the internal down counter.

Access: Readable/writable in 32-bit units.

Address: <ADPAn_base> + 800_H + 4_H × j

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SEL		—	—	—	—	—	—	—	—	—	—	—	CNMD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 28.14 ADPACNTCFG Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	Reserved	When writing, write the value after a reset.
29, 28	SEL	Count Type Selection These bits select the condition for counting by counter j. 00 : Values in excess of the upper and lower limits are counted as normal. 01 : Values in excess of the lower limit are counted as errors and values in excess of the upper limit are counted as normal. 10 : Values in excess of the upper limit are counted as errors and values in excess of the lower limit are counter as normal. 11 : Values in excess of the upper and lower limits are counted as errors.
27 to 17	Reserved	When writing, write the value after a reset.
16	CNMD	Noise Count Method Selection 0 : Error determination counter is reset once the value of counter j falls within the preset thresholds. 1 : Error determination counter is reset once the normal recovery counter value becomes 0.
15 to 12	Reserved	When writing, write the value after a reset.
11 to 8	NRMCNT	Normal Recovery Counter Setting The number of counts of the normal recovery counter is selected by these bits. After reaching the selected number of counts, the relevant output is released from the hi-Z state and this counter is reset. 0_H : Normal Recovery Counter is disabled. 1_H : The relevant output is released from the hi-Z state once the value of counter j falls below the preset thresholds. . . . F_H : The relevant output is released from the hi-Z state when the value of counter j falls below the preset thresholds fifteen times consecutively. Hi-Z control is not performed when the normal recovery counter is disabled.

Table 28.14 ADPACNTCFG Register Contents (2/2)

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after a reset.
3 to 0	ERRCNT	Error Determination Counter Setting The number of counts by the error determination counter is selected by these bits. After reaching the selected number of counts, the relevant output is placed into a hi-Z state. The counter value is reset according to the setting of the CNMD register. 0_H : Error determination counter is disabled. 1_H : The concerned output is placed into a hi-Z state once the value of the counter j exceeds the preset thresholds. . . . F_H : The concerned output is placed into a hi-Z state when the value of the counter j exceeds the preset thresholds fifteen times in total. Hi-Z control is not performed when the error determination counter is disabled.

28.3.9 ADPACNTCTRj ─ Counter Control Register j

Each of these registers makes initial settings for the corresponding counter.

Access: Writable in 32-bit units.

Address: <ADPAn_base> + 900_H + 4_H × j

Value after reset: —

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLR	
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 28.15 ADPACNTCTR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	The write value should be 0.
17, 16	CLR	Counter Clear Register These bits initializes counter j by reloading the configuration for the counter and cancelling the given request for the hi-Z state. 00 : Has no effect. 11 : Initializes counter j. Reloads the configuration for the counter and cancels the request for the hi-Z state which has been made. Other than above: Setting prohibited.
15 to 0	Reserved	The write value should be 0.

28.3.10 ADPADMASELq ─ DMA Resource Selection q

ADPA is configured to output twenty four DMA requests. Resources for a DMA request and the counter which issues the request are selected by this register. Selecting the counter eventually selects the conditions for counting threshold judgment results.

Access: Readable/writable in 32-bit units.

Address: <ADPAn_base> + $C00_H$ + 4_H × q

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TIMSEL		—	—	—	CNTSEL				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 28.16 ADPADMASEL Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When writing, write the value after a reset.
9, 8	TIMSEL	DMA Output Timing Select These bits select the timing to issue a DMA request. 00 : Issuance of DMA request is disabled. 01 : A DMA request is issued when the relevant output is released from the hi-Z state. 10 : A DMA request is issued when the relevant output is placed into a hi-Z state. 11 : A DMA request is issued when the relevant output is placed into or released from the hi-Z state.
7 to 5	Reserved	When writing, write the value after a reset.
4 to 0	CNTSEL	DMA Request Issue Counter Selection These bits select the counter which issues a DMA request. 00_H : Counter 0 01_H : Counter 1 17_H :Counter 23 18_H or above : Setting prohibited

28.3.11 ADPATPUL0 ─ Test Pulse Injection Register 0

This register generates test pulses.

Access: Writable in 32-bit units.

Address: <ADPAn_base> + $F00_H$

Value after reset: —

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	TPULNRM

	TPULUND															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 28.19 ADPATPUL2 Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	The write value should be 0.
23 to 0	TPULUND	Injection of Pulse in Excess of Lower Threshold Each of these bits injects a pulse notifying the corresponding counter that the result of AD conversion exceeded the preset lower threshold. For example, writing 1 to bit 0 injects a pulse to counter 0. A single writing injects one pulse. Writing 0 to these bits is ignored.

28.4 Function

28.4.1 Noise Count Method

This part of the section describes how to count noises in ADPA. The number of times the result of AD conversion exceeds the given upper or lower threshold is counted and used for controlling hi-Z state of outputs from TSG3. Two counting methods are provided with different conditions for initializing the error determination counter as shown in figures below.

Noise count method when

ADPACNTCFGj.CNMD = 0,

ADPACNTCFGj.NRMCNT = 3, and

ADPACNTCFGj.ERRCNT = 3

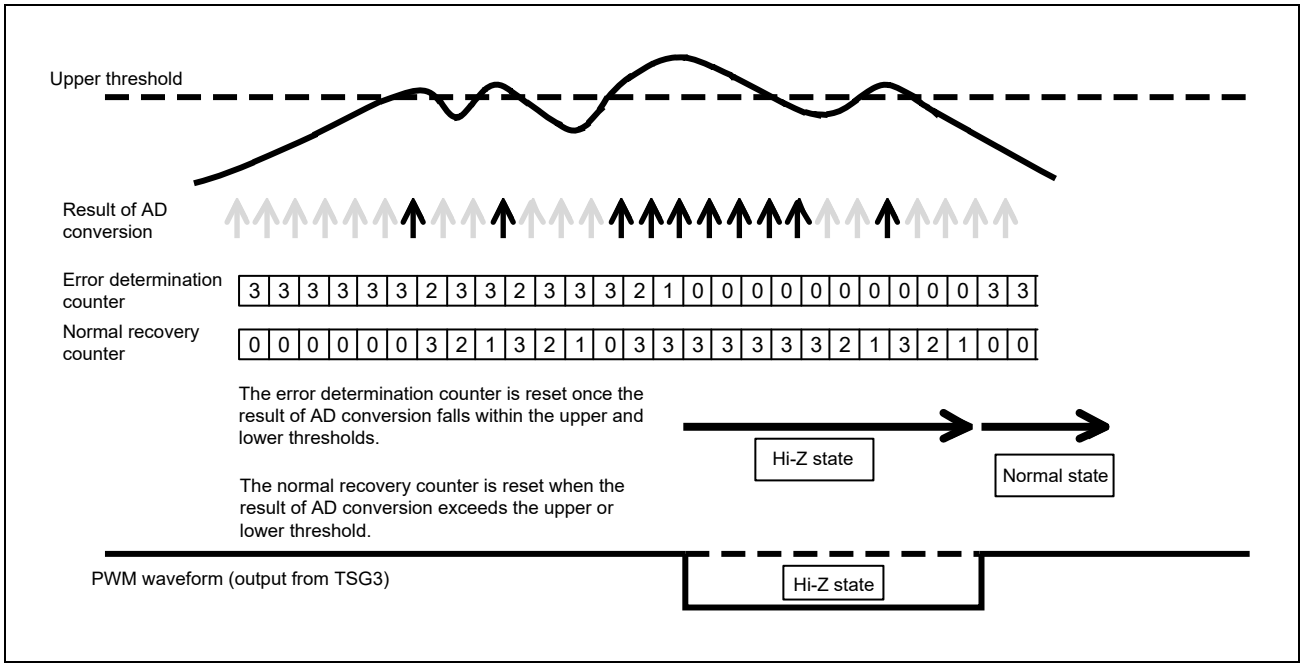

Figure 28.3 Noise Count Method 1

Noise count method when

ADPACNTCFGj.CNMD = 1,

ADPACNTCFGj.NRMCNT = 3, and

ADPACNTCFGj.ERRCNT = 3

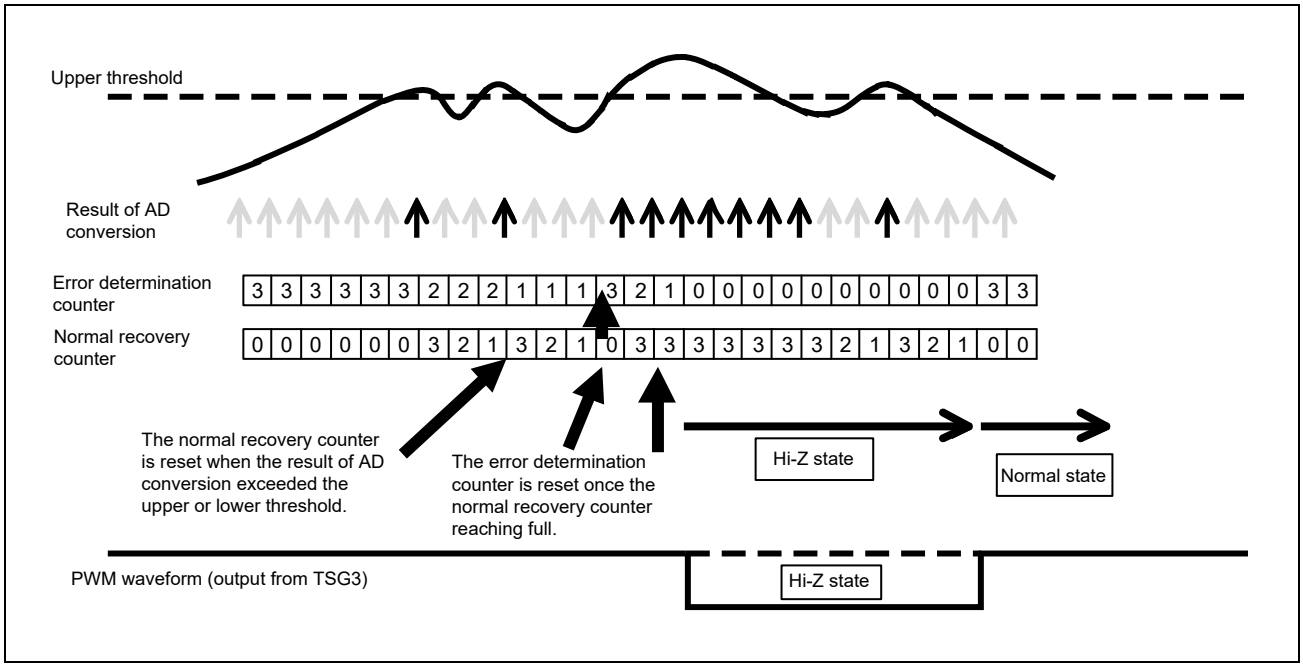

Figure 28.4 Noise Count Method 2

28.5 Operational Procedures

28.5.1 Basic Operation

(1) Configuration of ADC (see **Section 27, AD Converter (ADCC)** for details.)

Make necessary settings of the VCULME, VCLLME, and VCULLMTBS bits of the ADCC virtual channel register (ADCCkVCRj) and the virtual channel threshold table registers (ADCCkVCULLMTBR0 to 6) and perform threshold judgement.

CAUTION

The above settings are not related to the scan group upper limit/lower limit table select register.

(2) Configuration of TSG3

See **Section 20, Motor Control Timer (TSG3)** for details.

(3) Configuration of ADPA

Configure the following registers.

Counter setting registers (ADPACNTCFGj)

Counter enable registers (ADPACNTENCTRm)

Interrupt control registers (ADPAINTSTCm)

Hi-Z release mode selection registers (ADPAMDCTRm)

(4) Start AD conversion

Start AD conversion after configuring ADPA. When the settings for ADPA counter setting registers are changed, the error determination counter and normal recovery counter reload the new settings.

28.5.2 Start-Up Diagnosis

ADPA is also available in combination with self-diagnosis function provided for ADC. Details on this function are described in **Section 27, AD Converter (ADCC)**. Furthermore, by using the test pulse injection registers, users can inject desired conversion results to the target register for testing.

As a start-up diagnosis, whether hi-Z control works properly or not is checked by reading the hi-Z control state register after performing AD conversion for test by using either self-diagnosis function of ADC or test pulse injection registers.

Section 29 Functional Safety

This section describes the overview of the safety facilities of the RH850/C1M-A microcontrollers.

These microcontrollers were developed to meet the requirements for a Safety Element out of Context (SEooC) as described in the ISO26262. Contact our sales office for the details regarding the development process and safety facilities.

The following lists the failure detection functions provided by these products.

29.1 Overview

ECC and EDC

Detects failures of memories and data transfer path; correct some types of failures.

Lockstep

Detects failures of CPU1 in the early stage.

Memory Protection

Detects erroneous access to the memories and peripheral circuits to protect the data in these elements against erroneous access.

MISG

Monitors write access to a specific address by the CPU, generates the signatures based on the written data, and automatically compares the generated signatures with each other.

Clock Monitor

Monitors the clock operation to detect abnormal operation.

Duplex Configuration

For detecting failures on the failure detection circuits themselves, the functions shown in the table below have the dual hardware configuration. Failures on these functions are notified to the ECM.

Duplexed Functionality	Remark
Lockstep comparator	A lockstep comparator for CPU1
ECC decoder	
Address parity decoder	

For the ECC decoder for the peripheral RAM and data flash, the hardware including the control registers has dual configuration. When using the duplex failure detection function, set the same values to the control registers of the master and checker. For the other ECC decoders and address parity checker, control registers are not in dual configuration.

Error Control Module (ECM)

The ECM monitors various failures detected in the LSI and specifies the operation for the detected failure.

29.2 ECC and EDC

29.2.1 Overview

29.2.1.1 ECC

This product incorporates ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories; and memories and the ECC decoder.

Table 29.1 ECC Overview

Applicable Memory	Applicable Data Width [bit]	Operation upon Error Detection				Failure Insertion
		Detection/Correction	Notice to ECM	Error State	Address Capture	
Code flash	128	SEC-DED	Possible	Possible	Possible	Possible
Data flash	32	SEC-DED	Possible	Possible	Possible	Possible
Local RAM (CPU1, CPU2, SubCPU)	32	SEC-DED	Possible	Possible	Possible	Possible
Global RAM	32	SEC-DED	Possible	Possible	Possible	Possible
Instruction cache (data)	64	SEC-DED	Possible	Possible	Possible	Possible
Instruction cache (TAG)	16	SED-DED	Possible	Possible	Possible	Possible
RAM for DTS	32	SEC-DED	Possible	Possible	Possible	Possible
Peripheral RAM (32 bits)	32	SEC-DED	Possible	Possible	Possible	Possible

- Applicable data width

ECC encoding is applied to the data of the shown width.
If narrower data is to be written, the following processes are required. Here, ECC is also checked when data is read in (1).

(1) Read data to which ECC encoding is applied, including data to be overwritten.

(2) Replace data to be overwritten.

(3) Write back the data generated in (2).

- Detection/Correction

  SEC-DED: Detection and correction of 1-bit errors and detection of 2-bit errors are possible.

  SED-DED: Detection of 1-bit errors and 2-bit errors is possible.

- Notice to ECM

  A detected error is notified to the ECM.

- Error status

  The state of the detected error is retained.

- Address capture

  The address at which the error is detected is retained.

- Failure insertion

  Self-diagnosis of the ECC decoder is possible by intentionally generating an ECC error.

29.2.1.2 Address Parity

This product incorporates address parity for the following memories. The address parity enables detection of errors during address decoding. The address parity also enables detection of errors produced at addresses between the parity encoder and memories.

Table 29.2 Address Parity Overview

Applicable Memory	Parity Bit	Notice to ECM	Error Statues	Address Capture	Failure Insertion
Code flash	2 bits*1	Possible	Possible	Possible	Possible
Local RAM	2 bits*2	Possible	Possible	Possible	Possible
Global RAM	2 bits*2	Possible	Possible	Possible	Possible

Note 1. An address parity bit is written to one location in the memory at every 128 bits of data. Since the data are read in 256-bit units, twice the size of the data to be written, the address parity bits consist of 2 bits where one bit is an inversion of the other.

Note 2. The parity bits corresponding to the written address are written to two locations in the memory. When they are compared to the parity bits corresponding to the read address and errors are detected in both of the two parity bits stored in the memory, it is handled as an address parity error. When an error is detected only at one of the parity bits, it is handled as a parity bit error.

29.2.1.3 Data Parity

This product incorporates data parity for the particular data transfer. The data parity enables detection of errors of the transferred data. For details, see **Section 29.2.9, Data Parity for Data Transfer Path**.

29.2.2 Code Flash ECC and Address Parity

29.2.2.1 Overview

The Code Flash ECC is summarized in the table.

Table 29.3 Overview of the Code Flash ECC

Item	Description
Detection and correction of ECC errors	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. This function is enabled after a reset, that is, detection and notification of 2-bit errors and detection and correction of 1-bit errors are enabled.
Address parity	Address parity check can be either enabled or disabled. Address parity is checked during data read. This function is enabled after a reset.
Error notification	Errors are notified to the ECM on occurrence of ECC errors and parity errors. ECC error: • Error notification can be either enabled or disabled upon detection of a 2-bit ECC error. • Error notification can be either enabled or disabled upon detection of a 1-bit ECC error. After a reset, error notification upon detection of a 2-bit ECC error is enabled and error notification upon detection of a 1-bit ECC error is disabled Parity error: • Error notification can be either enabled or disabled upon detection of an address parity error. After a reset, error notification upon detection of an address parity error is enabled. The error notification signal is issued to the ECM, where a 2-bit ECC error and an address parity error are handled as one source, and a 1-bit ECC error is handled as one source.
Error states	A status register is provided, which indicates the statuses of 2-bit ECC error detection, 1-bit ECC error detection, and address parity error detection. If an error occurs while no error status is set, the applicable status is set. The error status can be cleared using the clear register.
Address capture	If an ECC error or a parity error occurs while no error status is set, the address at which the associated error has occurred is captured. The address is captured when a 2-bit ECC error, a 1-bit ECC error, or an address parity error is detected. The error status serves as the enable bit of the captured address.
Self-diagnosis	Data in the ROM and the ECC and address parity bits can all be read directly. Desired values can also be written to the ROM and to the ECC and address parity bits.
Others	The ECM can initiate a transition to the safe state in response to the detection of a 2-bit ECC error during the fetching of an instruction.

The ECC decoder and address parity generator are provided each for the read ports (CPU1, CPU2, SubCPU, and interconnect) connected to the Code Flash interface. The address parity checker is provided in the access controller for the code flash. For details, see **Figure 29.1**. The error information of the CPU1, CPU2, and SubCPU are retained in the registers, by each instruction and by each data. The instruction and data of the error information of the interconnect are retained in the same register. See **Figure 29.2**.

29.2.2.2 List of Registers

Table 29.4 List of Registers

Module Name	Register Name	Symbol*1	Address
ECCFLI	Code flash address parity control register	CFAPCTL	FFC6 2000H
ECCFLI	Code flash ECC control register (SIC)	CFECCCTL_SIC	FFC6 2200H
ECCFLI	Code flash error information control register (SIC)	CFERRINT_SIC	FFC6 2204H
ECCFLI	Code flash status clear register (SIC)	CFSTCLR_SIC	FFC6 2208H
ECCFLI	Code flash error count overflow status register (SIC)	CFOVFSTR_SIC	FFC6 220CH
ECCFLI	Code flash 1st error status register (SIC)	CF1STERSTR_SIC	FFC6 2210H
ECCFLI	Code flash 1st error address register (SIC)	CF1STEADR0_SIC	FFC6 2250H
ECCFLI	Code flash sub-test control register (SIC)	CFSTSTCTL_SIC	FFC6 2350H
ECCFLI	Code flash ECC control register (PE1)	CFECCCTL_PE1	FFC6 2400H
ECCFLI	Code flash error information control register (PE1)	CFERRINT_PE1	FFC6 2404H
ECCFLI	Code flash status clear register (PE1)	CFSTCLR_PE1	FFC6 2408H
ECCFLI	Code flash error count overflow status register (PE1)	CFOVFSTR_PE1	FFC6 240CH
ECCFLI	Code flash 1st error status register (PE1)	CF1STERSTR_PE1	FFC6 2410H
ECCFLI	Code flash 1st error address register 0 (PE1)	CF1STEADR0_PE1	FFC6 2450H
ECCFLI	Code flash 1st error address register 1 (PE1)	CF1STEADR1_PE1	FFC6 2454H
ECCFLI	Code flash sub-test control register (PE1)	CFSTSTCTL_PE1	FFC6 2550H
ECCFLI	Code flash ECC control register (PE2)	CFECCCTL_PE2	FFC6 2600H
ECCFLI	Code flash error information control register (PE2)	CFERRINT_PE2	FFC6 2604H
ECCFLI	Code flash status clear register (PE2)	CFSTCLR_PE2	FFC6 2608H
ECCFLI	Code flash error count overflow status register (PE2)	CFOVFSTR_PE2	FFC6 260CH
ECCFLI	Code flash 1st error status register (PE2)	CF1STERSTR_PE2	FFC6 2610H
ECCFLI	Code flash 1st error address register 0 (PE2)	CF1STEADR0_PE2	FFC6 2650H
ECCFLI	Code flash 1st error address register 1 (PE2)	CF1STEADR1_PE2	FFC6 2654H
ECCFLI	Code flash sub-test control register (PE2)	CFSTSTCTL_PE2	FFC6 2750H
ECCFLI	Code flash ECC control register (PE3)	CFECCCTL_PE3	FF75 3000H
ECCFLI	Code flash error information control register (PE3)	CFERRINT_PE3	FF75 3004H
ECCFLI	Code flash status clear register (PE3)	CFSTCLR_PE3	FF75 3008H
ECCFLI	Code flash error count overflow status register (PE3)	CFOVFSTR_PE3	FF75 300CH
ECCFLI	Code flash 1st error status register (PE3)	CF1STERSTR_PE3	FF75 3010H
ECCFLI	Code flash 1st error address register 0 (PE3)	CF1STEADR0_PE3	FF75 3050H
ECCFLI	Code flash 1st error address register 1 (PE3)	CF1STEADR1_PE3	FF75 3054H
ECCFLI	Code flash sub-test control register (PE3)	CFSTSTCTL_PE3	FF75 3150H

Note 1. The registers with symbols “_SIC”, “_PE1”, “_PE2”, and “_PE3” as suffixes are provided to the particular ECC controllers: the registers with “_SIC” are provided to the ECC controller for access from the system interconnect to the code flash, the registers with “_PE1” are provided to the ECC controller for access from CPU1, the registers with “_PE2” are provided to the ECC controller for access from CPU2, and the registers with "_PE3" are provided to the ECC controller for access from the SubCPU.

29.2.2.3 Details of Registers

(1) CFAPCTL — Code Flash Address Parity Control Register

CFAPCTL enables or disables address parity check. Set the PROT[1:0] bits to 01_B when writing to this register. This register is initialized by an internal reset or an external reset.

Access: CFAPCTL is readable/writable in 32-bit units.
CFAPCTLL is readable/writable in 16-bit units.

Address: CFAPCTL : FFC6 2000H
CFAPCTLL : FFC6 2000H :

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	APARIDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 29.5 CFAPCTL Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	The read value is 0. The write value should be 0.
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are read as 0.
13 to 1	Reserved	The read value is 0. The write value should be 0.
0	APARIDIS	Address Parity Check Disable Enables or disables address parity check by the address parity circuit. 0: Enables address parity check. 1: Disables address parity check

(2) CFECCCTL_SIC/PE1/PE2/PE3 — Code Flash ECC Control Register

CFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. Set the PROT[1:0] bits to 01_B when writing to this register. This register is initialized by an internal reset or an external reset.

Access: CFECCCTL_SIC, CFECCCTL_PE1, CFECCCTL_PE2, and CFECCCTL_PE3 are readable/writable in 32-bit units.
CFECCCTL_SICL, CFECCCTL_PE1L, CFECCCTL_PE2L, and CFECCCTL_PE3L are readable/writable in 16-bit units.

Address: CFECCCTL_SIC: FFC6 2200H, CFECCCTL_PE1 : FFC6 2400H,
CFECCCTL_PE2: FFC6 2600H, CFECCCTL_PE3 : FF75 3000H,
CFECCCTL_SICL: FFC6 2200H, CFECCCTL_PE1L : FFC6 2400H,
CFECCCTL_PE2L: FFC6 2600H, CFECCCTL_PE3L : FF75 3000H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 29.6 CFECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	The read value is 0. The write value should be 0.
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
13 to 2	Reserved	The read value is 0. The write value should be 0.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(3) CFERRINT_SIC/PE1/PE2/PE3 — Code Flash Error Information Control Register

CFERRINT enables or disables generation of the error notification signal to the ECM upon detection of a 2-bit ECC error, a 1-bit ECC error, or an address parity error.

This register is initialized by an internal reset or an external reset.

Access: CFERRINT_SIC, CFERRINT_PE1, CFERRINT_PE2, and CFERRINT_PE3 are readable/writable in 32-bit units.
CFERRINT_SICL, CFERRINT_PE1L, CFERRINT_PE2L, and CFERRINT_PE3L are readable/writable in 16-bit units.
CFERRINT_SICLL, CFERRINT_PE1LL, CFERRINT_PE2LL, and CFERRINT_PE3LL are readable/writable in 8-bit units.

Address: CFERRINT_SIC : FFC6 2204H, CFERRINT_PE1 : FFC6 2404H,
CFERRINT_PE2 : FFC6 2604H, CFERRINT_PE3 : FF75 3004H,
CFERRINT_SICL : FFC6 2204H, CFERRINT_PE1L : FFC6 2404H,
CFERRINT_PE2L : FFC6 2604H, CFERRINT_PE3L : FF75 3004H,
CFERRINT_SICLL : FFC6 2204H, CFERRINT_PE1LL : FFC6 2404H,
CFERRINT_PE2LL : FFC6 2604H, CFERRINT_PE3LL : FF75 3004H

Value after reset: 0000 0006H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	APEIE	DEDIE	SEDIE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 29.7 CFERRINT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	The read value is 0. The write value should be 0.
2	APEIE	Address Parity Error Notification Enable Enables or disables generation of the error notification signal upon detection of an address parity error when address parity check is enabled. 0: Disables notification of the address parity error. 1: Enables notification of the address parity error.
1	DEDIE	2-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error.
0	SEDIE	1-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error.

(4) CFSTCLR_SIC/PE1/PE2/PE3 — Code Flash Status Clear Register

CFSTCLR clears the error flags in the error status register (CF1STERSTR), the overflow flag in the error count overflow status register (CFOVFSTR), and the error address register (CF1STEADR). CFSTCLR is a write-only register and is always read as 0.

Access: CFSTCLR_SIC, CFSTCLR_PE1, CFSTCLR_PE2, and CFSTCLR_PE3 are writable in 32-bit units.
CFSTCLR_SICL, CFSTCLR_PE1L, CFSTCLR_PE2L, and CFSTCLR_PE3L are writable in 16-bit units.
CFSTCLR_SICLL, CFSTCLR_PE1LL, CFSTCLR_PE2LL, and CFSTCLR_PE3LL are writable in 8-bit units.

Address: CFSTCLR_SIC : FFC6 2208H, CFSTCLR_PE1 : FFC6 2408H,
CFSTCLR_PE2 : FFC6 2608H, CFSTCLR_PE3 : FF75 3008H,
CFSTCLR_SICL : FFC6 2208H, CFSTCLR_PE1L : FFC6 2408H,
CFSTCLR_PE2L : FFC6 2608H, CFSTCLR_PE3L : FF75 3004H,
CFSTCLR_SICLL : FFC6 2208H, CFSTCLR_PE1LL : FFC6 2408H,
CFSTCLR_PE2LL : FFC6 2608H, CFSTCLR_PE3LL : FF75 3008H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCLR1	STCLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 29.8 CFSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	The read value is 0. The write value should be 0.
1	STCLR1	Error Overflow Flag Clear for Data Writing 1 to this bit clears the APEF1, DEDF1, and SEDF1 flags in CF1STERSTR; ERROVF1 flag in CFOVFSTR; and CF1STEADR1.
0	STCLR0	Error Overflow Flag Clear for Instruction and SIC Writing 1 to this bit clears the APEF0, DEDF0, and SEDF0 flags in CF1STERSTR; ERROVF0 flag in CFOVFSTR; and CF1STEADR0.

(5) CFOVFSTR_SIC/PE1/PE2/PE3 — Code Flash Error Count Overflow Status Register

CFOVFSTR indicates overflows of the error counter. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF is cleared by an internal reset, an external reset, or setting the CFSTCLR.STCLR bit to 1.

Access: CFOVFSTR_SIC, CFOVFSTR_PE1, CFOVFSTR_PE2, and CFOVFSTR_PE3 are readable in 32-bit units.
CFOVFSTR_SICL, CFOVFSTR_PE1L, CFOVFSTR_PE2L, and CFOVFSTR_PE3L are readable in 16-bit units.
CFOVFSTR_SICLL, CFOVFSTR_PE1LL, CFOVFSTR_PE2LL, and CFOVFSTR_PE3LL are readable in 8-bit units.

Address: CFOVFSTR_SIC : FFC6 220C$_H$, CFOVFSTR_PE1 : FFC6 240C$_H$,
CFOVFSTR_PE2 : FFC6 260C$_H$, CFOVFSTR_PE3 : FF75 300C$_H$,
CFOVFSTR_SICL : FFC6 220C$_H$, CFOVFSTR_PE1L : FFC6 240C$_H$,
CFOVFSTR_PE2L : FFC6 260C$_H$, CFOVFSTR_PE3L : FF75 300C$_H$,
CFOVFSTR_SICLL : FFC6 220C$_H$, CFOVFSTR_PE1LL : FFC6 240C$_H$,
CFOVFSTR_PE2LL : FFC6 260C$_H$, CFOVFSTR_PE3LL : FF75 300C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.9 CFOVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	The read value is 0. The write value should be 0.
1	ERROVF1	Error Overflow Flag for Data This flag is set if the second error occurs while any of the error flags (APEF1, DEDF1, and SEDF1) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.
0	ERROVF0	Error Overflow Flag for Instruction and SIC This flag is set if the second error occurs while any of the error flags (APEF0, DEDF0, and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(6) CF1STERSTR_SIC/PE1/PE2/PE3 — Code Flash 1st Error Status Register

CF1STERSTR monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. The error flag is overwritten if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error monitor flag is set.

If multiple errors occur simultaneously, all the corresponding error flags are set. CF1STERSTR is cleared by an internal reset, an external reset, or setting the STCLR bit in CFSTCLR to 1.

Access: CF1STERSTR_SIC, CF1STERSTR_PE1, CF1STERSTR_PE2, and CF1STERSTR_PE3 are readable in 32-bit units.
CF1STERSTR_SICL, CF1STERSTR_PE1L, CF1STERSTR_PE2L, and CF1STERSTR_PE3L are readable in 16-bit units.
CF1STERSTR_SICLL, CF1STERSTR_SICLH, CF1STERSTR_PE1LL, CF1STERSTR_PE1LH, CF1STERSTR_PE2LL, CF1STERSTR_PE2LH, CF1STERSTR_PE3LL, and CF1STERSTR_PE3LH are readable in 8-bit units.

Address: CF1STERSTR_SIC : FFC6 2210$_H$, CF1STERSTR_PE1 : FFC6 2410$_H$,
CF1STERSTR_PE2 : FFC6 2610$_H$, CF1STERSTR_PE3 : FF75 3010$_H$,
CF1STERSTR_(SIC/PE1/PE2/PE3)L : CF1STERSTR_(SIC/PE1/PE2/PE3) + 00$_H$,
CF1STERSTR_(SIC/PE1/PE2/PE3)LL : CF1STERSTR_(SIC/PE1/PE2/PE3) + 00$_H$,
CF1STERSTR_(SIC/PE1/PE2/PE3)LH : CF1STERSTR_(SIC/PE1/PE2/PE3) + 01$_H$

Value after reset: 0000 0000$_H$

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. These bits are reserved in the CF1STERSTR_SIC register. They are always read as 0. The write value should always be 0.

Table 29.10 CF1STERSTR Register Contents

Bit Position	Bit Name	Function
31 to 11, 7 to 3	Reserved	The read value is 0. The write value should be 0.
2 + 8n	APEFn	Address Parity Error Monitor Flag Clearing conditions: A reset is generated or the CFSTCLR.STCLRn bit is set to 1. Setting conditions: An address parity error has occurred while the error flags DEDFn and APEFn are 0.
1 + 8n	DEDFn	ECC 2-bit Error Monitor Flag Clearing conditions: A reset is generated or the CFSTCLR.STCLRn bit is set to 1. Setting conditions: A 2-bit error has occurred while the error flags DEDFn and APEFn are 0.
0 + 8n	SEDFn	ECC 1-bit Error Monitor Flag Clearing conditions: A reset is generated or the CFSTCLR. STCLRn bit is set to 1. Setting conditions: A 1-bit error has occurred while the error flags DEDFn, SEDFn, and APEFn are 0.

Note: SIC: n = 0
PE1/PE2/PE3: n = 0 (for instructions), n = 1 (for data)

(7) CF1STEADRn_SIC/PE1/PE2/PE3 — Code flash 1st error address register n
SIC: n = 0, PE1/PE2/PE3: n = 0, 1

CF1STEADR holds the address at which an error has occurred.

The error address is set if an error occurs while all the error flags are 0 in CF1STERSTR. The address is updated if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error or an address parity error occurs, the address is not updated.

EADR[27:5] of this register correspond to bits [27:5] of the real address. The real address can be calculated by appending the higher-order address bits [31:28] as a base address.

CF1STEADR0 is cleared by an internal reset, an external reset, or setting the STCLR bit in CFSTCLR to 1.

Access: CF1STEADR0_SIC, CF1STEADRn_PE1, CF1STEADRn_PE2, and CF1STEADRn_PE3 are readable in 32-bit units.
CF1STEADRn_(SIC/PE1/PE2/PE3)_(L/H) is readable in 16-bit units.
CF1STEADRn_(SIC/PE1/PE2/PE3)_(LL/LH/HL/HH) is readable in 8-bit units.

Address: CF1STEADR0_SIC : FFC6 2250$_H$,
CF1STEADR0_PE1 : FFC6 2450$_H$, CF1STEADR1_PE1 : FFC6 2454$_H$,
CF1STEADR0_PE2 : FFC6 2650$_H$, CF1STEADR1_PE2 : FFC6 2654$_H$,
CF1STEADR0_PE3 : FF75 3050$_H$, CF1STEADR1_PE3 : FF75 3054$_H$,
CF1STEADR0_(SIC/PE1/PE2/PE3)_L : CF1STEADR0_(SIC/PE1/PE2/PE3) + 00$_H$,
CF1STEADR0_(SIC/PE1/PE2/PE3)_H : CF1STEADR0_(SIC/PE1/PE2/PE3) + 02$_H$,
CF1STEADR0_(SIC/PE1/PE2/PE3)_LL : CF1STEADR0_(SIC/PE1/PE2/PE3) + 00$_H$,
CF1STEADR0_(SIC/PE1/PE2/PE3)_LH : CF1STEADR0_(SIC/PE1/PE2/PE3) + 01$_H$,
CF1STEADR0_(SIC/PE1/PE2/PE3)_HL : CF1STEADR0_(SIC/PE1/PE2/PE3) + 02$_H$,
CF1STEADR0_(SIC/PE1/PE2/PE3)_HH : CF1STEADR0_(SIC/PE1/PE2/PE3) + 03$_H$,
CF1STEADR1_(SIC/PE1/PE2/PE3)_L : CF1STEADR1_(SIC/PE1/PE2/PE3) + 00$_H$,
CF1STEADR1_(SIC/PE1/PE2/PE3)_H : CF1STEADR1_(SIC/PE1/PE2/PE3) + 02$_H$,
CF1STEADR1_(SIC/PE1/PE2/PE3)_LL : CF1STEADR1_(SIC/PE1/PE2/PE3) + 00$_H$,
CF1STEADR1_(SIC/PE1/PE2/PE3)_LH : CF1STEADR1_(SIC/PE1/PE2/PE3) + 01$_H$,
CF1STEADR1_(SIC/PE1/PE2/PE3)_HL : CF1STEADR1_(SIC/PE1/PE2/PE3) + 02$_H$,
CF1STEADR1_(SIC/PE1/PE2/PE3)_HH : CF1STEADR1_(SIC/PE1/PE2/PE3) + 03$_H$

Value after reset: 0000 0000$_H$

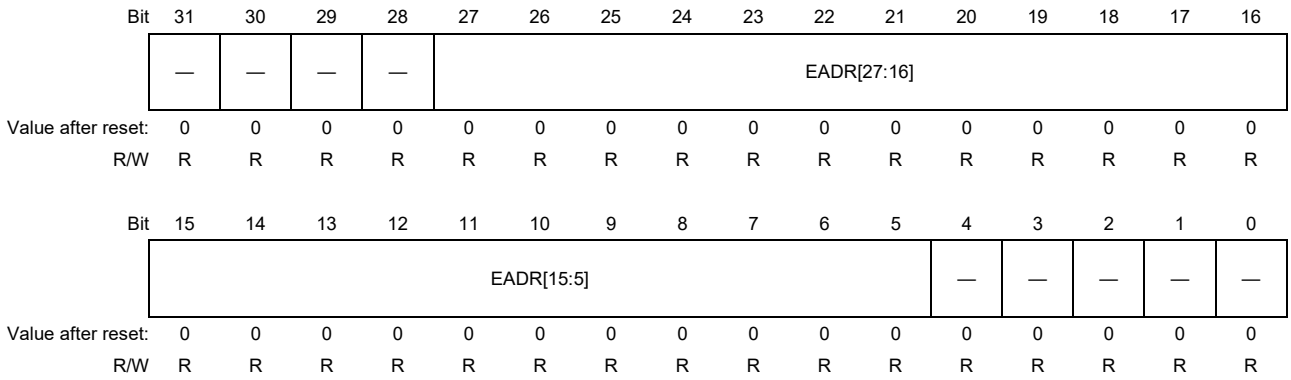

Table 29.11 CF1STEADRn Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	The read value is 0. The write value should be 0.
27 to 5	EADR[27:5]	1st Error Address These bits monitor the address of the first error. The error address is set if an error occurs while all the error flags are 0 in CF1STERSTR. The address is updated if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error or an address parity error occurs, the address is not updated.
4 to 0	Reserved	The read value is 0. The write value should be 0.

Note: SIC: n = 0
PE1/PE2/PE3: n = 0 (for instruction), n = 1 (for data)

(8) CFSTSTCTL_SIC/PE1/PE2/PE3 — Code flash sub-test control register

CFSTSTCTL is used for the ECC test (self-diagnosis). This register is dedicated for the code flash. After ECC test mode is enabled by setting ECCTST = 1, the ECC and address parity bits can be read directly. Set the PROT[1:0] bits to 01_B when writing to this register.

This register is initialized by an internal reset or an external reset.

Access: CFSTSTCTL_SIC, CFSTSTCTL_PE1, CFSTSTCTL_PE2, and CFSTSTCTL_PE3 are readable/writable in 32-bit units. CFSTSTCTL_SICL, CFSTSTCTL_PE1L, CFSTSTCTL_PE2L, and CFSTSTCTL_PE3L are readable/writable in 16-bit units.

Address: CFSTSTCTL_SIC : FFC6 2350$_H$, CFSTSTCTL_PE1 : FFC6 2550$_H$, CFSTSTCTL_PE2 : FFC6 2750$_H$, CFSTSTCTL_PE3 : FF75 3150$_H$, CFSTSTCTL_SICL : FFC6 2350$_H$, CFSTSTCTL_PE1L : FFC6 2550$_H$, CFSTSTCTL_PE2L : FFC6 2750$_H$, CFSTSTCTL_PE3L : FF75 3150$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 29.12 CFSTSTCTL_SIC/PE1/PE2/PE3 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	The read value is 0. The write value should be 0.
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
13 to 1	Reserved	The read value is 0. The write value should be 0.
0	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC and address parity bits can be read directly.

Correctly reading instructions from the code flash access path is not possible while ECC test mode is selected (ECCTST = 1). While the access path for the CPU is set to test mode (including during changes to the value of the ECCTST bit), the CPU must run a program from the local RAM or global RAM and must not fetch instructions from the code flash memory.

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see **Section 3, CPU System**.From the code flash access path with ECC test mode selected, access must be made by reading 4 bytes aligned to 16n address. The results of code flash reading are as follows:

Table 29.13 Results of Code Flags Reading

Bit Position	Contents
bit[31:10]	Always 0
bit[9]	Address parity bit
bit[8:0]	ECC bits

29.2.2.4 Test Function

Through appropriate register setting, the code flash, ECC bits, and address parity bits can be read.

(1) Reading code flash data

1. Set the ECCDIS bit in the CFECCCTL register to 1 to disable ECC error detection and correction.
2. When ECCDIS = 1, neither error detection nor correction proceeds when the code flash is read; the data output from the code flash is read unchanged.

How to exit this test mode:

3. Set the ECCDIS bit in the CFECCCTL register to 0 to enable ECC error detection and correction

(2) Reading the ECC bits and address parity bits

1. Set the ECCDIS bit in the CFECCCTL register to 1 to disable ECC error detection and correction.
2. Set the ECCTST bit in the CFSTSTCTL register to 1 to set test mode.
3. When the code flash is read, the ECC and address parity bits are read instead of the code flash data.

How to exit this test mode:

4. Set the ECCDIS bit in the CFECCCTL register to 0 to enable ECC error detection and correction.
5. Set the ECCTST bit in the CFSTSTCTL register to 0 to set normal mode.

(3) Self-diagnosis

Self-diagnosis of the ECC decoder and address parity decoder for the access paths is possible by writing incorrect data to the code flash memory beforehand (fault injection) and then reading this data. In writing of the address parity, since an address-parity bit is generated for each 128-bit unit, two address-parity bits correspond to the 256-bit unit of reading, so always write inverse values to the two bits even when injecting an error.

For details on programming of the code flash, refer to *RH850/C1M-A Flash Memory User's Manual: Hardware Interface*.

29.2.3 Data Flash ECC

29.2.3.1 Overview

The data flash ECC is summarized in the table below.

Table 29.14 Overview of Data Flash ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. This function is enabled after a reset, that is, detection and notification of 2-bit errors and detection and correction of 1-bit errors are enabled.
Error notification	Upon occurrence of an ECC error, the ECM is notified of the error. ECC Error: • Error notification can be either enabled or disabled upon detection of a 2-bit ECC error. • Error notification can be either enabled or disabled upon detection of a 1-bit ECC error. In the state after reset, error notification is enabled upon detection of a 2-bit ECC error, and error notification is disabled upon detection of a 1-bit ECC error. The error notification signal is output, where a 2-bit ECC error is handled as one source, and a 1-bit ECC error is handled as one source. ECC errors of data flash are included in the system error exemption (SYSERR exception). For details, see **Section 3, CPU System**.
Error status	A status register is provided, which indicates the statuses of 2-bit ECC error detection and 1-bit ECC error detection. If an error occurs while no error status flag is set, the corresponding status is set. The error status can be cleared by using the clear register.
Address capture	If an ECC error occurs while no error status flag is set, the address at which the associated error has occurred is captured. The address is captured when a 2-bit ECC error or a 1-bit ECC error is detected. The error status serves as the enable bit of the capture address.
Self-diagnosis	Data in the ROM and the ECC bits can be read directly. Desired values can be written as ROM data and to the ECC bits.

29.2.3.2 List of Registers

(1) List of ECC modules

Table 29.15 List of ECC Modules

ECC Module Name and Register Base Address			
Master*1		Checker*1	
Module Name	Base Address <Base_addr>	Module Name	Base Address
ECCEEP	FFC6 2C00$_H$	ECCEEPC	FFC6 2E00$_H$

Note 1. Two modules (one for master and the other for checker) are provided for duplex configuration.

(2) List of registers

The following registers are provided for the individual ECC modules.

Table 29.16 List of Registers

Module Name	Register Name	Symbol	Address
ECCEEP	Data Flash ECC control register	DFECCCTL	<Base_addr>
ECCEEP	Data flash error status register	DFERSTR	<Base_addr> + 04$_H$
ECCEEP	Data flash error status clear register	DFERSTC	<Base_addr> + 08$_H$
ECCEEP	Data flash error overflow status register	DFOVFSTR	<Base_addr> + 0C$_H$
ECCEEP	Data flash error overflow status clear register	DFOVFSTC	<Base_addr> + 10$_H$
ECCEEP	Data flash error notification control register	DFERRINT	<Base_addr> + 14$_H$
ECCEEP	Data flash 1st error address register	DFEADR	<Base_addr> + 18$_H$
ECCEEP	Data flash test control register	DFTSTCTL	<Base_addr> + 1C$_H$

29.2.3.3 Details of Registers

(1) DFECCCTL — Data flash ECC control register

DFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. DFECCCTL is initialized by an internal reset or an external reset.

Set the PROT[1:0] bits to 01_B when writing to DFECCCTL.

Access: DFECCCTL register is readable/writable in 16-bit units.

Address: DFECCCTL : <Base_addr>

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 29.17 DFECCCTL Register Contents

Bit Position	Bit Name	Function
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
13 to 2	Reserved	The read value is 0. The write value should be 0.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) DFERSTR — Data flash error status register

DFERSTR monitors occurrence of errors.

DFERSTR is initialized by an internal reset, an external reset, or setting the clear bit in the data flash error status clear register.

The SEDF bit is set if a 1-bit ECC error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if a 2-bit ECC error is detected.

Access: DFERSTR register is readable in 8-bit units.

Address: DFERSTR : <Base_addr> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDF	SEDF
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 29.18 DFERSTR Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	The read value is 0. The write value should be 0.
1	DEDF	2-Bit ECC Error Monitor This bit is set if a 2-bit ECC error is generated while SEDF and DEDF are 0. Clearing conditions: A reset is generated or the ERRCLR bit in the DFERSTC register is set. Setting condition: A 2-bit ECC error is generated with both SEDF and DEDF being 0.
0	SEDF	1-Bit ECC Error Monitor This bit is set if a 1-bit ECC error is generated while SEDF and DEDF are 0. Clearing conditions: A reset is generated or the ERRCLR bit is set in data flash error status clear register. Setting condition: A 1-bit ECC error is generated with both SEDF and DEDF being 0.

(3) DFERSTC — Data flash error status clear register

DFERSTC clears the error flags in the data flash error status register. DFERSTC is a write-only register and is always read as 0.

Access: DFERSTC register is writable in 8-bit units.

Address: DFERSTC : <Base_addr> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERRCLR
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 29.19 DFERSTC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	The read value is 0. The write value should be 0.
0	ERRCLR	SEDF/DEDF Flag Clear Writing 1 to this bit clears the SEDF/DEDF flag.

(4) DFOVFSTR — Data flash error overflow status register

DFOVFSTR monitors occurrence of data flash error overflow. The ERROVF flag is cleared by an internal reset, an external reset, or setting the ERROVFCLR bit to 1 in DFOVFSTC.

Access: DFOVFSTR register is readable in 8-bit units.

Address: DFOVFSTR : <Base_addr> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVF
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 29.20 DFOVFSTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	The read value is 0. The write value should be 0.
0	ERROVF	Error Overflow Flag This flag is set if an ECC error occurs while the error address register is full.

(5) DFOVFSTC — Data flash error overflow status clear register

DFOVFSTC clears the data flash error overflow flag. Setting the ERROVFCLR bit to 1 clears this flag.

Access: DFOVFSTC register is writable in 8-bit units.

Address: DFOVFSTC : <Base_addr> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVFCLR
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 29.21 DFOVFSTC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	The read value is 0. The write value should be 0.
0	ERROVFCLR	Error Overflow Flag Clear Writing 1 to this bit clears the ERROVF flag. This bit is always read as 0.

(6) DFERRINT — Data flash error notification control register

DFERRINT enables or disables generation of the error notification signal upon detection of a 2-bit ECC error or a 1-bit ECC error.

Access: DFERRINT register is readable/writable in 8-bit units.

Address: DFERRINT : <Base_addr> + 14_H

Value after reset: 02_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset:	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 29.22 DFERRINT Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	The read value is 0. The write value should be 0.
1	DEDIE	2-Bit ECC Error Notification Control Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error.
0	SEDIE	1-Bit ECC Error Notification Control Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error.

(7) DFEADR — Data flash 1st error address register

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0.

Access: DFEADR register is readable in 32-bit units.

Address: DFEADR : <Base_addr> + 18_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	DFEADR[20:16]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DFEADR[15:2]														—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.23 DFEADR Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	The read value is 0. The write value should be 0.
20 to 2	DFEADR[20:2]	ECC Error Address These bits are read-only and used to monitor the address at which an ECC error has occurred. Since this register holds the internal address, add the base address ($FF20\ 0000_H$) of the data flash memory to transform the internal address to the real address.
1, 0	Reserved	The read value is 0. The write value should be 0.

(8) DFTSTCTL — Data flash test control register

DFTSTCTL is used for the ECC test. After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read.

Set the PROT[1:0] bits to 01B when writing to DFTSTCTL.

Access: DFTSTCTL register is readable/writable in 16-bit units.

Address: DFTSTCTL : <Base_addr> + $1C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 29.24 DFTSTCTL Register Contents

Bit Position	Bit Name	Function
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
13 to 1	Reserved	When read, 0 is always returned. The write value should be 0.
0	ECCTST	ECC Test Sets ECC test mode.

29.2.3.4 Test Function

Data in the ROM and the ECC bits can be read through the setting of the data flash test control register (DFTSTCTL).

(1) Reading the ROM data

1. Set the ECCDIS bit in the data flash ECC control register to 1 to disable ECC error detection and correction.
2. When ECCDIS = 1, neither error detection nor correction proceeds when the data flash is read; the data output from the data flash is read unchanged.

How to exit this test mode:

3. Set the ECCDIS bit in the data flash ECC control register to 0 to enable ECC error detection and correction.

(2) Reading the ECC data

1. Set the ECCDIS bit in the DFECCCTL register to 1 to disable ECC error detection and correction.
2. Set the ECCTST bit in the DFTSTCTL register to 1 to set test mode.
3. When the data flash is read, the 7 lower-order bits of read data are read as ECC data.

How to exit this test mode:

4. Set the ECCDIS bit in the DFECCCTL register to 0 to enable ECC error detection and correction.
5. Set the ECCTST bit in the DFTSTCTL register to 0 to set normal mode.

(3) Self-diagnosis

Self-diagnosis of the ECC decoder is possible by writing incorrect data to the data flash memory beforehand (fault injection) and then reading this data. A 1- or 2-bit ECC error fault can be injected by generating correct ECC bits once and inverting only the appropriate bits.

For details on programming of the data flash, refer to *RH850/C1M-A Flash Memory User's Manual: Hardware Interface*.

29.2.4 Local RAM (CPU1, CPU2, SubCPU) ECC and Address Parity

29.2.4.1 Overview

The local RAM ECC of CPU1, CPU2, and SubCPU are summarized in the table below.

Table 29.25 Overview of the Local RAM CPU1, CPU2, and SubCPU

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. This function is enabled after a reset, that is, detection of 2-bit errors and detection and correction of 1-bit errors are enabled.
Address parity	Address parity check can be either enabled or disabled. During data write, a parity bit generated based on the written address is written simultaneously with the write data. At this time, the same parity bit is written to two locations in the RAM. During data read, comparison is performed between a parity bit generated based on the read address and a parity bit read from the RAM. The error decoding specifications are shown in **Table 29.26, Address Parity Definitions**. This function is enabled after a reset.
Error notification	Indicators of the occurrence of ECC and address parity errors are conveyed to ECM. ECC Error: • Error notification can be either enabled or disabled upon detection of a 2-bit ECC error. • Error notification can be either enabled or disabled upon detection of a 1-bit ECC error. The register values after a reset enable notification of the 2-bit error and disable notification of the 1-bit error. Parity Error: • Error notification can be either enabled or disabled upon detection of an address parity error. • Error notification can be either enabled or disabled upon detection of a parity bit error. The register values after a reset enable notification of the address parity error and disable notification of the parity bit error. The error notification signal is output, where a 2-bit ECC error and an address parity error are handled as one source, and a 1-bit ECC error and a parity bit error are handled as one source.
Error status	A status register is provided, which indicates the states of 2-bit ECC error detection, 1-bit ECC error detection, and address parity error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	If an ECC error or a parity error occurs while no error status is set, the address at which the associated error has occurred is captured. The address is captured when a 2-bit ECC error, a 1-bit ECC error, or an address parity error is detected. The error status serves as the enable bit of the capture address.
Self-diagnosis	Desired values can be written as RAM data and to the ECC and address parity bits. Data in the RAM and the ECC and address parity bits can be read directly.

The definitions of the address parity error during read accesses are shown in the table below.

Table 29.26 Address Parity Definitions

RAM Macro Address Parity Bit 1	RAM Macro Address Parity Bit 2	Read Address Parity	Error Determination and Error Name
0	0	0	No error
0	0	1	Address parity error
0	1	0	Parity bit error
0	1	1	Parity bit error
1	0	0	Parity bit error
1	0	1	Parity bit error
1	1	0	Address parity error
1	1	1	No error

The local RAM of CPU1, CPU2, and the SubCPU has structures that can read and write a maximum of 128 bits of data simultaneously. In the meanwhile, ECC or address parity is provided for each 32-bit data, and the 32-bit data is divided into four words (word 0 to word 3). The relationship between addresses and words is described below.

Table 29.27 Relationship between Addresses and Words

Four Lower-Order Bits of Address (Hexadecimal Notation)	F_H to C_H	B_H to 8_H	7_H to 4_H	3_H to 0_H
Word number	Word 3	Word 2	Word 1	Word 0

The error information of the CPU1, CPU2, and SubCPU are retained by each instruction and by each data.

29.2.4.2 List of Registers

Table 29.28 List of Registers

Module Name	Register Name	Symbol*1	Address
ECCCPU1	Local RAM address parity control register (PE1)	LRAPCTL_PE1	FFC6 5000H
ECCCPU1	Local RAM test control register (PE1)	LRTSTCTL_PE1	FFC6 5004H
ECCCPU1	Local RAM test data read buffer 0 (PE1)	LRTDATBF0_PE1	FFC6 5008H
ECCCPU1	Local RAM test data read buffer 1 (PE1)	LRTDATBF1_PE1	FFC6 500CH
ECCCPU2	Local RAM address parity control register (PE2)	LRAPCTL_PE2	FFC6 5020H
ECCCPU2	Local RAM test control register (PE2)	LRTSTCTL_PE2	FFC6 5024H
ECCCPU2	Local RAM test data read buffer 0 (PE2)	LRTDATBF0_PE2	FFC6 5028H
ECCCPU2	Local RAM test data read buffer 1 (PE2)	LRTDATBF1_PE2	FFC6 502CH
ECCCPU1	Local RAM ECC control register (PE1)	LRECCCTL_PE1	FFC6 5400H
ECCCPU1	Local RAM error information control register (PE1)	LRERRINT_PE1	FFC6 5404H
ECCCPU1	Local RAM status clear register (PE1)	LRSTCLR_PE1	FFC6 5408H
ECCCPU1	Local RAM error count overflow status register (PE1)	LROVFSTR_PE1	FFC6 540CH
ECCCPU1	Local RAM 1st error status register (PE1)	LR1STERSTR_PE1	FFC6 5410H
ECCCPU1	Local RAM 1st error address register 0(PE1)	LR1STEADR0_PE1	FFC6 5450H
ECCCPU1	Local RAM 1st error address register 1(PE1)	LR1STEADR1_PE1	FFC6 5454H
ECCCPU2	Local RAM ECC control register (PE2)	LRECCCTL_PE2	FFC6 5600H
ECCCPU2	Local RAM error information control register (PE2)	LRERRINT_PE2	FFC6 5604H
ECCCPU2	Local RAM status clear register (PE2)	LRSTCLR_PE2	FFC6 5608H
ECCCPU2	Local RAM error count overflow status register (PE2)	LROVFSTR_PE2	FFC6 560CH
ECCCPU2	Local RAM 1st error status register (PE2)	LR1STERSTR_PE2	FFC6 5610H
ECCCPU2	Local RAM 1st error address register 0 (PE2)	LR1STEADR0_PE2	FFC6 5650H
ECCCPU2	Local RAM 1st error address register 1 (PE2)	LR1STEADR1_PE2	FFC6 5654H
ECCCPU3	Local RAM address parity control register (PE3)	LRAPCTL_PE3	FF75 4000H
ECCCPU3	Local RAM test control register (PE3)	LRTSTCTL_PE3	FF75 4004H
ECCCPU3	Local RAM test data read buffer 0 (PE3)	LRTDATBF0_PE3	FF75 4008H
ECCCPU3	Local RAM test data read buffer 1(PE3)	LRTDATBF1_PE3	FF75 400CH
ECCCPU3	Local RAM ECC control register (PE3)	LRECCCTL_PE3	FF75 5000H
ECCCPU3	Local RAM error information control register (PE3)	LRERRINT_PE3	FF75 5004H
ECCCPU3	Local RAM status clear register (PE3)	LRSTCLR_PE3	FF75 5008H
ECCCPU3	Local RAM error count overflow status register (PE3)	LROVFSTR_PE3	FF75 500CH
ECCCPU3	Local RAM 1st error status register (PE3)	LR1STERSTR_PE3	FF75 5010H
ECCCPU3	Local RAM 1st error address register 0 (PE3)	LR1STEADR0_PE3	FF75 5050H
ECCCPU3	Local RAM 1st error address register 1(PE3)	LR1STEADR1_PE3	FF75 5054H

Note 1. The registers with "_PE1" are provided for access to the local RAM of CPU1, the registers with "_PE2" are provided for access to the local RAM of CPU2, and the registers with "_PE3" are provided for access to the local RAM of the SubCPU.

29.2.4.3 Details of Registers

(1) LRAPCTL_PE1/PE2/PE3 — Local RAM address parity control register

LRAPCTL enables or disables address parity check. Set the PROT[1:0] bits to 01_B when writing to LRAPCTL.

LRAPCTL is initialized by an internal reset or an external reset.

Access: LRAPCTL_PE1, LRAPCTL_PE2, LRAPCTL_PE3 are readable/writable in 32-bit units.
LRAPCTL_PE1L, LRAPCTL_PE2L, LRAPCTL_PE3L are readable/writable in 16-bit units.

Address: LRAPCTL_PE1 : FFC6 5000H , LRAPCTL_PE2 : FFC6 5020H , LRAPCTL_PE3 : FF75 4000H ,
LRAPCTL_PE1L : FFC6 5000H , LRAPCTL_PE2L : FFC6 5020H , LRAPCTL_PE3L : FF75 4000H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	APARIDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 29.29 LRAPCTL Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	The read value is 0. The write value should be 0.
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
13 to 1	Reserved	The read value is 0. The write value should be 0.
0	APARIDIS	Address Parity Check Disable Enables or disables address parity check by all the address parity circuits (word 0 to word 3). 0: Enables address parity check. 1: Disables address parity check.

(2) LRTSTCTL_PE1/PE2/PE3 — Local RAM test control register

This register is used for the ECC test (self-diagnosis) and address parity checker test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, desired values can be written to the ECC and address parity bits. The DATSEL bit is used to select RAM data or the ECC and address parity bits.

By setting address parity test mode (APTESTi = 1; i = 0, 1, 2, 3), the parity to be input to the address parity checker is inverted. Set the PROT[1:0] bits to 01B when writing to LRTSTCTL.

LRTSTCTL is initialized by an internal reset or an external reset.

Access: LRTSTCTL_PE1, LRTSTCTL_PE2, and LRTSTCTL_PE3 are readable/writable in 32-bit units.
LRTSTCTL_PE1L, LRTSTCTL_PE2L, and LRTSTCTL_PE3L are readable/writable in 16-bit units.

Address: LRTSTCTL_PE1 : FFC6 5004H, LRTSTCTL_PE2 : FFC6 5024H, LRTSTCTL_PE3 : FF75 4004H,
LRTSTCTL_PE1L : FFC6 5004H, LRTSTCTL_PE2L : FFC6 5024H, LRTSTCTL_PE3L : FF75 4004H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.30 LRTSTCTL_PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, 0 is always returned. The write value should be 0.
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
13 to 6	Reserved	When read, 0 is always returned. The write value should be 0.
5	APTEST3	Address Parity Checker (Word 3) Test Sets the address parity checker to test mode. When APTEST3 = 1, the parity generated through the address parity generator is inverted.
4	APTEST2	Address Parity Checker (Word 2) Test Sets the address parity checker to test mode. When APTEST2 = 1, the parity generated through the address parity generator is inverted.
3	APTEST1	Address Parity Checker (Word 1) Test Sets the address parity checker to test mode. When APTEST1 = 1, the parity generated through the address parity generator is inverted.
2	APTEST0	Address Parity Checker (Word 0) Test Sets the address parity checker to test mode. When APTEST0 = 1, the parity generated through the address parity generator is inverted.
1	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC and address parity bits can be read directly.
0	DATSEL	Data Select This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. 0: RAM data is selected. 1: The ECC bits and address parity bit are selected.

CAUTION

When ECC test mode for the local RAM is enabled (ECCTST = 1), access to the local RAM should be in 4-byte units.

(3) LRTDATBFn_PE1/PE2/PE3 — Local RAM test data read buffer n (n = 0, 1)

In ECC test mode (self-diagnosis), the ECC and address parity bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL, reading from the local RAM reads out the ECC and address parity bits, and these bits are stored in this buffer.

This register is initialized by an internal reset or an external reset.

Access: LRTDATBFn_(PE1/PE2/PE3) register is readable in 32-bit units.
LRTDATBFn_(PE1/PE2/PE3)(L/H) register is readable in 16-bit units.
LRTDATBFn_(PE1/PE2/PE3)(LL/LH/HL/HH) register is readable in 8-bit units.

Address: LRTDATBF0_PE1 : FFC6 5008H, LRTDATBF1_PE1 : FFC6 500CH,
LRTDATBF0_PE2 : FFC6 5028H, LRTDATBF1_PE2 : FFC6 502CH,
LRTDATBF0_PE3 : FF75 4008H, LRTDATBF1_PE3 : FF75 400CH,
LRTDATBFn_(PE1/PE2/PE3)L : LRTDATBFn_(PE1/PE2/PE3)+00H,
LRTDATBFn_(PE1/PE2/PE3)H : LRTDATBFn_(PE1/PE2/PE3)+02H,
LRTDATBFn_(PE1/PE2/PE3)LL : LRTDATBFn_(PE1/PE2/PE3)+00H,
LRTDATBFn_(PE1/PE2/PE3)LH : LRTDATBFn_(PE1/PE2/PE3)+01H,
LRTDATBFn_(PE1/PE2/PE3)HL : LRTDATBFn_(PE1/PE2/PE3)+02H,
LRTDATBFn_(PE1/PE2/PE3)HH : LRTDATBFn_(PE1/PE2/PE3)+03H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	LRDATABF								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.31 LRDATBFn Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, 0 is always returned. The write value should be 0.
24 to 16	LRDATABF	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the corresponding bank in the local RAM, the ECC bits for the local RAM (word (2n + 1)) and the address parity bit are respectively stored in LRTDATABF[22:16] and LRTDATABF[24:23].
15 to 9	Reserved	When read, 0 is always returned. The write value should be 0.
8 to 0	LRDATABF	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the corresponding word in the local RAM, the ECC bits for the local RAM (word (2n)) and the address parity bit are respectively stored in LRTDATABF[6:0] and LRTDATABF[8:7].

(4) LRECCCTL_PE1/PE2/PE3 — Local RAM ECC control register

LRECCCTL enables or disables ECC error detection and correction and 1-bit error correction. Set the PROT[1:0] bits to 01B when writing to LRECCCTL.

LRECCCTL is initialized by an internal reset or an external reset.

Access: LRECCCTL_PE1, LRECCCTL_PE2, and LRECCCTL_PE3 are readable/writable in 32-bit units.
LRECCCTL_PE1L, LRECCCTL_PE2L, and LRECCCTL_PE3L are readable/writable in 16-bit units.

Address: LRECCCTL_PE1 : FFC6 5400H, LRECCCTL_PE2 : FFC6 5600H, LRECCCTL_PE3 : FF75 5000H,
LRECCCTL_PE1L : FFC6 5400H, LRECCCTL_PE2L : FFC6 5600H, LRECCCTL_PE3L : FF75 5000H

Value after reset: 0000 0000H

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 29.32 LRECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	The read value is 0. The write value should be 0.
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
13 to 2	Reserved	The read value is 0. The write value should be 0.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(5) LRERRINT_PE1/PE2/PE3 — Local RAM error information control

LRERRINT enables or disables generation of the error notification signal to the ECM upon detection of a 2-bit ECC error, a 1-bit ECC error, an address parity error, or a parity bit error.

LRERRINT is initialized by an internal reset or an external reset.

Access: LRERRINT_PE1, LRERRINT_PE2, and LRERRINT_PE3 are readable/writable in 32-bit units.
LRERRINT_PE1L, LRERRINT_PE2L, and LRERRINT_PE3L are readable/writable in 16-bit units.
LRERRINT_PE1LL, LRERRINT_PE2LL, and LRERRINT_PE3LL are readable/writable in 8-bit units.

Address: LRERRINT_PE1 : FFC6 5404H, LRERRINT_PE2 : FFC6 5604H, LRERRINT_PE3 : FF75 5004H,
LRERRINT_PE1L : FFC6 5404H, LRERRINT_PE2L : FFC6 5604H, LRERRINT_PE3L : FF75 5004H,
LRERRINT_PE1LL : FFC6 5404H, LRERRINT_PE2LL : FFC6 5604H, LRERRINT_PE3LL : FF75 5004H

Value after reset: 0000 0006H

Table 29.33 LRERRINT Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	The read value is 0. The write value should be 0.
3	PBEIE	Parity Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a parity bit error when address parity check is enabled. 0: Disables notification of the parity bit error. 1: Enables notification of the parity bit error.
2	APEIE	Address Parity Error Notification Enable Enables or disables generation of the error notification signal upon detection of an address parity error when address parity check is enabled. 0: Disables notification of the address parity error. 1: Enables notification of the address parity error.
1	DEDIE	2-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error
0	SEDIE	1-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error.

(6) LRSTCLR_PE1/PE2/PE3 — Local RAM status clear register

LRSTCLR clears the error flags in the error status register (LR1STERSTR) and the overflow flag in the error count overflow status register (LROVFSTR). LRSTCLR is a write-only register and is always read as 0.

Access: LRSTCLR_PE1, LRSTCLR_PE2, and LRSTCLR_PE3 are writable in 32-bit units.
LRSTCLR_PE1L, LRSTCLR_PE2L, and LRSTCLR_PE3L are writable in 16-bit units.
LRSTCLR_PE1LL, LRSTCLR_PE2LL, and LRSTCLR_PE3LL are writable in 8-bit units.

Address: LRSTCLR_PE1 : FFC6 5408$_H$, LRSTCLR_PE2 : FFC6 5608$_H$, LRSTCLR_PE3 : FF75 5008$_H$,
LRSTCLR_PE1L : FFC6 5408$_H$, LRSTCLR_PE2L : FFC6 5608$_H$, LRSTCLR_PE3L : FF75 5008$_H$,
LRSTCLR_PE1LL : FFC6 5408$_H$, LRSTCLR_PE2LL : FFC6 5608$_H$, LRSTCLR_PE3LL : FF75 5008$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCLR1	STCLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 29.34 LRSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	The read value is 0. The write value should be 0.
1	STCLR1	Error Overflow Flag Clear (for data) Writing 1 to this bit clears the PBEF1, APEF1, DEDF1, and SEDF1 flags in LR1STERSTR, the ERROVF1 flag in LROVFSTR, and LR1STEADR1.
0	STCLR0	Error Overflow Flag Clear (for instruction) Writing 1 to this bit clears the PBEF0, APEF0, DEDF0, and SEDF0 flags in LR1STERSTR and ERROVF0 flag in LROVFSTR and LR1STEADR0.

(7) LROVFSTR_PE1/PE2/PE3 — Local RAM error count overflow status register

LROVFSTR monitors occurrence of error overflow. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in LRSTCLR.

Access: LROVFSTR_PE1, LROVFSTR_PE2, and LROVFSTR_PE3 are readable in 32-bit units.
LROVFSTR_PE1L, LROVFSTR_PE2L, and LROVFSTR_PE3L are readable in 16-bit units.
LROVFSTR_PE1LL, LROVFSTR_PE2LL, and LROVFSTR_PE3LL are readable in 8-bit units.

Address: LROVFSTR_PE1 : FFC6 540C$_H$, LROVFSTR_PE2 : FFC6 560C$_H$, LROVFSTR_PE3 : FF75 500C$_H$,
LROVFSTR_PE1L : FFC6 540C$_H$, LROVFSTR_PE2L : FFC6 560C$_H$, LROVFSTR_PE3L : FF75 500C$_H$,
LROVFSTR_PE1LL : FFC6 540C$_H$, LROVFSTR_PE2LL : FFC6 560C$_H$,
LROVFSTR_PE3LL : FF75 500C$_H$

Value after reset: 0000 0000$_H$

Table 29.35 LROVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	The read value is 0. The write value should be 0.
1	ERROVF1	Error Overflow Flag (for Data) This flag is set if the second error occurs while any of the error flags (PBEF1, APEF1, DEDF1, SEDF1) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.
0	ERROVF0	Error Overflow Flag (for Instruction) This flag is set if the second error occurs while any of the error flags (PBEF0, APEF0, DEDF0, SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(8) LR1STERSTR_PE1/PE2/PE3 — Local RAM 1st error status register

LR1STERSTR monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. The error flag is overwritten if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag or parity bit error flag is set.

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR is cleared by an internal reset, an external reset, or setting 1 to the STCLR bit in LRSTCLR.

Access: LR1STERSTR_PE1, LR1STERSTR_PE2, and LR1STERSTR_PE3 are readable in 32-bit units.
LR1STERSTR_PE1L, LR1STERSTR_PE2L, and LR1STERSTR_PE3L are readable in 16-bit units.
LR1STERSTR_PE1LL, LR1STERSTR_PE1LH, LR1STERSTR_PE2LL, LR1STERSTR_PE2LH,
LR1STERSTR_PE3LL, and LR1STERSTR_PE3LH are readable in 8-bit units.

Address: LR1STERSTR_PE1 : FFC6 5410$_H$, LR1STERSTR_PE2 : FFC6 5610$_H$,
LR1STERSTR_PE3 : FF75 5010$_H$,
LR1STERSTR_PE1L : FFC6 5410$_H$, LR1STERSTR_PE2L : FFC6 5610$_H$,
LR1STERSTR_PE3L : FF75 5010$_H$,
LR1STERSTR_PE1LL : FFC6 5410$_H$, LR1STERSTR_PE1LH : FFC6 5411$_H$,
LR1STERSTR_PE2LL : FFC6 5610$_H$, LR1STERSTR_PE2LH : FFC6 5611$_H$
LR1STERSTR_PE3LL : FF75 5010$_H$, LR1STERSTR_PE3LH : FF75 5011$_H$

Table 29.36 LR1STERSTR Register Contents

Bit Position	Bit Name	Function
31 to 12 7 to 4	Reserved	The read value is 0. The write value should be 0.
3 + 8n	PBEFn	Parity Bit Error Monitor Flag 0: Cleared to 0 by setting 1 to the STCLRn bit in LRSTCLR. 1: Indicates that a parity bit error has occurred while all the error flags PBEFn, APEFn, DEDFn, and SEDFn are 0.
2 + 8n	APEFn	Address Parity Error Monitor Flag 0: Cleared to 0 by setting 1 to the STCLRn bit in LRSTCLR. 1: Indicates that an address parity error has occurred while the error flags DEDFn and APEFn are 0. This flag is set equally for read and write; the error generation source is not considered.
1 + 8n	DEDFn	2-Bit ECC Error Monitor Flag 0: Cleared to 0 by setting 1 to the STCLRn bit in LRSTCLR. 1: Indicates that a 2-bit ECC error has occurred while the error flags DEDFn and APEFn are 0.
0 + 8n	SEDFn	1-Bit ECC Error Monitor Flag 0: Cleared to 0 by setting 1 to the STCLRn bit in LRSTCLR. 1: Indicates that a 1-bit ECC error has occurred while all the error flags PBEFn, APEFn, DEDFn, and SEDFn are 0.

Note: n = 0: Error detection in the instruction; n = 1: Error detection in the data

(9) LR1STEADRn_PE1/PE2/PE3 — Local RAM 1st error address register n (n = 0, 1)

LR1STEADRn holds the address at which an error has occurred while the error flag in LR1STERSTR is set to 0. The address information is overwritten if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag or parity bit error flag is set.

Once a 2-bit ECC error or an address parity error occurs, the address is not updated.

EADR[22:2] of this register correspond to bits [22:2] of the real address. The real address can be calculated by appending the higher-order address bits [31:23] as a base address.

LR1STEADR is cleared by an internal reset, an external reset, or setting the STCLR bit in CFSTCLR to 1.

Access: LR1STEADRn_(PE1/PE2/PE3) is readable in 32-bit units.
LR1STEADRn_(PE1/PE2/PE3)(L/H) is readable in 16-bit units.
LR1STEADRn_(PE1/PE2/PE3)(LL/LH/HL/HH) is readable in 8-bit units.

Address: LR1STEADR0_PE1 : FFC6 5450H, LR1STEADR1_PE1 : FFC6 5454H,
LR1STEADR0_PE2 : FFC6 5650H, LR1STEADR1_PE2 : FFC6 5654H,
LR1STEADR0_PE3 : FF75 5050H, LR1STEADR1_PE3 : FF75 5054H,
LR1STEADRn_(PE1/PE2/PE3)L : LR1STEADRn_(PE1/PE2/PE3) +00H,
LR1STEADRn_(PE1/PE2/PE3)H : LR1STEADRn_(PE1/PE2/PE3) +02H,
LR1STEADRn_(PE1/PE2/PE3)LL : LR1STEADRn_(PE1/PE2/PE3) +00H,
LR1STEADRn_(PE1/PE2/PE3)LH : LR1STEADRn_(PE1/PE2/PE3) +01H,
LR1STEADRn_(PE1/PE2/PE3)HL : LR1STEADRn_(PE1/PE2/PE3) +02H,
LR1STEADRn_(PE1/PE2/PE3)HH : LR1STEADRn_(PE1/PE2/PE3) +03H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	EADR[22:16]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.37 LR1STEADRn Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	The read value is 0. The write value should be 0.
22 to 2	EADR[22:2]	1st Error Address (for Word n) These bits monitor the address of the first error. The error address is set if an error occurs while all the error flags are 0 in LR1STERSTR. The address is updated if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error or an address parity error occurs, the address is not updated.
1 to 0	Reserved	The read value is 0. The write value should be 0.

Note: n = 0 (for instruction), n = 1 (for data)

The second bit is always 0 for the following registers.

LR1STEADR0_PE1

LR1STEADR0_PE2

LR1STEADR0_PE3

For example, if an error address FEF0 0000_H is stored in the above registers, an error has occurred either at FEF0 0000_H or FEF0 0004_H.

29.2.4.4 Test Function

Through appropriate register setting, desired values can be written as RAM data and to the ECC and address parity bits. Also, data in the RAM and the ECC and address parity bits can all be read.

(1) Writing the RAM data

1. Set the ECCTST bit in the LRTSTCTL register to 1 to set test mode.
2. Set the corresponding DATSEL bit in the LRTSTCTL register to 0 to select RAM data for access when writing.
3. When data is written to the local RAM, only the RAM data can be modified without updating the ECC bits.

How to exit this test mode:

4. Set the ECCTST bit in the LRTSTCTL register to 0 to disable test mode (normal mode).

(2) Reading the RAM data

1. Set the ECCDIS bit in the LRECCCTL register to 1 to disable ECC error detection and correction.
2. Read the local RAM. Since neither error detection nor correction proceeds when the local RAM is read, the RAM data is read unchanged.

How to exit this test mode:

3. Set the ECCDIS bit in the LRECCCTL register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC and address parity bits

1. Set the ECCTST bit in the LRTSTCTL register to 1 to set test mode.
2. Set the corresponding DATSEL bit in the LRTSTCTL register to 1 to select the ECC bits and the address parity bit for access when writing.
3. When data is written to the local RAM, only the ECC and address parity bits can be modified without updating the RAM data. At that time, bits [6:0] and bits [8:7] are respectively written to the ECC bits and to the address parity bit.

How to exit this test mode:

4. Set the ECCTST bit in the local RAM test control register to 0 to disable test mode (normal mode).

(4) Reading the ECC and address parity bits

1. Set the ECCTST bit in the LRTSTCTL register to 1 to set test mode.
2. When the local RAM is read, the ECC and address parity bits are stored in the word corresponding to local RAM test data read buffer 0 or local RAM test data read buffer 1.

How to exit this test mode:

3. Set the ECCTST bit in the LRTSTCTL register to 0 to disable test mode (normal mode).

(5) Self-diagnosis of the ECC check function

Desired values can be written as the RAM data and/or ECC bits by following the procedure described in (1) or (3) above. Therefore, a fault can be injected by, for example, inverting appropriate bits of the RAM data and/or ECC bits. After that, self-diagnosis of the ECC decoder is possible by reading the local RAM in normal mode and checking the result of error correction or detection.

(6) Self-diagnosis of the address parity check function

Self-diagnosis is enabled by following either of the two procedures below.

1. Setting APTESTi (i = 0, 1, 2, 3) in the LRTSTCTL register to 1 inverts the result of address parity generation for the corresponding word. That is, a fault can be injected to the address parity generator. Writing to the corresponding word in the local RAM in this state and checking the result of parity error detection allows self-diagnosis of the address parity check function in writing.
2. Desired data can be written to the address parity bit through the procedure described in (4) above. This enables injection of a 1-bit or 2-bit fault to the address parity bit by inverting the address parity bit. After that, self-diagnosis of the address parity bit checking function for reading is possible by reading the local RAM in normal mode and checking the result of parity error detection.

29.2.5 Global RAM ECC and Address Parity

29.2.5.1 Overview

The Global RAM ECC is summarized in the table below.

Table 29.38 Overview of the Global RAM ECC

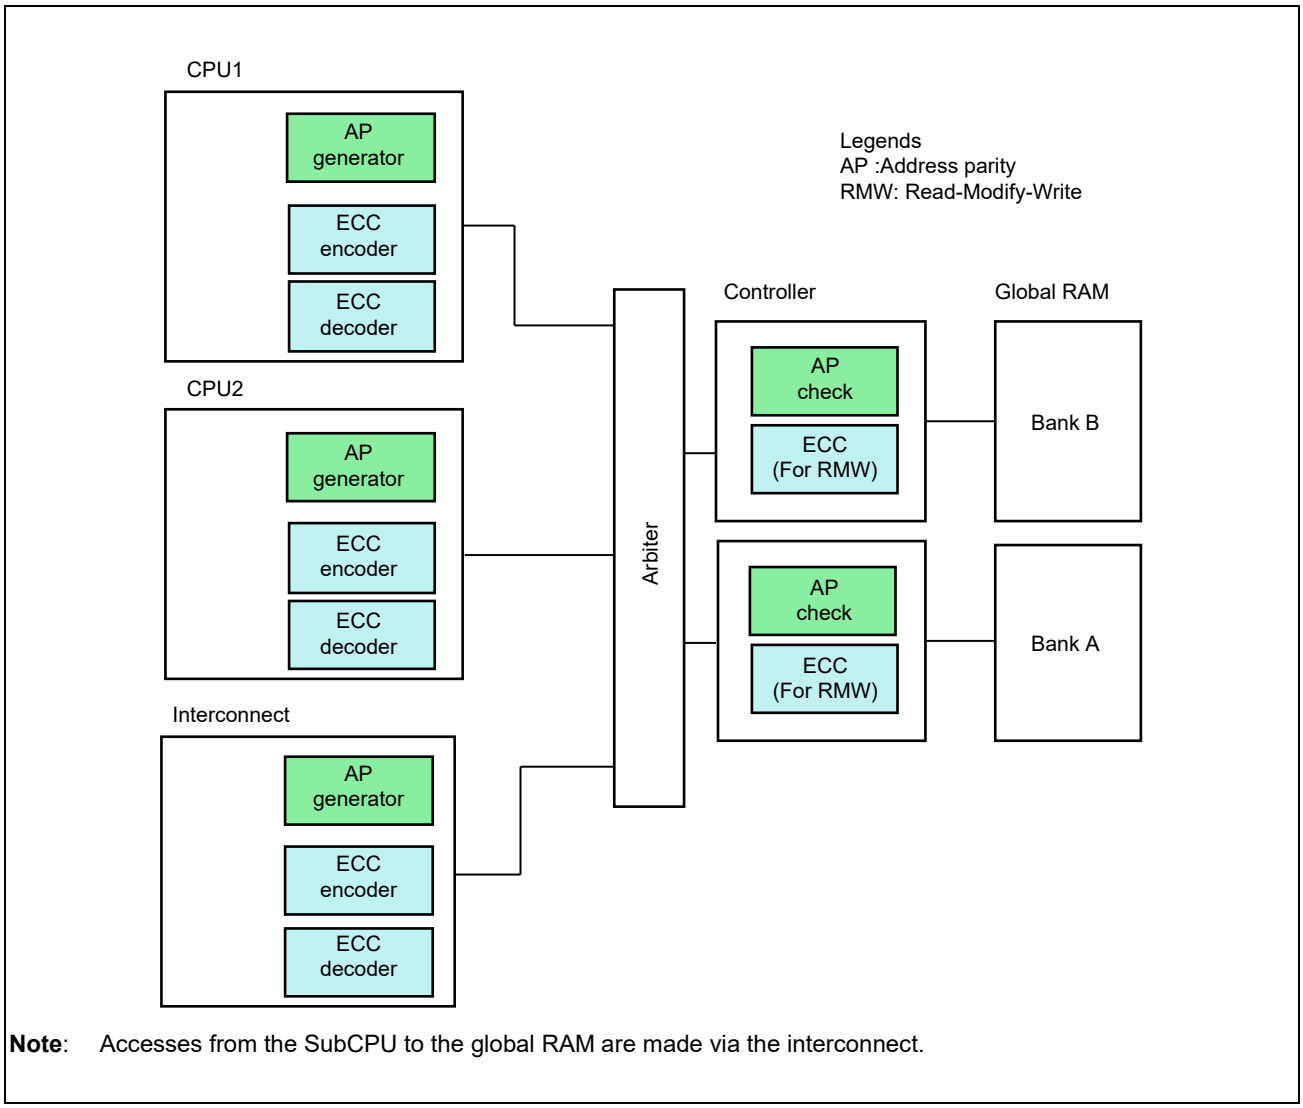
Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. This function is enabled after a reset, that is, detection of 2-bit errors and detection and correction of 1-bit errors are enabled.
Address parity	Address parity check can be either enabled or disabled. During data write, a parity bit generated based on the written address is written simultaneously with the write data. At this time, the parity bit is written to only one location in the RAM. During data read, comparison is performed between a parity bit generated based on the read address and a parity bit read from the memory. See **Table 29.39, Address Parity** for the specification of error decoding. This function is enabled after a reset.
Error notification	Indicators of the occurrence of ECC and address parity errors are conveyed to the ECM. ECC Error: • Error notification can be either enabled or disabled upon detection of a 2-bit ECC error. • Error notification can be either enabled or disabled upon detection of a 1-bit ECC error. The register values after a reset enable error notification upon detection of a 2-bit ECC error, and disable error notification upon detection of a 1-bit ECC error. Parity Error: • Error notification can be either enabled or disabled upon detection of an address parity error. • Error notification can be either enabled or disabled upon detection of a parity bit error. The register values after a reset enable error notification upon detection of an address parity error, and disable error notification upon detection of a parity bit error. The error notification signal is output, where a 2-bit ECC error and an address parity error are handled as one source, and a 1-bit ECC error and parity bit error is handled as one source.
Error status	A status register is provided, which indicates the states of 2-bit ECC error detection, 1-bit ECC error detection, and address parity error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	If an ECC error or a parity error occurs while no error status is set, the address at which the associated error has occurred is captured. The address is captured when a 2-bit ECC error, a 1-bit ECC error, or an address parity error is detected. The error status serves as the enable bit of the capture address.
Self-diagnosis	Desired values can be written as RAM data and to the ECC and address parity bits. Data in the RAM and the ECC and address parity bits can be read directly.

The definitions of the address parity error during read accesses are shown in the table below.

Table 29.39 Address Parity Definitions

Address Parity Bit		Read Address Parity	Error Determination and Error Name
0	0	0	No error
0	0	1	Address parity error
0	1	0	Parity bit error
0	1	1	Parity bit error
1	0	0	Parity bit error
1	0	1	Parity bit error
1	1	0	Address parity error
1	1	1	No error

The ECC encoder, decoder, and address parity generator are provided each for the access path (CPU1, CPU2, SubCPU, and interconnect) connected to the global RAM. The address parity checker is provided in the banks A and B of the global RAM. Also, the ECC decoder and encoder which supports RMW processing are provided for each bank A and B. Access from the SubCPU to the global RAM is made via interconnect. For details, see **Figure 29.3**.



- RMW Processing

  Bit manipulation instructions, 2-byte writing and 1-byte writing are executed in three steps:

  1) Reading of 32-bit data;
  2) generation of write data by replacement of the predetermined data (modifying);
  3) writing of 32-bit data. In this section, such operations are referred to as read-modify-write (RMW) processing. RMW processing for the global RAM proceeds in the controller for each bank.

  In RWM processing, the ECC is decoded for the read operation in step 1), while the ECC is encoded for the write operation in step 3). See **Figure 29.4** for the configuration of the ECC for RMW.

  For the ECC decoder to use in updating the data, which is referred to as the write data in step 2), failure injection is possible by switching the input data from registers at which an arbitrary values can be set. See **Section 29.2.5.4, Test Function** for how to inject failures.

Note: Accesses from the SubCPU to the global RAM are made via the interconnect.

Figure 29.3 ECC and Address parity for the Global RAM

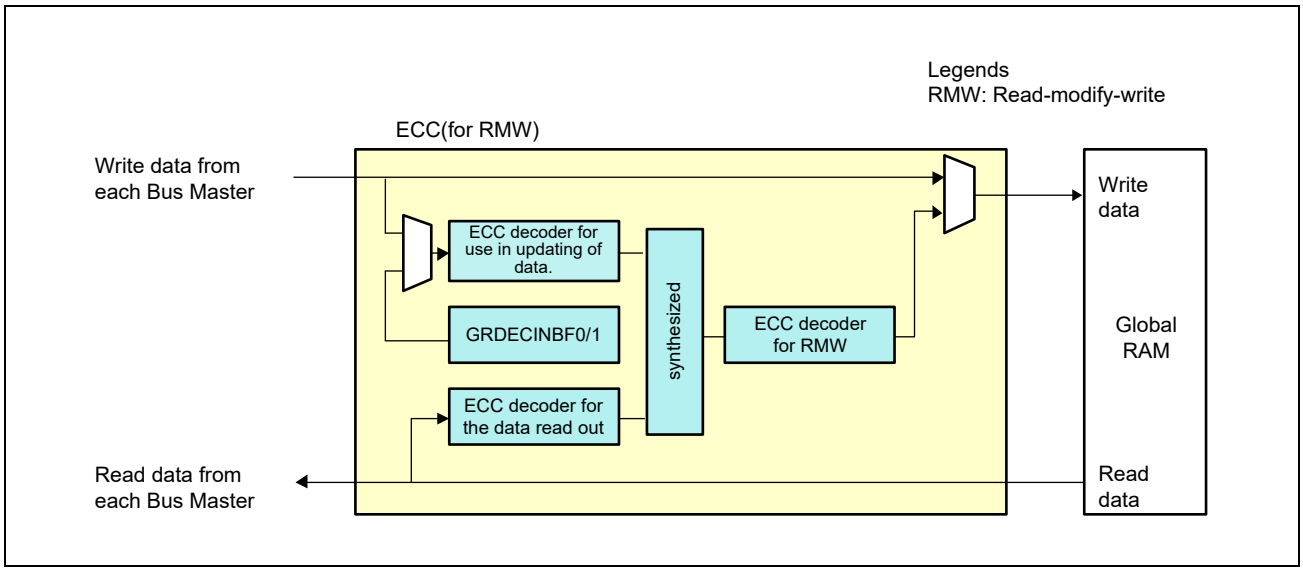


Figure 29.4 Global RAM ECC Configuration for RWM

Up to 64 bits of data can be simultaneously read from or written to the global RAM.

Each bus master (CPU1, CPU2, interconnect) has 64-bit data bus and the corresponding controllers have 128-bit data bus for each bank A and B. Meanwhile, the ECC and address parity are provided for each 32-bit data. That is, two each of the ECC decoder, ECC encoder, ECC circuit (for RMW), and address parity checker in **Figure 29.4** are provided for the individual bus masters, one for the 32 higher-order bits and the other for the 32 lower-order bits while four each of those are provided for the individual controllers, each in word 0 to 3, which are the 128 bits of data divided by four.

Word 0 to 3 are divided into even smaller units in bank A and bank B.

Table 29.40 Addresses and Corresponding ECC Circuits

4 Lower-Order Bits of the Address (in hexadecimal notation)	F_H to C_H	B_H to 8_H	7_H to 4_H	3_H to 0_H
Corresponding ECC circuit (at bus master)	Higher-order 32 bits	Lower-order 32 bits	Higher-order 32 bits	Lower-order 32 bits
Corresponding ECC circuit (at controller)	Word 3	Word 2	Word 1	Word 0

CAUTION

Global RAM is divided into bank A and B at the address FEF0 0000 H.

Note that the error information of the CPU1 and CPU2 are retained by each instruction and by each data. The error information of the interconnect are retained on the basis of the address of the data (higher-order bits or lower-order bits). See **Figure 29.5**.

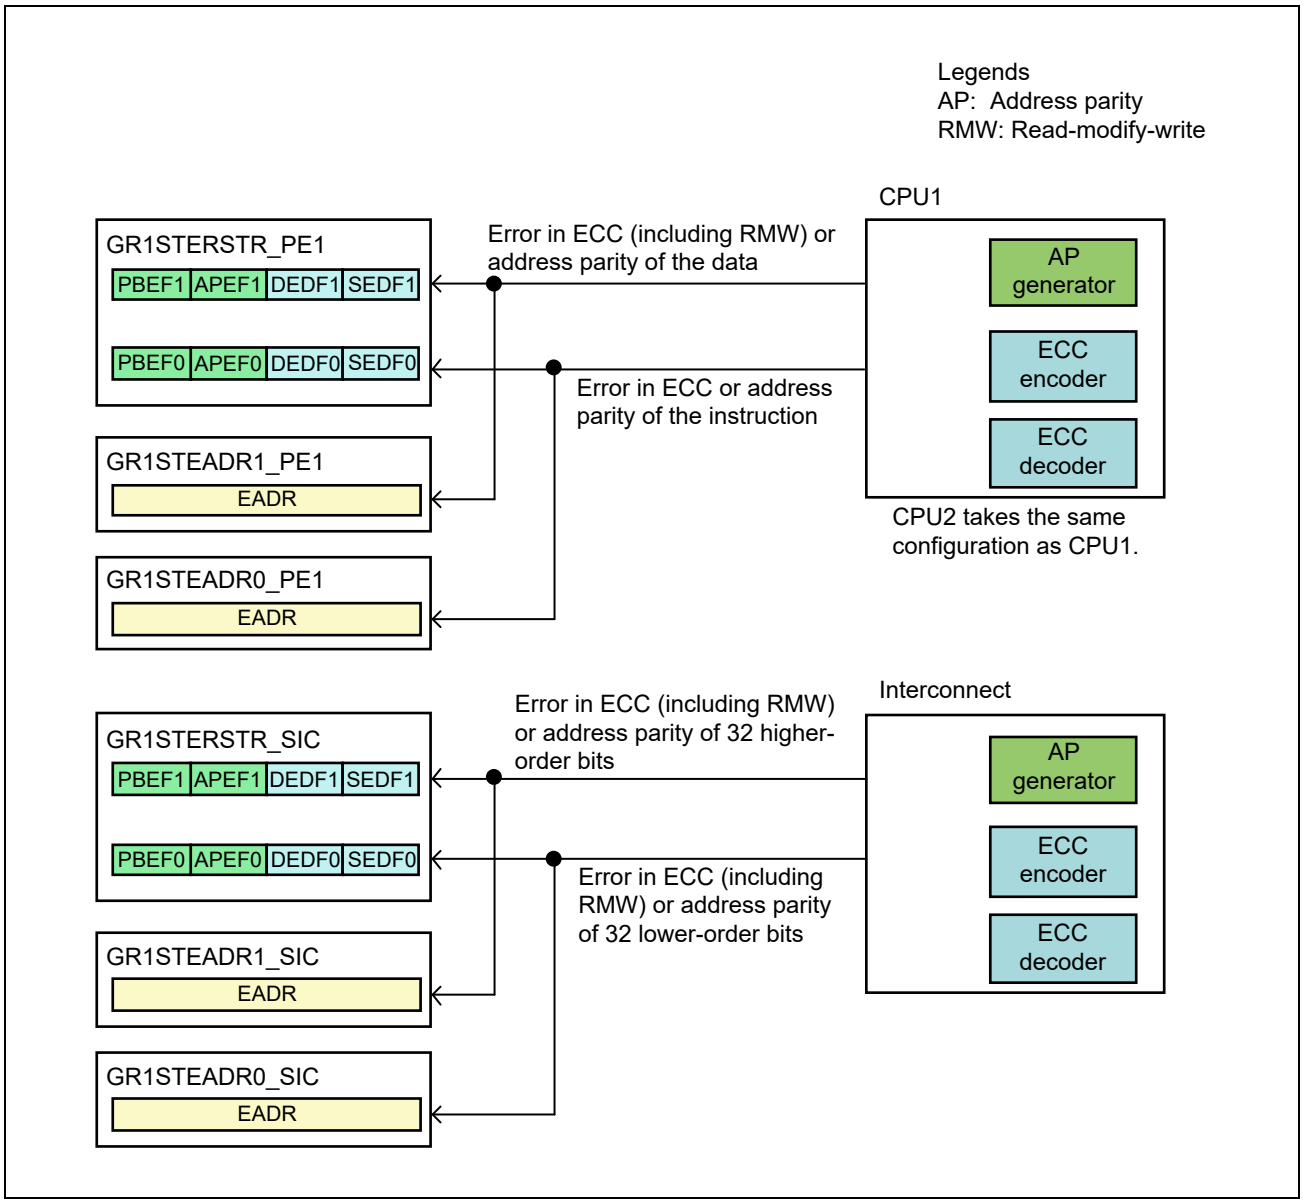

Figure 29.5 Structure for Holding Error Information in the Global RAM

29.2.5.2 List of Registers

Table 29.41 List of Registers

Module Name	Register Name	Symbol*1	Address
ECCGRAM	Global RAM ECC control register (GRAMC)	GRECCCTL_GRAMC	FFC6 4000H
ECCGRAM	Global RAM test control register	GRTSTCTL	FFC6 4180H
ECCGRAM	Global RAM test data read buffer	GRTDATBF	FFC6 4184H
ECCGRAM	Global RAM ECC decoder input data buffer 0	GRDECINBF0	FFC6 4188H
ECCGRAM	Global RAM ECC decoder input data buffer 1	GRDECINBF1	FFC6 418CH
ECCGRAM	Global RAM error information control register (SIC)	GRERRINT_SIC	FFC6 4204H
ECCGRAM	Global RAM status clear register (SIC)	GRSTCLR_SIC	FFC6 4208H
ECCGRAM	Global RAM error count overflow status register (SIC)	GROVFSTR_SIC	FFC6 420CH
ECCGRAM	Global RAM 1st error status register (SIC)	GR1STERSTR_SIC	FFC6 4210H
ECCGRAM	Global RAM 1st error (lower-order 32-bit data) address register (SIC)	GR1STEADR0_SIC	FFC6 4250H
ECCGRAM	Global RAM 1st error (higher-order 32-bit data) address register (SIC)	GR1STEADR1_SIC	FFC6 4254H
ECCGRAM	Global RAM error information control register (PE1)	GRERRINT_PE1	FFC6 4404H
ECCGRAM	Global RAM status clear register (PE1)	GRSTCLR_PE1	FFC6 4408H
ECCGRAM	Global RAM error count overflow status register (PE1)	GROVFSTR_PE1	FFC6 440CH
ECCGRAM	Global RAM 1st error status register (PE1)	GR1STERSTR_PE1	FFC6 4410H
ECCGRAM	Global RAM 1st error (instruction) address register (PE1)	GR1STEADR0_PE1	FFC6 4450H
ECCGRAM	Global RAM 1st error (data) address register (PE1)	GR1STEADR1_PE1	FFC6 4454H
ECCGRAM	Global RAM error information control register (PE2)	GRERRINT_PE2	FFC6 4604H
ECCGRAM	Global RAM status clear register (PE2)	GRSTCLR_PE2	FFC6 4608H
ECCGRAM	Global RAM error count overflow status register (PE2)	GROVFSTR_PE2	FFC6 460CH
ECCGRAM	Global RAM 1st error status register (PE2)	GR1STERSTR_PE2	FFC6 4610H
ECCGRAM	Global RAM 1st error (instruction) address register (PE2)	GR1STEADR0_PE2	FFC6 4650H
ECCGRAM	Global RAM 1st error (data) address register (PE2)	GR1STEADR1_PE2	FFC6 4654H

Note 1. The registers with symbols “_SIC”, “_PE1”, and “_PE2” as suffixes are provided to the ECC controller for each access port: the registers with “_SIC” are provided to the ECC controller for access from the system interconnect to the global RAM, the registers with “_PE1” are provided to the ECC controller for access from CPU1 to the global RAM, and the registers with “_PE2” are provided to the ECC controller for access from CPU2 to the global RAM. The registers with “_GRAMC” are control registers that are common to all access ports.

29.2.5.3 Details of Registers

(1) GRECCCTL_GRAMC — Global RAM ECC control register

GRECCCTL_GRAMC is the ECC and address parity control register shared by global RAMs. It enables or disables address parity check and specifies ECC processing. Set the PROT[1:0] bits to 01_B when writing to this register.

GRECCCTL_GRAMC is initialized by an internal reset or an external reset.

Access: GRECCCTL_GRAMC is readable/writable in 32-bit units.
GRECCCTL_GRAMCL is readable/writable in 16-bit units.

Address: GRECCCTL_GRAMC : FFC6 4000$_H$,
GRECCCTL_GRAMCL : FFC6 4000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	APARIDIS	SECDIS	ECCDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 29.42 GRECCCTL_GRAMC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	The read value is 0. The write value should be 0.
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
13 to 3	Reserved	The read value is 0. The write value should be 0.
2	APARIDIS	Address Parity Check Disable Enables or disables address parity check. In the initial state, the parity check is enabled. 0: Enables address parity check. 1: Disables address parity check.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction. **Caution** The encoding function is enabled even though the error detection and correction are disabled.

(2) GRTSTCTL — Global RAM test control register

This register is used for the ECC test (self-diagnosis) and address parity checker test (self-diagnosis). After ECC test mode is enabled by setting TESTEN = 1, desired values can be written to the ECC and address parity bits. The DATSEL bit is used to select the RAM data or the ECC and address parity bits. Also, input and output by the ECC decoder in the global RAM controller can be controlled for testing (self-diagnosis).

By setting address parity test mode (MAPTEST = 1, BAPTEST = 1), the parity to be input to the address parity checker is inverted. Set the PROT[1:0] bits to 01_B when writing to GRTSTCTL.

This register is initialized by an internal reset or an external reset.

Access: GRTSTCTL is readable/writable in 32-bit units.

Address: GRTSTCTL : FFC6 4180_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 29.43 GRTSTCTL Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
29 to 26	Reserved	The read value is 0. The write value should be 0.
25 to 24	MAPBIT[1:0]	Sets the memory address parity bits. Memory address parity is used for address parity check in read accesses. The setting of these bits are enabled only when TESTEN is 1 while MAPTEST[7:0] is not 00_H. When MAPBIT = 1, the applicable address parity bit is inverted. MAPBIT[1:0] and the corresponding memory address parity bits are; MAPBIT[0]: The lower-order address parity bit MAPBIT[1]: The higher-order address parity bit The setting of these bits apply to all words and banks.
23 to 16	MAPTEST[7:0]	Sets the memory address parity checker to test mode. The setting of MAPBIT[1:0] is enabled when MAPTEST = 1. The setting of these bits is enabled only when TESTEN = 1. MAPTEST [0]: Bank A word 0 MAPTEST [1]: Bank A word 1 MAPTEST [2]: Bank A word 2 MAPTEST [3]: Bank A word 3 MAPTEST [4]: Bank B word 0 MAPTEST [5]: Bank B word 1 MAPTEST [6]: Bank B word 2 MAPTEST [7]: Bank B word 3
15 to 8	BAPTEST[7:0]	Sets the bus address parity checker to test mode. Bus address parity is used for address parity check in write accesses. When BAPTEST = 1, the parity generated through the bus address parity generator is inverted. The setting of these bits is enabled only when TESTEN = 1. BAPTEST [0]: Bank A word 0 BAPTEST [1]: Bank A word 1 BAPTEST [2]: Bank A word 2 BAPTEST [3]: Bank A word 3 BAPTEST [4]: Bank B word 0 BAPTEST [5]: Bank B word 1 BAPTEST [6]: Bank B word 2 BAPTEST [7]: Bank B word 3
7	Reserved	The read value is 0. The write value should be 0.

Table 29.43 GRTSTCTL Register Contents (2/2)

Bit Position	Bit Name	Function
6 to 4	RAMSEL[2:0]	Selects the bank and word of the global RAM from which the data is read into the GRTDATBF register. 000_B: Bank A word 0 001_B: Bank A word 1 010_B: Bank A word 2 011_B: Bank A word 3 100_B: Bank B word 0 101_B: Bank B word 1 110_B: Bank B word 2 111_B: Bank B word 3 The setting of these bits is enabled only when TESTEN = 1.
3, 2	DATSEL[1:0]	These bits select the data to be written to the RAM and the data to be read from GRTDATBF. These bits are valid when TESTEN = 1. 00_B: • GRTDATBF: The RAM data is stored when the RAM is read. • Global RAM: Only the data field in the RAM is updated when the RAM is written. The ECC bit and the address parity bit are not updated. 01_B: • GRTDATBF: The ECC bit and the address parity bit are stored when the RAM is read. • Global RAM: Only the ECC bit and the address parity bit are updated when the RAM is written. The data field is not updated. $1x_B$: Reserved (setting is prohibited)
1	DECINEN	ECC Decoder Error Injection Enable for RMW This bit is valid when TESTEN = 1. This bit enables input of the value in the ECC decoder input buffer to the ECC decoder for use in updating of data in RMW. 0: The value in the ECC decoder input buffer is not input. 1: The value in the ECC decoder input buffer is input.
0	TESTEN	ECC Test When the ECC test mode is set (TESTEN = 1), the values in the ECC bit and the address parity bit can be read directly.

(3) GRTDATBF — Global RAM test data read buffer

Data in the RAM, the ECC bits, and address parity bit can be read from this register. When the RAM is read, the value selected by the DATSEL1 or DATSEL0 bit of the GRTSTCTL register is stored in this buffer.

Access: GRTDATBF is readable in 32-bit units.
GRTDATBFL and GRTDATBFH are readable in 16-bit units.
GRTDATBFLL, GRTDATBFLH, GRTDATBFHL, and GRTDATBFHH are readable in 8-bit units.

Address: GRTDATBF : FFC6 4184H
GRTDATBFL : FFC6 4184H, GRTDATBFH : FFC6 4186H,
GRTDATBFLL : FFC6 4184H, GRTDATBFLH : FFC6 4185H,
GRTDATBFHL : FFC6 4186H, GRTDATBFHH : FF75 4187H

Value after reset: 0000 0000H

Table 29.44 GRTDATBF Register Contents

Bit Position	Bit Name	Function
31 to 0	GRTDATBF	These bits operate as a buffer for retaining test data set by the GRTSTCTL register. The bank and word of the global RAM at which the data are to be retained are selected by the setting of the GRTSTCTL.RAMSEL bits and the data are selected by the setting of the GRTSTCTL.DATSEL bits. These bits are only valid while TESTEN = 1. When GRTSTCTL.TESEN = 0, the values are not retained in this register. When GRTSTCTL.TESEN = 1, the data corresponding to the setting of GRTSTCTL.DATSEL are retained. When (DATSEL1, DATSEL0) = (0, 0): When the global RAM is read, the RAM data are stored in GRTDATBF [31:0]. When (DATSEL1, DATSEL0) = (0, 1): When the global RAM is read, the ECC bits and the address parity bit are respectively stored in GRTDATBF [6:0] and GRTDATBF [8:7]. 0 is stored in GRTDATBF [31:9]. When (DATSEL1, DATSEL0) = (1, x): The values are not retained in this register.

(4) GRDECINBF0 — Global RAM ECC decoder input data buffer 0

This register holds the 32 bits of data from RAM for input to the ECC decoder to use in updating the data at the time of RMW access. Self-diagnosis of the ECC decoder can be performed by using this register.

Access: GRDECINBF0 is readable/writable in 32-bit units.
GRDECINBF0L and GRDECINBF0H are readable/writable in 16-bit units.
GRDECINBF0LL, GRDECINBF0LH, GRDECINBF0HL, and GRDECINBF0HH are readable/writable in 8-bit units.

Address: GRDECINBF0 : FFC6 4188H,
GRDECINBF0L : FFC6 4188H, GRDECINBF0H : FFC6 418AH,
GRDECINBF0LL : FFC6 4188H, GRDECINBF0LH : FFC6 4189H,

Table 29.45 GRDECINBF00 Register Contents

Bit Position	Bit Name	Function
31 to 0	GRDECINBF0	These bits are valid when TESTEN = 1 (selecting test mode) in the GRTSTCTL register. When DECINEN = 1, the value of this register is input to the ECC decoder as data for use in updating in response to the execution of an RMW instruction. This register is common to banks A and B, the higher-order bits and the lower-order bits, and words 0 to 3.

(5) GRDECINBF1 — Global RAM ECC decoder input data buffer 1

This register holds the 7 bits of the ECC encode data for input to the ECC decoder to use in updating the data at the time of RMW access. Self-diagnosis of the ECC decoder can be performed by using this register.

Access: GRDECINBF1 is readable/writable in 32-bit units.
GRDECINBF1L is readable/writable in 16-bit units.
GRDECINBF1LL is readable/writable in 8-bit units.

Address: GRDECINBF1 : FFC6 418C$_H$,
GRDECINBF1L : FFC6 418C$_H$,
GRDECINBF1LL : FFC6 418C$_H$

Value after reset: 0000 0000$_H$

Table 29.46 GRDECINBF1 Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	The read value is 0. The write value should be 0.
6 to 0	GRDECINBF1	These bits are valid when TESTEN = 1 (selecting test mode) in the GRTSTCTL register. When DECINEN = 1, the value of this register is input to the ECC decoder as the 7-bit data for use in updating in response to the execution of an RMW instruction. This register is common to banks A and B, the higher-order bits and the lower-order bits, and words 0 to 3.

(6) GRERRINT_SIC/PE1/PE2 — Global RAM error information control register

GRERRINT enables or disables generation of the error notification signal to the ECM upon detection of a 2-bit ECC error, a 1-bit ECC error, or an address parity error.

The setting of this register is used for accesses through the respective access port.

GRERRINT is initialized by an internal reset or an external reset.

Access: GRERRINT_SIC, GRERRINT_PE1, and GRERRINT_PE2 are readable/writable in 32-bit units.
GRERRINT_SICL, GRERRINT_PE1L, and GRERRINT_PE2L are readable/writable in 16-bit units.
GRERRINT_SICLL, GRERRINT_PE1LL, and GRERRINT_PE2LL are readable/writable in 8-bit units.

Address: GRERRINT_SIC : FFC6 4204H, GRERRINT_PE1 : FFC6 4404H, GRERRINT_PE2 : FFC6 4604H,
GRERRINT_SICL : FFC6 4204H, GRERRINT_PE1L : FFC6 4404H, GRERRINT_PE2L : FFC6 4604H,

Table 29.47 GRERRINT Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	The read value is 0. The write value should be 0.
3	PBEIE	Parity Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a parity bit error when address parity check is enabled. 0: Disables notification of the parity bit error. 1: Enables notification of the parity bit error.
2	APEIE	Address Parity Error Notification Enable Enables or disables generation of the error notification signal upon detection of an address parity error when address parity check is enabled. 0: Disables notification of the address parity error. 1: Enables notification of the address parity error.
1	DEDIE	2-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error.
0	SEDIE	1-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error.

(7) GRSTCLR_SIC/PE1/PE2 — Global RAM status clear register

GRSTCLR clears the error flags in the error status register (GR1STERSTR), the overflow flag in the error count overflow status register (GROVFSTR), and the error address register (GR1STEADR).

GRSTCLR is a write-only register and is always read as 0.

The setting of this register is used for accesses through the respective access port.

Access: GRSTCLR_SIC, GRSTCLR_PE1, and GRSTCLR_PE2 are writable in 32-bit units.
GRSTCLR_SICL, GRSTCLR_PE1L, and GRSTCLR_PE2L are writable in 16-bit units.
GRSTCLR_SICLL, GRSTCLR_PE1LL, and GRSTCLR_PE2LL are writable in 8-bit units.

Address: GRSTCLR_SIC : FFC6 4208$_H$, GRSTCLR_PE1 : FFC6 4408$_H$, GRSTCLR_PE2 : FFC6 4608$_H$,
GRSTCLR_SICL : FFC6 4208$_H$, GRSTCLR_PE1L : FFC6 4408$_H$, GRSTCLR_PE2L : FFC6 4608$_H$,
GRSTCLR_SICLL : FFC6 4208$_H$, GRSTCLR_PE1LL : FFC6 4408$_H$, GRSTCLR_PE2LL : FFC6 4608$_H$

Table 29.48 GRSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	The read value is 0. The write value should be 0.
1	STCLR1	Error Overflow Flag Clear (PE1 and PE2: for data and for RMW access, SIC: for the 32 higher-order bits and for RMW access) Writing 1 to this bit clears the PBEF1, APEF1, DEDF1, and SEDF1 flags in GR1STERSTR, the ERROVF1 flag in GROVFSTR, and GR1STEADR1.
0	STCLR0	Error Overflow Flag Clear (PE1 and PE2: for instruction, SIC: for the 32 lower-order bits and for RMW access) Writing 1 to this bit clears the PBEF0, APEF0, DEDF0, and SEDF0 flags in GR1STERSTR, the ERROVF0 flag in GROVFSTR, and GR1STEADR0.

(8) GROVFSTR_SIC/PE1/PE2 — Global RAM error count overflow status register

GROVFSTR monitors occurrence of error overflow. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in GRSTCLR.

The setting of this register is used for accesses through the respective access port.

Access: GROVFSTR_SIC, GROVFSTR_PE1, and GROVFSTR_PE2 are readable in 32-bit units.
GROVFSTR_SICL, GROVFSTR_PE1L, and GROVFSTR_PE2L are readable in 16-bit units.
GROVFSTR_SICLL, GROVFSTR_PE1LL, and GROVFSTR_PE2LL are readable in 8-bit units.

Address: GROVFSTR_SIC : FFC6 420C$_H$, GROVFSTR_PE1 : FFC6 440C$_H$, GROVFSTR_PE2 : FFC6 460C$_H$,
GROVFSTR_SICL : FFC6 420C$_H$, GROVFSTR_PE1L : FFC6 440C$_H$,
GROVFSTR_PE2L : FFC6 460C$_H$,
GROVFSTR_SICLL : FFC6 420C$_H$, GROVFSTR_PE1LL : FFC6 440C$_H$,
GROVFSTR_PE2LL : FFC6 460C$_H$

Value after reset: 0000 0000$_H$

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.49 GROVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	The read value is 0. The write value should be 0.
1	ERROVF1	Error Overflow Flag (PE1 and PE2: for data and for RMW access, SIC: for the 32 higher-order bits and for RMW access) This flag is set if the second error occurs while any of the error flags (PBEF1, APEF1, DEDF1, and SEDF1) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.
0	ERROVF0	Error Overflow Flag (PE1 and PE2: for instruction, SIC: for the 32 lower-order bits and for RMW access) This flag is set if the second error occurs while any of the error flags (PBEF0, APEF0, DEDF0, and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(9) GR1STERSTR_SIC/PE1/PE2 — Global RAM 1st error status register

GR1STERSTR monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. The applicable error flag is set if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag, the parity bit error flag, or both are set.

If more than one error occurs simultaneously, all the corresponding error flags are set. GR1STERSTR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in GRSTCLR.

The setting of this register is used for accesses through the respective access port.

Access: GR1STERSTR_SIC, GR1STERSTR_PE1, and GR1STERSTR_PE2 are readable in 32-bit units.
GR1STERSTR_SICL, GR1STERSTR_PE1L, and GR1STERSTR_PE2L are readable in 16-bit units.
GR1STERSTR_SICLL, GR1STERSTR_SICLH, GR1STERSTR_PE1LL, GR1STERSTR_PE1LH,
GR1STERSTR_PE2LL, and GR1STERSTR_PE2LH are readable in 8-bit units.

Address: GR1STERSTR_SIC : FFC6 4210$_H$, GR1STERSTR_PE1 : FFC6 4410$_H$,
GR1STERSTR_PE2 : FFC6 4610$_H$,
GR1STERSTR_SICL : FFC6 4210$_H$, GR1STERSTR_PE1L : FFC6 4410$_H$,
GR1STERSTR_PE2L : FFC6 4610$_H$,
GR1STERSTR_SICLL : FFC6 4210$_H$, GR1STERSTR_SICLH : FFC6 4211$_H$,
GR1STERSTR_PE1LL : FFC6 4410$_H$, GR1STERSTR_PE1LH : FFC6 4411$_H$,
GR1STERSTR_PE2LL : FFC6 4610$_H$, GR1STERSTR_PE2LH : FFC6 4611$_H$

Value after reset: 0000 0000$_H$

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.50 GR1STERSTR Register Contents

Bit Position	Bit Name	Function
31 to 12, 7 to 4	Reserved	The read value is 0. The write value should be 0.
3 + 8n	PBEFn	Parity Bit Error Monitor Flag Clearing condition: Setting 1 to the STCLRn bit in GRSTCLR. Setting condition: A parity bit error has occurred while all the error flags PBEFn, APEFn, DEDFn, and SEDFn are 0.
2 + 8n	APEFn	Address Parity Error Monitor Flag Clearing condition: Setting 1 to the STCLRn bit in GRSTCLR. Setting condition: An address parity error has occurred while the error flags APEFn and DEDFn are 0. **CAUTION:** This flag is set equally for read and write; the error generation source is not considered.
1 + 8n	DEDFn	2-Bit ECC Error Monitor Flag Clearing condition: Setting 1 to the STCLRn bit in GRSTCLR. Setting condition: A 2-bit ECC error has occurred while the error flags APEFn and DEDFn are 0.
0 + 8n	SEDFn	1-Bit ECC Error Monitor Flag Clearing condition: Setting 1 to the STCLRn bit in GRSTCLR. Setting condition: A 1-bit ECC error has occurred while all the error flags PBEFn, APEFn, DEDFn, and SEDFn are 0.

NOTE

SIC: n = 0: Error detection in the 32 lower-order bits and RMW access
n = 1: Error detection in the 32 higher-order bits and RMW access
PE1/PE2: n = 0: Error detection in the instruction
n = 1: Error detection in the data and RMW access

(10) GR1STEADRn_SIC/PE1/PE2 — Global RAM 1st error address register n (n = 0, 1)

GR1STEADRn holds the address at which an error has occurred.

The error address is set if an error occurs while all the error flags are 0 in GR1STERSTR. The address is updated if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag, the parity bit error flag, or both are set. Once a 2-bit ECC error or an address parity error occurs, the address is not updated.

EADR[20:2] of this register correspond to bits [20:2] of the real address. The real address can be calculated by appending the higher-order address bits [31:21] as a base address. GR1STEADR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in GRSTCLR. During accesses to the lower-order 32-bit data, the address is stored in GR1STEADR0. During accesses to the higher-order 32-bit data, the address is stored in GR1STEADR1.

The setting of this register is used for accesses through the respective access port.

Access: GR1STEADRn_(SIC/PE1/PE2) is readable in 32-bit units.
GR1STEADRn_(SIC/PE1/PE2)(L/H) is readable in 16-bit units.
GR1STEADRn_(SIC/PE1/PE2)(LL/LH/HL/HH) is readable in 8-bit units.

Address: GR1STEADR0_SIC : FFC6 4250H, GR1STEADR1_SIC : FFC6 4254H,
GR1STEADR0_PE1 : FFC6 4450H, GR1STEADR1_PE1 : FFC6 4454H,
GR1STEADR0_PE2 : FFC6 4650H, GR1STEADR1_PE2 : FFC6 4654H,
GR1STEADRn_(SIC/PE1/PE2)L : GR1STEADRn_(SIC/PE1/PE2) + 00H

Table 29.51 GR1STEADRn Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	The read value is 0. The write value should be 0.
20 to 2	EADR[20:2]	1st Error Address These bits monitor the address of the first error. The error address is set if an error occurs while all the error flags are 0 in GR1STERSTR. The address is updated if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error or an address parity error occurs, the address is not updated
1, 0	Reserved	The read value is 0. The write value should be 0.

NOTE

SIC: n = 0: Error detection in the 32 lower-order bits and RMW access
n = 1: Error detection in the 32 higher-order bits and RMW access
PE1/PE2: n = 0: Error detection in the instruction
n = 1: Error detection in the data and RMW access

The second bit is always 0 for the following registers.

GR1STEADR0_PE1

GR1STEADR0_PE2

For example, if an address FEF0 0000_H is stored in the above registers, an error has occurred either at FEF0 0000_H or FEF0 0004_H.

29.2.5.4 Test Function

Through appropriate register setting, desired values can be written as RAM data and to the ECC and address parity bits.

Also, data in the RAM and the ECC and address parity bits and the ECC decoder output data for RMW can all be read.

It is possible to input the desired data in the ECC decoder for RMW.

(1) Writing RAM data

1. Set the TESTEN bit in the GRTSTCTL register to 1 to set test mode.
2. Set the corresponding DATSEL1 to 0 and DATSEL0 to 0 in the GRTSTCTL register to select RAM data for access when writing.
3. When data is written to the global RAM, only the RAM data can be modified without updating the ECC bits.

How to exit this test mode:

4. Set the TESTEN bit in the GRTSTCTL register to 0 to disable test mode (normal mode).

(2) Reading RAM data

1. Set the ECCDIS bit in the GRECCCTL_GRAMC register to 1 to disable ECC error detection and correction.
2. Read the global RAM. Since neither error detection nor correction proceeds when the global RAM is read, the RAM data is read unchanged.

How to exit this test mode:

3. Set the ECCDIS bit in the GRECCCTL_GRAMC register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC and address parity bits

1. Set the TESTEN bit in the GRTSTCTL register to 1 to set test mode.
2. Set the corresponding DATSEL1 bit to 0 and DATSEL0 bit to 1 in the GRTSTCTL register to select the ECC bits and the address parity bit for access when writing.
3. When data is written to the global RAM, only the ECC and address parity bits can be modified without updating the RAM data. At that time, bits [6:0] and bits [8:7] are respectively written to the ECC bits and to the address parity bit.

CAUTION

Writing desired values to the RAM data and the address parity bit should be in order of 1) writing the RAM data and then 2) writing the address parity bit. When writing desired values to the RAM data and ECC bits, you can start either by writing to the RAM data or ECC bits.

How to exit this test mode:

4. Set the TESTEN bit in the GRTSTCTL register to 0 to disable test mode (normal mode).

(4) Reading the ECC and address parity bits

1. Set the TESTEN bit in the GRTSTCTL register to 1 to set test mode.
2. Setting the DATSEL1 and DATSEL0 bits in the GRTSTCTL register to 0 and 1, respectively, to select the ECC and address parity bits for access when reading.
   Set the RAMSEL bit of the GRTSTCTL register depending on the global RAM to read the data from.
3. When the global RAM is read, the ECC bits and the address parity bit are stored in the GRTDATBF register.

How to exit this test mode:

4. Set the TESTEN bit in the GRTSTCTL register to 0 to disable test mode (normal mode).

(5) Self-diagnosis of the ECC check function for the access ports

Desired values can be written to the RAM data and/or ECC bits by following the procedure described in (1) or (3) above. Therefore, a fault can be injected by, for example, inverting appropriate bits of the RAM data and/or ECC bits. After that, self-diagnosis of the ECC decoder is possible by reading the global RAM in normal mode and checking the result of error correction or detection.

(6) Self-diagnosis of the address parity check function

Self-diagnosis of write access and read access is enabled by following either of the two procedures below.

(1) In write access, setting BAPTEST[7:0] in the GRTSTCTL register to 1 inverts the result of address parity generation for the corresponding data area (words 0 to 3) of the corresponding bank (bank A or B). That is, a fault can be injected to the address parity generator. Writing to the corresponding data area of the corresponding bank in the global RAM in this state and checking the result of parity error detection allows self-diagnosis of the address parity check function in writing.

(2) In read access, setting MAPTEST[7:0] in the GRTSTCTL register to 1 inverts the result of address parity generation for the corresponding data area (words 0 to 3) of the corresponding bank (bank A or B). That is, a fault can be injected to the address parity generator. Reading from the corresponding data area of the corresponding bank in the global RAM in this state returns the address parity error according to the setting in the MAPBIT[1:0] bits. Checking the result of parity error detection allows self-diagnosis of the address parity check function in reading. Additionally, self-diagnosis is also possible by following the procedure described in (3) and (4) above, by writing a desired value in the address party bit. A 1-bit or 2-bit failure can be injected to the address parity bit by inverting the value in the bit. Then, read the global RAM in normal mode and check the result of error detection.

(7) Self-diagnosis of the ECC check function for the data read in an RMW operation

Desired values can be written to the RAM data and/or ECC bits by following the procedure described in (1) or (3) above. Therefore, a fault can be injected by, for example, inverting appropriate bits of the RAM data and/or ECC bits. After RMW processing for the global RAM proceeds, self-diagnosis of the ECC decoder is possible by checking the result of error correction or detection.

(8) Self-diagnosis of the ECC decoder for the data being updated at the time of RMW access

Setting DECINEN in the GRTSTCTL register to 1 makes the output data from the ECC decoder for the data being updated at the time of RMW access the target for reading. Though this setting, the input data from the ECC decoder is switched to the data from the ECC decoder input buffer 0 or 1 (GRDECINBF0, 1) in the global RAM from write data sent from the access ports.

As a result, suitable erroneous values can be injected by setting an appropriate value in ECC decoder input buffer 0 or 1.

After RMW processing for the global RAM proceeds, self-diagnosis of the ECC decoder is possible by checking the result of error correction or detection.

29.2.6 Instruction Cache ECC and EDC

29.2.6.1 Overview

The instruction cache ECC is summarized in the table below.

Table 29.52 Overview of the Instruction Cache ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. This function is enabled after a reset, that is, detection of 2-bit errors and detection and correction of 1-bit errors are enabled.
Address parity	None
Error notification	An indicator of the occurrence of an ECC error is conveyed to the ECM. ECC Error: • Enabling or disabling of error notification upon detection of a 2-bit ECC error can be selected. • Enabling or disabling of error notification upon detection of a 1-bit ECC error can be selected. The register values after a reset disable notification of the 2-bit ECC error and disable notification of the 1-bit ECC error. The error notification signal is output, where a 2-bit ECC error is handled as one source, and a 1-bit ECC error is handled as one source.
Error status	A status register is provided, which indicates the states of 2-bit ECC error detection and 1-bit ECC error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	If an ECC error occurs while no error status is set, the address at which the associated error has occurred is captured. The address is captured when a 2-bit ECC error or a 1-bit ECC error is detected. The error status serves as the enable bit of the capture address.
Self-diagnosis	A cache instruction is used to write the desired values as RAM data and to the ECC bits. Similarly, data in the RAM and the ECC bits can be read directly. Since instructions as described above go through the same encoding or decoding path as a normal cache fill or instruction fetch, only such instructions can be used in inserting and confirming errors.

29.2.6.2 List of Registers

29.2.6.3 Details of Registers

(1) IDECCCTL_PE1/PE2/PE3 — Instruction cache data RAM ECC control register

IDECCCTL enables or disables ECC error detection and correction and 1-bit error correction for cache data RAM. Set the PROT[1:0] bits to 01_B when writing to IDECCCTL.

IDECCCTL is initialized by an internal reset or an external reset.

Access: IDECCCTL_PE1, IDECCCTL_PE2, and IDECCCTL_PE3 are readable/writable in 32-bit units.
IDECCCTL_PE1L, IDECCCTL_PE2L, and IDECCCTL_PE3L are readable/writable in 16-bit units.

Address: IDECCCTL_PE1 : FFC6 0400_H, IDECCCTL_PE2 : FFC6 0600_H, IDECCCTL_PE3 : FF75 1000_H,
IDECCCTL_PE1L : FFC6 0400_H, IDECCCTL_PE2L : FFC6 0600_H, IDECCCTL_PE3L : FF75 1000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 29.54 IDECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	The read value is 0. The write value should be 0.
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
13 to 2	Reserved	The read value is 0. The write value should be 0.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) IDERRINT_PE1/PE2/PE3 — Instruction cache data RAM error information control register

IDERRINT enables or disables generation of the error notification signal to the ECM upon detection of a 2-bit ECC error or a 1-bit ECC error in cache data RAM.

IDERRINT is initialized by an internal reset or an external reset.

Access: IDERRINT_PE1, IDERRINT_PE2, and IDERRINT_PE3 are readable/writable in 32-bit units.
IDERRINT_PE1L, IDERRINT_PE2L, and IDERRINT_PE3L are readable/writable in 16-bit units.
IDERRINT_PE1LL, IDERRINT_PE2LL, and IDERRINT_PE3LL are readable/writable in 8-bit units.

Address: IDERRINT_PE1 : FFC6 0404H, IDERRINT_PE2 : FFC6 0604H, IDERRINT_PE3 : FF75 1004H,
IDERRINT_PE1L : FFC6 0404H, IDERRINT_PE2L : FFC6 0604H, IDERRINT_PE3L : FF75 1004H,
IDERRINT_PE1LL : FFC6 0404H, IDERRINT_PE2LL : FFC6 0604H, IDERRINT_PE3LL : FF75 1004H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 29.55 IDERRINT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	The read value is 0. The write value should be 0.
1	DEDIE	2-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error.
0	SEDIE	1-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error.

(3) IDSTCLR_PE1/PE2/PE3 — Instruction cache data RAM error status clear register

IDSTCLR clears the error flags in the error status register (ID1STERSTR), the overflow flag in the error count overflow status register (IDOVFSTR), and the error address register (ID1STEADR).

IDSTCLR is a write-only register and is always read as 0.

Access: IDSTCLR_PE1, IDSTCLR_PE2, and IDSTCLR_PE3 are writable in 32-bit units.
IDSTCLR_PE1L, IDSTCLR_PE2L, and IDSTCLR_PE3L are writable in 16-bit units.
IDSTCLR_PE1LL, IDSTCLR_PE2LL, and IDSTCLR_PE3LL are writable in 8-bit units.

Address: IDSTCLR_PE1 : FFC6 0408H, IDSTCLR_PE2 : FFC6 0608H, IDSTCLR_PE3 : FF75 1008H,
IDSTCLR_PE1L : FFC6 0408H, IDSTCLR_PE2L : FFC6 0608H, IDSTCLR_PE3L : FF75 1008H,
IDSTCLR_PE1LL : FFC6 0408H, IDSTCLR_PE2LL : FFC6 0608H, IDSTCLR_PE3LL : FF75 1008H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 29.56 IDSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	The read value is 0. The write value should be 0.
0	STCLR0	Error Overflow Flag Clear Writing 1 to this bit clears the DEDF0 and SEDF0 flags in ID1STERSTR, ERROVF0 flag in IDOVFSTR; and ID1STEADR0.

(4) IDOVFSTR_PE1/PE2/PE3 — Instruction cache data RAM error count overflow status register

IDOVFSTR monitors occurrence of error overflow in cache data RAM. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in IDSTCLR.

Access: IDOVFSTR_PE1, IDOVFSTR_PE2, and IDOVFSTR_PE3 are readable in 32-bit units.
IDOVFSTR_PE1L, IDOVFSTR_PE2L, and IDOVFSTR_PE3L are readable in 16-bit units.
IDOVFSTR_PE1LL, IDOVFSTR_PE2LL, and IDOVFSTR_PE3LL are readable in 8-bit units.

Address: IDOVFSTR_PE1 : FFC6 040C$_H$, IDOVFSTR_PE2 : FFC6 060C$_H$, IDOVFSTR_PE3 : FF75 100C$_H$,
IDOVFSTR_PE1L : FFC6 040C$_H$, IDOVFSTR_PE2L : FFC6 060C$_H$, IDOVFSTR_PE3L : FF75 100C$_H$,
IDOVFSTR_PE1LL : FFC6 040C$_H$, IDOVFSTR_PE2LL : FFC6 060C$_H$, IDOVFSTR_PE3LL : FF75 100C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.57 IDOVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	The read value is 0. The write value should be 0.
0	ERROVF0	Error Overflow Flag This flag is set if the second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(5) ID1STERSTR_PE1/PE2/PE3 — Instruction cache data RAM 1st error status register

ID1STERSTR monitors occurrence of the first error in cache data RAM. The error status is set if an error occurs while all the error flags for the relevant banks are 0. The applicable error flag is set if a 2-bit ECC error occurs while the 1-bit ECC error flag is set, and the 1-bit ECC error flag is not changed.

On the other hand, the applicable error flag is not set if a 1-bit ECC error occurs while the 2-bit ECC error flag is set.

If more than one error occurs simultaneously in a bank, all the corresponding error flags are set.

ID1STERSTR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in IDSTCLR.

Access: ID1STERSTR_PE1, ID1STERSTR_PE2, and ID1STERSTR_PE3 are readable in 32-bit units.
ID1STERSTR_PE1L, ID1STERSTR_PE2L, and ID1STERSTR_PE3L are readable in 16-bit units.
ID1STERSTR_PE1LL, ID1STERSTR_PE2LL, and ID1STERSTR_PE3LL are readable in 8-bit units.

Address: ID1STERSTR_PE1 : FFC6 0410$_H$, ID1STERSTR_PE2 : FFC6 0610$_H$,
ID1STERSTR_PE3 : FF75 1010$_H$,
ID1STERSTR_PE1L : FFC6 0410$_H$, ID1STERSTR_PE2L : FFC6 0610$_H$,
ID1STERSTR_PE3L : FF75 1010$_H$,
ID1STERSTR_PE1LL : FFC6 0410$_H$, ID1STERSTR_PE2LL : FFC6 0610$_H$,
ID1STERSTR_PE3LL : FF75 1010$_H$

Value after reset: 0000 0000$_H$

Table 29.58 ID1STERSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	The read value is 0. The write value should be 0.
1	DEDF0	2-Bit ECC Error Monitor Flag Clearing condition: Reset or setting the STCLR0 bit to 1 in IDSTCLR. Setting condition: A 2-bit ECC error has occurred while the error flag DEDF0 is 0.
0	SEDF0	1-Bit ECC Error Monitor Flag Clearing condition: Reset or setting the STCLR0 bit to 1 in IDSTCLR. Setting condition: A 1-bit ECC error has occurred while the error flags DEDF0 and SEDF0 are 0.

(6) ID1STEADR0_PE1/PE2/PE3 — Instruction cache data RAM 1st error address register

ID1STEADR holds the address at which an error has occurred in cache data RAM. The error address is set if an error occurs while all the error flags for the relevant banks are 0 in ID1STERSTR. The address is updated if a 2-bit ECC error is found while the 1-bit ECC error flag is set for a first error. Once a 2-bit ECC error occurs, the address is not updated.

ID1STEADR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in IDSTCLR.

Addresses of data RAM and tag RAM for the cached data are specified from the addresses of the code flash and this register holds the address of the cached data in the code flash. For relationship between the coder flash address and the data RAM and the tag RAM of the instruction cache, see Section **3.2.2 Instruction Cache and Data Buffer**.

ID1STEADR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in IDSTCLR.

Access: ID1STEADR0_ (PE1/PE2/PE3) is readable in 32-bit units.
ID1STEADR0_ (PE1/PE2/PE3) (L/H) is readable in 16-bit units.
ID1STEADR0_ (PE1/PE2/PE3) (LL/LH/HL/HH) is readable in 8-bit units.

Address: ID1STEADR0_PE1 : FFC6 0450$_H$, ID1STEADR0_PE2 : FFC6 0650$_H$, ID1STEADR0_PE3 : FF75 1050$_H$,
ID1STEADR0_ (PE1/PE2/PE3)L : ID1STEADR0_ (PE1/PE2/PE3) + 00$_H$
ID1STEADR0_ (PE1/PE2/PE3)H : ID1STEADR0_ (PE1/PE2/PE3) + 02$_H$
ID1STEADR0_ (PE1/PE2/PE3)LL : ID1STEADR0_ (PE1/PE2/PE3) + 00$_H$
ID1STEADR0_ (PE1/PE2/PE3)LH : ID1STEADR0_ (PE1/PE2/PE3) + 01$_H$
ID1STEADR0_ (PE1/PE2/PE3)HL : ID1STEADR0_ (PE1/PE2/PE3) + 02$_H$
ID1STEADR0_ (PE1/PE2/PE3)HH : ID1STEADR0_ (PE1/PE2/PE3) + 03$_H$

Value after reset: 0000 0000$_H$

Table 29.59 ID1STEADR0 Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	The read value is 0. The write value should be 0.
24 to 3	EADR0[24:3]	1st Error Address These bits monitor the address of the first error. The error address is set if an error occurs while all the error flags are 0 in ID1STERSTR. The address is updated if a 2-bit ECC error is found while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error occurs, the address is not updated.
2 to 0	Reserved	The read value is 0. The write value should be 0.

(7) ITECCCTL_PE1/PE2/PE3 — Instruction cache tag RAM ECC control register

ITECCCTL enables or disables ECC error detection in cache tag RAM. Set the PROT[1:0] bits to 01_B when writing to ITECCCTL.

ITECCCTL is initialized by an internal reset or an external reset.

Access: ITECCCTL_PE1, ITECCCTL_PE2, and ITECCCTL_PE3 are readable/writable in 32-bit units.
ITECCCTL_PE1L, ITECCCTL_PE2L, and ITECCCTL_PE3L are readable/writable in 16-bit units.

Address: ITECCCTL_PE1 : FFC6 1400$_H$, ITECCCTL_PE2 : FFC6 1600$_H$, ITECCCTL_PE3 : FF75 2000$_H$,
ITECCCTL_PE1L : FFC6 1400$_H$, ITECCCTL_PE2L : FFC6 1600$_H$, ITECCCTL_PE3L : FF75 2000$_H$

Value after reset: 0000 0000$_H$

Table 29.60 ECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	The read value is 0. The write value should be 0.
15, 14	PROT[1:0]	These bits enable writing to this register. These bits are always read as 0.
13 to 1	Reserved	The read value is 0. The write value should be 0.
0	ECCDIS	ECC Disable Enables or disables ECC error detection 0: Enables ECC error detection. 1: Disables ECC error detection.

(8) ITERRINT_PE1/PE2/PE3 — Instruction cache tag RAM error information control register

ITERRINT enables or disables generation of the error notification signal to the ECM upon detection of a 2-bit ECC error or a 1-bit ECC error in cache tag RAM.

ITERRINT is initialized by an internal reset or an external reset.

Access: ITERRINT_PE1, ITERRINT_PE2, and ITERRINT_PE3 are readable/writable in 32-bit units.
ITERRINT_PE1L, ITERRINT_PE2L, and ITERRINT_PE3L are readable/writable in 16-bit units.
ITERRINT_PE1LL, ITERRINT_PE2LL, and ITERRINT_PE3LL are readable/writable in 8-bit units.

Address: ITERRINT_PE1 : FFC6 1404$_H$, ITERRINT_PE2 : FFC6 1604$_H$, ITERRINT_PE3 : FF75 2004$_H$,
ITERRINT_PE1L : FFC6 1404$_H$, ITERRINT_PE2L : FFC6 1604$_H$, ITERRINT_PE3L : FF75 2004$_H$,

Bit Position	Bit Name	Function
31 to 2	Reserved	The read value is 0. The write value should be 0.
1	DEDIE	2-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection is enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error.
0	SEDIE	1-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection is enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error.

(9) ITSTCLR_PE1/PE2/PE3 — Instruction cache tag RAM error status clear register

ITSTCLR clears the error flags in the error status register (IT1STERSTR), the overflow flag in the error count overflow status register (ITOVFSTR), and the error address register (IT1STEADR).

ITSTCLR is a write-only register and is always read as 0.

Access: ITSTCLR_PE1, ITSTCLR_PE2, and ITSTCLR_PE3 are writable in 32-bit units.
ITSTCLR_PE1L, ITSTCLR_PE2L, and ITSTCLR_PE3L are writable in 16-bit units.
ITSTCLR_PE1LL, ITSTCLR_PE2LL, and ITSTCLR_PE3LL are writable in 8-bit units.

Address: ITSTCLR_PE1 : FFC6 1408$_H$, ITSTCLR_PE2 : FFC6 1608$_H$, ITSTCLR_PE3 : FF75 2008$_H$,
ITSTCLR_PE1L : FFC6 1408$_H$, ITSTCLR_PE2L : FFC6 1608$_H$, ITSTCLR_PE3L : FF75 2008$_H$,
ITSTCLR_PE1LL : FFC6 1408$_H$, ITSTCLR_PE2LL : FFC6 1608$_H$, ITSTCLR_PE3LL : FF75 2008$_H$

Value after reset: 0000 0000$_H$

Table 29.62 STCLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	The read value is 0. The write value should be 0.
0	STCLR0	Error Overflow Flag Clear Writing 1 to this bit clears the DEDF0 and SEDF0 flags in IT1STERSTR, ERROVF0 flag in ITOVFSTR, and IT1STEADR0.

(10) ITOVFSTR_PE1/PE2/PE3 — Instruction cache tag RAM error count overflow status register

ITOVFSTR monitors occurrence of error overflow in cache tag RAM. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in ITSTCLR.

Access: ITOVFSTR_PE1, ITOVFSTR_PE2, and ITOVFSTR_PE3 are readable in 32-bit units.
ITOVFSTR_PE1L, ITOVFSTR_PE2L, and ITOVFSTR_PE3L are readable in 16-bit units.
ITOVFSTR_PE1LL, ITOVFSTR_PE2LL, and ITOVFSTR_PE3LL are readable in 8-bit units.

Address: ITOVFSTR_PE1 : FFC6 140C$_H$, ITOVFSTR_PE2 : FFC6 160C$_H$, ITOVFSTR_PE3 : FF75 200C$_H$,
ITOVFSTR_PE1L : FFC6 140C$_H$, ITOVFSTR_PE2L : FFC6 160C$_H$, ITOVFSTR_PE3L : FF75 200C$_H$,
ITOVFSTR_PE1LL : FFC6 140C$_H$, ITOVFSTR_PE2LL : FFC6 160C$_H$, ITOVFSTR_PE3LL : FF75 200C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.63 ITOVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	The read value is 0. The write value should be 0.
0	ERROVF0	Error Overflow Flag This flag is set if the second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(11) IT1STERSTR_PE1/PE2/PE3 — Instruction cache tag RAM 1st error status register

IT1STERSTR monitors occurrence of the first error in cache tag RAM. The error status is set if an error occurs while all the error flags of the IT1STERSTR register are 0. The applicable error flag is set if a 2-bit ECC error occurs while the 1-bit ECC error flag is set, and the 1-bit ECC error flag is not changed.

On the other hand, the applicable error flag is not set if a 1-bit ECC error occurs while the 2-bit ECC error flag is set.

This register cannot specify the Way at which an error has occurred.

IT1STERSTR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in ITSTCLR.

Access: IT1STERSTR_PE1, IT1STERSTR_PE2, and IT1STERSTR_PE3 are readable in 32-bit units.
IT1STERSTR_PE1L, IT1STERSTR_PE2L, and IT1STERSTR_PE3L are readable in 16-bit units.
IT1STERSTR_PE1LL, IT1STERSTR_PE2LL, and IT1STERSTR_PE3LL are readable in 8-bit units.

Address: IT1STERSTR_PE1 : FFC6 1410$_H$, IT1STERSTR_PE2 : FFC6 1610$_H$,
IT1STERSTR_PE3 : FF75 2010$_H$,
IT1STERSTR_PE1L : FFC6 1410$_H$, IT1STERSTR_PE2L : FFC6 1610$_H$,
IT1STERSTR_PE3L : FF75 2010$_H$,
IT1STERSTR_PE1LL : FFC6 1410$_H$, IT1STERSTR_PE2LL : FFC6 1610$_H$,
IT1STERSTR_PE3LL : FF75 2010$_H$

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF0	SEDF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.64 IT1STERSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, 0 is always returned. The write value should be 0.
1	DEDF0	2-Bit ECC Error Monitor Flag Clearing condition: Reset or setting the STCLR0 bit to 1 in ITSTCLR. Setting condition: A 2-bit ECC error has occurred while the error flag DEDF0 is 0.
0	SEDF0	1-Bit ECC Error Monitor Flag Clearing condition: Reset or setting the STCLR0 bit to 1 in ITSTCLR. Setting condition: A 1-bit ECC error has occurred while the error flags DEDF0 and SEDF0 are 0.

(12) IT1STEADR0_PE1/PE2/PE3 — Instruction cache tag RAM 1st error address register

IT1STEADR holds the address at which an error has occurred in cache tag RAM. The error address is set if an error occurs while all the error flags for the relevant banks are 0 in IT1STERSTR. The address is updated if a 2-bit ECC error is found while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error occurs, the address will not be updated. Addresses of data RAM and tag RAM for the cached data are specified from the addresses of the code flash. This register holds the address of the cached data in the code flash.

For relationship between the coder flash address and the data RAM and the tag RAM of the instruction cache, see **Section 3.2.2, Instruction Cache and Data Buffer**.

IT1STEADR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in ITSTCLR.

Access: IT1STEADR0_ (PE1/PE2/PE3) is readable in 32-bit units.
IT1STEADR0_ (PE1/PE2/PE3) (L/H) is readable in 16-bit units.
IT1STEADR0_ (PE1/PE2/PE3) (LL/LH/HL/HH) is readable in 8-bit units.

Address: IT1STEADR0_PE1 : FFC6 1450H, IT1STEADR0_PE2 : FFC6 1650H, IT1STEADR0_PE3 : FF75 2050H,
IT1STEADR0_ (PE1/PE2/PE3)L : IT1STEADR0_ (PE1/PE2/PE3) + 00H,
IT1STEADR0_ (PE1/PE2/PE3)H : IT1STEADR0_ (PE1/PE2/PE3) + 02H,
IT1STEADR0_ (PE1/PE2/PE3)LL : IT1STEADR0_ (PE1/PE2/PE3) + 00H,
IT1STEADR0_ (PE1/PE2/PE3)LH : IT1STEADR0_ (PE1/PE2/PE3) + 01H,
IT1STEADR0_ (PE1/PE2/PE3)HL : IT1STEADR0_ (PE1/PE2/PE3) + 02H,
IT1STEADR0_ (PE1/PE2/PE3)HH : IT1STEADR0_ (PE1/PE2/PE3) + 03H

Value after reset: 0000 0000H

Table 29.65 IT1STEADR0 Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	The read value is 0. The write value should be 0.
24 to 5	EADR[24:5]	1st Error Address These bits monitor the address of the first error. The error address is set if an error occurs while all the error flags are 0 in IT1STERSTR. The address is updated if a 2-bit ECC error is found while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error or an address parity error occurs, the address is not updated.
4 to 0	Reserved	The read value is 0. The write value should be 0.

29.2.6.4 Test Function

A cache instruction is used to write the desired values as RAM data and to the ECC bits, and read data in the RAM and the ECC bits directly.

Since instructions as described above go through the same encoding or decoding path as a normal cache fill or instruction fetch, only such instructions can be used in inserting and confirming errors.

For details, refer to *RH850 Family User's Manual: Software*.

29.2.7 DTS RAM ECC

See **Section 7, DMA Controller**.

29.2.8 ECC for Peripheral RAM (32 Bits)

29.2.8.1 Overview

This is an ECC module for the RAM of the following peripheral modules.

RS-CAN, CSIH

Error Detection and Correction

7-bit ECC data is appended to the 32-bit RAM data.

This ECC module provides 2-bit ECC error detection and 1-bit ECC error detection and correction.

CAUTION

This module is not capable of reliably detecting errors in three or more bits.

If errors occur in three or more bits, the module may detect the errors as 1- or 2-bit ECC errors or not detect any errors.

Depending on the settings, this may lead to the correction of a bit that was not actually inverted.

Enabling or disabling ECC error detection and correction

- ECC error detection can be either enabled or disabled.
- 1-bit ECC error correction can be either enabled or disabled.
- If all the bits of RAM output data are stuck at 0 or 1, it is detected as a 2-bit ECC error.

Error notification

- The ECM is notified when 2-bit ECC errors are detected (this can be enabled or disabled).
- The ECM is notified when 1-bit ECC errors are detected (this can be enabled or disabled).
- Once the ECM has been notified of an error, even if another ECC error is detected, the ECM is not notified until the error status bit corresponding to the initial error is cleared.

Error status

- Detection of 2- and 1-bit ECC errors can be monitored.
- Special registers are provided to clear error status.

Address capture

- Only one address at which an ECC error has occurred can be captured.
- The address at which an error has occurred is captured for a 2-bit or 1-bit ECC error that was first detected since the corresponding error monitoring flag was cleared.

Test function (Error injection)

- By setting the test mode, register values can be used as the data to be output to the RAM. When a peripheral module writes to the RAM, the value of the ECEDB[31:0] bits can be written to the RAM data section, and the value of the ECERDB[6:0] bits can be written to the ECC redundant bit section.
- By setting the test mode, the ECC redundant bit section can be latched when RAM data is read, and the value can be confirmed.
- By setting the test mode, the ECC redundant bit (encoding circuit) and syndrome code (decoding circuit), which are generated from the input data, can be confirmed.

29.2.8.2 List of Registers

(1) List of ECC modules

The RAMs of the multiple peripheral functions are provided with the ECC modules. The following table shows the peripheral functions provided with the ECC modules, the corresponding ECC module names, and base addresses of the ECC modules.

Table 29.66 List of ECC Modules

Supported Peripheral Function		ECC Module Names and Register Base Addresses			
		Master Side*1		Checker Side*1	
		Module Name	Base Address <base_addr>	Module Name	Base Address <base_addr>
RS-CANFD	Message buffer RAM (MB RAM)	E7RC1M	FFC71000$_H$	E7RC1C	FFC71200$_H$
	Acceptance filter list RAM (AFL RAM)	E7RC2M	FFC71400$_H$	E7RC2C	FFC71600$_H$
CSIH	CSIH0	E7CS0M	FFC70000$_H$	E7CS0C	FFC70200$_H$
	CSIH1	E7CS1M	FFC70400$_H$	E7CS1C	FFC70600$_H$
	CSIH2	E7CS2M	FFC70800$_H$	E7CS1C	FFC70A00$_H$

Note 1. Two modules (one for master and the other for checker) are provided for duplex configuration.

(2) List of registers

Each ECC module has the registers shown in the following table.

Table 29.67 List of Registers

Module Name	Register Name	Symbol	Address
*1	ECC control register*2	E710CTL	<base_addr>+00_H
*1	ECC test mode control register	E710TMC	<base_addr>+04_H
*1	ECC redundant bit data control test register	E710TRC	<base_addr>+08_H
*1	ECC encoder and decoder data test register	E710TED	<base_addr>+$0C_H$
*1	ECC error address register	E710EAD	<base_addr>+10_H

Note 1. For the names of each ECC module, see **Table 29.66 List of ECC Modules**.

Note 2. The reset value of the LSB in the ECC control register is undefined.

(3) Register map

Table 29.68 Register Map

Abbreviation	31 24	23 16	15 8	7 0	Offset address
E710CTL	— (00_H)	— (00_H)	ECCTL[15:8]	ECCTL[7:0]	00_H
E710TMC	— (00_H)	— (00_H)	ECTMC[15:8]	ECTMC[7:0]	04_H
E710TRC	ECSYND[7:0]	ECHORD[7:0]	ECECRD[7:0]	ECERDB[7:0]	08_H
E710TED	ECEDB[31:24]	ECEDB[23:16]	ECEDB[15:8]	ECEDB[7:0]	$0C_H$
E710EAD	ECEAD[31:24]	ECEAD[23:16]	ECEAD[15:8]	ECEAD[7:0]	10_H

29.2.8.3 Details of Registers

(1) E710CTL — ECC control register

E710CTL controls the status and modes of the ECC module.

E710CTL can be read and written to using the 16-bit or 8-bit manipulation instruction.

However, only the 16-bit manipulation instruction is valid for writing to bit 7.

Access: E710CTL is readable/writable in 16-bit units.
E710CTLL and E710CTLH are readable/writable in 8-bit units.

Address: E710CTL : <base_addr> + 00_H,
E710CTLL : <base_addr> + 00_H,
E710CTLH : <base_addr> + 01_H

Value after reset: $001X_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA[1:0]		—	—	ECOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	—
R/W	W*1	W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R	R

Note 1. Reading this bit always returns 0.

Table 29.69 E710CTL Register Contents (1/2)

Bit Position	Bit Name	Function
15, 14	EMCA[1:0]	Access Control 1 and 0 to ECC Mode Select Bit These bits reserve the write trigger to bit 7. The read value is always 0.
13, 12	Reserved	The read value is 0. The write value should be 0.
11	ECOVFF	Error Overflow Detection Flag This flag is set if the second error occurs while any of the error flags (ECER2F and ECER1F) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error. This flag is cleared by an internal reset, an external reset, when through mode is enabled (ECTHM = 1), or setting 1 to the ECER2C and ECER1C bits.
10	ECER2C	2-Bit ECC Error Detection Flag Clear This bit clears the bit 2 (ECER2F) status flag. The read value is always 0, and writing 0 to ECER2C does not change the value. If writing 1 to ECER2C conflicts with the condition for setting bit 2, the former takes priority. Writing 1 to ECER2C while ECER2F is set clears ECER2F.
9	ECER1C	1-Bit ECC Error Detection Flag Clear This bit clears the bit 1 (ECER1F) status flag. The read value is always 0, and writing 0 to ECER1C does not change the internal state. If writing 1 to ECER1C conflicts with the condition for setting bit 1, the former takes priority. Writing 1 to ECER1C while ECER1F is set clears ECER1F.
8	Reserved	The read value is 0. The write value should be 0.

Table 29.69 E710CTL Register Contents (2/2)

Bit Position	Bit Name	Function
7	ECTHM	ECC Function Disable Select Selects the ECC decoding operation. Write access to ECTHM is enabled when the value of bits 15 and 14 is 01_B. Therefore, only the 16-bit manipulation instruction is valid. Setting ECTHM to 1 disables error detection and bit correction. Here, if the data to be output to the peripheral module contains an error, the data is output without bit correction. Setting ECTHM to 1 has no effect on the encoder side. 0: ECC detection and correction enabled. 1: ECC detection and correction disabled.
6	Reserved	The read value is 0. The write value should be 0.
5	EC1ECP	1-Bit ECC Error Correction Enable 0: Enables 1-bit error correction upon error detection. 1: Disables 1-bit error correction upon error detection.
4	EC2EDIC	2-Bit ECC Error Detection Notification Enable 0: When a 2-bit error is detected, the ECM is not notified of the error. 1: When a 2-bit error is detected, the ECM is notified of the error.
3	EC1EDIC	1-Bit ECC Error Detection Notification Enable 0: When a 1-bit error is detected, the ECM is not notified of the error. 1: When a 1-bit error is detected, the ECM is notified of the error.
2	ECER2F	2-Bit ECC Error Detection Flag Indicates that errors have been detected in two bits among bits 0 to 38 of data read from the RAM while error detection is enabled. This bit is read-only. 0: A 2-bit error has not occurred. 1: A 2-bit error has occurred. [Clearing conditions] (1) Reset is applied. (2) 1 is written to ECER2C. (3) ECC detection and correction are disabled (ECTHM = 1).
1	ECER1F	1-Bit ECC Error Detection And Correction Flag Indicates that an error has been detected in one bit among bits 0 to 38 of data read from the RAM while error detection is enabled. This bit is read-only. 0: A 1-bit error has not occurred. 1: A 1-bit error has occurred. [Clearing conditions] (1) Reset is applied. (2) 1 is written to ECER1C. (3) The ECC detection and correction are disabled (ECTHM = 1).
0	ECEMF	ECC Error Message Flag Indicates that the current read data bus contains an error. ECEMF is updated every time RAM data is output. Since the RAM value after a reset is undefined, it is determined to be an error, and thus ECEMF may be set. Therefore, the ECEMF bit value after a reset is undefined. 0: The current read data bus contains no bit errors. 1: The current read data bus contains bit errors. ECEMF remains set as long as RAM data containing a bit error is output with error detection being enabled. [Clearing conditions] (1) ECC detection and correction are disabled (ECTHM = 1). (2) Decoding circuit input data contains no 1-bit errors. ECEMF remains set as long as RAM data containing a bit error is output with error detection being enabled.

(2) E710TMC — ECC test mode control register

E710TMC is a 16-bit register to switch the mode to test mode and controls the mode.

E710TMC can be read and written to using the 16-bit or 8-bit manipulation instruction.

However, only the 16-bit manipulation instruction is valid for writing to bit 7.

Access: E710TMC is readable/writable in 16-bit units.
E710TMCL and E710TMCH are readable/writable in 8-bit units.

Address: E710TMC: <base_addr> + 04_H,
E710TMCL : <base_addr> + 04_H,
E710TMCH : <base_addr> + 05_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA[1:0]		—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W*1	W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. Reading this bit always returns 0.

Table 29.70 E710TMC Register Contents

Bit Position	Bit Name	Function
15, 14	ETMA[1:0]	Access Control 1 and 0 to ECC Test Mode Control Enable Bit These bits reserve the write trigger to bit 7. The read value is always 0.
13 to 8	Reserved	The read value is 0. The write value should be 0.
7	ECTMCE	ECC Test Mode Enable ECTMCE enables or disables access to the test registers and test control bits. Access to ETCMCE is enabled when the value of bits 15 and 14 is 10_B. 0: Disables access to the test registers and test control bits. 1: Enables access to the test registers and test control bits.
6, 5	Reserved	The read value is 0. The write value should be 0.
4	ECTRRS	ECC RAM Read Test Mode Select ECTRRS enables the external read status of RAM to be generated by reading the E710TED register, and also allows the RAM output data to be read when the E710TRC.ECERDB[7:0] bits and the E710TED register are read. Write access to ECTRRS is enabled only when ECTMCE is 1 (can be set simultaneously). ECTRRS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Disables generation of RAM read status for testing when E710TED is read. 1: Enables generation of RAM read status for testing when E710TED is read. When E710TRC.ECERDB[7:0] and E710TED are read, the values of the RAM output data pin are read.
3	ECREOS	ECC Redundant Bit Output Data Select ECREOS selects either the ECC encoder output data or the ECERDB register value to be output as the ECC redundant bit output. Write access to ECREOS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREOS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows encoding result to be output as the ECC redundant bit output. 1: Allows the E710TRC.ECERDB[6:0] value to be output as the ECC redundant bit output.
2	ECENS	ECC Encoder Input Select ECENS selects either the data value from the peripheral module or the internal test register value (E710TED.ECEDB[31:0]) as the input signal to be encoded. Write access to ECENS is enabled only when ECTMCE is 1 (can be set simultaneously). ECENS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows the RAM write data from the peripheral module to be input as the ECC encoder input data. 1: Allows the E710TED.ECEDB[31:0] value to be input as the ECC encoder input data.
1	ECDCS	ECC Decoder Input Select ECDCS selects either the lower 32-bit data value from the RAM or the internal test register value (E710TED.ECEDB[31:0]) as the lower 32-bit data of the input signal to be decoded. Write access to ECDCS is enabled only when ECTMCE is 1 (can be set simultaneously). ECDCS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows the lower 32-bit RAM output data to be input to the data area (32 lower-order bits) to the decoder. 1: Allows the E710TED.ECEDB[31:0] value to be input to the data area to the decoder.
0	ECREIS	ECC Redundant Bit Input Data Select ECREIS selects either the upper 7-bit data value from the RAM (redundant bit area) or the test register value (E710TRC.ECERDB[6:0]) as the upper 7-bit data of the input signal to be decoded. Write access to ECREIS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREIS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows the upper 7-bit RAM output data to be input to the ECC redundant bit area to the decoder. 1: Allows the E710TRC.ECERDB[6:0] value to be input to the ECC redundant bit area to the decoder.

(3) E710TED — ECC encoder and decoder data test register

E710TED is a 32-bit data test register for ECC encoding and decoding.

When ECTMCE = 1, E710TED can be read and written to using the 32-bit manipulation instruction.

When ECTMCE = 0, E710TED is always read as 0.

In test mode, the E710TED value can be used as the input data to the encoding circuit and decoding circuit.

Access: E710TED is readable/writable in 32-bit units.

Address: E710TED: <base_addr> + $0C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEDB[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEDB[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1	R/W *1

Note 1. When ECTMCE = 0, the read value is always 0. When writing, write 0.

NOTE

Changing ECTMCE from 1 to 0 resets E710TED synchronously.

When E710TMC:ECENS = 1, the value of this register is input to the encoding circuit and supplied to the RAM.

When E710TMC:ECDCS = 1, the value of this register is input as the bits 31-0 of the input data to the decoding circuit.

When E710TMC:ECTRRS = 1, reading this register returns the RAM output data instead of the data written to this register

(4) E710TRC — ECC redundant bit data control test register

E710TRC is a 32-bit test register consisting of four fields (ECSYND, ECHORD, ECECRD, and ECERDB) corresponding to the ECC redundant bit area. Each field can be accessed as the 8-bit register with the same name. For details of each field, refer to the descriptions of these four registers.

Access: ECSYND, ECHORD, ECECRD, and ECERDB are simultaneously accessible by E710TRC in 32-bit units.

Address: E710TRC: <base_addr> + 08_H

Value after reset: See the descriptions of each register ECSYND, ECHORD, ECECRD, and ECERDB.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECSYND								ECHORD							
Value after reset:	*1	*1	*1	*1	*1	*1	*1	*1	*2	*2	*2	*2	*2	*2	*2	*2
R/W	*1	*1	*1	*1	*1	*1	*1	*1	*2	*2	*2	*2	*2	*2	*2	*2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECECRD								ECERDB							
Value after reset:	*3	*3	*3	*3	*3	*3	*3	*3	*4	*4	*4	*4	*4	*4	*4	*4
R/W	*3	*3	*3	*3	*3	*3	*3	*3	*4	*4	*4	*4	*4	*4	*4	*4

Note 1. See the description of the ECSYND register.

Note 2. See the description of the ECHORD register.

Note 3. See the description of the ECECRD register.

Note 4. See the description of the ECERDB register.

NOTE

Changing ECTMCE from 1 to 0 resets E710TRC synchronously.

(5) ECSYND — ECC decoder syndrome data register

ECSYND is a read-only register to confirm the syndrome code generated by the decoding circuit in test mode (ECTMCE = 1).

Write access to ECSYND is ignored.

Access: E710TRC (.ECSYND) is readable/writable in 32-bit units.
(ECSYND as a single register is readable in 8-bit units.)

Address: E710TRC (.ECSYND): <base_addr> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24
	—	SYND[6:0]						
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

When read, the ECSYND bits return the value of the syndrome code (synd[6:0]) generated based on the input data to the decoding circuit.

The ECSYND bits are not holding circuits; the register value changes as the input signal changes.

ECSYND is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 31 is a reserved bit. It is always read as 0 and the write value should be 0.

(6) ECHORD — ECC -bit redundant bit data holding test register

ECHORD holds the 7-bit ECC redundant area (higher-order 7 bits of RAM data), which cannot be confirmed by the peripheral module, when the peripheral module accesses the RAM for reading in test mode (ECTMCE = 1).

Access: E710TRC (.ECHORD) is readable/writable in 32-bit units.
(ECHORD as a single register is readable in 8-bit units.)

Address: E710TRC (.ECHORD): <base_addr> + 08_H

Value after reset: 0000 0000_H

Bit	23	22	21	20	19	18	17	16
	—	HORD[6:0]						
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

The ECHORD bits are loaded with the higher-order 7 bits of RAM output data at the next rising edge of the operating clock signal after the peripheral module accesses the RAM for reading data in test mode (ECTMCE = 1).

The ECHORD bits are also loaded with the higher-order 7 bits of RAM output data at the next rising edge of the operating clock signal when the ECEDB[15:0] bits are read while E710TMC.ECTRRS = 1.

ECHORD is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 23 is a reserved bit. It is always read as 0 and the write value should be 0.

(7) ECECRD — ECC encode test register

ECECRD is a read-only register to read the 7-bit redundant section generated by the encoding circuit in test mode (ECTMCE = 1).

Access: E710TRC (.ECECRD) is readable/writable in 32-bit units.
(ECECRD as a single register is readable in 8-bit units.)

Address: E710TRC (.ECECRD): <base_addr> + 08_H

Value after reset: 0000 0000_H

Bit	15	14	13	12	11	10	9	8
	—	ECRD[6:0]						
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

ECECRD is used to confirm the redundant bits generated by the input data from the peripheral module.

The read data is the result of encoding (ecc[6:0]). It is not in the output value.

ECECRD is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 15 is a reserved bit. It is always read as 0 and the write value should be 0.

(8) ECERDB — ECC redundant bit input and output substitution buffer register

ECERDB is a buffer register for the data that substitutes for the input and output data for the 7-bit ECC redundant data area in test mode (ECTMCE = 1).

ECERDB can be read and written to in ECC test mode (ECTMCE = 1).

Access: E710TRC (.ECERDB) readable/writable in 32-bit units.
(ECERDB as a single register is readable/writable in 8-bit units.)

Address: E710TRC (.ECERDB): <base_addr> + 08_H

Value after reset: $0000\ 0000_H$

Bit	7	6	5	4	3	2	1	0
	—	ERDB[6:0]						
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When ECREOS = 1, the ECERDB value, instead of the seven redundant bits generated by the encoding circuit, is output to the pin to be supplied to the RAM.

When ECREIS = 1, the ECERDB value, instead of the higher-order seven data bits to be input to the decoding circuit, is handled by the decoding circuit.

When ECTRRS = 1, reading ECERDB returns the signal value supplied to RAM instead of the data written to ECERDB.

Bit 7 is a reserved bit. It is always read as 0 and the write value should be 0.

(9) E710EAD — ECC error address register

E710EAD is a read-only register to hold the address at which an ECC error has occurred.

If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in E710EAD as the address at which the ECC error has occurred.

The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored.

Only one address can be held in E710EAD.

Access: E710EAD is readable in 32-bit units.

Address: E710EAD: <base_addr> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

29.2.8.4 Notification to ECM

This module can detect two error signals through programming. The ECM is notified of the detected error.

- 1-bit error notification

  If an error is detected in one bit among bits 0 to 38 of data read from the RAM while 1-bit error notification is enabled (EC1EDIC = 1_B), the 1-bit error is indicated. However, it will not be indicated if ECER1F or ECER2F is already set.

- 2-bit error notification

  If errors are detected in two bits among bits 0 to 38 of data read from the RAM while 2-bit error notification control is enabled (EC2EDIC = 1_B), the 2-bit error is indicated. However, it will not be indicated if ECER2F is already set.

29.2.8.5 Test Function

(1) Writing to RAM data

Write data to the peripheral RAM. However, the ECC corresponding to the written data will be written to the ECC bits simultaneously. In order to write a specified value to the ECC bits, use the ECC test mode described in (3) below.

(2) Reading RAM data

1. Set the ECTHM bit in the ECC control register to 1 to disable ECC error detection and correction.
2. Read the peripheral RAM. Since neither error detection nor correction proceeds when the peripheral RAM is read, the RAM data is read unchanged.

How to exit this test mode:

3. Set the ECTHM bit in the ECC control register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC bits

1. Set the ECTMCE bit in the ECC test mode control register to 1 to set ECC test mode.
2. Write the value for writing to the ECC bits to the E710TRC.ECERDB[6:0] bits.
3. Set the ECREOS bit in the ECC test mode control register to 1 to select writing of the value of the E710TRC.ECERDB[6:0] bits to the ECC bits.
4. When data are written to the peripheral RAM, the value in the E710TRC.ECERDB[6:0] bits will be written to the ECC bits.

How to exit this test mode:

5. Set the ECTMCE bit in the ECC test mode control register to 0 to set normal mode.

(4) Reading the ECC bits

1. Set the ECTMCE bit in the ECC test mode control register to 1 to set ECC test mode.
2. When data in the peripheral RAM is read, the ECC bits are stored in the E710TRC.ECHORD[6:0] bits.

How to exit this test mode:

3. Set the ECTMCE bit in the ECC test mode control register to 0 to set normal mode.

29.2.9 Data Parity for Data Transfer Path

The following shows the transfer paths to which data parity is applied. Data parity errors can be detected during data transfer from the access sources to destinations shown below. If a parity error is detected in any of the paths, the error is notified to the ECM.

Table 29.71 Transfer Path to which Data Parity is Applied

Access Source (Master)	Access Destination (Slave)
CPU1, CPU2, SubCPU, DMAC, DTS	INTC2, INTIF, EINT, EMUEINT, DMAC, DTS, CSIH, ADCC, RDC3A, Port group, DNF, RSENT
DMAC, DTS	Local RAM and global RAM of CPU1, CPU2, and SubCPU
CPU1, CPU2, SubCPU	Local RAM of other cores
SubCPU	Global RAM

When a data parity error occurs during read operation, error data is returned to each master. When a data parity error occurs during write operation, the write operation is cancelled if the slave is INTC2, INTIF, EINT, EMUEINT, ADC, RDC3A, DNF, or RSENT.

Some of the parity-applied modules have the control registers in the parity controllers (encoder and decoder), which can hold status upon detection of an error. If a parity error is detected in these modules, it is possible to identify the access that caused the error.

On the other hand, parity controllers which do not have control registers always perform parity detection. Though the status upon detection of an error is not retained in these controllers, whether an error has been detected or not is retained in the ECM.

29.2.9.1 List of Registers

Table 29.72 List of Registers

Module Name	Register Name	Symbol	Address
APDP	P-Bus data parity status register xx	APDPERRST_xx	<base_addr> + 0_H
APDP	P-Bus data parity status clear register xx	APDPERRSTC_xx	<base_addr> + 4_H
APDP	P-Bus data parity test mode control register xx	APDPTMC_xx	<base_addr> + 8_H
APDP	P-Bus data parity error address register xx	APDPERRADR_xx	<base_addr> + C_H

The suffix after each symbol in the above table indicates a parity-applied module for which the control register is provided. The table below shows the parity-applied modules and base addresses <base_addr>.

Table 29.73 List of Data Parity Control Modules

xx	Module to which Parity is Applied	Base Address <base_addr>
INTC2	INTC2	FFC6 8800$_H$
EINT	EINT	FFC8 6000$_H$
EMUEINT	EMUEINT	FFC8 6020$_H$
INTIF	INTIF	FFF9 9000$_H$
PDMA	DMA_DTS	FFC6 8900$_H$
SNT0	RSENT0	FFDC_2100$_H$
SNT1	RSENT1	FF7C_2120$_H$
SNT2	RSENT2	FFDC_2140$_H$
SNT3	RSENT3	FF7C_2160$_H$
CS0A	CSIH0 (group A)*1	FFF9 6000$_H$
CS0B	CSIH0 (group B)*1	FFF9 6020$_H$
CS1A	CSIH1 (group A)*1	FFF9 6040$_H$
CS1B	CSIH1 (group B)*1	FFF9 6060$_H$
CS2A	CSIH2 (group A)*1	FFF9 6080$_H$
CS2B	CSIH2 (group B)*1	FFF9 60A0$_H$
ADC0	ADCC0	FFC8 8000$_H$
ADC1	ADCC1	FF68 8020$_H$
ADC2	ADCC2	FFC8 8040$_H$
PT	Port group	FFC8 5000$_H$
DNF0	DNF0	FFC8 50C0$_H$
DNF1	DNF1	FFC8 50E0$_H$
DNF2	DNF2	FFC8 5100$_H$
DNF3	DNF3	FFC8 5120$_H$
DNF4	DNF4	FFC8 5140$_H$
DNF5	DNF5	FFC8 5160$_H$
DNF6	DNF6	FFC8 5180$_H$
DNF7	DNF7	FFC8 51A0$_H$
DNF8	DNF8	FFC8 51C0$_H$
RDC3A0	RDC3A0	FFFA 2000$_H$
RDC3A1	RDC3A1	FFFA 2020$_H$

Note 1. Each CSIHx register is divided into two groups and they are controlled separately.
Group A: CSIHnCTL0 to 2, CSIHnSTR0, and CSIHnSTCR0
Group B: Other than above.

29.2.9.2 Details of Registers

(1) APDPERRST_xx — P-bus data parity status register

For the suffix “xx”, see **Table 29.73 List of Data Parity Control Modules**.

Access: APDPERRST_xx is readable in 32-bit units.
APDPERRST_xxL is readable in 16-bit units.
APDPERRST_xxLL is readable in 8-bit units.

Address: <base_addr> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	APDPERR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.74 APDPERRST Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	The read value is 0. The write value should be 0.
0	APDPERR	Data Parity Error Monitor Flag Indicates occurrence of the parity error. APDPERR is cleared by setting the data parity error monitor flag clear bit (APDPERRC) to 1. 0: Indicates that a parity error has not occurred. 1: Indicates that a parity error has occurred.

(2) APDPERRSTC_xx — P-bus data parity status clear register

For the suffix “xx”, see **Table 29.73 List of Data Parity Control Modules**.

Access: APDPERRSTC_xx is writable in 32-bit units.
APDPERRSTC_xxL is writable in 16-bit units.
APDPERRSTC_xxLL is writable in 8-bit units.

Address: <base_addr> + 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	APDPERRC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 29.75 APDPERRSTC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	The read value is 0. The write value should be 0.
0	APDPERRC	Clears the data parity error monitor flag (APDPERR). Writing 1 to this bit with the APDPERR bit set clears APDPERR. This bit is always read as 0.

(3) APDPTMC_xx — P-bus data parity test mode control register

Set the APDPTMC[1:0] bits to 01_B when writing to this register.

For the suffix "xx", see **Table 29.73 List of Data Parity Control Modules**.

Access: APDPTMC_xx is readable/writable in 32-bit units.
APDPTMC_xxL is readable/writable in 16-bit units.

Address: <base_addr> + 08_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	APDPTMC[1:0]		—	—	—	—	—	—	—	—	—	—	APDPEIC3	APDPEIC2	APDPEIC1	APDPEIC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 29.76 APDPTMC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	The read value is 0. The write value should be 0.
15, 14	APDPTMC[1:0]	Data Parity Test Mode Control Setting APDPTMC[1:0] to 01_B enables write accesses to the error insertion control bits 3 to 0 (APDPEIC3 to APDPEIC0). When APDPTMC[1:0] are not 01_B, APDPEIC3 to APDPEIC0 are not written to even though a write access is attempted. These bits are always read as 0.
13 to 4	Reserved	The read value is 0. The write value should be 0.
3	APDPEIC3	Byte-Lane 3 Error Insertion Control Changes the type of the parity bit generation and check for byte-lane 3 (bits 31 to 24) to odd parity. 0: Parity bit generation and check is performed with even parity. 1: Parity bit generation and check is performed with odd parity. (Error insertion)
2	APDPEIC2	Byte-Lane 2 Error Insertion Control Changes the type of the parity bit generation and check for byte-lane 2 (bits 23 to 16) to odd parity. 0: Parity bit generation and check is performed with even parity. 1: Parity bit generation and check is performed with odd parity. (Error insertion)
1	APDPEIC1	Byte-Lane 1 Error Insertion Control Changes the type of the parity bit generation and check for byte-lane 1 (bits 15 to 8) to odd parity. APDPEIC1 can be written to when APDPTMC[1:0] = 01_B. 0: Parity bit generation and check is performed with even parity. 1: Parity bit generation and check is performed with odd parity. (Error insertion)
0	APDPEIC0	Byte-Lane 0 Error Insertion Control Changes the type of the parity bit generation and check for byte-lane 0 (bits 7 to 0) to odd parity. APDPEIC0 can be written to when APDPTMC[1:0] = 01_B 0: Parity bit generation and check is performed with even parity. 1: Parity bit generation and check is performed with odd parity. (Error insertion)

(4) APDPERRADR_xx — P-bus data parity error address register

For the suffix “xx”, see **Table 29.73 List of Data Parity Control Modules**.

Access: APDPERRADR_xx is readable in 32-bit units.

Address: <base_addr> + $0C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	APDPERRADR[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	APDPERRADR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.77 APDPERRADR Register Contents

Bit Position	Bit Name	Function
31 to 0	APDPERRADR [31:0]	Data Parity Error Address Holds the address at which the first parity error has occurred while the data parity error monitor flag (APDPAERR) is not set. The retained information is not updated even though the next parity error occurs while DPAERR is set.

29.3 Lockstep

This product incorporates CPU1 with the lockstep function to quickly detect CPU failures without special software. CPU1 executes the program using two different cores, that is, master core and checker core, and constantly compares the execution results of the two cores. When the results do not agree, the CPU1 determines that an error has occurred in one of the cores, and notifies the lock step error to the ECM.

Bus outputs to be compared are outputs to the local RAM for CPU1, global RAM, a CPU peripheral, interconnect, the P-bus, code flash memory, and the tag RAM and data RAM of the instruction cache.

The lockstep function of the CPU1 features failure insertion, with which errors can be intentionally caused and thus self-diagnosis of the lockstep operation is possible. Also, when a lockstep compare error occurred, the address and the data of the error are captured by a specified register.

29.3.1 List of Registers

Table 29.78 List of Registers

Module Name	Register Name	Symbol	Address
TESTCOMP	Comparator test register 0	TESTCOMPREG0	FFFE ED00$_H$
TESTCOMP	Comparator test register 1	TESTCOMPREG1	FFFE ED04$_H$
TESTCOMP	Lockstep error control register	LS_ERR_CNT	FFFE EE00$_H$
TESTCOMP	Lockstep error status register	LS_ERR_ST	FFFE EE04$_H$
TESTCOMP	Lockstep error address register	LS_ERR_ADDRESS	FFFE EE10$_H$
TESTCOMP	Lockstep error data register	LS_ERR_DATA	FFFE EE14$_H$

These registers are placed in the CPU Peripheral of CPU1. These registers can only be accessed by CPU1.

29.3.2 Details of Registers

29.3.2.1 TESTCOMPREG0 — Comparator test register 0

TESTCOMPREG0 is a test register 0 used for the lockstep function of CPU1.

In combination with TESTCOMPREG1, TESTCOMPREG0 enables self-diagnosis of the lockstep function. The following gives an example of self-diagnosis procedure.

(1) Write arbitrary value to TESTCOMPREG0.

(2) Write a different value to TESTCOMPREG1.

(3) Read TESTCOMPREG0. The different values are read and sent to the master core and checker core.

(4) Using the values read, run the comparator to be diagnosed.

Access: TESTCOMPREG0 is readable/writable in 32-bit units.
TESTCOMPREG0L and TESTCOMPREG0H are readable/writable in 16-bit units.
TESTCOMPREG0LL, TESTCOMPREG0LH, TESTCOMPREG0HL, and TESTCOMPREG0HH are readable/writable in 8-bit units.

Address: TESTCOMPREG0 : FFFE ED00$_H$,
TESTCOMPREG0L: FFFE ED00$_H$, TESTCOMPREG0H: FFFE ED02$_H$,
TESTCOMPREG0LL: FFFE ED00$_H$, TESTCOMPREG0LH: FFFE ED01$_H$,
TESTCOMPREG0HL: FFFE ED02$_H$, TESTCOMPREG0HH: FFFE ED03$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TESTCOMPREG0[31:16]

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TESTCOMPREG0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.79 TESTCOMPREG0 Register Contents

Bit Position	Bit Name	Function
31 to 0	TESTCOMPREG0[31:0]	Write: Data is written to each byte. Read: PE1: TESTCOMPREG0[31:0] value is read. PE1C: TESTCOMPREG1[31:0] value is read.

29.3.2.2 TESTCOMPREG1 — Comparator test register 1

TESTCOMPREG1 is a test register 1 used for the lockstep function of CPU1.

In combination with TESTCOMPREG0, TESTCOMPREG1 enables self-diagnosis of the lockstep function.

Access: TESTCOMPREG1 is readable/writable in 32-bit units.
TESTCOMPREG1L and TESTCOMPREG1H are readable/writable in 16-bit units.
TESTCOMPREG1LL, TESTCOMPREG1LH, TESTCOMPREG1HL, and TESTCOMPREG1HH are readable/writable in 8-bit units.

Address: TESTCOMPREG1 : FFFE ED04H,
TESTCOMPREG1L: FFFE ED04H, TESTCOMPREG1H: FFFE ED06H,
TESTCOMPREG1LL: FFFE ED04H, TESTCOMPREG1LH: FFFE ED05H,
TESTCOMPREG1HL: FFFE ED06H, TESTCOMPREG1HH: FFFE ED07H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TESTCOMPREG1[31:16]

Table 29.80 TESTCOMPREG1 Register Contents

Bit Position	Bit Name	Function
31 to 0	TESTCOMPREG1 [31:0]	Write: Data is written to each byte. Read: PE1: TESTCOMPREG1[31:0] value is read. PE1C: TESTCOMPREG0[31:0] value is read

29.3.2.3 LS_ERR_CNT — Lockstep error control register

LS_ERR_CNT enables or disables capturing of the address at which a lockstep error has occurred and the data which contains the error. Depending on the destination of access by the CPU, the error information is captured in the corresponding bit of this register.

Access: LS_ERR_CNT is readable/writable in 32-bit units.

Address: LS_ERR_CNT : FFFE EE00$_H$

Value after reset: 0000 000F$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	L1RAM	L2RAM	GAPB	LAPB
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 29.81 LS_ERR_CNT Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	The read value is 0. The write value should be 0.
3	L1RAM	Enables or disables capturing of the address in the local RAM at which a lockstep error has occurred and the data which contains the error. 0: Capturing is disabled. 1: Capturing is enabled.
2	L2RAM	Enables or disables capturing of the address in the global RAM at which a lockstep error has occurred and the data which contains the error. 0: Capturing is disabled. 1: Capturing is enabled.
1	GAPB	Enables or disables capturing of the address at which a lockstep error has occurred and the data which contains the error in an access through P-bus*1. 0: Capturing is disabled. 1: Capturing is enabled.
0	LAPB	Enables or disables capturing of the address at which a lockstep error has occurred and the data which contains the error in an access to IPIR or MEV*1 0: Capturing is disabled. 1: Capturing is enabled.

Note 1. For access configuration of P-bus, IPIR, and MEV, see **Section 3, CPU System**.

29.3.2.4 LS_ERR_ST — Lockstep error status register

LS_ERR_ST monitors the first lockstep error. As long as the error flag for the first error remains uncleared, the error flags for the subsequent errors will not be set to 1. If two or more error sources are generated at the same time, the error flag will be set in the flags L1RAMW0 to 3, L2RAMP0 to 1, GAPB, and LAPB, in this order. These flags are cleared by an internal reset, an external reset, or writing 1 to this register.

Access: LS_ERR_ST is readable/writable in 32-bit units.

Address: LS_ERR_ST : FFFE EE04$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	L1RAMW0	L1RAMW1	L1RAMW2	L1RAMW3	L2RAMP0	L2RAMP1	GAPB	LAPB
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.82 LS_ERR_ST Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The read value is 0. The write value should be 0.
7	L1RAMW0	Indicates whether or not the information (address and data) in word 0 of the local RAM has been captured as the source of the lockstep error. This flag is cleared by writing 1 to this bit. 0: No information has been captured. 1: Information has been captured.
6	L1RAMW1	Indicates whether or not the information (address and data) in word 1 of the local RAM has been captured as the source of the lockstep error. This flag is cleared by writing 1 to this bit. 0: No information has been captured. 1: Information has been captured.
5	L1RAMW2	Indicates whether or not the information (address and data) in word 2 of the local RAM has been captured as the source of the lockstep error. This flag is cleared by writing 1 to this bit. 0: No information has been captured. 1: Information has been captured.
4	L1RAMW3	Indicates whether or not the information (address and data) in word 3 of the local RAM has been captured as the source of the lockstep error. This flag is cleared by writing 1 to this bit. 0: No information has been captured. 1: Information has been captured.
3	L2RAMP0	Indicates whether or not the information (address and data) in the lower-order bits of the global RAM has been captured as the source of the lockstep error. This flag is cleared by writing 1 to this bit. 0: No information has been captured. 1: Information has been captured.
2	L2RAMP1	Indicates whether or not the information (address and data) in the higher-order bits of the global RAM has been captured as the source of a lockstep error. This flag is cleared by writing 1 to this bit. 0: No information has been captured. 1: Information has been captured.
1	GAPB	Indicates whether or not the information (address and data) has been captured as the source of a lockstep error in an access through P-bus*1. This flag is cleared by writing 1 to this bit. 0: No information has been captured. 1: Information has been captured.
0	LAPB	Indicates whether or not the information (address and data) has been captured as the source of a lockstep error in an access to IPIR or MEV*1. This flag is cleared by writing 1 to this bit. 0: No information has been captured. 1: Information has been captured.

Note 1. For access configuration of P-bus, IPIR, and MEV, see **Section 3, CPU System**.

29.3.2.5 LS_ERR_ADDRESS — Lockstep error address register

LS_ERR_ADDRESS holds the address at which an error occurred. The address of the error source corresponding to the error flag of LS_ERR_ST which has been set is held in this register.

Access: LS_ERR_ADDRESS is readable in 32-bit units.

Address: LS_ERR_ADDRESS : FFFE EE10H

Value after reset: — (retained)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 29.83 LS_ERR_ADDRESS Register Contents

Bit Position	Bit Name	Function
31 to 0	Address[31:0]	Monitors the address at which a lockstep error has occurred. The following shows the valid bits of each flag when the corresponding address is captured and how to change the address of each to real address. 0 is stored in invalid bits. L1RAMW0: Local RAM base_address + (Address [14:0]<<4) L1RAMW1: Local RAM base_address + (Address [14:0]<<4) + 0x4 L1RAMW2: Local RAM base_address + (Address [14:0]<<4) + 0x8 L1RAMW3: Local RAM base_address + (Address [14:0]<<4) + 0xC L2RAMP0: Global RAM_base_address + Address [20:0] L2RAMP1: Global RAM_base_address + Address [20:0] + 0x4 GAPB: Address [31:0] LAPB: 0xFF000000 + Address [23:0]

29.3.2.6 LS_ERR_DATA — Lockstep error data register

LS_ERR_DATA_L holds the data which contains an error. The data which contain the error from the error source corresponding to the error flag of LS_ERR_ST which has been set is held in this register.

Access: LS_ERR_DATA is readable in 32-bit units.

Address: LS_ERR_DATA : FFFE EE14H

Value after reset: — (retained)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA [31:16]															
Value after reset:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA [15:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.84 LS_ERR_DATA Register Contents

Bit Position	Bit Name	Function
31 to 0	DATA [31:0]	Monitors the data bits [31:0] which contains a lockstep error.

29.4 Memory Protection

29.4.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU :

  CPU1, CPU2, and SubCPU protect memories against illegal accesses from themselves. Accesses to addresses that are prohibited by the MPU are never issued by the CPU1, CPU2, or SubCPU. For details, refer to the *H850 Family User's Manual: Software*.

- Slave Guard: A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.
  - PEG:

    The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see **Section 3, CPU System**.
  - IPG (Internal Peripheral device Guard): The CPU Peripheral is protected against illegal accesses. For details, see **Section 3, CPU System**.
  - GRG : The global RAM is protected against illegal accesses.
  - PBG: The control registers in the peripheral circuits and memories are protected against illegal accesses. For details, see **Section 29.4.3, PBG**.

29.4.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.

Table 29.85 Identifiers for Slave Guard

Identifier	Function
UM	When the CPU makes an access, the operating mode of the CPU is indicated. 0: Supervisor mode 1: User mode When the DMAC or DTS makes an access, the value of this identifier is the value in the channel master setting register. When the other master makes an access, the value of this identifier is always 0.
SPID	When the CPU makes an access, the system protection identifier SPID that is assigned to the CPU is indicated. When the DMAC or DTS makes an access, the value of this identifier is the value in the channel master setting register.When the other master makes an access, the value of this identifier is always 00_B.
PEID	The access source bus master is indicated. 000_B: Reserved 001_B: CPU1 010_B: CPU2 011_B: SubCPU 100_B: Reserved 101_B: Reserved 110_B: Reserved 111_B: DMAC/DTS

29.4.2 GRG (Global RAM Guard)

This product is provided with 8-channel GRG, which is described in detail in the following sections.

29.4.2.1 List of Registers

Table 29.86 List of Registers (1/2)

Module Name	Register Name	Symbol	Address
MGDGR	GRG control register (SIC)	MGDGRSCTL_SIC	FFC4 9100$_H$
MGDGR	GRG error status register (SIC)	MGDGRSSTAT_SIC	FFC4 9104$_H$
MGDGR	GRG error address register (SIC)	MGDGRSAD_SIC	FFC4 9108$_H$
MGDGR	GRG error access type register (SIC)	MGDGRSTYPE_SIC	FFC4 910C$_H$
MGDGR	GRG control register (PE1)	MGDGRSCTL_PE1	FFC4 9200$_H$
MGDGR	GRG error status register (PE1)	MGDGRSSTAT_PE1	FFC4 9204$_H$
MGDGR	GRG error address register (PE1)	MGDGRSAD_PE1	FFC4 9208$_H$
MGDGR	GRG error access type register (PE1)	MGDGRSTYPE_PE1	FFC4 920C$_H$
MGDGR	GRG control register (PE2)	MGDGRSCTL_PE2	FFC4 9300$_H$
MGDGR	GRG error status register (PE2)	MGDGRSSTAT_PE2	FFC4 9304$_H$
MGDGR	GRG error address register (PE2)	MGDGRSAD_PE2	FFC4 9308$_H$

MGDGR	GRG compare base address register 4	MGDGRBAD4	FFC4 9448$_H$
MGDGR	GRG valid compare address register 4	MGDGRADV4	FFC4 944C$_H$
MGDGR	GRG protection setting register 5	MGDGRPROT5	FFC4 9450$_H$
MGDGR	GRG protection SPID setting register 5	MGDGRSPID5	FFC4 9454$_H$
MGDGR	GRG compare base address register 5	MGDGRBAD5	FFC4 9458$_H$
MGDGR	GRG valid compare address register 5	MGDGRADV5	FFC4 945C$_H$
MGDGR	GRG protection setting register 6	MGDGRPROT6	FFC4 9460$_H$
MGDGR	GRG protection SPID setting register 6	MGDGRSPID6	FFC4 9464$_H$
MGDGR	GRG compare base address register 6	MGDGRBAD6	FFC4 9468$_H$
MGDGR	GRG valid compare address register 6	MGDGRADV6	FFC4 946C$_H$
MGDGR	GRG protection setting register 7	MGDGRPROT7	FFC4 9470$_H$
MGDGR	GRG protection SPID setting register 7	MGDGRSPID7	FFC4 9474$_H$
MGDGR	GRG compare base address register 7	MGDGRBAD7	FFC4 9478$_H$
MGDGR	GRG valid compare address register 7	MGDGRADV7	FFC4 947C$_H$

- MGDGRPROTn, MGDGRSPIDn , MGDGRBADn, and MGDGRADVn set the protection specifications for each channel (n = 0 to 7).
- MGDGRSCTL_*, MGDGRSSTAT_*, MGDGRSAD_*, and MGDGRSTYPE_* indicate error information on each access port. "_SIC" represents access from the system interconnect to the global RAM, "_PE1" represents access from CPU1 to the global RAM, and "_PE2" represents access from CPU2 to the global RAM. Access from the SubCPU to the global RAM is made via the system interconnect.
- An access to the reserved areas shown below is notified as an error and the ERR bit of MGDGRSSTAT_* is set to 1. The concerned address is stored in the GRIFA bits of MGDGRSAD_*.

  C1M-A2: FEE0_0000$_H$ to FEEE_FFFF$_H$ and FEF1_0000$_H$ to FEFF_FFFF$_H$

  C1M-A1: FEE0_0000$_H$ to FEEE_FFFF$_H$ and FEF0_0000$_H$ to FEFF_FFFF$_H$

29.4.2.2 Details of Registers

(1) MGDGRSCTL_SIC/PE1/PE2 — GRG control register

Access: MGDGRSCTL_SIC, MGDGRSCTL_PE1, and MGDGRSCTL_PE2 are readable/writable in 32-bit units.
MGDGRSCTL_SICL, MGDGRSCTL_PE1L, and MGDGRSCTL_PE2L are readable/writable in 16-bit units.
MGDGRSCTL_SICLL, MGDGRSCTL_PE1LL, and MGDGRSCTL_PE2LL are readable/writable in 8-bit units.

Address: MGDGRSCTL_SIC : FFC4 9100$_H$, MGDGRSCTL_PE1 : FFC4 9200$_H$,
MGDGRSCTL_PE2 : FFC4 9300$_H$,
MGDGRSCTL_SICL : FFC4 9100$_H$, MGDGRSCTL_PE1L : FFC4 9200$_H$,
MGDGRSCTL_PE2L : FFC4 9300$_H$,
MGDGRSCTL_SICLL : FFC4 9100$_H$, MGDGRSCTL_PE1LL : FFC4 9200$_H$,
MGDGRSCTL_PE2LL : FFC4 9300$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERRCLO	ERRCLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 29.87 MGDGRSCTL_SIC/PE1/PE2

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are always read as 0. The write value should be 0.
1	ERRCLO	Error Entry Overflow Flag Clear 0: Not used. 1: Clears the overflow flag.
0	ERRCLE	Error Detection Flag Clear 0: Not used. 1: Clears the error detection flag. Set this bit simultaneously with ERRCLO as shown below.

Table 29.88 Combinations of Values in ERRCLO and ERRCLE

ERRCLO	ERRCLE	Function
0	0	No bit will be cleared.
0	1	No bit will be cleared. (This setting is ignored.)
1	0	The OVF bit is cleared.
1	1	Both OVF and ERR bits are cleared.

(2) MGDGRSSTAT_SIC/PE1/PE2 — GRG error status register

Access: MGDGRSSTAT_SIC, MGDGRSSTAT_PE1, and MGDGRSSTAT_PE2 are readable in 32-bit units.
MGDGRSSTAT_SICL, MGDGRSSTAT_PE1L, and MGDGRSSTAT_PE2L are readable in 16-bit units.
MGDGRSSTAT_SICLL, MGDGRSSTAT_PE1LL, and MGDGRSSTAT_PE2LL are readable in 8-bit units.

Address: MGDGRSSTAT_SIC : FFC4 9104H, MGDGRSSTAT_PE1 : FFC4 9204H,
MGDGRSSTAT_PE2 : FFC4 9304H,
MGDGRSSTAT_SICL : FFC4 9104H, MGDGRSSTAT_PE1L : FFC4 9204H,
MGDGRSSTAT_PE2L : FFC4 9304H,
MGDGRSSTAT_SICLL : FFC4 9104H, MGDGRSSTAT_PE1LL : FFC4 9204H,
MGDGRSSTAT_PE2LL : FFC4 9304H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.89 MGDGRSSTAT_SIC/PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are always read as 0. The write value should be 0.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: Overflow occurred Since the error entry depth of GRG is 1, when another guard violation occurs after the error detection flag was set due to the earlier guard violation, the error entry overflow occurs and this flag is set. Though occurrence of overflow is reported to ECM, guard violation error information is not captured in case of an overflow.
0	ERR	Error Detection Flag 0: No error 1: An error occurred

CAUTION

- An access to the reserved areas shown below is detected as an error and the ERR bit is set to 1.
  C1M-A2: FEE0_0000H to FEEE_FFFFH and FEF1_0000H to FEFF_FFFFH
  C1M-A1: FEE0_0000H to FEEE_FFFFH and FEF0_0000H to FEFF_FFFFH

(3) MGDGRSAD_SIC/PE1/PE2 — GRG error address register

Access: MGDGRSAD_SIC, MGDGRSAD_PE1, and MGDGRSAD_PE2 are readable in 32-bit units.
MGDGRSAD_SICL, MGDGRSAD_PE1L, and MGDGRSAD_PE2L are readable in 16-bit units.
MGDGRSAD_SICLL, MGDGRSAD_PE1LL, and MGDGRSAD_PE2LL are readable in 8-bit units.

Address: MGDGRSAD_SIC : FFC4 9108H, MGDGRSAD_PE1 : FFC4 9208H,
MGDGRSAD_PE2 : FFC4 9308H,
MGDGRSAD_SICL : FFC4 9108H, MGDGRSAD_PE1L : FFC4 9208H,
MGDGRSAD_PE2L : FFC4 9308H,
MGDGRSAD_SICLL : FFC4 9108H, MGDGRSAD_PE1LL : FFC4 9208H,
MGDGRSAD_PE2LL : FFC4 9308H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	GRIFA[20:16]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.90 MGDGRSAD_SIC/PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	These bits are always read as 0. The write value should be 0.
20 to 0	GRIFA[20:0]	These bits hold the address at which an error has occurred.

CAUTION

- An access to the reserved areas shown below is detected as an error and the concerned address is stored in GRIFA.
  C1M-A2: FEE0_0000H to FEEE_FFFFH and FEF1_0000H to FEFF_FFFFH
  C1M-A1: FEE0_0000H to FEEE_FFFFH and FEF0_0000H to FEFF_FFFFH

(4) MGDGRSTYPE_SIC/PE1/PE2 — GRG error access type register

Access: MGDGRSTYPE_SIC, MGDGRSTYPE_PE1, and MGDGRSTYPE_PE2 are readable in 32-bit units.
MGDGRSTYPE_SICL, MGDGRSTYPE_PE1L, and MGDGRSTYPE_PE2L are readable in 16-bit units.
MGDGRSTYPE_SICLL, MGDGRSTYPE_SICLH, MGDGRSTYPE_PE1LL, MGDGRSTYPE_PE1LH , MGDGRSTYPE_PE2LL, and MGDGRSTYPE_PE2LH are readable in 8-bit units.

Address: MGDGRSTYPE_SIC : FFC4 910C$_H$, MGDGRSTYPE_PE1 : FFC4 920C$_H$,
MGDGRSTYPE_PE2 : FFC4 930C$_H$,
MGDGRSTYPE_SICL : FFC4 910C$_H$, MGDGRSTYPE_PE1L : FFC4 920C$_H$,
MGDGRSTYPE_PE2L : FFC4 930C$_H$,
MGDGRSTYPE_SICLL : FFC4 910C$_H$, MGDGRSTYPE_SICLH : FFC4 910D$_H$,
MGDGRSTYPE_PE1LL : FFC4 920C$_H$, MGDGRSTYPE_PE1LH : FFC4 920D$_H$,
MGDGRSTYPE_PE2LL : FFC4 930C$_H$, MGDGRSTYPE_PE2LH : FFC4 930D$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.91 MGDGRSTYPE_SIC/PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. The write value should be 0.
15 to 13	PEID[2:0]	PEID of the error source.
12 to 10	Reserved	The read value is 0. The write value should be 0.
9, 8	SPID[1:0]	SPID of the error source.
7	Reserved	The read value is 0. The write value should be 0.
6	UM	UM of the error source.
5	Reserved	These bits are always read as 0. The write value should be 0.
4 to 0	TYPE[4:0]	(Reference Information) Transfer type at the time of error occurrence These bits hold a signal used for an internal bus or interconnect.

(5) MGDGRPROTn — GRG protection setting register n (n = 0 to 7)

Access: MGDGRPROT0, MGDGRPROT1, MGDGRPROT2, MGDGRPROT3, MGDGRPROT4, MGDGRPROT5, MGDGRPROT6, and MGDGRPROT7 are readable/writable in 32-bit units.
MGDGRPROT0H, MGDGRPROT1H, MGDGRPROT2H, MGDGRPROT3H,
MGDGRPROT4H, MGDGRPROT5H, MGDGRPROT6H, and MGDGRPROT7H are readable/writable in 16-bit units.
MGDGRPROT0HL, MGDGRPROT0HH, MGDGRPROT1HL, MGDGRPROT1HH,
MGDGRPROT2HL, MGDGRPROT2HH, MGDGRPROT3HL, MGDGRPROT3HH,
MGDGRPROT4HL, MGDGRPROT4HH, MGDGRPROT5HL, MGDGRPROT5HH,
MGDGRPROT6HL, MGDGRPROT6HH, MGDGRPROT7HL, and MGDGRPROT7HH are readable/writable in 8-bit units.

Address: MGDGRPROT0 : FFC4 9400H, MGDGRPROT1 : FFC4 9410H, MGDGRPROT2 : FFC4 9420H,
MGDGRPROT3 : FFC4 9430H, MGDGRPROT4 : FFC4 9440H, MGDGRPROT5 : FFC4 9450H,
MGDGRPROT6 : FFC4 9460H, MGDGRPROT7 : FFC4 9470H,

Table 29.92 MGDGRPROTn Register Contents

Bit Position	Bit Name	Function
31	Reserved	These bits are always read as 0. The write value should be 0.
30	EN	Protection Enable 0: Disables protection function. 1: Enables protection function. The setting of this bit covers only the types of access allowed by this register.
29 to 27	Reserved	These bits are always read as 0. The write value should be 0.
26	Reserved	This bit is always read as 1. The write value should be 1.
25	UM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24	DEB	Debug Access 0: Disables access from the debug master. 1: Enables access from the debug master. Be sure to set this bit to 1. If the setting is 0, the debugger or RAM monitor tool may not operate correctly.
23 to 16	PEID[7:0]	PEID Access The PEID field is a bit list, in which one bit corresponds to one PEID value. Setting multiple bits enables multiple ID values simultaneously. For example, setting the PEID field to 0101_B enables access with PEID = 0 and PEID = 2. 0: Disables access with PEID = n. 1: Enables access with PEID = n.
15 to 0	Reserved	These bits are always read as 0. The write value should be 0.

(6) MGDGRSPIDn — GRG protection SPID setting register n (n = 0 to 7)

Access: MGDGRSPIDn is readable/writable in 32-bit units.
MGDGRSPIDnL is readable/writable in 16-bit units.
MGDGRSPIDnLL is readable/writable in 8-bit units.

Address: MGDGRSPID0 : FFC4 9404$_H$, MGDGRSPID1 : FFC4 9414$_H$, MGDGRSPID2 : FFC4 9424$_H$,
MGDGRSPID3 : FFC4 9434$_H$, MGDGRSPID4 : FFC4 9444$_H$, MGDGRSPID5 : FFC4 9454$_H$,
MGDGRSPID6 : FFC4 9464$_H$, MGDGRSPID7 : FFC4 9474$_H$,
MGDGRSPID0L : FFC4 9404$_H$, MGDGRSPID1L : FFC4 9414$_H$, MGDGRSPID2L : FFC4 9424$_H$,
MGDGRSPID3L : FFC4 9434$_H$, MGDGRSPID4L : FFC4 9444$_H$, MGDGRSPID5L : FFC4 9454$_H$,

	ADV[15:9]							—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R

Table 29.95 MGDGRADV n Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	These bits are always read as 0. The write value should be 0.
20 to 9	ADV[20:9]	Bits of addresses corresponding to bits from among MGDGRADVn[20:9] which have the value 1 are compared. When MGDGRADVn[20:9] are all 1, the 512 bytes from the address specified by MGDGRBADn are protected. When MGDGRADVn[20:9] are all 0, the entire global RAM is subject to protection.
8 to 0	Reserved	These bits are always read as 0. The write value should be 0.

Setting example: When MGDGRBADn[20:9] = 800$_H$ and MGDGRADVn[20:9] = FF7$_H$, the global RAM guard protection areas n are FEF0 0000$_H$ to FEF0 01FF$_H$ and FEF0 1000$_H$ to FEF0 11FF$_H$.

Concept: When MGDGRBADn[20:9] = 800$_H$, the base address is FEF0 0000$_H$ and the base address of the range to which the setting applies is indicated within [ ] below.

1111	1110	111 [1	0000	0000	000] 0	0000	0000
F	E	F	0	0	0	0	0

When MGDGRADVn[20:9] = $FF7_H$, the setting of the lower bits 9-0 is 0 so the corresponding bit of addresses is not compared, and the 512 bytes represented by

1111 1110 111 [1 0000 000x 000] x xxxx xxxx,

i.e.,

F E F 0 0 0 0 0 to

F E F 0 0 1 F F,

and

F E F 0 1 0 0 0 to

F E F 0 1 1 F F

(1 Kbyte in total) are protected.

29.4.3 PBG

The PBG module is divided into several PBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG channel can designate the access against which a single peripheral circuit should be protected. Each PBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG group names, and the PBG channel numbers.

Table 29.96 Peripheral Modules to be Protected and the Corresponding PBG Channel Numbers (1/4)

	2	System control (group B)*3	

Note 1. The CSIHx registers are divided into the following two groups and controlled separately.
Group A: CSIHnCTL0 to CSIHnCTL2, CSIHnSTR0, and CSIHnSTCR0
Group B: Other than above

Note 2. The registers of the EMU3 are not protected against accesses made by the SubCPU because they are through the dedicated bus. For protection, use the MPU. For details on the MPU, see **Section 3.2.1, Core Functions**.

Note 3. The system control registers are divided into the following two groups and controlled separately.
Group A: RESF, RESFC, PLL0CLKS, PLL0CLKC1, CKSC0CTL, CKSC0ACT, CLKD0DIV, CLKD0STAT, CKSC1CTL, CKSC1ACT, CLMAnCTL0 (n=0 to 3), CLMAnCMPL (n=0 to 3), CLMAnCMPH (n=0 to 3), CLMAnPCMD (n=0 to 3), CLMAnPS (n=0 to 3), CLMATEST, CLMATESTS, FHVE3, and FHVE15
Group B: SWRESA, PROT1PHCMD, and PROT1PS

29.4.3.1 List of Registers

The following table lists the register provided for each PBG channel.

Table 29.97 List of Register Provided for Each PBG Channel

Module Name	Register Name	Symbol	Address
PBG	PBGxx protection register n	FSGDxxDPROTn	<base_addr0> + 4*n

The following table lists the registers provided for each PBG group.

Table 29.98 List of Registers Provided for Each PBG Group

Module Name	Register Name	Symbol	Address
PBG	PBGxx error control register	ERRSLVxxCTL	<base_addr1> + 0_H
PBG	PBGxx error status register	ERRSLVxxSTAT	<base_addr1> + 4_H
PBG	PBGxx error address register	ERRSLVxxADDR	<base_addr1> + 8_H
PBG	PBGxx error type register	ERRSLVxxTYPE	<base_addr1> + C_H

In the above tables, “xx” and “n” in the register names and symbols represents the PBG group numbers and PBG channel numbers, respectively. The table below shows the base address values <base_addr0> and <base_addr1>, which correspond to each of the PBG group numbers and PBG channel numbers.

Table 29.99 Base Addresses

PBG Group	PBG Group xx	PBG Channel Number n	<base_addr0>	<base_addr1>
PBG0	0	0, 1	FFC4 $C000_H$	FFC4 $C800_H$
PBG1	1	4 to 7	FFC4 $C100_H$	FFC4 $C900_H$
PBG2	2	0 to 9	FFDC 0000_H	FFDC 0200_H
PBG3	3	0 to 8	FF7C 0800_H	FF7C $0A00_H$
PBG4	4	0 to 14	FFDD $D000_H$	FFDD $D200_H$
PBG5	5	0 to 8	FF7D $D800_H$	FF7D $DA00_H$
PBG6	6	0 to 11	FFF9 4000_H	FFF9 4200_H
PBG7	7	0 to 15	FFF9 4400_H	FFF9 4600_H
PBG8	8	0 to 8	FFF9 4800_H	FFF9 $4A00_H$
PBG9	9	0 to 15	FFC4 0000_H	FFC4 0200_H
PBG10	10	0, 2, 4 to 15	FFC4 0400_H	FFC4 0600_H
PBG11	11	0 to 8	FFC4 0800_H	FFC4 $0A00_H$
PBG12	12	0 to 4	FF67 8000_H	FF67 8200_H
PBG13	13	0 to 2	FFF9 0000_H	FFF9 0200_H

29.4.3.2 Details of Registers

(1) FSGDxxDPROTn — PBGxx protection register n

FSGDxxDPROTn designates the access to be rejected against which the peripheral circuit control registers and RAM should be protected. Any access that is disabled using any of the identifiers is rejected as an illegal access.

Access: FSGDxxDPROTn is readable/writable in 32-bit units.
FSGDxxDPROTn (L/H) is readable/writable in 16-bit units.
FSGDxxDPROTn (LL/LH/HL/HH) is readable/writable in 8-bit units.

Address: FSGDxxDPROTn : <base_addr0> + 4 × n
FSGDxxDPROTnL : FSGDxxDPROTn + 00_H
FSGDxxDPROTnH : FSGDxxDPROTn + 02_H
FSGDxxDPROTnLL : FSGDxxDPROTn + 00_H
FSGDxxDPROTnLH : FSGDxxDPROTn + 01_H
FSGDxxDPROTnHL : FSGDxxDPROTn + 02_H
FSGDxxDPROTnHH : FSGDxxDPROTn + 03_H

Value after reset: $07FF\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PROTUM	PROTPEID[7:0]								—
Value after reset:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PROTSPID[3:0]				PROTDEB	PROTRDPDEF	PROTWRPDEF	PROTRD	PROTWR
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.100 FSGDxxDPROTn Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	The read value is 0. The write value should be 0.
26	Reserved	This bit is read as 1. The write value should be 1.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 17	PROTPEID[7:0]	PEID Access The PROTnPEID field is a bit list, in which one bit corresponds to one PEID value. Setting multiple bits enables multiple ID values simultaneously. For example, setting the PROTnPEID field to 0101_B enables access with PEID = 0 and PEID = 2. 0: Disables access with PEID = n. 1: Enables access with PEID = n.
16 to 9	Reserved	These bits are read as 1. The write value should be 1.
8 to 5	PROTSPID[3:0]	SPID Access The PROTnSPID field is a bit list, in which one bit corresponds to one SPID value. Setting multiple bits enables the multiple SPID values simultaneously. For example, setting the PROTnSPID field to 0101_B enables access with SPID = 0 and SPID = 2. 0: Disables access with SPID = n. 1: Enables access with SPID = n.
4	PROTDEB	Debug Access 0: Disables access from the debug master. 1: Enables access from the debug master. Always set 1 to this bit. Setting 0 may lead to incorrect operations of the debugger or the RAM monitoring tool.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master. 1: Only enables reading by the access-permitted master.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master. 1: Only enables write access from the access-permitted master.
1	PROTRD	Read Permission 0: Reading by any master is prohibited. 1: Reading by the access-permitted master only is permitted. Note, however, if both PROTRDPDEF and PROTRD are set to 0, the setting of PROTRDPDEF takes priority, that is, read access from any master is enabled.
0	PROTWR	Default Write Protection 0: Enables write access from any master. 1: Only enables write access from the access-permitted master. Note however, if both PROTWRPDEF and PROTWR are set to 0, the setting of PROTWRPDEF takes priority, that is, write access from any master is enabled.

(2) ERRSLVxxCTL — PBGxx error control register

ERRSLVxxCTL clears the status in the error status registers of PBGxx.

Access: ERRSLVxxCTL is writable in 32-bit units.
ERRSLVxxCTL (L/H) is writable in 16-bit units.
ERRSLVxxCTL (LL/HH/HL/HH) is writable in 8-bit units.

Address: ERRSLVxxCTL : <base_addr1>,
ERRSLVxxCTLL : ERRSLVxxCTL + 00_H,
ERRSLVxxCTLH : ERRSLVxxCTL + 02_H,
ERRSLVxxCTLLL : ERRSLVxxCTL + 00_H,
ERRSLVxxCTLLH : ERRSLVxxCTL + 01_H,
ERRSLVxxCTLHL : ERRSLVxxCTL + 02_H,
ERRSLVxxCTLHH : ERRSLVxxCTL + 03_H,

Value after reset: $0000\ 0000_H$

0	CLRE	Error Detection Flag Clear 0: No operation. 1: Clears the error detection flag.

(3) ERRSLVxxSTAT — PBGxx error status register

ERRSLVxxSTAT holds the status of the illegal access detected by PBGxx.

Access: ERRSLVxxSTAT is readable in 32-bit units.
ERRSLVxxSTAT (L/H) is readable in 16-bit units.
ERRSLVxxSTAT (LL/LH/HL/HH) is readable in 8-bit units.

Address: ERRSLVxxSTAT : <base_addr1> + 04_H,
ERRSLVxxSTATL : ERRSLVxxSTAT + 00_H,
ERRSLVxxSTATH : ERRSLVxxSTAT + 02_H,
ERRSLVxxSTATLL : ERRSLVxxSTAT + 00_H,
ERRSLVxxSTATLH : ERRSLVxxSTAT + 01_H,

Bit Position	Bit Name	Function
31 to 2	Reserved	The read value is 0. The write value should be 0.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: Overflow occurred Since the error entry depth of PBG is 1, when another guard violation occurs after the error detection flag was set due to the earlier guard violation, the error entry overflow occurs and this flag is set. Occurrence of overflow is not reported to ECM. Guard violation error information is not captured in case of an overflow.
0	ERR	Error Detection Flag 0: No error 1: An error occurred

(4) ERRSLVxxADDR — PBGxx error address register

ERRSLVxxADDR holds the address of the illegal access detected by PBGxx.

Access: ERRSLVxxADDR is readable in 32-bit units.

Address: ERRSLVxxADDR: <base_addr1> + 08_H

Value after reset: $0000\ 0000_H$

(5) ERRSLVxxTYPE — PBGxx error type register

ERRSLVxxTYPE holds the type of illegal access detected by PBGxx.

Access: ERRSLVxxTYPE is readable in 32-bit units.
ERRSLVxxTYPE (L/H) is readable in 16-bit units.

Address: ERRSLVxxTYPE : <base_addr1> + $0C_H$,
ERRSLVxxTYPEL : ERRSLVxxTYPE + 00_H ,
ERRSLVxxTYPEH : ERRSLVxxTYPE + 02_H

Value after reset: $0000\ 0000_H$

Table 29.104 ERRSLVxxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	The read value is 0. The write value should be 0.
15 to 13	PEID[2:0]	PEID of the error source.
12 to 10	Reserved	The read value is 0. The write value should be 0.
9, 8	SPID[1:0]	SPID of the error source.
7	Reserved	The read value is 0. The write value should be 0.
6	UM	UM of the error source.
5	Reserved	The read value is 0. The write value should be 0.
4 to 1	STRB[3:0]	(Reference Information) The strobe signal at the time of error occurrence. These bits hold a signal used for an internal bus or interconnect.
0	WRITE	(Reference Information) The write signal at the time of error occurrence. This bit holds a signal used for an internal bus or interconnect.

29.5 Multi-Input Signature Generator (MISG)

29.5.1 Overview

This LSI incorporates multi-input signature generators (MISG) for self-diagnosis by the CPUs. The table below shows the overview of the MISG specifications.

Table 29.105 MISG Overview

Item	Description
Generating polynomials	The polynomials are available for use in signature generation. • MISR1: G (x) = x32 +x26 +x23 +x22 +x16 +x12 +x11 +x10 +x8 +x7 +x5 +x4 +x2 +x +1 • MISR2: G (x) = x32 +x22 +x2 +x +1 To support signature generation for 64-bit data, each CPU is connected with an MISG that has two MISRs (MISR1 and MISR2).
Signature generation	Signature generation can be enabled or disabled. • Signature generation in MISR1 is enabled or disabled. • Signature generation in MISR2 is enabled or disabled. The following two conditions can be selected as conditions for signature generation • Writing to the register A signature is generated by writing to the MISR1 calculation register (MISRCDR_*) • Monitoring write access A signature is generated if writing to the address area specified for monitoring occurs when writing by the CPU is being monitored. The address area is specified by the monitoring area base address register and the monitoring area address mask register.
Automatic signature comparison	Two signature generation units are selected for comparison of signatures. Each signature generation unit has a data counter and comparison proceeds when the values of the data counters in the MISGs selected as the target for comparison match. The data counter counts the number of write accesses to the MISRCDR_* register or the address area being monitored.
Error notification	When signatures are compared and do not match, the ECM is notified of an error. Enabling or disabling of error notification to the ECM can be selected. An interrupt request for the INTC is not made directly.

Throughout this section, an asterisk (*) in MISRCDR_*, MISR1_*, and MISR2_* respectively refers to PE1, PE2, and PE3.

29.5.2 Block Diagram

29.5.2.1 MISG

The figure below is a block diagram of the MISG. The MISG consists of three signature generation units and a signature comparison unit.

Write monitoring mode for signature generation conditions (refer to **Section 29.5.3.1(2)**) can only be executed between the corresponding signature generation unit and the CPU. Therefore, each signature generation unit is given a name corresponding to the CPU number (MISG_PE1, MISG_PE2, or MISG_PE3). MISG_PE1 can monitor CPU1's write accesses, MISG_PE2 can monitor CPU2's write accesses, and the MISG_PE3 can monitor the SubCPU's write accesses.

When register write mode is the signature generation condition, there is no correspondence between a CPU and the signature generation unit. Any CPU can generate a signature in any signature generation unit.

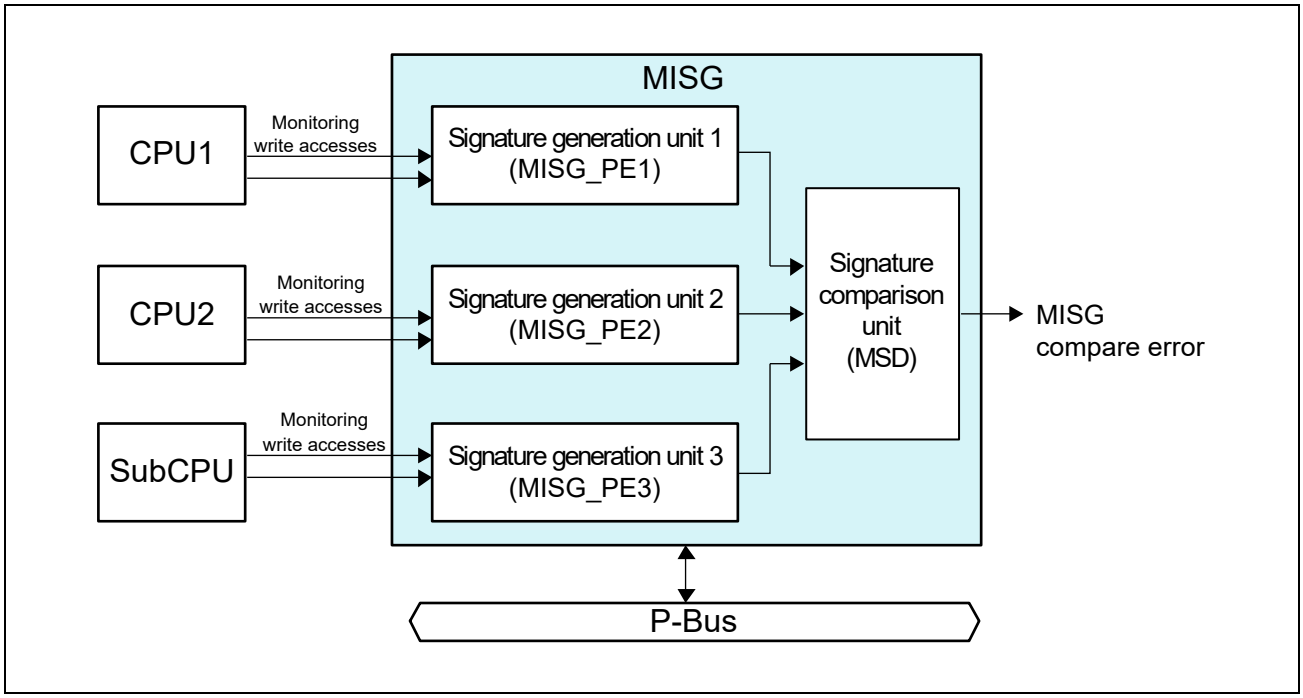

Figure 29.6 MISG Block Diagram (for Multi Core)

29.5.2.2 Signature Generation

The figure below shows the flow of data in signature generation. The signature generation unit consists of two 32-bit signature generators (MISR1_* and MISR2_*).

MISR1_* and MISR2_* can generate a signature from the 64 bits of write data of the CPU to be monitored or the data written to MISRCDR_*.

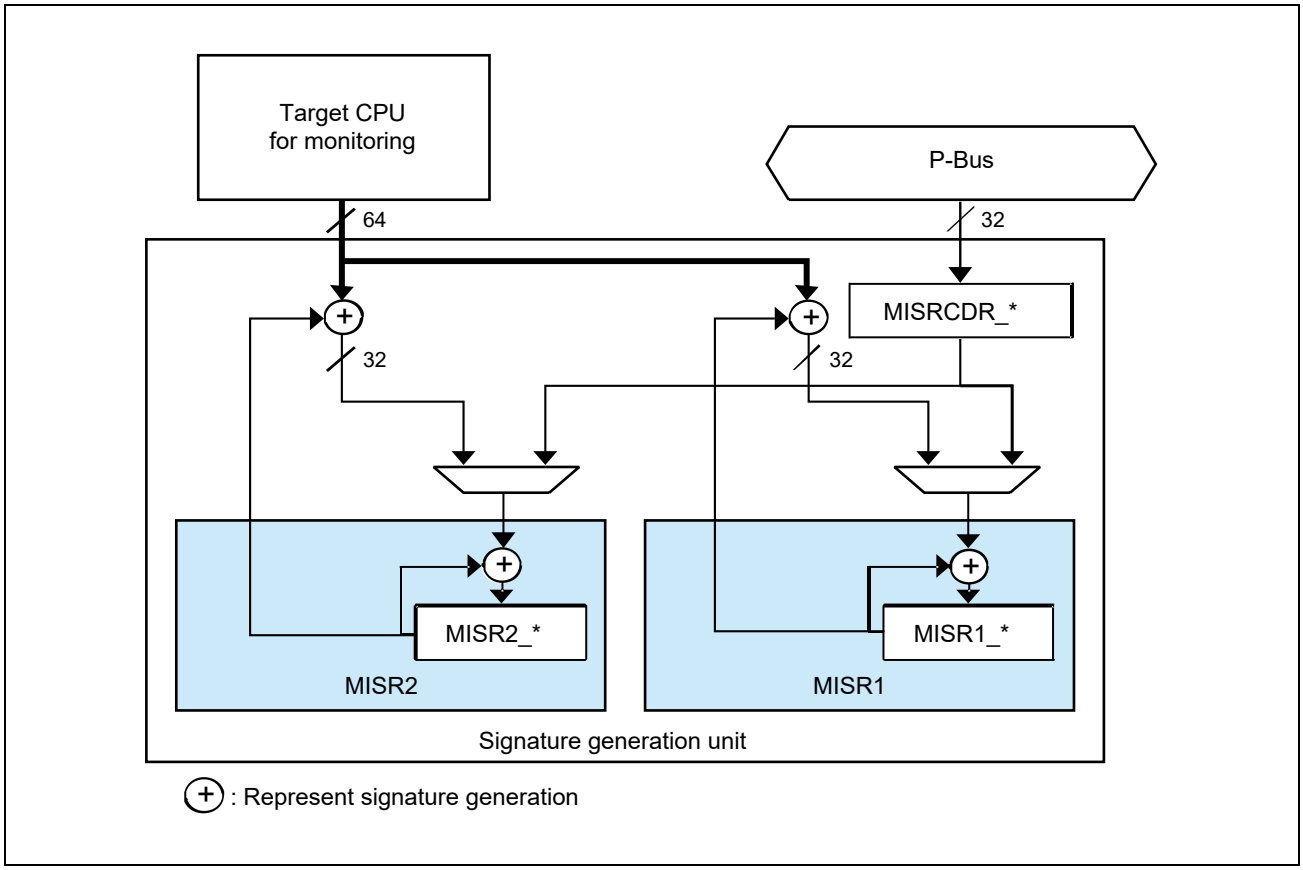

Figure 29.7 Signature Generation Units

A block diagram of signature generation of MISR1_* and the polynomial used for this is shown below.

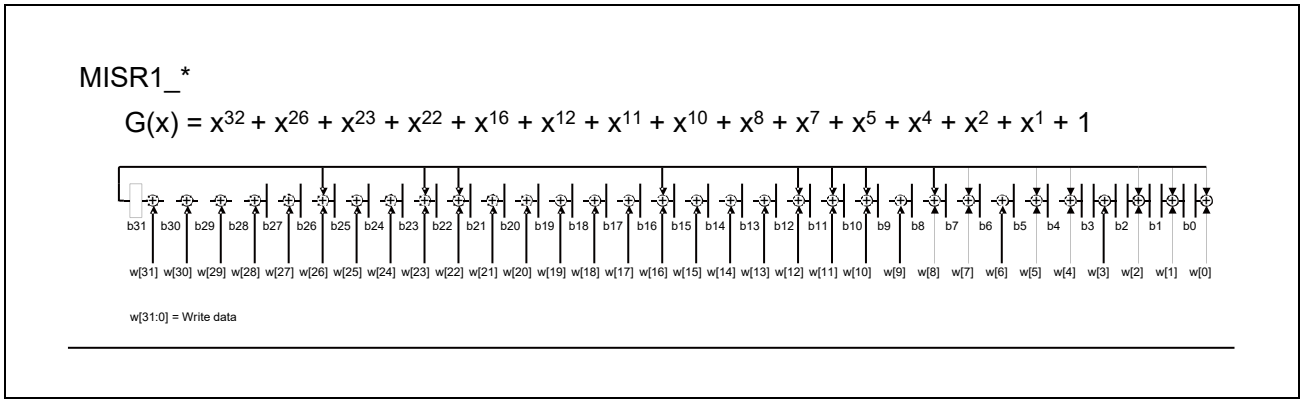

Figure 29.8 Block Diagram of Signature Generation in MISR1_*

A block diagram of signature generation of MISR2_* and the polynomial used for this is shown below.

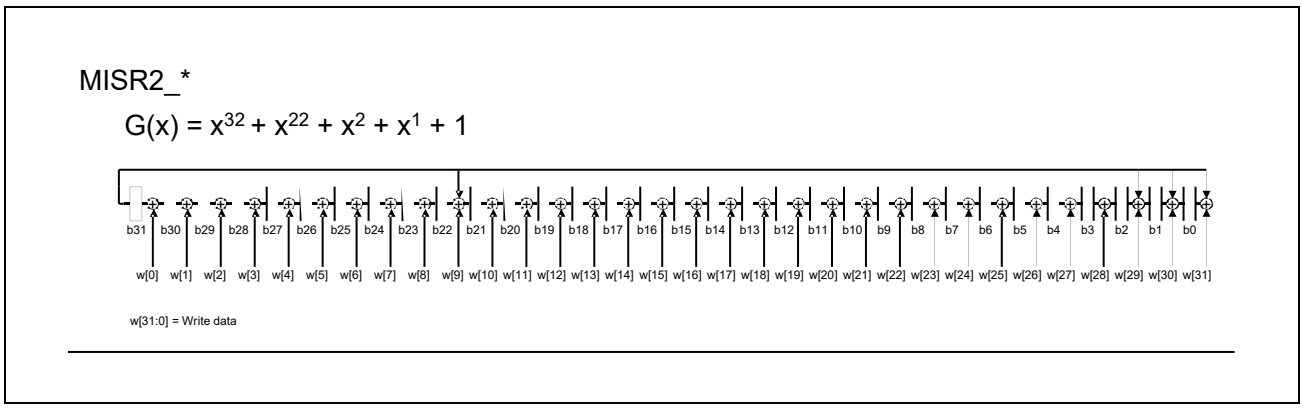

Figure 29.9 Block Diagram of Signature Generation in MISR2_*

29.5.3 Functional Specification

29.5.3.1 Conditions for Signature Generation

The conditions for signature generation in MISR1 and MISR2 can be selected by the setting of the MISR control register (MISRCR).

Table 29.106 Signature Generation Conditions in MISRi (i = 1, 2)

MISRCR. MISRiEN	MISRCR. MISEiCND	Signature Generation Conditions
0	Reserved	MISRi does not generate a signature.
1	0	Register write mode MISRi generates a signature after write access to MISRCDR_*.
1	1	Write monitoring mode MISRi generates a signature after the corresponding CPU writes to an address specified for monitoring.

(1) Register write mode

Writing to the MISR calculation register (MISRCDR_*) while MISR1 is in register write mode leads to the generation of a 32-bit signature from the value held in the multi-input signature register 1 (MISR1_*) and the data written to MISRCDR_*, and the result is retained in MISR1_*. Similarly, a 32-bit signature is generated from the value held in the multi-input signature register 2 (MISR2_*) and the data written to MISRCDR_*, and the result is retained in MISR2_*.

Writing to MISRCDR_* can proceed in 8-, 16-, or 32-bit units, and bits to which a value is not written are treated as 0. For example, writing to the 16 lower-order bits of MISRCDR_* leads to the generation of a signature with the 16 higher-order bits of write data treated as 0. Similarly, writing to the 16 higher-order bits of MISRCDR_* leads to the generation of a signature with the 16 lower-order bits of write data treated as 0. However, these cases will not arise if access is by using the IO header file.

MISR1 and MISR2 do not identify the bus master which writes to the MISRCDR_*. Writing by any bus master, whether a CPU, DMAC, or debugging master, produces a signature.

(2) Write monitoring mode

When the CPU writes to an address area specified for monitoring while MISR1 is in write-monitoring mode, MISR1 generates compressed 32-bit signatures from the value in MISR1_* and 64-bit data being written by the CPU, and generates signatures from the 32-bit compressed data and the value that is again held in MISR1_*. The generated signatures are stored in MISR1_*. Similarly, when the CPU writes to an address area specified for monitoring while MISR2 is in write-monitoring mode, MISR2 generates compressed 32-bit signatures from the value in MISR2_* and 64-bit data being written by the CPU, and generates signatures from the 32-bit compressed data and the value that is again held in MISR2_*. The generated signatures are stored in MISR2_*.

The address area specified for monitoring for signature generation is set by the MISR monitoring area base address register (MISRBASEADR) and the MISR monitoring area address mask register (MISRADRMSK). If the CPU write address is within the address area specified for monitoring, a signature is generated.

Write monitoring mode monitors write access by the corresponding CPU in 8-, -16, -32, or -64 units. When writing proceeds in 8-, or -16 units, remaining bits to which a value is not written are treated as 0, and compressed 32 bit data from 64-bit data is always input to MISR1 or MISR2. Write data are allocated to the lower-order side regardless of the destination address. For example, when 16 bits are written to an address of the form 4N + 2, the 16 bits are allocated to the lower-order side and a signature is generated with the 16 higher-order bits treated as 0.

The CPU write access destinations that can be monitored by MISR1 and MISR2 are as follows:

- Local RAM and global RAM
- CPU peripheral (local APB)
- Peripheral circuit connected to the interconnect or to the P-Bus

The restrictions described below apply to the given store operations.

(1) Instructions that identify write data in slave responses:
Store operations such as BitOp, CAXI, and STC.W are not subject to monitoring.

(2) Instructions for saving units of data larger than 64 bits on the stack (PREPARE and PUSHSP):

Signature values between the masters may not be matched when the instruction is suspended because of an interrupt. Therefore, the area to be used with the instructions must not be subject to monitoring or steps must be taken to make sure that the operation is not suspended due to an interrupt.

Write monitoring mode can only be executed between the specified signature generation unit and the corresponding CPU. In this product, the following monitoring operations are possible.

Monitoring of CPU1 write access by signature generation unit 1

Monitoring of CPU2 write access by signature generation unit 2

Monitoring of SubCPU write access by signature generation unit 3

A signature is not generated if write monitoring mode is set for a signature generation unit that does not support write monitoring mode. At this time, reference to the values of MISRBASEADR and MISRADRMSK is not possible from anywhere.

29.5.3.2 Automatic Signature Comparison

Of the signature generation units, two or three signature generation units are selected for the comparison of signatures by the MISRCMPENi or MISR2CMPENi (i = 0, 1, 2) bit. Each signature generation unit has a data counter, and the signatures are compared if the values of the data counters generated in two signature generation units selected as targets for comparison match.

If two signatures are to be compared, use MISRCMPENi or MISR2CMPENi (i = 0, 1, 2) in the MISRCMPCTL register to enable signature comparison by two signature generation units.

If three signatures are to be compared, use two or three bits of MISRCMPENi or MISR2CMPENi to enable comparison by the corresponding signature generation units.

29.5.3.3 Data Counter

The MISR data counter register (MISRDCNT) counts how many times writing to MISRCDR_* or the address range specified by BASEADR and ADRMSK proceeds.

When the CNTSTA bit = 1 and the CNTTRG bit = 0 in the data counter control register (MISRDCNTCTL), MISRDCNT counts the number of write accesses to MISRCDR_*.

When the CNTSTA bit = 1 and the CNTTRG bit = 1 in MISRDCNTCTL, MISRDCNT counts the number of write accesses by the corresponding CPU to the address range specified by MISRBASEADR and MISRADRMSK.

MISRDCNT can count the number of times either MISR1 or MISR2 or both MISR1 and MISR2 generate signatures by setting the trigger for counting up by MISRDCNT as the signature generation condition in MISR1 or MISR2. Note, however, that if the signature generation conditions for MISR1 and MISR2 and the trigger for counting up by the data counter are not consistent, the value of MISRDCNT and the signature generation count will not match.

CAUTIONS

1. When the MISR1EN and MISR2EN bits in the MISRCR register are both 0, counting by MISRDCNT is not incremented even if writing to MISRCDR_* and the address range specified by MISRBASEADR and MISRADRMSK proceeded.
2. In the signature generation unit that does not support write monitoring mode, the data counter MISRDCNT is not incremented when the CPU write access to the monitoring address area is set as the trigger for counting up by the data counter.

29.5.3.4 Error Notification

When the CMPERREN bit in the error notification control register (MISRERRCTL) is set to 1, the ECM is notified of an error when signatures are compared and do not match. At the same time, the error flag in the compare error status register is set. An interrupt request for the INTC is not generated.

29.5.4 Register Specifications

29.5.4.1 Register Map

The table below lists the registers of the signature generation units.

The registers with symbols ending in “_PE1” are those of signature generation unit 1 (MISG_PE1).

The registers with symbols ending in “_PE2” are those of signature generation unit 2 (MISG_PE2).

The registers with symbols ending in “_PE3” are those of signature generation unit 3 (MISG_PE3).

Note that the endings of the register symbols (“_PE1”, “_PE2", and "PE3”) are omitted if signature generation units 1 to 3 do not require identification.

MISG_PE1_base = FFC5 1000_H

MISG_PE2_base = FFC5 2000_H

MISG_PE3_base = FF75 0000_H

Table 29.107 List of Registers of the Signature Generation Units

Module Name	Register Name	Symbol	Address
MISG	Multi input signature register 1 (PE1)	MISR1_PE1	<MISG_PE1_base> + 000_H

MISG	MISR data count register (PE3)	MISRDCNT_ PE3	<MISG_PE3_base> + 028_H

The table below lists the registers of the signature comparison unit (MSD sub-block).

MSD_base = $FFC5\ 0000_H$

Table 29.108 List of Registers of the Signature Comparison Units (MSD Sub-Block)

Module Name	Register Name	Symbol	Address
MISG	MISR comparator control register	MISRCMPCTL	<MSD_base> + 00_H
MISG	MISR compare error status register	MISRCMPERSTR	<MSD_base> + 04_H
MISG	MISR compare error status clear register	MISRCMPERRSTC	<MSD_base> + 08_H
MISG	MISR error notification control register	MISRERRCTL	<MSD_base> + $0C_H$

Note: In case to access to a register in a unit smaller than 32 bits, the bits that are not specified are ignored when they are written and 0 is returned when they are read.

The following describes the control registers of the signature comparison unit.

29.5.4.2 MISRCDR_PE1/PE2/ PE3 — MISR calculation data register

The MISR calculation data register is a 32-bit write-only register.

When signature generation in register write mode is selected, a signature is generated in MISR1 or MISR2 by writing to this register. Data written to this register is the data input to the multi-input signature register 1 (MISR1_*) or the multi-input signature register 2 (MISR2_*). For the conditions for signature generation, see **Section 29.5.3.1, Conditions for Signature Generation**.

This register can be written in 8-, 16-, or 32-bit units. When writing proceeds in 8- or 16-bit units, remaining bits to which a value is not written are treated as 0, and 32-bit data is always input to MISR1_* or MISR2_*.

Access: MISRCDR_ (PE1/PE2/PE3) is writable in 32-bit units.
MISRCDR_ (PE1/PE2/PE3) (L/H) is writable in 16-bit units.
MISRCDR_ (PE1/PE2/PE3) (LL/LH/HL/HH) is writable in 8-bit units.

Address: MISRCDR_PE1 : <MISG_PE1_base> + 010_H, MISRCDR_PE2 : <MISG_PE2_base> + 010_H,
MISRCDR_PE3 : <MISG_PE3_base> + 010_H,
MISRCDR_ (PE1/PE2/PE3)L : MISRCDR_ (PE1/PE2/PE3) + 00_H,
MISRCDR_ (PE1/PE2/PE3)H : MISRCDR_ (PE1/PE2/PE3) + 02_H,
MISRCDR_ (PE1/PE2/PE3)LL : MISRCDR_ (PE1/PE2/PE3) + 00_H,
MISRCDR_ (PE1/PE2/PE3)LH : MISRCDR_ (PE1/PE2/PE3) + 01_H,
MISRCDR_ (PE1/PE2/PE3)HL : MISRCDR_ (PE1/PE2/PE3) + 02_H,
MISRCDR_ (PE1/PE2/PE3)HH : MISRCDR_ (PE1/PE2/PE3) + 03_H

Value after reset: ---- ---- (undefined)

Table 29.109 MISRCDR_PE1/PE2/PE3 Register Contents

Bit Position	Bit Name	Function
31 to 0	MISRCDR31 to MISRCDR0	Calculation Data Input data to MISR1 or MISR2. When the MISR1EN bit = 1 and the MISR1CND bit = 0 in the MISRCR register, or the MISR2EN bit = 1 and the MISR2CND bit = 0, a new signature is generated each time the MISRCDR register is written, and the result is retained in MISR1 or MISR2.

29.5.4.3 MISR1_PE1/PE2/ PE3 — Multi-input signature register 1

The multi-input signature register is a 32-bit writable register.

Once the signature generation condition is met, this register generates a new signature each time the condition is met and retains the generated value. For the conditions for signature generation, see **Section 29.5.3.1, Conditions for Signature Generation**.

Signatures are generated by using the following polynomial:

$G(x) = x32 + x26 + x23 + x22 + x16 + x12 + x11 + x10 + x8 + x7 + x5 + x4 + x2 + x + 1$

Access: MISR1_PE1, MISR1_PE2, and MISR1_PE3 are readable/writable in 32-bit units.

Address: MISR1_PE1 : <MISG_PE1_base> + 000H,
MISR1_PE2 : <MISG_PE2_base> + 000H,
MISR1_PE3 : <MISG_PE3_base> + 000H

Table 29.110 MISR1_PE1/PE2/ PE3 Register Contents

Bit Position	Bit Name	Function
31 to 0	MISR131 to MISR10	Multi-Input Signature Register 1 When read, a new signature is always read.

29.5.4.4 MISR2_PE1/PE2/ PE3 — Multiple-input signature register 2

The multi-input signature register 2 is a 32-bit writable register.

Once the signature generation condition is met, this register generates a new signature each time the condition is met and retains the generated value. For the conditions for signature generation, see **Section 29.5.3.1, Conditions for Signature Generation**.

Signatures are generated by using the following polynomial:

$G(x) = x32 + x22 + x2 + x + 1$

Access: MISR2_PE1, MISR2_PE2, and MISR2_PE3 are readable/writable in 32-bit units.

Address: MISR2_PE1 : <MISG_PE1_base> + 008_H,
MISR2_PE2 : <MISG_PE2_base> + 008_H,
MISR2_PE3 : <MISG_PE3_base> + 008_H

Value after reset: $0000\ 0000_H$

Table 29.111 MISR2_PE1/PE2/ PE3 Register Contents

Bit Position	Bit Name	Function
31 to 0	MISR231 to MISR20	Multi-Input Signature Register 2 When read, a new signature is always read.

29.5.4.5 MISRCR_PE1/PE2/ PE3 — MISR control register

MISRCR_* is an 8-bit readable and writable register.

The MISR1EN and MISR2EN bits are used to enable or disable signature generation in MISR1 and MISR2.

When the MISR1EN or MISR2EN bit is 1, MISR1 or MISR2 generates a signature and retains the generated value. When the MISR1EN or MISR2EN bit is 0, MISR1 or MISR2 does not generate signatures and the values of these registers are not updated.

When the MISR1EN or MISR2EN bit is 1, the MISR1CND or MISR2CND bit selects the signal generation condition in MISR1 orMISR2. Setting the MISR1CND or MISR2CND bit to 0 selects signature generation in register write mode by MISR1 or MISR2, so writing to MISRCDR_* leads to signature generation. Setting the MISR1CND or MISR2CND bit to 1 selects signature generation in write monitoring mode by MISR1 or MISR2, writing by the CPU to the address range specified by the MISRBASEADR and MISRADRMSK registers leads to signature generation. For the conditions for signature generation, see **Section 29.5.3.1, Conditions for Signature Generation**.

Access: MISRCR_PE1, MISRCR_PE2, and MISRCR_PE3 are readable/writable in 8-bit units.

Address: MISRCR_PE1 : <MISG_PE1_base> + 018_H,
MISRCR_PE2 : <MISG_PE2_base> + 018_H,
MISRCR_PE3 : <MISG_PE3_base> + 018_H

Value after reset: 00_H

Bit Position	Bit Name	Function
7 to 4	Reserved	The read value is 0. The write value should be 0.
3	MISR2CND	MISR2 Signature Write Control This bit sets the signature generation condition in MISR2 when the MISR2EN bit = 1. 0: Register write mode 1: Write monitoring mode
2	MISR1CND	MISR1 Signature Write Control This bit sets the signature generation condition in MISR1 when the MISR1EN bit = 1. 0: Register write mode 1: Write monitoring mode
1	MISR2EN	MISR2 Enable 0: MISR2 does not generate a signature. 1: MISR2 generates a signature and the MISR2H and MISR2_* values are updated.
0	MISR1EN	MISR1 Enable 0: MISR1 does not generate a signature. 1: MISR1 generates a signature and the MISR1H and MISR1_* values are updated.

29.5.4.6 MISRBASEADR_PE1/PE2/ PE3 — MISR monitoring area base address register

MISRBASEADR specifies the CPU write access area to be monitored by MISG when signature generation in write monitoring mode is selected. In combination with the setting of the monitoring area mask address register, this register specifies the address range of the monitoring area. For the conditions for signature generation, see **Section 29.5.3.1, Conditions for Signature Generation**.

Access: MISRBASEADR_ (PE1/PE2/PE3) is readable/writable in 32-bit units.
MISRBASEADR_ (PE1/PE2/PE3) (L/H) is readable/writable in 16-bit units.
MISRBASEADR_ (PE1/PE2/PE3) (LL/LH/HL/HH) is readable/writable in 8-bit units.

Address: MISRBASEADR_PE1 : <MISG_PE1_base> + 01C$_H$,
MISRBASEADR_PE2 : <MISG_PE2_base> + 01C$_H$,
MISRBASEADR_PE3 : <MISG_PE3_base> + 01C$_H$,

29.5.4.7 MISRADRMSK_PE1/PE2/PE3 — MISR monitor area address mask register

MISRADRMSK specifies the CPU write access area to be monitored by MISG when signature generation in write monitoring mode is selected. In combination with the setting of the monitoring area base address register, this register specifies the address range of the monitoring area. For the conditions for signature generation, see **Section 29.5.3.1, Conditions for Signature Generation**.

Access: MISRADRMSK_ (PE1/PE2/PE3) readable/writable in 32-bit units.
MISRADRMSK_ (PE1/PE2/PE3) (L/H) is readable/writable in 16-bit units.
MISRADRMSK_ (PE1/PE2/PE3) (LL/LH/HL/HH) is readable/writable in 8-bit units.

Address: MISRADRMSK_PE1 : <MISG_PE1_base> + 020H,
MISRADRMSK_PE2 : <MISG_PE2_base> + 020H,

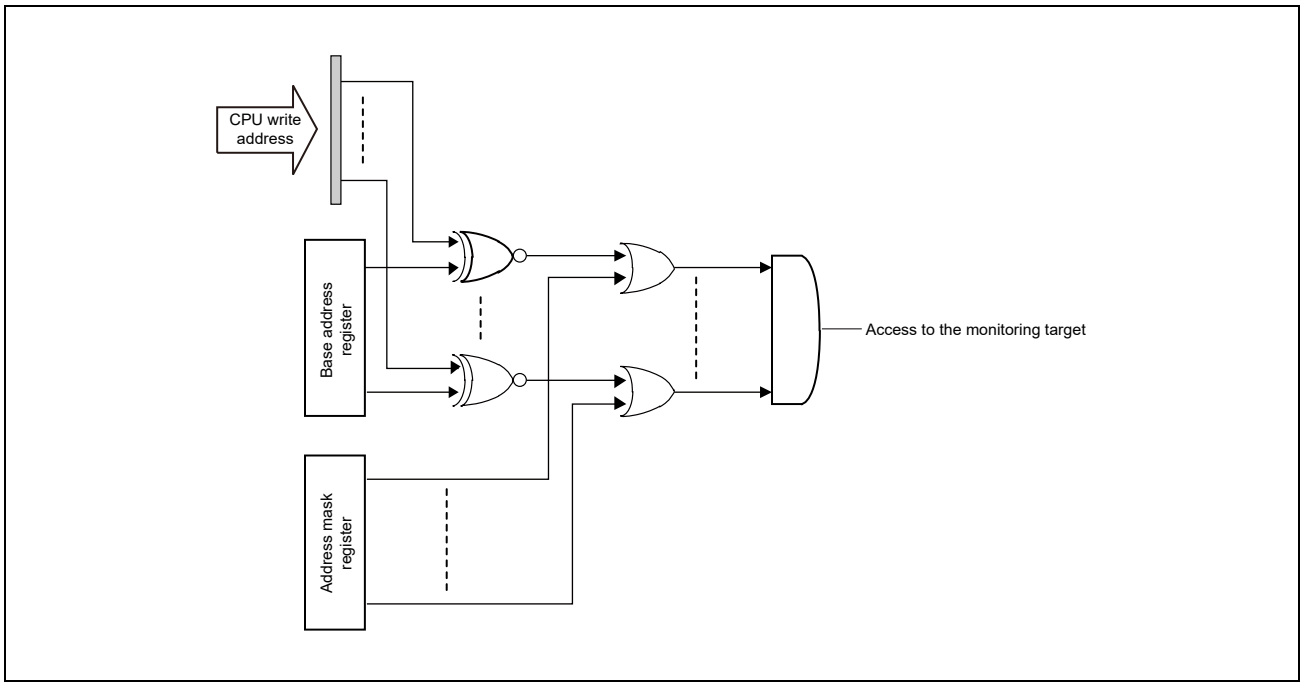

Figure 29.10 How to Detect Access to the Monitoring Area

29.5.4.8 MISRDCNTCTL_PE1/PE2/ PE3 — MISR data counter control register

This register controls operation of the MSIR data counter register. If the event selected by the CNTTRG bit occurs while the CNTSTA bit is 1, the data counter is incremented. For operation of the data counter, see **Section 29.5.3.3, Data Counter**.

Access: MISRDCNTCTL_PE1, MISRDCNTCTL_PE2, and MISRDCNTCTL_PE3 are readable/writable in 8-bit units.

Address: MISRDCNTCTL_PE1 : <MISG_PE1_base> + 024H,
MISRDCNTCTL_PE2 : <MISG_PE2_base> + 024H,
MISRDCNTCTL_PE3 : <MISG_PE3_base> + 024H

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are always read as 0. The write value should be 0.
1	CNTTRG	Count-Up Trigger Select This bit selects the trigger for counting up by the data counter. 0: Write access to the MISRCDR_* register 1: Write access to the address area specified by the MISRBASEADR and MISRADRMSK registers
0	CNTSTA	Data Counter Start This bit is an enable bit for the data counter. If the event selected by the CNTTRG bit occurs while CNTSTA = 1, the data counter is incremented. 0: The data counter is stopped. 1: The data counter is operating.

29.5.4.9 MISRDCNT_PE1/PE2/ PE3 — MISR data counter register

The data counter is a 16-bit readable and writable register.

If the data counter values of two signature generation units selected for comparison match, automatic comparison of the signatures proceeds.

When the CNTTRG bit in the data counter control register is 0, the data counter is incremented by write access to the MISR calculation data register. When the CNTTRG bit in the data control register is 1, the data counter is incremented by write access by the corresponding CPU to the address area specified by the MISRBASEADR and MISRADRMSK registers. For operation of the data counter, see **Section 29.5.3.3, Data Counter**.

Access: MISRDCNT_PE1, MISRDCNT_PE2, and MISRDCNT_PE3 are readable/writable in 16-bit units.
MISRDCNT_PE1L, MISRDCNT_PE1H, MISRDCNT_PE2L, MISRDCNT_PE2H, MISRDCNT_PE3L, and MISRDCNT_PE3H are readable/writable in 8-bit units.

Address: MISRDCNT_PE1 : <MISG_PE1_base> + 028_H,
MISRDCNT_PE2 : <MISG_PE2_base> + 028_H,
MISRDCNT_PE3 : <MISG_PE3_base> + 028_H,

Table 29.116 MISRDCNT_PE1/PE2/PE3 Register Contents

Bit Position	Bit Name	Function
15 to 0	DCNT15 to DCNT0	Data Counter Register

The following describes the control registers of the MSD unit (signature comparison unit).

29.5.4.10 MISRCMPCTL — MISR comparator control register

MISRCMPCTL is a 16-bit readable and writable register.

This register controls the comparator that compares signatures generated in the signature generation units. For automatic comparison of signatures, see **Section 29.5.3.2, Automatic Signature Comparison**.

Access: MISRCMPCTL is readable/writable in 16-bit units.
MISRCMPCTLL and MISRCMPCTLH are readable/writable in 8-bit units.

Address: MISRCMPCTL : <MSD_base> + 00_H,
MISRCMPCTLL : <MSD_base> + 00_H, MISRCMPCTLH : <MSD_base> + 01_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	MISR2CMPEN2	MISR2CMPEN1	MISR2CMPEN0	MISR1CMPEN2	MISR1CMPEN1	MISR1CMPEN0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 29.117 MISRCMPCTL Register Contents

Bit Position	Bit Name	Function
15 to 6	Reserved	These bits are always read as 0. The write value should be 0.
5	MISR2CMPEN2	MISR2 Signature Compare Enable 2 This bit controls comparison of signatures retained in MISR2 of MISG_PE3 and MISG_PE1. 0: Disables comparison 1: Enables comparison
4	MISR2CMPEN1	MISR2 Signature Compare Enable 1 This bit controls comparison of signatures retained in MISR2 of MISG_PE2 and MISG_PE3. 0: Disables comparison 1: Enables comparison
3	MISR2CMPEN0	MISR2 Signature Compare Enable 0 This bit controls comparison of signatures retained in MISR2 of MISG_PE1 and MISG_PE2. 0: Disables comparison 1: Enables comparison
2	MISR1CMPEN2	MISR1 Signature Compare Enable 2 This bit controls comparison of signatures retained in MISR1 of MISG_PE3 and MISG_PE1. 0: Disables comparison 1: Enables comparison
1	MISR1CMPEN1	MISR1 Signature Compare Enable 1 This bit controls comparison of signatures retained in MISR1 of MISG_PE2 and MISG_PE3. 0: Disables comparison 1: Enables comparison
0	MISR1CMPEN0	MISR1 Signature Compare Enable 0 This bit controls comparison of signatures retained in MISR1 of MISG_PE1 and MISG_PE2. 0: Disables comparison 1: Enables comparison

29.5.4.11 MISRCMPERSTR — MISR compare error status register

The compare error status register is an 8-bit readable register.

If a mismatch occurs in signature comparison enabled by the comparator control register, the corresponding error flag is set.

The error flag is cleared by writing 1 to the corresponding clear bit in the compare error status clear register. The flag is also cleared by a reset.

Access: MISRCMPERSTR is readable in 8-bit units.

Address: MISRCMPERSTR : <MSD_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	MISR2ERR2	MISR2ERR1	MISR2ERR0	MISR1ERR2	MISR1ERR1	MISR1ERR0
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 29.118 MISRCMPERSTR Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	The read value is 0. The write value should be 0.
5	MISR2ERR2	MISR2 Signature Compare Error Flag 2 This flag is set when signatures retained in MISR2 of MISG_PE1 and MISG_PE3 are compared and do not match. 0: A mismatch has not occurred in signature comparison. 1: A mismatch has occurred in signature comparison.
4	MISR2ERR1	MISR2 Signature Compare Error Flag 1 This flag is set when signatures retained in MISR2 of MISG_PE2 and MISG_PE3 are compared and do not match. 0: A mismatch has not occurred in signature comparison. 1: A mismatch has occurred in signature comparison.
3	MISR2ERR0	MISR2 Signature Compare Error Flag 0 This flag is set when signatures retained in MISR2 of MISG_PE1 and MISG_PE2 are compared and do not match. 0: A mismatch has not occurred in signature comparison. 1: A mismatch has occurred in signature comparison.
2	MISR1ERR2	MISR1 Signature Compare Error Flag 2 This flag is set when signatures retained in MISR1 of MISG_PE1 and MISG_PE3 are compared and do not match. 0: A mismatch has not occurred in signature comparison. 1: A mismatch has occurred in signature comparison.
1	MISR1ERR1	MISR1 Signature Compare Error Flag 1 This flag is set when signatures retained in MISR1 of MISG_PE2 and MISG_PE3 are compared and do not match. 0: A mismatch has not occurred in signature comparison. 1: A mismatch has occurred in signature comparison.
0	MISR1ERR0	MISR1 Signature Compare Error Flag 0 This flag is set when signatures retained in MISR1 of MISG_PE1 and MISG_PE2 are compared and do not match. 0: A mismatch has not occurred in signature comparison. 1: A mismatch has occurred in signature comparison.

29.5.4.12 MISRCMPERRSTC — MISR compare error status clear register

The compare error status clear register is an 8-bit write-only register.

When an error flag in the compare error status register is 1, writing 1 to corresponding clear bit clears the error flag. Read the MISR compare error status register and write 1 to the clear bit for the flag being 1.

Access: MISRCMPERRSTC is writable in 8-bit units.

Address: MISRCMPERRSTC : <MSD_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	MISR2CLR2	MISR2CLR1	MISR2CLR0	MISR1CLR2	MISR1CLR1	MISR1CLR0
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	W	W	W	W	W	W

Table 29.119 MISRCMPERRSTC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	The read value is 0. The write value should be 0.
5	MISR2CLR2	MISR2 Signature Compare Error Clear 2 Writing 1 to this bit clears the MISR2ERR2 bit in the MISRCMPERSTR register.
4	MISR2CLR1	MISR2 Signature Compare Error Clear 1 Writing 1 to this bit clears the MISR2ERR1 bit in the MISRCMPERSTR register.
3	MISR2CLR0	MISR2 Signature Compare Error Clear 0 Writing 1 to this bit clears the MISR2ERR0 bit in the MISRCMPERSTR register.
2	MISR1CLR2	MISR1 Signature Compare Error Clear 2 Writing 1 to this bit clears the MISR1ERR2 bit in the MISRCMPERSTR register.
1	MISR1CLR1	MISR1 Signature Compare Error Clear 1 Writing 1 to this bit clears the MISR1ERR1 bit in the MISRCMPERSTR register.
0	MISR1CLR0	MISR1 Signature Compare Error Clear 0 Writing 1 to this bit clears the MISR1ERR0 bit in the MISRCMPERSTR register.

29.5.4.13 MISRERRCTL — MISR error notification control register

The error notification control register is an 8-bit readable and writable register.

This register enables or disables error notification when signatures are compared by the automatic signature comparison and do not mach. For the automatic signature comparison and error notification, see **Section 29.5.3.2, Automatic Signature Comparison** and **29.5.3.4, Error Notification.**

Access: MISRERRCTL is readable/writable in 8-bit units.

Address: MISRERRCTL : <MSD_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CMPERREN
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 29.120 MISRERRCTL Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	These bits are always read as 0. The write value should be 0.
0	CMPERREN	Compare Error Notification Enable This bit enables or disables error notification when signatures are compared and do not mach. 0: Error notification does not proceed even if a mismatch has occurred in signature comparison. 1: Error notification proceeds if a mismatch has occurred in signature comparison.

29.5.5 Usage Example

29.5.5.1 Usage example 1

The self-diagnostic program eases diagnosis by CPU. By using the MISG to compress intermediate transitions, the self-diagnostic program makes the saving and comparison of all intermediate results unnecessary.

Results of self-diagnosis including intermediate transitions can be judged by comparing the results of compression by the MISG with the expected results when the program ends.

This has the effect of reducing requirements for memory capacity and times for processing comparisons (substitution by CRCs is also possible).

Setting example (when PE1 is running the self-diagnosis program)

The descriptions of registers of an MISG below applies to the registers of signature generation unit 1

(MISG_PE1), which is for PE1.

(1) Initialize the multi-input signature register 1 (MISR1_*), multi-input signature register 2 (MISR2_*) and data counter register (MISRDCNT).

(2) Set the MISR1CND or MISR2CND bit in the MISR control register (MISRCR) to 1 to select signature generation by MISR1 or MISR2 in write monitoring mode.

(3) Use the MISR monitoring area base address register (MISRBASEADR) and MISR monitoring area address mask register (MISRADRMSK) to set the address area for monitoring.

(4) Set the MISR1EN or MISR2EN bit in the MISR control register to 1 to enable signature generation in MISR1 or MISR2.

(5) Run the self-diagnostic program on PE1.

(6) Upon completion of execution of the self-diagnostic program, MISR1_* or MISR2_* data is compared with the expected value in flash memory.

29.5.5.2 Usage example 2

Use multiple processors to run the same processing (including the self-diagnostic program) to confirm the correctness of results. Comparing results from different hardware raises reliability.

Setting example (when PE1 and PE3 are running the same task)

The descriptions of registers of an MISG below applies to the MISG registers of PE1 and PE3.

(1) Initialize the multi-input signature register 1 (MISR1_*), multi-input signature register 2 (MISR2_*), and data counter register (MISRDCNT).

(2) Set the MISR1CND or MISR2CND bit in the MISR control register (MISRCR) to 0 to select signature generation by MISR1 or MISR2 in register write mode.

(3) Set MISR1CMPEN1 or MISR2CMPEN1 in the MISR comparator control register (MISRCMPCTL) to 1 to enable signature comparison by the comparator.

(4) Set the CMPERREN bit in the MISR error notification control register to 1 to enable error notification to the ECM.

(5) Set the CNTTRG bit in the MISR data counter control register (MISRDCNTCTL) to 0 to set writing to MISRCDR_* as the trigger for counting up by the data counter. Set the CNTSTA bit to 1 to enable operation of the data counter.

(6) Set the MISR1EN or MISR2EN bit in the MISR control register to 1 to enable signature generation in MISR1 or MISR2.

(7) Run the self-diagnostic program on all CPUs.

(8) The self-diagnostic program stores intermediate results while the program is running in MISRCDR_* of the signature generation units. The signatures in the MISR1 and MISR2 registers of MISG_PE1 and MISG_PCU are compared whenever the values of the data counter registers (MISRDCNT) of MISG_PE1 and MISG_PCU match.

(9) Check the comparison status register to see if there were errors in comparison.

29.6 Clock Monitors

29.6.1 Overview

This product incorporates the clock monitors to monitor the clock operation by detecting the abnormal frequency of the clock to be monitored. The clock monitors provide the following functions.

- Monitors to see if the frequency of the clock to be monitored is within the specified range based on the sampling clock.
- Issues an error notice to the ECM upon detection of the abnormal state of the clock.

The table below shows the clocks monitored by the clock monitors and the sampling clocks used.

Table 29.121 List of Clocks Monitored by Each Clock Monitor and Sampling Clocks Used

Clock Monitor Channel	Monitor Clock	Sampling Clock
CLMA0	Low-speed peripheral clock (40 MHz SSG)	Unmodulated low-speed peripheral clock (40 MHz clean)
CLMA1	Non-modulated low-speed peripheral clock (40 MHz clean)	10 MHz (1/2 main OSC)
CLMA2	WDTA counter clock (1/80 of the main OSC or LS IntOSC)*1	LS IntOSC (when the WDTA counter clock is 1/80 of the main OSC) or 1/80 of the main OSC (when the WDTA counter clock is LS IntOSC)
CLMA3	LS IntOSC (when the WDTA counter clock is 1/80 of the main OSC) or 1/80 of the main OSC (when the WDTA counter clock is LS IntOSC)	WDTA counter clock (1/80 of the main OSC or the LS IntOSC)*1

Note 1. For switching the WDTA counter clock, see **Section 10, Clock Controller**.

29.6.2 List of Registers

29.6.2.1 Clock Monitor Channel Register

Table 29.122 List of Registers

Module Name	Register Name	Symbol	Address
CLMAn	CLMAn control register 0	CLMAnCTL0	<Base_adr> + 00_H
CLMAn	CLMAn compare register L	CLMAnCMPL	<Base_adr> + 08_H
CLMAn	CLMAn compare register H	CLMAnCMPH	<Base_adr> + $0C_H$
CLMAn	CLMAn protection command register	CLMAnPCMD	<Base_adr> + 10_H
CLMAn	CLMAn protection command register	CLMAnPS	<Base_adr> + 14_H

The base addresses of the registers are shown below.

Table 29.123 List of Base Address Registers

Clock Monitor Channel	<Base_addr>
CLMA0	FFF8 8400_H
CLMA1	FFF8 8420_H
CLMA2	FFF8 8440_H
CLMA3	FFF8 8460_H

29.6.2.2 Shared registers

Table 29.124 List of Shared Registers

Module Name	Register Name	Symbol	Address	Protection
CLMAC	CLMA Self-Test Register	CLMATEST	FFF8 8204_H	PROT1PHCMD*1
CLMAC	CLMA Self-Test Status Register	CLMATESTS	FFF8 8208_H	

Note 1. For this register, see **Section 10, Clock Controller**.

29.6.3 Details of Registers

29.6.3.1 CLMAnCTL0 — CLMAn control register 0

CLMAnCTL0 controls the operation of the clock monitors. CLMAnCTL0 is protected by the CLMAnPCMD register.

CLMAnCTL0 can be initialized by either an internal reset or an external reset.

Access: CLMAnCTL0 is readable/writable in 8-bit units.

Address: CLMAnCTL0 : <Base_adr> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAnCLME
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W*1

Note 1. This register can be cleared by a reset. Writing 0 to this register is ignored.

Table 29.125 CLMAnCTL0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	These bits are always read as 0. When writing, follow the procedure of the protection release sequence and write the value after reset or the inverse.
0	CLMAnCLME	Clock Monitor Operation 0: Disables operation. 1: Enables operation.

29.6.3.2 CLMAnCMPL — CLMAn compare register L

CLMAnCMPL sets the lower limit of the normal frequency range used for comparison.

CLMAnCMPL can be initialized by either an internal reset or an external reset.

Access: CLMAnCMPL is readable/writable in 16-bit units.

Address: CLMAnCMPL : <Base_adr> + 08H

Value after reset: 0001H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPL[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.126 CLMAnCMPL Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	The read value is 0. The write value should be 0.
11 to 0	CLMAnCMPL[11:0]	Lower Limit of Normal Frequency Range These bits can be written to when CLMAnCTL0.CLMAnCLME is 0. Once CLMAnCTL0.CLMAnCLME is set to 1, writing to these bits is invalid.

29.6.3.3 CLMAnCMPH — CLMAn compare register H

CLMAnCMPH sets the upper limit of the normal frequency range used for comparison.

CLMAnCMPH can be initialized by either an internal reset or an external reset.

Access: CLMAnCMPH is readable/writable in 16-bit units.

Address: CLMAnCMPH : <Base_adr> + 0CH

Value after reset: 03FFH

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPH[11:0]											
Value after reset:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.127 CLMAnCMPH Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	The read value is 0. The write value should be 0.
11 to 0	CLMAnCMPH[11:0]	Upper Limit of Normal Frequency Range These bits can be written to when CLMAnCTL0.CLMAnCLME is 0. Once CLMAnCTL0.CLMAnCLME is set to 1, writing to these bits is invalid.

29.6.3.4 CLMAnPCMD — CLMAn protection command register

CLMAnPCMD is a special sequential register for CLMAnCTL0.

CLMAnPCMD can be initialized by either an internal reset or an external reset.

Access: CLMAnPCMD is writable in 8-bit units.

Address: CLMAnPCMD : <Base_adr> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CLMAnPCMD[7:0]							
Value after reset:	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W

See **Section 29.6.6.1, Writing to protected registers** for details on the protection method.

29.6.3.5 CLMAnPS — CLMAn protection command status register

CLMAnPS is a special sequential register for CLMAnCTL0.

CLMAnPS can be initialized by either an internal reset or an external reset

Access: CLMAnPS is readable in 8-bit units.

Address: CLMAnPS : <Base_adr> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAnPRERR
Value after reset:	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 29.128 CLMAnPS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	These bits are always read as 0.
0	CLMAnPRERR	Protection Error Detection 0: A protection error has not occurred. 1: A protection error has occurred.

Operating conditions of the CLMAnPRERR bit:

Setting condition: Access to CLMAnCTL0, which is the target for protection specified by CLMAnPCMD, without following the protection cancelling sequence.

Clearing condition: Writing of $A5_H$ to the CLMAnPCMD register (step 1 in the protection cancelling sequence).

29.6.3.6 CLMATEST — CLMA self-test register

CLMATEST is used for self-testing of CLMA3 to CLMA0.

CLMATEST can be protected by the PROT1PHCMD register.

CLMATEST is initialized by an internal reset or an external reset.

Access: CLMATEST is readable/writable in 32-bit units.

Address: CLMATEST : FFF8 8204H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CLMA3 TESTEN	CLMA2 TESTEN	CLMA1 TESTEN	CLMA0 TESTEN	ERRMSK	MONCL KMSK	RESCLM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.129 CLMATEST Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	These bits are always read as 0. When writing, follow the procedure of the protection release sequence and write the value after reset or the inverse.
6 to 3	CLMA3TESTEN CLMA2TESTEN CLMA1TESTEN CLMA0TESTEN	These bits enable or disable self-testing of CLMA3 to CLMA0. 0: Disables self-testing of the corresponding CLMAn. 1: Enables self-testing of the corresponding CLMAn.
2	ERRMSK	Masks an error notification to the ECM when CLMAn detects an error. When the ERRMSK is set for a certain CLMAn, the associated CLMAn does not issue an error notification to the ECM even if it detects an error. ERRMSK setting is valid only for the CLMAn for which CLMAnTESTEN (n = 0 to 3) is set to 1. 0: Does not mask an error notification to the ECM. 1: Masks an error notification to the ECM.
1	MONCLKMSK	Fixes the level of the clock input to the CLMAn that should be monitored, to the low level. Setting of MONCLKMSK is valid only for the CLMAn for which CLMAnTESTEN (n = 0 to 3) is set to 1. 0: Does not fix the clock input to the CLMAn that should be monitored to the low level. 1: Fixes the clock input to the CLMAn that should be monitored to the low level.
0	RESCLM	Initializes CLMAn forcibly. RESCLM setting is valid only for the CLMAn for which CLMAnTESTEN (n = 0 to 3) is set to 1. 0: Does not initialize CLMAn. 1: Initializes CLMAn

29.6.3.7 CLMATESTS — CLMA self-test status register

CLMATESTS indicates the self-testing result of CLMA3 to CLMA0.

CLMATESTS is initialized by an internal reset or an external reset.

Access: CLMATESTS is readable in 32-bit units.

Address: CLMATESTS : FFF8 8208H

Value after reset: 0000 0000H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CLMA3 ERRS	CLMA2 ERRS	CLMA1 ERRS	CLMA0 ERRS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.130 CLMATESTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	These bits are always read as 0.
3 to 0	CLMA3ERRS CLMA2ERRS CLMA1ERRS CLAM0ERRS	These bits indicate whether or not CLMA3 to CLMA0 have detected an error. These bits are not affected by CLMATEST.ERRMSK. 0: The corresponding CLMAn has not detected an error. 1: The corresponding CLMAn has detected an error.

29.6.4 Detection of Abnormal Clock Frequency

1. CLMAn counts the number of rising edges of the monitored clock signal within 16 sampling clock cycles, and compares the count with the specified thresholds.
   - The lower threshold is specified using the CLMAnCMPL[11:0] bits in CLMAnCMPL register.
   - The upper threshold is specified using the CLMAnCMPH[11:0] bits in CLMAnCMPH register.
2. When the frequency of the monitored clock is so low*1 that the counter value falls below the value set in CLMAnCMPL[11:0] in the CLMAnCMPL register, CLMAn notifies the ECM of the abnormal clock. CLMAn also notifies the ECM of the abnormal clock when the clock frequency is so high that the counter value exceeds the value set in CLMAnCMPH[11:0] in the CLMAnCMPH register.

Note that even if the frequency of the monitored clock fluctuates during the sampling period, an error is not notified as long as the number of detected edges falls within the specified range.

Note 1. The abnormal state of the clock may not be detected when the monitored clock comes to a complete stop.

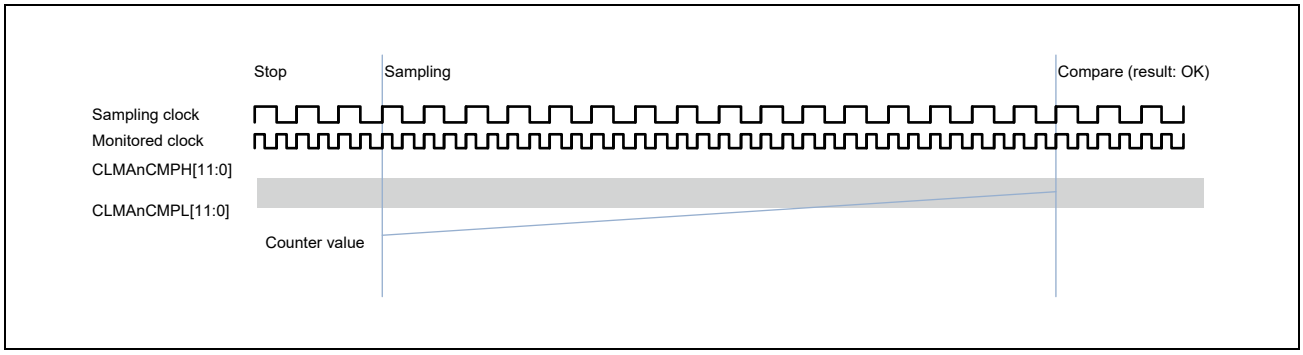

Figure 29.11 Operation when Clock Frequency is within the Specified Range

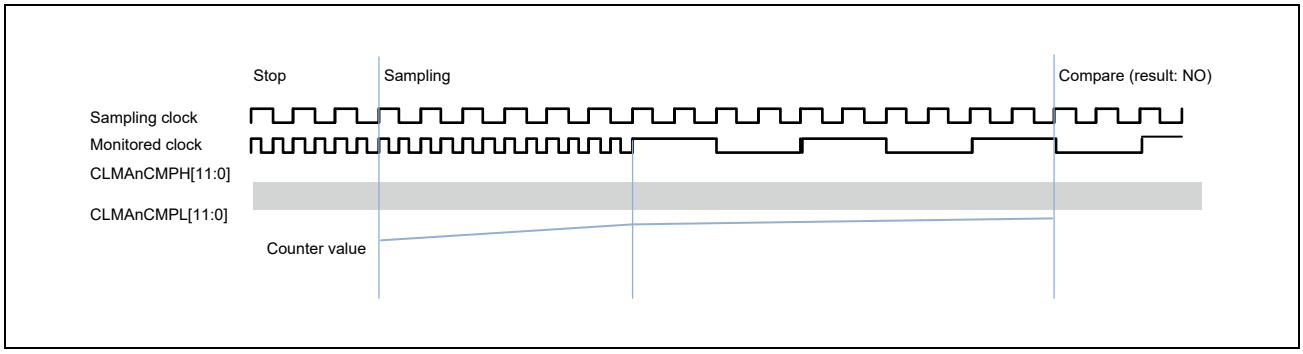

Figure 29.12 Operation when Clock Frequency is Lower than the Specified Range

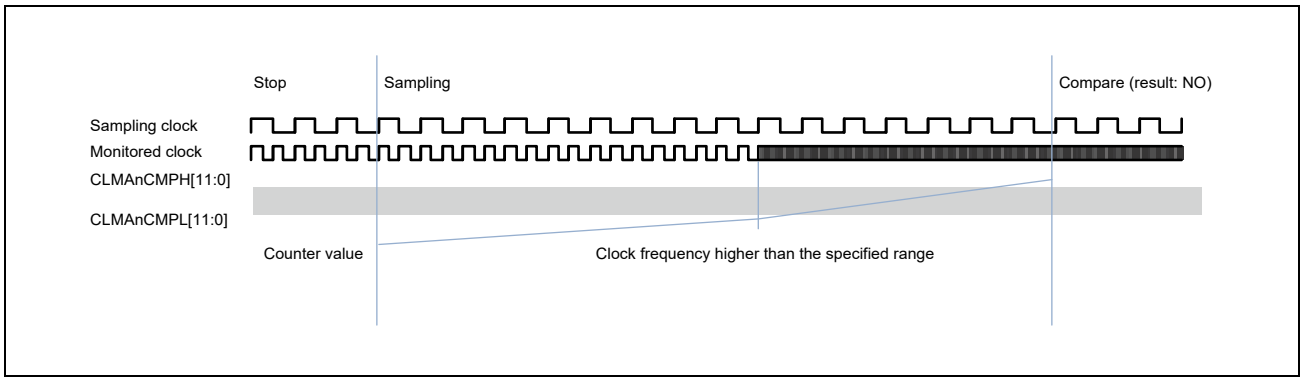

Figure 29.13 Operation when Clock Frequency is Higher than the Specified Range

(1) Calculating the thresholds set by CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]

The minimum and maximum values of the clock cycles of the monitored clock CLMATMON that are assumed to be valid within 16 cycles of the sampling clock CLMATSMP are set in the comparison registers CLMAnCMPL and CLMAnCMPH.

The expected clock cycle is indicated by "N".

$$\frac{16}{f_{CLMATSMP}} = \frac{N}{f_{CLMATMON}}$$

$$N = \frac{f_{CLMATMON}}{f_{CLMATSMP}} \times 16$$

Considering the allowed frequency deviations of CLMATMON and CLMATSMP, the threshold values can be calculated by the following formulas:

Lower threshold $= N_{min}$

$$= \frac{f_{CLMATMON\ (min)}}{f_{CLMATSMP\ (max)}} \times 16 - 1$$

Upper threshold $= N_{max}$

$$= \frac{f_{CLMATMON\ (max)}}{f_{CLMATSMP\ (min)}} \times 16 + 1$$

NOTE

PLL jitter is covered by " + 1" and " – 1" as in the formulas.

Example

If $f_{CLMATSMP}$ = 240 kHz (±8%) and $f_{CLMATMON}$ = 16 MHz (±5%), the recommendable thresholds will be as follows:

N_{min} = 15,200 / 259.2×16 – 1

= 937.27

CLMAnCMPL = 937 = $03A9_H$

N_{max} = 16,800 / 220.8×16 + 1

= 1,218.39

CLMAnCMPH = 1,219 = $04C3_H$

Minimum threshold:

The following restrictions must be taken into consideration.

- CLMAnCMPL ≥ 0001_H
- CLMAnCMPH ≥ CLMAnCMPL + 0003_H

(2) Definition of initial values input to the threshold registers

The values of the threshold registers after a reset are as follows.

- CLMAnCMPL [11:0] = 001_H
- CLMAnCMPH [11:0] = $3FF_H$

29.6.5 Self-Diagnosis

Self-diagnosis of the clock monitor is available as described below.

(1) Set the thresholds for the clock monitor to be subject to self-diagnosis (set CLMAnCMPL and CLMAnCMPH). At this time, the thresholds must be set such that an error will be produced.

(2) Specify the clock monitor to be subject to self-diagnosis.
Setting the CLMATEST.CLMAnTESEN bit to 1 enables specifying the corresponding clock monitor to be subject to self-diagnosis.

(3) To prevent error notice to the ECM based on self-diagnosis, set CLMATEST.ERRMSKL simultaneously with step (2).

(4) Set the CLMAnCTL0.CLMAnCLME bit to 1 to enable operation for clock monitoring.

(5) Wait for the time long enough to allow error occurrence, read the CLMATESTS register to see if an error has been generated in the clock monitor to be self-diagnosed. The time from the start of self-diagnosis to the error occurrence depends on the sampling period. A maximum of two sampling cycles are required.

(6) Clear the error generated by self-diagnosis.
Setting CLMATEST.RESCLM to 1 enables initializing the clock monitor to be self-diagnosed.

(7) Terminate self-diagnosis.
Setting all the bits in CLMATEST to 0 enables terminating self-diagnosis.

Before restarting the clock monitor that has been self-diagnosed, set the registers again as required.

29.6.6 Notes on Register Setting

29.6.6.1 Writing to protected registers

Writing to the CLMAnCTL0 register (n = 0 to 3) of each clock monitor is only possible with the protection release sequence described below.

Procedure

(1) Write the fixed value ($A5_H$) to register CLMAnPCMD.

(2) Write the new setting to register CLMAnCTL0. Write the value after a reset to the reserved bits.

(3) Write the bitwise inverse of the setting value to register CLMAnCTL0. Write the inverse of the value after a reset to the reserved bits.

(4) Write the new setting to register CLMAnCTL0. Write the value after a reset to the reserved bits.

A value can only be written to a write-protected register by following the procedure above.

Protection is not released if the procedure is not followed correctly. The setting will not be written to the write-protected register and the CLMAnPS.CLMAnPRERR bit will be set to 1. (You can confirm if the values set in the targeted register was correctly written by checking that the setting of the CLMAnPS.CLMAnPRERR bit is 0 after step 4, although this procedure is not a requirement).

In case of failure to follow the sequence, repeat the procedure from the beginning.

In case of writing to another register during steps (1) to (4) of the sequence, the protection function operates as follows. Operation is also as described when any interrupt is accepted during the sequence and the interrupt handling includes access to another register.

- When the writing is to another register in the same module*1, writing to the protected register fails and the CLMAnPS.CLMAnPRERR bit is set to 1.
- When writing is to a register in another module, writing to the protected register will successfully proceed to completion, if the remainder of the procedure is followed correctly.

Reading of another register while the sequence is in progress does not lead to failure.

For writing to CLMATEST, see the description of the PROT1PHCMD register.

Note 1. “Another register in the same module” indicates a register under the same module name as that containing the write-protected register. For the module names of the registers, see **Section 29.6.2, List of Registers**.

29.6.6.2 Setting CLMAnCMPL/CLMAnCMPH register

The CLMAnCMPL/CLMAnCMPH registers should be set so that the following conditions are satisfied. If the clock monitor is otherwise used, operation cannot be guaranteed.

- $1 \leq$ CLMAnCMPL
- CLMAnCMPL + 3 $\leq$ CLMAnCMPH (n = 0, 1, 2, 3)

29.7 ECM

The ECM monitors various failure detection states in the LSI chip, and defines the operation to be carried out upon failure detection. For the details of the ECM, see **Section 30, Error Control Module (ECM)**.

Section 30 Error Control Module (ECM)

This section describes an error control module (ECM).

The first part of this section describes all RH850/C1M-A specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the ECM.

30.1 Features of RH850/C1M-A ECM

30.1.1 Number of Units

This microcontroller has the following number of units of the ECM.

Table 30.1 Number of Units

Product	RH850/C1M-A
Number of Units	1
Name	ECM

30.1.2 Register Base Address

ECM base addresses are listed in the following table.

ECM register addresses are given as offsets from the base addresses in general.

Table 30.2 Register Base Address

Base Address Name	Base Address
ECM master <ECMM_base>	FFCB 0000_H
ECM checker <ECMC_base>	FFCB 1000_H
ECM common part <ECM_base>	FFCB 2000_H

30.1.3 Clock Supply

ECM clock is listed in the following table.

Table 30.3 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
ECM	PCLK	CLK_LSB (Low-speed peripheral clock)

30.1.4 Interrupt and DMA/DTS

ECM interrupt requests are listed in the following table.

Table 30.4 Interrupt Request

Interrupt Name	Interrupt Number	DMA Trigger Number		DTS Trigger Number	
		1st	2nd	1st	2nd
Error control module NMI interrupt	(FEINT)	—	—	—	—
Error control module interrupt	8	—	—	—	—

Note: The ECM does not support DMA or DTS trigger sources.

30.1.5 Reset Sources

ECM reset sources are listed in the following table. ECM is initialized by these reset sources.

However, the ECM master/checker error source status register is initialized only by external reset. For details, see **Section 30.3, Registers (30.3.4, 30.3.5)**.

Table 30.5 Reset Sources

Unit Name	Reset Source
ECM	Reset by all reset sources.

30.1.6 External Input/Output Signals

External input/output signals of ECM are listed in the following table.

Table 30.6 External Input/Output Signals

Unit Signal Name	Description	Pin Signal Name
$\overline{\text{ERROROUT_M}}$	ERROROUT pin (master)	$\overline{\text{ERROROUT_M}}$
$\overline{\text{ERROROUT_C}}$	ERROROUT pin (checker)	$\overline{\text{ERROROUT_C}}$

30.2 Overview

30.2.1 Function Overview

The error control module (ECM) collects error signals coming from different error sources and monitoring circuits. It also outputs error signals from the ERROROUT pins ($\overline{\text{ERROROUT_M}}$ and $\overline{\text{ERROROUT_C}}$) and generates interrupts and internal reset signals. **Table 30.7** lists the functions of ECM.

Table 30.7 List of Functions

Item	Description
Safety processing	ECM can handle the following processing in response to error signal inputs from individual modules. • Error flag set • Maskable interrupt generation Maskable interrupt generation can be controlled (enabled/disabled) for individual errors. • FE level interrupt generation FE level interrupt generation can be controlled (enabled/disabled) for individual errors. • Internal reset generation Internal reset generation can be controlled (enabled/disabled) for individual errors. • ERROROUT output Pin output mask can be controlled (enabled/disabled) for individual errors. Output can be toggled in response to a timer input or made at a fixed level.
Error status	ECM incorporates the ECM master/checker error source status register, which can be used to confirm the error status from the error flag. The error flags are only cleared by an external reset or by writing the corresponding bit of the ECM error source status clear trigger register to 1. In case of an internal reset, the error flags are kept and the reset generation source can be confirmed by reading the ECM master/checker error source status register after reset.
Debug, self-diagnosis	Pseudo errors can be generated for debug and self-diagnosis. The operation during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for the mask to the ERROROUT output, interrupt, or internal reset apply in the same way. • ECM incorporates a loop-back function of the ERROROUT output that is used to diagnose the path to the ERROROUT pin. The status of the ERROROUT pin is reflected to the ECM master/checker error source status register and can be confirmed by reading the register.
Timeout function	ECM incorporates a function that generates an ERROROUT output or internal reset when the value counted by the delay timer matches with the ECM delay timer compare register because the delay timer was not stopped during the interrupt processing after being started simultaneously with the occurrence of an interrupt request. The value counted by the delay timer is in cycles of the low-speed peripheral clock.
Register protection	A write-protection with a special sequence is incorporated to protect registers from inadvertent write access.
Others	ECM is duplexed. The ERROROUT pin is duplexed to the two pins of the master pin and the checker pin. The ERROROUT outputs from the ECM master and ECM checker are constantly compared. If they do not match, an ECM compare error (error source 26) occurs.

30.2.2 Block Diagram

Figure 30.1 is a block diagram of the ECM.

The ERROROUT output, internal reset, and ERROROUTZ signals are active low, while the maskable and FE level interrupt signals are active high.

Note that the ERROROUTZ signal for PIC1B is not toggled even if the ECM is in dynamic mode.

See **Section 24, Peripheral Interconnection (PIC)** for details on PIC.

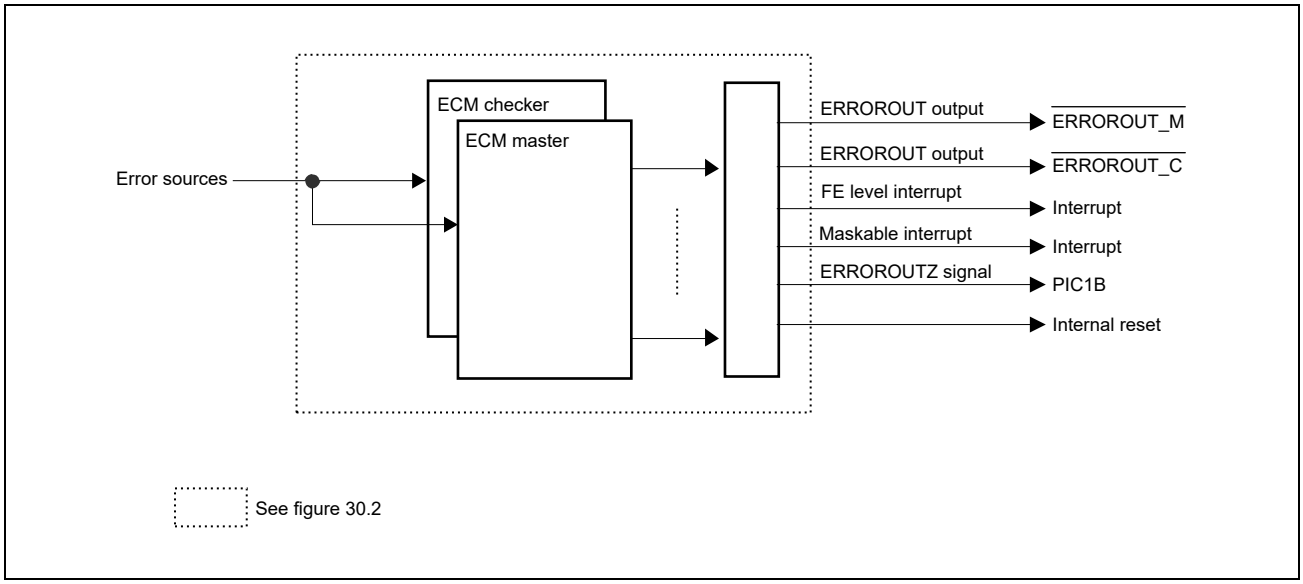

Figure 30.1 Outline of ECM

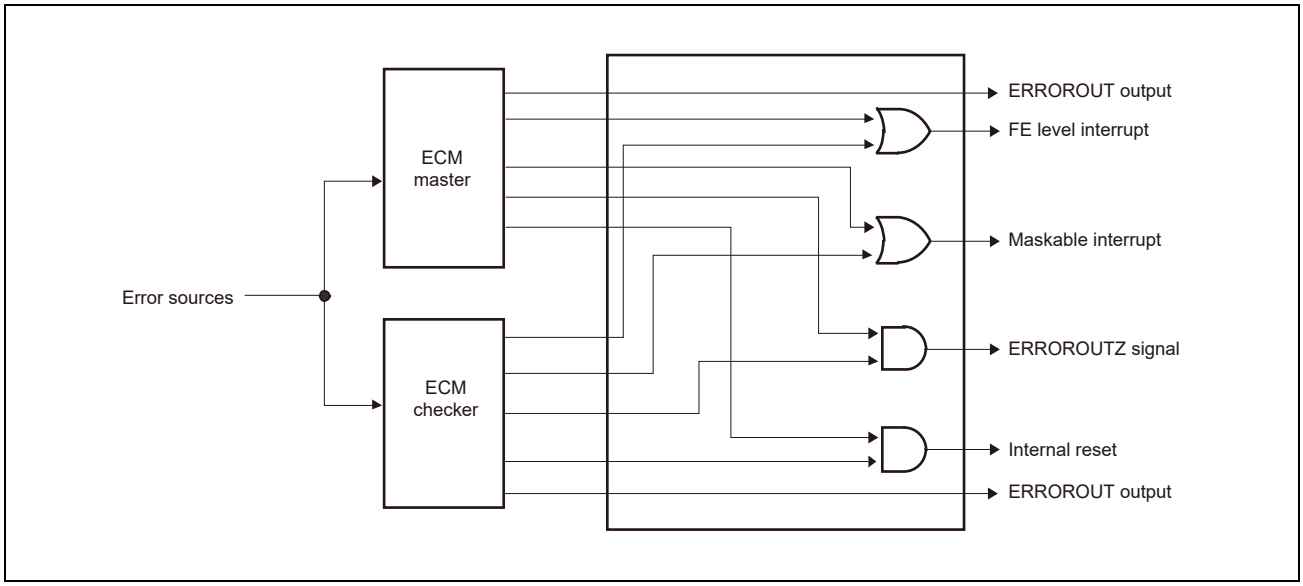

Figure 30.2 Connection of ECM

30.2.3 Error Sources and Safety Processing

Table 30.8 lists the error sources and safety processing of the ECM of RH850/C1M-A.

Table 30.8 List of Error Sources and Safety Processing (1/2) (√: supported,—: not supported)

Error Source No.	Module	Error Source	Error Flag Set	Maskable Interrupt	FE Level Interrupt	Internal reset	ERROR OUT Output	Delay Timer Start
0	WDTA	WDTA error*2	√	√	√	√ *1	√	√

Note 1. In the initial state, generation of an internal reset is allowed.
Note 2. For the details of this error, see **Section 16, Window Watchdog Timer A (WDTA)**.
Note 3. For the details of this error, see **Section 29, Functional Safety**.
Note 4. For the details of this error, see **Section 3, CPU System**.
Note 5. For the details of this error, see **Table 30.7, List of Functions**.
Note 6. For the details of this error, see **Section 27, A/D Converter (ADCC)**.
Note 7. For the details of the errors No. 38 and No. 39, refer to the *RH850/C1M-A Flash Memory User's Manual: Hardware Interface*.
Note 8. For the details of this error, see **Section 7, DMA Controller**.
Note 9. For the details of this error, see **Section 17, OS Timer (OSTM)**.
Note 10. For the details of this error, see **Section 20, Motor Control Timer (TSG3)**.
Note 11. For the details of this error, see **Section 25, Enhanced Motor Control Unit 3 (EMU3)**.
Note 12. For the details of this error, see **Section 26, R/D Converter (RDC3A)**.
Note 13. Operation of the device is not guaranteed if an FACI reset transfer error has occurred. When clearing the error signal output by the ERROROUT pin after release from the reset state, confirm that an FACI reset transfer error has not occurred by checking that an error state is not being indicated again.

Error sources are merged as described in **Table 30.9**.

Table 30.9 Merging of Error Sources (1/2)

Error Source No.	Module	Error Source	Note
0	WDTA	WDTA error (WDTA0, WDTA1)	Errors of WDTA0 and WDTA1 are merged. In the initial state, generation of an internal reset is allowed.
6	RAM	Local RAM (CPU1, CPU2): 2-bit ECC error and address parity error	2-bit ECC errors and address parity errors of the local RAM for CPU1and CPU2 are merged.
7		Local RAM (CPU1, CPU2): 1-bit ECC error and parity bit error	1-bit ECC errors and parity bit errors of the local RAM for CPU1, CPU2 are merged.
8		Global RAM: 2-bit ECC error and address parity error	2-bit ECC errors and address parity errors when global RAM is accessed from each master are merged.
9		Global RAM: 1-bit ECC error and parity bit error	1-bit ECC errors and parity bit errors when global RAM is accessed from each master are merged.
10		Peripheral RAM (CAN, CSIH, DTS): 2-bit ECC error	2-bit ECC errors of the RAM for peripheral circuits are merged.
11		Peripheral RAM (CAN, CSIH, DTS): 1-bit ECC error	1-bit ECC errors of the RAM for peripheral circuits are merged.
12	Code flash	Code flash 2-bit ECC error Code flash address parity error	2-bit ECC errors when code flash is accessed from CPU1 and CPU2 are merged.
13		Code flash 1-bit ECC error	1-bit ECC errors when code flash is accessed from CPU1 and CPU2 are merged.
14	Instruction cache	Instruction cache data (CPU1, CPU2): 2-bit ECC error	2-bit ECC errors of PE1 and PE2 cache data array are merged.
15		Instruction cache data (CPU1, CPU2): 1-bit ECC error	1-bit ECC errors of PE1 and PE2 cache data array are merged.
16		Instruction cache tag (CPU1, CPU2): 2-bit ECC error	2-bit ECC errors of PE1 and PE2 cache data array are merged.
17		Instruction cache tag (CPU1, CPU2): 1-bit ECC error	1-bit ECC errors of PE1 and PE2 cache tag array are merged.
20	PE guard (PEG)	PEG error (CPU1, CPU2, SubCPU)	PEG errors of CPU1, CPU2, and SubCPU are merged.
21	Global RAM Guard (GRG)	GRG error	GRG errors for each access path of CPU1, CPU2, and DMA are merged.

Table 30.9 Merging of Error Sources (2/2)

Error Source No.	Module	Error Source	Note
22	PBG	PBG error	PBG errors for each peripheral circuit are merged.
25	Data parity	Data parity error	Data parity errors of each access path are merged.
31	SubCPU RAM 2-bit ECC error	Local RAM (SubCPU): 2-bit ECC error and address parity error, Instruction cache data (SubCPU): 2-bit ECC error, Instruction cache tag (SubCPU): 2-bit ECC error	2-bit ECC errors and address parity errors of the local RAM of the SubCPU, 2-bit ECC errors of cache data array, and 2-bit ECC errors of cache tag array are merged.
32	SubCPU RAM 1-bit ECC error	Local RAM (SubCPU): 1-bit ECC error and address parity error, Instruction cache data (SubCPU): 1-bit ECC error, Instruction cache tag (SubCPU): 1-bit ECC error	1-bit ECC errors and address parity errors of local RAM of the SubCPU, 1-bit ECC errors of cache data array, and 1-bit ECC errors of cache tag array are merged.
33	SubCPU code flash	Code flash 2-bit ECC error Code flash address parity error	2-bit ECC errors when code flash is accessed from SubCPU are merged.
34		Code flash 1-bit ECC error	1-bit ECC errors when code flash is accessed from SubCPU are merged.
37	ADCC	AD parity error	AD parity errors or ADCC0, ADCC1, and ADCC2 are merged.
40	EMU3	EMU3 error signal	EMU30 interrupt 7 and EMU31 interrupt 7 are merged.
41	DMA	DTS RAM Data 2-bit and 1-bit ECC errors	2-bit and 1-bit ECC errors of DTS RAM are merged.
42	Duplex	Error detection using on-chip self-diagnostic (duplex) circuit	Errors of each self-diagnostic circuit are merged.
46	TSG3	TSG3 error (INTTSG3nIER)	Errors of TSG30, TSG31, and TSG32 are merged.
47	RDC3A	RDC3A error detection	Errors of RDC3A0 and RDC3A1are merged.

Note: Error sources not listed in **Table 30.9** are not merged.

30.3 Registers

30.3.1 List of Registers

ECM registers are assigned to three address areas: the address area for ECM common registers, the address area for ECM master registers, and the address area for ECM checker registers. The address area for ECM common registers is used for both master and checker registers. Writing to this common area is performed by master and checker registers simultaneously. Reading from the common area reads the master register's value. ECM master and checker registers can be written separately.

The ECM master registers are listed in the following table.

See **Section 30.1.2, Register Base Address** for <ECMM_base>, <ECMC_base>, and <ECM_base>.

Table 30.10 List of Registers (ECM Master)

Module Name	Register Name	Symbol	Protection by Sequence	Address
ECMM	ECM master error set trigger register	ECMMESET	Protected	<ECMM_base> + 00_H
ECMM	ECM master error clear trigger register	ECMMECLR	Protected	<ECMM_base> + 04_H
ECMM	ECM master error source status register 0	ECMMESSTR0	Not protected	<ECMM_base> + 08_H
ECMM	ECM master error source status register 1	ECMMESSTR1	Not protected	<ECMM_base> + $0C_H$
ECMM	ECM master protection command register	ECMMPCMD0	Not protected	<ECMM_base> + 10_H

The ECM checker registers are listed in the following table.

Table 30.11 List of Registers (ECM Checker)

Module Name	Register Name	Symbol	Protection by Sequence	Address
ECMC	ECM checker error set trigger register	ECMCESET	Protected	<ECMC_base> + 00_H
ECMC	ECM checker error clear trigger register	ECMCECLR	Protected	<ECMC_base> + 04_H
ECMC	ECM checker error source status register 0	ECMCESSTR0	Not protected	<ECMC_base> + 08_H
ECMC	ECM checker error source status register 1	ECMCESSTR1	Not protected	<ECMC_base> + $0C_H$
ECMC	ECM checker protection command register	ECMCPCMD0	Not protected	<ECMC_base> + 10_H

The ECM common part registers are listed in the following table.

Table 30.12 List of Registers (ECM Common Part)

Module Name	Register Name	Symbol	Protection by Sequence	Address
ECM	ECM error pulse configuration register	ECMEPCFG	Protected	<ECM_base> + 00_H
ECM	ECM maskable interrupt configuration register 0	ECMMICFG0	Protected	<ECM_base> + 04_H
ECM	ECM maskable interrupt configuration register 1	ECMMICFG1	Protected	<ECM_base> + 08_H
ECM	ECM FE level interrupt configuration register 0	ECMNMICFG0	Protected	<ECM_base> + $0C_H$
ECM	ECM FE level interrupt configuration register 1	ECMNMICFG1	Protected	<ECM_base> + 10_H
ECM	ECM internal reset configuration register 0	ECMIRCFG0	Protected	<ECM_base> + 14_H
ECM	ECM internal reset configuration register 1	ECMIRCFG1	Protected	<ECM_base> + 18_H
ECM	ECM error mask register 0	ECMEMK0	Protected	<ECM_base> + $1C_H$
ECM	ECM error mask register 1	ECMEMK1	Protected	<ECM_base> + 20_H
ECM	ECM error source status clear trigger register 0	ECMESSTC0	Protected	<ECM_base> + 24_H
ECM	ECM error source status clear trigger register 1	ECMESSTC1	Protected	<ECM_base> + 28_H
ECM	ECM protection command register	ECMPCMD1	Not protected	<ECM_base> + $2C_H$
ECM	ECM protection status register	ECMPS	Not protected	<ECM_base> + 30_H
ECM	ECM pseudo error trigger register 0	ECMPE0	Protected	<ECM_base> + 34_H
ECM	ECM pseudo error trigger register 1	ECMPE1	Protected	<ECM_base> + 38_H
ECM	ECM delay timer control register	ECMDTMCTL	Protected	<ECM_base> + $3C_H$
ECM	ECM delay timer register	ECMDTMR	Not protected	<ECM_base> + 40_H
ECM	ECM delay timer compare register	ECMDTMCMP	Protected	<ECM_base> + 44_H
ECM	ECM delay timer configuration register 0	ECMDTMCFG0	Protected	<ECM_base> + 48_H
ECM	ECM delay timer configuration register 1	ECMDTMCFG1	Protected	<ECM_base> + $4C_H$
ECM	ECM delay timer configuration register 2	ECMDTMCFG2	Protected	<ECM_base> + 50_H
ECM	ECM delay timer configuration register 3	ECMDTMCFG3	Protected	<ECM_base> + 54_H

30.3.2 ECMmESET (m = M/C) ─ ECM Master/Checker Error Set Trigger Register

The ECM master/checker error set trigger register is for selecting output of the error signal from the ERROROUT pin. When the ECMmEST bit is set to 1, the ERROROUT pin immediately outputs the error signal. The output cannot be masked. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence. This register is always read as 00_H.

Access: This register can be written in 8-bit units.

Address: <ECMM_base>
<ECMC_base>

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMmEST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 30.13 ECMmESET Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
0	ECMmEST	Error Set Trigger 0: Writing 0 is invalid 1: Set the output level from the ERROROUT pin to error output.

CAUTIONS

Setting the ERROROUT output from the ERROROUT pin via the ECMmESET register will set the ECMmSSE026 bit of the ECMmESSTR0 register (ECM compare error). Therefore, the ECMmESET register has to be set following the sequence below.

1. Set the ECMEMK026 bit of the ECMEMK0 register to “masked”.
2. Prevent the generation of interrupts by setting the ECMMIE026 bit of the ECMMICFG0 register to “prohibited” and the ECMNMIE026 bit of the ECMNMICFG0 register to “prohibited”.
3. Prevent generation of an internal reset by setting the ECMIRE026 bit of the ECMIRCFG0 register to “prohibited”.
4. Set the ERROROUT output with the ECMmESET register.
5. Clear error flags by setting the ECMCLSSE026 bit of the ECMESSTC0 register.
6. Make the following settings in accord with the condition of usage for the ECM compare error.
   • To allow output of the ERROROUT signal from the ERROROUT pin, set the ECMEMK026 bit of the ECMEMK0 register to “not masked”.
   • To enable generation of interrupts, set the ECMMIE026 bit of the ECMMICFG0 register to “enabled” or the ECMNMIE026 bit of the ECMNMICFG0 register to “enabled”.
   • To enable generation of an internal reset, set the ECMIRE026 bit of the ECMIRCFG0 register to “enabled”.

30.3.3 ECMmECLR (m = M/C) ─ ECM Master/Checker Error Clear Trigger Register

The ECM master/checker error clear trigger register is for setting the error signal from the ERROROUT pin to normal output. When the ECMmECT bit is set to 1, the ERROROUT pin immediately outputs a signal to indicate normal operation as long as no sources lead to setting of the ERROROUT pin to indicate an error. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence. This register is always read as 00_H.

Access: This register can be written in 8-bit units.

Address: <ECMM_base> + 04_H
<ECMC_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMmECT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 30.14 ECMmECLR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
0	ECMmECT	Error Clear Trigger 0: Writing 0 is invalid 1: Set the output level from the ERROROUT pin to normal output.

CAUTIONS

Clearing of the ERROROUT output is only possible if all errors, not masked by ECMEMK0/1, are cleared beforehand.

Clearing the ERROROUT output via the ECMmECLR register will set the ECMmSSE026 bit of the ECMmESSTR0 register (ECM compare error). Therefore, the ECMmECLR register has to be set following the sequence below.

1. Set the ECMEMK026 (ECM compare error) bit of the ECMEMK0 register to “masked”.
2. Disable interrupts by setting the ECMMIE026 bit of the ECMMICFG0 register to “disabled” and the ECMNMIE026 bit of the ECMNMICFG0 register to “disabled”.
3. Disable an internal reset by setting the ECMIRE026 bit of the ECMIRCFG0 register to “disabled”.
4. Use the ECMmECLR register to clear the ERROROUT output.
5. Clear error flags by setting the ECMCLSSE026 bit of the ECMESSTC0 register.
6. Make the following settings in accord with the condition of usage for the ECM compare error.
   • To allow output of the ERROROUT signal from the ERROROUT pin, set the ECMEMK026 bit of the ECMEMK0 register to “not masked”.
   • To enable generation of interrupts, set the ECMMIE026 bit of the ECMMICFG0 register to “enabled” or the ECMNMIE026 bit of the ECMNMICFG0 register to “enabled”.
   • To enable generation of an internal reset, set the ECMIRE026 bit of the ECMIRCFG0 register to “enabled”.

30.3.4 ECMmESSTR0 (m = M/C) ─ ECM Master/Checker Error Source Status Register 0

The ECM master/checker error source status register 0 indicates the state of individual error sources, which is irrelevant to the setting of the error mask. The status can be cleared only by an external reset or by writing 1 to the corresponding bit of the ECM error source status clear trigger register 0. An internal reset will not affect this register.

Access: This register can be read in 32-bit units.

Address: <ECMM_base> + 08_H
<ECMC_base> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECMmSSE031	ECMmSSE030	ECMmSSE029	ECMmSSE028	ECMmSSE027	ECMmSSE026	ECMmSSE025	—	—	ECMmSSE022	ECMmSSE021	ECMmSSE020	ECMmSSE019	ECMmSSE018	ECMmSSE017	ECMmSSE016
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMmSSE015	ECMmSSE014	ECMmSSE013	ECMmSSE012	ECMmSSE011	ECMmSSE010	ECMmSSE009	ECMmSSE008	ECMmSSE007	ECMmSSE006	ECMmSSE005	ECMmSSE004	—	ECMmSSE002	ECMmSSE001	ECMmSSE000
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.15 ECMmESSTR0 Register Contents

Bit Position	Bit Name	Function
31 to 25	ECMmSSE031 to ECMmSSE025	Error Source Status ECMmSSE031 to ECMmSSE025 correspond to error sources 31 to 25. 0: Error not occurred 1: Error occurred
24, 23	—	Reserved. When read, the value returned is undefined.
22 to 4	ECMmSSE022 to ECMmSSE004	Error Source Status ECMmSSE022 to ECMmSSE004 correspond to error sources 22 to 4. 0: Error not occurred 1: Error occurred
3	—	Reserved. When read, the value returned is undefined.
2 to 0	ECMmSSE002 to ECMmSSE000	Error Source Status ECMmSSE002 to ECMmSSE000 correspond to error sources 2 to 0. 0: Error not occurred 1: Error occurred

30.3.5 ECMmESSTR1 (m = M/C) ─ ECM Master/Checker Error Source Status Register 1

The ECM master/checker error source status register 1 indicates the state of individual error sources, which is irrelevant to the setting of the error mask. The status can be cleared only by writing 1 to the corresponding bit of the ECM error source status clear trigger register 1 or by an external reset. An internal reset will not affect this register.

Access: This register can be read in 32-bit units.

Address: <ECMM_base> + $0C_H$
<ECMC_base> + $0C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECMmSSE131	ECMmSSE130	ECMmSSE129	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMmSSE115	ECMmSSE114	ECMmSSE113	ECMmSSE112	ECMmSSE111	ECMmSSE110	ECMmSSE109	ECMmSSE108	ECMmSSE107	ECMmSSE106	ECMmSSE105	—	—	ECMmSSE102	ECMmSSE101	ECMmSSE100
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.16 ECMmESSTR1 Register Contents

Bit Position	Bit Name	Function
31	ECMmSSE131	Indicates the ERROROUT output loopback status. 0: ERROROUT output is error output. 1: ERROROUT output is normal output.
30	ECMmSSE130	Indicates the ECMmESET write status. 0: No error 1: Error is set by the ECMmEST bit of the ECMmESET register
29	ECMmSSE129	Indicates whether delay timer overflow has occurred. 0: Delay timer overflow not occurred 1: Delay timer overflow occurred
28 to 16	—	Reserved. When read, the value returned is undefined.
15 to 5	ECMmSSE115 to ECMmSSE105	Error Source Status ECMmSSE115 to ECMmSSE105 correspond to error sources 47 to 37. 0: Error not occurred 1: Error occurred
4, 3	—	Reserved. When read, the value returned is undefined.
2 to 0	ECMmSSE102 to ECMmSSE100	Error Source Status ECMmSSE102 to ECMmSSE100 correspond to error sources 34 to 32. 0: Error not occurred 1: Error occurred

30.3.6 ECMmPCMD0 (m = M/C) ─ ECM Master/Checker Protection Command Register

The ECM master/checker protection command register protects the write-protected registers against illegal writing due to incorrect operation of the program, etc.

Refer to **Section 30.3.1, List of Registers**, for the registers to be protected by the ECM master/checker protection command register.

Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECMM_base> + 10_H
<ECMC_base> + 10_H

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset								Undefined								
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ECMmREG0[7:0]							
Value after reset								Undefined								
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 30.17 ECMmPCMD0 Register Contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved. When writing to these bits, write 0.
7 to 0	ECMmREG0[7:0]	Protection command that enables writing to write protected ECMm registers. Fixed value 0000 00A5$_H$

30.3.7 ECMEPCFG ─ ECM Error Pulse Configuration Register

The ECM error pulse configuration register sets the type of ERROROUT signal that is output on the ERROROUT pin. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be read/written in 8-bit units.

Address: <ECM_base>

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMSL0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 30.18 ECMEPCFG Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
0	ECMSL0	ERROROUT Pin Operation Configuration Setting for the type of ERROROUT signal that is output on the ERROROUT pin 0: Non-dynamic mode 1: Dynamic mode

30.3.8 ECMMICFG0 ─ ECM Maskable Interrupt Configuration Register 0

The ECM maskable interrupt configuration register 0 is used to set the generation of ECM maskable interrupts. The generation of maskable interrupts in response to errors is selectable. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 04_H

Value after reset: $0000\ 0000_H$

Table 30.19 ECMMICFG0 Register Contents

Bit Position	Bit Name	Function
31 to 25	ECMMIE031 to ECMMIE025	ECM Maskable Interrupt Generation Control ECMMIE031 to ECMMIE025 correspond to error sources 31 to 25. 0: Interrupt generation disabled 1: Interrupt generation enabled
24, 23	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
22 to 4	ECMMIE022 to ECMMIE004	ECM Maskable Interrupt Generation Control ECMMIE022 to ECMMIE004 correspond to error sources 22 to 4. 0: Interrupt generation disabled 1: Interrupt generation enabled
3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMMIE002 to ECMMIE000	ECM Maskable Interrupt Generation Control ECMMIE002 to ECMMIE000 correspond to error sources 2 to 0. 0: Interrupt generation disabled 1: Interrupt generation enabled

30.3.9 ECMMICFG1 ─ ECM Maskable Interrupt Configuration Register 1

The ECM maskable interrupt configuration register 1 is used to set the generation of ECM maskable interrupts. The generation of maskable interrupts in response to errors is selectable. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.20 ECMMICFG1 Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
15 to 8	ECMMIE115 to ECMMIE108	ECM Maskable Interrupt Generation Control ECMMIE115 to ECMMIE108 correspond to error sources 47 to 40. 0: Interrupt generation disabled 1: Interrupt generation enabled
7	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
6, 5	ECMMIE106, ECMMIE105	ECM Maskable Interrupt Generation Control ECMMIE106, ECMMIE105 correspond to error sources 38, 37. 0: Interrupt generation disabled 1: Interrupt generation enabled
4, 3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMMIE102 to ECMMIE100	ECM Maskable Interrupt Generation Control ECMMIE102 to ECMMIE100 correspond to error sources 34 to 32. 0: Interrupt generation disabled 1: Interrupt generation enabled

30.3.10 ECMNMICFG0 ─ ECM FE Level Interrupt Configuration Register 0

The ECM FE level interrupt configuration register 0 is used to set the generation of ECM FE level interrupts. The generation of maskable interrupts in response to errors is selectable. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + $0C_H$

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 16	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
15 to 8	ECMNMIE115 to ECMNMIE108	ECM FE level Interrupt Generation Control ECMNMIE115 to ECMNMIE108 correspond to error sources 47 to 40. 0: Interrupt generation disabled 1: Interrupt generation enabled
7	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
6, 5	ECMNMIE106, ECMNMIE105	ECM FE level Interrupt Generation Control ECMNMIE106, ECMNMIE105 correspond to error sources 38, 37. 0: Interrupt generation disabled 1: Interrupt generation enabled
4, 3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMNMIE102 to ECMNMIE100	ECM FE level Interrupt Generation Control ECMNMIE102 to ECMNMIE100 correspond to error sources 34 to 32. 0: Interrupt generation disabled 1: Interrupt generation enabled

30.3.12 ECMIRCFG0 ─ ECM Internal Reset Configuration Register 0

The ECM internal reset configuration register 0 is used to set the generation of an internal reset in response to an internal error. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to Section **30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 14_H

Value after reset: 0000 $000F_H$

Table 30.26 ECMEMK1 Register Contents

Bit Position	Bit Name	Function
31, 30	—	Reserved. When read, the value returned is undefined. When writing to these bits, follow the procedure of the protection unlock sequence to write 1.
29	ECMEMK129	Corresponds to delay timer overflow. 0: ERROROUT output not masked 1: ERROROUT output masked
28 to 16	—	Reserved. When read, the value returned is undefined. When writing to these bits, follow the procedure of the protection unlock sequence to write 1.
15 to 5	ECMEMK115 to ECMEMK105	ECM ERROROUT Output Mask Control ECMEMK115 to ECMEMK105 correspond to error sources 47 to 37. 0: ERROROUT output not masked 1: ERROROUT output masked
4, 3	—	Reserved. When read, the value returned is undefined. When writing to these bits, follow the procedure of the protection unlock sequence to write 1.
2 to 0	ECMEMK102 to ECMEMK100	ECM ERROROUT Output Mask Control ECMEMK102 to ECMEMK100 correspond to error sources 34 to 32. 0: ERROROUT output not masked 1: ERROROUT output masked

30.3.16 ECMESSTC0 ─ ECM Error Source Status Clear Trigger Register 0

The ECM error source status clear trigger register 0 is used to clear the states of the individual error sources of the ECM master/checker error source status register 0. Both the error states of the ECM master and the ECM checker are cleared simultaneously. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 24_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.27 ECMESSTC0 Register Contents

Bit Position	Bit Name	Function
31 to 25	ECMCLSSE031 to ECMCLSSE025	ECM Error Status Clear ECMCLSSE031 to ECMCLSSE025 correspond to error sources 31 to 25. 0: Corresponding error status unchanged 1: Corresponding error status cleared
24, 23	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
22 to 4	ECMCLSSE022 to ECMCLSSE004	ECM Error Status Clear ECMCLSSE022 to ECMCLSSE004 correspond to error sources 22 to 4. 0: Corresponding error status unchanged 1: Corresponding error status cleared
3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMCLSSE002 to ECMCLSSE000	ECM Error Status Clear ECMCLSSE002 to ECMCLSSE000 correspond to error sources 2 to 0. 0: Corresponding error status unchanged 1: Corresponding error status cleared

30.3.17 ECMESSTC1 ─ ECM Error Source Status Clear Trigger Register 1

The ECM error source status clear trigger register 1 is used to clear the states of the individual error sources of the ECM master/checker error source status register 1. Both the error states of the ECM master and the ECM checker are cleared simultaneously. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 28_H

Value after reset: 00000000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.28 ECMESSTC1 Register Contents

Bit Position	Bit Name	Function
31	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
30, 29	ECMCLSSE130, ECMCLSSE129	ECM Error Status Clear ECMCLSSE130 and ECMCLSSE129 correspond to the write status of the ECMmESET register and delay timer overflow. 0: Corresponding error status unchanged 1: Corresponding error status cleared
28 to 16	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
15 to 5	ECMCLSSE115 to ECMCLSSE105	ECM Error Status Clear ECMCLSSE115 to ECMCLSSE105 correspond to error sources 47 to 37. 0: Corresponding error status unchanged 1: Corresponding error status cleared
4, 3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMCLSSE102 to ECMCLSSE100	ECM Error Status Clear ECMCLSSE102 to ECMCLSSE100 correspond to error sources 34 to 32. 0: Corresponding error status unchanged 1: Corresponding error status cleared

30.3.18 ECMPCMD1 ─ ECM Protection Command Register

Refer to **Section 30.3.1, List of Registers**, for the registers to be protected by the ECM protection command register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + $2C_H$

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.29 ECMPCMD1 Register Contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
7 to 0	ECMREG17 to ECMREG10	Protection command that enables writing to write protected ECM registers. Fixed value 0000 $00A5_H$

30.3.19 ECMPS ─ ECM Protection Status Register

The ECM protection status register indicates whether the write protected register has been written successfully or not. For details, refer to **Section 30.4.5, Write Protected Registers**.

Access: This register can be read in 8-bit units.

Address: <ECM_base> + 30_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMPRERR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 30.30 ECMPS Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned.
0	ECMPRERR	ECM Protection Status Indicates whether the write protected register has been written successfully or not. 0: Writing was successfully completed. 1: Writing failed

30.3.20 ECMPE0 ─ ECM Pseudo Error Trigger Register 0

The ECM pseudo error trigger register 0 is used to generate a pseudo error for test purposes. The ECM operation in response to the generation of a pseudo error is identical to that in response to a real error source. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 34_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.31 ECMPE0 Register Contents

Bit Position	Bit Name	Function
31 to 25	ECMPE031 to ECMPE025	ECM Pseudo Error Trigger ECMPE031 to ECMPE025 correspond to error sources 31 to 25. 0: Pseudo error not generated 1: Generates corresponding pseudo error
24, 23	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
22 to 4	ECMPE022 to ECMPE004	ECM Pseudo Error Trigger ECMPE022 to ECMPE004 correspond to error sources 22 to 4. 0: Pseudo error not generated 1: Generates corresponding pseudo error
3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMPE002 to ECMPE000	ECM Pseudo Error Trigger ECMPE002 to ECMPE000 correspond to error sources 2 to 0. 0: Pseudo error not generated 1: Generates corresponding pseudo error

30.3.21 ECMPE1 – ECM Pseudo Error Trigger Register 1

The ECM pseudo error trigger register 1 is used to generate a pseudo error for test purposes. The ECM operation in response to the generation of a pseudo error is identical to that in response to a real error source. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 38_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	ECMPE129	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 30.32 ECMPE1 Register Contents

Bit Position	Bit Name	Function
31, 30	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
29	ECMPE129	ECM Pseudo Error Trigger Corresponds to delay timer overflow. 0: Pseudo error not generated 1: Generates corresponding pseudo error
28 to 16	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
15 to 5	ECMPE115 to ECMPE105	ECM Pseudo Error Trigger ECMPE115 to ECMPE105 correspond to error sources 47 to 37. 0: Pseudo error not generated 1: Generates corresponding pseudo error
4, 3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMPE102 to ECMPE100	ECM Pseudo Error Trigger ECMPE102 to ECMPE100 correspond to error sources 34 to 32. 0: Pseudo error not generated 1: Generates corresponding pseudo error

30.3.22 ECMDTMCTL – ECM Delay Timer Control Register

The ECM delay timer control register is used to control the delay timer. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be written in 8-bit units.

Address: <ECM_base> + $3C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ECMSTP	ECMSTA
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 30.33 ECMDTMCTL Register Contents

Bit Position	Bit Name	Function
7 to 2	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
1	ECMSTP	Delay Timer Stop Writing 1 to this bit initializes the delay timer counter, causing the delay timer to stop. The ECMSTA bit is set to 0 at the same time.
0	ECMSTA	Delay Timer Start Specifies the operation of the delay timer when an interrupt is occurred. Writing 1 to this bit initializes the delay timer counter, causing the timer to start operation. Writing 0 to this bit initializes the delay timer counter, causing the timer to stop. 0: Timer stops 1: Timer starts

30.3.23 ECMDTMR ─ ECM Delay Timer Register

The ECM delay timer register indicates the value of the delay timer counter. Writing 1 to the ECMSTP bit of the ECM delay timer control register (ECMDTMCTL) or writing 0 to the ECMSTA bit initializes the delay timer counter.

Access: This register can be read in 16-bit units.

Address: <ECM_base> + 40_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMDTMR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

30.3.24 ECMDTMCMP ─ ECM Delay Timer Compare Register

When the value of the ECM delay timer compare register matches with the value of the delay timer counter, a delay timer overflow signal is generated to set the ECMmSSE129n bit. Writing data to this register has to be conducted while the delay timer is stopped. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be read/written in 16-bit units.

Address: <ECM_base> + 44_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMDTMCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

30.3.25 ECMDTMCFG0 ─ ECM Delay Timer Configuration Register 0

The ECM delay timer configuration register 0 is used to enable or disable the delay timer to be started by a maskable interrupt in response to an error. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 48_H

Value after reset: 0000 0000_H

Table 30.34 ECMDTMCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 25	ECMTE031 to ECMTE025	ECM Delay Timer Start Control ECMTE031 to ECMTE025 correspond to maskable interrupts generated by error sources 31 to 25. 0: Delay timer start disabled 1: Delay timer start enabled
24, 23	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
22 to 4	ECMTE022 to ECMTE004	ECM Delay Timer Start Control ECMTE022 to ECMTE004 correspond to maskable interrupts generated by error sources 22 to 4. 0: Delay timer start disabled 1: Delay timer start enabled
3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMTE002 to ECMTE000	ECM Delay Timer Start Control ECMTE002 to ECMTE000 correspond to the maskable interrupts generated by error sources 2 to 0. 0: Delay timer start disabled 1: Delay timer start enabled

30.3.26 ECMDTMCFG1 ─ ECM Delay Timer Configuration Register 1

The ECM delay timer configuration register 1 is used to enable or disable the delay timer to be started by a maskable interrupt in response to an error. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + $4C_H$

Value after reset: 0000 0000_H

Table 30.35 ECMDTMCFG1 Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
15 to 8	ECMTE115 to ECMTE108	ECM Delay Timer Start Control ECMTE115 to ECMTE108 correspond to maskable interrupts generated by error sources 47 to 40. 0: Delay timer start disabled 1: Delay timer start enabled
7	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
6, 5	ECMTE106, ECMTE105	ECM Delay Timer Start Control ECMTE106, ECMTE105 correspond to maskable interrupts generated by error sources 38, 37. 0: Delay timer start disabled 1: Delay timer start enabled
4, 3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMTE102 to ECMTE100	ECM Delay Timer Start Control ECMTE102 to ECMTE100 correspond to maskable interrupts generated by error sources 34 to 32. 0: Delay timer start disabled 1: Delay timer start enabled

30.3.27 ECMDTMCFG2 ─ ECM Delay Timer Configuration Register 2

The ECM delay timer configuration register 2 is used to enable or disable the delay timer to be started by an FE level interrupt in response to an error. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 50_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.36 ECMDTMCFG2 Register Contents

Bit Position	Bit Name	Function
31 to 25	ECMTE231 to ECMTE225	ECM Delay Timer Start Control ECMTE231 to ECMTE225 correspond to FE level interrupts generated by error sources 31 to 25. 0: Delay timer start disabled 1: Delay timer start enabled
24, 23	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
22 to 4	ECMTE222 to ECMTE204	ECM Delay Timer Start Control ECMTE222 to ECMTE204 correspond to FE level interrupts generated by error sources 22 to 4. 0: Delay timer start disabled 1: Delay timer start enabled
3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMTE202 to ECMTE200	ECM Delay Timer Start Control ECMTE202 to ECMTE200 correspond to FE level interrupts generated by error sources 2 to 0. 0: Delay timer start disabled 1: Delay timer start enabled

30.3.28 ECMDTMCFG3 ─ ECM Delay Timer Configuration Register 3

The ECM delay timer configuration register 3 is used to enable or disable the delay timer to be started by an FE level interrupt in response to an error. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 30.4.5, Write Protected Registers**, for details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 54_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.37 ECMDTMCFG3 Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
15 to 8	ECMTE315 to ECMTE308	ECM Delay Timer Start Control ECMTE315 to ECMTE308 correspond to FE level interrupts generated by error sources 47 to 40. 0: Delay timer start disabled 1: Delay timer start enabled
7	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
6, 5	ECMTE306, ECMTE305	ECM Delay Timer Start Control ECMTE306, ECMTE305 correspond to FE level interrupts generated by error sources 38, 37. 0: Delay timer start disabled 1: Delay timer start enabled
4, 3	—	Reserved. When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
2 to 0	ECMTE302 to ECMTE300	ECM Delay Timer Start Control ECMTE302 to ECMTE300 correspond to FE level interrupts generated by error sources 34 to 32. 0: Delay timer start disabled 1: Delay timer start enabled

30.4 Functions

30.4.1 Operations for ERROROUT Output

After release from the reset state, the output on the $\overline{\text{ERROROUT_M}}$ pin indicates an error.

Use this pin after clearing its indication of error by setting the ECMmECT bit to 1, which is described in **Section 30.3.3, ECMmECLR (m = M/C) ─ ECM Master/Checker Error Clear Trigger Register**. Since the $\overline{\text{ERROROUT_C}}$ pin is a multi-functional pin that can be used also as a general-purpose I/O pin or for other functions, select the $\overline{\text{ERROROUT_C}}$ function before using this function. Refer to **Section 2, Pins**, for how to configure the port.

The ERROROUT output signal can be configured for two different modes of operation, non-dynamic or dynamic. Furthermore, when the ERROROUT output is selected and the signal is in dynamic mode, output on the pin indicates errors on occurrence of error sources regardless of the pulse cycle.

Table 30.38 ERROROUT Output Operation

Error State ECMmSSE031 to ECMmSSE000 ECMmSSE115 to ECMmSSE100	Operating Mode ECMSL0 Bit	ERROROUT Output Operating Mode	ERROROUT Output Level
0	0	Non-dynamic	High level
(Normal)	1	Dynamic	Toggles*1 (according to timer input*2)
1	0	Non-dynamic	Low level
(Error)	1	Dynamic	Low level

Note 1. The ERROROUTZ signal for PIC1B is not toggled.

Note 2. For details, see **Section 17, OS Timer (OSTM)**.

30.4.1.1 Dynamic Mode

Enabling Dynamic Mode

1. Initialize OSTM0.
2. Set the ERROROUT output to normal output by setting the ECMmECT bit (m = M/C) in the ECM master/checker error clear trigger register to 1.
3. Set the ECMSL0 bit in the ECM error pulse configuration register to 1 to specify dynamic mode.
4. Start up OSTM0.

30.4.1.2 Non-Dynamic Mode

Disabling Dynamic Mode

1. Set the ERROROUT output to error output by setting the ECMmEST bit (m = M/C) in the ECM master/checker error set trigger register to 1.
2. Stop OSTM0.
3. Clear the ECMSL0 bit in the ECM error pulse configuration register to 0 to specify non-dynamic mode.

30.4.2 Loop-Back Function

ECM incorporates a loop-back function that is used to check the path to the ERROROUT pin. The output level of the ERROROUT pin can be checked with the ECMmSSE131 bit (m = M/C) in the ECM master/checker error source status register 1.

30.4.3 Pseudo Error Generation

ECM incorporates a function that can generate pseudo errors for test or debug purposes. The operation of the ECM during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for error masks, interrupt, internal reset, or delay timer apply to the operation of ECM.

30.4.4 Error State

The error state is indicated by the ECM master/checker error source status register 0 and the ECM master/checker error source status register 1. The error state is only cleared by an external reset or by writing 1 to the corresponding bit of the ECM error source status clear trigger register. In case of an internal reset, the error state is kept and the error of the reset source can be confirmed by reading the ECM master/checker error source status register 0 and the ECM master/checker error source status register 1 after release from the reset state.

30.4.5 Write Protected Registers

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc.

30.4.5.1 Sequence of Writing to the Write-Protected Registers

Writing to the write-protected registers is only possible with the protection unlock sequence described below.

1. Write the fixed value (0000 00A5$_H$) to the ECM protection command register ECMPCMD1 and ECM master/checker protection command register ECMmPCMD0.
2. Write the new setting to the write-protected registers in the ECM and ECMm. Write the value after a reset*[1] to the reserved bits.
3. Write the bitwise inverse of the setting value to the same registers as in step 2. Write the inverse of the value after a reset*[1] to the reserved bits.
4. Write the new setting to the same registers as in step 2. Write the value after a reset*[1] to the reserved bits.

A value can only be written to a write-protected register by following the procedure above.

Note 1. For the reserved bits of the ECMEMK0 and ECMEMK1 registers, write 1 in steps 2 and 4 and 0 in step 3.

Protection is not unlocked if the procedure is not followed correctly, the setting is not written to the write-protected register, and the ECMPRERR bit of the ECM protection status register ECMPS is set to 1. (Although this is not a requirement, you can confirm if the values set in the targeted register was correctly written by checking that the setting of the ECMPRERR bit of the ECM protection status register ECMPS is 0 after step 4.)

In case of failure to follow the sequence, repeat the procedure from the beginning.

In case of writing to another register during steps 1 to 4 of the sequence, the protection function operates as follows. Operation is also as described when any interrupt is accepted during the sequence and the interrupt handling includes access to another register.

- When the writing is to another register*[2] in the same module, writing to the protected register fails and the protection status bit in the protection status register is set to 1.
- When writing is to a register in another module, writing to the protected register will successfully proceed to completion, if the remainder of the procedure is followed correctly.

Reading of another register while the sequence is in progress does not lead to failure.

Note 2. As to ECM, all registers listed in **Section 30.3.1, List of Registers** are treated as “another register in the same module”.

30.4.6 Timeout Function for Interrupt Processing

The ECM incorporates a function that generates an ERROROUT output or internal reset when the count value of the delay timer incorporated in the ECM matches with the value of the ECM delay timer compare register because the delay timer was not stopped during the interrupt processing after being started simultaneously with the occurrence of an interrupt request. The timer counting is not stopped when a debugger break occurs.

The counting of the delay timer always starts from 0 whenever an error occurred. Configure the duration until an internal reset or the ERROROUT output is generated with the settings of the ECM delay timer compare register (ECMDTMCMP) described in **Section 30.3.24, ECMDTMCMP ─ ECM Delay Timer Compare Register**.

If another error by which the delay timer is to be started occurs while the delay timer is running, the current value counted by the delay timer is not reset but the timer continues to run.

Section 31 Data CRC (DCRA)

This section contains a generic description of the data CRC function A (DCRA).

The first section describes all properties specific to the RH850/C1M-A, such as units, register base addresses, input/output signal names, etc.
The remainder of the section describes the functions and registers of the DCRA.

31.1 Features of RH850/C1M-A DCRA

31.1.1 Number of Units

This microcontroller has the following number of units of the DCRA.

Table 31.1 Number of Units

Product Name	RH850/C1M-A
Units	2
Name	DCRAn (n = 0 to 1)

Table 31.2 Index

Index	Meaning
n	Throughout this section, the individual channels of a DCRA is identified by the index “n” (n = 0 to 1), for example, DCRAnCTL for the DCRAn control register.

31.1.2 Register Base Addresses

DCRA base addresses are listed in the following table.

DCRA register addresses are given as offsets from the individual base address.

Table 31.3 Register Base Addresses

Base Address Name	Base Address
<DCRA0_base>	FFF7 0000_H
<DCRA1_base>	FF97 1000_H

31.1.3 Clock Supply

The DCRA clock supply is listed in the following table.

Table 31.4 DCRAn Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
DCRAn	PCLK	CLK_LSB (low-speed peripheral clock)

31.1.4 Reset Source

The DCRA reset sources are shown below. DCRA is initialized by the reset sources below.

Table 31.5 Reset Source

Unit Name	Reset Source
DCRAn	Reset by any reset source

31.2 Overview

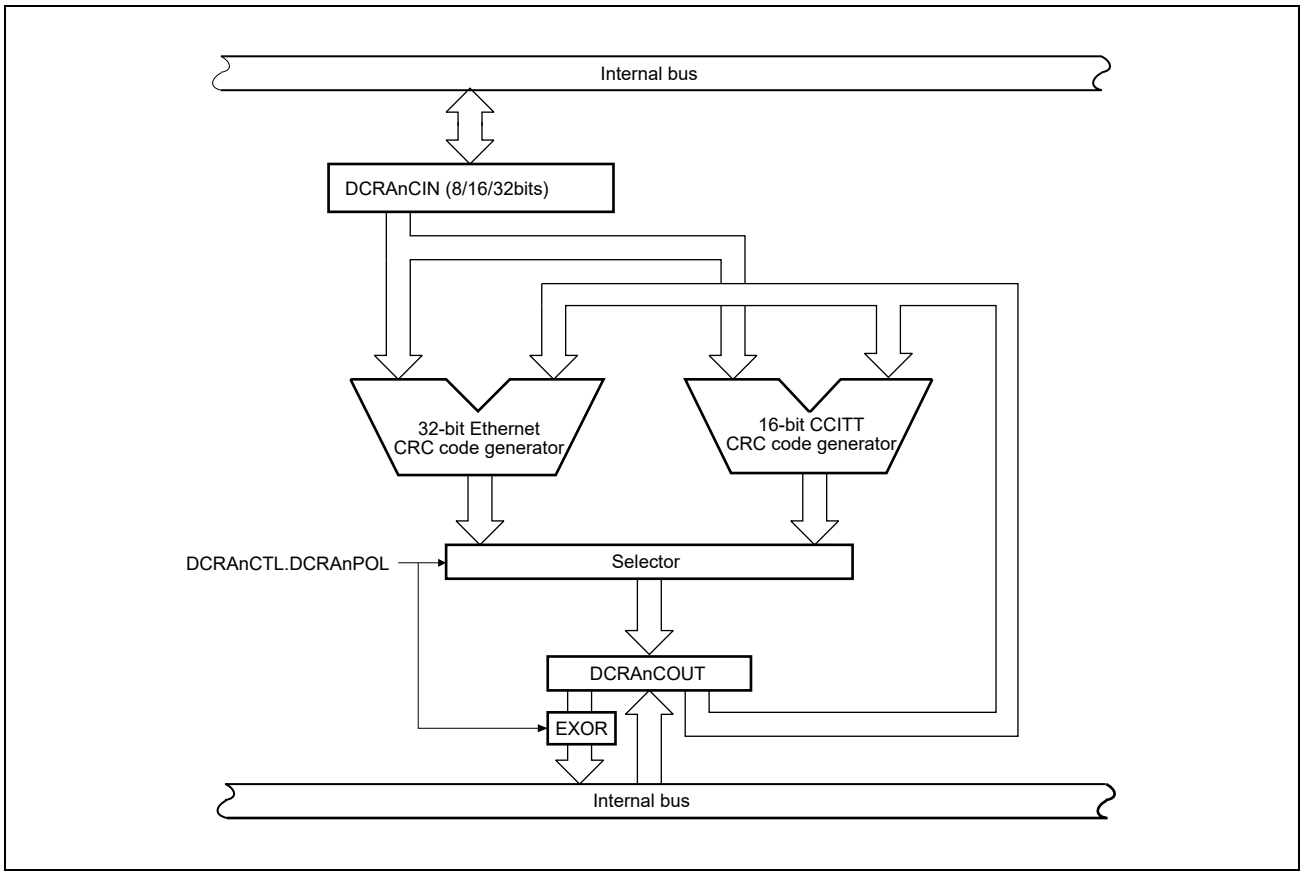
31.2.1 Functional Overview

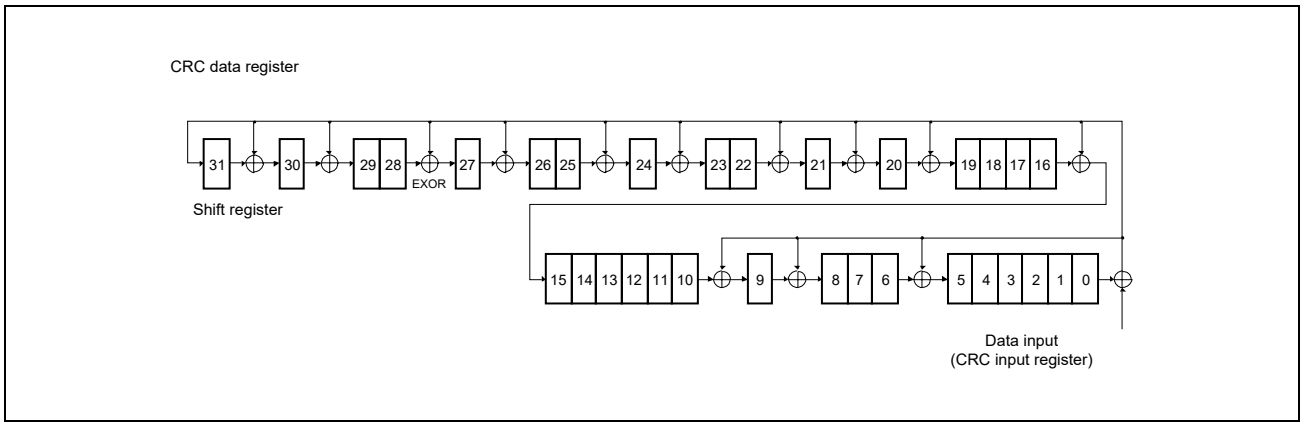
The data CRC function A can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- 32-bit Ethernet CRC
  $(X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X^1 + 1)$
- 16-bit CCITT CRC
  $(X^{16} + X^{12} + X^5 + 1)$
- CRC of an arbitrary data block length can be generated.
- After initialization of the CRC data register, every write access to the CRC input register generates a new CRC according to the selected polynomial, and the result is stored in the CRC data register.

31.2.2 Block Diagram

The following picture shows the block diagram of the data CRC function A.





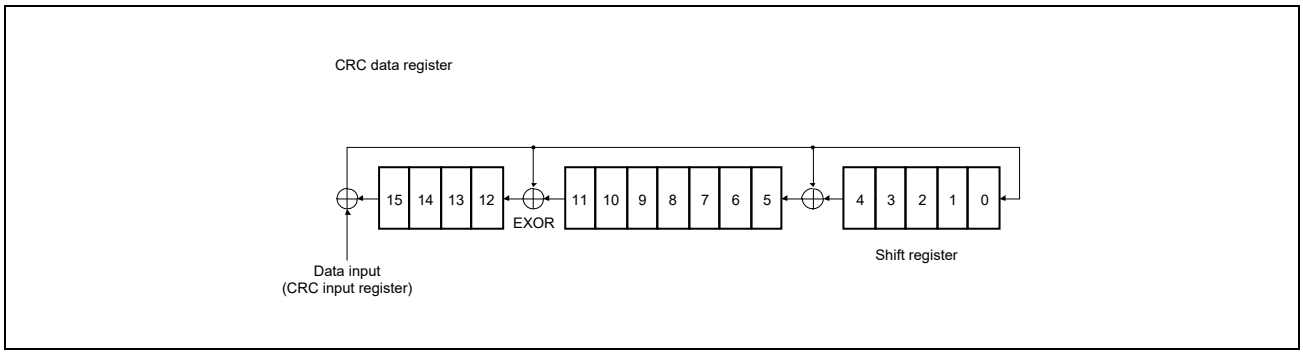


Figure 31.1 Block Diagram of Data CRC Function A

31.2.3 Operation Circuit

- 32-bit Ethernet

- 16-bit CCITT

31.3 Registers

31.3.1 List of Registers

The DCRA registers are listed in the following table.

See **Section 31.1.2, Register Base Addresses** for <DCRAn_base>.

Table 31.6 List of Registers

Module Name	Register Name	Symbol	Address
DCRAn	CRC input register	DCRAnCIN	<DCRAn_base> + 00_H
DCRAn	CRC data register	DCRAnCOUT	<DCRAn_base> + 04_H
DCRAn	CRC control register	DCRAnCTL	<DCRAn_base> + 20_H

31.3.2 DCRAnCIN — CRC Input Register

This register holds the input data for the CRC calculation. The effective bit width used for CRC calculation must be set by DCRAnCTL.DCRAnISZ[1:0].

When data is written to this register, the CRC code is generated.

The CRC calculation is immediately started after the DCRAnCIN register is written. The DCRAnCOUT register must be initialized, with the initial start value, before the first data of the data block is written to DCRAnCIN register.

Access: This register can be read/written in 32-bit units.

Address: <DCRAn_base>

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRAnCIN[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRAnCIN[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.7 DCRAnCIN Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRAnCIN [31:0]	Input Data for CRC Calculation The valid bits are: • for 32 bits, the effective bit width: DCRAnCIN[31:0] • for 16 bits, the effective bit width: DCRAnCIN[15:0] • for 8 bits, the effective bit width: DCRAnCIN[7:0]

31.3.3 DCRAnCOUT – CRC Data Register

This register stores the result of the CRC code generated by the 32-bit Ethernet or 16-bit CCITT polynomial.

Access: This register can be read/written in 32-bit units.

Address: <DCRAn_base> + 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRAnCOUT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRAnCOUT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The read value after reset is 0000 0000_H since the 32-bit Ethernet polynomial is selected as the CRC generating function after reset.

Table 31.8 DCRAnCOUT Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRAnCOUT [31:0]	Result of the CRC Code Generation When the 16-bit CCITT polynomial is enabled, bits 15 to 0 show the CRC result. Bits 31 to 16 are undefined. Read value of this register results in Ex-ORed with the value below. • Using 32-bit Ethernet polynomial: FFFF $FFFF_H$ • Using 16-bit CCITT polynomial: 0000_H For example, AAAA $AAAA_H$ is read when DCRAnCOUT = 5555 5555_H by the 32-bit Ethernet polynomial.

CAUTION

This register must be initialized (the initial start value must be set) before the first data of the data block is written to the DCRAnCIN register.

31.3.4 DCRAnCTL ─ CRC Control Register

This register controls the CRC generation process.

Access: This register can be read/written in 8-bit units.

Address: <DCRAn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	DCRAnISZ[1:0]		DCRAnPOL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 31.9 DCRAnCTL Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2, 1	DCRAnISZ[1:0]	Specify the CRC input bit width: 00: 32 bits (DCRAnCIN[31:0]) 01: 16 bits (DCRAnCIN[15:0]) 10: 8 bits (DCRAnCIN[7:0]) 11: Setting prohibited
0	DCRAnPOL	Specifies the CRC generating function: 0: 32-bit Ethernet CRC polynomial generation. The byte order of the DCRAnCIN register is LSB (least significant bit) first. This means that, if the input bit width is 8 bits (DCRAnISZ[1:0]= 10_B), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 0 (LSB) is the start bit of the input data. 1: 16-bit CCITT CRC polynomial generation. The byte order of the DCRAnCIN register is MSB (most significant bit) first. This means that, if the input bit width is 8 bits (DCRAnISZ[1:0]= 10_B), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 7 (MSB) is the start bit of the input data.

CAUTIONS

- After changing the CRC generating function (DCRAnCTL.DCRAnPOL), the DCRAnCOUT register must be initialized (the initial start value must be set).
- The CRC input bit width (DCRAnCTL.DCRAnISZ[1:0]) must be set according to the data block bit width. Switching the CRC bit input width is not allowed during processing of a data block (a data block consists of N bytes, half words or words). After the final CRC result is read from the DCRAnCOUT register, the CRC input bit width can be changed. In this case, the DCRAnCOUT register must be initialized (the initial start value must be set) afterwards.

31.4 Function

The data CRC function A generates a CRC (cyclic redundancy check) of an arbitrary data block length. The data is forwarded to the data CRC function in 8-, 16- or 32-bit units. The CRC polynomial can either be selected for 32-bit Ethernet or 16-bit CCITT.

The initial start value must be set at the DCRAnCOUT register before the first write access to the CRC input register (DCRAnCIN) is performed.

The flowchart below shows the CRC generating procedure.

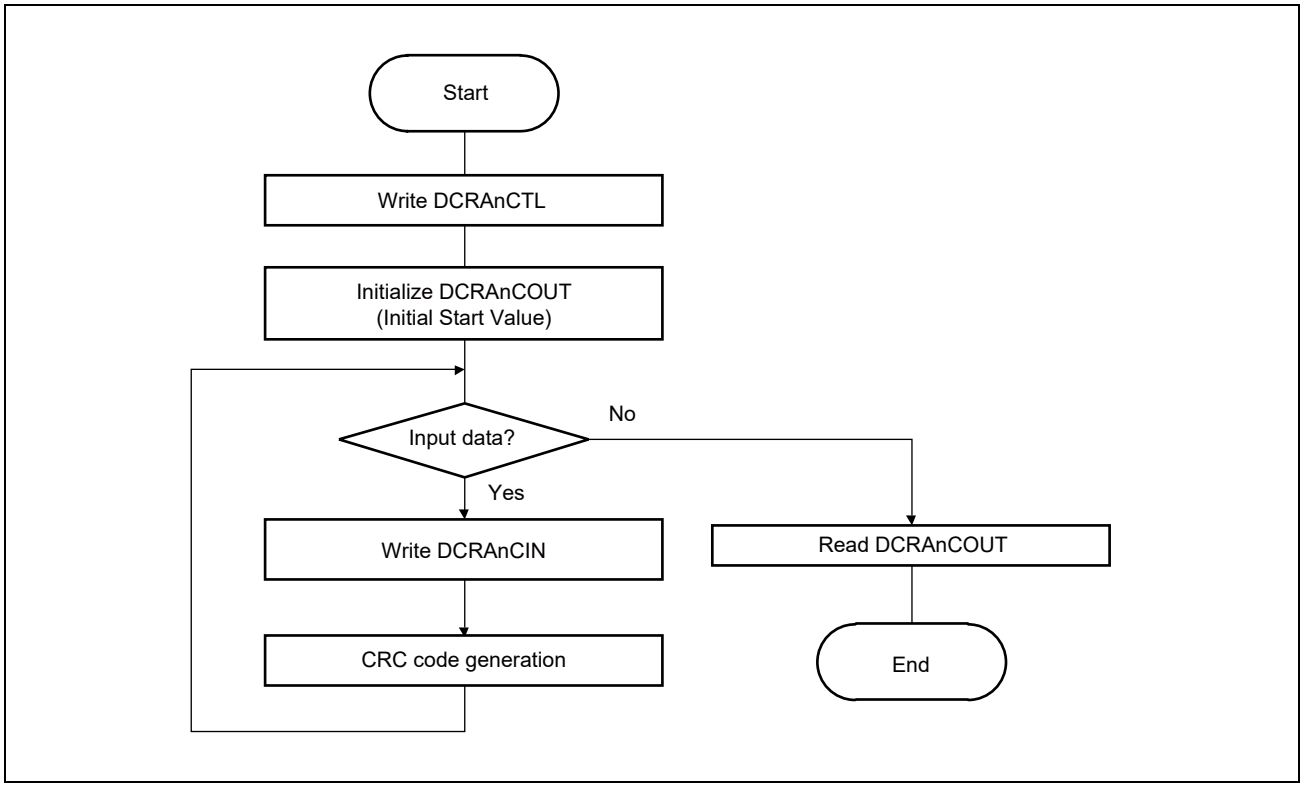

Figure 31.2 Flowchart of Data CRC Function A

NOTES

1. Before writing the first data to DCRAnCIN, the CRC output register DCRAnCOUT must be initialized (the initial start value must be set).
2. DCRAnCOUT must be re-initialized by setting the initial start value when the polynomial is changed by changing DCRAnCTL.DCRAnPOL.
3. Setting example of the initial start values of the respective polynomials
   The following is the example of setting values.

Table 31.10 Setting Example of Initial Start Values (when read at a reset)

	Initial Start Value	EXOR Value	DCRAnCOUT Read Value
32-bit Ethernet	FFFF FFFF$_H$	FFFF FFFF$_H$	0000 0000$_H$
16-bit CCITT	XXXX FFFF$_H$	XXXX 0000$_H$	XXXX FFFF$_H$

Section 32 Intelligent Cryptographic Unit E (ICUSE)

A separate document is provided for ICUSE (intelligent cryptographic unit (slave type) E). Please contact our sales representative for details.

Section 33 Secure Watchdog Timer A (SWDTA)

A separate document is provided for SWDTA (secure watchdog timer A). Please contact our sales representative for details.

Section 34 On-Chip Debugging Unit (OCD)

34.1 Debug Function

This microcontroller has an on-chip debug function. By using the on-chip debug emulator, programs can be debugged with the microcontroller mounted in the target system.

CAUTION

The debug functions described in this section are supported by the microcontroller but whether they are usable depends on the debugger. For details on debugging, see the user's manual of the debugger you are using.

(1) Debug interface

This microcontroller supports the NEXUS JTAG Interface, and low-pin debug interface (4 pins) (hereinafter referred to as 4-pin LPD) as debug interfaces.This microcontroller also incorporates the AUD-RAM monitor that supports monitoring and tuning of the on-chip RAM, data peripheral registers, etc by the AUD-RAM monitor interfaces. For the AUD-RAM monitor, see **Section 34.4, AUD-RAM Monitor (AUDR)**.

(2) Debug monitor function

In debug mode, the monitoring program is executed in the debugging-only area.

The basic debug functions below can be used by running a monitoring program.

- Downloading user programs
- Reading and writing user resources including the memory and registers while the user program is suspended
- Running the user program starting at any address

(3) On-chip break function

12 break points are included in each CPU. Four of them can be designated for any access (access address and access data).

(4) Software break function

A software break point can be designated for any address.

(5) Forced break function

Execution of the user program can be forcibly suspended.

(6) Forced reset function

The microcontroller (this product) can be forcibly reset.

(7) Real-time RAM monitoring (RRM)

The memory can be read during program execution. Because this read access uses debug-dedicated DMA, it has minimal effect on program execution.

(8) Dynamic memory modification (DMM)

The memory can be written during program execution. Because this write access uses debug-dedicated DMA, it has minimal effect on program execution.

(9) Timer function

Using a 32-bit counter, the time for running the user program can be measured based on the clock for debug.

(10) Mask function

A reset factor (external reset, software reset, and ECM reset) can be masked.

(11) Event detection function

Events can be detected by the following: execution address, access address, access data, range (comparison in size), and sequential execution.

(12) Hot plug-in function

Debugging can be started in normal operating mode without an input of an external reset.

(13) Security function

To prevent the contents of the flash memory from being read by an unauthorized person, a 128-bit ID code (OCD_ID) can be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code written to the microcontroller, the flash memory cannot be accessed.

(14) Tracing function

Execution history, data changes, etc. of the user program can be obtained. For details, see **Section 34.2, Trace Control Function**.

(15) Multi Core debug function

The following functions are supported as the multi-core debugger for CPU1, CPU2*[1], and the SubCPU:

- Synchronization functions (including reset, execution, and break)
- Synchronous setting
- Simultaneous tracing for multiple cores.

Note 1. C1M-A1 does not have CPU2.

34.2 Trace Control Function

This product provides several trace functions including branch PC trace of the CPU, data trace, and DMA data trace.

(1) Trace RAM

This product has 32 Kbytes of the trace RAM.

The trace information in the trace RAM is accessible via the debug interface: NEXUS, 4-pin LPD.

(2) Software Trace

This function enables the obtaining of history of user program execution, data changes, etc.

The software trace information can be output via the debug interface 4-pin LPD.

34.3 Peripheral Break Control

34.3.1 Overview

The peripheral break function stops the peripheral modules if the user program is stopped, for instance upon a breakpoint hit.

The on-chip modules can be classified into two by its operation at the time of peripheral break as follows:

(1) Modules that are unconditionally stopped:

WDTA0, WDTA1*1, SWDTA0, SWDTA1*1

(2) Modules that can select abeyance or continuation*2:

OSTM0, OSTM1, OSTM2, OSTM3, TAPA0, TAPA1, TAPA2*1, TAPA3, TAPA4, TAPA5, TSG30, TSG31, TSG32, CSIH0, CSIH1, CSIH2, TAUJ0, TAUJ1*1, TAUD0, TAUD1, TAUD2, TAUD3*1, ENCA0, ENCA1, TPBA0, TPBA1*1

Note 1. This is not provided for C1M-A1.

Note 2. TAPAn forcibly places the output pins of TAUDn and TSG3n into Hi-Z when its function is stopped by peripheral break. The value of the TAPAnHOF[10:8] bits of the TAPAnFLG register becomes 111_B. The applicable output pins are as follow:
TAPAnUN, TAPAnUP, TAPAnVN, TAPAnVP, TAPAnWN, TAPAnWP, and TSG3nO1 to TSG3nO6

34.4 AUD-RAM Monitor (AUDR)

34.4.1 Overview

This product includes the AUD (Advanced User Debugger) -RAM monitor (AUDR) to support debugging of a user program under conditions as if it were actually mounted in the system. The AUDR is a function to read and write the resources mapped to memory spaces including an on-chip memory and a peripheral register during LSI operation.

Table 34.1 lists the outlines of the AUDR and **Figure 34.1** shows the block diagram of the AUDR.

Table 34.1 Outlines of the AUDR

Item	Outline
Transfer method	Clock-synchronous parallel interface (4 bits)
Transfer clock generation	Transfer clock is generated at the external host (RAM monitor tool) side.
Transfer clock frequency	Maximum 20 MHz
Access area	Physical address area on the system bus
Access data size	8, 16, 32, and 64 bits
Access address input bit width	8, 16, 24, and 32 bits The same values as those of the previous access address are used for the upper bits of access address, which are not input.
Data transfer method	• Single transfer: Single data is transferred to the access address that has been input. • Continuous transfer: Up to 16 data are continuously transferred from the access address that has been input. The access address is automatically incremented depending on data size.
I/O pin	7 pins ($\overline{\text{AUDRST}}$, AUDCK, $\overline{\text{AUDSYNC}}$, and AUDATA3 to AUDATA0)
Function	• RAM monitor function: Read and write are performed from a system bus to an accessible physical address area. This function enables reference to and modification of an on-chip memory, a peripheral register, and the like. • Configuration information retention (startup communication) function: The values of the AUDATA3 to AUDATA0 pins at the time of release from the internal reset state are retained. This function is used for communication with a RAM monitor tool. • Synchronization communication (message board) function: This flag register is used for communication of the firmware operated by the CPU with a RAM monitor tool.

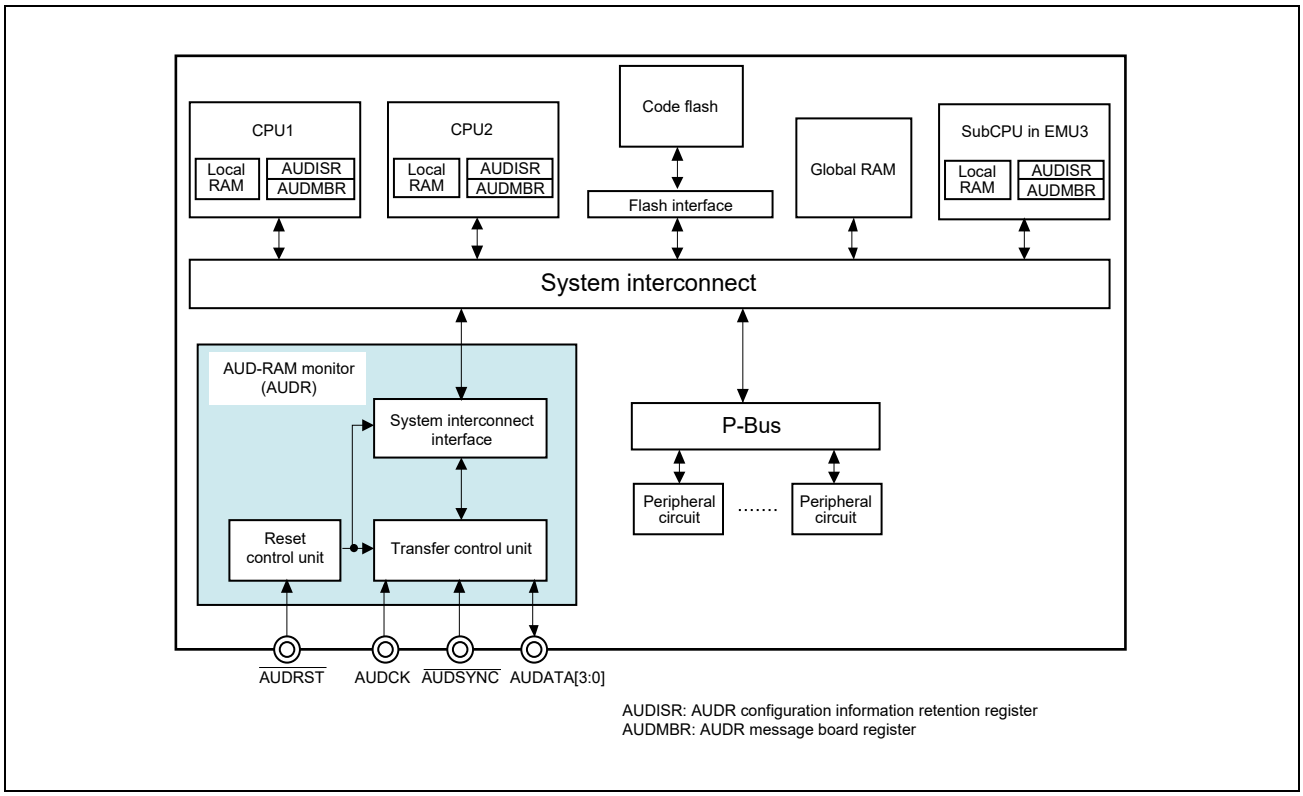

Figure 34.1 Block Diagram of the AUDR

34.4.2 I/O Pins

Table 34.2 lists the I/O pins of the AUDR.

Table 34.2 I/O Pins of AUDR

Pin Name	I/O	Description
$\overline{\text{AUDRST}}$	Input	AUDR reset input pin Inputting L to this pin resets the AUDR, but it does not initialize the AUDISR, AUDMBR and AUDMBRC (described below). When this pin is not connected, it is internally pulled-down.
AUDCK	Input	External clock input pin The frequency of clock that can be input is 20 MHz or under. When this pin is not connected, it is internally pulled-up.
$\overline{\text{AUDSYNC}}$	Input	Timing control signal input pin L: A command, an address, and write data are input and the status flag is output. H: The read-out data is output, and the pin enters into an idle state. When this pin is not connected, it is internally pulled-up. **CAUTION:** This pin should not be negated (to a high level) until the ready state is entered by inputting a command or the like from the outside to the AUDATA. For details, see the protocol mentioned below.
AUDATA3 to AUDATA0	Input/Output	4-bit parallel data I/O pin. The following information is input and output by time division. • Command (input) • Address (input) • Write data (input)/Read data (output) • Status flag (output) When this pin is not connected, it is internally pulled-up.

34.4.3 Description of Registers

Table 34.3 lists the registers related to the AUDR.

Table 34.3 List of Registers

Register Name	Abbreviation	Value after Reset	R/W	Address	Access Size	Reference Section
AUDR configuration information retention register	AUDISR	$000X_H$*1	R	FA00 5000_H (CPU)*4 F900 5000_H (AUDR)*4 F800 5000_H (AUDR)*4 F700 5000_H (AUDR)*4	16*5	**34.4.3.1**
AUDR message board register	AUDMBR	0000_H	R/W*2	FA00 5004_H (CPU)*4 F900 5004_H (AUDR)*4 F800 5004_H (AUDR)*4 F700 5004_H (AUDR)*4	16*5	**34.4.3.2**
	AUDMBRC		R/W*2, *3	FA00 5008_H (CPU)*4 F900 5008_H (AUDR)*4 F800 5008_H (AUDR)*4 F700 5008_H (AUDR)*4	16*5	

Note 1. The values of the AUDATA3 to AUDATA0 pins at the time of release from the internal reset state are retained in bits 3 to 0.

Note 2. Only 1 can be written to the bits that have been set to 0. 0 cannot be written to the bits that have been set to 1.

Note 3. All bits are cleared to 0 after read.

Note 4. Different addresses are used for the AUDISR and AUDMBR/AUDMBRC bits when they are accessed from the CPU and when they are accessed from the AUDR. Use FA00 $500X_H$ for an access from the CPU. Use F900 $500X_H$ for an access from the AUDR to the CPU1 registers. Use F800 $500X_H$ for an access from the AUDR to the CPU2 registers. Use F700 $500X_H$ for an access from AUDR to the SubCPU registers in the EMU3.
Although these addresses are “reserved area”, it is capable of accessing to these addresses for communication with AUDR tool.

Note 5. If an access in data sizes other than 16 bits (half-word) is performed, correct operation is not guaranteed.

34.4.3.1 AUDISR — AUDR Configuration Information Retention Register

AUDISR is a 16-bit readable register. It can be read out from the CPU and the AUDR.

Use FA00 5000_H for an access from the CPU to the AUDISR.

Use F900 5000_H for an access from the AUDR to the AUDISR of CPU1.

Use F800 5000_H for an access from the AUDR to the AUDISR of CPU2.

Use F700 5000_H for an access from the AUDR to the AUDISR of the SubCPU in EMU3.

The AUDISR register is not initialized by AUDR reset. The AUDISR can be also read out from the CPU during AUDR reset.

This register is used in the way described below.

- Retention of configuration information
  On release from an internal reset, the register retains the values corresponding to the levels on pins AUDATA3 to AUDATA0. Setting the levels on pins AUDATA3 to AUDATA0 in the emulator configuration allows the CPU to judge the connection configuration of the emulator.
  If nothing is connected to the AUD RAM monitoring-related pins, pins AUDATA3 to AUDATA0 are pulled up and the register is read as $000F_H$. If an AUD RAM monitoring tool is connected, the levels on pins AUDATA3 to AUDATA0 will correspond to a value other than $000F_H$. Reading of the AUDISR by the CPU can then be used to judge that a tool is connected.
  In addition, the values from pins AUDATA3 to AUDATA0 can be used to identify the vendor that is the source of the connected tool.

For details, see **Table 34.3, List of Registers** about access size, address and value after reset.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	DATA			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	Values of the AUDATA3 to AUDATA0 pins			
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 34.4 AUDISR Register Contents

Bit Position	Bit Name	Function
15 to 4	—	Reserved These bits are always read as 0. When writing, always write 0.
3 to 0	DATA	The values of the AUDATA3 to AUDATA0 pins at the time of release from the internal reset state are retained.

34.4.3.2 AUDMBR/AUDMBRC — AUDR Message Board Register

The AUDMBR/AUDMBRC registers are 16-bit readable/writable registers. The registers can be read and written from the CPU and the AUDR tool.

Use FA00 5004_H or FA00 5008_H for an access from the CPU to the AUDMBR/AUDMBRC. Use F900 5004_H or F900 5008_H for an access from the AUDR to the AUDMBR/AUDMBRC of CPU1. Use F800 5004_H or F800 5008_H for an access from the AUDR to the AUDMBR/AUDMBRC of CPU2. Use F700 5004_H or F700 5008_H for an access from the AUDR to the AUDMBR/AUDMBRC of the SubCPU in EMU3.

When the CPU reads the AUDMBRC from FA00 5008_H, all bits of the AUDMBR/AUDMBRC are cleared to 0 after reading. When the CPU reads the AUDMBR from FA00 5004_H, the bits of the AUDMBR/AUDMBRC are not cleared.

When the AUDR reads the AUDMBR of CPU1 from F900 5008_H, all bits of the AUDMBR/AUDMBRC of CPU1 are cleared to 0 after reading. When the AUDR tool reads the AUDMBR of CPU1 from F900 5004_H, the bits of the AUDMBR/AUDMBRC of CPU1 are not cleared. It is the same about the AUDMBR/AUDMBRC of CPU2 and the SubCPU in EMU3.

The CPU and the AUDR can write to the AUDMBR/AUDMBRC from the above addresses. However, writing 0 to the bits that have been set to 1 will be ignored (they can only be set to 1).

Table 34.6 summarizes the recommended accesses to the AUDMBR/AUDMBRC.

The AUDMBR/AUDMBRC registers are not initialized by AUDR reset. The AUDMBR/AUDMBRC can be also read and written from the CPU during AUDR reset.

AUDMBR and AUDMBRC are used in the way described below.

- Synchronous communications (message board) function
  The firmware (program) run by the CPU uses AUDMBR/AUDMBRC as a flag register for use in communications with the emulator, which reads AUDMBR/AUDMBRC by using the RAM monitoring function. This allows the emulator to follow the state of firmware (program) operations.

For details, see **Table 34.3, List of Registers** about access size, address and value after reset.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AUDMBR															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.5 AUDMBR/AUDMBRC Register Contents

Bit Position	Bit Name	Function
15 to 0	AUDMBR	Communication flag between the AUDR and the CPU

Table 34.6 Recommended Access to the AUDMBR/AUDMBRC

Accessing Master	Address	R/W	Access	Remarks
CPU	FA00 5004_H (AUDMBR)	Write	Only 1 can be written. Writing 0 is ignored.	—
		Read	Reading is enabled.	Not cleared after reading.
AUDR	AUDMBR (CPU1): F900 5008_H AUDMBR (CPU2): F800 5008_H AUDMBR (SubCPU in EMU3): F700 5008_H (AUDMBRC)	Write	Only 1 can be written. Writing 0 is ignored.	—
		Read	Reading is enabled.	All bits are cleared to 0 after reading.

34.4.4 RAM Monitoring

34.4.4.1 Communication Protocol

Input a command, counter value, address, and data to the AUDATA pin in the format shown in **Figure 34.2**. For details, see **Section 34.4.4.2, Operation**.

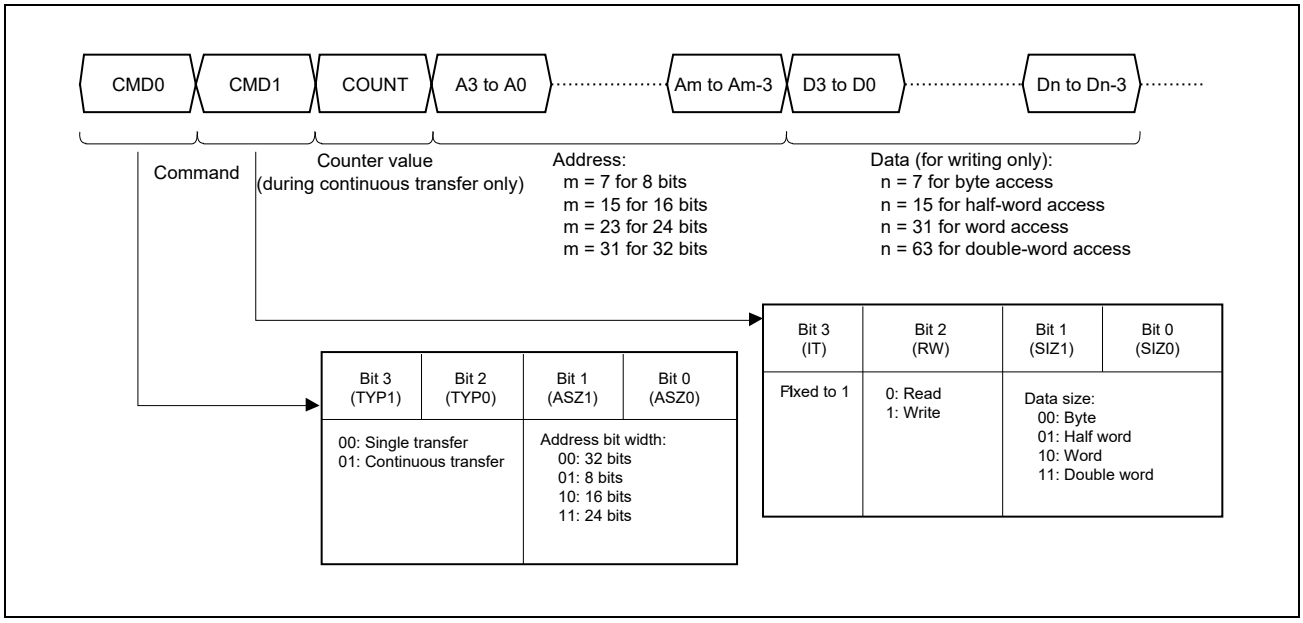

Figure 34.2 AUDATA Pin Input Format

34.4.4.2 Operation

(1) Single transfer

Single transfer is a method of transmitting single data to an address that has been input for access. **Figure 34.3** shows an example of reading operation during single transfer and **Figure 34.4** shows an example of writing operation during single transfer.

When the $\overline{\text{AUDSYNC}}$ pin is asserted and a command, address and data (only for writing) are input to the AUDATA pin in the format shown in **Figure 34.2**, the AUDR starts reading or writing operation for the specified address. The AUDR outputs the Not Ready flag (0000) to the AUDATA pin during this internal execution. After successful completion of the internal execution, the AUDR outputs the Ready flag (0001) to the AUDATA pin (see **Figure 34.3** and **Figure 34.4**).

For reading, after the Ready flag is output and the $\overline{\text{AUDSYNC}}$ pin is negated, the read data is output from the AUDATA pin (see **Figure 34.3**).

After output of the read data and until input of the next command, at least one AUDCK cycle is required for switching of the input/output states of the pins.

In addition, after the $\overline{\text{AUDSYNC}}$ pin is negated following the completion of processing for write access, when the next command is input, at least one AUDCK cycle is required for switching of the input/output states of the pins. Therefore, the $\overline{\text{AUDSYNC}}$ pin is negated for two cycles of AUDCK.

If a command other than those shown in **Figure 34.2** is input to CMD0 and CMD1, the AUDR disables this processing as a command error and sets the CFLG bit in the Ready flag to 1. When a bus error occurs during the internal execution, the AUDR disables this processing and sets the BFLG bit in the Ready flag to 1 (see **Figure 34.5**).

When an error is detected, the read data is not output.

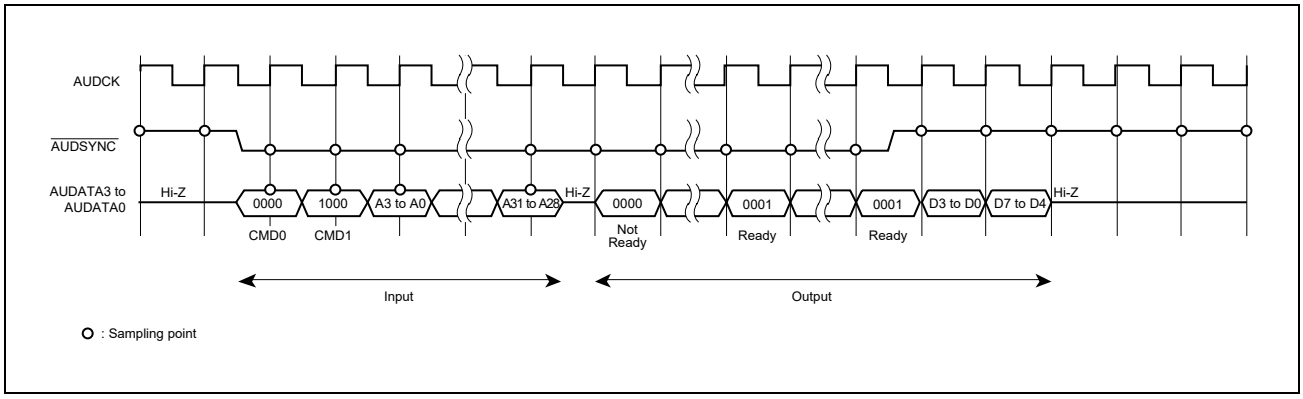

Figure 34.3 Example of Reading Operation in Single Transfer (address 32 bits; byte read)

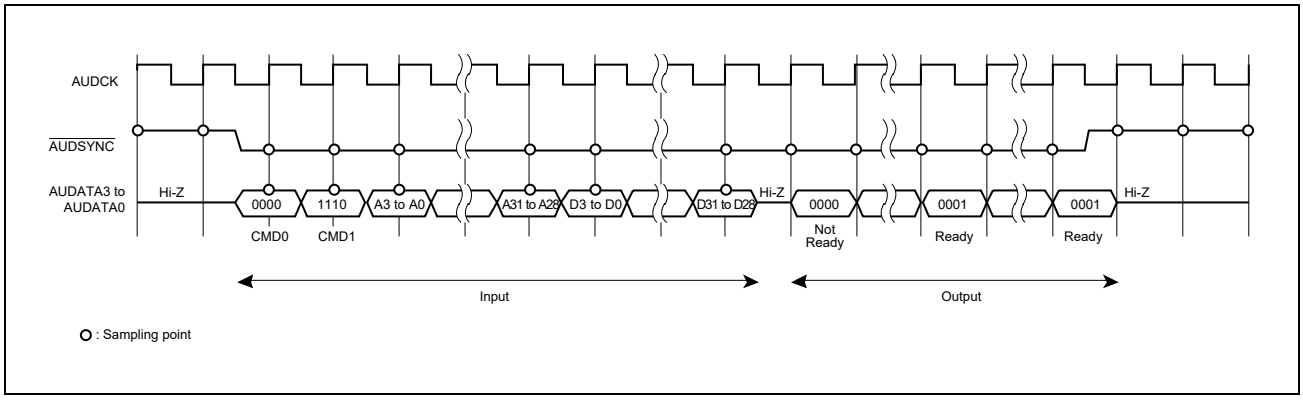

Figure 34.4 Example of Writing Operation in Single Transfer (address 32 bits; word write)

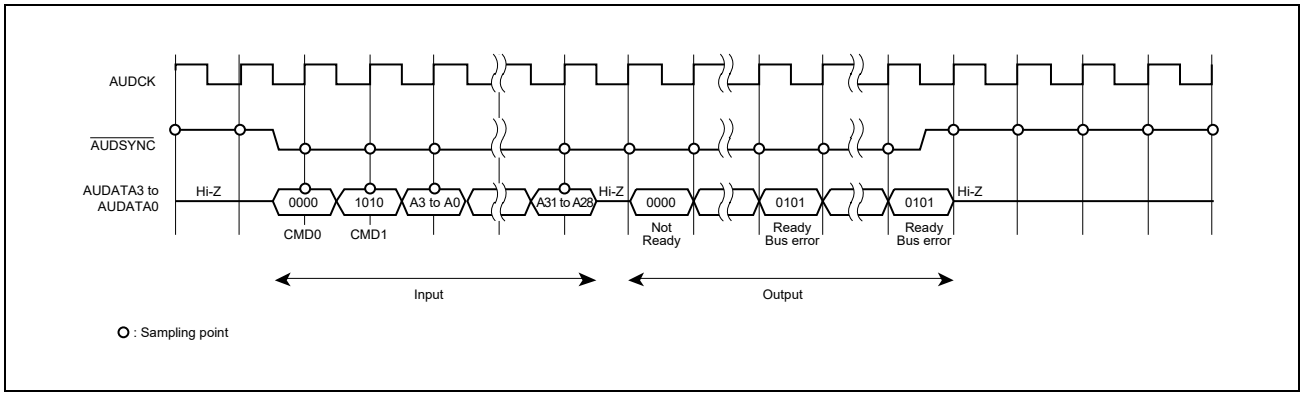

Figure 34.5 Example of Error Occurrence in Single Transfer (address 32 bits; word read)

(2) Continuous transfer

Continuous transfer is a continuous transmitting method of up to 16 data to the address that has been input. The address to be accessed is automatically incremented depending on the data size after completion of each data transfer. **Figure 34.6** shows an example of reading operation during continuous transfer and **Figure 34.7** shows an example of writing operation during continuous transfer.

The first data transfer is equivalent to single transfer except that COUNT (counter value) shown in **Figure 34.2** should be input. The number of data to be transferred minus 1 is input to the COUNT.

In the second and subsequent data transfer, the input of CMD0, CMD1, COUNT is skipped, and addresses are skipped to input. The second and subsequent data transfer for reading and writing proceed as follows.

For reading, when the $\overline{\text{AUDSYNC}}$ pin is asserted after completion of the previous data transfer, the AUDR outputs the Not Ready flag (0000) to the AUDATA pin during this internal execution. After successful completion of the internal execution, the AUDR outputs the Ready flag (0001) to the AUDATA pin. Then after the $\overline{\text{AUDSYNC}}$ pin is negated, the read data is output from the AUDATA pin. This operation is repeated until the number of data specified in COUNT is read (see **Figure 34.6**).

For writing, when the $\overline{\text{AUDSYNC}}$ pin is asserted after completion of the previous data transfer, the AUDR inputs data to be written to the AUDATA pin. After that, the AUDR starts the internal execution. The AUDR outputs the Not Ready flag (0000) to the AUDATA pin during this operation. After successful completion of the internal execution, the AUDR outputs the Ready flag (0001) to the AUDATA pin. This operation is repeated until the number of data specified in COUNT are written (see **Figure 34.7**).

When the $\overline{\text{AUDSYNC}}$ pin is re-asserted to input the next write data, at least two cycles of AUDCK are required for negating the $\overline{\text{AUDSYNC}}$ pin.

If a bus error occurs during the internal execution, the AUDR suspends data transfer operation and sets the BFLG bit in the Ready flag to 1 (see **Figure 34.8**).

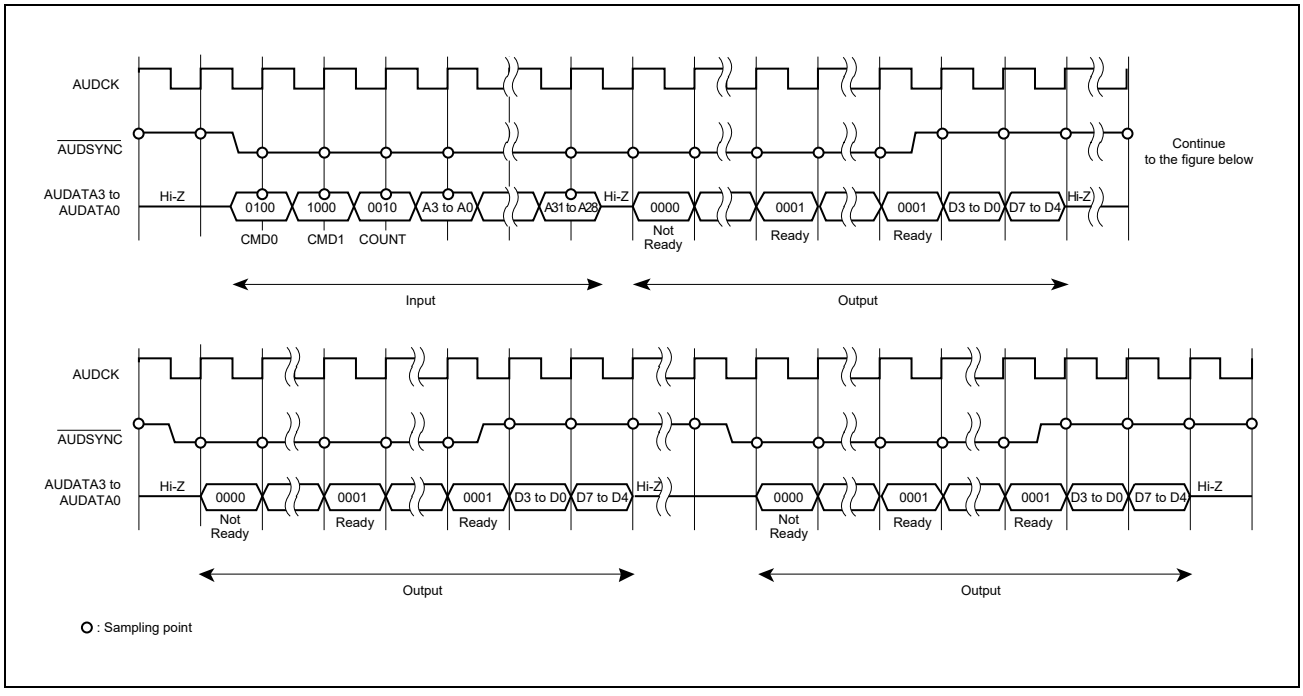

Figure 34.6 Example of Reading Operation in Continuous Transfer (address 32 bits; byte read × three units of data)

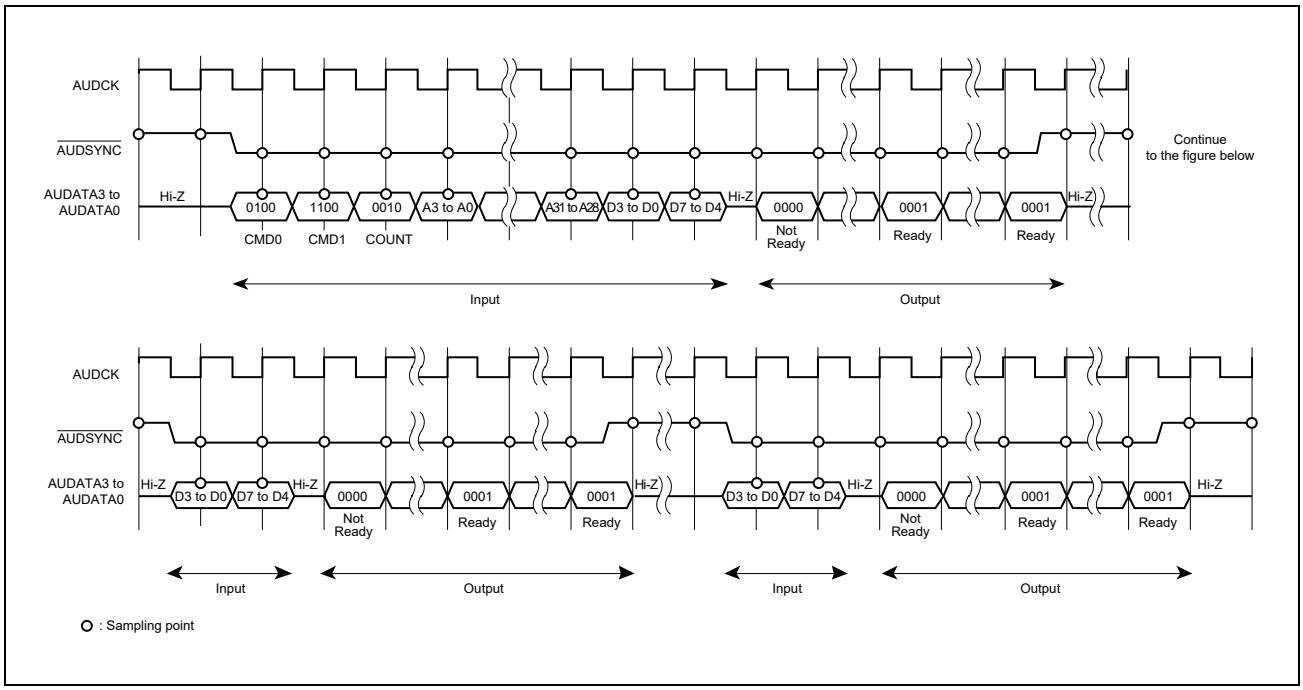

Figure 34.7 Example of Writing Operation in Continuous Transfer (address 32 bits; byte write × three units of data)

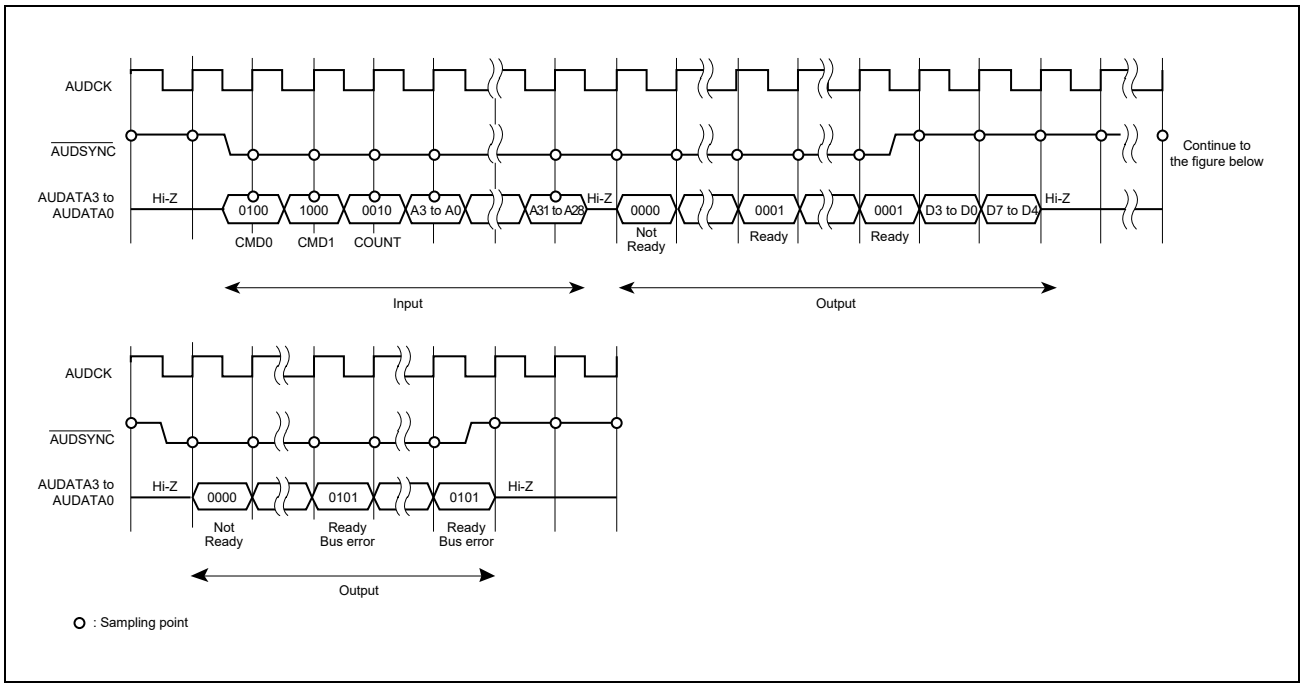

Figure 34.8 Example of Error Occurrence in Continuous Transfer (address 32 bits; byte read × three units of data)

(3) Command error conditions

Table 34.7 Command (CMD0) Error Conditions

Bit 3 (TYP1)	Bit 2 (TYP0)	Bit 1 (ASZ1)	Bit 0 (ASZ0)	Description
0	0	0	0	Single transfer Address bit width: 32 bits
0	0	0	1	Single transfer Address bit width: 8 bits
0	0	1	0	Single transfer Address bit width: 16 bits
0	0	1	1	Single transfer Address bit width: 24 bits
0	1	0	0	Continuous transfer Address bit width: 32 bits
0	1	0	1	Continuous transfer Address bit width: 8 bits
0	1	1	0	Continuous transfer Address bit width: 16 bits
0	1	1	1	Continuous transfer Address bit width: 24 bits
1	×	×	×	Command error

Table 34.8 Command (CMD1) Error Conditions

Bit 3 (IT)	Bit 2 (RW)	Bit 1 (SIZ1)	Bit 0 (SIZ0)	Description
0	x	x	x	Command error
1	0	0	0	Read: Byte
1	0	0	1	Read: Half word
1	0	1	0	Read: Word
1	0	1	1	Read: Double word
1	1	0	0	Write: Byte
1	1	0	1	Write: Half word
1	1	1	0	Write: Word
1	1	1	1	Write: Double word

(4) Bus error conditions

- Half-word access is made to the addresses of 4n + 1 and 4n + 3.
- Word access is made to the addresses of 4n + 1, 4n + 2, and 4n + 3.
- Double-word access is made to the addresses of 8n + 1, 8n + 2, 8n + 3, 8n + 4, 8n + 5, 8n + 6, and 8n + 7.
- An error response is received from the system bus.

(5) AUDATA pin input format

Table 34.9 Input Format Bit Position

Order of Input	Format Name	Bit Position				√: Required; —: Not Required

Table 34.17 Read Data Format

Bit Name	Function	Description
D63 to D0	Output read data	The number of output bits depends on the setting of the SIZ[1:0] bits in CMD1 (for details, see **Table 34.16**).

34.4.4.3 Usage Notes on the AUDR Function

- Do not negate the $\overline{\text{AUDSYNC}}$ pin until one cycle of AUDCK has elapsed after a command is input to the AUDATA pin and the Ready flag has been returned.
- When uninitialized memory is accessed through the AUDR, a bus error may occur due to ECC error detection.

34.4.4.4 Enabling and Disabling RAM Monitoring

Enabling or disabling of the RAM monitoring function can be specified by using the option byte (AUDREN).

AUDREN: Enable Bit of the AUDR

For setting of option byte, see **Section 35, Flash Memory**.

NOTE

The AUDR is disabled in serial programming mode regardless of this setting.

34.5 Cautions on Using On-Chip Debugger

(1) Treatment of devices used for debugging

Do not install a device that was used for debugging on a mass-produced product, because the flash memory was rewritten during system debugging and thus the number of write/erase count of flash memory cannot be guaranteed.

(2) Hot plug-out is not supported

This product does not support hot plug-out for power off (including removal of the connector) of the debug tool in debug mode. Do not turn off the power of the NEXUS tool (including removal of the connector) in debug mode.

(3) Handling of pins when ending on-chip debugging

When ending on-chip debugging, set the $\overline{\text{DCUTRST}}$ pin and external reset pin to the low level.

(4) When using the debugger

When a debugger is used, the program written to the microcomputer before preparation for communications between the OCD emulator and microcomputer is complete is executed from the reset vector. For this reason, take care to ensure that this does not lead to any operations which you do not expect or intend.

This communications preparation period depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer.

Section 35 Flash Memory

This section describes the characteristics of the flash memory mounted on the RH850/C1M-A, memory map, flash memory programming, and so on.

35.1 Features

- Code flash memory capacity:
  - User area C1M-A2: 4 Mbytes (two-bank configuration)
    C1M-A1: 2 Mbytes (one-bank configuration)
  - User boot area 32 Kbytes
- Data flash memory capacity:
  - Data area 64 Kbytes
- Method of programming
  - Programming by a dedicated flash memory programmer via a serial interface communication (serial programming)
  - Programming of the flash memory by a user program (self-programming)
- Support for security functions to protect against illicit tampering with or reading out of data in flash memory
- Support for protection functions to protect against erroneous overwriting of the flash memory
- Support for the error detection/correction function in the flash memory
- Support for the BGO (Back Ground Operation) function
  - The code flash memory can be read during programming the data flash memory
- The initial setting of this product can be set to an expansion area of the flash memory (option bytes)

35.2 Structure of Memory

Figure 35.1 and **Figure 35.2** illustrate the mapping of the code flash memory in the C1M-A2 and C1M-A1, respectively. The user area of the code flash memory of this product is divided into 8- and 32-Kbyte blocks, which serve as the units of erasure. The user area is available as an area for storing the user program.

As a protection area that cannot be rewritten by the self-programming, a single block of 32-Kbyte user boot area is incorporated. The user boot area is available as an area for storing a boot program and the like where you want to prohibit rewriting at the time of operation of the user program. The boot program includes the one for programming the code flash memory using any interface.

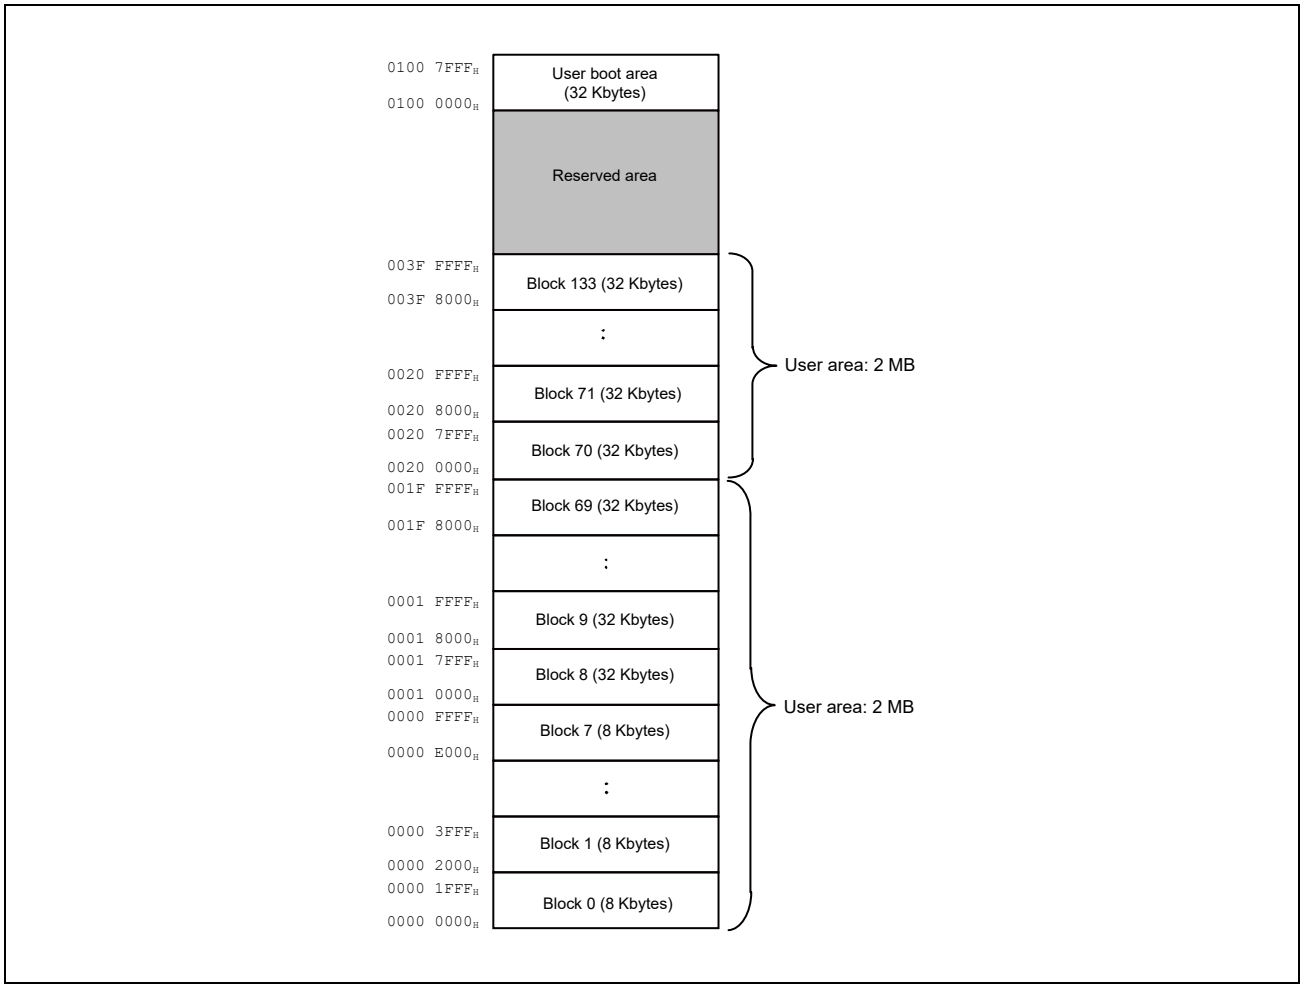

Figure 35.1 Mapping of the Code Flash Memory (8 KB × 8 + 32 KB × 126 configuration) in the C1M-A2

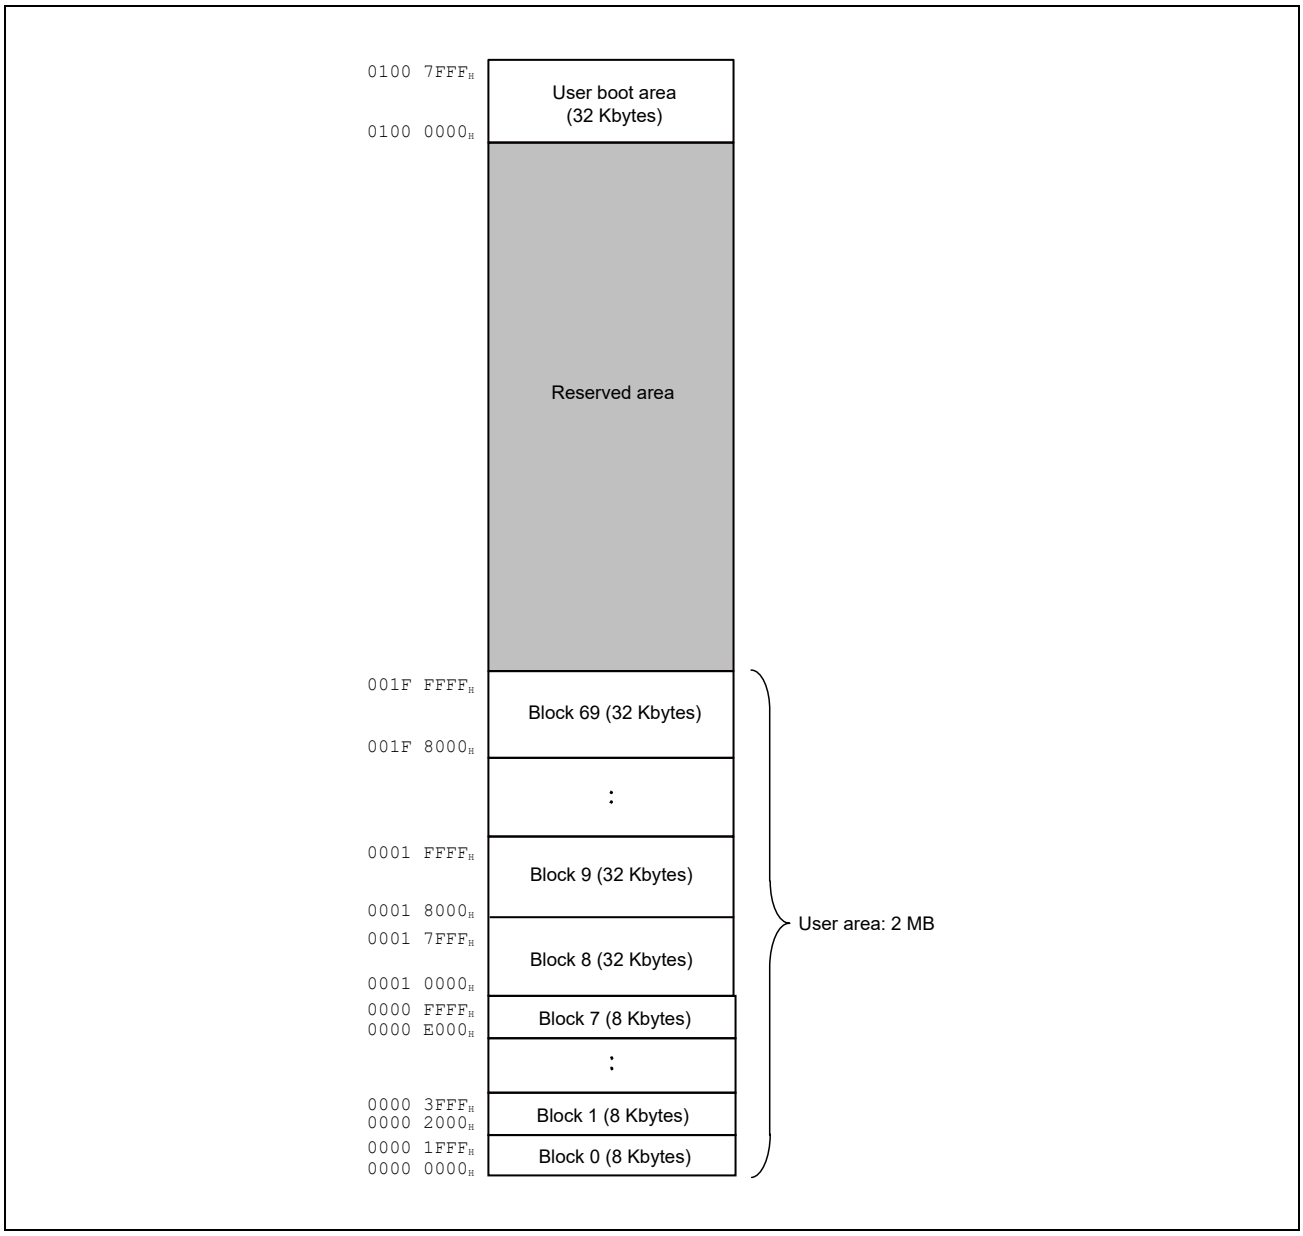

Figure 35.2 Mapping of the Code Flash Memory (8 KB × 8 + 32 KB × 62 configuration) in the C1M-A1

The data area of the data flash memory in this product is divided into 64-byte blocks, with each being a unit for erasure. **Figure 35.3** shows the mapping of the data flash memory.

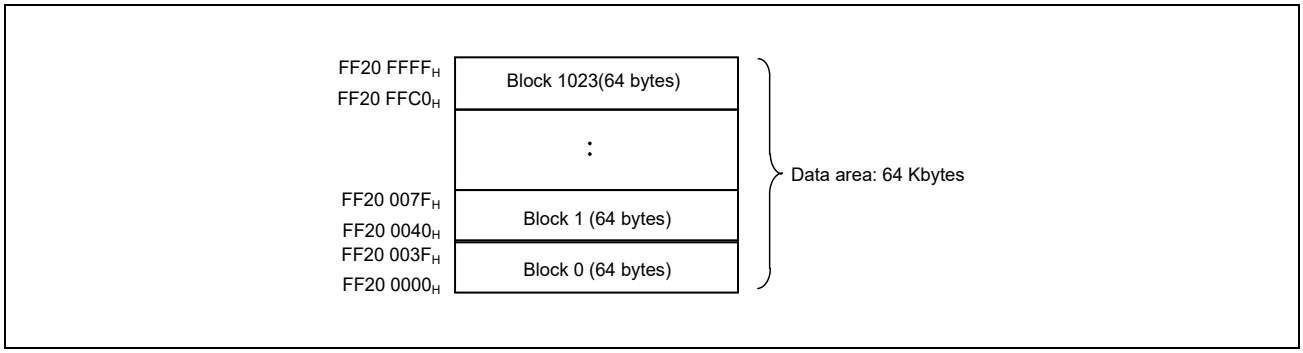

Figure 35.3 Mapping of the Data Flash Memory (64 bytes × 1024 configuration)

35.3 Operating Modes Associated with Flash Memory

Figure 35.4 is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, refer to **Section 5, Operating Mode**.

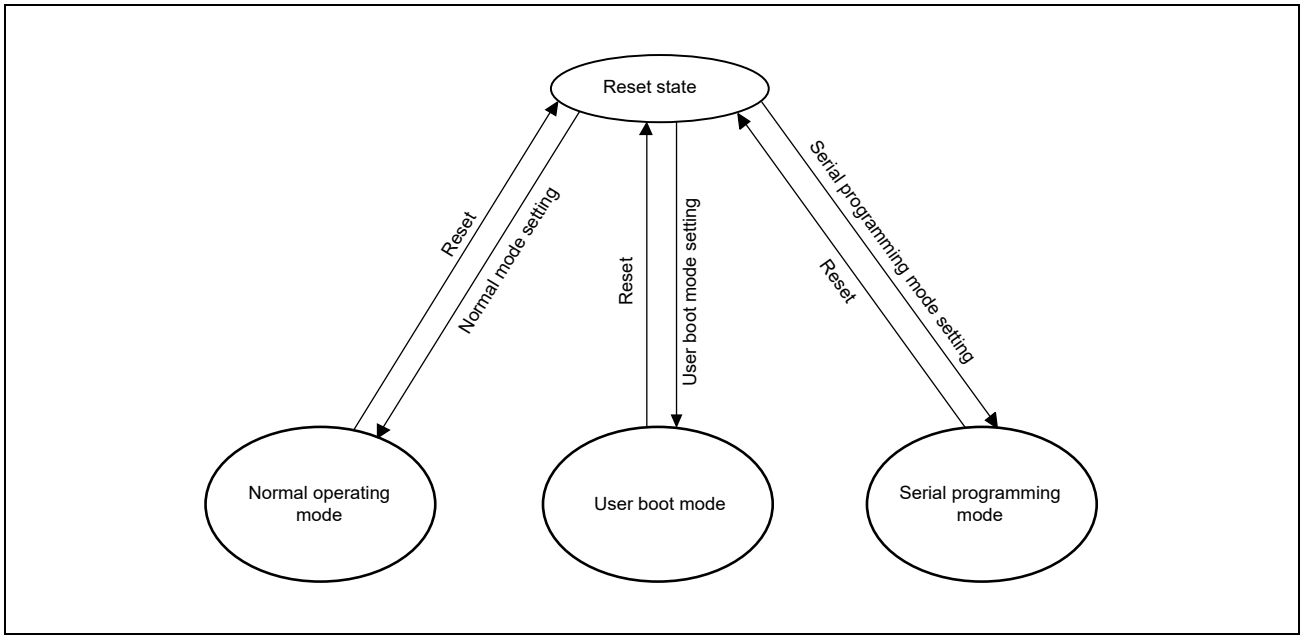

Figure 35.4 Mode Transition Associated with Flash Memory

The flash memory area which is programmable and erasable and the boot program after reset release are different in each mode. **Table 35.1** shows the differences.

Table 35.1 Differences in Each Mode

Item	Normal Operating Mode*1	User Boot Mode	Serial Programming Mode
Programmable and erasable area	• User area • Data area	• User area • Data area	• User area • User boot area • Data area
Boot program at the time of reset	Program in user area	Program in user boot area	Embedded program for serial programming

Note 1. Normal operating mode refers to a user boot mode whose activation area is a user area.

35.4 Functional Overview

The flash memory mounted on this product can be updated via a serial interface communication by a dedicated flash memory programmer (serial programming), whether before or after being mounted on the target system.

Furthermore, security functions to prohibit updating of the user program written in the mounted flash memory are incorporated, and this can prevent tampering by third parties.

Programming function by the user program (self-programming) is suited for applications where the target system program may require updating after manufacturing or shipping. Protection features for the safe rewriting of the flash memory area are also incorporated. In addition, interrupt processing during self-programming is supported, so programming can proceed at the same time as interrupt processing associated with external communication control, etc., and this allows programming under various conditions.

Table 35.2 gives an overview of the methods of programming and the corresponding operating modes.

Table 35.2 Methods of Programming

Methods of Programming	Functional Overview	Operating Mode
Serial programming	A dedicated flash-memory programmer is capable of on-board programming the flash memory after the device is mounted on the target system.	Serial programming mode
	A dedicated flash-memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system.	
Self programming	The user program that is written to code flash memory in advance of serial programming executing is also capable of programming the flash memory. The background operation capability makes it possible to fetch instructions or otherwise read data from code flash memory while the data flash memory is being programmed. For this reason, it is possible to program the data flash memory by executing a program written to the code flash memory. Instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being programmed by self-programming. In such cases, a program for updating must be transferred to the local RAM or global RAM in advance and executed.	Normal operating mode User boot mode

When performing self-programming, see the *RH850/C1M-A Flash Memory User's Manual: Hardware Interface* of this product.

Table 35.3 lists the functions of the mounted flash memory. Dedicated flash-memory programmer commands realize serial programming, while reading of the on-chip flash memory by interface operation of flash memory or the user program realizes self-programming.

Table 35.3 Basic Functions at a Glance

Function	Description in Overview	Level of Support (○: Supported, △: Conditionally Supported, ×: Not Supported)	
		Serial programming	Self-programming
Blank checking	This is used to check a specified block to ensure that writing to it has not already proceeded. Results of reading from code flash memory and data flash memory to which nothing has been written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	○	○
Block erasure	This is for erasing the contents of a specified block of memory.	○	○
Programming	This is for writing to a specified address.	○	○
Verification and checksum	Data that are read out from flash memory are compared with data transferred from the flash memory programmer.	○	○
Reading	Data that have been written to the flash memory are read out.	○	○
Setting for OTP (one-time programming)	A specified block of code flash memory is set for OTP (OTP can only be set, that is, it is not possible to release a block's OTP setting).	○	○
Setting an ID	An ID setting is made for use in controlling the connection of a dedicated flash memory programmer for serial programming and enabling of programming of the code flash memory by self-programming.	○	○
Security settings	Security settings are for use in serial programming.	○	△ (only when setting is prohibited after being permitted)
Protection settings	Lock bits for all blocks of code flash memory are provided.	○	○
Setting of option bytes	Option bytes are set to change them from the initial values for this product.	○	○
Clearing the configuration	ID setting, security settings, protection settings, and option byte settings are initialized.	○	×

For details on serial programming, see the *PG-FP5 Flash Memory Programmer User's Manual*, and the *Renesas Flash Programmer Flash Programming Software User's Manual.*

When performing self-programming, see the *RH850/C1M-A Flash Memory User's Manual: Hardware Interface* of this product.

The mounted flash memory supports various security functions.

The OTP setting and authentication of the ID code are security functions for use with serial programming and self-programming.

In serial programming, authentication of the ID code, prohibiting connection of a dedicated flash-memory programmer, and prohibition of commands (for block erasure, programming, and reading) are available for use as security functions.

The security functions supported by the mounted flash memory are listed in **Table 35.4**, and the operations when security is enabled are listed in **Table 35.5**.

Table 35.4 Summary of Security Functions

Function	Description
OTP	OTP can be individually set for each block of the user area and the user boot area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self-programming is prohibited. Once set, the OTP setting cannot be released. Furthermore, since execution of the configuration clearing command is prohibited for any area for which OTP has been set, changing a security setting from “prohibited” to “permitted” is not possible.
ID authentication	The result of ID authentication can be used to control the connection of a dedicated flash memory programmer for serial programming. The result of ID authentication can also be used to control enabling of programming of the code flash memory by self-programming.
Prohibition of connection of a dedicated flash memory programmer	The connection of a dedicated flash memory programmer for serial programming is prohibited. Since execution of the configuration clearing command is also prohibited when the connection of a dedicated flash memory programmer is prohibited, changing a security setting from “prohibited” to “permitted” is not possible.
Prohibition of block erasure commands	Block erasure commands at the time of serial programming are prohibited. Since execution of the configuration clearing command is also prohibited when block erasure commands are prohibited, changing a security setting from “prohibited” to “permitted” is not possible.
Prohibition of programming commands	Block erasure commands and programming commands at the time of serial programming are prohibited. Block erasure commands can be run only by the method of erasing all user areas from Block 0 in turn → erasing the user boot areas → erasing all data areas from Block 0 in turn. Only through execution of the configuration clearing command, the prohibition can be lifted.
Prohibition of read commands	Read commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command, the prohibition can be lifted.

Table 35.5 Available Operations and Security Settings

Function	All Security Settings and Erasure, Programming, and Read Operations (○: Executable, ×: Not Executable, –: Not Supported)		Point for Caution Regarding the Security Setting	
	Serial programming	Self-programming	Serial programming	Self-programming
OTP	• Areas for which OTP is set Block erasure commands: × Programming commands: × Read commands: ○ • Areas for which OTP is not set Block erasure commands: ○ Programming commands: ○ Read commands: ○	• Areas for which OTP is set Block erasure: × Programming: × Reading: ○ • Areas for which OTP is not set Block erasure: ○ Programming: ○ Reading: ○	The OTP setting cannot be released. Execution of the configuration clearing command is not possible.	The OTP setting cannot be released.
ID authentication	• When the ID codes do not match Block erasure commands: × Programming commands: × Read commands: × • When the ID codes match Block erasure commands: ○ Programming commands: ○ Read commands: ○	• When the ID codes do not match - Code flash memory Block erasure: × Programming: × Reading: ○ - Data flash memory Block erasure: ○ Programming: ○ Reading: ○ • When the ID codes match Block erasure: ○ Programming: ○ Reading: ○	The configuration clearing command can initialize the setting for prohibition. The setting for prohibition of block erasure commands is not available. The setting for prohibition of programming commands is not available. The setting for prohibition of read commands is not available.	ID authentication is always in effect.
Prohibition of the connection of a dedicated flash memory programmer	Block erasure commands: × Programming commands: × Read commands: ×	Block erasure: ○ Programming: ○ Reading: ○	Since execution of the configuration clearing command is prohibited, initialization of the setting for prohibition is not possible.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of block erasure commands	Block erasure commands: × Programming commands: ○ Read commands: ○	Block erasure: ○ Programming: ○ Reading: ○	Since execution of the configuration clearing command is prohibited, initialization of the setting for prohibition is not possible. The setting for ID authentication to be effective for serial programming is not available.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of programming commands	Block erasure commands: ×*1 Programming commands: × Read commands: ○	Block erasure: ○ Programming: ○ Reading: ○	Executing the configuration clearing command only can initialize the setting for prohibition. The setting for ID authentication to be effective for serial programming is not available.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of read commands	Block erasure commands: ○ Programming commands: ○ Read commands: ×	Block erasure: ○ Programming: ○ Reading: ○		

Note 1. Block erasure commands can be run only by the method of erasing all user areas from Block 0 in turn → erasing the user boot areas → erasing all data areas from Block 0 in turn.

The mounted flash memory supports various protection functions. The protection functions supported by the mounted flash memory are listed in **Table 35.6.**

Table 35.6 Summary of Protection Functions

Function	Description
Block protection	Lock bit settings can be individually made to enable or disable programming and erasure of each block of the user area of code flash memory. Programming and erasure by self-programming of an area for which the lock bit is set and the lock bit function is enabled are prohibited. Programming or erasure can proceed again when the lock bit function is disabled after having been enabled. When a block of code flash memory is erased, the lock bit for that block is also erased.
User boot protection	Programming and erasure of the user boot area by self-programming are prohibited. Programming and erasure of the user boot area by serial programming are possible.

35.5 Serial Programming

A dedicated flash memory programmer can be used for programming of the flash memory in serial programming mode.

Serial Programming

The microcontroller is mounted on the system board at the time of serial programming. Providing a connector to the board enables writing to the microcontroller by the flash memory programmer to proceed.

35.5.1 Environments for Programming

The recommended environments for writing the data into the flash memory of the microcontroller are described below.

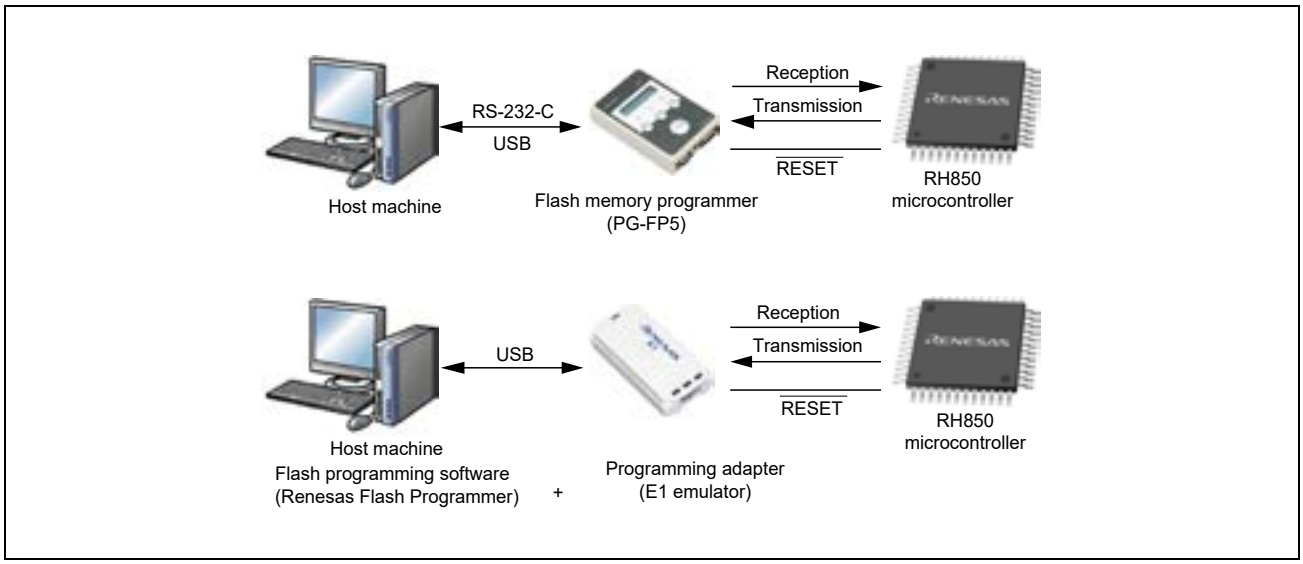

Figure 35.5 Environments for Writing Programs into the Flash Memory

By using the PG-FP5 flash memory programmer or the combination of the Renesas Flash Programmer (software for writing to flash memory) running on the host machine and the E1 emulator as an programming adaptor, the user is easily able to erase, program, and verify the contents of the on-chip memory of flash-memory-equipped microcontrollers from Renesas Electronics.

The PG-FP5 flash memory programmer handles programming from a host machine or programming in stand-alone mode while the Renesas Flash Programmer only handles programming from a host machine.

NOTE

Refer to the *PG-FP5 Flash Memory Programmer User's Manual* for the details of PG-FP5, and the *Renesas Flash Programmer Flash Programming Software User's Manual* for details of Renesas flash programmer for flash programming software.

35.5.2 Selection of the Communication Method

In this product, either 2-wire UART method or clock synchronous method can be selected as a serial communication method by the FLMODE pin. For details on how to set the FLMODE pin, see **Section 5, Operating Modes.** For details on how to set the programming environment in accordance with each communication method, see the *PG-FP5 Flash Memory Programmer User's Manual* and the *Renesas Flash Programmer Flash Programming Software User's Manual.*

35.6 Self-Programming

35.6.1 Overview

This product supports programming of the flash memory by the user program itself. The code flash and data flash memory can be programmed by using the commands of flash memory application command interface (FACI) for flash memory programming in user's applications. Therefore, update of the user program and programming of constant data fields can be possible.

When the data flash memory is programmed, the background operation facility makes it possible to execute a programming program from the code flash memory to program the data flash memory. Furthermore, the programming program can be copied to local RAM or global RAM in advance of the programming operation, and executed from the given destination to perform the programming.

For the comprehensive information on flash self-programming, see the *Code Flash Library,* the *Data Flash Library*, and the *RH850/C1M-A Flash Memory User's Manual: Hardware Interface* of this product.

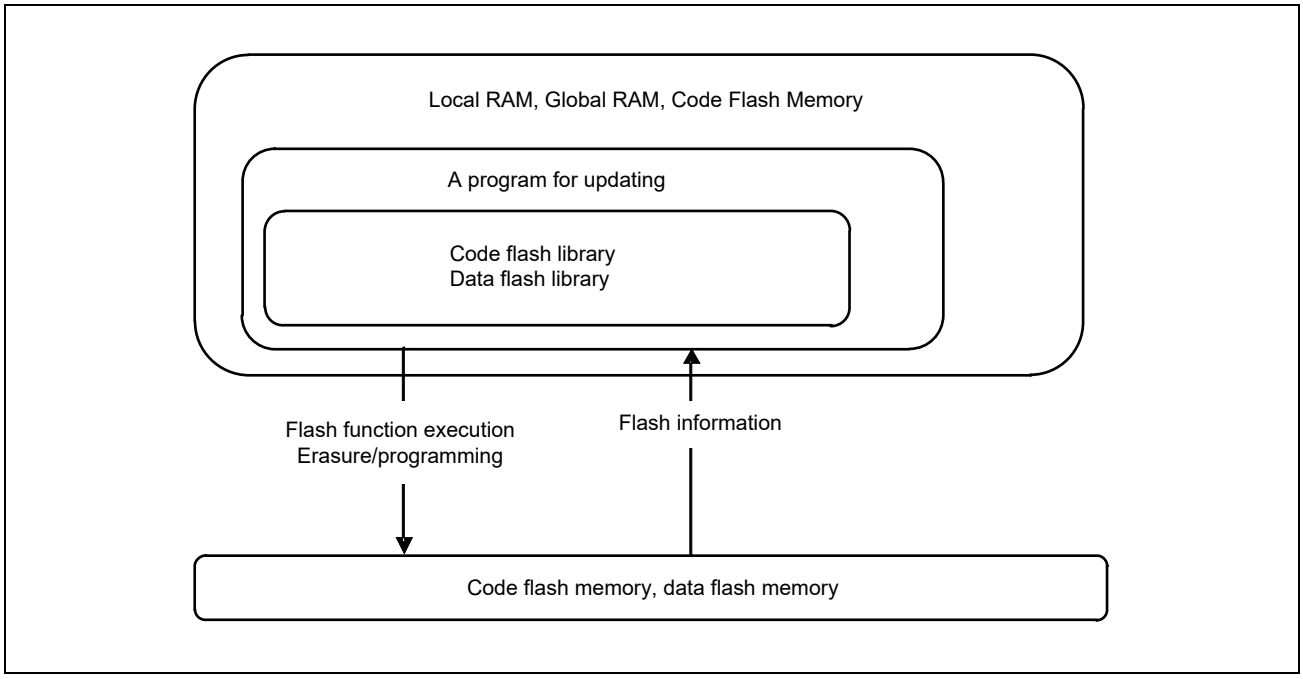

Figure 35.6 Concept of Self-Programming

35.6.2 Background Operation

Background operations can be used when the combination of the flash memory for writing and the flash memory for reading is any of those listed below.

Table 35.7 Conditions under which Background Operation is Usable

Range for Writing	Range for Reading
Data Flash Memory	Code Flash Memory

35.7 Reading Flash Memory

35.7.1 Reading Code Flash Memory

Special settings are not required to read code flash memory in normal mode and user boot mode. Data can simply be read out through access to addresses in the code flash memory. Code Flash

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. In addition, since the data value is not guaranteed in case of an ECC error, use blank checking when you need to confirm that an area is in the non-programmed state. For details on the ECC function, see **Section 29, Functional Safety**.

35.7.2 Reading Data Flash Memory

Configure the number of read cycles in the FRDCYCLD register prior to reading data from data flash memory in normal mode and user boot mode. Once this register is properly configured, data can be read by simply accessing addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programming again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

35.8 Register Descriptions

35.8.1 Registers Related to Data Flash Memory

Table 35.8 lists registers related to the data flash memory.

Table 35.8 List of Registers related to the Data Flash Memory

Module Name	Register Name	Abbreviation	R/W	Value after reset	Address	Access size
FLASH	Data flash memory read cycle setting register	FRDCYCLD	R/W	$0F_H$	FFC5 9810_H	8

35.8.1.1 FRDCYCLD - Data Flash Memory Read Cycle Setting Register

This register is used to set the data flash memory read cycle.

Access: This register can be read or written in 8-bit units.

Address: FFC5 9810_H

Value after reset: $0F_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FRDCYCLD[3:0]			
Value after reset	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 35.9 FRDCYCLD Register Contents

Bit Position	Bit Name	Function
7 to 4	—	Reserved
3 to 0	FRDCYCLD [3:0]	Number of the data flash memory read cycle The data flash memory is read by the set value + 1 cycle. 0_H-2_H: Setting prohibited 3_H: Read cycle 4 4_H: Read cycle 5 5_H: Read cycle 6 6_H: Read cycle 7 7_H: Read cycle 8 8_H: Read cycle 9 9_H-F_H: Read cycle 10

Note: 1 read cycle is CLK_LSB.

35.8.2 Registers Related to Programming/Erasure Protection of Flash Memory

Table 35.10 lists registers related to the programming/erasure protection of the flash memory.

Table 35.10 List of Registers Related to the Programming/Erasure Protection of the Flash Memory

Module Name	Register Name	Abbreviation	R/W	Value after reset	Address	Access size
FLASH	FHVE15 control register	FHVE15	R/W	0000 0000_H	FFF8 $A430_H$	32
FLASH	FHVE3 control register	FHVE3	R/W	0000 0000_H	FFF8 2410_H	32

35.8.2.1 FHVE15 — FHVE15 Control Register

FHVE15 is a readable/writable register for software protection of flash memory against programming, erasure, and blank checking. Set both the FHVE15 and FHVE3 registers in the programmable, erasable, and blank-checkable state (0000 0001_H) to program, erase, or blank-check flash memory.

Access: This register can be read or written in 32-bit units.

Address: FFF8 $A430_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FHVE 15CNT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 35.11 FHVE15 Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved
0	FHVE15CNT	0: Programming, erasure, and blank checking are disabled. 1: Programming, erasure, and blank checking are enabled.

35.8.2.2 FHVE3 — FHVE3 Control Register

FHVE3 is a readable/writable register for software protection of flash memory against programming, erasure, and blank checking. Set both the FHVE15 and FHVE3 registers in the programmable, erasable, and blank-checkable state (0000 0001_H) to program, erase, or blank-check flash memory.

Access: This register can be read or written in 32-bit units.

Address: FFF8 2410_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 35.12 FHVE3 Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved
0	FHVE3CNT	0: Programming, erasure, and blank checking are disabled. 1: Programming, erasure, and blank checking are enabled.

35.8.3 Registers Related to Product Information

The flash memory has the expansion area that stores the product information such as a product name and the size of included memory. The value stored in this expansion area is transferred to the registers related to product information at the time of reset.

Table 35.13 lists registers related to product information.

Table 35.13 List of Registers Related to Product Information

Module Name	Register Name	Abbreviation	R/W	Value after reset	Address	Access size
FLASH	Product name storage register (1)	PRDNAME1	R	See **Table 35.14**	FFCD 00D0$_H$	32
FLASH	Product name storage register (2)	PRDNAME2	R	See **Table 35.14**	FFCD 00D4$_H$	32
FLASH	Product name storage register (3)	PRDNAME3	R	See **Table 35.14**	FFCD 00D8$_H$	32
FLASH	Product name storage register (4)	PRDNAME4	R	See **Table 35.14**	FFCD 00DC$_H$	32

Table 35.14 Relation between Product Name and PRDNAME Initial Value (Value after reset)

Product Group Name	Product Model Name	PRDNAME4	PRDNAME3	PRDNAME2	PRDNAME1
C1M-A2	R7F701275	2020 2020$_H$	2020 2035$_H$	3732 3130$_H$	3746 3752$_H$

35.8.3.1 PRDNAMEn (n = 1 to 4) — Product Name Storage Register

This register stores the product name. The product model name is stored in 16-byte ASCII code, and PRDNAME1, PRDNAME2, PRDNAME3, and PRDNAME4 correspond to the fourth to first bytes, eighth to fifth bytes, twelfth to ninth bytes, and sixteenth to thirteenth bytes of the product model name respectively.

Access: This register can be read in 32-bit units.

Address: PRDNAME1: FFCD 00D0$_H$
PRDNAME2: FFCD 00D4$_H$
PRDNAME3: FFCD 00D8$_H$
PRDNAME4: FFCD 00DC$_H$

Value after reset: C1M-A product name Initial value (PRDNAMEn, n = 1 to 4)
See **Table 35.14, Relation between Product Name and PRDNAME Initial Value (Value after reset)**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. The value is the one shown in **Table 35.14, Relation between Product Name and PRDNAME Initial Value (Value after reset)**

Table 35.15 List of Registers Related to Product Information

Bit Position	Bit Name	Function
31 to 0	PRDNAMEn[31:0]	Product Name Product model names are shown in 16-byte ASCII code. PRDNAME1[31:0]: The fourth to first bytes of the product model name PRDNAME2[31:0]: The eighth to fifth bytes of the product model name PRDNAME3[31:0]: The twelfth to ninth bytes of the product model name PRDNAME4[31:0]: The sixteenth to thirteenth bytes of the product model name

35.9 Option Bytes

The flash memory has the extended area (option bytes) to store data specified by the user for various purposes. **Table 35.16** shows the setting areas of the option bytes. In a reserved area, 1 is always read out. Also, always set 1 as a set value. Changes in settings such as initial setting of peripheral functions using option bytes become effective after release from the reset state. For details on option bytes setting and how to read out, see the *PG-FP5 Flash Memory Programmer User's Manual*, and the *Renesas Flash Programmer Flash Programming Software User's Manual*, or the *RH850/C1M-A Flash Memory User's Manuals: Hardware Interface.*

Table 35.16 Setting Areas of Option Bytes

Option Byte Area (8 bits each x 32 = 256 bits in total)	Option Byte Register	Setting-enabled Area	Initial State at the time of Shipping*1
Option Bytes 4 to 1	OPBT0	Enabled	7FFF FFFE$_H$
Option Bytes 8 to 5			FFFF FFFF$_H$
	—	Reserved	
Option Bytes 12 to 9	OPBT2	Enabled	FFFF FFFF$_H$
Option Bytes 16 to 13	OPBT3	Enabled	7FFF FFFF$_H$
Option Bytes 20 to 17	OPBT4	Enabled	7FFF FFFF$_H$
Option Bytes 24 to 21	—	Reserved	FFFF FFFF$_H$
Option Bytes 28 to 25	OPBT6	Enabled	FFFF FFFA$_H$
Option Bytes 32 to 29	—	Reserved	FFFF FFFF$_H$

Note 1. This is a value of the initial state of the shipping product, which can be changed by the option byte setting.

35.9.1 OPBT0 — Option Byte 0 Register

Access: This register can be read /written in 32-bit units only when using on-chip debug function.

Address: FFCD 0030$_H$

Value after reset: User defined (7FFF FFFE$_H$ at the time of shipping)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. For the option byte areas and the initial state at the time of shipping of this register, see **Table 35.16**. Reading and setting (R/W) of the option byte areas are possible only when using FACI commands, PG-FP5 Flash Memory Programmer, and Renesas Flash Programmer Flash Programming Software.

Table 35.21 OPBT6 Register Contents

Bit Position	Bit Name	Function
31 to 21,	—	Reserved When read, the value after reset is returned. When writing to these bits, write the read value.
20	WDTCLKSEL	Selects the clock of the counter clock of WDTA and SWDTA (WDTATCKI). 0: LS IntOSC (240 kHz) 1: Main OSC x1/80 (250 kHz)
19 to 10	—	Reserved When read, the value after reset is returned. When writing to these bits, write the read value.
9	STARTUPPE	• For C1M-A2: Selects the boot mode of CPU. 0: After reset release, only CPU1 starts. CPU2 is in a stopped status. 1: After reset release, CPU1 and CPU2 start simultaneously. • For C1M-A1: Reserved When read, the value after reset is returned. When writing to these bits, write the read value.
8 to 0	—	Reserved When read, the value after reset is returned. When writing to these bits, write the read value.

35.10 Notes

(1) Reading areas where programming or erasure was interrupted

When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid undefined data that are read out becoming the source of faulty operation, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.

(2) Reading the code flash memory that has been erased but not yet been programming again

Note that reading from an area of code flash memory that has been erased but not yet been programming again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.

(3) Prohibition of additional writing

Writing to a given area twice is not possible. If you want to overwrite data in an area of flash memory after writing to the area has been completed, erase the area first.

(4) Resets during programming and erasure

In the case of an external reset during programming and erasure, wait for at least min-width of reset pulse once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.

(5) Allocation of vectors for interrupts and other exceptions during programming and erasure

In the case of an interrupt or other exception during transferring an FCU firmware, or programming or erasing a code flash, mask the interrupt or exception in advance, or place an interrupt handler address table*[1] and exception handler in an instruction fetchable space other than the code flash.

Note 1. It applies in cases where the table reference method is selected as the interrupt handler address selection method. For details, see the *RH850G3MH: Software*.

(6) Abnormal termination of programming and erasure

Even if programming/erasure ends abnormally due to the generation of an external reset or instantaneous power failure, the programming/erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming or erasure ends abnormally, the blank check function cannot judge whether the area is erased successfully or not. Erase the area again to prove that the corresponding area is completely erased before using. If programming and erasure of code flash memory are not completed normally, the lock bit for the target area may be enabled (locked). In such cases, erase the block to erase the lock bit while the lock bit is in the disabled state (the area is not locked).

(7) Items prohibited during programming and erasure

Do not perform the following operations during programming and erasure of the flash memory.

- Have the operating voltage from the power supply go beyond the allowed range.
- Update the values of FHVE15 and FHVE3. Update the values of FHVE15 and FHVE3.
- Change the operating frequency of the peripheral clock.

(8) Prohibition of the various command execution of the flash memory before the completion of the clock gear up sequence

Execute the various commands in serial programming and self-programming after the completion of the clock gear up sequence. For details on the clock gear up sequence, see **Section 10, Clock Controller**.

(9) Ensuring the coherency of the instruction cache and the data buffer

After the completion of programming/erasing the code flash memory, a reset or clearance of the instruction cache and the data buffer is needed in order to ensure the coherency of the instruction cache and the data buffer. For details on the instruction cache and the data buffer, see **Section 3, CPU System**.

Section 36 Flash Security

To protect the code flash memory, data flash memory, and ID codes, this product has the security functions described in **Section 35, Flash Memory**, and functions to restrict connection of the debug interface, which are described in this section.

For detailed descriptions of the security functions in serial programming mode and how to program the flash memory, see **Section 35, Flash Memory**.

In this section, the interfaces that may be used in on-chip debugging (the Nexus and 4-pin LPD) are referred to as “debug interfaces”. In addition, ID authentication to protect the code flash memory, data flash memory, and ID codes in user boot mode is referred to as “SELF ID authentication”, and ID authentication to protect against access through the on-chip debug functions is referred to as “OCD ID authentication”.

The data length of each ID code during SELF ID and OCD ID authentication as well as the ID code in the ID authentication stage of serial programming is 128 bits. In the initial state of the product at shipment, the ID codes are FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF$_H$.

36.1 Features

36.1.1 Protection of Code Flash Memory, Data Flash Memory, and ID Codes

This microcontroller includes the following security functions in user boot mode and serial programming mode to prevent any leaking of the user program programmed in the code flash memory.

36.1.1.1 Functions Unique to User Boot Mode

SELF-ID authentication provides protections against the following operations: programming or erasure of code flash memory, rewriting to the option bytes, and rewriting or reading of ID codes.

Security States

This mode has two security states, protection locked and protection unlocked. Transition between these states can be made by changing SELF-ID authentication and the ID codes.

- Protection unlocked
  Security functions have been unlocked by SELF ID authentication so that protection against programing/erasure of code flash memory, rewriting to option bytes, and rewriting/reading of ID codes is released.
- Protection locked
  Security functions have been enabled by SELF ID authentication and protection against programing/erasure of code flash memory, rewriting to option bytes, and rewriting/reading of ID codes is in place.

36.1.1.2 Functions Unique to Serial Programming Mode

Three functions are provided as security functions unique to serial programming mode: ID authentication, prohibition of programming, erasure, and read commands, and prohibition of serial programmer connection. Parallel use of these functions is not allowed.

(1) ID Authentication
ID codes are checked for authenticity to protect the code flash memory and data flash memory. Programming, erasure, and reading of the code flash and data flash memory can proceed upon successful ID authentication.

(2) Prohibition of Programming, Erasure, and Read Commands
Issuing of programming, erasure, and read commands can be enabled or disabled individually for the code flash memory and data flash memory. All commands are permitted for both areas in the initial state of the product as shipped.

(3) Prohibition of Serial Programmer Connection
Issuing commands for programming, erasure, or reading to the code flash memory and data flash memory can be disabled in serial programming mode. Transitions to other functions are not possible once this state is set.

36.1.1.3 Common Function of User Boot Mode and Serial Programming Mode

OTP (One Time Programming)

Setting an area of the code flash memory as OTP protects it against any further programming and erasure. For details of the setting, see **Section 35, Flash Memory**.

36.1.2 Connection Restriction Function of Debug Interface

This product is provided with unauthorized access protection via debug interfaces and two security levels are available.

- Security level 1:
  Debug interfaces can be used. At this level, the on-chip debugging function is protected by OCD ID authentication. For OCD to be used, it must be unlocked by using OCD ID authentication.
- Security level 2:
  At this level, the debug interfaces cannot be used.

As described so far, restrictions on the connection of code flash and data flash memory, ID code protection, and availability of the debug interfaces differ according to the mode. **Table 36.1** summarizes security functions in each mode.

Table 36.1 Security Functions in Each Mode

Operation Mode	Code Flash and Data Flash, ID Code Protection	Restriction on Debug Interface Connection
User boot mode	• SELF ID authentication • OTP (parallel use possible)	• Security level 1 (OCD ID authentication) • Security level 2 (Debug interface connection is prohibited)
Serial programming mode	• ID authentication • Programming commands, block erasure commands, and read commands are prohibited. • Connection of serial programmers is prohibited. (The above three cannot be used in parallel.) • OTP (parallel use possible)	• No function (Debug interface connection is always prohibited.)

36.2 Security in User Boot Mode

36.2.1 SELF ID Authentication

To prevent leakage of the user program written to the code flash memory, this product has security functions to enable or disable the programming/erasure of code flash memory, rewriting to option bytes, and rewriting/reading of ID codes. The setting of enabling or disabling of these functions can be switched through SELF ID authentication with the ID code the user has set as the expected value.

36.2.2 SELF ID Authentication and Security State

Table 36.2 and **Figure 36.1** show SELF ID authentication security state and conditions for transition.

Table 36.2 Security State Set by SELF ID Authentication

State	SELF ID Authentication	Protection State of Reprogramming/Erasure of Code Flash, Rewriting to Option Bytes, Rewriting/Reading of ID Codes.
Protection unlocked	Unlocked	Not protected
Protection locked	Locked	Protected

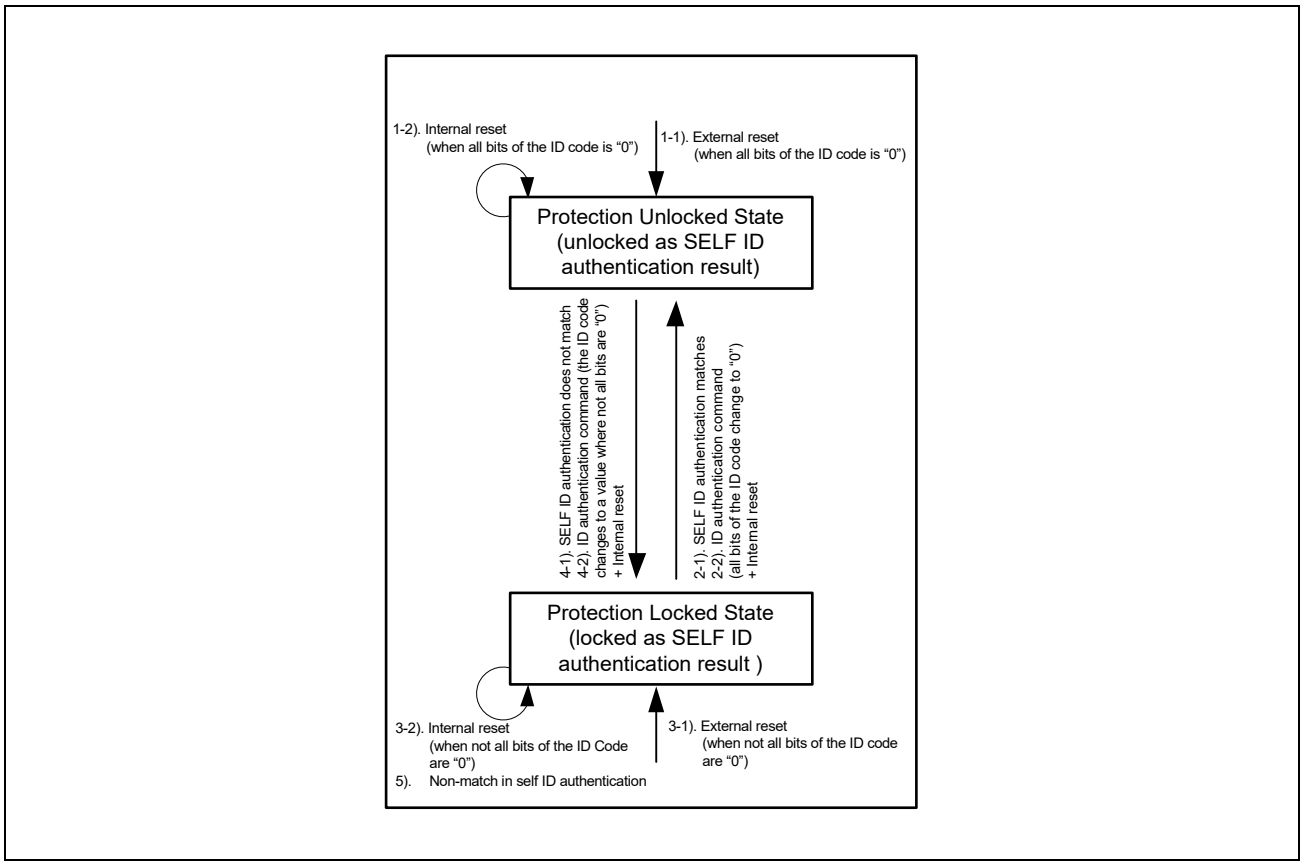

Figure 36.1 Security Setting State by SELF ID Authentication and Transition

The conditions for the transitions of security states are shown in **Figure 36.1** as follows.

- Conditions for Transitions to the Protection Unlocked State

1) Startup when protection is released

1-1) When an external reset is applied while the ID code is all 0s, startup proceeds with protection released.

1-2) When an internal reset is applied without modification of the ID code while all bits of the ID code are 0, startup proceeds with protection in place.

2) Transition from protection locked to protection released

2-1) A transition to the protection unlocked state follows a match in SELF ID authentication matches.

2-2) When an internal reset is applied after changing the ID code has been changed from other than “all bits 0” to “all bits 0”, startup proceeds with protection released.

- Conditions for Transitions to Protection Locked

3) Conditions for transitions to protection locked

3-1) When an external reset is applied while the ID code is other than “all bits 0”, startup proceeds with protection in place.

3-2) When an internal reset is applied without modification of the ID code while not all bits of the ID code are 0, startup proceeds with protection in place.

4) Transition from protection unlocked to protection locked

4-1) A transition to the protection locked state follows a non-match in SELF ID authentication.

4-2) When an internal reset is applied after the ID code has been changed from “all bits 0” to “other than all bits 0”, startup proceeds with protection in place.

5) To retain protection locked

Protection remains in place in case of a non-match in SELF ID authentication.

36.3 Security Functions in Serial Programming Mode

For details of security functions in serial programming mode, see **Section 35, Flash Memory**.

36.4 Restricting Connection with Debug Interfaces

This product is capable of restricting connection of the debug interfaces to protect against unauthorized access via the debug interfaces. This feature has two security levels.

- Security level 1: Restrict access to OCD functions by using OCD ID authentication
- Security level 2: Prohibit all connection to the debug interfaces

These security levels can be changed by bits 30 and 29 (OPJTAG1 and OPJTAG0) in option byte 2 in the extended area of the flash memory.
In this section, OPJTAG0 and OPJTAG1 are referred to as the OPJTAG bits.

36.4.1 Security Levels and State of Restricting the Connection of Debug Interfaces

Table 36.3 show each security level and the corresponding security states and **Figure 36.2** shows the conditions for transitions.

Table 36.3 Security Levels and State of Restricting Connection to the Debug Interfaces

State	Result of OCD ID Authentication	OPJTAG Bit*1	Restriction on Debug Interface Connection
Security level 1	Unlocked	Other than 00_B	No restriction
	Locked	Other than 00_B	Restriction on access via the debug interfaces is in place.
Security level 2	—	00_B	Connection to the debug interfaces is prohibited.

Note 1. For a detailed description of the OPJTAG bits, see **Section 35, Flash Memory**.

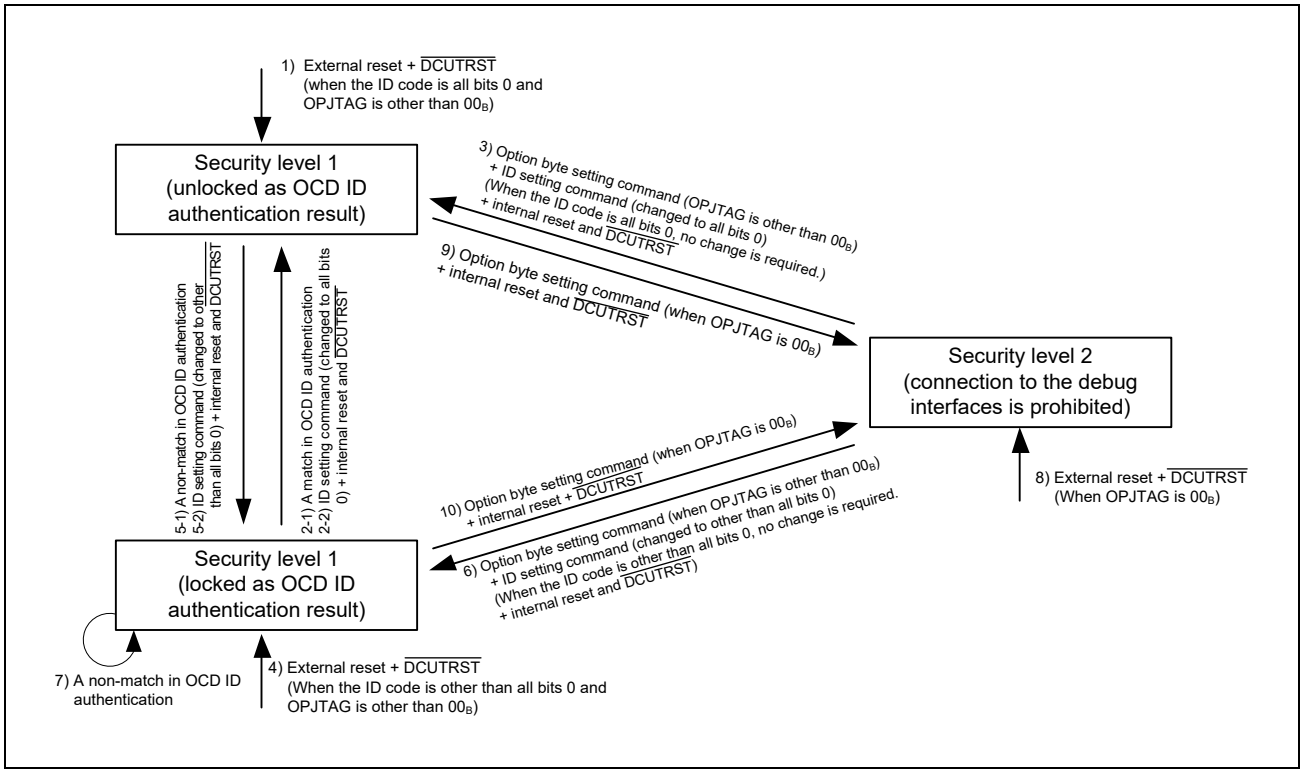

Figure 36.2 Transitions of Security Level

Conditions for transitions to each security level described in **Figure 36.2**.

- Conditions for Transitions to Security Level 1 (unlocked as OCD ID authentication result)

1) Startup in the state of security level 1 (unlocked as OCD ID authentication result)

When an external reset and a reset by $\overline{\text{DCUTRST}}$ are applied while the ID code is all 0s and while the value of the OPJTAG is other than 00_B, startup proceeds with security level 1 (unlocked as OCD ID authentication result).

2) Transition from security level 1 (locked as OCD ID authentication result) to security level 1 (unlocked as OCD ID authentication result)

2-1) Transition to security level 1 (unlocked as OCD ID authentication result) follows a match in OCD ID authentication.

2-2) When an internal reset or a reset by $\overline{\text{DCUTRST}}$ is applied after changing the ID code to “all bits 0”, startup proceeds at security level 1 (unlocked as OCD ID authentication result).

3) Transition from security level 2 to security level 1 (unlocked as OCD ID authentication result)

When an internal reset or a reset by $\overline{\text{DCUTRST}}$ is applied after changing the ID code to “all bits 0” and the value of the OPJTAG to other than 00_B, startup proceeds at security level 1 (unlocked as OCD ID authentication result).

- Conditions for Transitions to Security Level 1 (locked as OCD ID Authentication result)

4) Startup in the state of security level 1 (locked as OCD ID authentication result)

When an external reset or a reset by $\overline{\text{DCUTRST}}$ is applied while the ID code is “other than all bits 0” and the value of the OPJTAG is other than 00_B, startup proceeds at security level 1 (locked as OCD ID authentication result).

5) Transition from security level 1 (unlocked as OCD ID authentication result) to security level 1 (locked as OCD ID authentication result)

5-1) A transition to security level 1 (locked as OCD ID authentication result) follows a non-match in OCD ID authentication.

5-2) When an internal reset or a reset by $\overline{\text{DCUTRST}}$ is applied after changing the ID code to “other than all bits 0”, startup proceeds at security level 1 (locked as OCD ID authentication result).

6) Transition from security level 2 to security level 1 (locked as OCD ID authentication result)

When an internal reset or a reset by $\overline{\text{DCUTRST}}$ is applied after changing the ID code to “other than all bits 0” and the value of OPJTAG is other than 00_B, startup proceeds at security level 1 (locked as OCD ID authentication result).

7) Retaining security level 1 (locked as OCD ID authentication result)

In case of a non-match in OCD ID authentication, security level 1 (locked as OCD ID authentication result) remains in place.

- Transition to Security Level 2

  8) Startup at security level 2

     When an external reset or a reset by $\overline{\text{DCUTRST}}$ is applied while the value of OPJTAG is 00_B, startup proceeds at security level 2.

  9) Transition from security level 1 (unlocked as OCD ID authentication result) to security level 2

     When an internal reset or a reset by $\overline{\text{DCUTRST}}$ is applied after changing the value of the OPJTAG to 00_B, startup proceeds at security level 2.

  10) Transition from security level 1 (locked as OCD ID authentication result) to security level 2

      When an internal reset or a reset by $\overline{\text{DCUTRST}}$ is applied after changing the value of the OPJTAG to 00_B, startup proceeds at security level 2.

Section 37 RAM

37.1 List of On-Chip RAM

RH850/C1M-A includes the following RAM.

- Local RAM (CPU1): 64 Kbytes
- Local RAM (CPU2): 64 Kbytes (C1M-A2)
- Local RAM (EMU): 64 Kbytes
- Global RAM: Up to 128 Kbytes*1

Note 1. Refer to **Table 1.1, Overview of Products** for including size in each product.

37.2 Features

Access:

CPU1, CPU2, the sub-CPU in EMU3, and the DMAC can access the local RAM of the CPUs (CPU1, CPU2, sub-CPU in EMU3) and the global RAM.

For details of address map and access availability, see **Section 4, Address Space**.

ECC:

The local RAM of CPU1, CPU2, and the sub-CPU in EMU3 and the global RAM include ECC and address parity.

For details, see **Section 29, Functional Safety**.

37.3 Notes

(1) The local RAM and global RAM must be initialized with the maximum bit length of its access size before using the RAM.

If the RAM is accessed before its initialization, an ECC error may be detected. Also if initialization with the maximum bit length is not performed (e.g. if a 32-bit RAM is initialized by an 8-bit or 16-bit access), an ECC error may be detected.

(2) Buffers are included for high-speed access between the following RAMs and the CPU.

- Local RAM (CPU1), Local RAM (CPU2), Local RAM (EMU)

  After a value has been written to an address, reading the value from the same address may lead to reading from the buffer instead of the RAM.

  Ways to make sure that values are being read from the RAM are as follows.

  1. Only read the first byte to have been written after having written more than 32 bytes of data.
  2. Issue a SYNCM instruction between a write instruction and an instruction to read from the same address.

Section 38 Boundary Scan

This section contains a generic description of the boundary scan function.

RH850/C1M-A has the JTAG interface and provides the functionality of boundary scan.

38.1 Overview

Boundary scan is a test method specified in IEEE 1149.1 standard used for testing the connection between devices mounted on a printed-circuit board. The boundary scan function of RH850/C1M-A conforms to the IEEE 1149.1-2001 standard.

38.2 Features

- Five test signals (DCUTCK, DCUTDI, DCUTDO, DCUTMS, and $\overline{\text{DCUTRST}}$)
- TAP controller
- Instruction register
- Bypass register
- Boundary scan register

The JTAG interface has six commands.

- BYPASS mode
  Test mode conforming to the IEEE 1149.1
- EXTEST mode
  Test mode conforming to the IEEE 1149.1
- SAMPLE/PRELOAD mode
  Test mode conforming to the IEEE 1149.1
- CLAMP mode
  Test mode conforming to the IEEE 1149.1
- HIGHZ mode
  Test mode conforming to the IEEE 1149.1
- IDCODE mode
  Test mode conforming to the IEEE 1149.1

Figure 38.1 shows a block diagram of the JTAG interface.

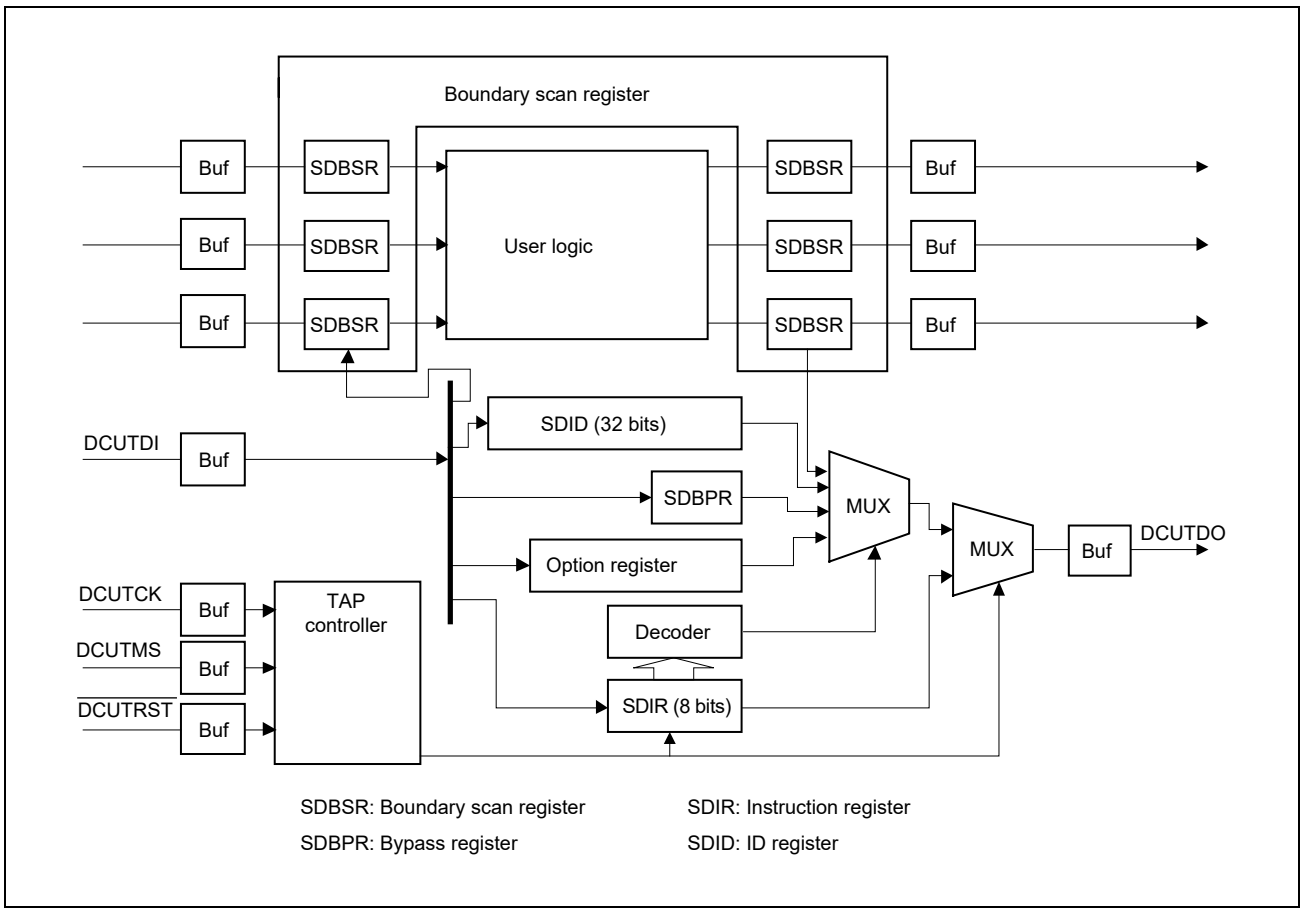

Figure 38.1 Block Diagram of JTAG Interface

38.3 Input/Output Pins

There are five JTAG control signals: DCUTCK, DCUTDI, DCUTMS, DCUTDO, and $\overline{\text{DCUTRST}}$.

Table 38.1 shows the pin configuration.

Table 38.1 Pin Configuration

Pin Name	Description
DCUTCK	Serial data input/output clock pin Data is supplied via the data input pin (DCUTDI) and is output from the data output pin (DCUTDO) in synchronization with this clock signal.
DCUTMS	Mode select input pin Changing the level of this signal in synchronization with DCUTCK changes the state of the TAP controller. For the protocol, refer to **Figure 38.2, TAP Controller State Transition Diagram**.
$\overline{\text{DCUTRST}}$	Reset input pin A low-level input of this signal, which is accepted asynchronously with DCUTCK, resets the JTAG interface. Even if the JTAG interface is not used, $\overline{\text{DCUTRST}}$ must be held low for the specified time at a power on.
DCUTDI	Serial data input pin Changing the state of this pin in synchronization with DCUTCK allows data to be sent to the JTAG interface.
DCUTDO	Serial data output pin Reading the state of this pin in synchronization with DCUTCK allows data to be read from the JTAG interface.

38.4 Register Descriptions

The JTAG interface has the following registers. None of the registers can be accessed by the CPU.

- SDIR: Instruction register
- SDID: ID register
- SDBPR: Bypass register
- SDBSR: Boundary scan register

Table 38.2 Register Configuration

Register Name	Symbol	Access Size	Initial Value*1
Instruction register	SDIR	8	55_H
ID register	SDID	32	1832 $B447_H$ (C1M-A2) 1832 $D447_H$ (C1M-A1)
Bypass register	SDBPR	1	Undefined
Boundary scan register	SDBSR	—	Undefined

Note 1. Registers are initialized when $\overline{\text{DCUTRST}}$ pin is 0 or when TAP is in the Test-Logic-Reset state.

Commands can be serially transferred from the serial data input pin (DCUTDI) and input to the instruction register (SDIR). The bypass register (SDBPR) is a 1-bit register, to which DCUTDI and DCUTDO are connected in BYPASS mode, CLAMP mode, and HIGHZ mode. The boundary scan register (SDBSR) is connected DCUTDI and DCUTDO in SAMPLE/PRELOAD mode and EXTEST mode. The ID code register (SDID) is a 32-bit register, from which the ID code is output via DCUTDO in IDCODE mode.

Table 38.3 shows the serial transfer types possible with the JTAG interface registers.

Table 38.3 Serial Transfer Types Possible with JTAG Interface Registers

Register	Serial Input	Serial Output
SDIR	Possible	Impossible *1
SDBPR	Possible	Possible
SDBSR	Possible	Possible
SDID	Impossible	Possible

Note 1. A fixed value is read out.

38.4.1 Instruction Register (SDIR)

SDIR is an 8-bit register that holds a boundary scan command. SDIR is initialized by asserting $\overline{\text{DCUTRST}}$ or in the TAP Test-Logic-Reset state. Operation is not guaranteed when any reserved command is set in this register.

Table 38.4 Boundary Scan Commands

IR Code								Description
0	0	0	0	0	0	0	0	JTAG EXTEST
0	1	0	0	0	0	0	0	JTAG SAMPLE/PRELOAD
1	1	0	1	0	0	0	0	JTAG CLAMP
1	0	0	0	0	0	0	0	JTAG HIGHZ
0	1	0	1	0	1	0	1	JTAG IDCODE (value after reset)
1	1	1	1	1	1	1	1	JTAG BYPASS
Other than above								Reserved

38.4.2 SDID — ID Register

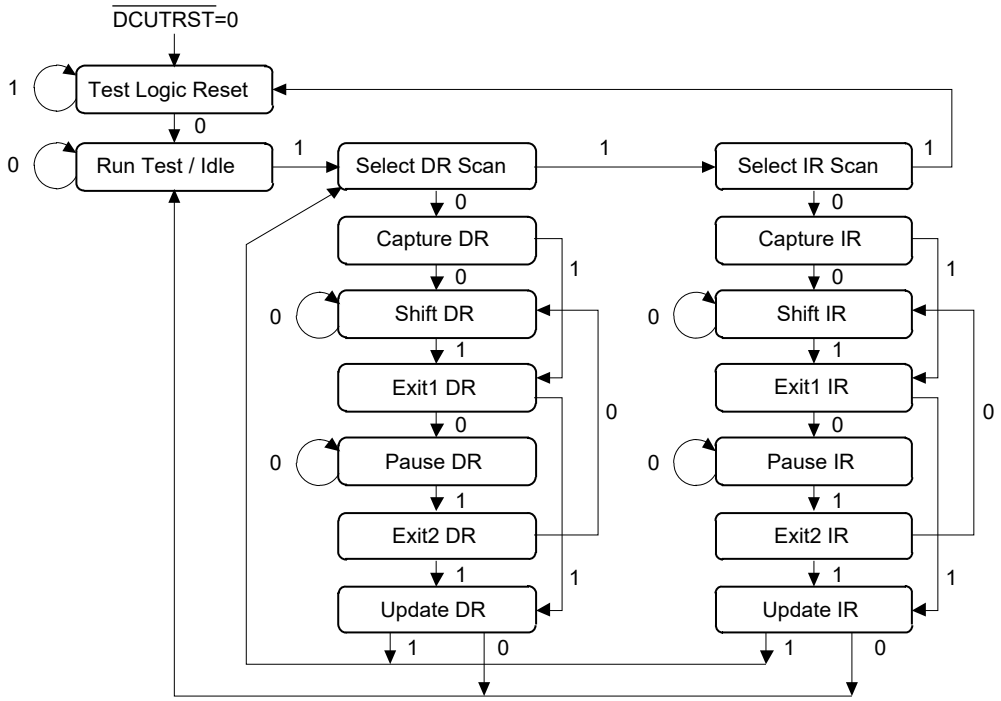
SDID is a 32-bit register that indicates an LSI-specific ID.

SDID can be read via the JTAG interface pin when the IDCODE command is set but cannot be written to.

For the read values, refer to **Table 38.2, Register Configuration**.

38.4.3 SDBPR — Bypass Register

SDBPR is a 1-bit register. When SDIR is set to BYPASS mode, SDBPR is connected between DCUTDI and DCUTDO. The value after reset is undefined. SDBPR is not initialized by a power-on reset or asserted $\overline{\text{DCUTRST}}$.



38.4.4 SDBSR — Boundary Scan Register

SDBSR is a shift register located on the PADs for controlling the external I/O pins. When SDIR is set to SAMPLE/PRELOAD or EXTEST mode, SDBSR is connected between DCUTDI and DCUTDO. The value after reset is undefined. SDBSR is not initialized by a power-on reset or asserted $\overline{\text{DCUTRST}}$.

38.5 Operation

38.5.1 TAP Controller

Figure 38.2 shows the TAP controller internal states.

Note: Transition is made according to the DCUTMS value at the rising edge of DCUTCK. The DCUTDI value is sampled at the rising edge of DCUTCK and is shifted at the falling edge. DCUTDO is in the high-impedance state in the states other than Shift-DR and Shift-IR. Asserting $\overline{\text{DCUTRST}}$ causes transition to Test-Logic-Reset state asynchronously with DCUTCK.

Figure 38.2 TAP Controller State Transition Diagram

38.5.2 Supported Commands

38.5.2.1 BYPASS

The BYPASS command is a standard command indispensable to bypass register operation. This command shortens the shift path to achieve high-speed serial data transfer of other LSIs on the printed-circuit board. During execution of this command, the test circuit has no effect on the system circuit.

38.5.2.2 SAMPLE/PRELOAD

The SAMPLE/PRELOAD command is used to input the value to the boundary scan register from the internal circuits of this LSI; to output the value from the scan path; and to load data onto the scan path. During execution of this command, the level of the input pin of this LSI is sent to the internal circuits as is, and the value of the internal circuits is output to the outside via the output pin as is. Executing this command has no effect on the system circuit of this LSI.

The SAMPLE operation allows taking in the snapshots of the value to be transferred to the internal circuits from the input pin or the value to be transferred to the output pin from the internal circuits to the boundary scan register and allows reading the snapshots from the scan path. Snapshots can be taken in without preventing the normal operation of this LSI.

The PRELOAD operation allows setting the value after reset to the parallel output latch of the boundary scan register from the scan path prior to the EXTEST command. If the EXTEST command is executed without PRELOAD operation, the undefined value is output from the output pin until the first scan sequence is completed (transfer to the output latch) because the parallel output latch value is always output to the output pin with the EXTEST command.

38.5.2.3 EXTEST

The EXTEST command is used to test the external circuits when this LSI is mounted on the printed-circuit board. When this command is executed, the output pin is used to output the test data (previously set with the SAMPLE/PRELOAD command) from the boundary scan register to the printed-circuit board; whereas the input pin is used to take in the test result from the printed-circuit board to the boundary scan register. When the EXTEST command is executed N times for testing, the test data for the Nth execution is scanned in at the (N - 1)th scan-out.

If the data is loaded onto the boundary scan register of the output pin in the Capture-DR state of this command, it is not used for testing the external circuits (replaced through shift operation).

38.5.2.4 CLAMP

When the CLAMP command is selected, the output pin outputs the boundary scan register value that has been previously set with the SAMPLE/PRELOAD command. While the CLAMP command is selected, the boundary scan register retains the previous state regardless of the TAP controller state.

The bypass register is connected between DCUTDI and DCUTDO and operates in the same manner as when the BYPASS command is selected.

38.5.2.5 HIGHZ

When the HIGHZ command is selected, all the output pins go to the high-impedance state. While the HIGHZ command is selected, the boundary scan register retains the previous state regardless of the TAP controller state.

The bypass register is connected between DCUTDI and DCUTDO and operates in the same manner as when the BYPASS command is selected.

38.5.2.6 IDCODE

The IDCODE command sets the JTAG interface pins to IDCODE mode, which is defined by the JTAG standard. When the JTAG interface is initialized (by asserting $\overline{\text{DCUTRST}}$ or placing TAP in the Test-Logic-Reset state), IDCODE mode is set.

38.5.3 Notes

There are restrictions related to the JTAG interface as follows.

- The power supply/GND pins are not subjected to boundary scan.
- The reference voltage pins of the A/D converter (A0VREFH, A1VREFH, and A2VREFH) are not subjected to boundary scan.
- The NC pins are not subjected to boundary scan.
- **Table 38.5** lists the pins not subjected to boundary scan.

Table 38.5 Pins Not Subjected to Boundary Scan

Type	Pins
Analog input	ADCC0I00, ADCC0I01, ADCC0I02, ADCC0I03, ADCC0I10, ADCC0I11, ADCC0I12, ADCC0I13, ADCC0I20, ADCC0I21, ADCC0I22, ADCC0I23, ADCC0I30, ADCC0I31, ADCC0I32, ADCC0I33, ADCC1I00, ADCC1I01, ADCC1I02, ADCC1I03, ADCC1I10, ADCC1I11, ADCC1I12, ADCC1I13, ADCC1I20, ADCC1I21, ADCC1I22, ADCC1I23, ADCC1I30, ADCC1I31, ADCC1I32, ADCC1I33, ADCC2I00, ADCC2I01, ADCC2I02, ADCC2I03, ADCC2I10, ADCC2I11, ADCC2I12, ADCC2I13, ADCC2I20, ADCC2I21, ADCC2I22, ADCC2I23, ADCC2I30, ADCC2I31, ADCC2I32, ADCC2I33, RDC3A0COM, RDC3A1COM, RDC3A0RSO, RDC3A1RSO, RDC3A0S1, RDC3A0S2, RDC3A0S3, RDC3A0S4, RDC3A1S1, RDC3A1S2, RDC3A1S3, RDC3A1S4
General-purpose input	P7_8
Debug system	AUDCK, $\overline{\text{DCURDY}}$, DCUDCK, DCUTDI, DCUTDO, DCUTMS, $\overline{\text{DCUTRST}}$
Mode setting	MD0, MD1, FLMODE
Clock, reset	X1, X2, $\overline{\text{RESET}}$
Error output	ERROROUT_M

- The HIGHZ command is invalid for the pulled-down pins.

38.6 Usage Notes

1. Once a command is set, it is not modified until another command is issued again. To continuously issue the same commands, insert a command that has no effect on chip operation (such as BYPASS mode) between the desired commands.
2. To start the system in boundary scan mode, negate $\overline{\text{DCUTRST}}$ while $\overline{\text{RESET}}$ is high.
3. For the maximum clock frequency that can be input to DCUTCK, refer to **Section 39, Electrical Characteristics**.
4. If the number of serially transferred bits exceeds the number of bits of the register connected between DCUTDI and DCUTDO, the data that is input from DCUTDI is output from DCUTDO after the serial data equal to the number of register bits are output.
5. If the serial transfer sequence is corrupted, be sure to reset $\overline{\text{DCUTRST}}$. Here, start the transfer over again regardless of the point of transfer corruption.
6. Data is output via DCUTDO at the falling edge of DCUTCK.
7. To facilitate debugging, route $\overline{\text{DCUTRST}}$ on the board in such a way that patterns can be easily cut.

Section 39 Electrical Characteristics

39.1 Absolute Maximum Ratings

Table 39.1 lists absolute maximum ratings.

Table 39.1 Absolute Maximum Ratings

Item		Symbol	Rated Value	Unit	Note
Power voltage*1	SYSVCC, VCC	VCC	– 0.3 to + 6.5	V	
	VDD	VDD	– 0.3 to + 1.8	V	
Input voltage	SYSVCC power pin	Vin	– 0.3 to SYSVCC + 0.3	V	See **Table 39.2** for intended pins
	VCC power pin	Vin	– 0.3 to VCC + 0.3	V	
Analog power voltage		A0VCC, A1VCC, A2VCC	– 0.3 to + 6.5	V	
		RVCC	– 0.3 to + 6.5	V	
Analog reference voltage		A0VREFH	– 0.3 to A0VCC + 0.3	V	
		A1VREFH	– 0.3 to A1VCC + 0.3	V	
		A2VREFH	– 0.3 to A2VCC + 0.3	V	
Analog input voltage		V_{AIN}	– 0.3 to A0VCC + 0.3 – 0.3 to A1VCC + 0.3 – 0.3 to A2VCC + 0.3	V	
		V_{RIN}	– 0.3 to RVCC + 0.3	V	
VSS differential voltage (Condition: Between any two of VSS, A0VSS, A1VSS, A2VSS, and RVSS)			– 0.1 to + 0.1	V	
Maximum input current (per pin)	Digital input pin	Imax	– 25 to + 25	mA	Only 1 pin simultaneously
	Analog input pin	Imax	– 25 to + 25	mA	
Junction temperature*1		Tj	– 40 to + 150	ºC	
Storage temperature		Tstg	– 55 to + 150	ºC	After installation

Note 1. Cumulative hours of operation of this LSI with Tj in the range from 125°C to 150°C must be kept within 3000

NOTE

Using this LSI without observing these absolute maximum ratings may result in permanent breakdown of the LSI.

This product is used in combination of multiple power voltages simultaneously in some cases. Use this LSI conforming to power pin connections, conditions for combination of power voltages to be applied, voltages that can be applied to pins, and output voltage conditions, which are specified in the manual. Using this LSI with unspecified power connection or voltage may result in permanent breakdown of the LSI or damage to the system that contains this LSI.

Input voltage, analog reference voltage and analog input voltage must not exceed 6.5 V.

39.2 DC Characteristics

39.2.1 Relationship between Power Name and Pin

Table 39.2 shows the relationship between power name and pin.

Table 39.2 Relationship between Power Name and Pin

Pin Name (Initial Value)	Circuit Power Name	I/O	Input Buffer Type	Note
Px_x	VCC	I/O	Schmitt B	Variable driving ability
P7_8	SYSVCC	I	Schmitt A	
ADCC0Ixx	A0VCC	I*1	Analog (ADC)	
ADCC1Ixx	A1VCC	I	Analog (ADC)	
ADCC2Ixx	A2VCC	I	Analog (ADC)	
RDC3AnSx*2	RVCC	I	Analog (RDC)	
RDC3AnRSO*2	RVCC	IO	—	
RDC3AnCOM*2	RVCC	IO	—	
$\overline{\text{RESET}}$	SYSVCC	I	Schmitt A	
FLMODE	SYSVCC	I	Schmitt A	
MD0	SYSVCC	I	Schmitt A	
MD1	SYSVCC	I	Schmitt A	
$\overline{\text{ERROROUT_M}}$	VCC	O	—	
X1	VCC	I	CMOS	
X2	VCC	O	—	
$\overline{\text{AUDRST}}$	VCC	I	Schmitt A	
AUDCK	VCC	I	CMOS	
AUDSYNC	VCC	I	CMOS	
AUDATAx	VCC	I/O	CMOS	
$\overline{\text{DCUTRST}}$ / $\overline{\text{LPDTRST}}$	VCC	I	Schmitt A	
DCUTDO/LPDO	VCC	O	—	
DCUTMS	VCC	I	CMOS	
DCUTCK/LPDCLK	VCC	I	CMOS	
DCUTDI/LPDI	VCC	I	CMOS	
$\overline{\text{DCURDY}}$ /LPDCLKOUT	VCC	O	—	

Note 1. Some pins also serve as RDC3A pins. Following pins are I/O for both functions.
ADCC1I00/RDC3A0SINMNT, ADCC1I01/RDC3A0COSMNT, ADCC0I12/RDC3A1SINMNT, ADCC0I13/RDC3A1COSMNT

Note 2. C1M-A2: n = 0-1, C1M-A1: n = 0

NOTE

A through current may develop within the pin when an intermediate potential is applied in a DC manner, even if the input buffer is of the Schmitt buffer type (Schmitt A, B).

39.2.2 Recommended Operating Conditions

Table 39.3 Recommended Operating Conditions

Symbol	Min.	Typ.	Max.	Unit	Note
SYSVCC	4.5	5.0	5.5	V	—
VCC	4.5	5.0	5.5		—
VDD	1.15	1.25	1.35		—
A0VCC, A1VCC,A2VCC*1	4.5	5.0	5.5		—
RVCC*1	4.5	5.0	5.5		—
A0VREFH, A1VREFH, A2VREFH*2	4.5	5.0	5.5		—

Note: VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V must be kept.

Note 1. A0VCC, A1VCC, A2VCC, and RVCC must be connected to the same electric potential.

Note 2. Do not exceed A0VCC, A1VCC, or A2VCC.

39.2.3 Input Voltage Characteristics

Table 39.4 DC Characteristics (Input Voltage)

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = – 40ºC to 150ºC

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Schmitt trigger input voltage (Buffer type A)	SYSVCC VCC	V_T^+ (V_{IH})	SYSVCC × 0.75 VCC × 0.75	—	SYSVCC + 0.3 VCC + 0.3	V	**Table 39.2** (Item of Schmitt A input buffer type)
		V_T^- (V_{IL})	–0.3	—	SYSVCC × 0.25 VCC × 0.25	V	
		V_{HS}	SYSVCC × 0.2 VCC × 0.2	—	—	V	
Schmitt trigger input voltage (Buffer type B)	VCC	V_T^+ (V_{IH})	VCC × 0.7	—	VCC + 0.3	V	**Table 39.2** (Item of Schmitt B input buffer type)
		V_T^- (V_{IL})	–0.3	—	VCC × 0.42	V	
		V_{HS}	VCC × 0.082	—	—	V	
CMOS input voltage	VCC	V_{IH}	VCC × 0.7	—	VCC + 0.3	V	**Table 39.2** (Item of CMOS input buffer type)
		V_{IL}	–0.3	—	VCC × 0.2	V	

39.2.4 Input Leak Current Characteristics

Table 39.5 DC Characteristics (Input Leak Current)

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Input leak current	Other than A/D port and R/D port*1	I lin I	—	—	1	µA	Vin = 0 V to SYSVCC Vin = 0 V to VCC
	A/D port	I lin I	—	—	0.1	µA	Vin = 0 V to A0VCC, A1VCC, A2VCC
	R/D port	I lin I	—	—	0.3	µA	Vin = 0 V to RVCC, and stopping RDC3A

Note 1. X1 pin is not intended. Pull-up/pull-down pins are also not intended.

39.2.5 Pull-Up/Pull-Down MOS Current Characteristics

Table 39.6 DC Characteristics (Pull-Up/pull-Down MOS Current)

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Input pull-up MOS current	DCUTMS, DCUTCK, DCUTDI	I_{pu}	—	—	350	µA	Vin = 0 V VCC = 4.5 to 5.5 V
	AUDCK, $\overline{\text{AUDSYNC}}$, AUDATA3-0*1		—	—	350	µA	Vin = 0 V VCC = 4.5 to 5.5 V
	General port		—	—	350	µA	Vin = 0 V, VCC = 4.5 to 5.5 V
Input pull-down MOS current	$\overline{\text{RESET}}$	I_{pd}	25	160	350	µA	Vin = SYSVCC = 4.5 to 5.5 V
	$\overline{\text{DCUTRST}}$		—	—	350	µA	Vin = SYSVCC = 4.5 to 5.5 V
	FLMODE, MD0, MD1		15	—	350	µA	Vin = SYSVCC = 4.5 to 5.5 V
	$\overline{\text{AUDRST}}$		—	—	350	µA	Vin = VCC = 4.5 to 5.5 V
	General port		—	—	350	µA	Vin = VCC = 4.5 to 5.5 V

Note 1. The pull-up of AUDATA3-0 is valid not only in input but also in output.

39.2.6 Output Voltage Characteristics

Table 39.7 DC Characteristics (Output Voltage)

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Output high level voltage	VCC power supply system pins	V_{OH}	VCC – 0.5	—	—	V	I_{OH} = 200 µA VCC = 4.5 to 5.5 V
			VCC – 1.0	—	—	V	I_{OH} = 1 mA VCC = 4.5 to 5.5 V
Output low level voltage	VCC power supply system pins	V_{OL}	—	—	0.4	V	I_{OL} = 1.6 mA VCC = 4.5 to 5.5 V
			—	—	1.2	V	I_{OL} = 4 mA VCC = 4.5 to 5.5 V

39.2.7 Allowable Output Current

Table 39.8 DC Characteristics (Allowable Output Current)

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Item	Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Output low-level allowable current (per pin)	IOL	—	—	4.0	mA	
Output low-level allowable current (total)	ΣIOL	—	—	80.0	mA	
Output high-level allowable current (per pin)	IOH	—	—	2.0	mA	
Output high-level allowable current (total)	ΣIOH	—	—	25.0	mA	

This item affects the calorific value and Tj of the chip. In addition to these restrictions, you also need to take thermal design into consideration.

39.2.8 Injection Current

Table 39.9 DC Characteristics (Injection Current)

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Item		Symbol	Min.	Typ.	Max.	Unit
DC injection current (per pin)	Logic pin	IIC	–2.0	—	2.0	mA
	Analog pin*1		–3.0	—	3.0	mA
DC injection current (total)		Σ|IIC|	–50.0	—	50.0	mA

This item affects the calorific value and Tj of the chip. In addition to these restrictions, you also need to take thermal design into consideration.

Note 1. The objects are ADCCn pins. However, the following pins are excluded:
ADCC1I00, ADCC1I01, ADCC0I12, ADCC0I13

39.2.9 Input Capacitance

Table 39.10 DC Characteristics (Input Capacitance)

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Input capacitance	All pins	Cin	—	10	20	pF	Vin = 0 V, f = 1 MHz Tj = 25ºC

39.2.10 Supply Current Characteristics

Table 39.11 DC Characteristics (Supply Current: C1M-A2)

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Core supply current	Normal operation	I_{dd}	—	—	730	mA	
(VDD power supply)	Current during reset	I_{ddrst}	—	—	335	mA	
VCC power supply current	Normal operation (excluding erasure of code flash)	I_{CC}	—	—	25	mA	Excluding I/O current
	Erasure of code flash	$I_{cc_cferase}$	—	—	60	mA	Excluding I/O current, *1
	Current during reset	I_{ccrst}	—	—	15	mA	
System supply current	Normal operation	I_{SYS}	—	—	7	mA	Including PLL current
(SYSVCC power supply)	Current during reset	I_{sysrst}	—	—	3	mA	
Analog power supply current (A0VCC, A1VCC, A2VCC power supply)		I_{AVCC}	—	—	30	mA	
Analog power supply current (RVCC power supply)		I_{RVCC}	—	—	20	mA	
ADC reference power supply current (A0VREFH, A1VREFH, A2VREFH)		I_{AVREF}	—	—	0.5	mA	

Note 1. Large fluctuations in current occur during erasure. The average current is 15 mA.

CAUTIONS

1. When the A/D converter is not used or it is in the standby state, do not open the A0VCC pin, A1VCC pin, A2VCC pin, A0VREFH pin, A1VREFH pin, A2VREFH pin, A0VSS pin, A1VSS pin, and A2VSS pin.
2. Supply current values are those measured when VIHmin = VCC – 0.5 V and VIL = 0.5 V with no load applied to all output pins.

Table 39.12 DC Characteristics (Supply Current: C1M-A1)

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Core supply current	Normal operation	I_{dd}	—	—	540	mA	
(VDD power supply)	Current during reset	I_{ddrst}	—	—	335	mA	
VCC power supply current	Normal operation (excluding erasure of code flash)	I_{CC}	—	—	25	mA	Excluding I/O current
	Erasure of code flash	$I_{cc_cferase}$	—	—	60	mA	Excluding I/O current, *1
	Current during reset	I_{ccrst}	—	—	15	mA	
System supply current	Normal operation	I_{SYS}	—	—	7	mA	Including PLL current
(SYSVCC power supply)	Current during reset	I_{sysrst}	—	—	3	mA	
Analog power supply current (A0VCC, A1VCC, A2VCC power supply)		I_{AVCC}	—	—	30	mA	
Analog power supply current (RVCC power supply)		I_{RVCC}	—	—	10	mA	
ADC reference power supply current (A0VREFH, A1VREFH, A2VREFH)		I_{AVREF}	—	—	0.5	mA	

Note 1. Large fluctuations in current occur during erasure. The average current is 15 mA.

CAUTIONS

1. When the A/D converter is not used or it is in the standby state, do not open the A0VCC pin, A1VCC pin, A2VCC pin, A0VREFH pin, A1VREFH pin, A2VREFH pin, A0VSS pin, A1VSS pin, and A2VSS pin.
2. Supply current values are those measured when VIHmin = VCC – 0.5 V and VIL = 0.5 V with no load applied to all output pins.

39.3 AC Characteristics

Unless otherwise described, the following timing conditions are applied.

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

- In the port control register, conditions where all output pins of the module used in the same channel are set to the same driving ability are applied to output pins whose driving ability is selectable. Unless otherwise specified, all driving ability settings are included.

- Unless otherwise described, AC measurement conditions described in the figure below are applied.

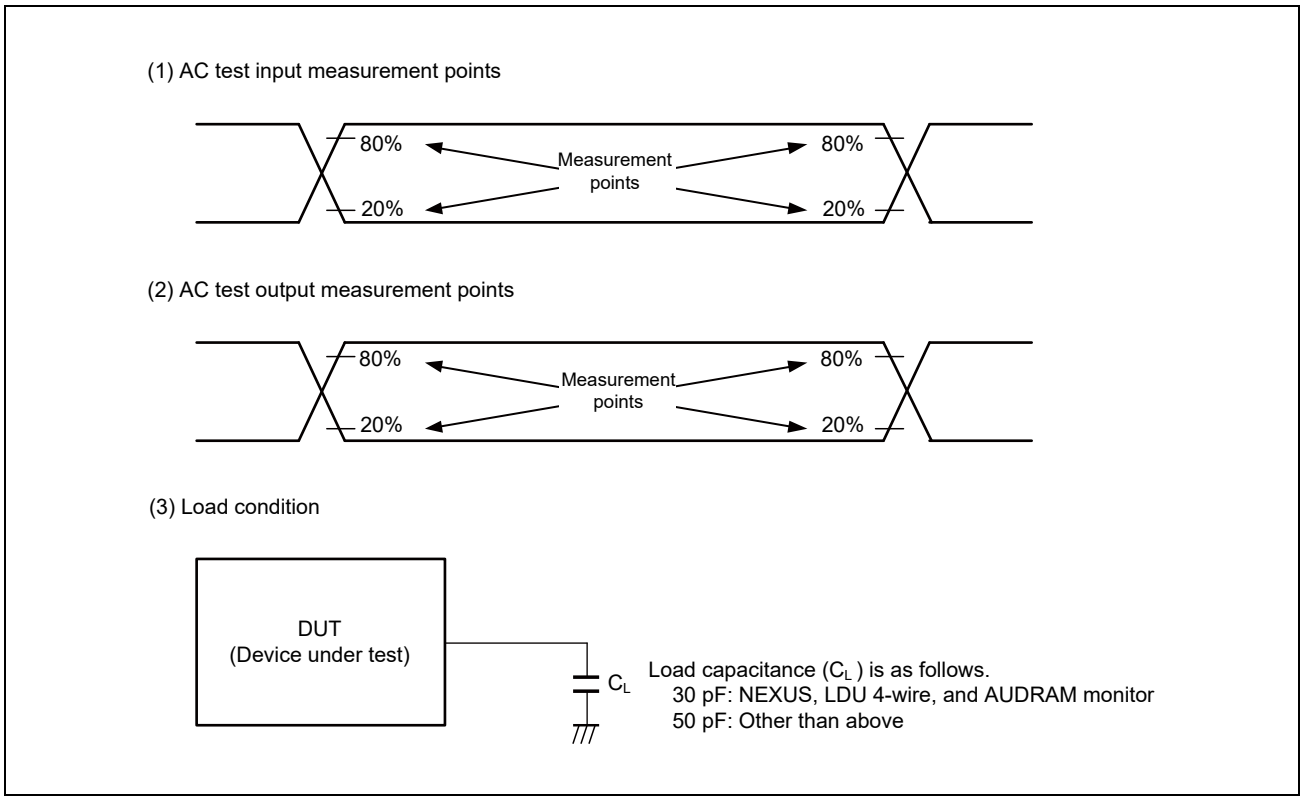


Figure 39.1 AC Measurement Conditions

39.3.1 Power On/Off Timings

Table 39.13 Power On/Off Timings

Item	Symbol	Min.	Max.	Unit	Note
Pin reset L time at power-on	tRESW1	10	—	ms	*1
Pin reset L time at power-off	tRESW2	0	—	µs	*2
PLL1 lock-in time	tPLL1L0	—	1	ms	*3

Note 1. tRESW1 is the reset time required for the supply of internal clock signals to become stable after all power voltages are turned on.

Note 2. tRESW2 is the time from assertion of the reset signal until all of the power voltages have dropped below the lower-limit voltages.

Note 3. tPLL1L0 is the time required for PLL1 to lock in after MOSC (main oscillator) oscillation has become stable.

CAUTIONS

- The states of I/O pins are not reset during the reset noise cancellation interval (max. 1.2 µs) following assertion of the reset signal while power is being turned off.
- If power is disconnected during programming or erasure of flash memory, data in the area of the flash memory that was being programmed or erased are not guaranteed.

39.4 A/D Converter Characteristics

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Table 39.31 A/D Converter Characteristics

Item	Symbol	Condition	Min.	Typ.	Max.	Unit
Digital resolution	—	—	—	12	—	bit
A/D conversion time*1	—	—	—	1	—	µs
Integral nonlinear error	—	Using T&H amplifier	—	—	±4	LSB
Offset error	—	Using T&H amplifier	—	—	±7.5	LSB
Full-scale error	—	Using T&H amplifier	—	—	±7.5	LSB
Quantization error	—	—	—	—	±0.5	LSB
Absolute error	—	—	—	—	±8.0	LSB
Self-diagnosis absolute error	—	In A/D converter self-diagnosis	—	—	±8.0	LSB
	—	In pin level self-diagnosis	—	—	±80	LSB
Analog input capacitance	—	A/D conversion standby	—	—	10	pF
	—	In sampling	—	—	20	pF
Allowable analog signal source impedance	—	—	—	—	3	kΩ
Channel T&H hold time*2	—	—	—	—	10	µs
T&H sampling time	—	—	—	—	0.45	µs
Pull-up resistance for A/D disconnection detection	—	AnVCC = 4.5V to 5.5V, ADCCnIpq = AnVSS	10	20	40	kΩ
Pull-down resistance for A/D disconnection detection	—	AnVCC = 4.5V to 5.5V, ADCCnIpq = AnVCC	10	20	40	kΩ
Input voltage range	—	Not used T&H amplifier	0	—	A0VREFH A1VREFH A2VREFH	V
	—	Using T&H amplifier	0.2	—	A0VREFH-0.2 A1VREFH-0.2 A2VREFH-0.2	V

Note 1. Conversion time for a channel, and not include T&H time.

Note 2. When the T&H circuit is in use, A/D conversion must be performed within the maximum time.

- Errors in the External Circuit of the A/D Converter

  A formula for errors in sampled values due to the external circuit of the A/D converter is given below.
  These errors will depend on the input circuit and conversion cycle. The formula given below for the errors is simplified for the calculation of sampling errors based on internal stray capacitance, amplifier offset, resistance of the signal source, and conversion cycle. This formula can also be used to calculate the effects of the signal source resistance and conversion cycle on these errors.

  The formula gives the error of analog input 2 as shown in the figure below when A/D conversion is performed in the order analog input 1 then 2.

$$Sampling\ error\ (LSB) = \left[\left(\frac{|V2 - V1| \times CIN1}{Ce + CIN1}| + \frac{|Vvfaerr| \times CIN2}{Ce + CIN2}\right) \times \frac{1}{1 - e^{-T1/(Re \times Ce)}} + \left(\frac{1}{T1} \times C1 \times V3 \times Re\right)\right] \times \frac{4096}{Vavrefh}$$

Table 39.32 Parameters of C1M-A

Item	Symbol	Reference	Unit
Common capacitance of the final stage of channel multiplexer	CIN1	1.6	pF
Common capacitance of the final stage of the amplifier and T&H control circuit	CIN2	10	pF
External capacitor on analog input pin	Ce	Depends on user board	uF
Signal source impedance	Re		kΩ
Conversion cycle of conversion pins	T1		ms
AnVREFH voltage (n = 0 to 2)	Vavrefh		V
Potential difference between V1 and V2	V2-V1	5	V
Offset voltage of amplifier and T&H control circuit	Vvfaerr	50	mV
Parasitic capacitance in channel multiplexer	C1	2	pF
|AnVCC voltage /2.5 – measured pin voltage| (n = 0 to 2)	V3	Depends on user board	V

- Values for conversion error calculated by using this formula do not include error (absolute error, etc.) specified in the A/D converter characteristics.
- This formula is a desktop formula and theoretical. When the signal source has an extremely high resistance or when the conversion cycle is too short, calculated and measured values may differ.
  Actual error depends on the capacitor, resistor, capacitance and resistance of board wiring, so please evaluate and verify the error on the user board is no greater than the value produced by this formula (Re < 1.5 MΩ and T1 ≥ 10 µs, or 1.5 MΩ ≤ Re ≤ 2 MΩ and T1 ≥ 512 µs).

39.5 R/D Converter Characteristics

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

39.5.1 RDC Conversion Performance

Table 39.33 RDC Conversion Performance (1/2)

Item	Condition		Min.	Typ.	Max.	Unit
Resolution*1			—	—	16	bit
Conversion accuracy*2	Absolute error in electrical angle signal while operation is stopped (12-bit resolution)	Angle conversion mode 0	—	—	±4	LSB
		Angle conversion mode 1	—	—	±4	
Settling time (Response for input of electric angle of 180°)	Settling range within ±8 LSB	Band 800 Hz	—	53	—	ms
		Band 1500 Hz	—	31	—	
		Band 1000 Hz	—	43	—	
		Band 500 Hz	—	85	—	
		Band 200 Hz	—	211	—	
		Automatic adjustment	—	1.9	—	
Maximum angular velocity*3 (The values in parentheses are applied to range setting as automatic adjustment)	16-bit resolution		15000 (7500)	—	—	min^{-1}
	14-bit resolution		60000 (30000)	—	—	
	13-bit resolution		120000 (60000)	—	—	
	12-bit resolution		240000 (120000)	—	—	
	11-bit resolution		480000 (240000)	—	—	
	10-bit resolution		960000 (480000)	—	—	
Maximum angular acceleration Following angular acceleration range (electrical angle)	Band 800 Hz		—	146000	—	rad/s^2
	Band 1500 Hz		—	513000	—	
	Band 1000 Hz		—	183000	—	
	Band 500 Hz		—	46000	—	
	Band 200 Hz		—	5000	—	
	Automatic adjustment		—	3000000	—	

Table 39.33 RDC Conversion Performance (2/2)

Item	Condition		Min.	Typ.	Max.	Unit
Response delay*4	Electrical angle output response delay in fixed angular velocity	Angle conversion mode 0	–0.2	—	0.20	°/10000 min^{-1}
		Angle conversion mode 1	–0.2	—	0.20	
BIST determination time*5	Obtaining the sum of squares in amplitude abnormality detection BIST (L side)		—	—	1	ms
	Obtaining the sum of squares in amplitude abnormality detection BIST (H side)		—	—	1	ms
	ADBIST		—	—	32	µs
	Angle conversion BIST (angle determination threshold is within ±8 LSB)		—	—	10	ms
	Resolver signal error detection BIST		—	—	0.5	ms
	Resolver signal cut off detection BIST		—	—	1	ms
	Conversion error BIST		—	—	10	ms
	Power short error BIST		—	—	80	µs
	Ground short error BIST		—	—	80	µs
BIST recovery time*6	All kinds of BIST		—	—	10	ms

Note 1. The resolution is changed by the setting of the maximum angular velocity select bit in the RDC3An control gain select register 1. The angle can be read with maximum 16-bit width by register access.

Note 2. It is the ability, when the waveform of analog input to RDC is ideal sign wave. RDC conversion result will defer from resolver machine angle with distortion or slippage of analog input signal or power supply voltage.

Note 3. Following angular velocity range (resolver electrical angle). It is changed by the setting of the maximum angular velocity select bit in the RDC3An control gain select register 1.

Note 4. PHI angle output from RDC is added accuracy error through analog circuit to this value. The read of PHI angle output register value with bus access needs access time. However, it does not need access time using PHI compare signal.

Note 5. It is the time to stabilize BIST determination.

Note 6. Recovery time from BIST operation to normal operation.
When the excitation frequency is under 9 kHz, BIST recovery time is maximum 15 ms.
When the conversion error determination time is set to over 10 ms, BIST recovery time is also set to over the setting value (10 ms).

39.5.2 RDC Analog Pin

Table 39.34 RDC Analog Pin Characteristics

Signal	Symbol	Item	Min.	Typ.	Max.	Unit
Signal source output*1 for resolver excitation power supply	RSO	Frequency	5	—	40	kHz
		Output voltage*2	0.38 × RVCC	0.4 × RVCC	0.42 × RVCC	VP-P
		Load impedance	10	—	—	kΩ
		Output switching*3	–40	±0	+20	%
Common voltage output for resolver excitation power supply	COM	Output voltage	0.475 × RVCC	0.5 × RVCC	0.525 × RVCC	V
		Load impedance	10	—	—	kΩ
Resolver excitation signal external input	R1E, R2E	Frequency*4, *10	5	—	40	kHz
		Input voltage range	0	—	RVCC	V
		Input voltage differential amplitude	2	—	—	VP-P
		Input impedance*11	32	40	48	kΩ
Resolver signal input	S1, S2, S3, S4	Frequency*10	5	—	40	kHz
		Input voltage range*5	—	—	—	V
		Input impedance*6	16.2	21	25.8	kΩ
		Input impedance switching*7	-40	±0	+40	%
Resolver signal monitor output	COSMNT, SINMNT	Frequency*8	5	—	40	kHz
		Output voltage*9	0.36 × RVCC	—	0.64 × RVCC	VP-P
		Load impedance	100	—	—	kΩ

Note 1. Pseudo sign wave output, 7-bit D/A output.

Note 2. The center of amplitude is COM voltage. Described values are default (±0%) of output adjustment.

Note 3. The output voltage can be adjusted in four steps of -40, -20, ±0, and +20% by adjust function.

Note 4. When the excitation frequency is over 22 kHz with resolver excitation signal external input (RDC3AnREF.EXIO = 0_B), set RDC3AnDIAG1.CVEDS = 1_B, and do not set using RD conversion error detection circuit (for high-speed rotation).

Note 5. Depends on external circuit.
Input voltage must be adjusted for COSMNT, SINMNT = 0.36 × RVCC to 0.64 × RVCC (VP-P).

Note 6. Input impedance with on-chip feed-back resistor. This is the default value (±0%).

Note 7. Can be adjusted from -40 to +40% in step of 10% by adjust function.

Note 8. Same as the frequency of resolver signal input.

Note 9. Must be adjusted within this range to keep angle conversion resolution.

Note 10. The phase error of the excitation component of the resolver excitation signal external input and the resolver signal input must be within 45º.

Note 11. When RDC3AnREF.EXIO = 0_B (i.e. the external excitation signal input is set), this impedance pulls the RSO (R1E) and COM (R2E) pins down to RVSS.

39.5.3 Error Detect Characteristics

Table 39.35 Error Detect Characteristics

Error Detect Item		Set Threshold (Default Setting)	Detect Time
Resolver signal error monitor output amplitude voltage*1	Set register RDC3AnDIAG0.EXCETH[7:0]	0.102 × (RVCC±5%) [Vp-p]	220 [µs] (typ.), 2 [ms] (max.)
Breaking of resolver signal (Direct current bias supply method) VSINMNT-VCOM or VCOSMNT-VCOM*2	The register used for setting threshold when DC resolver is selected RDC3AnDIAG0.SGBDTH[7:0]	COM + 0.35 × (RVCC±5%) [VDC]	10 [ms] (max.)
	The register used for setting threshold when VR resolver is selected RDC3AnDIAG0.SGBTH[7:0]	COM + 0.08 × (RVCC±5%) [VDC]	
R/D conversion error (over control declination) Recognition level for internal control declination (ε)*3	High side	$00CA8_H$	*4
	Low side	$1FFF3_H$	
Resolver signal power short error	Pins S1, S2, S3, and S4	0.9 × (RVCC±5%) [VDC]	0.08 [ms] (max.)
	Pins RSO and COM	0.8 × (RVCC±5%) [VDC]	
Resolver signal ground short error	Pins S1, S2, S3, and S4	0.1 × (RVCC±5%) [VDC]	0.08 [ms] (max.)
	Pins RSO and COM	0.2 × (RVCC±5%) [VDC]	
Sum square amplitude error Integral value of sum square of monitor output amplitude voltage (sin, cos) with an interval within the excitation period	High side	0.8 × (RVCC±5%) [Vp-p]	*5
	Low side	0.2 × (RVCC±5%) [Vp-p]	

Note 1. Determined as an error, when both of SINMNT and COSMNT become under threshold.

Note 2. Determined as an error, when DC level changed over threshold.

Note 3. Determined as over, when control declination becomes over high side threshold, or under low side threshold.

Note 4. Determined as an error, when control declination recognition rate becomes over 50% as average of period set by the EDPS [1:0] bits in the RDC3AnDIAG1 register (default is about 7.4 ms). It might not be detected, when the error continuous period is shorter than detect period.

Note 5. Dependent on the excitation frequency and amplitude error excitation period count settings.

39.6 Code Flash Characteristics

Table 39.36 Code Flash Basic Characteristics

Item	Symbol	Condition	Min.	Typ.	Max.	Unit
Number of programming times*1	CWRT	Retained for 20 years *2	1000	—	—	Times
Programming temperature	TPRG	Tj	–40	—	+150	ºC
Reading temperature	TREAD	Tj	–40	—	+150	ºC

Note 1. The number of programming times is the number of erasure of each block. If the number of programming times is n (n = 1000), each block can be erased n times. For example, if 256-byte data is written 128 times to different addresses of a 32KB block and then the block is erased, the number of programming times is counted as 1. Note, however, that writing data to the same address multiple times for one erasure is not allowed (overwrite is prohibited).

Note 2. This is the case when the average Ta = 85°C. This retained period is from when the erasure of the code flash memory has been normally completed.

Table 39.37 Code Flash Programming Characteristics

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Item	Condition	Block size	Min.	Typ.	Max.	Unit
Programming time	Number of programming times < 100	256 B	—	0.4*1	6*1	ms
		32 KB	—	80	360	ms
	Number of programming times ≥ 100	256 B	—	0.5*1	7.2*1	ms
		32 KB	—	96	432	ms
Erasing time*1	Number of programming times < 100	8 KB	—	39	120	ms
		32 KB		141	480	ms
	Number of programming times ≥ 100	8 KB	—	47	144	ms
		32 KB	—	169	576	ms

Note 1. Only the hardware processing time is included. Software overhead is not included.

39.7 Data Flash Characteristics

Table 39.38 Data Flash Basic Characteristics

Item	Symbol	Condition	Min.	Typ.	Max.	Unit
Number of programming times*1	CWRT	Retained for 20 years*2	125000	—	—	Times
		Retained for 3 years*2	250000	—	—	Times
Programming temperature	TPRG	Tj	–40	—	+150	ºC
Reading temperature	TREAD	Tj	–40	—	+150	ºC

Note 1. The number of programming times is the number of erasure of each block. If the number of programming times is n (n = 125000), each block can be erased n times. For example, if 4 byte data is written 16 times to different addresses of a 64KB block and then the bock is erased, the number of programming times is counted as 1. Note, however, that writing data to the same address multiple times for one erasure is not allowed (overwrite is prohibited).

Note 2. This is the case when the average Ta = 85°C. This retained period is from when the erasure of the data flash memory has been normally completed.

Table 39.39 Data Flash Programming Characteristics

Conditions: SYSVCC = VCC = 4.5 V to 5.5 V, VDD = 1.15 V to 1.35 V
A0VCC, A1VCC, A2VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
A2VREFH = 4.5 V to A2VCC, RVCC = 4.5 V to 5.5 V
VSS = A0VSS = A1VSS = A2VSS = RVSS = 0 V
Tj = –40ºC to 150ºC

Item	Block size	Min.	Typ.	Max.	Unit
Programming time*1	4 B	—	0.16	1.7	ms
Erasing time*1	64 B	—	1.7	10	ms
Blank checking time*1	4 B	—	—	30	µs
	64 B	—	—	100	µs

Note 1. Only the hardware processing time is included. Software overhead is not included.

39.8 Thermal Characteristics

39.8.1 Parameters

Table 39.40 Thermal Resistance of RH850/C1M-A

Package	Parameter	Estimate	Unit	Note
FPBGA1717-252	θja	20.6	ºC/ W	JESD51-9 compliant (4 layers)
	Ψjb	14.0	ºC/ W	JESD51-9 compliant (4 layers)
	Tb_inc	6.7	ºC/ W	JESD51-9 compliant (4 layers)
	Ψjt	0.22	ºC/ W	JESD51-9 compliant (4 layers)
LQFP2424-176	θja	30.0	ºC/ W	JESD51-7 compliant (4 layers)
	Ψjb	22.8	ºC/ W	JESD51-7 compliant (4 layers)
	Tb_inc	7.3	ºC/ W	JESD51-7 compliant (4 layers)
	Ψjt	0.34	ºC/ W	JESD51-7 compliant (4 layers)

Note: Thermal resistance and thermal characteristics parameters will change according to the usage environment.

39.8.2 Assumed Board

Table 39.41 JESD51-9 Compliant (4 layers)
